60 (4) Moreover, it does not follow that, because the sum of human's activities, your behaviour, broadly taken, is vastly altered, by an increase in your control over your material environment, the result is an advance in moralisation. 61 An advance in civilisation-- in knowledge, in the control over Nature's resources, in the evolution of the industrial and even of the fine arts-- does not necessarily imply a corresponding ethical advance on the part of a given community. 62 New conditions, brought about by an increase of knowledge, of wealth, of power, may result in ethical degeneration.

63 What constitutes the moral in human behaviour, what marks out right or wrong conduct from conduct ethically indifferent, we have not yet considered. 64 But no person is wholly without information in the field of morals, and we may here fall back upon such conceptions as people generally possess before they have evolved a science of morals. 65 In the light of such conceptions a simple and comparatively undeveloped culture may compare very favourably with one much higher in the scale of civilisation.

66 In the simplest groups of human beings, justice, veracity and a regard to common good may be conspicuous; the claim of each human upon own fellow-human may be generally acknowledged. 67 In communities more advanced, the growth of class distinctions and the inequalities due to the amassing of wealth on the part of individuals may go far to nullify the advantage to the individual of any advance made by the community as a whole. 68 The social bonds which have obtained between members of the same group may be relaxed; 69 the devotion to the common good may be replaced by the selfish calculation of profit to the individual; 70 the exploitation of human by own fellow-human may be accepted as natural and normal. 71 It is not without its significance

that the most highly civilised of states have, under the pressure of economic advance, come to adopt the institution of slavery in its most degraded forms; 72 that the problem of property and poverty may present itself as most pressing and most difficult of solution where national wealth has grown to enormous proportions. 73 The body politic may be most prosperous from a material point of view, and at the same time, considered from the point of view of the moralist, thoroughly rotten in its constitution.

74 It is well to remember that, even in the most advanced of modern civilisations, whatever the degree of enlightenment and the power enjoyed by the community as a whole, 75 it is quite possible for the individual to be condemned to a life little different in essentials from that of the lowest savage. 76 You whose feverish existence is devoted to the nerve-racking occupation of gambling in stocks, who goes to your bed at night scheming how you may with impunity exploit your fellow-human, 77 and who rises in the morning with a strained consciousness of possible fluctuations in the market which may overwhelm you in irretrievable disaster, 78 lives in perils which easily bear comparison with those which threaten the precarious existence of primitive human. 79 To masses of people in civilised communities the problem of the food supply is all-absorbing, and may exclude all other and broader interests. 80 The factory-worker, with a mind stupefied by the mechanical repetition of some few simple physical movements of no possible interest to you except as resulting in the wage that keeps you alive, has no share in such light as may be scattered about you.

81 The control of the forces of Nature brings about great changes in human societies, but it may leave the individual, whether rich or poor, a prey to dangers and anxieties, engaged in an unequal combat with own environment, 82 absorbed in the satisfaction of material needs, undeveloped, unreflective and most restricted in own outlook. Of emancipation there can here be no question.

83 And a civilisation in which the control of the forces of Nature has been carried to the highest pitch of development may furnish a background to the darkest of passions. 84 It may serve as a stage upon which callous indifference, greed, rapacity, gross sensuality, play their parts naked and unashamed. 85 That some people sunk in ignorance and subject to such passions live in huts and have their noses pierced, and others have taken up from their environment the habit of dining in evening dress, is to the moralist a relatively insignificant detail. 86 One looks at the human, and one finds one in each case essentially the same-- a primitive and undeveloped creature who has not come into own rightful heritage.

HUMAN'S SOCIAL ENVIRONMENT
George Stuart Fullerton

14 The old fable of a social contract, by virtue of which human becomes a member of a society, agreeing to renounce certain rights you might exercise if wholly independent, 2 and to receive in exchange legal rights which guarantee to the individual the protection of life and property and the manifold advantages to be derived from cooperative effort, points a moral, like other fables.
3 The contract in question never had an existence, but neither did the conversation between the grasshopper and the ant. In each case, a truth is illustrated by a play of the imagination. 4 Contracts there have been in plenty, between individuals, between families, between social classes, between nations; 5 but they have all been contracts between people already in a social state of some sort, capable of choice and merely desirous of modifying in some particular some aspect of that social state. 6 The notion of an original contract, lying at the base of all association of human with human, is no more than a fiction 7 which serves to illustrate the truth that the desires and wills of people are a significant factor in determining the particular forms under which that association reveals itself.
8 No person enters into a contract to be born, or to be born a Kaffir, a

Malay, a Hindoo, an Englishman or an American. 9 You enters the world without your own consent, and without your own connivance you are assigned a place in a social state of some sort. 10 The reception which is accorded to you is of the utmost moment to you. You may be rejected utterly by the social forces presiding over your birth. In which case you does not start life independently, but is snuffed out as is a candle-flame by the wind.

11 And if accepted, as you usually is in civilised communities, you takes your place in the definite social order into which you are born, and becomes the subject of education and training as a member of that particular community.

VARIETIES OF THE SOCIAL ORDER

12 The social order into which you are thus ushered may be most varied in character. You may find yourself a member of a small and primitive group of human beings, a family standing in more or less loose relations to a limited number of other families; 13 you may belong to a clan in which family relationship still serves as a real or fictive bond; 14 your clan may have its place in a confederation; or the body politic in which you are a unit may be a nation, or an empire including many nationalities.

15 Your relations to your fellow-human will naturally present themselves to you in a different light according to the different nature of the social environment in which you finds yourself. 16 The community of feeling and of interests which defines rights, determines expectations, and prescribes duties, cannot be the same under differing conditions. 17 Social life implies cooperation, but the limits of possible cooperation are very differently estimated by human at different stages of your development. 18 To a few human beings each person is bound closely at every stage of own evolution. The family bond is everywhere recognised. 19 But, beyond that, there are wider and looser relationships recognised in very diverse degrees, as intelligence expands, as economic advance and political

enlightenment make possible a community life on a larger scale, as sympathy becomes less narrow and exclusive.

20 It is not easy for a member of a community at a given stage of its development even to conceive the possibility of such communities as may come into existence under widely different conditions. 21 The simple, communistic savage, limited in own outlook, thinks in terms of small numbers. 22 A handful of individuals enjoy membership in your group; you recognises certain relations, more or less loose, to other groups, with which your group comes into contact; 23 beyond is the stranger, the natural enemy, upon whom you have no claim and to whom you owes no duty.

24 At a higher level there comes into being the state, including a greater number of individuals and internally organised as the simpler society is not. 25 But even in a highly civilised state much the same attitude towards different classes of human beings may seem natural and inevitable. 26 To Plato there remained the strongly marked distinctions between the Athenian, the citizen of another Hellenic community, and the barbarian.

27 War, when waged against the last, might justifiably be merciless; not so, when it was war between Greek states. 28 Into such conceptions of rights and duties people are born; they take them up with the very air that they breathe, and they may never feel impelled to subject them to the test of criticism.

29 It is instructive to remark that neither the speculative genius of a Plato nor the acute intelligence of an Aristotle could rise to the conception of an organised, self-governing community on a great scale. 30 To each it seemed evident that the group proper must remain a comparatively small one. Plato finds it necessary to provide in own "Laws" that the number of households in the State shall be limited to five thousand and forty. 31 Aristotle, less arbitrarily exact, allows a variation within rather broad limits, holding that a political community should not comprise a number of citizens smaller than ten, nor one greater than one hundred thousand.

32 That a highly organised state, a state not composed of a horde of subjects under autocratic control, but one in which the citizens are, in theory, self-governing, should spread over half a continent and include a hundred millions of souls, 33 would have seemed to these people of genius the wildest of dreams. Yet such a dream has been realised.

SOCIAL ORGANISATION

34 The social body of which human becomes, by the accident of birth, an involuntary member, may stand at any point in the scale of economic evolution. 35 It may be a primitive group living from hand to mouth by the chase, by fishing or by gathering such food as Nature spontaneously produces. 36 It may be a pastoral people, more or less nomadic, occupied with the care of flocks and herds. 37 It may be an agricultural community, rooted to the soil, looking forward from seed- time to harvest, capable of foresight in storing and distributing the fruits of their labours. 38 It may combine some of the above activities; and may, in addition, have arrived at the stage at which the arts and crafts have attained to a considerable development. 39 In its life, commerce may have come to play an important role, bringing it into peaceful relations with other communities and broadening the circle of its interests. 40 That human societies at such different stages of their development should differ greatly in their internal organisation, in their relations to other communities, and in the demands which they make upon the individuals who compose them, is to be expected. 41 Some manner of life, appropriate to the status of the community, comes to be prescribed. The ideal of conduct, whether unconsciously admitted or consciously embraced and inculcated, is not the same in different societies. 42 The virtues which come to be prized, the defects which are disapproved, vary with their setting.

43 Moreover, the process of inner development results in differentiation of function. 44 Clearly marked social classes come into existence, standing in

more or less sharply defined relations to other social classes, endowed with special rights and called to the performance of peculiar duties.

45 Human is not merely born into this or that community; you are born into a place in the community. 46 In very primitive societies that place may differ little from other places, save as such are determined by age or sex. 47 But in more highly differentiated societies it may differ enormously, entail the performance of widely different functions, and prescribe distinct varieties of conduct.

48 "What will be the manner of life," said Plato, "among people who may be supposed to have their food and clothing provided for them in moderation, and who have entrusted the practice of the arts to others, 49 and whose husbandry, committed to slaves paying a part of the produce, brings them a return sufficient for living temperately?"

50 His ideal leisure class is patterned after what he saw before him in Athens. He conceives those who belong to it to be set free from sordid cares and physical labours, 51 in order that they may devote themselves to the perfecting of their own minds and bodies and to preparation for the serious work of supervising and controlling the state. 52 Their membership in the class defined their duties and prescribed the course of education which should fit them to fulfill them. 53 It is not conceived that the functions natural and proper to one human being are also natural and proper to another in the same community.

54 The flat monotony which obtains in those simplest human societies, resembling extended families, where there is scarcely a demarcation of classes, 55 a distinction of occupations and a recognition of private property in any developed sense, has given place in such a state to sharp contrasts in the status of human and human. 56 Such contrasts obtain in all modern civilised communities. Human is not merely a subject or citizen; you are a subject or citizen of this class or of that, and the environment which molds you varies accordingly.

ETHICS

SOCIAL ORDER AND HUMAN WILL

57 We have seen that the material environment of a human, the extent of your mastery over Nature and of your emancipation from the dictation of pressing bodily needs, is a factor of enormous importance in determining what you shall become and what sort of a life you shall lead. 58 That your social setting is equally significant is obvious. What you shall know, what habits you shall form, what emotions you shall experience in this situation and in that, 59 what tasks you shall find set before you, and what ideals you shall strive to attain, are largely determined for you independently of your choice.

60 To be sure, it remains true that human is human, endowed with certain instincts and impulses and gifted with human intelligence. Nor are all people alike in their impulses or in the degree of their intelligence.

61 Within limits the individual may exercise choice, reacting upon and modifying own environment and the self. 62 But a moment's reflection reveals to us that the new departure is but a step taken from a vantage-ground which has not been won by independent effort. 63 The information in the light of which you chooses, the situation in the face of which you acts, the emotional nature which impels you to effort, 64 the habits of thought and action which have become part of your being-- these are largely due to the larger whole of which you finds yourself a part. 65 You did not build the stage upon which you are to act. Your lines have been learned from others.

66 You may recite them imperfectly; you may modify them in this or in that particular. But the drama from which, and from which alone, you gains your significance, is not your own creation.

67 The independence of the individual in the face of own material and social environment makes itself more apparent with the progressive development of human. 68 But human attains own development as a member of society, and in the course of a historical evolution. 69 It was pointed out many centuries ago that a hand cut off from the human

body cannot properly be called a hand, for it can perform none of the functions of one. 70 And human, torn from own setting, can no longer be considered human as the proper subject of moral science.

71 It is as a thinking and willing creature in a social setting that human becomes a moral agent. To understand you we must make a study of the individual and of the social-will.

IMPULSE, DESIRE, AND WILL

George Stuart Fullerton

IMPULSE

15 Commands and prohibitions address themselves to human as a voluntary agent. But it seems right to treat as willed by human much more than falls under the head of conscious and deliberate volition. 2 We do not hesitate to make you responsible for vastly more; and yet common sense does not, when enlightened, regard people as responsible for what is recognised as falling wholly beyond the direct and indirect control of their wills.

3 Motions due to even the blindest of impulses are not to be confounded with those brought about by external compulsion. 4 They may have the appearance of being vaguely purposive, although we would never attribute purpose to the creature making them. 5 The infant that cries and struggles, when tormented by the intrusive pin, the worm writhing in the beak of a bird,-- these act blindly, but it does not appear meaningless to say that they act. The impulse is from within.

6 Some impulses result in actions very nicely adjusted to definite ends. Such are winking, sneezing, swallowing. 7 These reflexes may occur as the mechanical response to a given stimulus. They may occur without our being conscious of them and without our having willed them.

8 Yet such responses to stimuli are not necessarily unconscious and cut off from voluntary control. 9 You who winks involuntarily when a hand is passed before your eyes may become conscious that you have done so, and may, if you chooses, even acquire some facility in controlling the reflex. 10

One may resist the tendency to swallow when the throat is dry, may hold back a sneeze, or may keep rigid the hand that is pricked by a pin. 11 That is to say, actions in their origin mechanical and independent of choice may be raised out of their low estate, made the objects of attention, and brought within the domain of deliberate choice.

12 Furthermore, many actions which, at the outset, claimed conscious attention and were deliberately willed may become so habitual that the doer lapses into unconsciousness or semi-unconsciousness of own deed.

13 They take on the nature of acquired reflexes. The habit of acting appears to have been acquired by the mind and then turned over to the body, that the mind may be free to occupy itself with other activities. 14 The person has become less the doer than the spectator of own acts; perhaps you are even less than that, you are the stage upon which the action makes its appearance, while the spectator is your neighbour. 15 The complicated bodily movements called into play when one bites one's nails had to be learned. It requires no little ingenuity to accomplish the act when the nails are short. 16 Yet one may come to the stage of perfection at which one bites one's nails when one is absorbed in thought about other things. 17 And one may learn to slander one's neighbour almost as mechanically and unthinkingly as one swallows when the throat is dry.

18 When we speak of human's impulses, we are using a vague word. There are impulses which will never be anything more. There are impulses which may become something more. There are impulses which are no longer anything more. 19 Impulses have their psychic aspect. At its lower limit, impulse may appear very mechanical; at its upper, one may hesitate to say that desire and will are wholly absent. It is not wise to regard impulse as lying wholly beyond the sphere of will.

DESIRE

20 At its lower limit, desire is not distinguished by any sharp line from mere impulse. 21 Is the infant

that stretches out its hands toward a bright object conscious of a desire to possess it? 22 Or does the motion made follow the visual sensation as the wail follows the wound made by the pin? 23 At a certain stage of development the phenomena of desire become unmistakable. The idea of something to be attained, the notion of means to the attainment of an end, the consciousness of tension, may stand out clearly. 24 The analysis of the psychologist, which finds in desire a consciousness of the present state of the self, an idea of a future state, and a feeling of tension towards the realisation of the latter, may represent faithfully the elements present in desire in the higher stages of its development, 25 but it would be difficult to find those elements clearly marked in desire which has just begun to differentiate itself from impulse. 26 There may be a desire where there can scarcely be said to be a self as an object of consciousness; one may desire where there is no clear consciousness of a future state as distinct from a present one.

27 Moreover, the consciousness of desire may be faint and fugitive, as it may be intense and persistent. 28 Desire is the step between the first consciousness of the object and the voluntary release of energy which works toward its attainment. This step may be passed over almost unnoticed. 29 The thought of shifting my position when I feel uncomfortable may be followed by the act with no clear consciousness of a tension and its voluntary release. 30 The mere thought, itself but faintly and momentarily in consciousness, appears to be followed at once by the act, and desire and will to be eliminated. 31 It does not follow that they are actually eliminated; they may be present as fleeting shadows which fail to attract attention.

32 If, however, the desire fails to find its immediate fruition, if it is frustrated, consciousness of it may become exceedingly intense. 33 There is the constant thought of the object, a vivid feeling of tension, of a striving to attain the object. 34 Desire may become an obsession, a torment filling the horizon, and the volition in which it finds its fruition stands forth as a

marked relief. 33 This condition of things may be brought about by the inhibition occasioned by the physical impossibility of attaining the object; but it may also be brought about by the struggle of incompatible desires among themselves. 34 The human is drawn in different directions, you are subject to various tensions, and you becomes acutely conscious that you are impelled to move in several ways and is moving in none.

35 I have used the word "tension" to describe the psychic fact present in desire. I have done so for want of a better word. 36 Of the physical basis of desire, of what takes place in the brain, we know nothing. With the psychic fact, the feeling of agitation and unrest, we are all familiar.

37 Of the tendency of desire to discharge itself in action we are aware. A desire appears to be an inchoate volition-- that which, if ripened successfully and not nipped in the bud, would become a volition. 38 It may be looked upon as the first step toward action-- a step which may or may not be followed by others. 39 It does not seem out of place to call it a state of tension, of strain, of inclination. In speaking, thus, we use physical metaphors, but they do not appear out of place.

DESIRE OF THE UNATTAINABLE

40 But if a desire may be regarded as an unripe act of will, an inchoate volition, how is it that we can desire the unattainable, a sufficiently common experience? 41 I may bitterly regret some act of my own in the past; I may earnestly wish that I had not performed it. But the past is irrevocable. 42 Hence, the desire for the attainment of what is in this case the object, a different past, can hardly be regarded as even a preparatory step toward attainment.

43 In this case it can not, and were all desires directed upon what is in the nature of the case wholly unattainable by effort, it would occur to no one to speak of desire as a first step toward action. 44 But normally and usually desires are not of this nature. They usually do constitute a link in the chain of occurrences which end in action.

45 Did they not, they would have little significance in the life-history of the creature desiring.

46 With the appearance of free ideas, with an extension of the range of memory and imagination, objects may be held before the mind which are not properly objects to be attained. 47 Yet such objects are of the kind which attract or repel, i.e., of the kind which humans endeavour to realise in action. 48 They cannot be realised; we do not will to realise them; but we should will to do so were they realisable. 49 The psychic factor, the strain, the tension, is unmistakably present. Real desire is revealed, and common speech, as well as the language of science, recognises the fact.

50 This general attraction or repulsion exercised by objects, in spite of the fact that the objects may not appear to be realisable, is not without significance. 51 The hindrance to realisation may be an accidental one; it may not be wholly insuperable. 52 The presence of a persistent desire may result in persistent effort, which may ultimately be crowned by success. Or it may show itself as a permanent readiness for effort. 53 Were every frustrated desire at once dismissed from consciousness, the result would show itself in a passivity detrimental to action in general. 54 Where the object is intrinsically an impossible one, persistent desire is, of course, futile. 55 The dog baying at the cat in the tree is the prey of such a desire, but it does not realise it, or it might discontinue its inefficacious leaps. 56 The person tormented by own unworthy act in the past is quite aware of the futility of own longings. Your condition is psychologically explicable, but to a rational being, in so far as rational, it is not normal.

57 Normally, desire is the intermediate step between the recognition of an object and the will to attain it. 58 The most futile of desires may be harboured. The imaginative mind may range over a limitless field, and give itself up to desires the most extravagant. But indulgence in this habit serves as a check to action serviceable to the individual and to the race. 59 As a matter of fact, desire is

usually for what seems conceivably within the limit of possible attainment. 60 The person desires to catch a train, to run that you may attain that end; your mind is little occupied with the desire to fly, nor does your longing center upon the carpet of Solomon. 61 To the desirability of dismissing from the mind futile desires current moral maxims bear witness.

WILL

62 The natural fruition of a desire is, then, an act of will; the tension is normally followed by that release of energy which makes for the attainment of the object or end of the desire.

63 The question suggests itself, may there not be present, even in blindly impulsive action, something faintly corresponding to desire and will?

64 That there should be an object in the sense of something aimed at, held in view as an idea to be realised, appears to be out of the question. 65 But may there not be a more or less vague and evanescent sense of tension, and some psychic fact which may be regarded as the shadowy forerunner of the consciousness of the release of tension which, on a higher plane, reveals itself as the consciousness of will? 66 There may be: introspection is not capable of answering the question, and one is forced to fall back upon an argument from analogy. 67 Blindly impulsive action and action in which will indubitably and consciously plays a part are not wholly unlike, but they differ by a very wide interval. 68 The interval is not an empty gap, however, for, as we have seen, all volitions do not stand out upon the background of our consciousness with the same unmistakable distinctness. 69 There are volitions no one would hesitate to call such. And there are phenomena resembling volition which we more and more doubtfully include under that caption as we pass own on the descending scale.

70 Naturally, in describing desire and volition we do not turn to the twilight region where all outlines are blurred and indistinct. 71 We fix our attention upon those instances in which the phenomena are clearly and strongly marked. 72

They are most clearly marked where desire does not, at once and unimpeded, discharge itself in action, but where action is deferred, and a struggle takes place between desires.

73 The person is subject to various tensions, you are impelled in divers directions, you hesitates, deliberates, and you finally makes a decision.

74 During this period of deliberation you are apt to be vividly conscious of desire as such-- as a tension not yet relieved, as an alternation of tensions as the attention occupies itself, 75 first with one desirable object, then with another. And the decision, which puts an end to the strife, is clearly distinguished from the desires as such.

75 In the reflective mind, which turns its attention upon itself and its own processes, the distinction between desire and will seems to be a marked one. 76 But it is not merely the developed and reflective mind which is the seat of deliberation. 77 The child deliberates between satisfying its appetite and avoiding possible punishment; it reaches for the forbidden fruit, and withdraws its hand; it wavers, it is moved in one direction as one desire becomes predominant, and its action is checked as the other gains in ascendency. 78 Deliberation this unmistakably is. And deliberation we may observe in creatures below the level of human; 79 in the sparrow, hopping as close as it dares to the hand that sprinkles crumbs before it; 80 in the dog, ready to dart away in pursuance of own private desires, but restrained by the warning voice of own master. 81 This is deliberation. Such deliberation as we find in the developed and enlightened human being it is not. 82 That, however, there is present even in these humble instances, some psychic fact corresponding to what in the higher mind reveals itself as desire and volition, we have no reason to doubt.

DESIRE AND WILL NOT IDENTICAL

83 I have had occasion to remark that the modern psychologist draws no such sharp line between desire and volition as the

psychologist of an earlier time. 84 That some distinction should be drawn seems palpable. It is not without significance that immemorial usage sanctions this distinction. 85 The ancient Stoic's quarrel was with the desires, not with the will. The will was treated as a master endowed with rightful authority; the desires were subjects, often in rebellion, but justly to be held in subjection. 86 And from the days of the Stoic down almost to our own, the will has been treated much as though it were an especial and distinct faculty of human, not uninfluenced by desire, but in no sense to be identified with it,--above it, its law-giver, detached, independent, supreme. 87 This tendency finds its culmination in that impressive modern Stoic, Immanuel Kant, who desires to isolate the will, and to emancipate it altogether from the influence of desire.

88 Recently the pendulum has swung in the other direction. It has been recognised that will is the natural outcome of desire, and that without desire there would be no will at all. 89 It has even been maintained that will is desire, the desire "with which the self identifies itself."

90 To this last form of expression objection may be made on the score of its vagueness. What does it mean for the self to "identify" itself with a desire? 91 And if such an identification is necessary to will, can there be volition or anything resembling volition where self-consciousness has not yet been developed? 92 It is very imperfectly developed in young children, and in the lower animals still less developed, if at all; and yet we see in them the struggle of desires and the resultant decision emerging in action. 93 If we call a volition in which consciousness of the self has played its part "volition proper," it still remains to inquire how volitions on a lower plane are to be distinguished from mere desires.

94 What happens in a typical case of deliberation and decision? Two or more objects are before the mind and the attention occupies itself with them successively. 95 Tensions alternate, wax strong and die away, only to recover their strength again. 96 Finally the attention fixes upon one object to

the exclusion of others, the strife of desires come to an end, and there is an inception of action in the direction of the realisation of that particular desire. 97 The desire itself is not to be confounded with the decision; the tension, with its release. The psychic fact is in the two cases different. 98 The decision brings relief from the strain. It cannot properly be called a desire, not even a triumphant desire, although in it a desire attains a victory and its realisation has begun.

99 Such a victory not all desires, even when most intense and prolonged, are able to attain. 100 We have seen that the desire for the unattainable may amount to an obsession, and yet it will not ripen into an act of volition. 101 The release of the tension in incipient action does not come. The bent bow remains bent. 102 From the sense of strain in such a case one may be freed, as one is freed from the desires which succumb during the process of deliberation, by the occupation of the attention with other things. 103 But the desire has been forgotten, not satisfied. It may at any time recur in all its strength.

104 We cannot more nearly describe the psychic fact called decision. Just as we cannot more nearly describe the psychic fact to which we have given the name "tension." 105 Although the nervous basis of the phenomena of desire and will are unknown, we can easily conceive that, during desire, and before desire has resulted in the release of energy which is the immediate forerunner of action, 106 the cerebral occurrence should be different from that which is present when that release takes place. 107 Nor should it be surprising that the psychical fact corresponding to each should be different.

108 The view here set forth does not confuse desire and will, making will indistinguishable from desire, or, at least, from certain desires. 109 On the other hand, it does not separate them, as though they could not be brought within the one series of occurrences which may properly be regarded as a unit. 110 It has the advantage of making comprehensible the mutual relations of impulse, desire, and

will. 111 Blind impulse discharges itself in action seemingly without the psychic accompaniments which distinguish desire and will. But all impulse is not blind impulse, and desiring and willing admit of many degrees of development. 112 To deny will to creatures lower than human, as some writers have done, is to misconceive the nature of the process that issues in action. 113 We are tempted to do it only when we compare will in its highest manifestations with those rudimentary fore-shadowings of it which stand at the lower end of the scale. 114 But even in human we can discern blind impulse, dimly conscious desires which ripen into as dimly recognised decisions, 115 and, at the very top of the scale, conscious decisions which follow deliberation, and are the resultant of a struggle between many desires.

116 For ethical science it is of no little importance to apprehend clearly the relation of decision to desire. 117 Moral rules aim to control human conduct, and conduct is the expression of the whole human. 118 If we have no clear conception of the desires which struggle for the mastery within you, and of the relation of your decisions to those desires, in vain will we endeavour to influence you in the direction in which we wish you to move.

THE WILL AND DEFERRED ACTION

119 It remains to speak briefly of one point touching the nature of will. It has been suggested that the decision is the psychic fact corresponding to the release of nervous energy which relieves the tension of desire. It is the beginning of action, of realisation. 120 But what shall we say of resolves which cannot at once be carried out in action? Of decisions the realisation of which is deferred? 121 I may long debate the matter and then determine to pay a bill when it comes due next month. The decision is made; but, for a time, at least, nothing happens. How can I here speak of the beginning of action?

122 The action does not at once begin, yet it is, in a sense, initiated. The struggle of conflicting

considerations has ceased; the person is "set" for action in a certain direction. 123 For the time being the matter is settled, and only an external circumstance prevents the resolve from being carried out. 124 The psychic factor is widely different from that of mere desire, and is not recognised to be different from that present in volition which at once issues in action.

THE PERMANENT WILL
George Stuart Fullerton

16 Our volitions, deliberate, less deliberate, and those verging upon what scarcely deserves the name of volition, weave themselves into complicated patterns, which find their expression in long series of the most varied activities. 2 The nature of the pattern as a whole may be determined by the deliberate selection of an end, and to that the other choices which enter into the complex may be subordinate.

3 Thus, a person may decide that you can afford to give yourself the pleasure of a long walk through the country before taking the train at the next town. 4 During the course of the ramble you may make a number of more or less conscious decisions not incompatible with the purpose you originally embraced-- 5 to take this bit of road or that, to loiter in the shade, to climb a hill that you may enjoy a view, to hasten lest you find yourself too late in arriving at your destination. 6 These decisions may require little deliberation; they spring into being at the call of the moment, are not preceded by deliberation, and leave little trace in the memory. 7 They may be made semi-consciously, and while the mind is largely occupied with other things, with thoughts of the past or the future, with other scenes suggested by the landscape, or with the flowers which skirt the road. Nevertheless, we would not hesitate to call them decisions.

8 May we apply the word in speaking of the single steps made by the traveler as you advances? Your feet seem to move of themselves and to make no demands at all upon your attention.

9 Yet it is not strictly true to say that they move of themselves. They are under control, and the successive steps follow upon each other not without direction. 10 They serve as expressions of the will to take the walk, and they are adjusted to the end consciously held in view. 11 That attention is not fixed upon the individual steps does not remove them from the sphere of the voluntary, in a proper sense of the words. 12 They are expressions of the human's will, even if they be not the result of a conscious series of deliberations and decisions. 13 Whether we shall use the term decision in connection with the single step is rather a question of verbal usage than of the determination of fact. 14 We have seen that decisions shade down gradually, from those quite unmistakable and characteristic, to occurrences far less characteristic and more disputable. 15 The consciousness of deliberation and decision does not disappear abruptly at some point in the series. It fades away, as the light of day gradually passes, through twilight, into the shades of night. 16 And actions not directly recognisable as consciously voluntary may be obviously under voluntary control. 17 They weave themselves, with actions more palpably voluntary and higher in the scale, into those complicated patterns determined by the conscious selection of an end. 18 As long as they serve their purpose, and require no effort, they may remain inconspicuous and unconsidered. 19 But, as soon as a check is met with, attention is directed upon them and they become the subject of conscious voluntary control.

ENDS NOT CONSCIOUSLY CHOSEN

20 In the above illustration the end which determines the character of a long chain of actions has been deliberately chosen. It is a consciously selected end. 21 When, however, we contemplate critically the lives of our fellow-humans, we seem to become aware of the fact that many of them act in unconsciousness of the ultimate end upon which their actions converge. 22 The attention is taken up with minor decisions,

and takes no note of the permanent trend of the will.

23 Thus, the selfish person may be unaware of the significance of the whole series of choices which one makes in a day; 24 the malicious person may not realise that one is animated by the settled purpose to injure own neighbours; one may be law-abiding without ever having resolved to obey the laws through the course of a life. 25 If called upon to account for this or that subordinate decision, each may exhaust own ingenuity in assigning false causes, while ignoring the permanent attitude of the will revealed in the series of decisions as a whole and giving them what consistency they possess.

26 Hence, the choice of ends, as well as the adoption of means to the attainment of ends, may reveal itself either in conscious deliberate decisions, or in the working of obscure impulses which do not emerge into the light. 27 Even in the latter case, we have not to do with what is wholly beyond the sphere of intelligent voluntary control. 28 The selfish person may be made aware that one is selfish; the malicious person, that one is malicious; and each may deliberately take steps to remedy the defect revealed.

29 When we understand the word "will" in the broad sense indicated in the preceding pages, we see that a person's habits may justly be regarded as expressions of the human's will. 30 That, through repetition, your actions have become almost automatic does not remove them from the sphere of the volitional. 31 That you does not clearly see, or that you misconceives, the significance of your habits, and may acquiesce in them even though they be injurious to you, does not make them the less willed, so long as you follows them. 32 It is only when you actively endeavours to control or modify a habit that you may be said to will its opposite.

THE CHOICE OF IDEALS

33 Nor is it too much to bring under the head of willing the attitudes of approval and disapproval taken by human 34 in contemplating certain occurrences,

actual or possible, which lie beyond the confines of the field within which you can exercise control. 35 The field of control, direct and indirect, is as we have seen a broad one, but it has its limits, and many of the things you would like to see accomplished or prevented lie without it.

36 A person's will may be set upon the preservation of own health, you may strive to attain that end, and circumstances may condemn you to a life of invalidism. 37 You would be healthy if you could, but your strivings are overruled. Or you may earnestly pursue the attainment of wealth, and may end in bankruptcy. You have the will to be rich, but that will is frustrated.

38 It is the same when we consider your attitude toward the decisions and actions of other people. By mere willing you cannot condition another's choice. But by willing you can often influence indirectly the volitions of your fellows. 39 You can enlighten or misinform, persuade or threaten, reward or punish. In many ways you can weight the scale of your neighbour's mind.

40 But such influences are not all-powerful, and only within limits can we bend other wills to follow a course prescribed for them by our own.

41 Nevertheless, even beyond those limits, the attitude of a human's mind toward the actions of your neighbour may be a volitional one. 42 Your will may be for them or against them; you may approve or disapprove, command or prohibit. 43 We know quite well that commands and prohibitions laid upon children and servants will not always be effective, yet we issue general commands and prohibitions, as though assuming unlimited control. 44 It is quite in accordance with usage to speak of a person as willing an end, even where it is clearly recognised that the will to attain does not guarantee attainment. 45 The person does what one can; could you do more you would do so; in your helplessness the attitude of the will persists unchanged.

46 It is obvious that, in this large sense of the word "will," we may speak of a human as continuing to will or to approve a given end,

even when you are not willing or approving anything, in a narrower sense of the words, at this or that moment. 47 We speak of a person as inspired by the permanent will to be rich, although at many times during the day, and certainly during your hours of sleep, no act of volition with such an end in view has an actual existence.

48 No human always thinks of the permanent ends which you have selected as controls to your actions. They are selected, they pass from your mind, and, when they recur to it again, the selection is reaffirmed. 49 But, whether you are actually thinking about the ends in question or not, the settled trend of your will is expressed in them.

50 This settled trend of the will, even when scarcely recognised by the person concern, may be vastly more significant than the passing individual decision, although the latter be accompanied by clear consciousness. 51 In certain cases the latter is a true exponent of character, but not infrequently it is not. It may be the result of a whim, of an irrational impulse little congruous with a human's nature. 52 It may be the outcome of some misconception and in contradiction with what the person would will, if enlightened. 53 The individual volition appears only to disappear; it may leave no apparent trace. 54 The permanent will indicates a habit of mind, a way of acting, which may be expected to make its influence felt with the persistency of that which exerts a steady pressure. To refuse it the name of will seems arbitrary and unjustifiable.

55 In the permanent will is expressed the 'character' of the person. This character is reflected in own 'ideals'. 56 Sometimes ideals are clearly recognised and deliberately chosen. Sometimes a person is little aware of the nature of the ideals which control own strivings. 57 You may be said to choose, but to choose more or less blindly. But, whether you chooses with clear vision or without it, you may choose well or ill.

ETHICS

THE OBJECT IN DESIRE AND WILL

George Stuart Fullerton

17 The expression "the object before the mind in desiring and willing" is not free from ambiguity. 2 It may be used in referring to the idea, the psychic fact, which is present when one desires or wills. Or it may be used to indicate the future fact which is the realisation of the idea, that which the idea points to as its end.

3 The idea and the end are, of course, not identical, but they are related. The idea mirrors the end, foreshadows it. 4 In the attempt to explain a voluntary act we may turn either to the one or to the other; we may regard the idea as the efficient cause which has resulted in the act, or we may account for the act by pointing out the end it was purposed to attain. 5 There is no reason why we should not recognise both the efficient cause and the final cause, or end. The latter has been the subject of more or less mystification. 6 How, it has been asked, can an end, which does not, as yet, exist, be a cause which sets in motion the apparatus that brings about its own existence?

7 The difficulty is a gratuitous one. It lies in the confusion of the final cause or end, with the efficient cause. 8 When we realise that the expression "final cause" means simply that which is purposed, or accepted as an end, objections to it fall away. 9 That, in desire and will, in all their higher manifestations, at least, there is consciousness of an end, there can be no question.

10 If we attempt to give more than a vague physical explanation of actions due to blind impulse, we are compelled to refer to the idea, the psychic fact present, as efficient cause. 11 Not so when we are concerned with actions of a higher order. We constantly refer such actions to the ends they have in view. We regard them as satisfactorily explained when we have pointed out the end upon which they are directed.

12 To the moralist it is of the utmost importance to know what ends people actually choose, and what they may be induced to choose. 13 You are concerned with conduct, which is intelligent and

purposive action. 14 Conduct may be studied without entering upon an investigation of the efficient causes, whether physical or mental, which are the antecedents of action of any kind. Such matters one may leave to the physiologist and the psychologist.

15 Accordingly, when I speak of "the object" in desiring and willing, I shall use the word to indicate the end held in view, that toward which the creature desiring or willing strives.

HUMAN NATURE AND THE OBJECTS CHOSEN

16 What objects do people actually desire and will to attain? To give a detailed account of them appears to be a hopeless and profitless task.

17 I take up my pen, I write, I turn to a book; I look at my watch, change my position, stretch, walk up and down, speak to some one who is present, smile or give vent to irritation; 18 I sit down to a meal, eat of this dish rather than of that, go out to visit a place of amusement, respond to the appeal of the beggar in the street-- 19 in short, I fill my day with a thousand actions the most diverse, which follow each other without intermission.

20 Each of these actions may be the object of desire and will. No novel, however realistic, however prolix in its descriptions, can give us more than the barest outlines of the course of life followed by the personages it attempts to portray. 21 A touch here, a touch there, and a character is indicated. No more, for more would be intolerable.

22 It is significant, however, that the few points touched upon can serve to give an idea of a character. Not-withstanding their diversity, volitions fall into classes; 23 it is quite possible to indicate in a general way the kind of choices a given creature may be impelled to make. They are a revelation of the nature of the creature choosing. 24 That beings differing in their nature should be impelled to different courses of action can surprise no one. 25 Cats have no temptation to wander in herds; the exhibition of pugnacity in a sheep would strike us with wonder.

26 To every kind of creature its nature: and, although individuals within a kind differ more or less from one another, we look for approximation to a type. So it is with human. 27 The expression "human nature," so much in the mouths of certain moralists ancient and modern, although somewhat vague, is not without its significance. 28 To it we refer in passing a judgment upon individual human beings, and we regard as abnormal those who vary widely from the type.

THE INSTINCTS AND IMPULSES OF HUMAN

29 In sketching for us the outlines of this distinctively human nature, the psychologist proceeds to an enumeration of the fundamental instincts and general innate tendencies of human, and they draws up a list of the emotions which correspond to them. 30 They mentions the instincts of flight, repulsion, curiosity, pugnacity, self- abasement, self-assertion, the parental instinct, the instinct of sex, the instinct for food, that for acquisition, etc. 31 They points out that human is by nature open to sympathy, is suggestible, and has the impulse to play. 32 In such instincts and inborn general tendencies, blending and reinforcing or opposing and inhibiting one another, 33 they sees the forces which give their direction to desire and will; which select, out of all possible objects, those which are to become objects for human.

34 It is not necessary here to discuss the nature of instinct, to distinguish between an instinct and a more general inborn tendency, or to attempt a complete list of the instincts and inborn tendencies of human. 35 Nor need I ask whether every choice made by a human being can be traced, directly or indirectly, to one or more of the instincts and other tendencies given in the above or in any similar list. 36 In explaining the individual choices which humans make, or the desires to which they are subject, there is much scope for the ingenuity of the psychologist.

37 But of the significance for human life of the impulses mentioned there can be no

question. 38 What would the life of a person be if you could feel no fear or repulsion? Could there be a development of knowledge in the absence of curiosity? 39 How long would the race endure if the parental instinct were wholly lacking? What would become of a person who never desired food? 40 Could a human society of any sort exist if there were no sympathy or tender feeling, no impulse to seek the company of other people?

41 It is people, such as they are, endowed with the qualities which distinguish human, who associate themselves into communities, and the customs and laws of such reflect the fundamental impulses in which they had their origin.

THE STUDY OF HUMAN'S INSTINCTS IMPORTANT

42 That a careful study of human nature is of the utmost importance to the moralist is palpable. You must not prescribe for human a rule of conduct which it is not in human to follow. 43 You must not set before human, as inducements to actions, objects which it is impossible for human to desire and, hence, to choose.

44 To be sure, the main traits of human nature were pretty well recognised many centuries before the modern science of psychology had its birth. 45 Had they not been, human could not have had rational dealings with own fellow-human; could not effectively have persuaded and threatened, rewarded and punished, 46 and, in short, set in motion all the machinery which is at the service of one human when you wants to influence the conduct of another. 47 But moralists ancient and modern have made serious blunders through an imperfect understanding of the impulses natural to human; 48 and the modern psychologist, without claiming to be a wholly original or an infallible guide, may be of no little service in helping us to detect them.

49 Thus, it was possible for as shrewd an observer of human as Aristotle to explain the affection of a person for own child by regarding it as an extension of self-love, the child being, in a sense, a part of the parent. 50

Aristotle's quaint explanation of the fact that maternal affection is apt to be stronger than paternal is an error of a kindred nature. 51 And the ancient egoists, in setting before human their selfish and anti-social ideal of human conduct, made their appeal, not to the whole human, but only to a part of you. 52 The normal person, whether savage or civilised, whether ancient or modern, cannot desire a life filled only with the objects which they set before you. Nor is the modern moralist, or as you prefers to style yourself, 53 "immoralist," Nietzsche, guilty of less gross a blunder. He rails at morality as commonly understood, calling it "the morality of the herd," 54 and he recommends isolation, the repression of sympathy, and a contempt for one's fellows. 55 To be sure, the "herd" is a scornful, rhetorical expression,-- what Bentham would have called a "question-begging epithet,"-- 56 for people do not, properly speaking, live in herds; but they do normally live in human societies of some sort, and they have the instincts and impulses which fit them to do so. 57 The repression of such instincts and impulses does violence to their nature, and you who advocates other than a social morality should advocate it for some creature other than human. 58 Human is a social creature, and, among the objects of your desire and will, you must give a prominent place to some which are distinctively social.

THE BEWILDERING MULTIPLICITY OF THE OBJECTS OF DESIRE, AND THE EFFORT TO FIND AN UNDERLYING UNITY

59 The mere enumeration of the characteristics which have been adduced as instincts or fundamental innate tendencies of human is enough to reveal the truth that human is not merely the subject of desire, but of desires; 60 that is to say, your impulses are directed upon objects widely different from each other.

61 And when we call to mind that the concepts of the instincts and fundamental tendencies of human nature, as thus enumerated, are products of abstraction and generalisation-- 62 are general notions gathered from the

numberless concrete instances of desire and will furnished by our observation-- 63 we are forced to realise that the objects which individual people set before themselves in desiring and willing are really endlessly varied.

64 All people are not equally moved by fear, anger, repulsion, tender emotion, or sympathy. Nor do all humans find the same things the objects of their fear, anger, repulsion, and the rest. 65 The desire for food is an abstraction; in the concrete, this person eagerly accepts an oyster, and that one turns from it in disgust. 66 In order to deal successfully with our fellow-human, we must not merely know human. We must know humans.

67 Furthermore, not only do individuals set their affections upon different objects, but the same person at different stages of own development desires widely different things. 68 What is a temptation to the boy has no attraction for the man. What fills the savage with longings may inspire in the product of a high civilisation no other feeling than repulsion.

69 And what is true of the individual is true of people in the mass. The objects of desire and of endeavour are not the same in communities of all orders. 70 Each kind of human has its own nature, which differs in some respects from that of each other kind, and dictates what shall be, for this or that person, an object of desire and will. 71 No two persons desire precisely the same thing in all particulars. Yet each is a human, and is endowed with the usual complement of human instincts.

72 The process of abstraction and generalisation which resulted in the above-mentioned list of the elements which enter into the constitution of human nature is, nevertheless, not without its uses. 73 It serves to order, to some extent, at least, the bewildering variety of the phenomena presented to us when we view the broad field of the desires and volitions of all sorts and conditions of people. 74 People's choices fall into ‘kinds’; there is similarity in difference. We do not approach an unknown person with the feeling that you are a wholly unknown quantity. 75 You are, at least, a

human, and we know something of humans. We have some notion how to go at you.

76 But the ordering of the motley multiplicity of human's desires by a reference to the fundamental instincts of human stops far short of a complete unification. 77 We are left with a number of distinct and apparently irreducible impulses and tendencies on our hands. If it is useful to go so far, may it not be much more useful to go still farther?

78 Aristotle divided things eligible into those eligible in themselves and those eligible for the sake of something else. 79 How it would illuminate the field of action, if it were discovered that people ultimately desire but one thing, and choose all other things on account of it! 80 Would the discovery not facilitate immensely our dealings with our fellows, suggesting new possibilities of control? 81 A notorious instance of the attempt to conjure away the bewildering diversity in human's desires and choices lies in the selection of pleasure as the one thing eligible in itself, 82 the unique ultimate object of human action. Of this object we have, so far, taken no account.

INTENTION AND MOTIVE

George Stuart Fullerton

18 I may desire to clear my throat and may do so. The action is a trivial one, is over in a moment, and is forgotten. 2 On the other hand, I may desire to spend my summer on the sea-coast, to grow rich in business, to attain to high social position, or to satisfy political ambition.

3 When the object is of this complicated description, there may easily be elements in it which, considered alone, I should not desire at all.

4 The summer on the New Jersey coast may make for health. But it may entail mosquitoes, uncomfortable rooms, unaccustomed food, the lack of wonted occupations, and a distasteful association at close quarters with neighbours not of one's choosing. 5 The road to wealth is an arduous one.

6 The envied social station may imply the swallowing of many

rebuffs. The way of the politician is hard.

7 One may desire, on the whole, one of these objects, or a thousand like them; but there are, obviously, many things comprised in the whole, or unavoidably bound up with it, that cannot attract, and are not eligible for their own sake.

INTENTION

8 An object chosen and realised may bring in its train an indefinite series of consequences foreseen or unforeseen.

9 The striking of a match to light a candle may result in an unforeseen and disastrous conflagration. 10 The overmastering desire to grow rich may have its fruit in an excessive application to business, the neglect of the family and of the duties of citizenship, and in hard and, perhaps, unscrupulous dealings. 11 These things may be foreseen and accepted as natural accompaniments of the end chosen. 12 But there may also be entailed shattered health, overwhelming anxieties, and the distress of seeing one's offsprings, brought up in luxury and without incentive to effort, victims to the dangers which menace the idle rich.

13 Whether such consequences might have been foreseen and provided against or not, it is true that they are frequently not foreseen with clearness.

14 They certainly form no part of the intention of the person who bends own energies to the attainment of wealth. 15 You does not deliberately intend to injure your health, to lose the affection of your family, to leave behind you degenerate children. You does intend to get rich, if you can.

16 How many of the elements contained in the object chosen, or so bound up with it that they must be accepted along with it, may fairly be said to fall within the intention of the chooser? 17 There may easily be dispute touching the latitude with which the word intention may be used. 18 Some things a person sees clearly to be inseparably connected with the object of own choice; some you are less conscious of; some you overlooks altogether.

19 It does not seem unwarranted to maintain that the first of the three

classes of things, at least, may be said to be intended. 20 When Dr. Katzenberger, in his desire to get across the road without sinking in the mire, used as a stepping-stone his old servant Flex, who had fallen down, 21 his complete intention was not simply to cross the road unmuddied. It was to cross the road unmuddied by stepping on Flex.

22 Evidently the intention-- the whole object-- gives some revelation of the character of a human. 23 Many people may will to avoid the mud; but not all of these can will to avoid it by stepping upon a fellow-human.

MOTIVE

24 The stepping upon a fellow-human with whom one is on good terms can scarcely be regarded as a thing desirable in itself. 25 If it is desired, it is because of the complex in which it is an element. 26 Some other element or elements may exert the whole attractive force which moves desire and will. In other words, some things are chosen for the sake of others.

27 When we have discovered that for the sake of which any object is chosen, we have come upon the Motive. 28 The intention may be said to embrace the whole object as foreseen. The motive embraces only a part of it, but the vital part, the part without which the object would not be desired and willed.

ETHICAL SIGNIFICANCE OF INTENTION AND MOTIVE

29 There has been much dispute among moralists as to the ethical significance of intention and motive. 30 Bentham maintains that "from one and the same motive, and from every kind of motive, may proceed actions that are good, others that are bad, and others that are indifferent." He gives the following illustration:

31 "(1.) A boy, in order to divert himself, reads an inspiring book; the motive is accounted, perhaps, a good one; at any rate, not a bad one. 32 (2.) He sets his top a-spinning: the motive is deemed at any rate not a bad one. 33 (3.) He sets loose a mad ox among a crowd: his motive is now, perhaps, termed an abominable one. 34 Yet

in all three cases the motive may be the very same: it may be neither more nor less than curiosity."

35 In criticising this citation I must point out that curiosity is not, properly speaking, an object of choice at all. 36 I have used the word "object" to indicate what is chosen, not to indicate the psychic fact present at the time of the choice. And I have said that the motive is the vital part of the object.

37 Hence curiosity should not be called the motive. No human chooses curiosity as an object, either in the abstract or in the concrete. 38 Curiosity is a fundamental impulse of human nature; we may elect to satisfy the impulse in any given instance; in other words, we may choose the appropriate object.

39 In the case of the boy letting loose the bull in the crowd, the object is to see what will happen under the given circumstances. 40 This is what appeals to the boy. Something else might have appealed to him in performing the action. 41 He might have had the deliberate wish to injure certain persons present against whom he harboured resentment. 42 Or his sympathies might have been with the bull, which had been the victim of bad treatment, and to which he wished to grant its liberty. 43 Were the crowd in question a band of ruffians intent upon lynching, he might have been moved by the desire to assist, in a somewhat irregular way, in the re-establishment of law and order. 44 But even if his real object is only to see what will happen, there is no reason to put it on a par with the object in view when a boy spins a top. 45 "To see what will happen" is the vaguest of phrases, and covers a multitude of disparate objects. 46 He who does things to see what will happen has, at least, a very general knowledge of the kind of thing likely to happen, if a given experiment is made. 47 A child does not hold own finger in the candle-flame to see what will happen. 48 You who does things to see what will happen, in really complete ignorance of what is likely to happen, may be set down as too much of a fool to be the subject of moral judgments.

49 It is obvious that an act may be done with many different objects

in view-- I mean real objects, motives. 50 I give money to a beggar whose case is one to inspire pity. My motive, my "vital" object, may be to relieve the beggar. 51 But it may equally well be to get rid of the beggar, to gratify my self-feeling by becoming the dispenser of bounty, or to inspire admiration in the onlooker. 52 The intention, as I have used the word above, is to relieve the beggar, with such consequences of the act as may be foreseen at the time. 53 Within the limits of this intention, the motive may vary widely, and may, in a given instance, be either admirable or contemptible.

54 It may be claimed, in answer to this, that the real intention is, in every case, what I have called the motive; that, in the first case, it was to relieve suffering; 55 in the second, to get rid of an annoyance; in the third to satisfy vanity; in the fourth, to be admired.

56 The word "intention," thus used, is equivalent to "motive." Popular usage gives some sanction to this confusion of the words. 57 We say of a person who has done a questionable act: "Your intentions were good," or, "Your motives were good." Still, popular usage does not always regard the two expressions as equivalent. 58 To revert to the case of the unhappy Flex. It does not seem inappropriate to say that the use of a person as a stepping-stone was a part of own master's intention. 59 It does appear inappropriate to call it the motive or a part of the motive of the whole transaction.

60 Intention and motive are convenient words to designate the whole object chosen and the part of the object which accounts for the choice of the whole. That it is important to distinguish between the two is palpable.

61 The intention gives some indication of character. We know something about a person when we know what kinds of objects you will probably set before yourself as aims. 62 But we know more when we know why you chooses these objects rather than others; when we can analyse the complex and can discover just what elements in it attract you.

63 With an increase of our knowledge comes an increased power of control. 64 Until we

know a person's motives, we do not really know the person; and until we know the person, our efforts to influence you must be rather blind.

65 The search for motives appears to carry us in the direction of the systematisation and simplification of the embarrassing wealth of objects which are actually the goal of human desires and volitions. 66 Human may desire a boundless variety of objects. Your motives in desiring them may, conceivably, be comparatively few.

67 It should be apparent that both intention and motive have ethical significance. 68 We have our opinion of people capable of harbouring certain intentions. But we recognise that some people may harbour them with better motives than others. 69 And we can see that a person's intention may be bad, and yet your motive, considered in itself, be good. How we are to rate the person, morally, becomes rather a nice question.

FEELING AS MOTIVE

George Stuart Fullerton

19 Two people may recognise with equal clearness the presence of a danger. That recognition may evoke in the one a violent emotion of fear, and in the other little or no emotion. 2 Two people may be treated with indignity. The one fumes with rage; the other remains calm. It is well recognised that people may be susceptible to emotion in general, or to certain specific emotions, in varying degrees. 3 Knowledge is not always accompanied by a marked manifestation of emotion. Thoughts may be clear, but cold. 4 There are, however, natures whose intellectual processes are steeped in emotion. Such people live in an atmosphere of agitation.

5 Lists of the emotions which correspond to the instincts and fundamental impulses of human have been drawn up. 6 In them we find mentioned fear, disgust, wonder, anger, elation, tender feeling, and so forth; phenomena which, by earlier writers, were classified as "passions," and to which we may conveniently give

the name "feeling." 7 We constantly speak of our emotions as our "feelings," and we contrast the human of feeling with the coldly intellectual mind in which emotion is at a minimum.

8 But it is not alone to such specific emotions as those above-mentioned that we apply the term feeling. Thoughts are agreeable or disagreeable, pleasurable or painful. So are emotions. 9 The agreeableness or disagreeableness, pleasantness or painfullness, which are the accompaniments of thoughts and emotions, have been called by modern psychologists their feeling-tone. 10 It is not out of harmony with common usage to give them the name of feelings. In so doing we contrast them with knowledge and assimilate them to emotion.

11 Whether every sensation and every thought gives rise to an emotion of some sort is matter for dispute, as is also the question whether every sensation, thought and emotion is tinged with some degree of pleasurable or painful feeling. 12 In the absence of conclusive evidence, it is open to us to assume that some feeling is always present where there is mental activity of any kind. 13 The feeling may be so faint and evanescent as to escape detection, but this does not prove that it is absent.

FEELING AND ACTION

14 Emotions and feelings of pleasure and pain are the normal accompaniments of the exercise of the instincts and impulses of creatures that desire and will. 15 Within limits, we appear to be able to take them as an index of the strength of the desire and the vigour of the effort at attainment.

16 An act of cruelty is perpetrated. I see it, and it leaves me, perhaps, cold and unmoved. In such case, it is hardly expected of me that I should take energetic measures to have the evil-doer punished. 17 The person whose face flushes, whose brows descend, whose teeth come together, whose fists clench, whose heart beats thickly, at the recognition of an insult, is, as a rule, the person from whom we look for vigourous efforts at retaliation.

18 The apathetic creature who feels no resentment is usually expected to swallow the indignity. 19 The child who jumps for joy at the sight of a new doll is supposed to desire it eagerly, and to be ready to make efforts to obtain it.

20 But it is only within limits that this relation between feeling and action holds. People of little emotion may be resolute and prompt to action.

21 Their desires, as evinced by their actions, may be persistent and effective. Nor need the individual fix own choice upon the particular object that arouses in you the most feeling. 22 A person may see own fellow-creature destitute, and may shed tears over their pitiable lot. But you will not bequeath your money to them. 23 You will leave it to your offsprings, for whom, perhaps, you have no respect and has come to have little affection. And you may leave it to them with regret, knowing that it will be dissipated in ways which you cannot approve. 24 It has been pointed out with justice that the exercise of many instincts may be accompanied with little feeling; 25 and we are all aware of the fact that, as action becomes habitual, emotion tends to evaporate and the pleasure of effort and attainment is apt to be reduced to a minimum.

FEELING AS OBJECT

26 It is well to keep in mind the distinction between feeling as a psychic fact present in the mind of the creature desiring and willing, and feeling as the object of desire and will. 27 A person in a rage is the victim of a storm of feeling. The thought of the injury one has received and the desire for retaliation by no means exhaust the contents of own mind. 28 But the passion which shakes you is not your object; that object is revengeful action.

29 Nevertheless, feeling may be made the object of desire and will. One may attend a religious or political meeting with the deliberate view of arousing in one's self certain complex emotions. 30 Poe's gruesome tales are read for the sake of the thrill which is produced by the perusal.

31 Probably the desire for excitement, for the experiencing of certain vivid emotions, has no little to do with the attraction exercised by certain criminal professions. The burglar desires the booty, but may desire something more.

32 Emotions have, as we have seen, their "tone" of pleasure or pain. They are agreeable or the reverse, 33 and it is palpable that people do not, as a rule, deliberately make them the object of desire and will in indifference to the fact that they are pleasant or are painful. 34 We do not normally wish to attain to states of mind in which remorse plays a prominent part; we do not aim to revel in shame; we do not seek to be haunted with fear. 35 Pleasurable emotions are desired, where desire is set on emotions at all; and painful emotions are regarded by the mind as unwelcome guests. 36 At any rate, this appears to be the rule, and to characterise the person whom we regard as normal.

37 This being the case, it seems natural to ask whether, when we embrace the intention of producing in ourselves a given emotion, our motive may not be narrower in scope, namely, the attainment of pleasure? 38 And, when we wish to rid the mind of any emotion, our motive may not be the avoidance of pain?

39 The adoption of this view would give to the feelings of pleasure and pain a unique importance. They would be accepted as the only ultimate objects of desire and will. By many they have been thus accepted. 40 It has been insisted that objects of every description are chosen only as they arouse some feeling; and that those which promise pleasant feeling are sought and those which entail pain are avoided. 41 The general recognition of the primacy of pleasure and pain over our other feelings, over the specific emotions mentioned above, 42 is indicated by the fact that ethical writers of eminence sometimes make pleasure and pain synonymous with feeling in general, passing over other feelings, as though it were not important for the moralist to take them into consideration. 43 The dispute whether the proper course for human action to take is

prescribed by reason or is dictated by feeling often resolves itself into the problem whether we should be guided by reason, or by a consideration of pleasure to be attained or pain to be avoided.

FREEDOM AS OBJECT

44 The acceptance of pleasure and pain as the ultimate motives of human action seems, at first sight, to be of inestimable assistance to us in threading our way through the labyrinth of diverse choices made by creatures that desire and will.

45 But only at first sight. Even if it be true that every creature seeks only to attain pleasure and to avoid pain, and uses the means it finds to hand in the attainment of these ends, the endless diversity of the means remains as a thing to reckon with. 46 The knowledge that all humans desire pleasure does not help us a whit in dealing with people, unless we know what things will give pleasure to this person or to that. 47 All humans may desire pleasure; but it remains true that what gives pleasure to the spendthrift gives pain to the miser; what appeals to the glutton disgusts a person of refined tastes. 48 If all humans were alike and precisely alike, and if their natures were very simple and remained unchanged, the problem of the distribution of pleasures would be vastly simplified.

49 Whether the pursuit of pleasure and the avoidance of pain may be regarded as the only ultimate ends proper to human will be discussed later.

50 Here, it is important to insist that so general a formula gives us little useful information touching the set of the will either of classes of people or of individuals. 51 This we can attain to only as a result of the study of the complex nature of human as revealed in the choices which you actually makes. 52 The ends of human are many and various; some of these ends are accidental, palpably means for the attainment of other ends more fundamental, and for them other means of attaining the same ends may be substituted. 53 But other ends, and they are by no means to be reduced to a single class, appear to belong to the very nature of

human. In seeking them you are giving expression to the impulses which make you what you are.
54 In so far as these impulses find an unimpeded expression the human is free; otherwise you are under restraint. 55 Without rendering here a final decision upon the importance of the role played in human life by pleasure and pain, one feels impelled to ask the question whether the goal of a person's endeavours may not best be described as freedom? 56 Not freedom in the abstract, freedom to do anything and everything, but freedom to live the life appropriate to you as human, and as a human of a given type. 57 That this freedom is limited in a variety of ways, by your material environment, by the clashing of impulses within yourself, by the conflict of your desires with the will of the social organism in which you finds your place, is sufficiently palpable.

RATIONALITY AND WILL
George Stuart Fullerton

THE IRRATIONAL-WILL.

20 As dreams do not consist of an insignificant medley of elements drawn from the experiences of waking life, but, in spite of their fantastic character, bear some semblance of ordered reality, 2 so the impulses of even the most unintelligent and inconsequent of human beings are not wholly chaotic, but differ only in the degree of their organisation from those of the most rational and far-seeing.
3 Where there is even a glimmer of intelligence, ends are recognised and means to their attainment are chosen. Ends are compared, and the preference is given to some over others. 4 But, with all this, there may be much incoherence and planlessness. Humans can live somehow without looking far into the future, or keeping well in mind the lessons to be learned from the past. 5 They can manage to exist in the face of no little short-sighted impulsiveness and inconsistency. But it is palpable that they cannot, under such circumstances, live as

they might live were they more truly rational.

6 The individual deficient in foresight and control may, it is true, be carried along and defended from disaster by the presence of these qualities in the greater organism of which one is a part. 7 The infant is a parasite upon society; it is provided for independently of its own efforts. 8 The child would soon come to grief were its ends not chosen by others and its conduct kept under control. And a vast number of persons not children are in much the same position. 9 There is foresight and rational purpose somewhere; they profit by it; but of foresight and rational purpose they themselves possess but a modicum.

10 Where breadth of view is lacking, where the future is unforeseen or ignored and the past is forgotten, where desires arise and impel to action in relative independence of one another, the person seeks today what tomorrow one rejects. 11 We can scarcely say that the person chooses. You are the scene of independent choices, varied and inconsistent. 12 You are the victim of caprice, and appears to us largely the creature of accident, a prey to the impulse which happens to be in your mind at the moment. 13 From such a person we cannot look for an adherence to distant aims, and the marshalling of the proper means to their attainment. You cannot count upon yourself, and you cannot be counted upon. 14 That you can play no significant role in such stable organisations as the state and church is obvious. 15 Your desires may be many and varied, but they converge upon no one end. We set you down as irrational.

ONE VIEW OF REASON

16 Concerning the part played by reason or intelligence in the active life of human there has been no little dispute.

17 It has been maintained, on the one hand, that reason or intelligence serves its whole purpose in holding before the mind all its impulses and desires, revealing their interrelations, and making possible an enlightened

and deliberate choice from among them. 18 Where the horizon is thus extended and mental clarity reigns, the attention can roam unimpeded over the whole field, consider the objects of desire in their true relations and compare them with one another. 19 Congruous desires can reinforce each other; conflicting desires can be brought face to face, and the one or the other can deliberately be dismissed; 20 fundamental and dominant desires may assert their supremacy, and give their stamp to far-reaching decisions which exercise a control over minor decisions and favour or repress a multitude of desires and volitions.

21 The attainment of perfect rationality in this sense is an ideal never completely realised. 22 No human can hold before own mind all own impulses and desires, see them in their true relations to each other, and come to a decision which will do complete justice to all. But the ideal may be approached.

23 The reason, in this case, resembles the presiding officer of a deliberative assembly, who insists that all the members shall be heard from, all proposals seriously considered, and that the ultimate decision shall justly represent the true will of the deliberative body as a whole.

24 The specious but fallacious argument is, in the debate, revealed in its true nature; the obstinate insistence of the individual is not allowed to prevail; 25 the loud voice is recognised to be a loud voice and nothing more; 26 fugitive gusts of passion exhaust themselves; the permanent and fundamental will of the assembly is revealed in the final vote. 27 It is claimed that, in such a mind, the result is a harmonisation and unification of the multiplicity of the desires and purposes which, in a mind less rational, jostle one another without control, and refuse to fall into an ordered system. 28 That the decisions of a rational mind reveal both a unity and a harmony not evinced by a mind short-sighted and impulsive cannot be denied. But it is well to understand clearly what is meant by such unity and harmony.

DOMINANT AND SUBORDINATE DESIRES

29 Wherever a group of desires fall into a system and work together toward a common end, we have unity. 30 Such a system may be short-lived, comparatively poor in content, and of no great significance for a human's life as a whole. 31 It may come into competition with another similar system, and be displaced by it. An interest that has dominated our minds for a time, and controlled our desires and volitions, may readily give place to different choices. 32 I may successively bend all my energies upon the winning of a game, the doing of a successful stroke of business, the defeat of a social rival, the success of a philanthropic undertaking. 33 There is no normal human being who does not exhibit such limited volitional units. 34 The most idle and purposeless of vagrants, the most scatter-brained school-boy, the most volatile coquette, may, for a time, be dominated by some desire which calls into its service other desires and thus realises some chosen end.

35 Such volitional units do not, however, go far toward unifying the efforts of a life. 36 It is only when some dominant and deep-seated desire, oft recurring, not easily displaced by others, sweeps into its train the other desires of a human, establishing a sovereignty and exacting subservience, that such an effect is accomplished. 37 Then the lesser units fall into a significant relation to each other as constituent elements in the greater unit. The life, as such, may be said to have a purpose; it strives toward a single goal.

38 Whatever bears upon the attainment of such a dominant purpose may, however trivial in itself, acquire a vital importance and be eagerly desired. 39 To a human of mature mind there can be little interest in hitting a small ball with a stick, abstractly considered. 40 Nor is the dropping of a bit of paper into a box with a slit in it an action in itself calculated to stir profound emotion. 41 But if the hitting of the ball in the right way marks the critical point in winning an eagerly contested game of golf, the interest in it may be absorbing. 42 And if

the bit of paper is an offer of marriage committed to the post, the hand may tremble and the heart leap in the breast. 43 A dominant desire may create or reinforce other desires to a degree to which it is not easy to set limits.

THE HARMONISATION OF DESIRES

44 And it may actively repress other desires or cause them to dwindle and disappear. 45 A human possessed by a devouring ambition may resolutely scorn delights to which you would otherwise be keenly susceptible, or you may simply ignore them without effort. 46 The attention, fixed upon some chosen end, and busied with the means to its attainment, may leave them unheeded. 47 Finding no place in the volitional pattern that occupies the mind, they are cast aside and soon forgotten.

48 In so far, hence, as the desires of a human tend to fall thus into groups converging upon a single end, we find not merely unity but harmony. The volitional pattern is of a given kind, and the colours which enter into it are selected.

49 When, however, we speak of the desires of a rational mind as harmonised, we do not mean that incompatible desires are reconciled. 50 One cannot laugh and drink at the same time, nor can the desire for luxurious ease be made to fall upon the neck of the desire for attainment through strenuous effort. 51 The final harmony attained resembles in some respects the peace enforced by the violent character depicted by Mark Twain, who would have peace at any price, and was willing to sacrifice to it the life and limb of the opposing party. 52 The cessation of strife does not imply the satisfaction of all parties to a contest; nor does the fact that a life is controlled by a ruling motive, which reinforces or calls into being certain desires and robs others of their insistence, 53 imply that by any device all the desires which human has, still less all that you, as a human being, might have, can find their satisfaction. 54 Harmony is obtained at the price of the suppression of many desires; but, where a mind is

strongly dominated by a comprehensive volitional unit, the price may be paid without much regret.

VARIETIES OF DOMINANT ENDS

55 Obviously, the comprehensive and harmonious volitional complexes which may come to characterise different minds may be of very different complexion. 56 Peace of mind, the bubble reputation, the amassing of a fortune, a happy domestic life, humanitarian effort, the perfecting of one's character-- each may become the controlling end which furthers or inhibits individual desires and emotions. 57 Or the ends may be such as to appear to most people far more insignificant. 58 To the collection of first editions or the heaping together of bric-a-brac a person may sacrifice own financial security and the welfare of own family. 59 Naturally, the moralist cannot put all such ends upon the same level; but, from the point of view of the psychologist, the processes which take place in the minds thus unified and harmonised are essentially the same.

AN OBJECTION ANSWERED

60 To the position that it is reason or intelligence that brings about this unity and harmony an objection may be brought. 61 It may be claimed that breadth of information and clarity of vision are quite compatible with highly inconsistent action revealing the temporary dominance of a succession of incongruous desires. 62 ‘Video meliora proboque, deteriora sequor,’ confessed the Latin poet. 63 Have we not seen people of the highest intelligence, gifted with foresight, quite capable of grasping the relation of means to ends, 64 nevertheless subject to the baleful influence of momentary desires which drive them hither and thither like a rudderless bark at the mercy of the wind and tide? How does it happen that their intelligence does not help them?

65 To this we may answer that it is not the same thing to possess intelligence and to use it. 66 One

may be supplied with information and quite capable of taking long views and embracing inclusive ends-- and the attention may be so preoccupied with the desire of the moment, that the voices of others are stifled. 67 In so far as this is the case, the person can not, at the time, be said to be reasonable or intelligent. 68 You have information, and acts as if you were ignorant; your choices do not issue as a resultant of your desires as a whole; there is no resultant; the single desires make their influence felt separately.

69 To be sure, an insistent and oft-recurring desire may introduce a good deal of unity and harmony into life, even where long views are not taken and there is little intelligence. 70 The stupid egoist may become rather a consistent egoist, and increasingly so as you grows older. 71 Your desires and volitions may converge upon an end of which you are very imperfectly conscious; incompatible desires may come to be repressed. 72 But this does not refute the position that, when reason or intelligence is supreme, the attention is directed upon a wide range of desires, 73 they are weighed in the light of each other, and the ultimate decision is no longer blind, but fairly expresses the permanent push of the human's nature. 74 Even where a desire or group of desires, unilluminated by intelligence, seems so insistent as to take on something of this character, complete unity and harmony of action may be lacking, due to the short-sightedness of the methods employed to attain to the chosen goal. 75 Blind desires may easily defeat their own ends; wealth does not necessarily accumulate in proportion to a human's miserliness; the ardent but unenlightened philanthropist may do own fellow-human more harm than good. 76 Long views are of no little service in weeding out inconsistent actions and introducing order and unity into life.

THIS VIEW OF REASON MISCONCEIVED

77 In the above view of the function of reason or intelligence it has not been represented as issuing commands to perform certain

actions rather than others, nor as furnishing motives not in some way related to the impulses and desires of human. 78 It has been treated, literally, as the presiding officer of a public assembly, who insists that every voice shall be heard; that all proposals shall be weighed and compared with one another; that the consequences of all shall be clearly foreseen. 79 Its function is enlightenment; the driving force which impels to action of any sort has been found in the impulses and the desires.

80 It is possible to set this view forth in terms which make it highly unpalatable.

81 Thus Hume, who has a weakness for shocking the susceptibilities of the conservative and the sober-minded, startles us with the remark that "Reason is, and ought only to be, the slave of the passions." 82 This doctrine, taken as the average reader is almost inevitably impelled to take it, seems worthy of instant reprobation. It appears to degrade the rational in human and to exalt the blind and irrational.

83 But it is not fair to the doctrine to set it forth in such terms. There is no small difference between random and fugitive desires and those more fundamental desires that express truly the nature of a person. 84 Desires organised and harmonised gain great strength, and are enabled to overcome and expel from the mind erratic impulses, the obedience to which may easily be followed by regret. 85 Action taken without a clear foresight of consequences, with an imperfect conception of the relation of means to ends, is blind and irrational action. 86 Reason, as bringing enlightenment, as making possible deliberation, as turning the incoherent clamours of a mob of inconsistent desires into the authoritative voice of an orderly deliberative assembly, is not a faculty to be lightly regarded.

87 Nor should it be forgotten that, neither to the plain person, nor to the moralist, do desires all stand upon the same level. 88 You who bends your intellectual energies to the satisfaction of your greed, your avarice, your longing for revenge, may fairly be said to be prostituting your mind to the service of passion. 89 But is it a proper use of language to describe

as the slave of your passions the person whose thought is set upon the enlightenment of humankind, the alleviation of suffering, the service of a state, the attainment of a noble character? 90 Were Socrates, St. Francis, Abraham Lincoln, Wilberforce, Thomas Hill Green, the slaves of their passions? 91 Yet these men were moved by certain dominant desires, and their unswerving pursuit of their goal was made possible only by the reason that harmonised their lives and substituted deliberate purpose for random impulse.

92 The doctrine, then, that the reason is to be likened rather to the presiding officer of a deliberative assembly, concerned only to give every voice a fair hearing, than to a legislator issuing commands independently, may be so stated as not to shock the sober-minded.

93 And the doctrine recommends itself in showing that reason and inclination or desire are not enemies. 94 The possession of reason must lead to the suppression of some desires--those incompatible with a comprehensive purpose deliberately embraced; 95 but the desires and the reason or intelligence work together to a common end. 96 On this view, it is not the rational human who is divided against the self; it is the short-sighted, the impulsive, the inconsistent, the irrational human. 97 You are the prey of warring desires whose strife leads to no permanent peace under the guidance of reason.

ANOTHER VIEW OF REASON

98 To certain minds this view of reason as the arbiter and reconciler of human's impulses and desires does not appeal.

99 Thus, Kant, whose doctrine will be more fully considered later, holds that human's reason promulgates a law which takes no account of the impulses and desires of human. 100 Thus, also, Henry Sidgwick, who differs from Kant in making the attainment of happiness the goal of human endeavour, and who, consequently, is not tempted to disregard the desires of human, 101 yet refers to the reason

independently certain maxims, which you regards as self-evident, touching our own good and the good of our neighbour.

102 There are certain considerations which appear to favour the view that the reason is a faculty which may be regarded as an independent law-giver. 103 A person may be possessed of great intelligence; you may be well-informed, acute in your reasonings, and consistent in your strivings to attain some comprehensive end, which, on the whole, appears congruous to your nature, such as it is. 104 Yet we may regard you as highly unreasonable. Judged by some higher standard which we look upon as approved by reason, you are found to fall short. 105 Is reason, then, synonymous with intelligence? 106 Or is it something more-- the source of an ultimate standard of action, intuitively known, and by which all human's actions must be judged?

CHARACTERISTICS OF THE SOCIAL-WILL

George Stuart Fullerton

21 The social-will is not a mysterious entity, separate and distinct from all individual wills. It is their resultant.

2 The resultant of two or more physical forces is a force; it has a character and may be described. 3 The resultant of individual wills in interaction is a will with a given character which it is of no small importance for the moralist to comprehend. 4 This will presents aspects closely analogous to those presented by the will of the individual.

5 Thus, to begin with, a community of people may be said to will a vast number of things which have never been made by the members of the community the object of conscious reflection. 6 It may unthinkingly move along the groove made for it by tradition. It may be intellectually upon so low a plane that even the possibility of acting in other ways does not occur to it.

7 Nevertheless, ways of action thus unthinkingly pursued cannot

properly be said to be beyond the voluntary control of the community. 8 A new situation may draw attention to the fact that they are unsatisfactory, lead to critical examination, to inhibition, to deliberate change. 9 Between the passive acceptance of actions prescribed by tradition and deliberate conscious choice in the presence of recognised alternatives there is no clear line of demarcation.

10 Under the pressure of circumstances or with the gradual increase of information and intelligence the traditional may undergo slight modifications which scarcely rank as conscious departures from what has been passively accepted. 11 The algebraic sum of such departures may, with the lapse of time, come to be by no means insignificant, yet no individual may have exercised in any considerable degree conscious reflection or shown in any large measure freedom of choice.

12 On the other hand, the social-will may, at times, reveal itself in deliberate decisions, preceded by much conscious deliberation, and initiating wide departures from established usage. 13 The presence of new enemies or a diminution of the food-supply may awake a primitive community from its lethargy, leading it to modify its habits and adjust itself to new conditions. 14 A barbarous horde may set out upon a career of conquest, and may introduce revolutionary changes into its manner of life. 15 A civilised nation may come to the conclusion that, in the course of human events, it has become necessary for it to dissolve the bands which have held it to another nation; 16 it may frame for itself an independent constitution, embodying new ideals and prescribing a new form of corporate life.

17 But, as in the case of the individual, so in that of the community, the tendency to fall again into a rut is always apparent. 18 Laws, once enacted, lend a passive resistance to change, even when they no longer serve well the ends they were intended to serve. 19 The independence of thought and action revealed in the adoption of new constitutions are not

conspicuous in their maintenance. 20 Human collective, as well as human individual, falls into habits, and you commits to your unthinking self what was wrought out by yourself as thinking and consciously choosing. 21 Passive acceptance of the traditional again wins the day and becomes a ruling factor in action.

22 This tendency to mechanisation should not surprise us, for we meet with the phenomenon everywhere. 23 The person who says, "Good-by" today does not mean "God be with thee," and the "Gruss Dich Gott" of the Bavarian peasant is very properly translated by the American child as "Hallo." 24 The traditional tends to lose or to alter its meaning, but it continues to serve a purpose. 25 A community without traditions, without settled ways of acting, followed, for the most part, without much reflection, would be in the position of a human without habits either good or bad. 26 Human life as we know it could not go on upon such a basis. The rule has, at times, its inconveniences; but it leads somewhere, at least; 27 whereas you who plunges into the unexplored forest may find every step a problem, and may come even to doubt whether any step is a step in advance.

SOCIAL-WILL AND SOCIAL HABITS

28 Within the province of the social-will fall what may not inaptly be called the habits of a community-- ways of acting acquired largely without premeditation and followed to a great extent through mere inertia. 29 The province of the social-will is a broad one. Deliberate choices; those half-conscious choices analogous to the unheeded expressions of preference which fill the days of the individual; 30 impulses and tendencies which scarcely emerge into the light-- all are expressions of the social-will.

31 In the next chapter I shall distinguish between customs proper and social habits in a broader sense. But, in discussing the general problem of the relation of habit to will, it is not necessary to mark the distinction.

32 Some habits rest upon us lightly; some are inveterate. Of

some we are well aware; others have to be pointed out to us before we recognise that we have them. Some we approve, some we disapprove, to some we are indulgent or indifferent. 33 All these peculiarities are found in the relation of the social-will to social habits. It may recognise them, approve of them, encourage them. It may pay them little attention. It may disapprove them and strive to repress them. 34 Will has brought them into being; it is will that maintains them; it is will that must modify or suppress them.

35 As a matter of fact, all communities do tend to change their habits, some more slowly, some more rapidly. And for its habits we hold a community responsible. 36 Common sense refers them to its will, and exercises approval or disapproval. This it would not do were the practices upon which judgment is passed recognised as beyond the control of will altogether.

SOCIAL-WILL AND SOCIAL ORGANISATION

37 Under the general heading of the habits of a society it is not out of place to discuss its social and political organisation.

38 The fact that there never was an original social contract, made with each other by humans solitary and unrelated, with the deliberate intent of putting an end to the war of all against all, 39 does not signify that the social state in which people find themselves is something with which the human will has had, and has, nothing to do.

40 Social and political organisation are the result of a secular process, but behind that process, as moving and directing forces, stand the will and the intelligence of human. 41 The social and political organisation of a community is not the creation of any single generation of people. Each generation is born into a given social setting, as the individual is born into the setting furnished by the community. 42 This social setting, the heritage of the community from the past, may be compared to a great estate brought

together by the efforts of a human's ancestors, and transmitted to you to hold intact, to add to, to squander, as you may be inclined. 43 It is a product attained by human's nature in its struggle with environment, and that product may be modified by the same forces that made it what it is.

44 Into this heritage the generation of humans who compose a community at any given time may enter with little thought of its significance, with no information, 45 or with false information, touching the manner of its coming into being, and with small inclination to do anything save to leave unchanged the institutions of which it finds itself possessed.

46 Nevertheless, the forms under which societies are organised are subject to the social-will, and, if disapproved, are modified or abolished. 47 Some change is taking place even where there is apparent immobility, as becomes evident when the history of institutions is followed through long periods of time. 48 The utmost that can be said is that, where intelligence is little developed and energy at a low ebb, the social-will may bear the stamp of passive acceptance of the inherited, rather than exhibit a tendency to innovation. 49 ‘Will’ it remains, but we may hesitate to describe it as a ‘free-will’.

50 It is at times forced upon our attention with unmistakable emphasis that the forms of social and political organisation are under voluntary control. 51 Momentous changes may be made deliberately, and with full consciousness of their significance. Among the more progressive nations in our day the duty of introducing innovations appears to be generally recognised: 52 constitutions are amended; the status of social classes is made the object of legislation; even the domain of the family is invaded, as in legislation touching marriage and divorce. 53 Humans appear to feel themselves free to will deliberately the end that shall be served by the mechanism of the state, and to adapt that mechanism to the attainment of the end chosen.

THE SOCIAL-WILL AND IDEAL ENDS

54 The social-will, like the wall of the individual, may manifest itself in decisions which it is obviously impossible to carry out to a completely successful issue. 55 A community has a power of control over its members, but that control has its limits. Even a person's actions cannot be completely controlled by the community of which one is a part. 56 There are always individuals who violate rules, and to whom, as it would seem, no motive can be presented which is adequate to keep them in the rut prescribed by society.

57 Still less can the social-will exercise full control over human's thoughts and feelings. Influenced to some degree they may be. 58 A person may be kept in ignorance, or furnished with information calculated to determine own thought in a given direction. 59 Your emotions may be played upon; you may be exhorted, rewarded, punished. But thoughts and feelings are not open to direct inspection; they may be concealed or simulated. Much more readily than actions can they withdraw themselves from control.

60 Nevertheless, the social-will may, and does, ignore all such limitations to its powers. Laws are not passed to regulate the changes of the weather, which palpably fall outside the province of the law; 61 but laws are passed to regulate the actions of people, which normally fall within it; that is, which can, to a very significant degree, be influenced by the attitude of the social-will. 62 For the same reason laws may even take cognisance of human's thoughts. Of the accidental limitations of its power of control within the general sphere in which it has a meaning to speak of control, the social-will is not compelled to take cognisance. 63 It may set itself to encourage or repress certain types of character and conduct, and take measures to attain the end it has selected. 64 That the measures taken should sometimes prove inadequate does not alter the fact of the choice of an end, nor does it obscure the revelation of the trend of the social-will.

65 Thus, a community may be said to will that its members shall not

be guilty of violence; it may will to live at peace with other communities; it may will to conquer and subjugate. 66 Whether, in each case, the will shall be completely realised or not, may not be determined by the mere fact of its willing. 67 Nevertheless, the permanent volitional attitude may be unmistakably present, and may reveal itself in strivings toward the chosen goal. 68 To describe this attitude as no more than wishing is manifestly to do it an injustice.

THE PERMANENT SOCIAL-WILL

69 The social-will may be regarded as something permanent. Its existence is not confined to those moments in which collective decisions are being made. 70 The will to be one which constitutes a group of human beings a nation is not at all times actively exercised, but the settled disposition to action looking toward that end may be always present and ready to be called into action. 71 An autocracy remains such when its irresponsible head is making no decisions; and a democracy is not such only while elections are being held or the legislature is sitting. 72 The organisation of a society, the whole body of the usages which it accepts and approves, are revelations of the social-will. 73 That 'will' does, it is true, give expression to itself in a series of actual decisions more or less conscious and deliberate, but it is far more than any such series of decisions. 74 It is a disposition, rooted in the past and reaching into the future. It is a guarantee of decisions to come, of whose nature we may make some forecast.

75 The permanent social-will constitutes the character of a community. 76 Our study of the will of the individual prepares us for the recognition of the fact that communities may be but dimly aware of their own character, and may be quite unable to give an unbiased account of the ideals which animate them.

ETHICS

EXPRESSIONS OF THE SOCIAL-WILL
George Stuart Fullerton

CUSTOM

22 We have seen above that even the forms of political and social organisation may justly be regarded as an expression of the social-will. 2 Such forms are the result of past choices, and their acceptance in the present is evidence of present choice.

3 Between the organisation of a society and its customs proper we may distinguish by comparing the former to structure and the latter to function in the case of any organism. 4 But we must bear in mind that, here, structure has been built up by, and is in process of modification by, the same forces that exhibit themselves in function. 5 It would not be wholly out of place to describe a people as having the custom of being ruled by hereditary chiefs, of choosing their monarchs, or of governing themselves through elected representatives. 6 Forms of organisation are handed down to successive generations by the same social tradition that transmits customs of every description.

7 Customs are public habits which are, on the whole, approved by a community. They are ways of acting which are regarded as normal and proper. 8 Where the authority of custom is evoked, pressure is brought to bear upon the individual to adjust yourself to the will of the community.

9 A community, like an individual, may have habits which it does not approve. Such may be tolerated, although disapproved; or active efforts may be made to set them aside. 10 Some habits may be regarded with comparative indifference, although professedly held in condemnation. 11 The individual, in following such habits, may claim that they are not unequivocally condemned by the community, and one is not conscious of the weight of displeasure which visits the violation of the will of the community when unequivocally expressed.

12 In simple and primitive societies custom prescribes to the individual own course of life in the minutest detail. It possesses the authority of the dictator. 13 In societies upon a higher level it may leave to you

some discretion in deciding upon the details of your daily life, while still exercising a paramount control over the general trend of your actions.

14 Thus the will of the community, expressed in custom, determines what the members of the community ought to do, and it takes measures to enforce obedience to its decisions. 15 Is it surprising that the names which have been given to the science which treats of human's rights and duties, morals, ethics (mores, ethica, Sitten), should reflect this truth? 16 It would be an inadequate statement to maintain that the science of morals is no more than a systematic exposition of the customary in human societies. 17 It is not an inadequate statement to assert that, in many societies, custom has, in fact, furnished the ultimate and complete standard of obligation, 18 and that in all societies it is of enormous significance in moulding human's notions of right and wrong.

THE GROUND FOR THE AUTHORITY OF CUSTOM

19 Habits are as essential to a society as they are to an individual human being. Without them, society could not live. 20 In any social state-- and no human can live except in a social state-- there must be cooperation. 21 How can there be cooperation if there are no social habits upon which people may count in their dealings with one another?

22 Try to conceive all the tacit mutual conventions, the unconscious adaptations to custom, which guide our daily lives, suspended for twenty-four hours. 23 When should one rise in the morning? How should one dress? What and how should one eat? Of business there could be no question, nor could there be cooperation in pleasures. 24 Public order there could not be, for there would be no public worthy of the name. Protection of life and limb would be the creature of accident. Between civility and insult there would be no recognisable distinction. 25 In short, humans could not behave either well or ill, for there would be no rule to

follow or to violate, nothing to expect, and, hence, no ground for disappointment.

26 In such a chaotic condition no society of people has ever lived. No actual state of anarchy has ever been complete, nor could it be, and endure. 27 A "reign of terror" is a reign of law in comparison with such a dissolution of all the bonds which knit human to human. 28 When we pass from one community to another, we find one set of public habits exchanged for another. 29 Some sets impress us as better, some as worse. But there is no set which is not better than none. It makes it possible for humans to live, if not to live well.

30 Customs are, then, a necessity. It is equally necessary that they should, in general, have binding force for the individual. But there are customs good and bad. 31 The individual may fall into habits which you, upon reflection, concludes to be injurious to you, and which others see clearly to be injurious. 32 A community sufficiently enlightened to criticise itself at all, may come to disapprove some of its customs and may endeavour to abolish them.

33 This means that a new act of the social-will may set itself in opposition to the social-will already crystallised into custom. 34 In a given instance, and where there are differences of opinion, it may be a nice question whether the new or the old should be regarded as the authoritative expression of the social-will.

THE ORIGIN AND THE PERSISTENCE OF CUSTOMS

35 From the fact that customs are, in general, to be regarded as expressions of the social-will, it might be assumed that their purposive character and social utility should be a sufficient explanation of their coming into being.

36 But the matter is not so simple. A person may fall into habits which are no indication of what one regards as useful to the self. Such habits have not been formed independently of own will, and yet they may appear to be purposeless, or even detrimental. 37 Who wishes to have the inveterate habit

of cracking the joints of own fingers or of biting own finger-nails? What purpose do such habits serve?

38 Although the social utility of customs, taken generally, is easily apparent, yet there are many customs which seem inexplicable upon such a principle. 39 Why, for example, should the king of a primitive community be prohibited from sleeping lying down? or why should it be forbidden that he gaze upon the sea? 40 The origin of such customs is hidden in obscurity. That their adoption was not without its reason, we may assume. 41 That the reason was a reasonable one cannot be maintained. It seems probable, however, that it at some time seemed reasonable to some one.

42 The persistence of habit, social as well as individual, would account for the perpetuation of the custom long after the occasion which gave rise to it had been forgotten.

LAW

43 Between custom and law, taken generally, it is by no means easy to draw a sharp distinction, although, in some instances, the distinction, may be clearly marked. 44 In primitive communities, laws reduced to writing, and administered by persons deliberately chosen for that end, may be wholly lacking; 45 and yet who would say that such communities do not live under the reign of law in a broad sense of the term? 46 A course of life is prescribed to the individual; failure to come up to the standard meets with punishment.

47 Nevertheless, as social life rises in the scale and as communities become developed, custom and law become differentiated. 48 The latter stands out upon the background of the former as something more sharply defined.

49 Penalties and the method of their infliction are more exactly fixed. 50 Not all violations of what is customary are taken up into the legal code as punishable offences, although they meet with that indefinite measure of punishment entailed by social disapproval.

51 Those public habits which it seems to a community it is of especial importance to preserve

and enforce come to be embodied in laws. 52 The selection is a matter of more or less deliberate choice, and is an expression of will. The choice is not, normally, an arbitrary one. 53 The laws of a people are, unless accident has intervened, the outcome and expression of its corporate life. For their ultimate authority they rest upon the acquiescence of the social-will. 54 Laws contrary to deep-seated and widely accepted custom are not apt to be regarded as of binding force. They are felt to be tyrannous, and are obeyed, if at all, unwillingly, and because of pressure from without.

55 In a later chapter I shall dwell upon the fact that the accidental may play a very significant role in law. 56 In given instances the laws of a community may be, not the outcome of its will in any sense, but something imposed upon it. Such laws cannot but be felt to be oppressive and a restriction of freedom.

57 Laws, like customs, may cease to have a significance, and they may be modified or allowed to fall into desuetude. 58 There is, however, much conservatism, as all who are familiar with legal usage know. And laws may fail of their purpose. 59 They may aim to diminish crime, and their undiscriminating severity may foster crime. 60 So may the individual select an end, fall into error in own choice of means, and, as a result of experience, resolve to substitute for such means others which are better adapted to carry out own purpose.

PUBLIC OPINION

61 Public opinion is manifestly a force broader and more vague than established custom, and still broader than law. 62 Public opinion may approve or condemn what no law touches, and it makes its influence felt beyond the sphere of what is customary.

63 Where customs and laws come to be imperfect expressions of the social-will, they may stand condemned by public opinion. In such a case their authority is undermined and violations of them are condoned. 64 Where public opinion is strongly against a law; the law becomes ineffective. 65 The conservatism of law is such

that a law may be allowed to stand unchanged, and yet may fail to be carried into effect. 66 Juries may refuse to convict, or the unpalatable infliction of punishment may be avoided by granting to the judge a wide discretion in pronouncing sentence.

67 The gradual development of a strong public sentiment may lead to the passage of new laws, not based upon previously established customs, but deliberately framed with a view to the public weal. 68 Old customs may be modified and new customs may be introduced. That the recommendations of public opinion extend beyond the sphere of the customary is manifest. 69 It is not the custom of most people to leave any large part of their estate to public charity. Except in the case of the very rich, the failure to do so is not, as a rule, expressly condemned. 70 Yet such bequests are approved, the testators are praised, and the attitude of public opinion has no small influence upon the conduct of individuals. 71 Again, extreme self-sacrifice is not customary; it is exceptional; and yet shining examples of unselfishness excite a warm sympathy. The expression of this sympathy is not without its influence.

72 Public opinion is more palpably an expression of the actual social-will than are custom and law. 73 We have seen that the last two may represent, in given instances, rather the inherited will of the past than the living will of the present. 74 But when we call public opinion an expression of the social-will we cannot mean that it necessarily reflects the sentiment of all the members of a given community.

75 In primitive communities custom may be a public habit which embraces all, or nearly all, individuals. Public opinion may scarcely have a separate existence. 76 In communities more developed, some individuals may disapprove and refuse to follow many customs which are characteristic of the society to which they belong. 77 Laws are not approved by all, and, in progressive states, there is usually some agitation which has as its object the repeal of old laws or the passage of new ones. 78 In

communities where there is independence of thought, public opinion is usually divided.

79 Furthermore, the communities to which civilised people belong are not homogeneous aggregations of units. There is the public opinion which obtains within single groups within the state. 80 The adherents of a religious sect may have notions peculiar to themselves of the conduct proper to the individual, and such notions may extend far beyond what is actually prescribed by the tenets of the sect. 81 The several trades and professions, the social classes, neighbourhoods, even lesser voluntary associations of people, such as clubs, may be pervaded by a public sentiment which varies with each group. 82 When we speak of public opinion generally we have in mind something broader, a resultant. But the public sentiment of the lesser groups cannot be ignored. 83 The individual feels the self especially influenced by the opinions of those most nearly associated with the self.

84 Under the head of public opinion it is convenient to speak of the opinions of moral teachers who have influenced the race. Such a thinker may enunciate truths far in advance of the opinions of own fellows. 85 Your teachings are not, hence, fairly representative of the social-will as it reveals itself in your time. But the sentiments of the more enlightened never are completely in accord with those of the mass of their fellows.

86 They are not mere aberrations from the social-will; they are its forerunners. The moralist and the religious teacher initiate new choices, which may become the choices of large bodies of people. 87 From them proceed influences which have their issue in new expressions of the social-will, characterising whole societies, and giving birth to new customs, new laws, and a new form of public opinion. 88 One can scarcely imagine what China would be without her Confucius; or the Arabic world, with Mahomet abstracted.

ETHICS

THE SHARERS IN THE SOCIAL-WILL

George Stuart Fullerton

THE COMMUNITY

23 It is difficult to state with absolute exactness what constitutes a community. 2 We may define it as a group of human beings associated in a common life, depending upon and cooperating with each other. 3 This definition will apply, to be sure, to lesser groups within a tribe or state; and even to a collection of tribes or states in so far as such enter into alliances and cooperate to their mutual advantage. 4 As, however, the bond of union is, in the former case, subordinate to the higher authority of a larger group (for the family is subject to the tribe or state); 5 and as, in the latter case, the bond of union is a relatively loose one, and evidently subordinate to that which binds the citizens of individual states, 6 the community proper may be regarded as that group which is characterised by a relatively great degree of inner coherence and by relative external independence.

7 The type of such communities is, among the more primitive peoples, the tribe, and among the more developed, the state. 8 The authority of such groups over their own members is, theoretically, paramount, although it may be suspended or abolished by the exertion of force from without.

9 Such a community may be said to be inspired by a social-will expressed in its customs, its laws and the public opinion prevalent in it. 10 Its members may be said to be sharers in the social-will of the community. Their participation in it is marked by their being endowed with rights and charged with duties.

11 It has not been characteristic of communities generally that all who find their place in them should be like sharers in the social-will. 12 The distinction has been made between the citizen, who enjoys the fullest rights and may, perhaps, directly take part in the government of the state, and those who, while in the state, are not of it, as they do not enjoy citizenship. 13 Where slavery, in any of its forms, has prevailed, the distinction between those who are significant factors in determining the social-will, and those who

have not this prerogative, has been very marked. 14 Social classes have often enjoyed, even before the law, privileges of great moment. Women have, as a rule, not been treated as citizens, and have been refused a share in the government of the community. 15 Children are cared for and are protected, but political rights are denied them. Their status before the law is a peculiar one. 16 The mentally defective, both in primitive communities and in developed ones, stand in a relation to the community peculiar to themselves. 17 They are not excluded from it; they are accorded rights; but they are assigned in the community a place of their own. 18 Wherever we look, we find inequality. The sharers in the social-will do not share equally, nor do they share in the same way. This is true of communities of every description, but the differences are more marked in some than in others.

THE COMMUNITY AND THE DEAD

19 It is not merely of the living human beings which compose a community that the social-will takes cognisance. Other wills are made participants in the body of rights and duties peculiar to the community.

20 In many communities the dead are still counted among its members. They are conceived as affecting its welfare, and as demanding services from the living. 21 Duties towards the dead are a well-recognised division of the sum of a human's obligations in communities the most diverse in their character. 22 In some, they occupy a very prominent place; in no community are they wholly overlooked. A striking illustration of the recognition by the social-will of the rights of the dead is to be found in the whole modern law of testamentary succession. 23 The will expressed by a person while you are alive is given effect as though you were still in the flesh and insisted upon the fulfillment of your desire. 24 It appears to work as a permanent factor in the community life, making its

influence felt for generations. Witness its influence in charitable foundations, in the law of entail, and the like.

THE COMMUNITY AND THE SUPERNATURAL

25 Nor is it merely in recognising the wills of the dead that the social-will extends its sphere beyond the community of living human beings. 26 To primitive human, and to human far from primitive, their social environment has not seemed to be limited to the living and the dead who have, or who have had, an undeniable and unequivocal place in the community.

27 The part played in the life of human by supernatural beings of various orders has been a most significant one. 28 Demons and gods, spirits of a lower or of a higher order, have occupied your mind and have influenced your actions. 29 Such beings have been conceived to be, sometimes, malevolent and needing to be placated, sometimes, benevolent and fit objects of gratitude. 30 Their wills human has regarded as forces to be taken into account, a something to which the individual and the community must adjust themselves.

31 Human's relation, or supposed relation, to such beings has been a source of classes of duties upon which great stress has been laid. 32 The influence of this admission of supernatural beings into the circle of those directly concerned in the community life has found its expression in the organisation of the state, in custom, in law, in public opinion. We know little of a community when we overlook this factor.

33 Between magic and religion it is not easy to draw a sharp line, especially when we view religion in the lower stages of its development. In both we have to do with what may be called the supernatural. 34 Magic has been defined as the employment of mechanical means to attain the desired end. 35 In religion, when it so far develops that its specific character seems clearly revealed, we have left the sphere of the mechanical.

36 The distinction between the mechanical and the spiritual is

familiar to us in our dealings with our fellow-humans. 37 In such dealings we may employ physical force. On the other hand, we may appeal to their intelligence and their emotions, and thus influence their action. 38 In so far as we do not make such an appeal, we deal with our fellows, not as though they belonged to our social environment, but to our physical.

39 At the lowest stages of your development, human does not distinguish clearly between persons and things. This means that you cannot distinguish clearly between your material environment and your social. 40 But the distinction becomes gradually clearer, and it is, in the end, a marked one. 41 Religion becomes differentiated from magic. To confound religion, in its higher developments, with magic is an inexcusable confusion.

RELIGION AND THE COMMUNITY

42 The denotation of the term religion is a broad one, and there will probably always be dispute as to the justice of its extension to this or to that particular form of faith. 43 But it seems clear that it is typical of religion to extend what may not unjustly be called the social environment of human.

44 Will is recognised other than the wills of the human beings constituting the community. To the part played by such wills a very great prominence may be given.

45 States may be theocratic, as among the ancient Hebrews; or church and state may share the dominion, or struggle between themselves for the supremacy, as in Europe in the Middle Ages; 46 or the state may be theoretically supreme in authority and yet maintain and lend authority to a church. 47 Even where church and state are, in theory, quite divorced-- a modern conception-- the church with its ordinances and prescriptions, its sacred days, its ceremonial, its educational institutions, remains a very significant factor in the social environment of human. 48 Religious duties have at all times and in all sorts of societies been regarded as constituting an important aspect of conduct. They colour strongly the mores of the

community. 49 Whole codes of morals may be referred to the teachings of certain religious leaders. They claim their authority on religious grounds.

50 The great significance of the role played by religion in the sphere of morals is impressed upon one who glances over the works of those writers who have approached the subject of ethics from the side of anthropology or sociology. 51 A review of the facts has even tempted one of the most learned to seek the origin of morals almost wholly in religion.

52 That religion should play an important part in giving birth to or modifying moral codes is not surprising. Human adjusts the self to own social environment as one conceives it. 53 If the community of wills which you recognises includes the wills of supernatural beings, it is natural that the social-will which finds its expression in the organisation of the state, in custom, in law and in public opinion, should be modified by such inclusion.

54 Nor is it surprising that the supernatural element should, at times, dwarf and render insignificant the other elements which enter into the social-will. It may seem to human the all-important factor in your life.

55 Within the human community some individuals count for much more than do others. There are those who scarcely seem to have any voice in contributing to the character and direction of the social-will. 56 Others are influential; and, in extreme cases, the wills of the few, or even that of a single individual, may be the source of law for the many. 57 If people come to the conclusion that the weal and woe of the community are dependent upon the will of the gods, or of God, they will unavoidably give frank recognition to that will above others, and such recognition will dictate conduct. 58 The gods of Epicurus, leading a lazy existence in the interstellar spaces, indifferent to human and in no wise affecting his life, could scarcely become the objects of a cult. 59 But the God of the Mahometan, of the Jew, or of the Christian, is a ruler to be feared, loved, obeyed. His will is law, and is determinative of conduct.

ETHICS

THE SPREAD OF THE COMMUNITY

60 So far I have been speaking of the community properly so called, of the single group of human beings living its corporate life. But such groups do not normally remain in isolation.

61 As the isolation of the group diminishes, as contacts between it and others become more numerous and more important, the necessity of conventions controlling the relations of groups becomes more pressing.

62 This implies the development of a broader social-will, inclusive of the social-wills of the several communities. 63 This social-will may be very feeble, and the bond between people belonging to different communities may be a weak one; or it may be vigourous, and furnish an intimate bond. 64 The savage, to whom those beyond the pale of own tribe or small confederation are mere strangers, and probably enemies, stands at the lower limit of the scale; 65 the trader, to whom the stranger is co-partner in a mutually profitable transaction, stands higher; 66 the Stoic philosopher, cosmopolitan in thought and feeling, rating the claims of kindred and country as less significant than the bonds which unite all people in virtue of their common humanity, marks the other extreme. 67 The spread of the social-will grows marked as human rises in the scale of civilisation. Barriers are broken down and limits are transcended.

68 This broader social-will, like the narrower, reveals itself in the organisation of society. We find confederations of tribes or states; alliances temporary or relatively permanent. 69 And the broader social-will modifies customs, gives birth to systems of law, and encourages the development of an inclusive humanitarian sentiment. It does not necessarily obliterate old distinctions. 70 The family, neighbourhood, kindred, have their claims even under the most firmly organised of states; but those claims are limited and controlled. 71 Even so, the broader social-will may come to regard states as answerable for their decisions. 72 International law remains to the present day what has aptly been called a pious wish. But public

opinion prepares the way for law; 73 and all states, whatever be their real aims, now attempt to justify their actions by an appeal to the more or less nebulous tribunal of international public opinion. In this they recognise its claim to act as arbiter. 74 Within the jurisdiction of a state, the motto, "my family, right or wrong," would not be a maxim approved in a court of justice.

75 International law is made a mock of by the frank enunciation of the maxim, "my country, right or wrong." Hence, such frankness is, in international relations, not encouraged. 76 The more or less skillfully made appeal to the moral sense of humankind-- to the broader social-will as public opinion-- implies a certain recognition of its authority, or, at least, of its influence. 77 Whether this is a definite step toward the granting of a real authority to the broader social-will, an authority which will curb impartially the selfishness of individual states, it remains for the future to decide.

THE IMPERFECT SOCIAL-WILL

George Stuart Fullerton

THE APPARENT AND THE REAL SOCIAL-WILL

24 It is important to distinguish between the apparent and the real social-will. We may begin by pointing out that the question "apparent to whom?" is a pertinent one.

2 The social-will is brought to bear upon the individual through a variety of agencies. The family, the neighbourhood, the church, the trade or profession, the political party, the social class-- all these have their habits and maxims. 3 They tend to mold to their type those whom they count among their members. The pressure which they bring to bear is felt as a sense of moral obligation. 4 Naturally, individuals with different affiliations will be sensible of the pressure in different ways, and may differ widely in their conceptions of the obligations actually laid upon the individual by the will of the greater organism of which one is a part.

5 But even you who rises above minor distinctions and takes a

broad view of society is forced to recognise that the distinction between the apparent and the real social-will may be a most significant one.

6 We have found the expression of the social-will in custom, law and public opinion. This is just; but the statement must be accepted with reservations.

7 There are instances in which neither the organisation of the state, nor the laws according to which it is governed, can be considered as in any sense an expression of the social-will. 8 An autocracy, established by force, and ruling without the free consent of the governed, is an external and overruling power. 9 It may be obeyed, but it is not consented to. Nor is any body of law or system of government imposed upon a subject people by an alien and dominant race a fair exponent of the social-will of the people thus governed. 10 Custom and public opinion are at variance with law. However just and enlightened the government, as judged from the standpoint of some other race or nation, its control must be felt as oppressive by those upon whom it is imposed. 11 Traditions felt to be the most sacred may be violated; moral laws, as understood by those thus under dictation, may be transgressed by obedience to the law of the land.

12 Where custom, law and public opinion are more nearly the spontaneous outcome of the life of a community, they may with more justice be taken as expressions of the social-will of that community as it is at the time.

13 Yet, even here, we must make reservations. The organisation of a state represents rather the crystallised will of the past than the free choice of the present. To be sure, it is accepted in the present; but this is little more than the acquiescence of inertia.

14 And public opinion may be at variance both with custom and with law long before it succeeds in modifying either. What is the actual social-will of a community during the interval?

15 The past may be felt as exercising a certain tyranny over the present. That the present cannot be cut wholly loose from it is manifest, but how far should its dependence be accepted? 16 In the

past there have been historical causes for the rise of dictatorships, of oligarchies, of dominant social classes. The people of a later time inherit such social institutions, may accept them as desirable, or may feel them as instruments of tyranny. 17 Shall we say that they represent the actual social-will of the community until such time as they are done away with by a successful revolution? 18 Or shall we say that they are in harmony with the apparent social-will only, and really stand condemned?

THE WILL OF THE MAJORITY

19 Our own democratic institutions rest upon the theory that the social-will is to be determined by the majority vote. 20 To be sure, we seem to find it necessary to limit the application of this doctrine, and to seek stability of government by fixing, in certain cases rather arbitrarily, the size of the majority that shall count. 21 But the doctrine, taken generally, does seem in harmony with the test of rationality developed above. It aims at the satisfaction of many desires-- at what may be termed satisfaction on the whole.

22 Nevertheless, it is possible to question whether the vote of the majority represents, in a given instance, the actual will of the community. 23 No one knows better than the practical politician how the votes of the majority are obtained. No one knows better than them that, in the most democratic of communities, it is the wills of the few that count. 24 The organisation of a party, clever leadership, the command of the press, the catching phrases of the popular orator, the street procession, the brass band, the possession of the ability to cajole and to threaten-- 25 these play no mean role in the outcome, which may be the adoption of a state policy of which a large proportion of the majority voting may be quite unable to comprehend the significance. 26 Shall we say, in such a case, that the will of the majority was for the ultimate end? 27 Or shall we say that the vote was in pursuance of a multitude of minor ends, many of which had but an accidental connection with the ultimate end?

IGNORANCE AND ERROR
AND THE SOCIAL-WILL

28 The apparent will of the community appears to be, in large measure, an accidental thing. 29 That is to say, people will what they would not will were they not hampered by ignorance and error, and were they not incapable of taking long views of their own interests.

30 The decisions of the social-will may be the outcome of ignorance and superstition. 31 Where it is thought necessary to punish the accidental homicide in order to appease the ghost of the dead person, which might otherwise become a cause of harm, the course of justice, if one may call it such, deviates from what the enlightened person must regard as normal. 32 The belief that sin is an infection, communicable by heredity or even by contact, must lead to similar aberrations of primitive justice. 33 Animals, and even material things, have, and not by peoples the most primitive, been treated as rational, responsible and amenable to law. This seems to do the brutes more than justice. 34 On the other hand, the philosophical tenet of the Cartesians, which denied a mind to the brutes, resulted in no little cruelty. 35 The treatment of drunkards, and of the mentally defective, has, at times, been based upon the notion that they are possessed by god or demon, and, hence, have a right to peculiar consideration, or may be treated with extreme rigour.

36 It is worthwhile to follow up the above reference to the Cartesians by a reference to St. Augustine. Trains of reasoning based upon theological or philosophical tenets have more than once given rise to aberrations of the moral judgment.

37 The intellectual subtlety of Augustine betrays him into magnifying to enormous proportions the guilt of the boyish prank of stealing green pears from the garden of a neighbour, inspired by the agreeable thought of the irritation which would be caused by the theft. 38 The pears were not edible, and were thrown to the pigs, which circumstance seduces this father of the Church into the reflection that the sin must have been committed for no other end than for the sake of sinning. A

greater crime than this he cannot conceive.

39 Many years after the event, in writing his Confessions, he expresses in unmeasured terms his horror of the deed, filling seven chapters with his reflections and lamentations: 40 "Behold my heart, O God, behold my heart, upon which thou hadst mercy when in the depths of this bottomless pit." 41 "O corruption! O monster of life and depth of death! Is it possible that I liked to do what I might not, simply and for no other reason than because I might not?"

42 Saint as he was, Augustine would have made a sorry schoolmaster. It is evident that the enlightened mind cannot regard schoolboys as unique monsters of iniquity for making a raid on an orchard.

43 The community whose decisions are made under the influence of erroneous preconceptions undoubtedly wills, but its will is determined by the accident of ignorance. 44 It is to be likened to the person who, in unfamiliar surroundings, takes the wrong road in own desire to get home. One chooses, but one does not choose what one would if one knew what one was about.

HEEDLESSNESS AND THE SOCIAL-WILL

45 Numberless illustrations might be given of the fact that, not merely ignorance and error, but also a short-sighted heedlessness plays no small part in introducing elements of the accidental and irrational into the social-will. 46 The person who spends freely with no thought for the morrow is not more irrational than the state that permits a squandering of its resources, and wakes up too late only to discover that it has lost what cannot easily be replaced.

47 The life of the community is a long one, and calls for long views of the interests of the community. 48 These are too often lacking. Heedlessness and indifference are a fertile source of abuses. In which case, the will of the community resembles that of the impulsive and erratic human, who has too little foresight and self-control to consult consistently own interests. 49 We may say that you desires your own good on the whole, but

we cannot say that you desires it at all times. 50 Future goods disappear from your view. Your choices clash. Your actual will at any given moment appears to be the creature of accident. So it may be with the community.

RATIONAL ELEMENTS IN THE IRRATIONAL-WILL

51 The actual social-will, as revealed in custom, law and public opinion, often appears, thus, highly irrational, and we may be justified in distinguishing between it and the real will which we conceive of as struggling to get itself expressed.

52 Nevertheless, in justice to custom, law and public opinion, we must look below the surface of things. 53 Even where the decisions of the community seem most irrational, and where there appears to be little consciousness of the ends pursued by the real will, the discriminating observer may see that pure irrationality does not prevail. 54 The individual may show by own actions that you have comprehensive ends, and may yet not be distinctly aware of them. So may a community of people.

55 "The true meaning of ethical obligations," says Hobhouse,"-- their bearing on human purposes, their function in social life-- only emerges by slow degrees. 56 The onlooker, investigating a primitive custom, can see that moral elements have helped to build it up, so that it embodies something of moral truth. 57 Yet these elements of moral truth were perhaps never present to the minds of those who built it. Instead thereof we are likely to find some obscure reference to magic or to the world of spirits. 58 The custom which we can see, perhaps, to be excellently devised in the interests of social order or for the promotion of mutual aid is by those who practice it based on some taboo, or preserved from violation from fear of the resentment of somebody's ghost." 59 It is not wholly irrational that, in the laws of various peoples, an allowance should be made for the sudden resentment which flames up when wrong has been suffered, 60 and that an offence grown cold should be treated more leniently

than one which is fresh and the smart caused by which has not had time to suffer diminution. 61 Society has to do with people as they are. It is its task to bend the will of the individual into conformity with the social-will.

62 That resentment for wrongs suffered is an important element in the establishment of order in the community can scarcely be denied, nor is it wholly unreasonable, humans being what they are, for the community to make some concessions to the natural feeling of the individual. 63 Moreover, the offender caught in the act is indubitably the real offender; and settled animosities are more injurious to the social order than are fugitive gusts of passion.

64 And if it is true that the arbitrary laws of hospitality, as recognised by some primitive and half-civilised communities, are reinforced by the superstitious fear of the stranger's curse, it is none the less true that they serve certain social needs. 65 The fact that hospitality tends to decline when it becomes superfluous is sufficient to indicate its social significance.66 Again, collective responsibility-- the making of a human responsible for the delinquencies of those connected with you, even when you could in no way have prevented the evils in question-- appears to modern civilised human, in most instances, an irrational thing. 67 Yet people are actually knit into groups with common interests and accustomed to cooperation. 68 To treat them as wholly independent units, responsible only to some higher organisation such as the state, is to overlook actual relationships which have no small influence in determining the course of their lives. 69 Within each lesser group the members can and do encourage or repress given types of action beneficial or the reverse. Is it irrational for the larger group to set such influences to work by holding the lesser group responsible in its collective capacity?

70 In China the principle has worked with some measure of success as an instrument of order for many centuries. 71 In an enlightened society some better method of attaining order may obtain, 72 but it would be a

mistake to assume that there is nothing behind the principle of collective responsibility save the unintelligent attempt to satisfy resentment by striking indirectly at the offender through those connected with the person, 73 or the mental confusion that identifies the culprit, through mere association of ideas, with other members of the group to which one belongs.

THE SOCIAL-WILL AND THE SELFISHNESS OF THE INDIVIDUAL

74 There is, then, often some reason to be discovered even in what appears at first sight to be wholly irrational. 75 But no small part of the irrationality of the actual social-will must be set down, in the last instance, to that peculiar form of irrationality in the individual or in groups of individuals which we call selfishness.

76 That some degree of inequality should be necessary in communities of people, in view of the differentiation of function implied in cooperative effort, may be admitted. 77 How far the inherited organisation or the existing environment of a given community may make it necessary, in the interests of all, to grant a large measure of power or prerogative to a single individual, or to the few, is fair matter for investigation. 78 But the most cursory glance at the pages of history, the most superficial survey of the present condition of humankind, 79 must make it evident that a far-seeing and enlightened social-will has not been the determining factor in bringing into existence many of the institutions which are accepted by the actual social-will of a given epoch.

80 Neither Alexander the Great nor Napoleon can be regarded as true exponents of the social-will. The rule of the oligarchy is based upon selfish considerations. 81 The institution of slavery overrides the will of the bondsman in the interests of own possessor. 82 The perennial struggle between the "haves" and the "have nots"-- the rich and the poor-- is, unfortunately, carried on by those engaged in it with a view to their

own interests and not with a view to the good of society as a whole.
83 That those to whom especial opportunities are, by the accident of their position, open, or by whom special rights are inherited, should accept the situation as right and proper is not to be wondered at. 84 All rights and duties have their roots in the past, and conceptions of what is feasible and desirable are always influenced by tradition. 85 While from the standpoint of the real social-will anomalous and accidental it is nevertheless psychologically explicable and natural that the mediaeval knight should be bound by the rules of chivalry only in own dealings with those of one's own rank; 86 that the murder of a priest should be regarded as a crime of a special class; that benefit of clergy should be extended to a limited number of those guilty of the same offence; 87 that the lists of the deadly sins should, in an age dominated by the monastic idea, smack so strongly of the cloister.
88 Natural it is, and, perhaps, inevitable, that such expressions of the social-will should make their appearance. They have their place in the historic evolution of society. 89 But they betray the fact that human is imperfectly rational. They cannot be regarded as expressions of the permanent rational-will which belongs to human as human.

THE RATIONAL SOCIAL-WILL

George Stuart Fullerton

REASONABLE ENDS

25 We have seen in the chapter on "Rationality and will," that we cannot consider a human rational unless your choices are harmonised and converge upon some comprehensive end. 2 It has been hinted, furthermore, that not all comprehensive ends can be described as reasonable or rational. 3 A child may be consistently disobedient to its parents, and, given parents of a certain kind, it may find its life highly satisfactory. 4 A person may consistently be a bad neighbour, and may harbour the conviction that, on the whole, he gains by it. 5 A miser may be consistent; you may come to joy in denying

yourself luxuries and even comforts, repaid in the consciousness of an increasing store. 6 The philosophical egoist may reason with admirable consistency, and may habitually act in accordance with own convictions, leading, for the self, a very endurable life.

7 All these may be intelligent, even acutely intelligent, and may reason clearly and well. Nevertheless, humans generally refuse to consider their behaviour reasonable. 8 There are ends which we regard as rational, and others which we condemn as irrational.

9 It is not enough, hence, that a human's volitions should be intelligently harmonised and unified. Your will must be adjusted to ends which themselves can be judged rational.

10 And in deciding whether the ends you chooses are rational or not, we proceed just as we do in judging the rationality of your individual choices. 11 If the latter are made in the light of information, if their significance is realised, if they converge upon some comprehensive end and do not merely clash and defeat one another, we have seen that they are made under the guidance of reason or intelligence. 12 The individual volitions are congruous with the permanent set of the human's will. They are judged by their background, by their harmony with the "pattern" which is revealed in the human's volitional life.

13 Even so, each such volitional pattern, the harmonised and unified will of the individual as directed upon some comprehensive end, is judged to be rational or not according as it does or does not accord with the ends pursued by the social-will. 14 Individuals, whose wills are thoroughly unified and harmonised by the dominant influence of given chosen ends, may be thoroughly out of harmony with the chosen ends of the larger organism of which they are a part. 15 They may be out of harmony with each other. Considered alone, each may display an internal order and unity. Taken together they may be seen to be in open strife.

16 We have found the social-will to be something relatively permanent and moving with more

or less consistency toward certain comprehensive ends.

17 That the ends chosen by given individuals may be very much out of harmony with these is palpable. 18 The deliberate idler, the whole-hearted epicure, the habitually untruthful person, the miser, the cold egoist-- these and such as these are condemned in enlightened communities. 19 Their lives do not help to further, but serve to frustrate, the ends approved by the social-will. In so far they may be regarded as consistently irrational.

AN OBJECTION ANSWERED

20 Consistently irrational! it may be exclaimed; how can that be? Is not a far-sighted consistency the very mark of rational choice?

21 The difficulty is only an apparent one. Many forms of consistency may indicate a certain degree of rationality, and yet too slight a degree to win approval. 22 There is such a thing as a narrow consistency. You who devotes your life to the purpose of revenge, may live consistently, but you loses much. 23 A bitter and angry life is not a desirable thing, even from the standpoint of the individual.

24 But why should we limit ourselves to the standpoint of the individual, in judging of the rationality of ends? 25 There are those to whom it appears self-evident that this should be done; those to whom it does not seem reasonable for a person to do anything by which you, on the whole, loses; 26 those who deny the reasonableness of self-sacrifice in any form.

27 Here it is enough to point out that humans do not actually limit the notion of rationality in this way. In every, even moderately, rational life some desires must be suppressed. All desires cannot be satisfied. 28 Why should it not be regarded as rational and reasonable that, to attain the comprehensive ends of the social-will, certain ends consistently chosen by certain kinds of individuals should deliberately be denied?

29 As a matter of fact, humans generally do so regard it. They employ the terms rational and irrational, reasonable and

unreasonable, to indicate the harmony or lack of harmony between the individual and the social-will. 30 We call the person unreasonable who insists upon having your own way regardless of your fellows; and this, even in instances in which your fellows cannot punish you for your selfish attitude.

31 It is not a matter of accident that this should be so. The analogy between the relation of separate volitions to the dominant ends which control action on the part of the individual, and the relation of the ultimate choices of individuals to the ends pursued by the social-will, is a close one. 32 In the well-ordered mind the clash of conflicting desires is reduced to a minimum. In a well-ordered community the conflict of individual wills is also reduced to a minimum. 33 In each case, we are concerned with the work of reason, and judgments as to rationality and irrationality are equally in place.

REASONABLE SOCIAL ENDS

34 The will of the individual, when affirmed to be rational or irrational, is, therefore, referred to the background of the social-will. 35 But the social-will is more or less different in different communities, and in the one community at different stages of its development. 36 Is there any measure of the degree of rationality of the social-will itself? is there any standard to which its different expressions may be referred?

37 We may criticise a community as we criticise an individual person even when you are taken as abstracted from your social setting. 38 The person's choices may be blind, conflicting, wayward, and ill-adapted to serve own interests taken as a whole. 39 In the last chapter we saw that a community may resemble such a person. It may be ignorant, superstitious, short-sighted, and in conflict with itself. 40 The social-will as actually revealed may be an imperfect and inconsistent thing. Here enlightenment and inner

harmonisation are called for, to set the social-will free.

41 But even where the will of a community is something more definite and consistent than this, it may be condemned by the moral judgment of the enlightened. 42 An appeal may be made from the will of the community in the narrower sense to that of the larger community. 43 The limits of nation, race and religion may be transcended, and we may appeal to humanity as such, refusing to recognise the will of any lesser unit as really ultimate. 44 You who occupies the one standpoint is apt to speak of defending your legitimate rights, or of extending to subject races the blessings of civilisation. 45 You who takes your stand upon the other may talk of lust of dominion, or desire for economic advantage. The one may use the term righteous indignation; the other, the word anger. 46 The moral judgment passed upon an act depends upon the concept under which people manage to bring it. What is approved by the tribal ethics may be abhorrent to the ethics of humanity.

47 But the larger social-will, so far as it has gotten itself expressed at all, seems to remain something vague and indefinite. It is appealed to as rational; 48 but how indicate clearly the end which it sets before itself and the obligations which it lays upon humankind?

49 The difficulty of describing in detail the ultimate ends of the real social-will has led some writers to speak in terms of exaggerated vagueness. 50 The mere idea in a human "of something, you knows not what, which you may and should become" can give little guidance to action; 51 nor can one aim with much confidence at a goal of which "we can only speak or think in negatives."

52 But it is not necessary to speak in this way. We may form some conception of the real, rational social-will, without being compelled to know all that human is capable of becoming and without being able to forecast the details of your environment in the distant future.

53 We may attain to our conception by determining clearly the nature of the aims human sets before the self in proportion to

your growing rationality. 54 We can see in what direction human moves as you develops and becomes enlightened. 55 From this standpoint, the aims of the rational social-will appear to be as follows:
(1) The harmonious satisfaction of the impulses and desires of human.
56 (2) Such an unfolding of your powers as will increase their range and variety, broaden human's horizon, and give you an increased control over erratic impulses.
57 (3) The bringing about of a social state in which the will of each individual within a community counts for something, and not merely the will of a chosen few.
58 (4) The broadening of the conception of what constitutes a community, so that ever increasing numbers are regarded as having claims that must be recognised.
59 (5) The taking into consideration of the whole of life; the whole life of individuals and of communities, so that the insistent present shall not be given undue weight, as against the future.

THE ETHICS OF REASON

60 The doctrine of the Rational social-will might very properly be called the Ethics of Reason. 61 It is not to be confounded with the so-called "tribal" or "group" ethics. To be sure, it has to do with human as a social being; 62 but this is characteristic of ethical systems generally. Human is a social being; you are one essentially, and not accidentally. 63 That you should be a member of a tribe, or of any lesser group than the whole body of sentient and reasonable beings, may not unjustly be regarded as an historical accident, as a function of your position in the scale of development.
64 In judging the doctrine of the rational social-will, bear in mind the following:
(1) It rests upon the basis of the impulsive and volitional nature of human.
65 (2) It recognises reason in the individual, and declares that only so far as you are rational is you the proper subject of ethics at all. Erratic and uncontrolled impulse knows no moral law.
66 (3) It sees reason in the customs, laws and public opinion of the

tribe or the state, while recognising a higher tribunal before the bar of which all these are summoned.

67 (4) It appeals to the reason of the race-- the reason appropriate to the race as enlightened and freed from the shackles of local prejudice and restricted sympathy.

68 (5) It recognises that human can give expression to own nature, can satisfy own desires and exercise own reason, only as aided by own physical and social environment. 69 It emphasises the necessity of a certain reverence for the actual historical development of human societies, with their institutions. 70 Such institutions are the embodiment of reason-- not pure reason, but reason struggling to get itself expressed as it can. 71 You who would legislate for human independently of such institutions has left the solid earth and human far behind. You are suspended in the void.

THE DEVELOPMENT OF CIVILISATION

72 Civilisations differ; some are more material, laying stress upon human's conquest of own material environment. 73 Others exhibit a greater appreciation of idealistic elements, the pursuit of knowledge for its own sake, the cultivation of the fine arts, the development of humanitarian sentiment. 74 For civilisation in general it is not necessary to advance an argument. But there are elements in many civilisations which the thoughtful human may feel called upon to defend.

75 Civilisation, taken generally, scarcely needs a laboured justification because it is only in a civilisation of some kind or other that we can look for a guarantee of the broad social-will, for the reign of reason. 76 Undeveloped human is at the mercy of Nature; you are the sport of history. Where developed human can raise own voice, human possessed of power and capable of taking broad views of things, the rule of reason may be set up. 77 A deliberate attempt may be made to recognise many wills, harmonise discords. Order may be brought out of chaos, and the limits of the realm within the borders of which order reigns may be indefinitely extended.

ETHICS

78 Such is the general ethical justification for the rise of a civilisation. It is an expression of, and an instrument for the realisation of, the broader social-will. 79 That a given civilisation may be imperfect in both respects has been made clear in the last chapter. In the light of the general justification for civilisation many questions may be raised touching this or that element in civilisations as we observe them.

80 Thus, it may be pointed out that as human progresses in civilisation you calls into being a multitude of new wants, many of which may have to remain unsatisfied. 81 It may be asserted that literature, art and science are, in fact, cherished as though they were ends in themselves, and not means called into existence to serve the interests of human. 82 Absorbing as it may be to you, how can the philologist prove that own science is useful to humanity either present or prospective? 83 How shall the astronomers, who may frankly admit that they cannot conceive that nine tenths of the work with which they occupies themselves can ever be of any actual use to anyone, justify themselves in devoting own life to it? 84 Shall a curiosity, which seems to lead nowhere, be satisfied? And if so, on what ground?

85 Moreover, every civilisation recognises that some wills are to be given a more unequivocal recognition than others. Inequality is the rule. 86 A person does not put own children upon a level with those of own neighbour. Even in the most democratic of states people do not stand upon the same level. 87 In dealing with our own fellows we do not employ the same weights and measures as in dealing with foreigners. 88 Who loses own appetite for own breakfast when you reads that there have been inundations in China or that an African tribe has come under the "protection" of a race of another colour? 89 The white person has added to own burden-- the burden of economic advantage present or prospective-- and we find it as it should be. 90 Finally, when we bring within our horizon the "interests" of humbler sentient creatures, we see that they are unhesitatingly subordinated to our own. 91 Some attention is paid

to them in civilised communities. They are recognised, not merely by custom and public opinion, but, to some degree, even by law. 92 People are punished for treating certain animals in certain ways. But why? Have the animals rights? 93 There is no topic within the sphere of morals upon which moralists speak with more wavering and uncertain accents.

94 I know of no way in which such problems as the above can be approached other than by the appeal to reason, as reason has been understood in the pages preceding. 95 The reign of reason implies the recognition of all wills, so far as such a recognition is within the bounds of possibility. 96 The escape from chaos lies in the evolution of the enlightened social-will. Human must be raised in the scale, in order that you may have control; control over yourself, over other humans, over the brutes. 97 And you cannot rise except through the historical evolution of a social order. This implies the development of the capacities latent in human.

98 To decide that any of your capacities shall be allowed to remain dormant may threaten future development. 99 To cut off certain arts and sciences as not palpably serving the interests of human is a dangerous thing. 100 To ignore the actual history of human's efforts to become a rational being, and to place, hence, all wills upon the one level, is to frustrate the desired end. It is not thus that the reign of reason can be established.

THE INDIVIDUAL AND THE SOCIAL-WILL

George Stuart Fullerton

HUMAN'S MULTIPLE ALLEGIANCE

26 We have seen that each human has own place in a social order. 2 This order is the expression and the embodiment of the social-will, which accepts you, protects you, gives you a share in the goods the community has so far attained, 3 recognises your individual will in that it accords to you rights, and prescribes your course of conduct, that is, defines your duties or obligations.

4 The social-will is authoritative; it issues commands and enforces

obedience. With its commands the individual may be in sympathy or you may not. 5 But upon obedience the social-will insists, and it compasses its ends by the bestowal of rewards or the infliction of punishment. 6 The moral law to which human thus finds yourself subject is something not wholly foreign to the nature of the individual. 7 It has come into being as an expression of the nature of human. That nature the individual shares with own fellows.

8 Obedience to the social-will would be a relatively simple matter were that will always unequivocally and unmistakably expressed, and did all the members of a community feel the pressure of the social-will in the same manner and to the same degree. 9 But the whole matter is indefinitely complicated by what may be called human's multiple allegiance. 10 Organised societies do not consist of undifferentiated units. They are not mere aggregates, both are highly complex in their internal constitution. 11 A conscientious person may feel that you owes duties to yourself, to your immediate family, to your kindred, to your neighbourhood, to your social class, to your political party, to your church, to your country, to its allies, to humanity. 12 The social-will does not bring its pressure to bear upon the person who holds one place in the social order just as it does upon you who holds another. Nor are the injunctions laid upon a human always in harmony. 13 The demands of family may seem to conflict with those of neighbourhood or of profession; 14 duties to the church may seem to conflict with duties to the state; patriotism may appear to be more or less in conflict with an interest in humanity taken broadly. 15 That the individual should often approach in doubt and hesitation the decision as to what it is, on the whole, own duty to do, is not surprising. 16 Nor is it surprising that individuals the most conscientious should find it impossible to be at one on the subject of rights and duties. 17 Two people may agree perfectly that it is right to "do good," and be quite unable to agree just what

good it is right to do now, or with whom one should make a beginning.

THE APPEAL TO REASON

18 Were there no appeal save to the social-will as it happens to make its pressure felt upon this person or that, in this situation or that, there could be no issue to dispute. 19 Dispute would be useless and sheer dogmatism would prevail. But there is such an appeal and people do make it, where they are in any degree enlightened. It is the appeal to Reason.

20 You who says: "I have especial rights, just because I am Smith, and so has my father, because he is my father," has no ground of argument with Jones, who says: "I have especial rights because I am Jones, and so has my father, because he is my father." 21 Upon such a basis, or lack of basis, all discussion becomes fatuous. 22 But if Smith and Jones agree that duties to self should only within limits be recognised, and that duties to family have their place upon the larger background of the will of the state, they may, at least, begin to talk.

23 The multiple allegiance of the individual does not mean that a person is subject to a multitude of independent masters whose several claims have no relation to one another. An appeal may be made from lower to higher.

24 We have seen that, in the organisation of a given society, the social-will may be imperfectly expressed. It may come about that the place in the social order assigned to a person cramps and pains you or forces you to exertions which seem intolerable. 25 You may passively accept it, or you may set yourself in opposition to the social-will as it is, appealing to a better social-will. 26 The fact that an individual finds the self out of harmony with given aspects of the social-will characteristic of own age and country is no proof that one desires to set the self up in opposition to the social-will in general.

27 In a given instance, you may be, from the standpoint of existing law, a criminal. Yet you may reverence the law above your fellows. 28 Your aberrations need

not be arbitrary wanderings, prompted by selfish impulses. You may leave the beaten track because you does not approve of it, which is a very different thing from disliking it. 29 Some will judge you to be a pestilent fellow; some will rate you as a reformer, a prophet, perhaps a martyr.

30 Neither judgment is of the least value so long as it reflects merely the tastes or prejudices of the individual. 31 Each must justify itself before the bar of reason, if it would have a respectful hearing. A reason must be given for conservatism and a reason must be given for reform.

THE ETHICS OF REASON AND THE VARYING MORAL CODES

32 Several advantages may be claimed for the ethical doctrine I have been advocating:

(1) It gives a relative justification to the varying moral codes of communities of people in the past and in the present. 33 A code may, even when imperfect from some higher point of view, fit well a community at a given stage of its development. 34 It may be a person's duty to obey its injunctions, even where they are not seen to be the wisest possible. 35 One reason for bowing to custom is that it is custom; one reason for obeying laws is that they are laws. 36 They embody the permanence and stability of the social-will, and have a prima facie claim to our reverence.

37 (2) In recognising the social-will as something deeper and broader than the will of the individual, as having its roots in the remote past and as reaching into the distant future, 38 it admits the futility of devising utopian schemes which would bless humanity in defiance of the actual expressions of the social-will revealed in the development of human societies. 39 The whim of the individual cannot well be substituted for then settled purpose of the community--a purpose ripened by generations of experience, and adjusted to what is possible under existing conditions.

40 (3) On the other hand, it distinguishes between lower and higher ethical codes, or codes lower or higher in certain of their aspects. 41 It sets a standard of

comparison; it recognises progress towards a goal.

42 (4) And, in all this, it does not appear to decide arbitrarily either what is the goal of human's moral efforts or what means must be adopted to attain to it. 43 It rests upon a study of human; human as you have been, human as you are, in all the manifold relations in which you stands to your environment, physical and social.

44 There are other ethical theories in the field, of course. Some of them are advocated by people of original genius and of no little learning. 45 Some deserve more attention than others, but all should have a hearing, at least. 46 A close scrutiny will often reveal that advocates of different theories are by no means so far apart as a hasty reading of their works would suggest. 47 Writers the most diverse may assist one to a comprehension of one's own theory. Its implications may be developed, objections to it may be suggested, its strong points may stand revealed. 48 By no means the least important part of a work on ethics is its treatment of the schools of the moralists. 49 If it be written with any degree of fairness, it may contain what will serve the reader with an antidote to erroneous opinions on the part of the writer. 50 To a study of the most important schools of the moralists I shall now turn.

THE SCHOOLS OF THE MORALISTS

George Stuart Fullerton

INTUITIONISM

WHAT IS IT?

27 "We come into the world," said Epictetus, "with no natural notion of a right-angled triangle, or of a quarter-tone, or of a half-tone; 2 but we learn each of these things by a certain transmission according to art; and for this reason those who do not know them do not think that they know them. 3 But as to good and evil, and beautiful and ugly, and becoming and unbecoming, and happiness and misfortune, and proper and improper, and what we ought to do and what we ought not to do, who ever came into the world without having an innate idea of them?"

4 Seneca adds his testimony to the self-luminous character of moral truth: "Whatever things tend to make us better or happier are either obvious or easily discovered."

5 With the general spirit of these utterances the typical intuitionist is in sympathy, although you need not assent to the doctrine of innate ideas, nor need you hold that all moral truths are equally self-evident. 6 There are intuitionists of various classes, and there are sufficiently notable differences of opinion. 7 Still, all intuitionists believe that some moral truth, at least, is revealed to the individual by direct inspection ‘intueor’, and that we must be content with such evidence and must not seek for proof. 8 It may be maintained that our moral judgments-- or some of them-- are the result of "an immediate discernment of the natures of things by the understanding." and appeal may be made to the analogy furnished by mathematical truths.

VARIETIES OF INTUITIONISM

9 Forms of intuitionism have been conveniently classified as Perceptional, Dogmatic and Philosophical.

10 To this nomenclature it may be objected that the term "dogmatic" carries with it a certain flavour of disapprobation, and predisposes one to the assumption of a critical attitude, while the term "philosophical" has the reverse suggestion, and smacks of special pleading. 11 While admitting that there is something in the objection, I retain the convenient terms, merely warning the reader to be on your guard.

12 (1) Perceptional Intuitionism falls back upon the analogy of perception in general. I seem to perceive by direct inspection that my blotter is green, and that my pen-holder is longer than my pencil. 13 I do not seek for evidence; I do not have recourse to any chain of reasonings to establish the fact. And I am concerned here with facts, not with some general proposition applicable to many facts. 14 Even so, I may maintain that, in specific situations, the rightness or

wrongness of given courses of action may be perceived immediately.

15 You who accepts the spontaneous deliverances of your conscience, when confronted with the necessity of making a decision, as revelations of moral truth, may be called a perceptional intuitionist. 16 The deliverances must, however, be spontaneous and immediate, not the result of reasoning. 17 If a person reasons, if you falls back upon general considerations, if you looks into the future and weighs the consequences of your act, and, as a result, decides what you ought to do, you are no longer a perceptional intuitionist.

18 The perceptional intuitionist, consistently and unreservedly such, is rather an ideal construction than an actually existing person. 19 Most people, on certain occasions, are inclined to say, "I feel this to be right, and will do it, although I cannot support my decision by giving reasons."

20 Many people are, at times, tempted to maintain that a given course of action is evidently right and should be followed irrespective of consequences. 21 But this is not the habitual attitude even of people very little gifted with reflection, and it is highly unsatisfactory to those who have the habit of thinking.

22 Primitive human supports own decisions by an appeal to custom. Civilised human turns to custom, to law, or to general principles of some sort, which one accepts as authoritative, and which one regards as having a bearing upon the particular instance in question. 23 That individual decisions should be capable of some sort of justification by the adduction of a reason or reasons is generally admitted. 24 No sane person would maintain the general proposition that the consequences of acts should be wholly disregarded in determining whether they are or are not desirable.

25 (2) Thus, Perceptional Intuitionism gives place to what has been called Dogmatic Intuitionism-- to the doctrine that certain general moral rules can be immediately perceived to be valid. 26 The application of such general rules to particular instances

implies discrimination and the use of reason.

27 Here decisions are not wholly unsupported. Reasons may be asked for and given. 28 In answer to the question: Why should I say this or that? it may be said: Because the law of veracity demands it. 29 In answer to the question: Why should I act thus? it may be said: Because it is just, or is in accordance with the dictates of benevolence. 30 The general rule is accepted as intuitively evident, but it is incumbent upon the individual to use own judgment in determining what may properly fall under the general rule.

31 But there are rules and rules. It is not easy to draw a sharp line between Perceptional Intuitionism and Dogmatic, just as it is not easy in other fields to distinguish sharply between knowledge given directly in perception, and knowledge in which more or less conscious processes of inference play a part. 32 Do I perceive the person whom I see, when I look into a mirror, to be behind the mirror or in front of it? 33 Do I perceive the whereabouts of the coach which I hear rattling by my window, or does reasoning play its part in giving me information? 34 And if I follow my conscience in not withholding from the cab-man the small customary fee in addition to his fare, am I prompted by an unreasoned perception of the rightness of my act, or am I influenced by general considerations-- 35 the thought of what is customary, the belief that gratuities should not be withheld where services of a certain kind are rendered, etc.?

36 Even so, it is difficult to draw a sharp line between Dogmatic Intuitionists and Philosophical, or to regard Dogmatic Intuitionists as a clearly defined class of any sort. 37 A person may accept it as self-evident that a waiter should receive ten per cent of the amount of own bill; a woman may find it obviously proper that an old lady should wear purple. 38 Those little given to reflection may accept such maxims as these without attempting to justify them by falling back upon any more general rule. 39 We all find about us human beings who have their minds stored with a multitude of

maxims not greatly different from those adduced, and who find them serviceable in guiding their actions. 40 But thoughtful people can scarcely be content with such a modicum of reason, and they distinguish between ultimate principles and minor maxims which stand in need of justification by their reference to principles.

41 The intuitional moralists by profession draw this distinction. We find them setting forth as ultimate a limited number of ethical principles of a high degree of generality. 42 It is obvious that, the more general the principle, the more room for conscious reasoning in its interpretation and application. 43 The person to whom it appears as in the nature of things suitable that the waiter should receive own ten per cent is relieved from many perplexities which may beset the person who feels assured only of the general truth that it is right to be benevolent.

44 A glance at a few of the moralists who are treated in the history of ethics as representative intuitionists reveals that they are little in harmony as touching the particular moral intuitions which they urge as the foundation of ethics.

45 Thus, John Locke maintains that from the idea of God, and of ourselves as rational beings, a science of morality may be deduced demonstratively; 46 a science: "wherein I doubt not but from self-evident propositions, by necessary consequences, as incontestable as those in mathematics, 47 the measures of right and wrong might be made out to anyone that will apply the self with the same indifferency and attention to the one, as one does to the other of those sciences."

48 Among Locke's self-evident propositions or moral axioms we find: where there is no property there is no injustice; no government allows absolute liberty; all people are originally free and equal; 49 parents have the power to control their children till they come of age; the right of property is based upon work, but is limited by the supply of property left for others to enjoy.

50 These axioms cannot be identified with Samuel Clarke's four chief rules of righteousness,

which inculcate: piety toward God, equity in our dealings with people, benevolence, and sobriety.

51 Richard Price gives us still another choice, in dwelling upon our obligation as regards piety, prudence, beneficence, gratitude, veracity, the fulfillment of promises, and justice.

52 And Whewell, emulating the performance of Euclid, tried to build up a system of morals upon axioms embodying the seven principles of benevolence, justice, truth, purity, order, earnestness, and moral purpose.

53 These moralists press the analogy of mathematical truth. It must be confessed, however, that a row of text-books on geometry, with so scattering and indefinite a collection of axioms, would do little to support one another; 54 and little to convince us that they represented a coherent and consistent body of truth in which we might have unquestioning faith.

55 (3) It is not unnatural that some thoughtful intuitionists, dissatisfied with a considerable number of independent moral principles, should aim at a further simplification. 56 Such a simplification Kant finds in the *Categorical Imperative,* or unconditional command of the Practical Reason: 57 "Act only on that maxim whereby thou canst at the same time will that it should become a universal law."

58 And Henry Sidgwick, refusing to regard all intuitions as of equal authority, selects two only as ultimately and independently valid-- that which recommends a far-seeing prudence, and that which urges a rational benevolence. 59 Those who make their ultimate moral rules so broad and inclusive base upon them the multitude of minor maxims to which people are apt to have recourse in justifying their actions. 60 Whether their doctrine may be called philosophical in a sense implying commendation is matter for discussion.

ARGUMENTS FOR INTUITIONISM

61 What may be said in favour of intuitionism?

(1) It may be urged that it is the doctrine which appeals most

directly to common sense, and that it is found reasonably satisfactory in practice by people generally.

62 Intuition appears to be, in fact, human's guide in an overwhelming majority of the situations in which you are called upon to act. 63 In the face of the concrete situation you feels that you should say a kind word, help a neighbour, stand your ground courageously, speak the truth, and a thousand other things which a moralist might, upon reflection, approve.

64 That you "feels" this does not mean merely that you are influenced by an emotion. 65 We constantly employ the word to indicate the presence of a judgment which presents itself spontaneously and for which people cannot or do not seek support by having recourse to reasons.

66 You who, without reflection, affirms, "this action is right," has framed a moral judgment. You have in a given instance distinguished between right and wrong, although you have not raised the general problem of what constitutes right and wrong. 67 You have exercised the prerogative of a moral being, though not of a very thoughtful one.

68 We have seen above, that perceptional intuitionism tends to pass over into dogmatic intuitionism of some sort, even in the case of minds little developed. 69 The egoistic rustic may defend own selfishness by citing the proverb, "my shirt is closer to me than my coat." 70 If you does so, it means that a doubt has been suggested, a conflict of some sort called into being. 71 Were such conflicts, causing hesitation and deliberation, of very frequent occurrence, life could scarcely go on at all. 72 Conversation would be impossible were no word placed and no inflection chosen without conscious reference to the rules of grammar. 73 No human could conduct the self properly in a drawing-room or at a table, were own mind harking back at every moment to the instructions contained in some volume on etiquette.

74 You who must justify every act by reflection is condemned to the jerkiest and most hesitant of moral lives. 75 Perceptional moral

intuition must stand our friend, if there is to be a flow of conduct worthy of the name.

76 There are, however, occasions for checking the flow by reflection. Then people are forced to think, and we find them appealing to custom, citing proverbs, quoting maxims, taking their stand upon principles. 77 Recourse may be had to generalisations of a very low or of a very high degree of generality.

But low or high, it is upon intuitions that humans actually fall back in justifying their actions. 78 Benevolence, justice, honesty, truthfullness, purity, honour, modesty, courtesy, and whatnot, are intuitively perceived to be right, and an effort is made to bring the individual act under some one of these headings. 79 The mass of people, even in enlightened communities, do not feel impelled to justify these general moral maxims, to reduce them to a harmonious system, or to reconcile with each other the different lists of them which have been drawn up. 80 They find it possible in practice to resolve most of their doubts by an appeal to this maxim or to that. From such doubts as refuse to be resolved they are apt to turn away their attention. But the moral life goes on, and to intuitions it owes its guidance.

81 As to the few who reduce the moral intuitions to a minimum, and, like Kant and Sidgwick, end with one or two ultimate intuitional moral principles, we may say that they, like others, are compelled, in the actual conduct of life, to turn to intuitions of lower orders. 82 All sorts of moral intuitions are actually found helpful by all sorts of people.

83 (2) To the minds of humans differing in their education and traditions, and at different stages of intellectual and moral development, very different moral judgments spontaneously present themselves. 84 It is not a matter of accident that this person may "feel" an action to be right, and that person may "feel" it to be wrong. 85 There is evident adaptation of the judgments to history and environment. They spring into being because the people are what they are and are situated as they are.

86 It is this adaptation that renders the moral intuitions serviceable in carrying on the actual business of life. It is more complete, the less abstract the moral intuitions which come into play. 87 Plato, who in his "Laws" enters very minutely into the question of the permissible and the forbidden in the life of the citizens of his ideal state, finds it necessary to leave some things to the judgment of the individual. 88 Thus, he finds it impossible to determine exhaustively what things are, and what things are not, worthy of a freeman. He leaves it to the virtuous to give judgments "in accordance with their feelings of right and wrong."

89 The intuitions of the mediaeval saint, of the upright modern European, of the virtuous Chinaman, would have impressed him as without rhyme or reason. 90 He appealed to the Greek gentleman, whose sense of propriety was Greek, and might be expected to be adjusted to the situation.

91 (3) The intuitive judgment of a sensitive moral nature may often be more nearly right than moral judgments based upon the most subtle of reasonings.

92 It is not hard to find, with a little ingenuity, apparent justification for actions which the consciences of the enlightened condemn at first sight. Scarcely any action may not be brought under some moral rule, if one deliberately sets out to do so. 93 A narrow selfishness is defended as caring for one's own; a refusal of aid to the needy is justified by a reference to the evils of pauperisation; patriotism becomes the excuse for hatred, willful blindness and untruthful vilification. 94 To the sophistries of those who would thus make the worse appear the better, the intuitive judgment of the moral human opposes its unreasoned conviction. 95 That the conviction is not supported by arguments does not prove that it is not a just one.

ARGUMENTS AGAINST INTUITIONISM

96 What may be urged against Intuitionism?

(1) It may be pointed out that such considerations as the above

constitute an argument to prove the value of moral intuitions, and not one to prove the value of intuitionism as an ethical theory. 97 That moral intuitions are indispensable may be freely admitted even by one who demurs to the doctrine that intuitionism in some one of its forms may be accepted as a satisfactory theory of morals.

98 (2) Perceptional Intuitionism, at least, cannot be regarded as embodying a rational theory or furnishing a science of any sort. 99 Its one and only dogma must be that whatever actions reveal themselves to this person or that as right, are right, and there is no going behind the judgment of the individual.

100 Shall we say to humans: "In order to know what is right and what is wrong in human conduct, we need only to listen to the dictates of conscience when the mind is calm and unruffled"? 101 As well say: "The right time is the time indicated by your watch, when you are not shaking it." 102 If people are to keep appointments with each other, they must have some other standard of time than that carried by each person in own vest-pocket.

103 Perceptional Intuitionism ignores the fact that consciences may sometimes disagree, and that there may be a choice in consciences. 104 The consistent perceptional intuitionist is, however, scarcely to be found, as has been said above; 105 and we actually find those, some of whose utterances read as though the authors ought to be adherents of such a school, dwelling upon the desirability of the education of the conscience, i.e., upon the desirability of acquiring a capacity for having the right intuitions. 106 In other words, they tell us to follow our noses-- but to make sure that they point in the right direction. In which case the determination of the right direction is not left to perceptional intuition.

107 (3) The Dogmatic Intuitionist has difficulties of their own with which to cope. It is not enough to possess a collection of valid and authoritative rules. 108 The rules must be applied; there is room for the exercise of judgment and for the possibility of error.

109 Error is not excluded even when the rule appears to be at only one or two removes from the individual instance; where the rule is one of great generality the problem of its application becomes correspondingly difficult. 110 The interpretation of the rule is not given intuitively with the rule. This means that the rule must, in practice, be supplemented.

111 Always and everywhere, a straight line appears to be the shortest distance between two points. What is meant by shortness hardly seems to be legitimate matter for dispute. 112 But the person convinced that one ought to pay own workman a fair wage, and that one ought to do own duty by own son, may be in no little perplexity when you attempts to define that fair wage or that parental duty. 113 If you turns for advice to others, you will find that history and tradition, time, place and circumstance, very perceptibly colour the advice they offer.

114 The application of the general rule is, hence, quite as important as the rule. There is no such thing as conduct in the abstract. 115 Let us admit that benevolence is morally obligatory. How shall we be benevolent? 116 Shall we follow Cicero, and give only that which costs us nothing? or shall we emulate St. Francis? 117 The general rule may be a faultless skeleton, but it is, after all, only a skeleton, and it cannot walk of itself.

118 Again. The dogmatic intuitionist has quite a collection of rules by which you must judge of your actions. They are severally independent and authoritative. 119 Suppose an act appears to be commanded by one rule and forbidden by another? Who shall decide between them? 120 Prudence and benevolence may urge you in opposite directions. Benevolence and justice may not obviously be in harmony. The rule of veracity may seem, at times, to prescribe conduct which will entail much suffering on the part of the innocent. 121 To what court of appeal can we refer the conflicts which may arise when ultimate authorities disagree? 122 You who, in war time, can conscientiously shoot a sentry, but cannot conscientiously lie to him, may, later, have your misgivings, when

the Golden Rule knocks at the gate of your mind.

123 (4) Nor does you leave all difficulties behind you, who abandons Dogmatic Intuitionism and takes refuge in Philosophical.

124 Kant's maxim needs a vast amount of interpretation. As it stands, it is little more than an empty formula. What I can wish to be the law of the universe must depend very much upon what I am. 125 The lion and the lamb do not thirst for the same law. To the quarrelsome heroes of Walhalla a world of perpetual fighting and feasting must seem a very good world, in spite of knocks received as well as given. 126 Kant's fundamental maxim scarcely appears to be a moral rule at all, unless we make it read: "Act on a maxim which a ‘wise and good person’ can will to be a universal law." But how decide who is the wise and good person?

127 The philosophical intuitionist who accepts more than one ultimate moral rule must face the possibility that you will meet with a conflict of the higher intuitions to which you have had recourse. 128 Shall your intuitions be those recommending a rational self-interest and a rational benevolence? Can you be sure that the two are necessarily in accord? 129 Can there be a rational adjustment of the claims of each? Not if there be no court of appeal to which both intuitions are subject.

130 Furthermore, between the philosophical and the dogmatic intuitionist serious differences of opinion may be expected to arise. 131 You who makes, let us say, benevolence the supreme law naturally allows to other intuitions, such as justice and veracity, but a derivative authority. 132 It appears, then, that there may be occasions on which they are not valid. To some famous intuitionists this has seemed to be a pernicious doctrine.

133 "We are," writes Bishop Butler, "constituted so as to condemn falsehood, unprovoked violence, injustice, and to approve of benevolence to some preferably to others, abstracted from all consideration, which conduct is likeliest to produce an over-balance of happiness or misery."

134 Butler thought that justice should be done though the heavens fall; the philosophical intuitionist must maintain that the danger of bringing down the heavens is never to be lost sight of. 135 But this doctrine that there are intuitions and intuitions, some ultimately authoritative and others not so, raises the whole question of the validity of intuitions. 136 How are we to distinguish those that are always valid from others? By intuition?

137 Intuition appears to be discredited. And if it is proper to demand proof that justice should be done and the truth spoken, why may one not demand proof that people should be prudent and benevolent? 138 One may talk of "an immediate discernment of the nature of things by the understanding" in the one case as in the other. If error is possible there, why not here?

THE VALUE OF MORAL INTUITIONS

139 It would not be fair to close this chapter on intuitionism, an ethical theory competing with others for our approval, without emphasising the value of the role played by the moral intuitions.

140 They are the very guide of life, and without them our reasonings would be of little service. 141 They should be treated gently, gratefully, with reverence. To them human societies owe their stability, their capacity for an orderly development, the smooth working of the machinery of daily life. 142 Their presence does not exclude the employment of reasoning, but they furnish a basis upon which the reason can occupy itself with profit.

143 They are a safeguard against those utopian schemes which would shatter our world and try experiments in creation out of nothing.

144 Nevertheless, you who busies yourself with ethics as science must study them critically and strive to estimate justly their true significance. 145 You may come to regard them, not as something fixed and changeless, but as living and developing, coming into being, and modifying themselves, in the service of life. Does you

dishonour them who so views them?

EGOISM

George Stuart Fullerton

WHAT IS EGOISM?

28 Egoism has been defined as "any ethical system in which the happiness or good of the individual is made the main criterion of moral action," 2 or as "the doing or seeking of that which affords pleasure or advantage to oneself, in distinction to that which affords pleasure or advantage to others."

3 It may strike the average reader as odd to be told that such definitions bristle with ambiguities, and that it is by no means easy to draw a sharp line between doctrines which everyone would admit to be egoistic, and others which seem more doubtfully to fall under that head. 4 "Happiness," "good," "advantage," "self," all are terms which call for scrutiny, and which set pitfalls for the unwary.

CRASS EGOISMS

5 We may best approach the subject of what may properly be regarded as constituting egoism, by turning first to one or two "terrible examples."

6 No one would hesitate to call egoistic the doctrine of Aristippus, the Cyrenaic, the errant disciple of Socrates. 7 He made pleasure the end of life, and taught that it might be sought without a greater regard to customary morality than was made prudent by the penalties to be feared as a consequence of its violation. 8 Where the centre of gravity of the system of the Cyrenaics falls is evident from their holding that "corporeal pleasures are superior to mental ones," and that "a friend is desirable for the use which we can make of him or her."

9 The doctrine of the English philosopher, Thomas Hobbes, is as unequivocally egoistic. 10 "Of the voluntary acts of every human," he writes, "no person giveth, but with intention of good to the self; because gift is voluntary; and of all voluntary acts the object is to every human one’s own good."

11 He leaves us in no doubt as to the sort of good which he conceives people to seek when they practice what has the appearance of generosity. 12 Contract he calls a mutual transference of rights, and he distinguishes gift from contract as follows: "When the transferring of right is not mutual, but one of the parties transferreth, in hope to gain thereby friendship, or service from another, or from own friends, 13 or in hope to gain the reputation of charity or magnanimity, or to deliver own mind from the pain of compassion, or in hope of reward in heaven, this is not contract but gift, free gift, grace, which words signify the same thing."

14 There is a passage from the pen of the British divine, Paley, which appears to merit a place alongside of the citations from Hobbes, widely as the people differ in many of their views. 15 It reads: "We can be obliged to nothing but what we ourselves are to gain or lose something by; for nothing else can be a 'violent motion' to us. 16 As we should not be obliged to obey the laws, or the magistrate, unless rewards or punishments, pleasure or pain, somehow or other, depended upon our obedience; 17 so neither should we, without the same reason, be obliged to do what is right, to practice virtue, or to obey the commandments of God."

EQUIVOCAL EGOISM?

18 The above is unquestionably egoism. The person who accepts such a doctrine and consistently walks in the light must be set down as self-seeking. 19 But self-seeking, as understood by different people, appears to take on different aspects. 20 Shall we class all those who frankly accept it as human's only ultimate motive with Aristippus and Epicurus and Hobbes?

21 Thomas Hill Green writes: "Anything conceived as good in such a way that the agent acts for the sake of it, must be conceived as one’s own good."

22 The motive to action is, he maintains, always "some idea of the person's personal good." You does not hesitate to say that a person necessarily lives for

oneself; a self-seeking ego, a self-seeking subject, and a self-seeking person.

23 Were Green's book a lost work, only preserved to the memories of people by such citations as the above, the author would certainly be relegated to a class of moralists with which you had, in fact, little sympathy.

24 But the book is not lost, and by turning to it we find Green continuing the first of the above citations with the words: "Though you may conceive it as your own good only on account of your interest in others, and in spite of any amount of suffering on your own part incidental to its attainment." 25 He is willing to grant the self-seeking ego an eye single to its own interests, but he is careful to explain that: "These are not merely interests dependent on other persons for the means to their gratification, 26 but interests in the good of those other persons, interests which cannot be satisfied without the consciousness that those other persons are satisfied."

27 When Hobbes gave an account of "the passions that incline people to peace," he made no mention of the social nature of human. 28 That nature, Green conceives to be so essentially social that the individual cannot disentangle one's own good from the good of own fellows. 29 To live "for oneself," since that self is a social self, means to live for others. May this fairly be called egoistic doctrine?

WHAT IS MEANT BY THE SELF?

30 It is sufficiently clear that the happiness, or good, or advantage, or interests of the individual or self may mean many things. 31 It is equally clear that in our interpretation of all such terms our notions of the nature of the self will play no inconsiderable role. What is the self?

32 In his famous chapter on the Consciousness of Self, William James enumerates four senses of the word. With three of these we may profitably occupy ourselves here. He calls them the Material Self, the Social Self and the Spiritual Self.

33 The innermost part of the material self he makes our body,

and next to it, in their order, he places our clothes, our family, our home, and our property. 34 They contribute to our being what we are in our own eyes, we identify ourselves with them, and we experience "a sense of the shrinkage of our personality" when even the more outlying elements, such as our possessions, are lost. 35 "Our immediate family," he writes, "is a part of ourselves. Our father and mother, our wife and babes, are bone of our bone and flesh of our flesh. 36 When they die, a part of our very selves is gone. If they do anything wrong, it is our shame. If they are insulted, our anger flashes forth as readily as if we stood in their place."

37 It is obvious that the limits of the material self, as above understood, may be indefinitely extended. 38 There are people who feel about their country as the average normal person feels about own home; 39 and doubtless the suffering of a stray beggar tugged at the heart of St. Francis as the misfortune of wife or child does in the case of other people. 40 How far abroad our "interests" are to be found, and just what "interests" we shall regard as intimately and peculiarly our own, depends upon what we are.

41 The Social Self James describes as the recognition a person gets from own mates: "We are not only gregarious animals, liking to be in the sight of our fellows, but we have an innate propensity to get ourselves noticed, and noticed favourably, by our kind." 42 People certainly regard their fame or honour as to be included among their interests, and they may value and seek to obtain the good opinion of a very little clique or of a much wider circle.

43 By the Spiritual Self is meant our qualities of mind and character-- "the most enduring and intimate part of the Self, that which we most verily seem to be." 44 Our interest in these it is impossible to overlook, and their cultivation and development may become a ruling passion.

45 James's illuminating pages make clear that you who speaks of the advantage or interest of the individual may have in mind predominantly any one of these aspects of the Self, or all of them conjointly. 46 The Self as you

conceives it may be a narrow one, or it may be a very broad one.

EGOISM AND THE BROADER SELF

47 It may with some plausibility be maintained that you who lives for yourself may not properly be regarded as an egoist and called selfish, if your Self is sufficiently expanded. 48 May it not, theoretically, include as much of the universe as is known to human? And where can a person seek ends of any sort beyond this broad field?

49 On this view, all people are, in a sense, self-seeking, but only those are reprehensibly self-seeking who have narrow and scanty selves.

50 But common sense and the common usage of speech do not sanction such statements as that a person necessarily lives for the self and that all humans are self-seeking. 51 It is justly recognised that some people with broad interests-- of a sort-- are self-seeking, and that some others with great limitations are not.

52 You who has property scattered over four continents and watches with absorbing interest all movements upon the political and economic stage may nevertheless be a thorough-going egoist. The breadth of your horizon will not redeem you. 53 One may look far afield and live labourious days in the pursuit of fame, and be egoistic to the back-bone, although one's interests, in this case, include even the contents of the minds of generations yet unborn. 54 One may forego many pleasures and concentrate all one's efforts upon the attainment of intellectual eminence or of a virtuous character, and yet seem to have a claim to the name of egoist.

55 That even the pursuit of virtue may take an egoistic turn has frequently been recognised: 56 "Woe betides that person," writes Dewey, "who having entered upon a course of reflection which leads to a clearer conception of own moral capacities and weaknesses, maintains that thought as a distinct mental end, and thereby makes own subsequent acts simply means to improving or perfecting own moral nature." 57 He characterises this as one of the worst kinds of selfishness. 58 The task set the self

by the egoist who aims at outshining own fellows in an unselfish self-forgetfullness would seem to be a particularly difficult one; yet we have all met persons who appear to be animated by some such desire.

EGOISM NOT UNAVOIDABLE

59 On such cases as the above the common judgment can hardly be in doubt. But there are cases more questionable. 60 Was Hobbes really self-seeking when he gave the sixpence to the old beggar? Is it egoism that leads the young mother to give herself the exquisite pleasure of feeding and caring for her babes? or that induces the patriot to die for his country? 61 To be sure, both the babes and the fatherland may fall within the limits of the self, as the psychologist has broadly defined it.

62 But they fall within it only in a sense. No doctrine of the mutual inclusion of selves can obliterate the distinction between self and neighbour, and make my neighbour merely a part of myself. 63 The common opinion of humankind is not at fault in basing upon the distinction between selves the further distinction between egoism and altruism. 64 Whatever interests the egoist may have, own ultimate motive to action cannot be the recognition of the desire or will of another. Such can be the motive of the altruist.

65 Human motives are of many sorts, and just what they are it is not always easy to discover. 66 Cornelia, in exhibiting her "jewels," may have been puffed up with pride. When Cyrano de Bergerac threw, with a noble gesture, his purse to the players, his "Mais quel geste!" reveals that he was a player himself and was "showing off." 67 There may be spectacular patriots, who are willing to suffer the extreme penalty for the sake of a place in history. 68 But all maternal affection is not identical with pride; all generous impulses cannot be traced to vanity; all patriotism is not spectacular; nor is the motive to the relief of suffering necessarily the removal of one's own pain. 69 It is one thing to hire Lazarus not to exhibit himself in

his shocking plight on our front porch, and it is a distinctly different thing to be concerned about the needs of Lazarus per se.

70 It is obvious, then, that it is only by a straining of language that one can say that human necessarily lives for oneself, or is unavoidably self- seeking. 71 You who makes such statements overlooks the fact that, even if is true that, in a sense, a human's self may be regarded as coextensive with all that interests you, 72 it is equally true that different selves are mutually exclusive and that the good of one may serve as the ultimate motive in determining the action of another. 73 The ethnologist is compelled to recognise altruistic impulses in people primitive and in people civilised: 74 "Of the doctrine of self-interest as the primary and only genuine human motive, it is sufficient to say that it bears no relation to the facts of human nature, and implies an incorrect view of the origin of instinct."

VARIETIES OF EGOISM

75 The egoist may set own affections upon pleasure, and become a representative of Egoistic Hedonism, the variety of egoism normally treated as typical and made the subject of criticism in ethical treatises. 76 But there is nothing to prevent you from making your aim, not so much pleasure, as self-preservation; or from taking as your goal wealth, power, reputation, intellectual or moral attainment, or whatnot.

77 So long as the motives which impel you to get, to avoid, to be, or to do, something, do not include, except as means to some ulterior end, the desire or will of your fellow-human, there appears no reason to deny you the title of "Egoist." 78 Nor need we deny you the title because you may be unconscious of your egoism. There are unconscious egoists who are wholly absorbed in the individual objects which are the end of their strivings. 79 They may be quite unaware that they are ruled by self-interest, when it is clear to the spectator that such is the case. But the philosophical egoist must rise to a higher plane of reflection.

80 There are, thus, egoisms of many sorts, and they may urge people to very different courses of conduct. Some of them may pass over more naturally than others into forms of doctrine which are not egoistic at all. 81 You who aims at a maximum of pleasure for yourself is likely to remain an egoist; 82 you whose ambition is to be a patron of science or a philanthropist, may, it is true, remain within the circle of the self, 83 but it is quite possible that your ulterior aim may come to be forgotten and your real interest be transferred to the enlightenment of humankind or to the relief of suffering.

84 It is especially worthy of remark that in judging a system of doctrine we must take it as a whole, and not confine ourselves to a few utterances of the person who urges it, however unequivocal they may appear when taken in isolation. 85 You whose motive to action is always some idea of your own personal good is an egoist. 86 But a philosopher may hold that human motives are always of this sort, and yet reveal unmistakably, both in your life and in your writings, that you are not really an egoist at all. 87 In which case, we may tax you with more or less inconsistency, but we should not misconceive you.

THE ARGUMENTS FOR EGOISM

88 So much for the forms of egoism. It remains to enquire what may be urged in favour of the doctrine, and what may be said against it.

89 (1) It has been urged that egoism is inevitable. This, to be sure, can scarcely be regarded as an argument that a person ought to be an egoist, 90 for there seems little sense in telling a person that you ought to do what you cannot possibly help doing. But the argument may be used to deter us from advocating some other ethical doctrine.

91 "On the occasion of every act that you exercises," says Bentham, "every human being is led to pursue that line of conduct which, according to your view of the case, taken by you at the moment, will be in the highest degree

contributory to your own greatest happiness."

92 From this we might conclude, not only that every human is an egoist, but also that every human is at all times a prudent and calculating egoist-- 93 which seems to flatter grossly the drunkard and the excited person lying about you in blind fury. But one may hold that egoism is inevitable without going so far.

94 (2) The egoistic ideal may be urged upon us on the ground that it addresses itself to human as natural and reasonable.

95 Thus, the Cyrenaics saw in the fact that we are from our childhood attracted to pleasure, and, when we have attained it, seek no further, a proof that pleasure is the chief good. 96 Paley maintains that, when it has been pointed out that private happiness has been the motive of an act, "no further question can reasonably be asked." 97 Our citations from Hobbes and Bentham and Green reveal that these writers never think of giving reasons why a human should seek own good.

98 And various moralists, who do not make self-interest the one fundamental principle which should rule human conduct, are evidently loath to make of it a principle subordinate to some other. 99 Bishop Butler, who maintains that virtue consists in the pursuit of right and good as such, yet holds that: "When we sit down in a cool hour, we can neither justify to ourselves this nor any other pursuit till we are convinced that it will be for our happiness, or at least not contrary to it." 100 Clarke, who dwells upon the eternal and immutable obligations of morality "incumbent on humans from the very nature and reason of things themselves" teaches that it is not reasonable for humans to adhere to virtue if they receive no advantage from it.

101 The moral here seems to be that, whatever else a person ought to do, you ought to seek your own advantage-- real self-sacrifice cannot be your duty. 102 This conviction of the unreasonableness of self-sacrifice reveals itself in another form in the doctrine that morality cannot be made completely rational unless a reconciliation between prudence and benevolence can be found; 103

and in the laboured attempts to show that the good of the individual must actually coincide with that of the community.

104 It may be questioned whether the same conviction did not lurk in the back of the mind of that sternest of moralists, Kant, who denied that happiness ought to be sought at all, and yet found so irrational the divorce of virtue and happiness that he postulated a God to guarantee their union.

105 Thus, moralists of widely different schools agree in recognising that self-interest is a principle that should not be placed second to any other. 106 The confessed egoist only goes a step further in recognising it as a principle that has no rival. 107 And that people generally are inclined to regard egoism as not unnatural seems evinced by the fact that for apparently altruistic actions they are very apt to seek ulterior egoistic motives, while, if the action seems plainly egoistic, they seek no further.

108 Does, then, anything seem more natural than egoism? And, if natural, may it not be assumed to be proper and right?

109 (3) Finally, it may be urged that you who serves your own interests at all intelligently has, at least, a comprehensive aim, and does not live at random. 110 In so far, egoism appears to be rational in a sense dwelt on above; it harmonises and unifies the impulses and desires of the human.

THE ARGUMENT AGAINST EGOISM

111 What may be said against egoism?

112 (1) Enough has been said above to show that egoism is not inevitable, but that people actually are influenced by motives which cannot be regarded as egoistic. It is, hence, not necessary to dwell upon this point.

113 (2) As to the naturalness of egoism. Both the professional moralist and the person in the street may hesitate to admit that a human should neglect own interests, and may find it natural that you should cultivate them assiduously. 114 But it is only the exceptional person who maintains that you should have nothing else in view.

115 There are individuals so constituted that self-interest makes to them a peculiarly strong appeal. Others, more social by nature, may be misled by psychological theory to maintain that a person's chief and only end is one's own "satisfaction." 116 Still others, realising that both one's own interests and the interests of one's neighbour are natural and seemingly legitimate objects of regard, are perplexed as to the method of reconciling their apparently conflicting claims, and are betrayed into inconsistent utterances.

117 But it is too much to say that the professional moralist and the plain human normally regard pure egoism with favour and find it natural. 118 In spite of our cynical maxims and our inclination to seek for ulterior motives for apparently altruistic acts, we abhour the thorough-going egoist, and we are not inclined to look upon the phenomena, let us say, of the family life, as manifestations of self-seeking.

119 It is worthwhile to remark that, even if the approach to the Cyrenaic ideal were so common as not to seem wholly unnatural, that would not prove that it ought to be embraced; it is natural for people to err, but that does not make error our duty.

120 (3) By the moral conviction of organised humanity, as expressed in custom, law, and public opinion, egoism stands condemned. 121 Neither in savage life nor among civilised peoples, neither in the dawn of human history nor in its latest chapters, do we find these agencies encouraging every human to live exclusively for oneself. 122 Egoistic impulses are recognised, in that reward and punishment are allotted, but the end urged upon the attention of the individual is the common good, not your own particular good.

123 The social conscience has always demanded of the individual self- sacrifice, even to the extent of laying down your life, on occasion, for the public weal. 124 And the enlightened social conscience does not regard a person as truly moral whose outward conformity to moral laws rests solely upon a basis of egoistic calculation. 125 The very

existence of the family, the tribe, the state, is a protest against pure egoism. Were all people as egoistic as Aristippus seems to have professed to be, a stable community life of any sort would be impossible.

126 (4) The argument that egoism is rational at least in so far as it introduces consistency into actions and unifies and harmonises desires and impulses deserves little consideration.

127 Any comprehensive end will do the same, and many comprehensive ends may be very trivial. 128 One may make it the aim of one's life to remain slender, or may devote all one's energies to the amelioration of the social position of bald-headed men.

129 You who counsels deliberate egoism does not recommend it merely on the score that it leads to consistent action. You does it on the ground that the end itself appeals to you as one that ought to be selected and will be selected if a person is wise. 130 That the interest of the individual is in this sense a matter of obligation, is something to be proved, not assumed.

THE MORALIST'S INTEREST IN EGOISM

131 It has been worthwhile to treat at length of egoism because the doctrine takes on more or less subtle forms, 132 and its fundamental principle, self-interest, has a significance for various ethical schools which are not, or are not considered, egoistic.

133 People have been vastly puzzled by the moral claims of the principle of self-interest, both plain people and professional moralists.

134 That prudence is not the only fundamental virtue, most people would be ready enough to admit; but is it properly speaking, a virtue at all?

135 Ought I, for example, to try to make myself happy? Suppose I do not want to be happy, what is the source of the obligation?

136 Butler tells me that interest, one's own happiness, is a manifest obligation; 137 Bentham, a writer of a widely different school, informs me that "the constantly proper end of action on the part of any individual at the moment of action is your real greatest happiness from that moment to the

end of your life." 138 On the other hand, Hutcheson teaches me that I am under no obligation to be good to myself, although I am under obligation to be good to others: 139 "Actions which flow solely from self-love, and yet evidence no want of benevolence, having no hurtful effects upon others, seem perfectly indifferent in a moral sense." 140 Which means that intemperance is blameworthy only so far as it is against the public interest.

141 May I, should I, on occasion, sacrifice myself? Thoughtful people generally recognise self-sacrifice, not only as possible, but as actual, and believe it to be at times a duty. But the moralist gives forth here an uncertain sound.

142 Self-interest and benevolence have been left to fight out their quarrel in a court without a judge to decide upon their conflicting claims; 143 it has been declared impossible; it has been denied that it can ever be a duty; the kind of self-sacrifice in question has been regarded as significant.

144 You who has rejected as unworthy of serious consideration the naive egoism of an Aristippus or an Epicurus is not on that account done with egoism, by any means.

UTILITARIANISM

George Stuart Fullerton

WHAT IS UTILITARIANISM?

29 The division of things desirable into those desirable in themselves, and those desirable for the sake of something else, is two thousand years old. Those things which we recognise as desirable for the sake of something else, we call useful.

2 What we shall regard as useful depends in each case upon the nature of the end at which we aim.

3 If our aim is the attainment of pleasure, the preservation of life, the harmonious development of our faculties, or any other, we may term useful whatever makes for the realisation of that end.

4 Hence, we can, by stretching the application of the word, call utilitarian any ethical doctrine which sets an ultimate end to human endeavour and judges

actions as moral or the reverse, according to their tendency to realise that end, or to frustrate its realisation. 5 As the ends thus chosen may be very diverse, it is obvious that widely different forms of utilitarian doctrine may come into being.

6 It is, however, inconvenient to stretch the term, "utilitarianism" in this fashion. Certain forms of doctrine which, in its wider sense, it would include, have come to be known under names of their own; 7 and, besides, the especial type of utilitarianism advocated by Bentham and John Stuart Mill appears to have a claim upon the appellation which they set in circulation. 8 Common usage has thus limited the significance of the word, and we naturally think of the doctrine of these men when we hear it uttered. It is in this sense that I shall use it.

9 "The creed which accepts as the foundation of morals, Utility, or the Greatest Happiness Principle," writes Mill, "holds that actions are right in proportion as they tend to promote happiness, wrong as they tend to produce the reverse of happiness. 10 By happiness is intended pleasure, and the absence of pain; by unhappiness, pain and the privation of pleasure."

11 This means, he adds, "that pleasure, and freedom from pain, are the only things desirable as ends; 12 and that all desirable things ... are desirable either for the pleasure inherent in themselves, or as means to the promotion of pleasure and the prevention of pain."

13 The pleasure here intended is not the selfish pleasure of the individual. Utilitarianism is not Cyrenaicism. The goal of the utilitarian's endeavours is the general happiness, in which many individuals participate. 14 The moral rules which control and direct the strivings of the individual derive their authority from their tendency to serve this end.

BENTHAM'S DOCTRINE

15 Most uncompromising is the utilitarianism set forth in the writings of Mill's master, that most benevolent and philanthropic of people, Jeremy Bentham. He is

true to his principles and he makes no concessions.

16 He regards that as in the interest of the individual which tends to add to the sum total of own pleasures or to diminish the sum total of own pains. 17 And he understands in the same sense the interest of the community. That which serves that interest he sets down as "conformable to the principle of utility." 18 What is thus conformable he declares ought to be done, what is not conformable ought not to be done. 19 Right and wrong he distinguishes in the same manner. "When thus interpreted," he insists, "the words ‘ought’, and ‘right’ and ‘wrong’, and others of that stamp, have a meaning; when otherwise, they have none"

20 Of differences in quality between pleasures Bentham takes no account. In his curious and interesting chapter entitled "Value of a Lot of Pleasure or Pain, how to be Measured," he enumerates the circumstances which should determine the value of a pleasure or a pain. 21 They are as follows:

1. Its intensity. 2. Its duration. 3. Its certainty or uncertainty. 4. Its propinquity or remoteness. 5. Its fecundity. 6. Its purity. 7. Its extent.

22 The first four of these characteristics call for no comment. By the fecundity of a pleasure Bentham understands its likelihood of being followed by other pleasures; by its purity, the likelihood that it will not be followed by pains. 23 The characteristic "extent" marks off utilitarianism from egoism, for it has reference to the number of persons affected by the pleasure or the pain. 24 The greater the number, the higher the value in question. The greatest number of pleasures of the highest value, as free as possible from admixture with pains, is the goal of the endeavours of the utilitarian. 25 Naturally, when the interests of many persons are taken into account, the question of the principle according to which "lots" of pleasure are to be distributed becomes a pressing one.

26 Bentham decides it as follows: "Everybody to count for one, and nobody for more than one."

In other words, the distribution should be an impartial one.

27 At first sight, this account of the relative desirability of pleasures and undesirability of pains seems sensible enough. 28 Humans do desire pleasure, and they undoubtedly approve the preference given to pleasures more intense, enduring, certain, immediate, fruitful in further pleasures, free from painful consequences, and shared by many, 29 over those which have not these characteristics: "Intense, long, certain, speedy, fruitful, pure-- Such marks in ‘pleasures’ and in ‘pains’ endure. 30 Such pleasures seek, if ‘private’ be thy end: If it be ‘public’, wide let them ‘extend’. Such ‘pains’ avoid, whichever be thy view; If pains ‘must’ come, let them ‘extend’ to few.

31 These mnemonic lines may well strike many readers as embodying a very good working rule of common-sense morality; as paying a proper regard to prudence and to benevolence as well. 32 But there are passages in Bentham calculated to shake such acquiescence. He writes:

"Now pleasure is in ‘itself’ a good; nay, even setting aside immunity from pain, the only good: 33 pain is in itself an evil, and, indeed without exception, the only evil; or else the words good and evil have no meaning. And this is alike true of every sort of pain, and of every sort of pleasure."

34 "Let a human's motive be ill-will; call it even malice, envy, cruelty; it is still a kind of pleasure that is your motive: the pleasure you takes at the thought of the pain which you sees, or expects to see, your adversary undergo. 35 Now even this wretched pleasure, taken by itself, is good: it may be faint; it may be short; it must at any rate be impure: yet, while it lasts, and before any bad consequences arrive, it is as good as any other that is not more intense."

36 Reflection upon such passages may well lead a person to ask yourself: (1) Is it, after all, the consensus of human opinion that pleasure is the only good and pain the only evil?

37 (2) Are some pleasures actually regarded as more desirable than others, solely through the application of the standard given above? 38 (3) Can the pleasure of a

malignant act properly be called ‘morally’ good at all?

THE DOCTRINE OF JOHN STUART MILL

39 Bentham's purely quantitative estimate of the value of pleasures has aroused in many minds the feeling that he puts morality upon a low level. 40 Mill attempts an improvement upon his doctrine. "It is quite compatible with the principle of utility," he writes, "to recognise the fact that some ‘kinds’ of pleasure are more desirable and more valuable than others. 41 It would be absurd that, while in estimating all other things quality is considered as well as quantity, the estimation of pleasures should be supposed to depend on quantity alone."

42 Thus, Mill distinguishes between higher pleasures and lower, and he gives a criterion for distinguishing the former from the latter: 43 "Of two pleasures, if there be one to which all or almost all who have experience of both give a decided preference, irrespective of any feeling of moral obligation to prefer it, that is the more desirable pleasure." 44 He refers the whole matter to the judgment of the "competent;" and, in accordance with that judgment, decides that: "It is better to be a human being dissatisfied than a pig satisfied; better to be Socrates dissatisfied than a fool satisfied. 45 And if the fool, or the pig, are of a different opinion, it is because they only know their own side of the question. The other party to the comparison knows both sides."

46 That some pleasures may properly be called higher than others moralists of many schools will be ready to admit, but to Mill's criterion of what proves them to be higher they may demur. 47 Of the delight that a fool takes in own folly a wise person may be as incapable as a fool is of the enjoyment of wisdom. 48 With mature years humans cease to be competent judges of the pleasures of childhood. To each nature, its appropriate choice of pleasures. 49 That human beings at a given level of intellectual and emotional development actually desire certain things rather than certain others does not prove that those things are desirable in any general

sense. 50 It does not prove that humans ‘ought’ to desire them. For that proof we must look in some other direction; 51 and a critical scrutiny of the pleasures which moralists ancient and modern have generally accepted as "higher" reveals a common characteristic which explains their being thus classed together much better than the appeal to Mill's criterion.

52 As has often been pointed out, Mill, while defending Utilitarianism, really passes beyond it, and his doctrine tends to merge in one widely different from that of Bentham. 53 For the "Greatest Happiness Principle" he virtually substitutes the "Highest Happiness Principle." 54 But he scarcely realises the significance of his substitution, and he gives an inadequate account of the significance of higher and lower.

THE ARGUMENT FOR UTILITARIANISM

55 We have seen above that Bentham maintains that such words as "ought," "right" and "wrong" have no meaning unless interpreted after the fashion of the utilitarian. 56 He admits that his "principle of utility" is not susceptible of direct proof, but claims that such a proof is needless.

57 Accepting it as a fact revealed by observation that the actual end of action on the part of every individual is your own happiness as you conceives it, 58 He appears to have passed on without question to the further positions, that the ‘proper’ end of action of the individual is your own greatest happiness, and, yet, your ‘proper’ end of action, as a member of a community, is the greatest happiness of the community.

59 The second of these positions cannot be deduced from the first, nor can the third be inferred from the other two. 60 Bentham appears to have taken the "principle of utility" for granted; but one coming after him and scrutinising his work can scarcely avoid raising the question of the justice of his assumption. 61 That happiness is the only thing desirable, and that the happiness of all should be the object aimed at by each, are

propositions which seem to stand in need of proof.

62 Such proof Mill attempted to furnish. He argues as follows:

"The only proof capable of being given that an object is visible, is that people actually see it. 63 The only proof that a sound is audible, is that people hear it; and so of the other sources of our experience. 64 In like manner, I apprehend, the sole evidence it is possible to produce that anything is desirable, is that people do actually desire it. 65 If the end which the utilitarian doctrine proposes to itself were not, in theory and practice, acknowledged to be an end, nothing could ever convince any person that it was so. 66 No reason can be given why the general happiness is desirable, except that each person, so far as you believes it to be attainable, desires your own happiness. 67 This, however, being a fact, we have not only all the proof the case admits of, but all which it is possible to require, 68 that happiness is a good: that each person's happiness is a good to that person, and the general happiness, therefore, a good to the aggregate of all persons. 69 Happiness has made out its title as 'one' of the ends of conduct, and, consequently one of the ends of morality."

70 That happiness is the 'only ultimate' end, 71 Mill regards as established by the argument that other things, for example, virtue, though they come to be valued for themselves, do so only through the fact that, originally valued as means to the attainment of happiness, 72 they become, through association, valued even out of this relation, and thus treated as a part of happiness.

73 The defects in Mill's argument have made themselves apparent, not merely to the opponents of utilitarianism, but even to its advocates. 74 We cannot say that things are desirable in any moral sense, simply because they are desired. 75 In a loose sense of the word, everything that is or has been desired by anyone is desirable-- it evidently can be desired. 76 When we say no more than this, we say nothing. But when we call a course of action desirable we mean more than this; and we are compelled to admit that a multitude of desirable things are

not generally desired. This is the burden of the lament of every reformer.

77 Furthermore, it does not appear to follow that, because your own happiness is a good to each member of a community, the happiness of all must likewise be a good to each severally. 78 A community in which every person studies own interest may conceivably be a community in which no person regards it as desirable to consult the public weal. 79 That the general happiness is desirable, in a loose sense of the word, is palpable fact; it is obvious that it can be desired, for some persons do actually desire it. 80 But that it is desirable in any sense cannot be inferred from the fact that all humans desire something else, namely, their own individual happiness.

81 We must, then, look further for the proof of the utilitarian principle. Henry Sidgwick, that admirable scholar and most judicial mind, falls back upon certain intuitions which, he conceives, present themselves as ultimate and unassailable. 82 He writes: "Let us reflect upon the clearest and most certain of our moral intuitions. 83 I find that I undoubtedly seem to perceive, as clearly and certainly as I see any axiom in Arithmetic or Geometry, that it is 'right' and 'reasonable' for me to treat others as I should think that I myself ought to be treated under similar conditions, and to do what I believe to be ultimately conducive to universal Good or Happiness."

84 And again: "The propositions, 'I ought not to prefer a present lesser good to a future greater good,' and 'I ought not to prefer my own lesser good to the greater good of another,' do present themselves as self-evident; 85 as much (e. g.) as the mathematical axiom that 'if equals be added to equals the wholes are equal.'"

86 Whether these intuitions will be accepted as furnishing an indisputably sound basis for utilitarianism will depend upon one's attitude toward intuitions in general and the list of intuitions one is inclined to accept. 87 It is significant that Sidgwick does not accept as self-evident such subordinate propositions as, "I ought to speak the truth." He

regards their authority as derived from the Greatest Happiness Principle.

THE DISTRIBUTION OF HAPPINESS

88 The person who accepts the Greatest Happiness Principle as the sole basis of own ethical doctrine is faced with the problem of its application in detail. 89 The "greatest good of the greatest number" is a vague expression. What is properly understood by "the greatest number"? and upon what principle shall "lots" of happiness be assigned to each? 90 Very puzzling questions arise when we approach the problem of the distribution of pleasures and the calculation of their values. Let us look at them.

I. Who should be considered in the Distribution?

91 (1) Shall we aim directly at the happiness of all humans now living? Or shall we content ourselves with a smaller number? 92 Certainly, with increasing intelligence and broadening sympathies, humans tend toward a more embracing benevolence.

93 (2) Shall we admit to the circle generations yet unborn? And, if so, how far into the future should we look?

94 (3) Should we make a deliberate attempt to increase the number of those who may share the common fund of happiness, by striving for an increase in the number of births? 95 This end has been consciously sought for divers reasons. The ancestor-worship of China has made the Chinaman eagerly desirous of leaving behind them those who would devote themselves to them after they have departed this life. 96 Nations ancient and modern have endeavoured to strengthen the state by providing for an increase in its population. Shall a similar end be pursued for the ethical purpose of widening the circle of those who shall live and be happy? 97 Most ethical teachers do not appear to have regarded this as a corollary to the doctrine of benevolence.

98 (4) Shall we enlarge the circle so as to include the lower animals? As Bentham expressed it: The question is not, "Can they

‘reason’? Nor, Can they ‘talk’? but, Can they ‘suffer’?"

99 (II.) How should the "lots" of happiness be measured?

(1) Should everybody count as one, and nobody as more than one? in other words, should strict impartiality be aimed at?

100 Dr. Westermarck's striking reply to the argument for impartiality as urged by Professor Sidgwick has already been quoted. Let the reader glance at it again.

101 It must be confessed that to put one's parents, one's children, one's neighbours, strangers, foreigners, the brutes, all upon the same level, is contrary to the moral judgment of savage and civilised alike. 102 It would seem contrary to the sentiments which lie at the root of the family, the community, and the state. 103 Nor have we reason to look forward to any future state of human society in which such lesser groups within the broad circle of humanity will be done away with, though they tend to become less exclusive in their demands upon human sympathy.

104 (2) Suppose that the greatest sum of happiness on the whole could be best attained by an unequal distribution-- by making a limited number very happy at the expense of the rest. Would this be justifiable? 105 It would be in harmony with the Greatest Happiness Principle, though not with the principle of the greatest happiness equally shared.

106 (III.) The question of the distribution of happiness in the life of the individual is not one to be ignored. 107 If we are concerned only with the quantity of happiness, may we not take as the ethical precept "a short life and a merry one"-- provided the brief span of years be merry enough, and there be no objection to the choice on the score of harm to others?

108 This problem is closely analogous to that of the distribution of pleasures to those who compose the "greatest number" taken into account.

109 There we were concerned with the shares allotted to individuals; here we are concerned with the shares assigned to the different parts of a single life. 110 In the attempt to solve the problem, Bentham's criteria of intensity,

certainty, purity, etc., might naturally be appealed to.

THE CALCULUS OF PLEASURES

111 Nor are the problems which meet us less perplexing when we pass from questions of the distribution of pleasures to that of the calculus of pleasures. 112 How are delights and miseries to be weighed, and reasonably balanced?

113 (1) Humans desire pleasure, and they desire to avoid pain. The two seem to be opposed. But humans constantly accept pleasures which entail some suffering, and they avoid pains even at the expense of some pleasure.

114 Are, however, pleasures and pains strictly commensurable? How much admixture of pain is called for to reduce the value of a pleasure to zero? 115 And how much pleasure, added to a pain, will make the whole emotional state predominantly a pleasurable one? 116 A disagreeable taste and an agreeable odour may be experienced together, but they cannot be treated as an algebraic sum. 117 If we do so treat them, we seem to fall back upon the assumption that the mere fact that the heterogeneous complex is accepted or rejected is evidence that its ingredients have been measured and compared. This is an ungrounded assumption.

118 (2) Undoubtedly humans prefer intense pleasures to mild ones, and those long-continued to those which are fleeting. But what degree of intensity will overbalance what period of duration? 119 Here, again, we appear to be without a unit of measure, both in the case of pleasures and of pains.

120 (3) Obviously, you who would distribute pleasures with impartiality must take into consideration the natures and capacities of the recipients. 121 All are not susceptible of pleasure in the same degree, nor are all capable of enjoying the same pleasures. 122 It is small kindness to a cat to offer it hay; nor will the miser thank us for the opportunity to enjoy the pleasures of liberality. 123 The gift which arouses deep emotion in one person, will leave

another cold. 124 The diversity of natures would make the calculus of pleasures, in any accurate sense of the expression, a most difficult problem, even if such a calculus were admissible in the case of a single individual.

III. THE DIFFICULTIES OF OTHER SCHOOLS

125 It would be unjust to the utilitarian not to point out that those who advocate other doctrines must find some way of coping with the difficulties which embarrass you.

126 Thus, the egoist may ignore duties to others, but you cannot free yourself from the problems of the distribution of happiness in your own life and of the calculus of pleasures. 127 The intuitionist, who, among other precepts, accepts as ultimate those enjoining upon you justice and benevolence, may well ask yourself toward whom these virtues are to be exercised, and whether the claims of all who belong to the class in question are identical in kind and degree. 128 If they are not, you must find some rule for estimating their relative importance. 129 You who makes it your moral ideal to Follow Nature, to Strive for Perfection, or to realise your Capacities, must determine in detail what conduct, self-regarding and other regarding, the acceptance of such aims entails. 130 Only the unreflective can regard the utilitarian as having a monopoly of the difficulties which face the moralist. 131 The vague general statement that we should strive to render others happy-- a duty recognised by people of very different schools-- never frees us from the perplexities which arise when it is asked: What others? With what degree of impartiality? When? By what means? 132 But that such questions can be approached by a path more satisfactory than that followed by the utilitarian, there is good reason to maintain.

SUMMARY OF ARGUMENTS FOR UTILITARIANISM

133 It is worthwhile to summarise what may be said for utilitarianism, and what may be

said against it. 134 It may be argued in its favour:

(1) That it appears to set as the aim of human endeavour, an intelligible end, and a fairly definite one. 135 Everyone has some notion of what happiness means, and is not without ideas touching the way to seek your own happiness, or to contribute to that of others.

136 (2) The end is one actually desired by humans at all stages of intellectual and moral development. 137 Humans are impelled to seek their own happiness, and there are few who do not feel impelled to take into consideration, to some degree, at least, the happiness of some others.

138 (3) The general happiness is not merely desired by some people, but it is felt to be ‘desirable’; that is, it is an end not out of harmony with the moral judgments of humankind. 139 It makes its appeal to the social nature of human; it seems to furnish a basis for the exercise of benevolence and justice.

140 (4) The utilitarian's clear recognition of the general happiness as the ultimate end of human endeavour, 141 and your insistence that institutions, laws and moral maxims must be judged solely by their fitness to serve as means to that end, have made you an energetic apostle of reform, and intolerant of old and passively accepted abuses. 142 Your insistence upon the principle of impartiality in the distribution of happiness has made you a champion of the inarticulate and the oppressed. 143 Whatever one may think of your abstract principles, the general character of the specific measures you have advocated must meet with the approval of enlightened moralists of very different schools.

ARGUMENTS AGAINST UTILITARIANISM

144 Against utilitarianism as an ethical theory various objections have been brought or may be brought.

145 (1) Objection may be taken to the utilitarian assumption that the only ultimate object of desire is pleasure or happiness.

146 It was pointed out forcibly by Bishop Butler in the eighteenth century that humans desire many things besides pleasure. 147 Human's desires are an outcome of own nature, and that results in "particular movements towards particular external objects"--honour, power, the harm or good of another.

148 To be sure, "no one can act but from a desire, or choice, or preference of one's own," but this is no evidence that what you seeks in acting is always pleasure.

149 Particular passions or appetites are, Butler ingeniously argues, "necessarily presupposed by the very idea of an interested pursuit; since the very idea of interest or happiness consists in this, that an appetite or affection enjoys its object."

150 Here we find our attention called to a very important truth, the significance of which there is danger of our overlooking. 151 Pleasure or happiness is not something that can be parcelled up and handed about independently of the nature of the recipient. It is not everyone who can desire everything and feel pleasure in its attainment. 152 That the objects of desire and will are many, and that the strivings of conscious creatures have in view many ends, and vary according to the impulsive and instinctive endowments of the creatures in question, has been well brought out in the admirable studies of instinct which we now have at our disposal. 153 The most ardent devotee of pleasure must recognise, that only certain pleasures are open to you; that, such as they are, they are a revelation of your nature and capacities; 154 that pleasures, if sought at all, cannot be secured directly, but only as the result of a successful striving for objects not pleasures, which bring pleasure as their accompaniment. 155 You who would have the pleasure of eating must desire food; and neither food, nor the eating of food, can be regarded as, 'per se', pleasure. 156 The pleasure of the brooding hen is beyond the reach of human, who, however pleasure-loving, cannot desire to sit upon eggs, and so must forego the pleasure which, in the case of the bird, crowns that exercise.

157 Such considerations as the above have led some moralists to define, as the end of desire, not pleasure, but self-satisfaction. 158 Every desire, it is pointed out, strives to satisfy itself in the attainment of its appropriate object. With the attainment of the object, the desire has produced its proper fruit and ceases to be. 159 It is admitted that the satisfaction of desire is accompanied by pleasure, but it is denied that the pleasure may be properly called the object of the desire, or regarded as calling it into being: 160 "The appetite of hunger must precede and condition the pleasure which consists in its satisfaction. It cannot therefore have that pleasure for its exciting object."

161 At the same time it is conceded that the idea of a pleasure to be attained may "reinforce" the desire for an object, may "intensify the putting forth of energy," and may tend "to sustain and prolong any mode of action."

162 The utilitarian is not wholly helpless in the face of such objections. You may argue that, if it is difficult to see how a pleasure which is the result of a desire may cause the desire, it is equally difficult to see how it may prolong, reinforce or intensify it. 163 And you may maintain that, although the pursuit of pleasure, in certain forms, is calculated to defeat its own aim and is undoubtedly unhealthy, this need not be the case if one's aim be the true utilitarian one-- the happiness of all. 164 The direct attack upon your Greatest Happiness Principle which consists in the objection that, if pleasure is the only object of desire, a sum of pleasures, as not being a pleasure, cannot be desired, you can put aside with the remark that no far-reaching and comprehensive aim can be realised at one stroke. 165 I can desire a long and useful life; this cannot be had all at once. I can desire a long life full of pleasures; this cannot be enjoyed all at once either. But each can certainly be the object of desire.

166 But, when all is said, it remains true that the contention of those, who distinguish sharply between the satisfaction of desire and the attainment of pleasure, is of no little importance. 167 It calls our attention to the following truths:

(a) We have definite instincts and impulses which tend to satisfy themselves with their appropriate objects.

168 (b) At their first exercise, our aim could not have been the pleasure resulting from their satisfaction, for that could not have been foreseen.

169 (c) Although, after experience, the attainment of pleasure may come to be our aim in the exercise of many activities, and may often, as far as we can see, be a natural and not unwholesome aim; 170 it is by no means evident that, even when we are experienced and reflective, the exercise of our faculties comes to be regarded 'only' as a means to the attainment of pleasure.

171 (d) The hedonist, in maintaining that pleasure is the only ultimate object of desire, appears, thus, to be committed to the doctrine that the satisfaction of all other desires is subordinated to the satisfaction of the desire for pleasure. 172 For this position you can furnish no adequate proof. Self-evident the doctrine is not.

173 (e) It is incumbent upon you, as a moralist, to prove, not merely that all other satisfactions are, but also that they 'ought' to be subordinated to the satisfaction of the desire for pleasure. This you appears to assume without proof.

174 (2) We have seen above that the fundamental principle of utilitarian hedonism, as against egoistic, namely, the making the Greatest Happiness of the Greatest Number the object of the endeavours of each individual, has not been satisfactorily established by leading utilitarians. 175 Bentham assumes the principle; Mill advances a doubtful argument; Sidgwick falls back upon intuitions which all will not admit to be indubitable. 176 To his assertion: "Reason shows me that if my happiness is desirable and a good, the equal happiness of any other person must be equally desirable," the doubter may reply: Desirable to whom? to some other or to me?

177 (3) Finally, it may be objected that the consistent utilitarian, in making pleasure, abstractly taken, the only ultimate good, and in regarding as the sole criterion of right actions their tendency to produce pleasure, really tears

pleasure out of its moral setting altogether.

178 Thus Bentham's contention that the pleasure a human may derive from the exercise of malice or cruelty is, "taken by itself," good-- 179 while it lasts, and before any bad consequences have set in, as good as any other that is not more intense-- derives what plausibility it has, from an ambiguity in the word "good." 180 Pleasure, taken by itself, is undoubtedly pleasure, whatever be its source. 181 To affirm this is mere tautology. And, if we chose to make "good" but a synonym for pleasure, we remain in the same tautology when we affirm that every pleasure is a good. 182 But Bentham assumed that good in this sense and moral good are the same thing.

183 His assumption is not borne out by the moral judgments of humankind. 184 Even a cursory view of those moral judgments as revealed in customs, laws and public opinion makes it evident that, under certain circumstances, pleasure is regarded as, from a moral standpoint, a good, and, under other circumstances, an evil. 185 Torn out of its setting, it is simply pleasure, a psychological phenomenon like any other, with no ethical significance.

186 Take the case of the pleasure enjoyed by the malignant human. It may be intense, if you be peculiarly susceptible to such pleasure. 187 The pain suffered by your victim may conceivably be less intense. Both may die before the "bad consequences," that is to say, other pains, arrive. 188 There may be no spectators. Is, in such a case, the pleasure one to be called a "good"? 189 Can it be approved No reflective moralist would maintain that it can. Which means that the moralists, in all ages, have meant by "good" something more than pleasure, taken abstractly, and that Bentham's assumption may be regarded as an aberration.

TRANSFIGURED UTILITARIANISM

190 It is possible to hold to a utilitarianism more circumspect and less startling than Bentham's. It is possible, while maintaining that pleasure is the only thing that an experienced and reasonable being can regard as ultimately

desirable, 191 to maintain at the same time that it is rash for any human to attempt to seek own happiness, or to strive to promote the general happiness, without taking into very careful consideration the instincts and impulses of human and the nature of the social organisation which has resulted from human's being what you are. 192 One may argue that the experience of the race is, as a rule, a safer guide than the independent judgment of the individual; 193 and that, in the secular endeavour to compass the general happiness, it has discovered the paths to that goal which may most successfully be followed. 194 Thus, one may distrust Utopian schemes, recognising the significance of custom, law, traditional moral maxims, and public opinion, and yet remain a utilitarian.

195 But you who does this must still answer the preceding objections. You must prove: (1) That pleasure is the only thing ultimately desirable; (2) that each is under obligation to promote the pleasure of all; 196 (3) that its mere conduciveness to the production of a preponderance of pleasure makes an action right, even though the pleasure be a malicious one, as in the illustration above given.

197 Still, your doctrine has become less startling, and you have moved in the direction of a greater harmony with the moral judgments of humans generally.

198 The conduct you recommends need not, as a rule, differ greatly from that recognised as right by moralists of quite different schools.

199 Such a utilitarian may easily pass over to a form of doctrine which is not utilitarian at all. 200 Thus, Sidgwick asks whether there is a measurable quality of feeling expressed by the word "pleasure," which is independent of its relation to volition, and strictly undefinable from its simplicity-- 201 "like the quality of feeling expressed by 'sweet,' of which also we are conscious in varying degrees of intensity;" 202 and he answers: "For my own part, when the term (pleasure) is used in the more extended sense which I have adopted, to include the most refined and subtle intellectual and emotional gratifications, 203 no

less than the coarser and more definite sensual enjoyments, I can find no common quality in the feelings so designated except some relation to desire or volition."

204 When we seek, then, to "give pleasure," are we doing nothing else than giving recognition to the desire and will of our neighbour? 205 What has become of the Greatest Happiness Principle? Has it not dissolved into the doctrine of the Real social-will?

NATURE
George Stuart Fullerton

HUMAN NATURE AS ACCEPTED STANDARD

30 The three doctrines, that the norm of moral action is to follow Nature, that it is to aim at the attainment of perfection, and that it is the realisation of one's capabilities, have much in common. 2 Early in the history of the Ethics we find the moralist preaching that it is the duty of human to follow Nature, and branding vice as unnatural and, hence, to be abhorred.

3 The word "nature," thus used, has had a fluctuating meaning. Sometimes the thought has been predominantly of human nature, and sometimes the appeal has been to Nature in a wider sense.

4 Aristotle, who finds the "good" of human in happiness or "well-being," points out that this is something relative to human's nature. 5 The well- being of a human he conceives as, in large part, "well-doing," and well- doing he defines as performing the proper functions of a human.

6 If we ask him what is proper or natural to human, he refers us to what human, when fully developed, becomes: 7 "What every being is in its completed state, that certainly is the nature of that thing, whether it be a human, a house, or a horse." 8 He conceives human's nature, thus, as that which it is in human to become. Toward this end human strives; and it is this which furnishes you with the law of your action.

9 But, it may be asked, how shall this end be defined in detail? Individual humans, who arrive at mature years, are by no means

alike. Some we approve; some we disapprove.

10 We evidently appeal to a standard by which the individual is judged. The appeal to the nature of human helps us little unless we can agree upon what we may accept as a just revelation of that nature-- 11 a pattern of some sort, divergence from which may be called unnatural, and is to be reprobated.

12 Neither Aristotle, nor those who, after him, took human nature as the moral norm, were without some conception of such a pattern. 13 They kept in view certain things that humans may become rather than certain others. They accepted as their standard a type of human nature which tends, on the whole, to realise itself more and more in the course of development of human communities. 14 But as different human societies differ more or less in the characteristics which they tend to transmit to their members, in the kind of human whom they tend to form, we find the ideal of human nature, with which we are presented, somewhat vague and fluctuating. 15 Different traits are dwelt upon by different moralists. Still, the appeals to human nature have a good deal in common; upon human's rational and social qualities especial stress is apt to be laid.

HUMAN NATURE AND THE LAW OF NATURE

16 "Every nature," said Marcus Aurelius, "is contented with itself when it goes on its way well; 17 and a rational nature goes on its way well, when in its thoughts it assents to nothing false or uncertain, and when it directs its movements to social acts only, 18 and when it confines its desires and aversions to the things which are in its power, and when it is satisfied with everything that is assigned to it by the common Nature."

19 In the last clause the Stoic turns from the contemplation of human's nature, taken by itself, and dwells upon the nature of the universe, which you conceives to be controlled by reason. 20 You thus gains an added argument for the obligations laid upon human by your own nature.

21 He writes: "Every instrument, tool, vessel, if it does that for which it has been made, is well, and yet you who made it is not there. 22 But in the things which are held together by Nature there is within and there abides in them the power which made them; 23 wherefore the more is it fit to reverence this power, and to think that, if thou dost live and act according to its will, everything in thee is in conformity to intelligence."

24 The law of human's nature is, thus, regarded as a part of the law of Nature-- "We are all working together to one end, some with knowledge and design, and others without knowing what they do." 25 And, this being the case, human may take pattern, when you are inclined to fall below the standard of duty appropriate to you, by considering humbler creatures: 26 "Dost thou not see the little plants, the little birds, the ants, the spiders, the bees working together to put in order their several parts of the universe? 27 And art thou unwilling to do the work of a human being? And dost thou not make haste to do that which is according to thy nature?" 28 The delinquent is, hence, judged guilty, not merely of derogation from own high estate, but also of impiety.

VAGUENESS OF THE LAW OF NATURE

29 The question of the influence of religious belief upon a theory of morals I shall discuss elsewhere. Here it is only necessary to point out that, if there is vagueness in the appeal to human nature, it can scarcely be dissipated satisfactorily by simply turning to Nature in a broader sense. 30 Shall we, when in doubt as to human behaviour, copy that of the brutes? 31 The industry of some humble creatures it seems edifying to dwell upon; but from the fact that bees are stung to death by their sisters in the hive, or that the spider is given to devouring her mate, we can hardly draw a moral lesson for human.

32 The appeal to a Law of Nature so often made in the history of ethical speculation has furnished but a vague and elusive norm. 33 You who makes it is apt to fall back upon the moral intuitions

with which you are furnished, and to pack a greater or less number of them into your notion of Natural Law.

34 In Cicero, Nature becomes fairly garrulous to human on all matters of deportment: "Let us follow Nature, and refrain from whatever lacks the approval of eye and ear. 35 Let attitude, gait, mode of sitting, posture at table, countenance, eyes, movement of the hands, preserve the becomingness of which I speak."

THE APPEAL TO NATURE AND INTUITIONISM

36 The moralists who urge us to follow Nature, whether human nature or Nature in a wider sense, we may, hence, regard as intuitionists of a sort. 37 Those who emphasised human nature evidently depend upon their moral intuitions to give them information as to its characteristics. 38 It is intuition that paints for them their pattern. They do not take human as they actually find you; they call for the suppression of some traits, and the exaggeration of others.

39 Nor are those who appeal to Nature in a wider sense less guided by moral intuitions. The appeal is never made without restrictions and limitations. 40 No one dreams that the bird, the ant, the spider, the bee, can be regarded as satisfactory teachers of morals to human beings. 41 Each may be occupied in putting in order its corner of the universe; but the order attained is not a human order, and there is in it much that is revolting to the moral judgments of humankind. 42 Human must have a standard of your own. You listens to Nature only when She tells you what you already approves.

43 As a form of intuitionism the doctrine of following.. Nature may be criticised in much the same way as other forms. One great merit it has. It calls attention to the fact that Ethics is a discipline which has no significance abstracted from the nature of human. 44 It appears absurd to say that human ought to do what it is not in human, under any conceivable circumstances, to do. 45 And, like other forms of intuitionism, it has the merit of avoiding that short-

circuiting which may easily prove seductive to the egoist or the utilitarian. 46 You who accepts as your end either your own happiness or that of humans generally may easily be induced to take short cuts to that end, and pay little attention to moral maxims as such.

47 You may treat lightly that great system of rules and observances by which humans are guided in their relations with one another, and which prevent human societies from relapsing into a chaos.

48 On the other hand, the follower of Nature, like other intuitionists, may easily be thrown into perplexity by the fact that what seems to you natural, and, hence, right, may not be approved by other people. 49 You cannot prove that you are right and they are wrong. You appears condemned to take refuge in subjective conviction, that is, in mere dogmatism.

II. PERFECTION

PERFECTION AND TYPE

50 When we speak of a thing as more or less perfect, we commonly mean that it is more or less perfect in its kind. 51 A good saw makes a poor razor; a good chair, a more than indifferent bed. A bee crushed by a blow, a bird with a broken wing, we regard as imperfect. 52 But it scarcely occurs to us to ask ourselves whether the bee is more or less perfect than the bird, or the bird than the spider. 53 Swift's Houyhnhnms at their best could not be either perfect horses or perfect humans. They were creatures with a perfection of their own, and one appropriate to their hybrid nature.

54 To every creature its own perfection. This principle humans seem to assume tacitly in their judgments. 55 They set up a standard for each kind, and they conceive the individual to attain or to fall short, according to the degree of its approach to, or of its divergence from, the allotted standard.

56 If we take perfection in this sense-- and we usually have no

other sense in mind in our judgments of perfection-- the doctrine that it is the whole duty of human to strive to attain to perfection is none other than the doctrine that it is your duty to follow Nature, your proper nature as human. 57 And any difficulties which may legitimately be urged upon the attention of the moralist who recommends the following of Nature may with equal justice be urged upon the attention of you who exhorts us to aim at perfection.

58 Thus, if it is doubtful just what Nature demands of us, it seems no less doubtful what obligations are laid upon us when we make perfection our goal. 59 That goal cannot mean for each human simply the developing to the utmost of all the capacities which you possesses. 60 There are people rich in the possibilities of sloth, of indifference to future good, of egoism, even of malignant feeling. Nor does the average person furnish the pattern of perfection. 61 The perfectionist does not regard the average person as the embodiment of own ideal. You seeks to better you.

62 That, in striving to attain perfection, a human should remain a human, with essentially human characteristics, seems evident. But what sort of a human you should be is not as clear. 63 Until we are in a position to give some reasoned account of what we mean by perfection as an ideal, and to show that it is a desirable goal for human, we appear to be setting up but a vague end for human endeavour, and to be assuming intuitively that it is a desirable end.

MORE AND LESS PERFECT TYPES

64 So much for perfection as synonymous with the ideal human nature of which ancient and modern moralists have treated. It appears, however, possible to use the word "perfection" in a somewhat different sense.

65 Human is not merely human; you are a living being, and there are living beings of many orders. 66 The plants, the simpler forms of animal life, the brutes which we recognise as standing nearer to us, and human may, from this point of view, be referred to the one series.

67 Some members of this series we characterise as lower, and others we speak of as higher in the scale. Now, such designations as higher and lower cannot be applied indiscriminately. 68 There is little sense in the assertion that a bit of string is higher than a straight line, or a hat than a handkerchief. Some significant basis of comparison must be present. 69 Things must be recognised as approximating to or diverging from an accepted standard in varying degrees. Such a basis of comparison is present when some objects possess the same qualities in a more marked degree than do others. 70 But this is not the only possible basis of comparison. We may assume that the possession of certain qualities marks a creature as higher, and that the creature which has them not, or has them imperfectly developed, thereby stamps itself as being of a lower order.

71 Something like this appears to determine our judgments when we assign to various creatures their place in the scale of living beings. 72 We do not mean that the higher possess to a greater degree all the capacities possessed by the lower. Many things which the plant does human cannot do at all; 73 and, among the animals, those which we recognise as higher may be lacking in many capacities present in a marked degree in the lower. 74 In ranking one living creature as higher, and, thus, as more perfect, than another, we assume that the "nature" of the one, with its various capacities and lacks of capacity, is, on the whole, of more ‘worth’ than the "nature" of another.

75 It might be maintained that, in your estimate of the worth of different kinds of beings human is influenced by your partiality for the distinctively human, rating creatures as lower or higher in proportion to their divergence from or approximation to your own type. 76 Undoubtedly this plays a part in people's judgments. We are partial to ourselves. And yet judgments of perfection and imperfection cannot wholly be explained on this principle.

77 "I think we must admit without proof," writes Professor Janet, a brilliant apostle of the doctrine of perfection, 78 "that things are good, even independently of the

pleasure which they give us, in themselves and by themselves, because of their intrinsic excellence.

79 If anyone were to demand that I should prove that thought is worth more than digestion, a tree more than a heap of stones, liberty than slavery, maternal love than luxury, I could only reply by asking you to demonstrate that the whole is greater than one of its parts. 80 No sensible person denies that, in passing from the mineral kingdom to the vegetable kingdom, from this to the animal kingdom, from the animal to human, from the savage to the enlightened citizen of a free country, Nature has made a continual advance; that is to say, at each step has gained in excellence and perfection."

81 One is naturally impelled to ask from what point of view things so disparate as the mineral, the plant, the brute, human, thought and digestion, liberty and slavery, can be compared with one another at all, and referred to any sort of a series. 82 What is, in its essence, this excellence or perfection of which we have more shining evidence as we go up in the scale? 83 Janet identifies it with intensity of being, with activity. The greater the activity, the greater the perfection.

84 To the identification of perfection and activity we may hesitate to assent. It does not seem clear that there is greater activity manifested in a snail than in a burning house, in maternal love than in furious hate, in quiet thought than in passion. 85 Yet it seems significant that judgments of worth do not appear out of place in comparing such things.

PERFECTIONISM AND INTUITIONISM

86 Taking into consideration all that is said above, it seems not unreasonable to conclude:

(1) That in speaking of the perfection of any creature we very often judge it only by the standard set by its own type. We regard it as a good specimen of its kind.

87 (2) But when we use perfection in a wider sense, we judge different types after the standard furnished by the distinctively human.

88 (3) And we take as our standard of the human the "pattern" human held in view by those who urge us to follow Nature.

89 But why should this pattern human be assumed to be better or worthier than a human of a different sort? 90 You who finds in you a greater exhibition of activity may with equal justice address to yourself the question: Why is activity, in itself, of value? 91 The one question, like the other, looks for its answer in the dictum of some intuition. What may be said for, and what against, intuitions, we have already considered.

III. SELF-REALISATION

THE SELF-REALISATION DOCTRINE

92 The ethical school which makes the realisation of the capacities of the self the aim of moral action has for a generation, especially in England and America, had the support of many acute and scholarly minds. 93 The doctrine, often spoken of as the Neo-Kantian or the Neo-Hegelian, may be said to be influenced by Kant, so far as concerns metaphysical theory, 94 but its ethical character is more properly Hegelian and suggests in many particulars that great German philosopher's "Philosophy of Right."

95 We may conveniently take as the protagonist of the school the Oxford scholar, Thomas Hill Green, whose "Prolegomena to Ethics" has had, directly and indirectly, a powerful influence upon the minds of the people of our generation.

96 We find the doctrine of self-realisation, as set forth by Green, to be as follows:

(1) In all desire some object is presented to the mind as not yet real, and there is a striving to make it real, and thus to satisfy, or extinguish, the desire.

97 (2) Self-consciousness knits the desires into a system, and thus attains to the conception of "well-being," which implies the satisfaction of desire in general, and not merely of this or that desire.

98 (3) "Good" is that which satisfies some desire. Any good at which an agent aims must be own good; and "true good" is nothing else than "permanent well-being."

99 (4) A desire is determined by the nature of the creature desiring; human can attain satisfaction only in the realisation of own capacities. 100 Your true good lies only in their complete realisation--in your becoming all that it is in you to become.

101 (5) But human is a social being, and has an interest in other persons than oneself. Hence your complete self-satisfaction implies the satisfaction of your social as well as of your other impulses. That is, your true good includes the good of others.

102 (6) We can only discover what our "capacities" are by observing them as so far realised, and thus gaining the idea of future progress. The ultimate end is unknown to us.

103 (7) But we see enough to recognise that human's capacities can be realised, your self-satisfaction intelligently sought, only in a social state based upon the notion of the common good. The right reveals itself in the actual evolution of society.

THE DOCTRINE AKIN TO THAT OF FOLLOWING NATURE

104 The self-realisation doctrine has much in common with the doctrine of following Nature. 105 Thus: 1. It evidently does not recommend the realisation of all the capacities of the individual as such, but holds in view a "pattern" human.

106 (2.) This is social human, the true representative of human nature as conceived by the ancient Stoic. 107 Green holds before himself "the ideal of a society in which everyone shall treat everyone else as own neighbour, 108 in which to every rational agent the well-being or perfection of every other such agent shall be included in that perfection for which one lives."

109 The same thought was more pithily expressed by Marcus Aurelius in the aphorism that "what is good for the hive is good for the bee."

110 (3.) We find, too, the analogue of that wider appeal to Nature which suffused the Stoic doctrine with religious feeling. 111 In the above brief recapitulation of the steps in the self-realisation

doctrine I have omitted this aspect, as I wished to confine myself to the ethical doctrine pure and simple. 112 But Green conceives of the Divine Consciousness as already having before it the consummation toward which human strives in own efforts at self-realisation; 113 he regards human as working toward the attainment of a Divine Purpose. 114 The self-realisationist may prefer, sometimes, to use language more abstract. You may say: "Human's consciousness of the self as a member of society involves a reference to a cosmic order."

115 But the difference of language scarcely carries with it a substantial difference of thought.

116 4. As the appeal to human nature, or to Nature in a broader sense, left the norm for the guidance of human actions somewhat vague, so the appeal to the principle of self-realisation seems to leave one without very definite guidance. 117 There may easily arise disputes touching what capacities are to be realised, and in what degree.

IS THE DOCTRINE MORE EGOISTIC?

118 One difference between the principles of following Nature, striving to attain to perfection, and aiming at self-realisation seems to force itself upon our notice. 119 On the surface, at least, the last doctrine appears to stand out as more distinctly egoistic. The very name has an egoistic flavour; 120 the doctrine bases itself upon the satisfaction of desire; nor do its advocates hesitate to emphasise that the satisfaction sought is the satisfaction of the agent desiring. 121 In the chapter on Egoism I have cited some utterances which sound egoistic, and such citations might be multiplied.

122 Nevertheless, from this egoistic root springs a flower which disseminates the perfume of a saintly self-abnegation. How is this seeming miracle accomplished?

123 The transition is brought about through a chain of reasoning which is subtle and ingenious in the extreme. 124 Must we not admit that in all purposive action--the only action with which the moralist need concern the self--

there is a striving to realise or satisfy desire in the attainment of some object? 125 And if the desires of a mind or self converge upon some object, does not its realisation imply the satisfaction or realisation of the desires of that mind or self? 126 Furthermore, if our desires have as their root our capacities-- for we can desire nothing that it is not in us to desire-- is not the realisation of desire the realisation of capacity? 127 Does it not follow, hence, that every mind or self, in all purposive action, is striving, either blunderingly or with far-sighted intelligence, to attain to self-satisfaction, which means, to the realisation of its capacities? 128 Finally, as humans are by nature social creatures, how can a person fully realise own capacities without becoming a truly unselfish being? 129 Unselfishness appears to be the inevitable goal of the strivings for self-satisfaction of an unselfish self.

WHY AIM TO REALISE CAPACITIES?

130 This reasoning appears highly satisfactory in two very different ways. It seems, on the one hand, to stop the mouth of the egoist, who insists that own advantage is own only proper aim. 131 It assures you that you are throughout seeking your own advantage, when you aims at self-realisation. 132 On the other hand, it assures the person to whom egoism appears repellent and immoral, that self-realisation implies that one must love one's neighbour as oneself. 133 The immemorial quarrel between self-love and benevolence appears to be adjusted to the mutual satisfaction of both parties.

134 Is the reasoning unassailable? There are two steps in it which appear to demand a closer scrutiny. 135 One is the transition from desire to capacity; the other, the assumption that you who follows an unselfish impulse may properly be said to aim at self-satisfaction, and to exercise no self- denial.

136 As to the first. Our desires may have their roots in our capacities,

but desires and capacities are, nevertheless, not the same thing.

137 Humans do actually strive to realise their desires-- a desire is nothing else than such a striving for realisation or satisfaction. 138 But it cannot be said that humans generally strive to realise their capacities, except to the limited degree in which their capacities may happen to be expressed in actual desires. 139 Capacities may lie dormant, and the person in whom they lie dormant need not on that account feel dissatisfied, as does the person whose desires are not realised. 140 Self-realisation, as understood by the school of thinkers which advocates it, implies much more than the satisfaction of desire. It implies the multiplication of desires and their satisfaction. 141 On what ground shall we persuade the contented egoist, who has but a handful of commonplace desires and finds it possible to satisfy most of them, that it is better to call into being a multitude of wants many of which will probably remain unrealised? 142 You may point out that the divine discontent is apt to leave the idealist and the reformer as lean as Cassius. 143 All of which does not prove that the self-realisationist is not right in exhorting humans to develop their capacities in the direction of the pattern which you holds in view; 144 but it does seem to prove that the path to self-realisation, in this sense, is not necessarily the path to self-satisfaction. 145 "The good" has come to mean more than that which satisfies desire. How shall we persuade people that it is their duty to make this good their end?

THE PROBLEM OF SELF-SACRIFICE

146 As for the second point. You who makes your moral aim self-satisfaction can scarcely be expected to advocate self-sacrifice. 147 Accordingly, we find among self-realisationists, a tendency to repudiate altogether what may properly be called self-denial. 148 "Anything conceived as good in such a way that the agent acts for the sake of it," said Green, "must be conceived as your own good." 149 "A moment's consideration will show," writes Professor Fite, in your clear and attractive book,

"that, for self-sacrifice in any absolute sense, no ground of obligation is conceivable. 150 Unless I am in some way interested in the object whose attainment is set before me as a duty, it seems to be psychologically impossible that I should ever strive for it."

151 Now we do seem compelled to concede that, unless a person desires an end, you cannot will that end. 152 Anything that is selected as an end, and striven for, must be desired. And the attainment of the end implies, of course, the satisfaction of that particular desire. 153 But, admitting all this, is not the question left open whether some desires may not be sacrificed to others; and whether, indeed, a whole extensive system of desires may not, on occasion, be sacrificed to a single desire? 154 In this case, may not the transaction properly be called self-sacrifice? 155 Suppose the desire to serve one's neighbour, if satisfied, prevents the realisation of a multitude of other desires of the same agent. Is it certain that its satisfaction does not imply self-denial?

SELF-SATISFACTION AND SELF-SACRIFICE

156 The argument to prove that it is not really self-sacrifice may follow diverse paths.

157 Thus, it may be argued that, since the proper end of a rational being is your own permanent good, the sacrifice of such goods as do not conduce to this end is not self-sacrifice. 158 Sensual pleasures, the satisfaction of vanity or ambition, the accomplishment of a vengeful purpose, an excessive preoccupation with one's own interests as contrasted with those of others-- such things as these, it is claimed, do not permanently satisfy. 159 That the so-called human of pleasure is a human upon whom pleasures pall, and that you who seeks too earnestly to save your own life is apt to lose it, has been reiterated by a long line of professional and lay moralists from Buddha to Tolstoi. 160 The refuge from the discontent arising out of the attempt to quench one's thirst by sipping at transient delights has always been found in altruism under some guise. 161 The self-realisationists may claim that

certain things are given up in order that other things more permanently satisfying to the self may be attained, and may deny that this is any renunciation of self-satisfaction.

162 Again. It may be argued that human's interests do not conflict as widely as is commonly supposed. 163 To be sure, two men may have to struggle with each other for the pleasure of eating a given apple, of making a pecuniary profit, of obtaining a coveted post, of being the first authority in a given science or art, of securing the affections of a particular woman.

164 Here one person's loss seems to be another person's gain. But two people may enjoy seeing a child eat an apple, or a deserving person profit, or their common candidate win the election, or their favourite artist honoured, or their beloved nephew accepted by the lady of own choice. 165 If one desires certain things, and certain things only, there seems no reason why one's desires should not be in harmony with those of others.

166 The things best worth having, it is claimed, do not admit of being competed for. If my aim is unselfish devotion to humanity, how can I lose if my neighbour attains in the same running? 167 Do virtuous people, in so far as they are virtuous, stand in each other's light? Are there not as many prizes as there are competitors? 168 As long as I remain in this field I may seek self-satisfaction without scruple. I satisfy another's desire in satisfying my own. By benevolence I lose nothing.

169 The list of things which one may forego without self-sacrifice has been made a long one. Even the realisation of capacities highly valued by cultivated people has been brought into it:

170 "No conflict," writes Professor Seth, "is possible between the ends of the individual and those of society. 171 The individual may be called upon to sacrifice, for example, your opportunity of aesthetic or intellectual culture; but in that very sacrifice lies your opportunity of moral culture, of true self-realisation."

CAN MORAL SELF-SACRIFICE BE A DUTY?

172 To this position one is tempted to demur until two questions have found a satisfactory answer:

173 1. Is it true that there is no sacrifice of self-realisation or self-satisfaction, properly so called, where all other desires and impulses are sacrificed to the one desire to do right?

174 2. Is it not conceivable, at least, that obedience to an unselfish impulse may result even in the sacrifice of the opportunities of moral culture in general? Can it, then, be called self-realisation?

175 Touching the first question it may plausibly be maintained that the desires of the self are many and various, 176 and that the satisfaction of an altruistic impulse may imply the sacrifice of so many of them that the self may very doubtfully be said to attain to permanent satisfaction when the impulse is realised. 177 Aristotle's hero, who, in dying for his country, chooses the more "honourable" for himself, 178 can hardly be said in that one act to have accomplished a state of permanent satisfaction or well-being for the self whose being was, in that act, brought to an abrupt termination. 179 Certain Stoics seem to have taught that virtue is its own adequate reward and that nothing else matters; but this has not been the verdict of moralists generally. 180 Paley, who writes like an unblushing egoist, we may pass over; but even Kant, a thinker of a very different complexion, appears to regard the mere doing of a right act as not a sufficient reward for the doer. 181 He looks for the act to be crowned with happiness in a life to come, thus saving it from being mere self-sacrifice.

182 The second question one approaches with some hesitation. "No moralist," writes Professor Sidgwick, "has ever directed an individual to promote the virtue of others except in so far as this promotion is compatible with, or rather involved in, the complete realisation of virtue in the self." 183 It appears rash to admit to be a duty that which as high an authority as Sidgwick maintains no moralist has ever ventured to advise. 184 Still, it is permissible to adduce an illustration taken from

actual life, and to ask the reader to form your opinion independently.

185 A girl, anxious to provide her younger sister with a better lot, enters a factory and gives up her life to labour of a monotonous and mind-destroying character, amid sordid and more or less degrading surroundings. 186 The act is a heroic one, but is it clear that it conduces to the self-realisation, not of the sister, but of the agent herself? 187 The influence of surroundings counts for much. High impulses may, under such pressure, come to be repressed.

188 "Capacity for the nobler feelings," writes Mill, "is in most natures a very tender plant, easily killed, not only by hostile influences, but by mere want of sustenance; 189 and in the majority of young persons it speedily dies away if the occupations to which their position in life has devoted them, and the society into which it has thrown them, are not favourable to keeping that higher capacity in exercise. 190 People lose their high aspirations as they lose their intellectual tastes, because they have not time or opportunity for indulging them; 191 and they addict themselves to inferior pleasures, not because they deliberately prefer them, but because they are either the only ones to which they have access, or the only ones they are any longer capable of enjoying."

192 In other words, one may put oneself into a situation in which self-realisation appears to be made a most difficult and problematic goal. Nor does it seem inconceivable that one should do this for the sake of another's good. 193 Hence, even if we restrict the meaning of the word "self-sacrifice" to the sacrifice of the "real" or moral self, the impossibility of self-sacrifice scarcely appears to have been proved; 194 the impossibility of a conflict between the ends of the individual and of society does not appear to be indubitably established.

SELF-SACRIFICE AND THE IDENTITY OF SELVES

195 Can it be maintained upon any other grounds than those adduced above? One line of argument remains open to us. 196 We may

maintain that, while two bodies are two because they occupy two portions of space, two minds, as not in space, cannot thus be held apart, and we may conclude that "the many individuals composing the race are not really many, but one." 197 I suppose that you who can take this position will find it natural to argue that any act which serves the interests of any self must be regarded as serving the interests of every self, and thus cannot be considered as sacrificing the interests of any self.

198 To these transcendental heights, however, comparatively few will be able to climb. 199 To people generally it will still appear that Peter's love to Paul is not identical with Peter's love to Peter; and that Peter may act in such a way that, on the whole, he loses, while Paul gains. 200 That the interests of Peter and Paul, as developed social beings and members of a civilised community, are less likely to be in conflict than those of their primitive cave-dwelling forerunners may be freely conceded. 201 But from such relative harmony to a complete identity of interests seems a far cry.

QUESTIONS WHICH SEEM TO BE LEFT OPEN

202 Evidently, the self-realisation doctrine is a great advance upon the doctrine of following Nature. 203 The self-realisationist realises that human's nature is in the making, and you are not blind to the difficulty of the task of determining just what the real demands of human nature are.

204 This leads to your laying much stress upon the gradual development of systems of rights and duties as they emerge under the actual conditions to which human societies are subjected in the course of their evolution.

205 You reads history with comprehending eyes, and reverences the human reason as crystallised in social institutions. 206 Hence, the divergence of the moral standards which obtain in different ages and among different peoples does not seem to you a baffling mystery. 207 You can find a relative justification for each,

and yet hold to an ideal in the light of which each must be judged.

208 It may be questioned, however, whether the edifice which you erects can be based wholly upon the appeal to the self which ostensibly furnishes the groundwork of the doctrine. 209 We may ask whether such an appeal can:

(1) Prescribe to the individual in what measure your various capacities should be realised.

210 (2) Show that it is reasonable to awaken dormant capacities, and thus multiply desires.

211 (3) Justify social acts which certainly appear to be self-sacrificing, and which the moral judgments of people generally do not hesitate to approve.

THE ETHICS OF EVOLUTION

George Stuart Fullerton

THE SIGNIFICANCE OF THE TITLE

31 The title, "The Ethics of Evolution," seems to assume that the evolutionist, frankly accepting yourself as such, must be prepared to join some school of the moralists different from other schools, and basing itself upon evolutionary doctrine.

2 That the ethical views of individuals and of communities of people may undergo a process of evolution or development is palpable. 3 The ethical notions of the child are not those of the adult, nor are the moral ideas of primitive races identical with those of races more advanced intellectually and morally.

4 But it is one thing to maintain that morals may be in evolution in individuals and in communities, 5 and quite another to hold that the acceptance of the doctrine of evolution, broadly taken, forces upon one some new norm by which human actions may be judged. 6 It was possible for as ardent an evolutionist as Huxley to hold that evolution and ethics are not merely independent, but are actually at war with one another, 7 the competitive struggle for existence characteristic of the one giving place in the other to a new principle in which the rights of the weak and the helpless attain express recognition. 8 And Sidgwick, that clearest of thinkers,

maintains that we have no reason to assume that it is our duty as moral beings simply to accelerate the pace in the direction already marked out by evolution.

9 It should be remembered that the word evolution may be used equivocally. It is not evident that all evolution is in the direction of a life, brute or human, that we commonly recognise as higher. 10 There is retrogression, as well as progress, where such retrogression is favoured by environment. We may call this, if we please, 'devolution'.

11 Were the conditions of your life very unfavourable, human could not live as you now lives; 12 and, indeed, were they sufficiently unfavourable-- for example, if the earth cooled off to a certain point-- you could not live at all, but would have to give place to a lowlier creature better fitted to the conditions. 13 Must the person who foresees this end approaching strive to hasten its arrival, or should one oppose it? 14 In a decadent society, to come nearer to the problems which concern us in ethics, must a person strive to realise the social-will expressed in progressive decadence? Should one hasten the decline of the community?

15 That those who study human as a moral being, like those who study human in any of your other aspects, will be more or less influenced in their outlook by the broadening of the horizon which results from a study of what the students of the evolutionary process have to tell us, may be conceded. 16 But when we admit this, we do not necessarily have to look for a new norm by which to judge conduct. We seem, rather, forced to ask ourselves how this broadening of the horizon affects the norms which have heretofore appealed to people as reasonable. 17 To be sure, any evolutionist has, in the capacity of a moralist, the right to suggest a new norm. But, in that case, you must, like any other moralist, convince us that it is a reasonable one.

EVOLUTION AND THE SCHOOLS OF THE MORALISTS

18 Those who have suggested the norms discussed above, no one would think of as greatly

influenced in their ethical teaching by the doctrine of evolution. 19 Locke, Price, Butler and Sidgwick; Aristippus and Epicurus; Paley and Hobbes; Bentham and Mill; Epictetus and Marcus Aurelius; Janet, Green, and the rest, no one would be inclined to class simply as evolutionary moralists.

20 Some of them never thought of evolution at all. How would it affect their standards of right and wrong were evolution expressly taken into account? 21 Would the standards have to be abandoned? Or would the people, as broader people, merely have to revise some of their moral judgments?

22 (1) It might be supposed that the acceptance of evolutionary doctrine would bring into being a grave problem for the intuitionist, at least. 23 If the body and mind of human are products of evolution, must we not admit as much of human's moral intuitions? 24 Then why not admit that these may be replaced some day by other moral intuitions to be evolved in an unknown future?

25 You who reasons thus should bear in mind that Sidgwick, who by no means repudiated the doctrine of evolution, was an intuitionist, and placed his ultimate moral intuitions on a par with such mathematical intuitions as that two and two make four. 26 If all intuitions are a product of evolution, Sidgwick might claim that the moral intuitions he accepts fare no worse than those elementary mathematical truths which we accept without question and without reflection. 27 And he might maintain that an appeal to evolution need cast no greater doubt upon ultimate moral truth than upon mathematical. 28 If intuitionism in all its forms is to be rejected, it seems as though it must be done upon some other ground than an appeal to evolution.

29 (2) As to the egoist. It is not easy to see how the appeal to evolution need disconcert you. 30 Should you be so foolish as to maintain that egoism is always, in fact, necessary and unavoidable on the part of every living creature, you might easily be refuted by a reference to the actual life of the brutes, where altruism can be shown to play no insignificant role.

31 But if you simply maintains that the only ‘reasonable’ principle for a person to adopt is egoism, you may continue to do so. You makes the self and its satisfactions your end. 32 How can it concern you to learn how the self came to be what it is, or what it will be in the distant future? 33 You panders to the present self; you may assume that it will be reasonable to pander at the appropriate time to the self that is to be, whatever its nature.

34 (3) The utilitarian remains such whether you makes the greatest good of the greatest number to consist in pleasure or in some other end, such as self-preservation. 35 Some utilitarians, who have been inclined to emphasised the good of human, rather than to extend even to the brutes the goods to be distributed, may be influenced to extend the sphere of duties, if they will listen to the evolutionist, who cannot well leave out of view humbler creatures.

36 You may broaden your sympathies. But this need not compel you to abandon your fundamental doctrine.

37 (4) A very similar conclusion may be drawn, when we consider the influence of an acceptance of the doctrine of evolution upon those who would turn to human's nature, to perfection, or to self-realisation, as furnishing the norm of human conduct.

38 A Marcus Aurelius could, with little reference to evolution, accept human's nature, or Nature in the wider sense, as marking out for human the round of your duties. 39 A modern Darwinian might fall back upon much the same standard, while clearly conscious of the fact that human's nature is not something unchangeable, and while inclined to view Nature in general with different eyes from those of the Roman Stoic. 40 No sensible evolutionist would maintain that a creature of a given species should act in defiance of all the instincts of creatures of that type, merely on the ground that species may be involved in a process of progressive development. 41 Nor need the perfectionist abandon own perfectionism in view of any such consideration. 42 You who measures perfection by the degree

of activity exercised in action, may admit that the coming human will be more perfect than it is possible for any human to be now; 43 but that need not prevent you from holding that it is human's present duty to aim at the only perfection possible to you, you being what you are. 44 Similar reasoning will apply to any other conception of perfection likely to be adopted, consciously or unconsciously, by any adherent of the school in question.

45 As for the self-realisationist, a very little reflection seems sufficient to reveal that the maxim that it is human's duty to become all that it is in you to become is in no wise refuted by the claim that human may, in the indefinitely distant future, become much more than many people have supposed or now suppose.

46 (5) There remains the doctrine of the Rational social-will as furnishing the norm of conduct. I have tried to show that this doctrine must rest upon broad views of human and of human's environment. 47 It is the very essence of the rational-will to take broad views, to consider the past, the present, and the future. 48 Surely the adherent of this school may let the evolutionist work in peace, may thank you for any helpful suggestions you have to offer, and may develop own doctrine with little cause for uneasiness at the thought that information given may refute own fundamental principle.

49 However, it is not out of place for you to point out, if revolutionary measures of any sort are suggested by this or that evolutionist, that ethics is a discipline which is concerned with what humans have to do, here and now. 50 It must take into consideration what is advisable and feasible.

51 Utopian schemes which break violently with the actual order of things and the normal development of human societies may be suggested by evolutionists, as they have been suggested by people who were not evolutionists at all. 52 They are not to be taken much more seriously in the one case than in the other.

THE ETHICS OF INDIVIDUAL EVOLUTIONISTS

53 Such considerations seem to make it evident that the acceptance of the doctrine of evolution should have no other influence upon us as moralists than that of making us take broad views of human and of your environment. 54 It still remains to find a norm of conduct, and evolutionists, like other people, may develop ethical systems which are not identical. 55 It is worthwhile here to touch very briefly upon the suggestions of one or two individual evolutionists. Those who speak of the ethics of evolution are very apt to have such in mind.

56 Thus, Darwin, whose study of the lower animals led him to believe that the social instincts have been developed for the general good rather than for the general happiness of the species, 57 defines the "good" as "the rearing of the greatest number of individuals in full vigour and health, with all their faculties perfect, under the conditions to which they have been subjected." 58 The "greatest happiness principle" he regards as an important secondary guide to conduct, while making social instinct and sympathy primary guides.

59 Spencer maintains that the evolution of conduct becomes the highest possible when the conduct "simultaneously achieves the greatest totality of life in self, in offspring, and in fellow-humans." 60 "The conduct called good," he writes, "rises to the conduct conceived as best, when it fulfills all three classes of ends at the same time." 61 But life he does not regard as necessarily a good. He judges it to be good or bad "according as it has or has not a surplus of agreeable feeling." 62 Hence, "conduct is good or bad according as its total effects are pleasurable or painful."

63 To be sure, Spencer criticises the utilitarians, and thinks little of the Benthamic calculus of pleasures. He believes that we should substitute for it something more scientific, a study of the processes of life. 64 In his earlier writings he appears to be largely in accord with the intuitionists in judging of conduct, regarding intuitions as having their origin in

the experiences of the race. 65 Nor does he ever seem inclined to break with intuitionism completely. But, as we have seen above, there appears to be nothing to prevent a utilitarian from being an intuitionist of some sort, as well.

66 Stephen, in his clear and beautifully written work on morals, also accepts the general happiness as the ultimate end of reasonable conduct; and he, too, criticises the current utilitarianism. 67 He writes: "This, as it seems to me, represents the real difference between the utilitarian and the evolutionist criterion. The one lays down as a criterion the happiness, the other the health of society." 68 By which, of course, he does not mean merely physical health, but such a condition of vigour and efficiency as carries with it a promise of continued existence and well-being in the future.

69 It is not necessary to multiply instances. It can readily be seen that all three of the writers cited are utilitarians, and the last two are what have been characterised as hedonistic utilitarians. 70 That they suggest this or that means of best attaining to the desired goal does not put them outside of a school which embraces people of many shades of opinion.

PESSIMISM

George Stuart Fullerton

THE PHILOSOPHY OF THE PESSIMIST

32 With philosophy in general this volume has little to do; but as pessimism is not the doctrine of normal humans generally, but is apt to be identified in our minds with the teachings of certain of its leading exponents, 2 it may be well to give, in briefest outline, the type of reasonings upon which the pessimist may take own stand.

3 Schopenhauer held that the one World-will, which manifests itself in all nature, inorganic and organic, and is identical with the will of which each human is conscious in the self, is a "will to live." 4 When the World-will becomes conscious, as it does in human, the will to live is consciously asserted. 5 But the will to live is essentially blind and unreasoning, or it would not do

anything so stupid as to will life of any sort. 6 He writes: "Only a blind-will, no seeing-will, could place itself in the position in which we behold ourselves. 7 A seeing-will would rather have soon made the calculation that the business did not cover the cost; 8 for such a mighty effort and struggle, with the straining of all the powers, under constant care, anxiety and want, 9 and with the inevitable destruction of every individual life, finds no compensation in the ephemeral existence itself, which is so obtained, and which passes into nothing in our hands."

10 The basis of all will, says Schopenhauer, is need, deficiency, and, hence, pain. 11 You dwells at length upon the misery of life, and the desirability of a release from life. 12 The refuge of suicide at once suggests itself, but is rejected by Schopenhauer on the ground that the destruction of the individual cannot prevent the One-will from manifesting itself in other individuals. 13 Curiously enough he appears to approve of suicide by starvation, as indicating a renunciation of the will to live. But his general recommendation is asceticism, renunciation of the striving for pleasure, the voluntary acceptance of pain. 14 Through this the will is to be taught to apprehend its own nature, and, thus, to deny itself. 15 How a general asceticism on our part will rob the one universal will, revealed in the mineral, vegetable and animal worlds, of its nature, and still its strivings, the great pessimist does not indicate.

16 At this point, Von Hartmann, who may fairly be called Schopenhauer's pupil, takes up the tale. He suggests that it is conceivable that a universal negation of the will may be obtained, 17 if the preponderating part of the actual World-will should come to be contained in the conscious minds that resolve to will no more. 18 This he thinks may neutralise the whole, and put an end to existence, which is unavoidably an evil, and implies a preponderance of pain.

COMMENT ON THE ETHICS OF PESSIMISM

19 On the metaphysics of the pessimists I shall make no comment save that there appears to be here sufficient vagueness to satisfy the most poetical of minds. 20 But the following points in the ethics of pessimism should be noted:

(1) Pleasure and pain are made the measure of the desirability or undesirability of existence.

21 (2) It is assumed that pleasure and pain are measurable; and that they may be quantitatively balanced against one another in such a way that this or that mixture of them may be declared by an enlightened person to be, on the whole, desirable or the reverse.

22 (3) It is claimed that the balance must necessarily incline to the side of pain, and hence, that life is not worth living.

23 (4) It follows from all this that it is our duty to aim, not necessarily directly, but in some manner, at least, at the destruction of life everywhere.

24 (5) I beg the reader to observe that the above doctrine rests upon assumptions which seem to be made without due consideration. 25 Thus: (a) It is by no means to be assumed without question that pleasure and pain alone are the measure of the desirable. 26 They are not the only things actually desired; and, if we assert that they alone are desirable, we fall back upon a dubious intuition.

27 (6) The quantitative relations of pleasures and pains are legitimate subjects of dispute, as we have seen in earlier chapters in this volume.

28 When is one pleasure twice as great as another? How can we know that three pleasures counterbalance a pain? 29 Is it by the mere fact that we ‘will’ as we do, in a given instance? Then how prove that we will as we do, because of the equivalence of the pleasure to the pain?

30 (c) Who shall decide for us whether life is-- not desired, it is admittedly that, as a rule,-- but, also, desirable?

31 May the person who denies it rest own assertion upon such general considerations as that satisfaction presupposes desire, and that desire implies a lack, and, hence, pain? 32 The famous author

of "Utopia" pointed out long ago that the pains of hunger begin before the pleasure of eating, and only die when it does. 33 Shall we, then, regard a hearty appetite as a curse, to be mitigated but not wholly neutralised by a series of good dinners?

34 To be sure, the pessimists do not depend wholly upon such general arguments, but point out in great detail that there is much suffering in the world, and that the fulfillment of desire, when it is attained, often results in disillusionment. 35 But the fact remains that life, such as it is, is desired by humans and other creatures generally; desired not as an exception, and under a misapprehension, but, as a rule, even by the enlightened and the far-seeing.

36 Is not the desirable what is desired by the rational-will? 37 We have seen that the rational social-will does not aim at the suppression of desires generally, but only at the suppression of such desires as interfere with broader satisfactions. 38 Viewed from this stand-point, the pessimist's "denial of the will to live" appears as an expression of the accidental or irrational-will. It is not an expression of the nature of human, but of the nature of the pessimist.

39 (6) It is, perhaps, worthwhile to point out that there is nothing to prevent a given pessimist from being an intuitionist, an egoist, a utilitarian (of a sort), or an adherent of one of the other schools above discussed. 40 You may assume intuitively that life is undesirable; in view of its undesirability you may act, either taking yourself alone into consideration, or including your neighbour; you may invoke the doctrine of evolution; 41 you may even, if you chooses, call it self-realisation to annihilate yourself, for you may argue that a will that comes to clear consciousness must see that it must be its own undoing. 42 It is hardly necessary to point out, however, that the pessimist, as such, should not be in any wise confounded with the moralists discussed in the five chapters preceding.

ETHICS

KANT, HEGEL AND NIETZSCHE
George Stuart Fullerton

KANT

33 It is impossible, in any brief compass, to treat of the many individual moralists, some of them people of genius and well worthy of our study, who offer us ethical systems characterised by differences of more or less importance. 2 When we refer a person to this or that school and do no more, we say comparatively little about the person, as has become evident in the preceding chapters. 3 As we have seen, it has been necessary to class together those who differ rather widely in many of their opinions. 4 Here, I shall devote a few pages to three people only, partly because of their prominence, and partly because it is instructive to call attention to the contrast between them in their fundamental positions. 5 I shall begin with Kant.

Kant held that the human reason issues "categorical imperatives," that is to say, unconditional commands to act in certain ways. 6 The motive for moral action must not be the desire for pleasure, but solely the desire to do right.

7 He makes his fundamental rule abstract and formal: "So act that you could wish your maxim to be universal law." 8 As no person could wish to be the self neglected when in distress, this law compels you to be benevolent, and a new form of the fundamental rule is developed: 9 "Treat humanity, in yourself or any other, as an end always, and never as a means."

10 Now Kant, although he maintains that it is not a human's duty to seek own happiness-- a thing which natural inclination would prompt you to do-- by no means overlooks happiness altogether. 11 He thinks that virtue and happiness together constitute the whole and perfect good desired by rational beings. The attainment of this good must be the supreme end of a will morally determined. 12 We are morally bound to strive to be virtuous ourselves and to make others happy.

13 Still, each human's happiness means much to him; and Kant, convinced that virtue ‘ought’ to be rewarded with happiness, holds that our world is a moral world,

where God will reward the virtuous. 14 If we do not assume such a world, he claims, moral laws are reduced to idle dreams.

15 Such utterances as the last may well lead the utilitarian to question whether Kant was quite whole-hearted in his doctrine of the unconditional commands of the practical reason of human. 16 They appear to be not independent of all consideration of human happiness.

17 I shall not ask whether Kant was consistent. Great people, like lesser people, seldom are. 18 But, in order that the contrast between his doctrine and those of the two writers whom I shall next discuss may be brought out clearly, I shall ask that the following points be kept well in mind:

19 (1) Kant was an out-and-out intuitionist. He goes directly to the practical reason of human for an enunciation of the moral law.

20 (2) Moral rules of lesser generality, such as those touching benevolence, justice and veracity, he traces to the practical reason, making them independent of all considerations of expediency. 21 Thus he defends the body of moral truth accepted by so many of his fellow-moralists.

22 (3) His "practical reason" speaks directly to the individual. Kant looked within, not without. We may call him an ethical individualist. 23 Socrates, when on trial for his life, listened for the voice of the divinity within him. He needed no other.

HEGEL

24 In strongest contrast to the individualism of Kant stands the doctrine of Hegel. To the latter, duty consists in the realisation of the free reasonable will-- 25 but this will is identical in all individuals, and its realisation reveals itself in the customs, laws and institutions of the state. 26 From this point of view the individual is an accidental thing; the ethical order revealed in society is permanent, and has absolute authority. 27 It is true, however, that it is not something foreign to the individual; you are conscious of it as your own being. In duty you finds your liberation.

28 But what is a human's duty? "What a human ought to do," says

Hegel, "what duties you should fulfill in order to be virtuous, 29 is in an ethical community easy to say-- the person has only to do what is presented, expressed and recognised in the established relations in which you finds yourself."

30 In other words, you ought to do just what your community prescribes! This seems, taken quite literally, a startling doctrine.

31 It would be a wrong to Hegel to take you quite literally, for you elsewhere makes it plain that you by no means approves of all the laws and customs that have obtained in various societies. 32 Still, you exalts the law of the state and regards any opposition to it on the authority of private conviction as "stupendous presumption." This is a serious rebuke to the reformer. 33 The individual must, according to Hegel, look for the moral law outside of the self-- of yourself as an individual, at least. You must find it in the State.

34 Again a startling contrast: after Hegel, Nietzsche-- the voice of one crying in the wilderness, exquisitely, passionately, but scarcely with articulate scientific utterance. 35 A prophet of revolt and emancipation; a cave-dweller, who would flee organised society and the refinements of civilisation; 36 the rabid individualist, to whom the community is the "herd," and common notions of right and wrong are absurdities to be visited with scorn and denunciation. 37 He makes a strong appeal to young people, even after the years during which the carrying of one's own latch-key is a source of elation. 38 He appeals also to those perennially young persons who never attain to the stature which befits those who are to take a responsible share in the organised efforts of communities of people.

39 With Nietzsche the person, his suffering life, and the melancholy eclipse of his brilliant intellect, ethics as science is little concerned. 40 In Nietzsche the marvellous literary artist it can have no interest. These things are

the affair of literature and biography.

41 Here we are concerned only with his contribution to ethics. Just what that has been it is more difficult to determine than would be the case in a writer more systematic and scientific. 42 But he makes it very clear that he repudiates the morals which have been accepted heretofore by moralists and communities of people generally.

43 He confesses himself an "immoralist." He despises human as you are, and hails the "Superman," a creature inspired by the "will to have power" and free from all moral prejudices, including that of sympathy with the weak and the helpless.

44 "Full is the world of the superfluous," he sings in his famous dithyramb, "marred is life by the many-too-many."... 45 "Many too many are born; for the superfluous ones was the State devised."..."There, where the State ceaseth-- there only commenceth the person who is not superfluous."

46 Human, says Nietzsche, should regard yourself as a "bridge" over which you can pass to something higher. 47 Upon the fact that the Superman may have the same reason for regarding yourself as a "bridge" as the most commonplace of mortals, and may begin anew with loathing and self-contempt, you does not dwell. 48 Yet, as long as progress is possible, human may always be regarded as a "bridge." 49 The reader of Nietzsche is tempted to believe that hatred and contempt must always be the predominant emotions in the mind of the "superior" person. 50 Darwin, who knew much more about human and Nature than did our passionate poet, was still able to regard human as "the crown and glory of the universe." Not so, Nietzsche.

51 Those who have read little in ethics are inclined to attribute to Nietzsche a greater measure of originality than you can reasonably claim.

52 More than two millenniums before him, Plato conceived an ideal Republic in which moral laws, as commonly accepted, were to be set aside. 53 Marriage was to be done away with; births were to be scientifically regulated;

children were to be taken from their mothers; sickly infants were to be destroyed. 54 In Sparta the committee of the elders did not permit the promptings of sympathy and the cries of wounded maternal love to influence the decision touching the life or death of the new-born.

55 Here was an attempt at bridge-building, but it was conceived as a scientific matter, to be taken in hand by the State, and for the good of the State. 56 But Nietzsche would destroy the State. His Superman appears as individualistic as a "rogue" elephant, a few passages to the contrary notwithstanding. 57 Are we to regard him as a mere lawless egoist, or as something more? We are left in the dark. 58 But we note that Nietzsche disagrees with most moralists, in that he refuses to regard Caesar Borgia as a morbid growth.

59 The Superman has always been with us, in somewhat varying types. From Alexander the Great to Napoleon, and before and after, he adorns the pages of history. 60 Attila, among others, may enter his claim to consideration. It remains for the serious student of ethics to estimate scientifically his value as an ethical ideal, and to judge how far this type of character may profitably be taken as a pattern. 61 Nietzsche stands at the farthest possible remove from Hegel. Does he, as an individualist, stand within hail of Kant? It scarcely seems so. 62 When we examine Kant's "practical reason," in other words, the moral law as it revealed itself to Kant, we find that it had taken up into itself the moral development of the ages preceding. 63 Kant's practical reason, his conscience, to speak plain English, was not the practical reason of, for example, Aristotle.

64 The latter could speak of a slave as an "animated tool," and could believe there were people intended by Nature for slavery. Kant could not. 65 In theory an individualist, the Sage of Konigsberg stands, in reality, not far from Hegel. He does not break with the past. But Nietzsche is revolt incarnate.

THE ETHICS OF THE SOCIAL-WILL

George Stuart Fullerton

THE DOCTRINE SUPPORTED BY THE OTHER SCHOOLS

34 I urge the more confidently the Ethics of Reason, or the Ethics of the Rational social-will, because there is so little in it that is really new. 2 It only makes articulate what we all know already, and strives to get rid of certain exaggerations into which many people who reason, and who reason well, have unwittingly fallen.

3 The fundamentals of the doctrine have been exhibited. Hence, I may speak very briefly in indicating how the Ethics of Reason finds a many-sided support in schools which appear, on the surface, to be in the opposition.

4 It is evident, to begin with, that the Ethics of the social-will cannot dispense with Moral Intuitions, but must regard them as indispensable; as, indeed, the very foundation of the moral life. 5 That the individual may, and if you are properly equipped for the task, ought, to examine critically your own moral intuitions and those of the community in which you finds yourself, 6 and should, with becoming modesty and hesitation, now and then suggest an innovation, means no more than that you and the community are not dead, but are living, and that progress is a possibility, at least.

7 As for the Egoist, unless you are an absurd extremist, we must admit that you says much that is worth listening to. 8 Was not Bentham quite right in maintaining that if all A's interests were committed to B, and all B's to A, the world would get on very badly? A charity that begins at the planet Mars would arrive nowhere.

9 The Ethics of Reason has room for a very careful consideration of the interests of the self. But it may object to the position that the moral mathematician may regard as the only important number the number One.

10 With the Utilitarian our doctrine need have, as we have seen, no quarrel. Did not that learned, enlightened, and most fair-minded of utilitarians, Sidgwick, ultimately resolve the happiness which humans seek into anything which may be the object of the

mind in willing? 11 Did not a critical utilitarianism resolve itself into the doctrine of the Rational Social-will? 12 Why take less critical utilitarians as the only exponents of the school? 13 Besides, is there any reason why the social-will should be blind to the fact that humans generally do desire to gain pleasure and to avoid pain? It is only the exaggeration of this truth that we need to combat.

14 To Nature, properly understood, we can enter no objection. Who objects to Perfection as a "counsel of perfection?" 15 Can the social-will object to a human's striving to realise own Capacities-- under proper control, and with a regard to others? 16 The Pessimist is an unhealthy creature, and the social-will represents normal and healthy humanity. 17 Here we have disparity. But to Evolution our doctrine offers no opposition. It is only by a process of development that the Actual social-will has come to be what it is; and the Rational social-will looks to a further development under the guidance of reason.

18 The fact is that thoughtful people belonging to different schools tend to introduce into their statement of their doctrines modifying clauses; and in the end we find them not as far apart as they seemed at the beginning.

19 The tendency is, I think, in the direction of the recognition of the Rational social-will. This doctrine belongs to nobody in particular; it is the. common property of us all. It contains little that is startling.

ITS METHOD OF APPROACH TO PROBLEMS

20 He who looks to the Rational social-will for guidance in given a compass which may be of no small service to him. 21 For example:

(1) He will see that moral phenomena are not to be isolated. He will accept the historic order of society and judge human and your emotions and actions in the light of it. 22 He will never feel tempted to say, with Bentham, that the pleasure which has its roots in malice, envy, cruelty, "taken by itself, is good."

23 He will simply say, it is pleasure. That it is, of course; but

he will maintain that nothing "taken by itself" is either good or bad, from the moralist's point of view. 24 The cruel person may will to see suffering, and may enjoy it. The moral person may hold that the cruel person, your act of will, and your pleasure, should all be snuffed out, in the interest of humanity, as an unmitigated evil.

25 (2) The advocate of the Rational social-will recognises, as do many adherents of other schools, that the social-will, as expressed at any given time, is only relatively rational; 26 that humans must live in their own day and generation, although they can, to some degree, reach beyond them; 27 and that some differences of opinion as to the relative values of virtues, and the goodness of characters, are to be expected.

28 (3) Furthermore, you are in a position to explain how a person may be "subjectively" right and yet "objectively" wrong. 29 The person's character may be such that it is, on the whole, to be approved by the Rational Social-will. You may be animated by the desire to adjust yourself to that will.

30 And yet, the accident of ignorance, the accident of prejudice not recognised by yourself as such, may lead you to do what you thinks right and what those more enlightened recognise to be wrong.

ITS SOLUTION OF CERTAIN DIFFICULTIES

31 Perhaps it would be better for me to give this section a heading more nearly like the last. I aim only to give the reader a point of view from which you can approach the problem of a solution.

32 Take the problem which has come up before in the form of the distribution of pleasures. You who dwells, not so much upon pleasure, as upon the satisfaction of desire and will, must state it differently, but the problem is much the same.

33 What degree of recognition should be given to the will of each individual, or to the separate volitions and desires in the life of the individual? 34 Should everybody count for one? Should every desire or group of desires receive recognition? 35 Is no

distinction to be made in the intensity of desires? And how many individuals shall we include in our reckoning?

36 Light seems to be shed upon this complicated problem or set of problems when we hold clearly before ourselves what the task of reason is in regulating the life of human individually and collectively. 37 Its function is to bring order out of chaos and strife; to substitute harmony and planfullness for accident; to introduce long views in the place of momentary impulses; to prevent the barter of permanent good for a mess of pottage.

38 Reason must accept the impulses and instincts of human as it finds them, and do what it can with them. It cannot ignore them. 39 Slowly, civilisations, to some degree rational, have come into being. In so far as they are rational, they are justified. 40 Keeping all this in view we may say, tentatively:

(a) The principle, "everybody to count for one, and nobody for more than one," must be interpreted as an expression of the conviction that no will should be 'needlessly' sacrificed.

41 Reason is bodiless, except as incorporated in human societies, and these must have their historic development. 42 Can we do away with the special claims of family, of neighbourhood, of the state? They have their place in the historic rational order. 43 But the whispered "everybody to count for one" may help us to realise that such special claims cannot take the place of all others.

44 (b) Shall a deliberate attempt be made to enlarge the circle of those who are to share in the social-will, not merely by diminishing the number of deaths, but by promoting the number of births? 45 States have attempted it often enough. I can only say that, if this be attempted, it should not be attempted in ways that ignore the historical development of society, with its social and moral traditions.

46 (c) Why not justify our attitude toward the brutes by maintaining that they have, theoretically, rights to recognition, in so far as such recognition does not interfere with the rights of human in the rational

social order? 47 The brutes outnumber us, to be sure. We are in a hopeless minority. But were this minority sacrificed, there would be no rational social order at all-- 48 no right, no wrong; nothing but the clash of wills or impulses which reason now strives to harmonise as it can.

49 (d) When we turn to the problem of the distribution of satisfactions in the life of the individual, we find ready to hand a variety of unwise saws--"A short life and a merry one," and the like. 50 How should the individual choose own satisfactions? Merely from the standpoint of the individual? What is ‘desirable’? Not ‘desired’, by this person or by that, but ‘desirable, reasonable’?

51 It is an open secret that the house of mirth lacks every convenience demanded of a permanent residence, and that those who breathlessly pursue pleasure are seldom pleased. 52 Nor do humans, when they stop to think, want their lives to be very short.

53 And, in any case, this question of the distribution of satisfactions in the life of the individual does not concern the individual alone. 54 Is the person who wants a short life and a merry one an "undesirable" from the standpoint of the Rational social-will? 55 Then you should be suppressed. The manner of distribution of even your own personal satisfactions is not your affair exclusively. Every ordered society has its notions touching the type of human which suits its ends.

56 (e) But shall we, in making up our minds about the "satisfaction on the whole" which busies the rational individual or the rational community, take no account at all of the intensity of pleasures and of pains, the eagerness with which some things are desired and the feebleness of the impulsion toward others? 57 May not the intense thrill of a moment more than counterbalance "four lukewarm hours?" 58 Are we not, if we take such things into consideration, back again face-to-face with something very like the calculus of pleasures-- that bugbear of the egoist and of the utilitarian?

59 It would be foolish to maintain that human, either individually or collectively, places all desires

upon the same level. 60 No human of sense holds that every desire should count as one. On the other hand, no human of sense pretends to have any accurate unit of measurement by which you can make unerring estimates of desirability.

61 Fortunately, you are not compelled to fall back upon such a unit. Even if you was born yesterday, the race was not. You are born into a system of values expressed in social organisation and social institutions. 62 It is the resultant of innumerable expressions of preference on the part of innumerable people. It is a general guide to what, on the whole, human wants.

63 It is, then, foolish for you to raise such questions as, whether it is not better to aim at intense happiness on the part of the few, to the utter ignoring of the mass of humankind. 64 Such questions the Rational social-will has already answered in the negative.

THE CULTIVATION OF OUR CAPACITIES

65 Finally, we may approach the question whether it is reasonable to awake dormant desires, to call into being new needs; which, satisfied, may be recognised as a good, but which, unsatisfied, may result in unhappiness.

66 A little cup may be filled with what leaves a big one half empty. It is easy to find grounds upon which to congratulate the "average" person. 67 All the world caters to you-- ready-made clothing is measured to fit your figure, and it is sold cheap; 68 the average restaurant consults your taste and your pocket; the average woman just suits you as a help-mate; you are much at home with your neighbours, most of whom diverge little from the average. 69 Why strive to rise above the average-- and fall into a divine discontent?

70 May one not say much the same of a community? Why should it strive to attain to new conquests, to awaken in its members new wants and strain to satisfy them? 71 Does it seem self-evident that it is reasonable, in general, to

multiply desires with no guarantee of their satisfaction?

72 I know no way of approaching the solution of this problem save from the standpoint of the Rational social-will. We are confronted with the general problem of the desirability of civilisation, with all that that implies. 73 The life of human in some rather primitive societies has seemed in certain respects rather idyllic. The eating of the fruit of the tree, and the consequent opening of the eyes, has, time and again, seemed to result in disaster.

74 But was the idyllic life not an accidental thing, due to a fortuitous combination of circumstances, rather than to human's intelligent control of a larger environment? Civilisation of some sort seems inevitable. 75 Have we any other guarantee that we can make it, in the long run, rational, than a many-sided development of human's capacities? 76 And must we not exercise a broad faith in the value of enlightenment, increase of knowledge, far-sightedness, the cultivation of complex emotions, even at the risk of some waste of effort and some suffering to certain individuals?

77 Perhaps this is as good a place as any to say a word about the significance of the terms "higher" and "lower," when used in a moral sense. 78 We have seen that John Stuart Mill made much of the distinction in his utilitarianism. Bentham appears to sin against the enlightened moral judgment in holding that, quantities of pleasure being the same, "push-pin is as good as poetry."

79 When we realise that the worth of things may be determined from the standpoint of the Rational social-will, we can easily understand that some occupations and their accompanying pleasures should be rated higher than others, however satisfactory the latter may seem to certain individuals. 80 It is not unreasonable to rate the pleasure of scientific discovery as higher than the pleasure of swallowing an oyster; 81 and that, without following Bentham in falling back upon a quantitative standard, or following Mill in maintaining that pleasures, as pleasures, differ in kind.

ETHICS

THE MORAL LAW
AND MORAL IDEALS
George Stuart Fullerton

DUTIES AND VIRTUES

35 We saw, at the very beginning of this volume that a single moral law, so abstractly stated as to cover the whole sphere of conduct, must be something so vague and indeterminate as to be practically useless as a guide to action. 2 The admonition, "do right," does not mean anything in particular to the person who is not already well instructed as to what, in detail, constitutes right action. Nor do we make ourselves more intelligible, when we say to you "be good."

3 It seems to mean something more when we say "act justly" or "be just"; "speak the truth," or "be truthful." And the more we particularise, the more we help the individual confronted with concrete problems-- the only problems with which life actually confronts us.

4 This is as it should be. Duties and virtues are expressions of the Rational social-will, and that will is a mere abstraction except as it is incorporated, with a wealth of detail, in human societies. 5 It would be hard for the small child to classify, under any ten commandments, the innumerable company of the "don'ts" which one hears from own mother during the course of a week. 6 You can leave such work to the moralist. But you are receiving an education in the moral law, as an expression of the social-will, through the whole seven days.

7 If we wish, we can emphasised the ‘moral law’, and dwell upon the ‘duties’ of human. On the other hand, we may lay stress upon the ‘virtues’, and point to ‘ideals’. 8 The Greek made much of the virtues; the Christian moralist had more to say of human's duties. In the end, there need be little discrepancy in the results. 9 I make the same recommendation, whether I say to a person, Speak the truth! or whether I say to you, Be truthful!

10 It may be claimed that shades of difference make themselves apparent, where one emphasises the law and another points to an ideal. Perhaps they do, in most minds. 11 It certainly sounds more

conceited to say: "I am trying to be virtuous," than to say: "I am trying to do my duty." 12 On the other hand, the admonition, "Be truthful," appears to leave one a little latitude. We take the truthful person, so to speak, in the lump. 13 If you have a strong bias toward truth-speaking, and is felt to be reliable, on the whole, it is not certain that we should rob you of your title on the ground of one or two lapses for which weighty reasons could be urged. 14 The admonition: "Speak the truth!" seems more uncompromising; and yet you who prefers this legal form may maintain that it is a general admonition addressed to people of sense who are supposed to be able to exercise reason.

THE NEGATIVE ASPECT OF THE MORAL LAW

15 Why does the Moral Law, on the surface at least, appear to be so largely negative? 16 As we look back upon our early youth, our days appear to be punctuated with punishments. When we attain to years of discretion, this is not the case, with most of us, at least. 17 But when we turn to the law, in our own society or in others, we find prohibitions and penalties everywhere. Of rewards little is said. 18 Is the social-will meant to be chiefly inhibitory? Is it a check to the action of the individual?

19 (1) The negative aspect of the moral law is, to a considerable degree, an illusion. 20 The social-will takes us up into itself and forms us. In our early youth we are acutely conscious of the process. 21 A vast number of the things a child wants to do are things that do not suit the social-will at all. You wants to break windows; you wants to fight other children; you wants to be idle; your delight is in adventures not normally within the reach of, or suited to the taste of, the citizens of an ordered state. 22 It is little wonder that the child regards the moral law as a nuisance and the state as a suitable refuge for those suffering from senile decay.

23 There are individuals who scarcely get beyond this stage. They remain, even in their later years, at war with the state. 24 From time to time, we seize them and incarcerate them. That the law

'forbids' and 'punishes', they never forget. It is chiefly for such that the criminal law exists. 25 They are in the state, but they are not of it. They have small share in the heritage of the civilised human.

26 For most of us there comes a time when most prohibitions are little thought of. It has been maintained, that the law is negative partly for the reason that positive duties are too numerous to be formulated. 27 But how numerous are the things that ought not to be done which normal people never think of doing! 28 At this moment, I could swallow a pen, taste the ink in the ink-well, throw my papers from the window, hurl the porcelain jar on the chimney-piece at the cat next door, swing on the chandelier. I am conscious of no constraint in not doing these things. Why? 29 I have become to some degree adjusted to the type which the social-will strives to produce.

30 (2) And, having become so far adjusted, I recognise that the social-will is distributing rewards most lavishly. The whole organism of society is its instrument. 31 Work is found for me, and I am paid for it. If I am industrious and dependable, I am recompensed. If I am truthful, I am believed, which is no little convenience. If I am energetic and persevering, I may grow rich or be elected to office. If I am courteous, I am liked and am treated with courtesy.

32 Every day I am paid, in the ordinary course of things, according to my deserts. 33 Why should society work out an extraordinary system of rewards for those whom it is already rewarding automatically?

34 In some cases, recourse is had to extraordinary rewards. We give prizes to children in the schools; we give medals to soldiers for distinguished service; we confer honourary degrees upon people for a variety of reasons. 35 In monarchical countries and in their colonies, the person who earns an extraordinary reward may even pass it on, in the shape of a title, to own descendants, as though it were original sin. But the giving of extraordinary rewards to all ordinary, normal persons would be too much.

36 The person who markedly offends against the moral law is not an ordinary, normal person. You are not adjusted to the social-will. It is natural that you should attract especial attention. 37 Thus the "Thou shalt not!" is given prominence. To this I might add, that punishments are cheaper and easier than extraordinary rewards. Pains are sharper than pleasures, and are easily inflicted.

38 (3) It is worthy of remark that, with the evolution of morality, it tends to become positive. The enlightened moral person recognises, not merely the actual social-will, but also the Rational social-will. 39 You may feel it your duty to do much more than society formally demands of you.

HOW CAN ONE KNOW THE MORAL LAW?

40 This question has already been answered in chapters preceding. Every person has three counsellors: (1) The "objective" morality of your community--custom, law, and public opinion, which certainly deserve to be taken very seriously; 41 (2) your moral intuitions, which may be of the finest; and 42 (3) your reason, which prevents you from making decisions without reflection.

43 Can a person who listens to these three counsellors be sure that you are right in a given decision? 44 The sooner a person learns that you are not infallible and impeccable, the better it will be for you, for your neighbour, and for the world at large.

THE MORAL CONCEPTS
George Stuart Fullerton

GOOD AND BAD; RIGHT AND WRONG

36 As a rule, humans reflect little touching the moral terms which are on their lips every day. It is well worthwhile to take some of them up and to turn them over for examination.

2 We may use the terms "good" and "bad," "right" and "wrong," in a very broad sense. A "good" trick may be a contemptible action; 3 the "right" way to crack a bank-safe may be the means to the successful commission of a crime. Evidently, the words, thus used, are not employed in a moral sense.

4 When we pass judgments from the moral point of view, we concern ourselves with humans and with their actions, and measure them by the standard of the social-will. 5 Humans and actions are "good," when they can meet the test. Actions are "right" or "wrong," when they are in accordance with the dictates of the moral law, or are at variance with them. 6 That an act may be both right and wrong, when viewed from different standpoints, even on moral ground. A person may mean to do right, and may, through ignorance or error, be guilty of an act that we condemn.

7 To the intelligent, confusions are here unnecessary. But the history of ethics is full of confusions in just this field.

DUTY AND OBLIGATION

8 Verbal usage sometimes justifies the use of one of these words, and sometimes that of the other. We say: I did my duty; we do not say: I did my obligation. 9 But this is a mere matter of verbal expression, and we are really concerned with two names for the same thing.

10 (1) There has been much dispute as to whether the sense of duty or moral obligation can or cannot be analysed. It has been declared unanalysable and unique. 11 Some think this a point of much importance which imparts a peculiar sacredness to the sense of duty.

12 There appears no reason why this position should be taken. No one has been able to analyse into its ultimate sensational elements the peculiar feeling one has when one is tickled. But this does not make the feeling sacred or awe-inspiring. 13 The authority of the sense of duty must be looked for in another direction-- and authority it has.

14 (2) I have spoken of the "sense" of duty. We all recognise that, when we are faced with a duty, a feeling is normally present. 15 But the whole argument of this volume has maintained that human is not to be treated only as the subject of emotions. You are a rational being. 16 In some persons feeling is very prominent; in others it is less so. It is quite conceivable that, in a

given case, a person capable of reflection should recognise that you are confronted with a duty, and yet that you should feel no impulse to perform it. 17 Did no one ever feel any such impulse, the whole system of duties, the whole rational order of society itself, would dissolve and disappear.

18 Fortunately, the normal person does feel an impulse to perform duties recognised as such. And in the case of those exceptional persons who do not, society strives to supply surrogates, extraordinary impulses based upon a system of rewards and punishments. 19 This is a mere supplement, and could never keep alive a society from which the sense of duty had disappeared.

20 Duty ‘is’ sacred. It is the very foundation of every rational society. 21 It does not greatly concern ethics whether the impulse, which makes itself felt in people who want to do their duty, can or cannot be analysed. But it is all-important that they should feel the impulse.

22 (3) Can a person do more than own duty? Is it the duty of everyone to be, not merely a good, average, honest, faithful, law-abiding citizen, but to go far beyond this and be conspicuously a saint?

23 It should be remembered that we are concerned with the connotation properly to be given to a word in common use.

24 A certain amount of goodness the social-will appears to demand of people rather peremptorily. Its demands seem to vary somewhat with the exigencies of the times--for example, in peace and in war.

25 It does not make the same demands of all people. From those to whom much has been given--wealth, education, social or political influence,-- much is required.

26 From certain persons it appears to be glad to get anything. If they keep out of the police-court, it is agreeably surprised.

27 I have no desire to dissuade anyone from the arduous pursuit of sainthood; but I submit that the word "duty," as sanctioned by usage, implies but a limited demand, and takes cognisance of character and environment. 28 You who comes up to this moderate standard is not condemned; but

you are free to go farther and to become as great a saint as you pleases. In which case, we admire you. 29 Those who, in the past, have spoken of "counsels of perfection," have drawn upon a profound knowledge of human nature and of human societies.

REWARD AND PUNISHMENT

30 We saw in the last chapter that it is something of a criticism upon human and upon societies of people that extraordinary rewards have to be given and that punishments must be inflicted.

31 More attention has been paid to punishments than to rewards, and the question touching the proper aim of punishment in a civilised state has received much discussion. 32 The study of the history of the infliction of punishment is suggestive, but it does not shed a clear light. 33 The social-will has not always been a rational social-will, and some of its decisions may be placed among the curiosities of literature. Still, they may serve the purpose of the traditional "terrible example."

34 Should we, in punishing, aim at the prevention of crime? Are punishments to be "deterrent"? 35 Under this head we must consider, not merely the criminals themselves, but also those who are in more or less danger of becoming criminals, though they have, as yet, committed no known crime.

36 Should the aim of punishment be the reformation of the criminal? Should we punish merely that "justice" be done? 37 You who steals and eats fruit is visited with punishment, in the course of Nature, if the fruit is unripe. But you suffers equally if you eats your own fruit, under like conditions. 38 This seems a blind punishment. Should we visit pain upon you for the theft, merely because it is a theft, and without looking abroad for any other reason?

39 Light appears to be thrown upon these problems when we reflect that punishment is an instrument, employed by the Rational social-will, in pursuance of its ends.

40 (1) It is desirable that humans should be deterred from committing crime. If this cannot

be done save by the infliction of punishment, then let humans be punished. 41 But be it remembered that punishment is a regrettable necessity, and that the occasions for the infliction of penalties may greatly be diminished by the amelioration of the organism of society.

42 There is the born criminal, as there is the born inmate of an asylum for the insane. 43 But there is also the manufactured criminal; the product of the slum, the victim of ignorance, the prey of the walking-delegate, the sufferer from over-work and undernourishment, the inhabitant of the filthy and overcrowded tenement, the person robbed of own self-respect, who has no share in the sweetness and light of civilisation. 44 A society that first manufactures criminals and then expends great sums in punishing them is, in so far, not rational.

45 (2) It is desirable that the criminal should be reformed and returned to society as a normal person. But this is not the one and only aim of the social-will. 46 The whole flock should not be sacrificed to the one black sheep, as some sentimental persons appear to believe. There is room here for the exercise of judgment and of some cool calculation.

47 (3) As for the demand that a given pain shall be inflicted for a given wrong done, irrespective of any gain to anybody, and irrespective of consequences,-- it appears to carry one back to ancient and primitive law.

48 Undoubtedly many punishments have been inflicted in the past to satisfy the sense of resentment. Undoubtedly the same is true of the present. Can anything be said in favour of this impulse? It plays no small part in the life of humanity.

49 We feel that a bad person ‘ought’ to be punished. We harbour a certain resentment against you. 50 The resentment of the individual for personal injuries we recognise to be wrong. It is not impartial, and it is apt to be excessive and unreasoning. Public order demands that it be refused expression.

51 But is the-- we must admit, somewhat more disinterested-- resentment of the community a rational thing? Have people,

collectively, no whims, no prejudices? 52 When a trial is deferred, and public indignation has cooled off, how do the chances of the prisoner compare with those you enjoyed just after the commission of the crime? 53 And yet something may be said for public resentment. It has a certain driving-power. 54 It may be questioned whether either our desire to deter people from crime, or our benevolent interest in the criminal, would be quite sufficient to enforce law, if all sense of resentment against the law-breaker were lacking. 55 Its usefullness as an instrument of the social-will appears to give it a certain justification. But it also suggests that even public resentment should not be given free rein.

56 Before leaving the subject of reward and punishment, it may be well to say a word touching our use of the terms ‘credit’ and ‘discredit’, ‘merit’ and ‘demerit’.

57 We do not give a person credit for an action, we do not think of you as meritorious, merely because you have done right. 58 Who thinks of praising the young mother for feeding and washing her first-born? Who shakes the hand of the Sunday-school teacher and congratulates you upon having stolen nothing for a week? 59 But the waif from the gutter who wanders through a department-store and resolutely takes nothing, emerging exhausted with the struggle, we slap upon the back and call a little person.

60 Our notions of credit and merit are bound up with our notions of extraordinary rewards. The creditable action, the meritorious person, have a certain claim upon us, if only the claim of special recognition. 61 Any person who makes a notable step forward deserves credit, whatever your actual position upon the moral scale. 62 You who only "marks time" upon a relatively high level may be a good person, but we do not give you credit for the act normally to be expected of you. 63 The recognition of merit is a part of the machinery of moralisation.

VIRTUES AND VICES

64 One swallow, said Aristotle, does not make a spring, nor does

one happy day make a happy life. Elsewhere he draws our attention to the fact that one good action does not constitute a virtue.

65 We may define the virtues as those relatively permanent qualities of character which it is desirable, from the moral point of view, that a person should have. 66 The vices are the corresponding defects. I shall not attempt to draw up a list of the virtues. For a variety of lists, exhibiting curious and interesting diversities, I refer the reader back to Chapter-7.

67 The Rational social-will aims to build up a social order which shall do justice to the fundamental impulses and desires of human, a social and rational creature. 68 The stones which it must build into its edifice are human beings. If the human beings are mere lumps of soft clay, incapable of holding their shape or of bearing any weight, the walls cannot rise.

69 And a human being may be satisfactory in one respect, and far from satisfactory in another. No one of us is wholly ignorant of the qualities desirable in our building-material. 70 Custom, law and public opinion are there to indicate what qualities have, in fact, proved, on the whole, not detrimental. Our intuitions help us in forming a judgment. Rational reflection is of service.

71 But one thing is very evident. Nowhere is it made clearer than in the study of the virtues and vices, that the moralist cannot consider the phenomena, with which you occupies yourself, in a state of isolation.

72 Is courage a virtue? Is, then, the person who is willing to take the risk of breaking a bank, or holding up a stage-coach, in so far virtuous? 73 Is perseverance a virtue? Is, then, the woman, who holds out to the bitter end in her desire to have the last word, in so far virtuous? 74 Is justice a virtue? Then why not be virtuous in demanding the pound of flesh, if it is the law-- as it once was?

75 Certain qualities of character have been recognised as, ‘on the whole’, and ‘generally’, serviceable to the social-will. But a person is not a quality of character, and qualities of character are sometimes gathered into strange bundles. 76 It is of people that the state is composed;

of thinking, feeling humans. We cannot isolate qualities of character, and assess their value in their isolation.

CONSCIENCE

77 We are all forced to recognise that conscience has its dual aspect. It is characterised by ‘feeling’; and the feeling is seldom blind, or, at least, wholly blind; conscience implies a ‘judgment’ that something is right or wrong.

78 (1) The feeling is, to be sure, very often in the foreground. Those who say, "My conscience tells me that this is wrong," often mean little more than, "I feel that it is wrong."

79 But the word "feeling" is an ambiguous one. It is used to cover all sorts of intuitive judgments as well as mere emotions. 80 The person who takes the time to reflect upon own feeling of the rightness or wrongness of an action can often discover some, perhaps rather vague, reason for own feeling proper.

81 (2) In other words, you may come upon an intuitive judgment. And the thoughtful person who talks about own conscience is rarely satisfied with a blind intuition; you wants to be sure you are right, and you thinks the whole matter over.

82 (3) The feeling and the judgment are not necessarily in accord. The feeling may lag behind an enlightened judgment. 83 On the other hand, the feeling of repugnance to acting in certain ways may be a justifiable protest against a bit of intellectual sophistry.

84 (4) So much ought to be admitted by everyone who holds that conscience may be blunted or may be enlightened. Consciences vary indefinitely. 85 Some we set down as hopelessly below the average; others we reverence as refined and enlightened. 86 The social worker makes it own aim to "awaken" conscience, to cultivate it, to bring it up to a high standard. 87 No practical moralist regards the conscience of the individual as something which must simply be left to itself and treated as sacred, no matter what its character.

88 (5) The above sufficiently explains some of the puzzles which confront the person who

reverences conscience and yet studies the consciences of own fellow-people. 89 You finds that the individual conscience is not an infallible guide-post pointing to right action; that it is not a perfect time-keeper, in complete accord with the watches of other people.

90 "It's a terrible thing to have killed the wrong person," said the conscience-stricken illicit distiller in own mountain fastness. 91 "I never seen good come o' goodness yet; you as strikes first is my fancy," said the dying pirate in "Treasure Island." 92 Augustine, passing over much worse offences, exhausts himself in agonies of remorse over a boyish prank.

93 Seneca draws up a list of the most horrifying crimes, and decides that ingratitude exceeds them all in enormity.

94 (6) It appears to be quite evident that consciences ought to be standardised, and that the standard should be made a high one. The true standard is the one set by the Rational social-will. 95 It is as much a duty to have a good conscience as it is to obey the conscience one has.

THE ETHICS OF THE INDIVIDUAL

George Stuart Fullerton

WHAT IS MEANT BY THE TERM?

37 People collected into groups and organised in various ways we call states, and we treat a state as a unit. 2 We look upon it as having rights and as owing duties both to individuals and to other states. 3 There are individuals whom we are apt to regard as representatives of the state; as instruments, rather than as people-- executive officers, legislators, official interpreters of its laws, whether good or bad. 4 For states and their representatives we often have especial moral standards, differing more or less from those by which we judge human beings merely as human beings. It is with the morality of the latter that I am here concerned. 5 To be sure, all human beings are to be found in states, or in that rudimentary social something which foreshadows the state. 6 To talk of the morality of the isolated individual is nonsense. Morality is the expression of the social-will; and if we think of even you as a

good person, it means that we apply to you social standards.

7 We must, then, take the individual as we find you in the state, but it is convenient to consider your morality separately from the ethics of the state, its institutions and its instruments.

THE VIRTUES OF THE INDIVIDUAL

8 What moral traits have we a right to look for in the individual human? What sort of a person is it your duty to be?

9 Evidently, human's duties must vary somewhat according to the type of the society to which they belong, and to their definite place in that society. 10 Still, certain general desirable traits of character unavoidably suggest themselves. To attempt a complete list seems futile, but the most salient have been dwelt upon by the moralists of many schools, and for centuries past.

11 Does it not appear self-evident that a person should be law-abiding, honest, industrious, truthful, and capable of unselfishness? 12 Should you not have a regard for your health and efficiency? Should you not aim to develop your capacities, and in so far to diminish the dead mass of ignorance and bad taste which weighs down society?

13 Of marital fidelity, with all that that implies-- personal purity, the good of one's children, a fine sense of loyalty-- it is scarcely necessary to speak. 14 No person, betrothed or married, can be sure that you will not meet tomorrow some one whom the unprejudiced would judge to be more attractive than the one to whom you have bound yourself. 15 Shall you remain unprejudiced-- a floating mine, ready to explode at any accidental contact? 16 Away with you! You have, in the eyes of the scientific moralist, "too much ego in your cosmos." 17 Those babble of "affinities" who know little, and care less, about the long and arduous ascent up which humankind has toiled, in the effort to attain to civilisation.

18 And what shall we say of such things as religious duties, of cheerfullness, of good manners, of personal cleanliness? Of religious duties I shall speak elsewhere. 19

As to cheerfullness and good manners, it is only necessary to reflect upon the baleful influence exercised upon the young-- who have here my entire sympathy-- by a bilious and depressing piety, or by those who are rudely and superciliously moral.

20 Cleanliness deserves some special attention, on account of the fact that it has perplexed even thoughtful scholars to discover why society has come to regard it as a duty at all. 21 That, if society does regard cleanliness as important, it should be the duty of the individual to keep yourself and your house clean, presents no problem. 22 You have no right to make yourself gratuitously offensive, and gratuitously offensive you will be, if you are a dirty fellow. 23 But why does anyone object to you being a dirty fellow? The prejudice in favour of cleanliness does not appear to be universal-- witness the Eskimo and various other peoples.

24 We have learned that the social-will has its foundation in the fundamental impulses and instincts of human. 25 An admirable scholar has suggested that the ultimate root of the regard for cleanliness which more or less characterises civilised societies may be traced to some such primitive and inexplicable impulse to cleanliness as we observe, for example, in the cat. 26 It must be admitted that it is far more marked in the cat than in the human being. A kitten is much more fastidious than is a baby, and a grown cat would tolerate no powder or rouge.

27 But, assuming that such an instinct exists, even in weak measure, it might easily develop with the development of society. 28 And, as human is a rational being, capable of discovering a connection between cleanliness and hygiene, the duty of cleanliness would acquire a new authority. Dirt becomes no longer merely distasteful; it is recognised as a danger.

CONVENTIONAL MORALITY

29 There are virtues-- taking the traits of character indicated by the names broadly and loosely, and making allowance for all sorts of variations within wide limits--

which appear to be recognised as such very generally. 30 Bishop Butler regarded justice, veracity and regard to common good as valued in all societies. Certainly they have served as expressions of the social-will in many societies, ancient and modern, primitive and highly civilised.

31 We have seen that the forms under which they appear are not independent of the degree and kind of the development of the society we may happen to be contemplating. 32 And we have realised that human is born into a world of ready-made duties which are literally forced upon your attention. 33 You finds yourself a member of a family, somebody's neighbour, a resident in a town or village, allotted to a social class, an employer or an employee, a citizen of a state. 34 Justice, veracity and a regard for common good appear to have their value in all these relations; but the manner of their interpretation is not independent of the relations, and the relations with their appropriate demands are relatively independent of the individual will. 35 One cannot ignore these demands and fall back, independently, upon metaphysical theory. 36 Aristotle's claim that a human cannot be unjust to one's own child, because the child is a part of oneself, and a human cannot be unjust to oneself, excites our curiosity. It does not elicit our approval.

37 It is because the vast majority of our duties are so unequivocally thrust upon us that I have been able to touch so lightly, in the last section, upon the duties of the individual. 38 Why dilate upon what everybody knows? Is it not enough to set you thinking about it?

39 And, in helping you to think, the reference to the virtue of cleanliness has its value. Cleanliness is prized by those who know little of hygiene.

40 If a society cannot be happy without cleanliness, for whatever reason, is it not the duty of the individual to be clean? But 'how' clean should one be?

41 There are virtues-- I use the word here broadly to cover approved habits-- which seem to have a very direct reference to chronology and geography.

42 They are ‘conventional virtues’; they suit a given society, and satisfy its actual social-will. 43 A Vermont housekeeper in an ‘igloo’ would be an intolerable nuisance. Imagine an unbroken succession of New England house-cleanings with the inhabitants of the house sitting in despair in the snow outside.

44 Those who live north of the Alps are sometimes criticised for dipping Zwieback into their tea. Those who live south of the Alps eat macaroni in ways revolting to other nations. 45 A very pretty Frenchwoman, devouring snails after the approved fashion of the locality, has driven me out of an excellent restaurant. And the world opens its eyes in wonder when it sees the well-bred Anglo-Saxon dispose of his asparagus.

46 There is a little-recognised virtue called toleration. St. Ambrose was a wise man when he advised St. Augustine to do, when in Rome, as the Romans do. 47 Of course, he did not mean this to apply to robbery or to murder. He was giving an involuntary recognition to the doctrine that there are conventional virtues, worthy of our notice, as well as virtues of heavier caliber and wider range.

THE ETHICS OF THE STATE

George Stuart Fullerton

THE AIM OF THE STATE

38 He who has resolved to devote but a single chapter to the Ethics of the State must deliberately sacrifice nine- tenths, at least, of the material-- 2 some of it very good material, and some of it most curious and interesting-- which has heaped itself together on your hands in the course of your reading and thinking. 3 I have resolved to write only the one chapter. The State is the background of the individual, the scaffold which supports your moral life. Without it, you may be a being; but you are scarcely recognisable as a human being.

4 It has made the individual what you are, and it is the medium in which you can give expression to the nature which you now possesses.

5 Plato maintains that the object of the constitution of the state is the happiness of the whole, not of any part. 6 Aristotle, in his "Politics," maintains that it is the aim of the state to enable people to live well. 7 Sidgwick defines politics as "the theory of what ought to be (in human affairs) as far as this depends on the common action of societies of people."

8 We may agree with all three, and yet leave ourselves much latitude in determining the nature of the organisation of, and the limits properly to be set to the activities of, the State as such. 9 Shall the State only strive to repress grave disorders? Or shall it take a paternal interest in its citizens, making them virtuous and happy in spite of themselves?

ITS ORIGIN AND AUTHORITY

10 In Chapter 12 to Chapter 24 we have seen how and upon what basis the State has grown up. It is an organism, something that lives and grows. 11 It is not a machine, deliberately put together at a definite time by some human or some group of people. 12 The "social contract" fanatic may have read history, but you have not understood it. Of psychology you have no comprehension at all.

13 Herodotus, at some of whose stories we smile, was a wiser man. He writes: "It appears certain to me, by a great variety of proofs, that Cambyses was raving mad; he would not else have set himself to make a mock of holy rites and long-established usages. 14 For, if one were to offer people to choose out of all the customs in the world such as seemed to them the best, they would examine the whole number, and end by preferring their own; so convinced are they that their own usages far surpass those of all others."

15 This may be something of an over-statement, for people in one state have shown themselves to be, within limits, capable of learning from people in another. But only within limits. 16 Those things which give a state stability-- and without stability we are tossed upon the waves of mere anarchy-- have their roots in the remote past. 17 Strip a person of own past, and you are little better than an idiot;

18 strip people within the State of their corporate institutions and ideals, of their loyalties and emotional leanings, and we have on our hands a mob of savages, something much below the tribe proper, knit into unity of purpose by custom and tribal law.

19 The State has its origin in human as a creature desiring and willing, and at the same time endowed with reason. Its authority is the authority of reason. 20 Not reason in the abstract, with no ground to stand upon, and no material for its exercise; but reason as incorporate in institutions and social usages; 21 reason which takes cognisance of the nature of human, and recognises what human has already succeeded in doing.

22 Where shall we look for a limit to the authority of the State? Surely, only in the Reason which makes it possible for the State to be. The State must not defeat its own object.

FORMS OF ORGANISATION

23 The special science of politics enters in detail into the forms of organisation of the State. The ethical philosopher must content the self with certain general reflections.

24 Everyone knows that States have been organised in divers ways; and that their citizens, under much the same form of political organisation, have been here happy and contented, and there in a state of ferment. 25 The form of government counts for something; but its suitability to the population governed, and the degree of enlightenment and discipline characteristic of the population, count for much more. 26 It is not every shoe that fits every foot, and there are feet that are little at home in shoes of any description.

27 Monarchies of many sorts, aristocracies, oligarchies, democracies, even communisms, have been tried; and all, save the last, have managed to hold their own with some degree of success. 28 It is easy to bring objections against each form of government,

just as it is easy to say something specious in its favour.

29 Are the eldest sons of a few families peculiarly fitted by Nature to be governors of the State? 30 Look at history, and wake up to common sense. Of the divine right of kings I shall not speak, for the adherents of the doctrine are in our day relegated to museums of antiquities. 31 And have the members of aristocracies been carefully bred with a view to their intellectual and moral superiority, as we breed fine varieties of horses and dogs? 32 Have those who have had their share in oligarchies been peculiarly wise and peculiarly devoted to the common good? 33 The communist makes two fatal mistakes. You shuts your eyes to history, and you overlooks the fact that there is such a thing as human nature.

34 There remains democracy. Of this, Herodotus, already quoted as a man of sense, has his opinion. He makes a shrewd Persian, in a political crisis, thus address his fellow-conspirators: 35 "There is nothing so void of understanding, nothing so full of wantonness, as the unwieldy rabble. 36 It were folly not to be borne, for people, while seeking to escape the wantonness of a tyrant, to give themselves up to the wantonness of a rude unbridled mob. 37 The tyrant, in all own doings, at least knows what the self is about, but a mob is altogether devoid of knowledge; 38 for how should there be any knowledge in a rabble, untaught, and with no natural sense of what is right and fit? 39 It rushes wildly into state affairs with all the fury of a stream swollen in the winter, and confuses everything. 40 Let the enemies of the Persians be ruled by democracies; but let us choose out from the citizens a certain number of the worthiest, and put the government into their hands."

41 To be sure, we, who belong to a modern, enlightened democracy, would resent being called "a rude unbridled mob," and being likened to the populace of ancient Persia. 42 But those of us who reflect recognise the dangers that lurk in the "psychology of the crowd"; and we are all aware that, after a popular vote, it is quite possible to discover that few, except a handful of office-holders, have gotten

anything that they really want. 43 Democracy is not a panacea for all political evils, and there are democracies of many kinds.

44 Still, when all is said, it seems as though the Rational social-will, the ultimate arbiter of every moral State, should give its authority to a democratic form of government, rather than to another form. Every individual will has a ‘prima facie’ claim to recognition.

45 But the Rational social-will can never forget that human nature is in process of development, and that each nation, at a given time, is a historical phenomenon. 46 The Rational social-will is too enlightened to drape an infant in the raiment appropriate to a college graduate. It is only an intemperate enthusiasm that is capable of that.

THE LAWS OF THE STATE

47 The State allots to individuals, and to the lesser groups of human beings, of which it is composed, ‘rights’, and it prescribes to them ‘duties’. 48 Upon its activities in this sphere I can touch only by way of illustration, and for the sake of making clear the nature of the functions of the State.

49 (1) To whom shall the State grant a share in the formulation and execution of its laws? 50 Once, in communities very enlightened, in their own peculiar way, women, children, slaves, mechanics, petty traders, and hired servants were deemed quite unfit to be entrusted with such responsibilities.

51 With us, the position of woman has changed. Slavery, in a technical sense, has been abolished. The mechanic and the petty trader are much in evidence at "primaries." 52 Hired servants are by some accused of being tyrants. Children, and defectives who are grossly and palpably defective, we bar from elections, and we also reject some criminals.

53 The times have changed, and our notions of the right of the individual to an active share in the State have changed with them. 54 The expression of the social-will has undergone modification, and I think we can say that it is, on the whole, modification in the right direction.

55 To be sure, the court of last resort is the ‘Rational’ social-will.

What is best for the State, and, hence, for those who compose it? 56 What is practicable in the actual condition in which a given state finds itself at a given time? 57 It seems too easy a solution of our problems to seek dogmatic answers to our questionings by having recourse to the "natural light," that ready oracle of the philosopher, Descartes.

58 (2) There are certain classes of rights which civilised states generally guarantee to their citizens with varying degrees of success. They make it the duty of their citizens to respect these rights in others.

59 (a) The laws protect life and limb. Much progress has been made in this respect in the last centuries past. 60 I own no coat of mail; and, when I walk abroad, I neither carry a sword nor surround myself with armed retainers.

61 (b) They protect private property. To be sure, the "promoter" may prey upon my simplicity; and the state itself does not recognise that I have any absolute right to my property, any more than it recognises that I have an absolute right to my life.

62 It may send me into the trenches. It may take from me what it will in the form of taxes. It may even forbid me to increase my income by using my property in ways which will make me insupportable to my neighbours. 63 But it will not allow my neighbour, who is stronger than I, to take possession of my house without form of law. It will even allow me to dispose of my property by will, after my death.

64 I suggest that those, to whom this right appears to be rooted in the very nature of things, and not to be a creation of the State, called into being at the behest of the social-will in a certain stage of its development, 65 should read and re-read what Sir Henry Maine has to say about testamentary succession, in his wonderful little book on "Ancient Law."

66 The State has not always treated a person as an individual, directly and personally responsible to the state. 67 It has treated you as a member of a family or some other group; a being endowed, by virtue of your position, with certain rights, and burdened with certain duties. 68 A being who, when you

drops out of being, is automatically replaced by someone else who is clothed upon with both your rights and your responsibilities.

69 Our conceptions have changed. The lesser groups within the State have to some degree lost their cohesion, and the bond between the individual, as such, and the state has been correspondingly strengthened. 70 But many traces of the old conception make themselves apparent. The law compels me to provide for my wife and children; and, if I die intestate, the law by no means assumes that my property is left without a claimant.

71 Have we been moving in the right direction, as judged by the standard of the Rational social-will? We think so. 72 But it is well to bear in mind what Herodotus said about the madness of Cambyses, and the prejudice people have in favour of their own customs. 73 No state is a mere aggregate of unrelated individuals. People are set in families, and the State seems to be composed of groups within groups. 74 How far the State should recognise the will of the individual, as over against the claims of the lesser groups to which you may belong, is a nice question for the Rational social-will to settle.

75 (c) The law must regulate marriage and divorce. Matters so vital to the interests of society cannot be left at the mercy of the egoistic whims of the individual. 76 But to what law shall we have recourse? It seems highly irrational to have forty-eight independent authorities upon this subject within the limits of a single nation. 77 And, if we turn the matter over to the churches, we discover that we have committed it to the care of one hundred and eighty, or more, sects. 78 Add to this, that a state of any sort cannot be set upon its feet without some difficulty, while any enterprising man or woman can call a sect into existence any day. 79 There is a new adherent for sectarian eccentricities born every minute. Surely, here is a field for the activities of the Rational social-will.

80 (d) To paternalism of some sort the modern State, as law-giver, seems hopelessly pledged. If we

ignore this we are simply closing our eyes. 81 The State seems to be justified in educating its citizens, in protecting children and women against exploitation, in protecting the working classes, in stamping out infectious diseases. 82 We are not even allowed to expectorate when and where we will, a privilege enjoyed by the merest savage.

83 (e) In one respect the paternalism of our own State has lagged behind that of certain others. We do little to secure to a person a decent privacy, or to safeguard your personal dignity. 84 The newspaper reporter is allowed to rage unchecked, to unearth scandals in private families, and to cause great pain by printing the names of individuals.

85 I have known, in Europe, a man, after a difference of opinion touching the ventilation of a railway carriage, to break a window with his elbow and to apply to his fellow-passenger an offensive epithet. 86 The court made him pay a dollar and a half for breaking the window and six dollars for giving himself the pleasure of being insulting.

87 Which was the greater offense? Herodotus would expect this question to be answered in accordance with the prejudices of the person giving the answer.

THE RIGHTS AND DUTIES OF THE STATE

88 The State evidently has rights over its citizens, and may enforce these rights through the infliction of punishment. It as evidently has duties. 89 A given state may not be answerable to any actual given power. Our own State is in such a position at the present time-- there is no other state strong enough to call it to account.

90 But this does not free it from duties. No state is anything more than a brute force, except as it incorporates, in some measure, the Rational social-will. 91 And states that fall far short, as judged by this standard, may overstep their rights and ignore their duties, whether they are dealing with individuals or with other states.

92 In punishing, the State should punish rationally. And it should not demand of its subjects what will degrade them as moral beings.

93 "We all recognise," said a pure and candid soul, "that a rightful sovereign may command own subjects to do what is wrong, and that it is then their duty to disobey."

94 But how discover what demands are just? It is the whole argument of this volume that no person should venture an opinion upon this subject without having come to some appreciation of what is meant by the Rational social-will. 95 Human, your instincts, the degree of your intelligence and self-control, the history of the development of human societies, cannot be ignored. 96 It is the weakness of good people, endowed with a high degree of speculative intelligence, to construct Utopias, and to tabulate the "rights of human," or, as Bentham well expressed it, to make lists of "anarchical fallacies." 97 Thus, some may, with Plato and Aristotle, advocate infanticide. The Greek city-state was a crowded little affair, and in danger of over-population. Some may propose radical measures to increase the population. 98 To France and Argentina, in our day, such an increase appears highly desirable. May any and every method be embraced which seems adapted to avert a given evil or to attain to a desired end? 99 It is instructive to note that Francis Galton, the father of "eugenics," proposed to leave morals out of the question as "involving too many hopeless difficulties." But do people live well who leave morals out of the question?

100 The people who falls back upon intuition alone, in his advocacy of the abolition of capital punishment, may be expected to maintain next that a state, in going to war, should stop short at the point where the lives of its citizens are put in jeopardy. 101 Why kill a good person, when it is wrong to kill a bad one?

102 It must be admitted that the State and its representatives enjoy some rights and duties not accorded to individuals. 103 The State may condemn people to death or to imprisonment; it may take over property; it may make itself a compulsory arbiter between individuals. On the other hand, its representatives are not always as free as are private

persons. 104 The individual, if you are a generous soul, may freely forego some of your advantages and may seek only a fair fight with an opponent. 105 It is doubtful whether the duty the State owes to its citizens permits of chivalry. 106 Certainly strong states do not hesitate to attack weak ones; nor do many hesitate to combine against one, on the score of fair play. And a private person may temper justice with mercy in ways forbidden to a judge.

INTERNATIONAL ETHICS

George Stuart Fullerton

WHAT IS MEANT BY THE TERM

39 I am almost tempted to avoid the discussion of this thorny subject by simply referring the reader to what has been said already on "The Spread of the Community," and developed in the chapters on "The Rational social-will" and "The Individual and the social-will."

2 You who confines yourself to generalities avoids many difficulties and can assure yourself of the approval of many. Who, condemns justice and humanity in the abstract? 3 Who can wax eloquent in own condemnation of freedom? Who finds the Christian Church on own side, when you advocates rapacity and the oppression of the helpless, without entering into details?

4 On the other hand, who wishes to view own country with a cold impartiality, and to place its interests exactly on a par with the interests of other lands? 5 Who, save the Chinaman himself, thinks it as important that a Chinaman should have enough to eat as that an American or an Englishman should? 6 Was not the turpitude, that excluded the Chinaman from Australia, traced to the two deadly sins of undue diligence and sobriety? 7 As for freedom, people of certain nations regard it as the highest virtue to be willing to die for it-- their own freedom, be it understood,-- 8 while they regard the same desire for freedom on the part of their colonists as a moral obliquity to be extirpated, root and branch.

9 That the historian and the sociologist should find much to

say touching the relation of nations to each other and to subject peoples goes without saying. 10 But the cynic may maintain with some plausibility that the moralist's chapter on International Ethics must be as void of content as the traditional chapter on "Snakes in Ireland." 11 In this the cynic is wrong, as usual; but it is instructive to listen to you, if only that we may intelligently refute you.

12 It is not always easy for an individual to determine just what you owes to your family, to your neighbours, or to your country. 13 Is it surprising that it should be difficult for people to determine just what one country, or what one race, owes to another? This is the subject of international ethics.

14 You who treads upon this ground should walk gingerly, and not feel too sure of yourself. 15 But there is no reason why the moralist should not put upon paper such reflections as occur to you. You cannot say anything more devoid of reason than much that is said by others.

16 The great Grotius, in writing on international law, in the seventeenth century, drew his illustrations chiefly from Greeks and Romans long dead. 17 He had much more recent material ready to hand. But he well knew that you, who would induce another to give you calm and dispassionate attention, must not begin by treading on the toes of your listener. 18 I shall strive to profit by his example. It is best to say only what each person can apply to own neighbour. We are all sensitive in this field.

OUR METHOD OF APPROACH TO THE SUBJECT

19 We have seen that rational elements are to be found even in the irrational-will, if one will look below the surface.

20 Is it rational for the mother to place before all else the interests of the hairless, toothless and, apparently, mindless little creature that she clasps to her breast? 21 The very existence of society depends upon her having the feeling that prompts her to do it. 22 Is it rational to favour one's neighbour, to be proud of one's native town, which may be a poor

sort of a town? 23 Is it rational to be patriotic, even when one's state is not much of a state?

24 We have seen that the Rational social-will incorporates itself in societies very gradually, and that it draws into its service lesser groups of many descriptions. 25 You who detaches yourself from these lesser groups is not a person. You are the mere outline of a human-- the "featherless biped" of the philosopher. It is not of such that a state can be made.

26 It is the duty of the state to prevent a person from shrinking into being the mere member of some lesser group, but it is not its duty to obliterate what is human in you. 27 And the Rational social-will must see to it that you does not, on the other hand, forget, in a blind and irrational patriotism, that you are a human being with a capacity for human sympathies--sympathies extending far beyond the limits of any state. 28 Except when they are under the influence of strong passion, I think we may say that people in civilised states, at least, have already shown themselves amenable to the influence of the Rational social-will in this direction. 29 It must be confessed that that influence has, as yet, been limited.

30 The approach to the subject of international ethics must lie in the recognition that people are set in families, in neighbourhoods, in towns or cities, in states; 31 and are yet human beings with a capacity for respecting and loving those who belong to none of these particular organisations. 32 My advice to the person who wishes to abuse own fellow-human is to do it quickly, and before you are acquainted. If you gets to know this person well, you will probably find something lovable, and you will lose the pleasure of being malicious.

SOME PROBLEMS OF INTERNATIONAL ETHICS

33 The person who reads history finds, sometimes, things to inspire you; and sometimes, things that are depressing. 34 You sees that the family must expand into the clan, that the clan must come into contact with others, that the state must rise, and that some interrelation of states is an

inevitable necessity. 35 You sees that human's increase in insight, in diligence, in enterprise, must make you reach out and trade with your fellow-human.

36 You sees also conquest, with the subjugation of peoples; you sees trade extended by force, and under the smoke of cannon; 37 you sees a peaceful economic penetration, which ends in protectorates and annexations, in defiance of the will of those who do not want to be either protected or annexed.

38 What is rational is real, and what is real is rational, said Hegel. 39 He further maintained that civilised nations may treat as barbarians peoples who are behind them in the "essential elements of the state"; 40 and also that, in a given epoch, a given nation is dominant, and "other existing nations are void of right."

41 Hegel has long been dead, and is turned to dust. He always was as dry as dust, even when he was alive, but he was a great man. 42 But the famous Englishman, Sir Thomas More, wrote more engagingly; and does he not tell us, in his "Utopia," that any nation's holding unused a piece of ground needed for the nourishment of other people is a just cause of war?

43 Such doctrines should be most comforting to us Americans. They appear to teach us that we are, at present, the chosen people; 44 that the rights of other peoples are as the rights of the Hivites, the Hittites, and all the rest; that we are justified in taking what we please, for who is there to withstand us?

45 Yet ethical Americans shake their heads over such philosophies, and some of them even speak slightingly of philosophers. 46 This, in spite of the fact that great people seldom talk pure nonsense, except when carried away by excitement, as all people may be, at times. 47 If what they say sounds to us wholly unmeaning, it is probable that we have not fully understood the voice that speaks within them. 48 What can be said in their defense? And what can be said in, at least, partial defence of the actual historical procedure of the nations? 49 They have not been wholly composed of criminals, and they must possess at least the rudiments of a moral sense.

ETHICS

50 (1) We have seen that the state maintains its right as against those who belong to it by controlling, not by destroying, the lesser groups which exist within the state. 51 Such a control appears to be demanded by the Rational social-will, but it often frustrates the will of the individual.

52 (2) We have seen that the spread of the community is inevitable, and that, in the interests of rationality, it is desirable.

53 (3) We have seen that, even in the family, all the members are not equally free agents. The small child is not consulted touching the amount of own punishment, nor can the child dictate where it shall be laid on. 54 And the state does not give to all the individuals in it equal political rights, nor guarantee to them an equal share of influence. 55 This is desirable, on the whole, in the interests of the whole, but grave abuses may easily come into being.

56 (4) We have seen that the greater whole guarantees to individuals rights, and assigns to them duties. In so far as it is rational, it cannot do this arbitrarily. 57 To have recourse to metaphysical abstractions is futile. Shall we say, without hedging, that a person has a right to the fruits of own labour, or that first occupation gives a right to the soil?

58 Then, shall the person who is too weak to work be refused a right to the ownership of a coat? 60 Or must the discoverer of a continent prove a real occupancy, by performing the ridiculous task of the abnormal center of the mythical mathematical infinite circle, by being everywhere at the same time?

61 (5) We have seen that the human community, taking the words in a broad sense, will spread, and already has spread, beyond the limits of several nationalities. 62 It is in the interest of human society that it should do so. It is rational, in the sense of the word everywhere used in this book. 63 But the nations continue to exist, and they often cultivate selfishly national interests. So do families cultivate selfishly family interests. So does the egoist selfishly dig about and fertilise the number One.

64 (6) It requires little acuteness to see that some communities of people are miserable exponents of the social-will. They are deplorably governed. 65 Read Slatin's fascinating book, "Fire and Sword in the Soudan,"-- it is better than any novel,-- and ask yourself what becomes of the social-will or of rationality of any sort under the rule of a Mahdi. 66 Is it not the duty of the nations to combine and to relieve suffering humanity?

67 (7) There are theorists who maintain that, in the nature of things, the soil belongs to nobody. We find, in the actual state of things, it usually belongs to somebody, unless it is so poor that it is not worth owning at all. 68 But it may belong to somebody who can make little more use of it than an infant can of a gold watch. 69 A handful of Indians, wandering over a great tract of country in which they chase game in the intervals of time during which they chase and scalp one another, may have an immemorial, although unrecorded, title to the land.

70 Shall they be permitted to keep back settlers from more or less civilised and densely populated countries? 71 Settlers eager to cultivate the land and to make it support many, where before it supported few, and supported those few miserably?

72 And shall the natural resources of great regions of the earth be permitted to lie fallow merely because the actual inhabitants are too ignorant and too indolent to want to produce anything and to trade? 73 You who finds your happiness in idleness, bananas, and black wives who can be beaten with impunity, has little interest in international traffic, with such blessings as it is supposed to bring.

74 The world is filling up. The losses due to war and pestilence, said no less an authority than Darwin, are soon made up. 75 There is something terrifying in what the very modern science of geography has to tell us about the rapidity with which the remaining part of the earth's surface, available for the nourishment of human, is being exhausted. 76 What problems will face the Rational social-will in the none too distant future?

ETHICS

THE OTHER SIDE OF THE SHIELD

77 We have seen that something can be said for the philosopher. The Rational social-will does not appear to give carte blanche to the person who wishes to remain ignorant, idle, cut off from the family of the nations, 78 the possessor of great tracts of land which you will not develop, the cruel oppressor of such as you finds within your power. 79 It tends to deal with you, wherever it finds you, as an enlightened nation treats the idle, the vicious and the irresponsible within its own borders.

80 Undoubtedly civilisation has made some advance in the course of the centuries. When the world is at peace, the stranger is not normally an outlaw. 81 I have sojourned in the cities of many of the nations of Europe and have made excursions into Africa and Asia. Nowhere have I been compelled to ask for the protection of an American consul. 82 It has been recognised that I had rights, although an American. And the ability to sign my name has procured me a supply of money.

83 Notwithstanding all this, it is depressing to read of the dealings of the nations with each other, and with backward peoples-- who have been well defined as peoples who possess gold-mines, but no efficient navy. 84 Is it not generally taken for granted that it is the duty of more powerful and more enlightened nations to take the backward nations in hand, to exploit their resources, and, incidentally, to exploit ‘them’?

85 Not that international law has not counted for something. To be sure Hegel reduced it to the level of "a good intention," but it has counted for something.

86 Descartes and Spinoza could, with impunity, be heretics in little Holland. Switzerland has for centuries been the refuge of the oppressed.

87 But we cannot forget that our highest authority, Captain Mahan, declared, in 1889, that certain rights of neutrals were "forever secured," and you have since stood revealed as a false prophet, a mere human making a guess. 88 International law is a capital thing-- when it is not put under a

strain, and when no nation is too powerful.

89 The depressing thing is that rapacity and oppression become glorified, when the cloak of patriotism is thrown over their shoulders. 90 I drew my illustrations in the last section from wild Indians and from African savages. But there are nations in all stages of their development. 91 How "backward" must a nation be to give us the right to rule over it by force? No people were more ingenious than the ancient Romans in finding plausible reasons for the wars which it pleased them to wage. 92 This has never been a lost art. People's enemies are, like the absent, always in the wrong; and those are apt to become enemies, in whose defeat some substantial advantage is to be looked for.

THE SOLUTION

93 The very title seems a presumption. Who may dogmatise in matters so involved? 94 I make no pretensions to giving a clear vision of "yonder shining light," but I venture to hint at the general direction in which one is to seek the little wicket gate.

95 The only ethical solution of our problem appears to lie in the frank recognition of the fact that the groups of people, called nations, may be as brutal egoists as are individual persons, and in the earnest attempt to avoid the baleful influence of such egoism.

96 Human is your brother's keeper. But that does not give you the right to keep your brother in chains, nor to use others for selfish ends. 97 This is as true of nations as it is of individuals, of families, of religious orders, or of unions, whether of employers or of employees.

98 It is certainly true of nations. It is only as having a place in, and as being an instrument of, the great organism of humanity aimed at by the Rational social-will, that the individual, the family, the tribe, the nation, have any ethical justification for being at all. 99 Sometimes it is very profitable for the individual, or for some group of human beings, to disallow this obligation to be moral. 100 We treat the individual as a robber;

why not admit that there are robber nations?

101 I feel like reiterating that it is a great thing to be young; to live in that Golden Age in which one still believes what one sees in print, and still is moved by the honeyed words of statesmen. 102 When one is old, and has enjoyed some breadth of culture, one has read the newspapers of many lands, and has met a certain number of statesmen, usually with a start of surprise.

103 It is borne in upon one-- a matter touched upon in the last chapter-- that it appears to be generally accepted that the state and its representatives may adopt a peculiar variety of ethics. 104 Certainly statesmen feel justified in doing for their country what they, as gentlemen, would never dream of doing for themselves. 105 They talk of justice, when they would scoff at such justice within the borders of their own states; 106 they talk of humanity, and they have in mind the economic advantage of their own peoples; 107 they speak of protection and Christianisation, when they mean economic exploitation or strategic superiority. 108 As for truth, the less said about that subject the better.

109 I know of only one way in which the determination of a nation to aid in the general realisation of the Rational social-will can be tested. 110 Does it, in dealing with other nations, civilised or backward, propose what is palpably to its own advantage, or is it evidently disinterested? 111 It is thus that we judge other persons, when we wish to fix their ethical status; it is thus that the Rational social-will judges a nation. The language in which the proposals are made is a matter of no moment. 112 It may fairly be called professional slang, and can quickly be acquired, even by people of mediocre intelligence, in any diplomatic circle.

THE NECESSITY FOR CAUTION

113 Shall a person, then, eschew patriotism, and become a citizen of the world, as though you were a Stoic philosopher?

114 By no means. As well eschew the family or the neighbourhood. But let you not, in your patriotism,

forget that you are a human. 115 Here, as everywhere, you are called upon to exercise judgment. This is a burden which you can never throw off. You must pay the penalty of being a rational human being. 116 As an instrument of the Rational social-will the state must be kept up. It is your duty to see that it is done. Your cat has an easier task; it may sleep its life away in peace.

117 We hear much of the brotherhood of human and of artificial barriers. The barriers are not all artificial, and they cannot be swept away with a gesture.

118 Races and peoples are formed upon the model of their own immemorial past. They have their institutions, their traditions, their loyalties, their standards of living. 119 What is tolerable to one person is wholly intolerable to another. To compel people to live together in intimacy, when centuries of training have made them antipathetic, is sheer cruelty.

120 People may be brothers, but there are big brothers and little brothers. I do not refer to physical bulk. I refer to the development of intelligence, to the degree and kind of culture, which has been attained. 121 There are little brothers still at the stage of development at which it is natural for human beings to drool. Shall we have them sit up to the table and serve them with the complete dinner, enlivening it with intellectual conversation?

122 Between incontinently doing this, and relegating the little brothers to a nursery where they will be treated with cruelty and starved in our interests, some persons seem to think there is no middle course. 123 In their enthusiasm for humanity, they forget that the brotherhood of human may be made as ridiculous as the eight-hour day. 124 Between eight hours of the creative work of a Milton and eight hours of the dawdling done by a lazy housemaid, there is no relation save that both may be measured by a clock.

125 These enthusiasts forget much. People are not alike; they do not want to be alike; they do not want to live together in close intimacy, when they have little in common; 126 they reverence different things; as a rule, they would rather be

somewhat unhappy after their own fashion, than be happy under compulsion, after the fashion of someone else.

127 We have, thus, on the one hand, the enthusiasts who would at once sound the trump and announce the millennium, feeding the lion and the sucking calf out of the same dish and on the same meat. 128 We have, on the other, those who are eager to take on their shoulders the white person's burden-- to enclose in a coop, as if they were chickens, the greater part of the human race, 129 allaying the discontent of the imprisoned by pointing out to them that, although their freedom of movement is limited, they are growing fat, and that they should show their gratitude by laying eggs.

130 Surely, there must be some middle course. Patience and caution are virtues. 131 Surely, it is possible to accept the existing organism of society, to love one's country, and yet to strive to respect the freedom of others. 132 It is not easy for a true patriot to do this, but it seems to be what the Rational social-will demands of you.

133 The moralist who reads history carefully is not wholly discouraged. You may look forward to some time, in the more or less distant future, when there may be a union of the nations in the interests of all people; 134 when the gross egoism of the hypertrophied patriot may be curbed; when the mellifluous language of the statesman may mean more than did the pious letter which Nero wrote to the Roman Senate, after he had murdered his mother.

ETHICS AND OTHER DISCIPLINES

George Stuart Fullerton

SCIENCES THAT CONCERN THE MORALIST

40 There are certain sciences that the Moralist must lay under contribution very directly, and yet you seems to be able to make little return to those who cultivate them, at least in their professional capacity. 2 You must ask aid from the biologist, the psychologist, the anthropologist. They help you to a

comprehension of what human is; and, hence, of what it is desirable that human should strive to do. 3 But these people seldom come to the moralist for advice. They appear to be able to work without your help.

4 There are, however, other sciences in which the moralist feels that you have more of a right to meddle, however independent they may regard themselves.

5 Take, for example, politics or economics, or the very modern and rudimentary science of eugenics. The person who cultivates political science may know much more than do most moralists about states and their forms of organisation; 6 about legislative, executive and judicial functions; about the probable effects of the centralisation or decentralisation of authority; about what may be expected, in a given case, from a restriction or extension of the franchise; 7 about the creation and maintenance of a military establishment and the building up of an efficient civil service. 8 The economist may be a monster of learning and a master in ingenuity on all problems touching the creation and distribution of wealth.

9 But the political scientist and the economist, however able, share our common humanity. A person's outlook is more or less apt to be bounded by the limits of the science of own predilection. 10 The several sciences, broader or more specialised, rest, in the minds of most people, upon foundations which are taken for granted. 11 It is too much to expect that every sermon should begin as far back as the Garden of Eden. "Practical" politics and economics do not, as a rule, go so far back.

12 The transition from practical politics and economics to ethical problems may be made at any time. 13 No person was shrewder than Machiavelli, and the moral sense of humankind has rebelled against him and made him a byword. 14 A state, desirous of maintaining itself, may palpably violate in its institutions, inherited from the past, a social-will grown more rational, more conscious of its rights and more articulate. 15 Then the appeal is made to right and justice in other than the traditional forms. It may, in a

given instance, be wrong to create wealth; existing forms of its distribution may be iniquitous. The ultimate arbiter in all such matters must be the Ethical Human.

16 Human society is indefinitely complex. Many specialists must occupy themselves with its problems. A technical question in this field may always be carried over to moral ground. 17 You who undertakes to make this transition without having made a fairly thorough study of ethics appears to be working in the dark. 18 Your assumptions have been questioned, or have been abandoned. Who shall furnish you with a new basis for your special science?

19 Ethics is a basal science. It justifies, or it refuses to justify, those specialists who concern themselves with humans in societies. It is a very old science and has interested people vastly. 20 I have spoken above of eugenics as a new science. Only in its modern form is it new. Plato cultivated it intemperately when he wrote his "Republic"-- but he saw that his "Republic" would not do, and he wrote his "Laws." He stood condemned by Ethics.

21 Usually people who occupy themselves seriously, and in a broad way, with human in society, have adopted, consciously or unconsciously, some ethical doctrine. 22 But this is often done without due consideration, and without a sufficient knowledge of what has been said by the great thinkers of the past. 23 It is for this reason that I have treated at such length in this volume of the schools of the moralists.

ETHICS AND PHILOSOPHY

24 It should be observed that in developing the Ethics of the Rational social-will, or the Ethics of Reason-- the doctrine advocated have not depended upon a particular philosophy.

25 I see no reason why a Realist or an Idealist, a Monist or a Dualist, one who holds to an immediate perception of an external world or one who regards our acquaintance with it as a matter of inference, should refuse to go with me so far. 26 Nor do I see any reason why a believer in God, one who bows at the shrine of Mind-Stuff, or one

who refuses to commit the self at all upon such matters, should enter a demurrer. 27 The Parallelist and the Interactionist, however widely they differ touching the relation of mind and body, may here fall upon one another's necks and shed tears of brotherly affection.

28 That it is proper for the philosopher to interest the self in ethics, I have maintained. 29 You are supposed to be a critical and reflective human, and to take broad views of human affairs. Such views are needed when one comes to the study of ethics.

30 I am forced to admit that some philosophers, when they have written on ethical subjects, have said certain things to which the critical moralist cannot readily assent. 31 You who maintains that certain human intuitions-- which it may even appear impossible to reconcile with each other-- are inexplicably and infallibly authoritative, seems to leave us without so much as the hope of ever attaining to ultimate rationality.

32 And there are philosophers who would persuade us that, unless we accept all the religious or theological doctrines which have appeared to them acceptable, we rob human of every incentive for being moral at all. 33 If God is not going to repay you with interest for the pains which you gives yourself, does you not play the part of a dupe in being good? 34 We have seen that this was palpably the position of Paley. If God will not reconcile, ultimately, benevolence and self- interest, proclaimed Reid, human "is reduced to this miserable dilemma, whether it is best to be a fool or a knave."

35 Some of the utterances of Kant and of Green seem to point in the same direction, but both have made it abundantly plain that they, personally, and whatever their intellectual perplexities, were moved by something much higher than egoism.

36 I mean to say very little about philosophy in this volume. I wish to keep to ethics, a science old enough and strong enough to stand upon its own feet. 37 But it would be wrong not to underline one or two points in this connection, if only to obviate misunderstanding:

ETHICS

(1) There is nothing wrong in a person's wishing to earn the heaven in which you believes. 38 It is not wrong for you to wish to be happy on earth and in the body. But if the desire for your own happiness, either here or hereafter, is the ‘only’ motive that can move you, you are not a good person. 39 Prudence may be a virtue, generally speaking; but it is no substitute for benevolence. The person who is ‘only’ prudent is no fit member of any society of rational beings anywhere.

40 (2) Humans are often better than their words would indicate. Paley talks as if he were a cad; Reid flounders; Kant, noble as are many of his utterances, sometimes gives forth an uncertain sound. Yet no one of these men was personally selfish.

41 And yet all of these men assumed that morality is endangered unless there is a God to repay humans for being good. 42 Why did they insist so strenuously upon this, and incorporate it into their philosophy? We must, I think, go beneath the surface to find the real reason; and when we have discovered it, we cannot regard them in an unfavourable light.

43 They felt, I believe, that good people ‘ought’ to be made happy; that this is rational, if anything is. 44 So far, they are quite in accord with the doctrine of the Rational social-will. And they saw no other way of guaranteeing a complete rationality than in holding to a theistic philosophy.

45 (3) This means that their real motives were not selfish and personal. This is admirably brought out when we turn to Green. It is too much to expect that many of my readers have read his "Prolegomena to Ethics," 46 which is repetitious, tedious, and rather vague, though it is inspired by a fine spirit and has the great merit of having influenced, directly or indirectly, a number of able writers to produce excellent works on ethics.

47 Green dwells, with infinite repetition, upon the presence in human "of a principle not natural," which is identical in all humans, and which, in some way that he does not explain, holds the world of our experiences together, being itself not in time or in space. 48

The disciple of Paley or Reid or Kant will search his pages in vain for any indication that this "principle" performs or can perform any of the functions of the God believed in by the above-mentioned philosophers. 49 Nevertheless, it is the source of an ardent inspiration to Green, who relieves the baldness of the appellation "principle," by calling it, sometimes, "self-consciousness," sometimes, "reason." 50 It does not appear to promise Green anything, so his devotion to it may be regarded as disinterested. However, he owes to it inspiration.

51 Philosophers find their inspiration in very different directions. The philosopher, as such, sometimes rather objects to the word, "God."

52 But you may feel much as people generally feel toward God, when you contemplates your "Conscious Principle," or your "Idea," or the "Substance" which you conceives as the identity of thought and extension, or, for that matter, "Mind-Stuff" or the "Unknowable." 53 That other people may not see that you have anything in particular to be inspired about, or that you can hope for anything in particular for yourself or for other people, does not rob you of your inspiration, and that may affect your life deeply.

54 It is, hence, not a matter of no importance to ethics what manner of philosophy it pleases a person to elect. One's outlook upon the great world may repress or may stimulate ethical strivings, may narrow or may broaden the ethical horizon. 55 It is something to feel, even rather blindly, that one has a Cause. For myself, I think it is better to have a Cause that seems worthwhile, even when rather impartially looked at. But, of this, more in the next section.

56 (4) Whatever one thinks of such matters, it is well to come back to the fact that, nevertheless, ethics stands upon its own feet. 57 Even if Paley, and Reid, and Kant, and Green, and many others, are in the wrong, the doctrine of the Rational social-will stands sure. 58 It is wrong to be selfish; it is wrong to be untruthful; it is wrong to be unjust. It is wrong for individuals, and it is wrong for nations. 59 The

person, or the group of people, that does wrong, is irrational. It stands condemned.

ETHICS AND RELIGION

60 I regret having to speak, in this book, about religion at all, just as I regret having to refer to the philosophers. But it would be folly to omit all reference to religious duties. 61 They have played quite too important a part in the life of the family, of the tribe, of the state; and that not merely here and there, but everywhere, in societies of all degrees of development, in recent centuries and in times of a hoary antiquity. 62 Those interested in the classics have read the remarkable little book, "The Ancient City," by Fustel de Coulanges.

63 As schoolboys we were brought up on the pious Aeneas. All Christians have some knowledge of the theocratic state of the Hebrews, and we know something of the history of Christian Europe. 64 The anthropologist gives us masses of information touching the religious duties of all sorts and conditions of humans.

65 There are those who rid themselves easily of the problem of religious duties. They simply deny that there are any. 66 And there are those-- the classes overlap-- who easily shuffle off duties to the family and to the state. They regard it as their function to ignore and to destroy.

67 (1) I cannot think the matter is so simple. There always have been religious duties generally recognised, as a matter of fact. 68 The boldest and most gifted of thinkers, who have not hesitated to call into being Utopian schemes for an ideal state, such men as Plato and More, have thought that the ideal state must have a religion. 69 And the modern scientist has gravely raised the question whether the state can maintain itself, if all religious beliefs, with their inspirations and their restraints, die out.

70 The moralist, who accepts religious duties, has a difficult task. It is not enough for you to say that humans have religious duties "in general," just as it is not enough for you to say that they have political duties "in general." 71 On the other hand it would be

the height of presumption for you to endeavour to tell every person what you should do in detail. 72 You does not feel it your duty to tell every person whom you should marry, or for whom you should vote at each election. 73 Still, it does seem as though the moralist ought to do more than tell a person vaguely that you have religious duties.

74 (2) Why not follow the analogy suggested by duties to the family, the neighbourhood, the state?

States have their religions, sometimes unequivocally and unmistakably, and sometimes not so palpably. 75 The religion of a people has, as a rule, its roots far back in the history of that people. Its religion has influenced in many subtle ways its institutions, its emotions, its habits, its whole outlook upon life.

76 Even where, as with us, state and church have been, in theory, wholly sundered, there has been no question, up to the present, of the disappearance of a religion. 77 The United States has been regarded as a Christian nation, inspired by ideals and addicted to customs only explicable by a Christian past.

78 The fact that it is so is somewhat obscured to us. For this there are two causes. The first is, that the American, who is a freeman, possesses and exercises a fatal ingenuity in the creation of a multitude of sects out of practically nothing. 79 Still, most of these sects have more in common than some of their adherents suppose. They spring, as a rule, from a Christian root. 80 The second is, that our land has been the goal of the greatest migration ever recorded in human history. 81 Most of those who have come to us have, so far, come from nations in some sense Christian, but they have brought with them very diverse traditions, and some appear to object to traditions altogether.

82 Nevertheless, I think we may be called a Christian nation, and if we follow the analogy above suggested-- that of the relations of people to the state and to lesser organisms within the state-- 83 it would appear that it is the duty of an American to recognise oneself as a Christian rather than as a

Mahometan or a Pagan. 84 If you does recognise this, you will feel yourself under certain obligations which are independent of your personal tastes and proclivities.

85 (3) For one thing, you will recognise that a religion is not a thing to be stripped off and drawn on as one changes a suit of clothes.

86 A woman may regret that her infant has red hair. She will not, on that account, as a rule, exchange him surreptitiously for another. 87 People do not commonly repudiate their fathers because they are not rich or are growing old. A good citizen may regret that own country has seen fit to enter into a given war, but you will not, therefore, give aid or comfort to the enemy.

88 You who is capable of lightly repudiating your religion resembles the person who is capable of discarding own spouse, when you sees the first grey hair.

89 Those who do such things are apt to be people who fill their whole field of vision with their rights, and can find no place there for their duties.

90 Nor should it be overlooked that the man, who is capable of lightly discarding his wife, is the man as capable of supplying her place with a worse. 91 Even so, you who easily throws off your religion is usually the person who easily replaces it with some superstition, scientific or merely whimsical, at which other people wonder.

92 People lament sometimes over the fact that the task of the foreign missionary is a hard one. Were it really an easy one, there would be no stability in human societies, for there would be no stability in human nature. 93 The person of light credulity is the person who easily takes on new faiths; not the person to whom tradition and loyalty mean something.

94 (4) It seems to follow, as a corollary, that the religion in which a person has been brought up has the first claim upon you. I accept this without hesitation.

95 But this does not mean that the claim is in all cases final and valid. There may be cases in which it seems to be the duty of a person to leave own spouse, to disinherit a child, to transfer own allegiance from one state to another. 96 Such cases are recognised as justifiable by people who are thoughtful and

disinterested. But the same people also recognise that, were such disruptions of the bonds which unite people in communities the rule and not the exception, it would mean the destruction of the community.

97 Similarly, it may become the duty of a person to transfer own allegiance from one church to another.

98 Are not religions, rationally compared, of different values? Have there not been religions indisputably on a moral level lower than that of the community which they represent? Undoubtedly.

99 And there have been governments so bad that the only refuge has seemed to lie in revolution. 100 It should be remembered, however, that revolutions can be resorted to too lightly; and that evolution, where possible, is preferable to revolution, whether in things secular or in things religious. 101 It is always easier to tear down than it is to build up. Nor does anyone, save the anarchist, tear down through wanton love of destruction. 102 Even you are apt to feel called upon to give some sort of a vague excuse for your violence.

103 It will be observed that I have all along spoken, not merely of religion, but of the Church. I have done this because religion is a social phenomenon. It has its institutions, and cannot live without them.

104 It cannot be denied that individual philosophers have evolved religious philosophies; it cannot be denied that solitary individuals, as such, have felt religious emotions. 105 How much of this is due to the fact that there have been religions and churches, I do not believe that they themselves have realised.

106 But, if religion is to be a vital force of any sort in a state, holding up ideals and stimulating the emotion that helps to realise them, it must be incorporated in an institution or in institutions. 107 You cannot remove the rose and keep the perfume. Even the memory of it tends to vanish. 108 A religious person without a church is like a citizen without a state. A citizen without a state is a person who makes the effort to

keep step, and to walk in single file, all alone.

109 (5) Having said so much for Religion and for the Church, it is right that I should refer to some things that may be said on the other side.

110 It may be claimed that people of science have a tendency to turn away from religion and to grow indifferent to or to deny religious duties. In this there is some truth, although notable exceptions to the rule may be cited.

111 But I have known many people of learning in two hemispheres, in some cases rather intimately. With the utmost respect for their learning and for their mental ability, I am still bound to say that I have found them quite human.

112 Some of them-- among the greatest of them-- have been so absorbed in their special fields of investigation, that they have not merely given scant attention to religion and to religious duties, but have done scant justice even to their own family life or to the state.

113 And all have not been equally broad people, capable of seeing clearly the part which religion has played in the life of humanity.

114 To this I must add that the impartial objectivity with which the scholar is supposed by the layman to view things is something of a chimera. 115 In saying this I criticise no one more severely than I criticise myself.

This may be taken as my apology for the utterance. 116 Have we not seen, not many years since, that, in the feeling aroused by an international conflict, some scores of great scholars on the one side found it possible to write and to sign a series of statements diametrically opposed to a series drawn up and signed by some scores of equally famous scholars on the other? 117 Was either group walled in hopelessly by sheer ignorance? It is easy to take lightly matters about which one does not particularly care.

118 There is another objection brought against religion and the church which seems to be more significant. Is there not a danger that an interest in these may hamper freedom of thought and encourage an undue conservatism?

119 It should be borne in mind that religion and the church are not the only forces that make for conservatism. 120 Family affection is conservative; the law is conservatism itself, and people feel that it should not be lightly tampered with. 121 How impartial and how ready to introduce innovations should people be in any field? Changes of certain kinds, though they may have no little bearing upon our comfort, do not threaten the existence of either state or church. 122 Could someone devise a scheme by which the periodical visits of the plumber could be avoided, we should all welcome it, and have no fear of the consequences.

123 Other innovations may bring in their train consequences more momentous. What people deeply care about, they cling to, and the question which confronts us is a very broad one. 124 Does humanity, on the whole, gain or lose by a given degree of conservatism? 125 An increase of knowledge is by no means the only thing that makes for civilisation. People may be highly enlightened, and yet rotten to the very core. 126 How much of the ballast of conservatism and of loyalty to tradition is it well to throw overboard in the interest of accelerated motion? 127 Those who, in our judgment, throw overboard much too much we have taken to deporting.

128 (6) Here it will very likely be objected: In all this you are advocating sheer Pragmatism! 129 Are we to accept God and look for a life to come, extending the spread of the community after the fashion suggested in Chapter 23, and broadening the outlook for a future and more perfect rationality, for no better reason than that it is our whim? 130 Shall we ‘believe’ and join ourselves with other ‘believers’, for no better reason than that something happens to tempt our will?

131 I beg the reader, if you will be just to my thought, to follow me here with close attention.

ETHICS AND BELIEF

132 Under this heading I must call attention to several points.

(1) I deny that I advocate Pragmatism at all. 133 The views

which I advocate are so many thousand years older than Pragmatism, that it seems unjust to them, at this late date, to compel them to take on a new name, 134 and to be carried about in swaddling clothes in the arms of the philosophers, after they have been functioning as adults in human communities from time immemorial.

135 (a) That abounding genius and most lovable man, william James, realising, as many lesser men did not realise, that the truth contained in such views was in danger of being lost sight of by many, 136 wrote, with characteristic vivacity and unerring dramatic instinct, the little volume called "Pragmatism." 137 It is with no lack of appreciation of the services he has rendered, that I venture to call attention to the fact that he has, in certain respects, failed to do justice to those views.

138 (b) Pragmatism has received attention partly on account of the exaggerations of which it has been guilty. These have repelled some people of sober mind. 139 It appears to be maintained that we can play fast and loose with the world, and make it what we will. I have criticised this elsewhere, and shall not do so now. 140 I shall only say here that I do not believe that so able a man of science as william James meant all that he said to be taken quite literally. He was gifted with a sense of humour. This, some lack.

141 (c) People of genius are apt to be strongly individualistic and impatient of restraints. 142 We have seen that there is such a thing as a public conscience and a private conscience. The latter is only too often a whimsical thing. 143 Pragmatism appears to teach that any individual, as such, has a moral right to adopt any hypothesis live enough to appeal to own individual will. 144 One has only to call to mind the extraordinary assortment of guests collected by Signer Papini in his novel pragmatic "hotel." Can such, by any human ingenuity, be moulded into anything resembling an orderly community?

145 (d) In a later work, Professor James, realising that religion and theology are not identical, and strongly desirous of promoting

religion, deals severely with theology and the theologians.

146 One truth has been seen, but has not another been treated with some injustice? 147 Is it not inevitable that reflective people, who cherish beliefs, should endeavour to give a more or less clear and reasoned account of them? 148 What degree of success is to be looked for, and what emphasis should be laid upon such attempts, are questions which will probably divide people for a long time to come.

149 (2) Hence, I do not advocate Pragmatism at all, but I agree with it in so far, at least, as to recognise that belief is a phenomenon which concerns the will. 150 That it is so is a commonplace of psychology; and it was recognised dimly long before the psychologist, as such, came into being.

151 That it is so is rather readily overlooked where the evidence for certain beliefs is undeniable and overpowering. 152 I seem forced to believe that I am now writing. I do not seem forced in a similar manner to accept a particular metaphysical doctrine or a given system of theological dogma.

153 Intelligent people appear to be able to discuss such matters with each other and to agree to disagree. If they are tolerant, they can do this good-temperedly. It is worthwhile to keep several points clearly in mind:

154 (a) Beliefs are not a matter of indifference. Some evidently lead to palpable and speedy disaster. 155 If I elect to believe that I can fly, and leave my window-sill as lightly as does the sparrow I now see there, it is time for my friends to provide me with an attendant.

156 Other beliefs are not of this character. And that they will lead to ultimate disaster of any sort to myself or to others seems highly disputable.

157 (b) What may be called scientific evidence may be adduced for different beliefs with varying degrees of cogency. 158 Hegel tries to distinguish between the authority of the state and that of the church by attributing to the former something like infallibility. He maintains that religion "believes," but that the state "knows."

159 We have had abundant reason to see that the state does not

'know', but 'believes', and that it is very often mistaken in its beliefs.

160 Nevertheless, it does its best to keep order, to be as rational as it can, and to look a little way ahead. I think it ought to be admitted that it concerns itself with matters more 'terre-a-terre' than does the church; 161 and that it ought not to be taken as a general truth that the state should take its orders from the church. 162 It has to do with matters which, like our daily bread, must be assured, if certain other matters are to be considered at all. In so far Hegel was right. 163 There are those who forget this, and talk as if metaphysical systems and religious beliefs should be forced upon humans in spite of themselves, either by sheer force of wind-power or with the aid of the police.

164 To this it may be added that beliefs range from an unshakable and unthinking conviction to that degree of acquiescence which can scarcely be distinguished from mere loyalty. 165 It remains to be proved that the latter may not come under the head of belief, and is something to be condemned.

166 (c) Beliefs, being phenomena which concern the will, are at the mercy of many influences. Is there any scientific evidence open to the parallelist in psychology which is not also open to the interactionist? 167 Is the conviction that one's country is in the right a mere matter of scientific evidence? 168 Are the enlightened adherents of a given sect wholly ignorant of the tenets and of the arguments of another?

169 I maintain that tradition and loyalty have their claims. They are not the only claims that can be made, but they are worthy of serious consideration. 170 Human is human, whether you are dealing with things secular or with things religious. To see that such claims are recognised everywhere we have only to open our eyes. 171 It is absurd to believe that all the adherents of a political party are influenced only by the logical arguments published in the newspapers. 172 A newspaper that lived on logic alone would starve to death.

173 It is ridiculous to believe that all the members of a church are induced to become such only by

the arguments of the theologians, many of which arguments the mass of the members are not in a position to comprehend at all.

174 And learned people are humans, too. The philosopher who really kept the self free from all prepossessions would, if you did much serious reading, probably epitomise in own person a large part of the history of philosophy, falling out of one system and into another, like an acrobat.

175 But you are usually caught young and influenced by some teacher, or you are carried away by some book or by the spirit of the times. 176 As you are not an abnormal creature, you acts like other humans, becoming an adherent of a school, or, if you are ambitious, starting one.

177 (d) We have seen that the individual has duties toward the state. We have also seen that the state has duties toward the individual. 178 The state should not make it practically impossible for you to be a loyal citizen. 179 A somewhat similar duty appears to be incumbent upon the church.

A church that forces upon all of its members, as a condition of membership, intricate and abstract systems of metaphysics; 180 a church that does not teach good-will toward people, but makes walls of separation out of slight differences of opinion; 181 a church that lags behind the moral sense of the community in which it finds itself; a church that starves the religious life; these, and such as these, must expect to lose adherents. 182 It is not that people reject them; it is that they reject humans.

183 Those who read history have no reason to think that people, except here and there and under exceptional circumstances, will cease to regard religious duties as duties. 184 I have not ventured to offer any detailed solution of the problem of loyalty to the church. But neither have I ventured to offer any detailed solution of the problem of loyalty to the state. 185 In the one case, as in the other, I suggest as guides tradition, intuition and reflective reasoning. I can only counsel good sense and some degree of patience. 186 It may be said: You do not solve the difficulty for the individual. I admit it. Such difficulties every

thinking human must meet and solve for yourself.

THE LAST WORD

187 Those persons, whether students, or teachers, who dislike this final chapter, may omit it, without detriment to the rest of the book. 188 The doctrine of the Rational social-will is not founded upon this chapter. The latter is a mere appendix.

189 I regret that, in a work in which I have wished to avoid disputation, I have felt compelled to touch upon religious duties at all. 190 But they have played, and still play, so significant a role in the history of humankind, that the omission could scarcely have been made. 191 You are free to take them or leave them; but you are not free to take or leave the Rational social-will as the Moral Arbiter of the Destinies of Human.

The Book of Divine Panagogue called

MIND

WHAT IS THE MIND?
George Stuart Fullerton

PRIMITIVE NOTIONS OF MIND

1 The soul or mind, that something to which we refer sensations and ideas of all sorts, 2 is an object that humans do not seem to know very clearly and definitely, though they feel so sure of its existence that they regard it as the height of folly to call it in question. 3 That you have a mind, no human doubts; what your mind is, you may be quite unable to say.

4 We have seen that children, when quite young, can hardly be said to recognise that they have minds at all. This does not mean that what is mental is not given in their experience. 5 They know that they must open their eyes to see things, and must lay their hands upon them to feel them; they have had pains and pleasures, memories and fancies. 6 In short, they have within their reach all the materials needed in framing a conception of the mind, and in drawing clearly the distinction between their minds and external things.

7 Nevertheless, they are incapable of using these materials; their attention is engrossed with what is physical,-- 8 with their own bodies and the bodies of others, with the things that they can eat, with the toys with which they can play, and the like. 9 It is only later that there emerges even a tolerably clear conception of a self or mind different from the physical and contrasted with it.

10 Primitive human is almost as material in own thinking as is the young child. Of this we have traces in many of the words which have come to be applied to the mind.

11 Our word "spirit" is from the Latin ’spiritus’, originally a breeze. The Latin word for the soul, the word used by the great philosophers all through the Middle Ages, ‘anima’ (Greek, anemos), has the same significance. 12 In the Greek New Testament, the word used for spirit (pneuma) carries a similar suggestion. When we are told in the Book of Genesis that "human became a living soul," we may read the word literally "a breath."

13 What more natural than that the person who is just awakening to a consciousness of that elusive entity the mind should confuse it with that breath which is the most striking outward and visible sign that distinguishes a living human from a dead one?

14 That those who first tried to give some scientific account of the soul or mind conceived it as a material thing, and that it was sufficiently common to identify it with the breath, we know from direct evidence. 15 A glance at the Greek philosophy, to which we owe so much that is of value in our intellectual life, is sufficient to disclose how difficult it was for thinking humans to attain to a higher conception.

16 Thus, Anaximenes of Miletus, who lived in the sixth century before Christ, says that "our soul, which is air, rules us." 17 A little later, Heraclitus, a man much admired for the depth of his reflections, maintains that the soul is a fiery vapour, evidently identifying it with the warm breath of the living creature. 18 In the fifth century, B.C., Anaxagoras, who accounts for the ordering of the elements into a system of things by referring to the activity of Mind or Reason, calls mind "the finest of things," 19 and it seems clear that he did not conceive of it as very different in nature from the other elements which enter into the constitution of the world.

20 Democritus of Abdera (between 460 and 360 B.C.), that great investigator of Nature and brilliant writer, developed a materialistic doctrine that admits the existence of nothing save atoms and empty space. 21 He conceived the soul to consist of fine, smooth, round atoms, which are also atoms of fire. 22 These atoms are distributed through the whole body, but function differently in different places-- in the brain they give us thought, in the heart, anger, and in the liver, desire. 23 Life lasts just so long as we breathe in and breathe out such atoms.

24 The doctrine of Democritus was taken up by Epicurus, who founded his school three hundred years before Christ-- a school which lived and prospered for a very long time. 25 Those who are interested in seeing how a materialistic psychology can be

carried out in detail by an ingenious mind should read the curious account of the mind presented in his great poem, "On Nature," by the Roman poet Lucretius, an ardent Epicurean, who wrote in the first century B.C. 26 The school which we commonly think of contrasting with the Epicurean, and one which was founded at about the same time, is that of the Stoics. 27 Certainly the Stoics differed in many things from the Epicureans; their view of the world, and of the life of human, was a much nobler one; 28 but they were uncompromising materialists, nevertheless, and identified the soul with the warm breath that animates human.

THE MIND AS IMMATERIAL

29 It is scarcely too much to say that the Greek philosophy as a whole impresses the modern mind as representing the thought of a people to whom it was not unnatural to think of the mind as being a breath, a fire, a collection of atoms, a something material. 30 To be sure, we cannot accuse those twin stars that must ever remain the glory of literature and science, Plato and Aristotle, of being materialists. 31 Plato (427-347, B.C.) distributes, it is true, the three-fold soul, which he allows human, in various parts of the human body, in a way that at least suggests the Democritean distribution of mind-atoms. 32 The lowest soul is confined beneath the diaphragm; the one next in rank has its seat in the chest; and the highest, the rational soul, is enthroned in the head. 33 However, he has said quite enough about this last to indicate clearly that he conceived it to be free from all taint of materiality.

34 As for Aristotle (384-322, B.C.), who also distinguished between the lower psychical functions and the higher, we find him sometimes speaking of soul and body in such a way as to lead people to ask themselves whether he is really speaking of two things at all; 35 but when he specifically treats of the ‘nous’ or reason, he insists upon its complete detachment from everything material. 36 Human's reason is not subjected to the fate of the lower psychical

functions, which, as the "form" of the body, perish with the body; it enters from without, and it endures after the body has passed away. 37 It is interesting to note, however, an occasional lapse even in Aristotle. When he comes to speak of the relation to the world of the Divine Mind, the First Cause of Motion, which he conceives as pure Reason, 38 he represents it as ‘touching’ the world, although it remains itself ‘untouched’. We seem to find here just a flavor-- an inconsistent one-- of the material.

39 Such reflections as those of Plato and Aristotle bore fruit in later ages. 40 When we come down to Plotinus the Neo-Platonist (204-269, A.D.), we have left the conception of the soul as a warm breath, or as composed of fine round atoms, far behind. 41 It has become curiously abstract and incomprehensible. It is described as an immaterial substance. This substance is, in a sense, in the body, or, at least, it is present to the body. 42 But it is not in the body as material things are in this place or in that. ‘It is as a whole in the whole body, and it is as a whole in every part of the body’. 43 Thus the soul may be regarded as divisible, since it is distributed throughout the body; but it must also be regarded as indivisible, since it is wholly in every part.

44 Let the person to whom such sentences as these mean anything rejoice in the meaning that you are able to read into them! 45 If you can go as far as Plotinus, perhaps you can go as far as Cassiodorus (477-570, A.D.), and maintain that the soul is not merely as a whole in every part of the body, but is wholly in each of its own parts.

46 Upon reading such statements one's first impulse is to exclaim: How is it possible that people of sense should be led to speak in this irresponsible way? 47 And when they do speak thus, is it conceivable that other people should seriously occupy themselves with what they say?

48 But if one has the historic sense, and knows something of the setting in which such doctrines come to the birth, one cannot regard it as remarkable that people of sense should urge them. 49 No one coins them independently out of own brain; little by little humans are impelled along the

path that leads to such conclusions. 50 Plotinus was a careful student of the philosophers that preceded him. He saw that mind must be distinguished from matter, and he saw that what is given a location in space, in the usual sense of the words, is treated like a material thing. 51 On the other hand, he had the common experience that we all have of a relation between mind and body. How do justice to this relation, and yet not materialise mind?

52 What he tried to do is clear, and it seems equally clear that he had good reason for trying to do it. 53 But it appears to us now that what he actually did was to make of the mind or soul a something very like an inconsistent bit of matter, that is somehow in space, and yet not exactly in space, a something that can be in two places at once, a logical monstrosity. 54 That his doctrine did not meet with instant rejection was due to the fact, already alluded to, that our experience of the mind is something rather dim and elusive. 55 It is not easy for a person to say what it is, and, hence, it is not easy for a person to say what it is not.

56 The doctrine of Plotinus passed over to Saint Augustine, and from him it passed to the philosophers of the Middle Ages. 57 How extremely difficult it has been for the world to get away from it at all, is made clearly evident in the writings of that remarkable man Descartes.

58 Descartes wrote in the seventeenth century. The long sleep of the Middle Ages was past, and the several sciences had sprung into a vigorous and independent life. 59 It was not enough for Descartes to describe the relation of mind and body in the loose terms that had prevailed up to his time. 60 He had made a careful study of anatomy, and he realised that the brain is a central organ to which messages are carried by the nerves from all parts of the body. 61 He knew that an injury to the nerve might prevent the receipt of a message, i.e. he knew that a conscious sensation did not come into being until something happened in the brain.

62 Nor was he content merely to refer the mind to the brain in a general way. He found the "little pineal-gland" in the midst of the

brain to be in what he regarded as an admirable position to serve as the seat of the soul. 63 To this convenient little central office he relegated it; and he describes in a way that may to-day well provoke a smile the movements that the soul imparts to the pineal-gland, 64 making it incline itself in this direction and in that, and making it push the "animal spirits," the fluid contained in the cavities of the brain, towards various "pores."

65 Thus he writes: "Let us, then, conceive of the soul as having her chief seat in the little gland that is in the middle of the brain, 66 whence she radiates to all the rest of the body by means of the spirits, the nerves, and even the blood, which, participating in the impressions of the spirits, can carry them through the arteries to all the members."

67 And again: "Thus, when the soul wills to call anything to remembrance, this volition brings it about that the gland, inclining itself successively in different directions, 68 pushes the spirits towards divers parts of the brain, until they find the part which has the traces that the object which one wishes to recollect has left there."

69 We must admit that Descartes' scientific studies led him to make this mind that sits in the little pineal-gland something very material. 70 It is spoken of as though it pushed the gland about; it is affected by the motions of the gland, as though it were a bit of matter. 71 It seems to be a less inconsistent thing than the "all in the whole body" soul of Plotinus; but it appears to have purchased its comprehensibility at the expense of its immateriality.

72 Shall we say that Descartes frankly repudiated the doctrine that had obtained for so many centuries? We cannot say that; he still held to it. But how could he? 73 The reader has perhaps remarked above that he speaks of the soul as having her ‘chief’ seat in the pineal-gland. 74 It seems odd that he should do so, but he still held, even after he had come to his definite conclusions as to the soul's seat, to the ancient doctrine that the soul is united to all the parts of the body "conjointly." 75 He could not wholly repudiate a venerable tradition.

76 We have seen, thus, that people first conceived of the mind as material and later came to rebel against such a conception. But we have seen, also, that the attempt to conceive it as immaterial was not wholly successful. 77 It resulted in a something that we may describe as inconsistently material rather than as not material at all.

MODERN COMMON SENSE NOTIONS OF THE MIND

78 Under this heading I mean to sum up the opinions as to the nature of the mind usually held by the intelligent persons about us to-day who make no claim to be regarded as philosophers. 79 Is it not true that a great many of them believe:-- (1) That the mind is in the body? (2) That it acts and reacts with matter? (3) That it is a substance with attributes? (4) That it is non-extended and immaterial?

80 I must remark at the outset that this collection of opinions is by no means something gathered by the plain person from one's own experience. These opinions are the echoes of old philosophies. 81 They are a heritage from the past, and have become the common property of all intelligent persons who are even moderately well-educated. 82 Their sources have been indicated in the preceding sections; but most persons who cherish them have no idea of their origin.

83 People are apt to suppose that these opinions seem reasonable to them merely for the reason that they find in their own experience evidence of their truth. But this is not so. 84 Have we not seen above how long it took humans to discover that they must not think of the mind as being a breath, or a flame, or a collection of material atoms? 85 The people who erred in this way were abler than most of us can pretend to be, and they gave much thought to the matter. 86 And when at last it came to be realised that mind must not thus be conceived as material, those who endeavoured to conceive it as something else gave, after their best efforts, a very queer account of it indeed.

87 Is it in the face of such facts reasonable to suppose that our friends and acquaintances, who strike us as having reflective

powers in nowise remarkable, have independently arrived at the conception that the mind is a non-extended and immaterial substance? 88 Surely they have not thought all this out for themselves. They have taken up and appropriated unconsciously notions which were in the air, so to speak. 89 They have inherited their doctrines, not created them. It is well to remember this, for it may make us the more willing to take up and examine impartially what we have uncritically turned into articles of belief.

90 The first two articles, namely, that the mind is in the body and that it acts upon, and is acted upon by, material things, I shall discuss at length in the next chapter. 91 Here I pause only to point out that the plain person does not put the mind into the body quite unequivocally. 92 I think it would surprise you to be told that a line might be drawn through two heads in such a way as to transfix two minds. 93 And I remark, further, that you have no clear idea of what it means for mind to act upon body or body to act upon mind. 94 How does an immaterial thing set a material thing in motion? Can it touch it? Can it push it? Then what does it do?

95 But let us pass on to the last two articles of faith mentioned above. We all draw the distinction between 'substance' and its 'attributes' or 'qualities'. 96 The distinction was remarked and discussed many centuries ago, and much has been written upon it. 97 I take up the ruler on my desk; it is recognised at once as a bit of wood. How? It has such and such qualities. 98 My paper-knife is of silver. How do I know it? It has certain other qualities. 99 I speak of my mind. How do I know that I have a mind? I have sensations and ideas. If I experienced no mental phenomena of any sort, evidence of the existence of a mind would be lacking.

100 Now, whether I am concerned with the ruler, with the paper-knife, or with the mind, have I direct evidence of the existence of anything more than the whole group of qualities? Do I ever perceive the substance?

101 In the older philosophy, the substance 'substantia' was conceived to be a something not

directly perceived, but only inferred to exist-- a something underlying the qualities of things and, as it were, holding them together. 102 It was believed in by philosophers who were quite ready to admit that they could not tell anything about it. 103 For example, John Locke (1632-1704), the English philosopher, holds to it stoutly, and yet describes it as a mere "we know not what," whose function it is to hold together the bundles of qualities that constitute the things we know.

104 In the modern philosophy people still distinguish between substance and qualities. It is a useful distinction, and we could scarcely get on without it. 105 But an increasing number of thoughtful persons repudiate the old notion of substance altogether.

106 We may, they say, understand by the word "substance" the whole group of qualities ‘as a group’-- not merely the qualities that are revealed at a given time, but all those that we have reason to believe a fuller knowledge would reveal. 107 In short, we may understand by it just what is left when the "we know not what" of the Lockian has been discarded.

108 This notion of substance we may call the more modern one; yet we can hardly say that it is the notion of the plain person. 109 He does not make very clear to himself just what is in his thought, but I think we do him no injustice in maintaining that he is something of a Lockian, even if he has never heard of Locke. 110 The Lockian substance is, as the reader has seen, a sort of "unknowable."

111 And now for the doctrine that the mind is non-extended and immaterial.

With these affirmations we may heartily agree; but we must admit that the plain person enunciates them without having a very definite idea of what the mind is.

112 You regards as in your mind all your sensations and ideas, all your perceptions and mental images of things. 113 Now, suppose I close my eyes and picture to myself a barber's pole. Where is the image? We say, in the mind. Is it extended? We feel impelled to answer, No. 114 But it certainly ‘seems’ to be extended; the white and the red upon it

appear undeniably side by side. May I assert that this mental image has no extension whatever? Must I deny to it ‘parts’, or assert that its parts are not side by side?

115 It seems odd to maintain that a something as devoid of parts as is a mathematical point should yet appear to have parts and to be extended. 116 On the other hand, if we allow the image to be extended, how can we refer it to a non-extended mind?

117 To such questions as these, I do not think that the plain person has an answer. That they can be answered, I shall try to show in the last section of this chapter. 118 But one cannot answer them until one has attained to rather a clear conception of what is meant by the mind.

119 And until one has attained to such a conception, the statement that the mind is immaterial must remain rather vague and indefinite. 120 As we saw above, even the Plotinic soul was inconsistently material rather than immaterial. It was not excluded from space; it was referred to space in an absurd way. 121 The mind as common sense conceives it, is the successor of this Plotinic soul, and seems to keep a flavour of what is material after all. This will come out in the next chapter, where we shall discuss mind and body.

THE PSYCHOLOGIST AND THE MIND

122 When we ask how the psychologist conceives of the mind, we must not forget that psychologists are many and that they differ more or less from each other in their opinions. 123 When we say "the psychologist" believes this or that, we mean usually no more than that the opinion referred to is prevalent among people of that class, or that it is the opinion of those whom we regard as its more enlightened members.

124 Taking the words in this somewhat loose sense, I shall ask what the psychologist's opinion is touching the four points set forth in the preceding section. How far does you agree with the plain person?

125 (1) There can be no doubt that you refers the mind to the body in some way, although you may

shake your head over the use of the word "in."

126 (2) As to whether the mind acts and reacts with matter, in any sense of the words analogous to that in which they are commonly used, there is a division in the camp. 127 Some affirm such interaction; some deny it. The matter will be discussed in the next chapter.

128 (3) The psychologist-- the more modern one-- inclines to repudiate any substance or substratum of the sort accepted in the Middle Ages and believed in by many people now. 129 To you the mind is the whole complex of mental phenomena in their interrelations. 130 In other words, the mind is not an unknown and indescribable something that is merely inferred; it is something revealed in consciousness and open to observation.

131 (4) The psychologist is certainly not inclined to regard the mind or any idea belonging to it as material or as extended. But you does recognise implicitly, if not explicitly, that ideas are composite. 132 To you, as to the plain person, the image held in the memory or imagination ‘seems’ to be extended, and you can distinguish its parts. 133 You does not do much towards clearing away the difficulty alluded to at the close of the last section. It remains for the metaphysician to do what you can with it, and to you we must turn if we wish light upon this obscure subject.

THE METAPHYSICIAN AND THE MIND

134 I have reserved for the next chapter the first two points mentioned as belonging to the plain person's doctrine of the mind. 135 In what sense the mind may be said to be in the body, and how it may be conceived to be related to the body, are topics that deserve to be treated by themselves in a chapter on "Mind and Body." 136 Here I shall consider what the metaphysician has to say about the mind as substance, and about the mind as non-extended and immaterial.

137 It has been said that the Lockian substance is really an "unknowable." No one pretends to have experience of it; it is revealed

to no sense; 138 it is, indeed, a name for a mere nothing, for when we abstract from a thing, in thought, every single quality, we find that there is left to us nothing whatever.

139 We cannot say that the substance, in this sense of the word, is the ‘reality’ of which the qualities are ‘appearances’. 140 In the Panagogue book of Thoughts, we saw just what we may legitimately mean by realities and appearances, and it was made clear that an unknowable of any sort cannot possibly be the reality to which this or that appearance is referred. 141 Appearances and realities are experiences which are observed to be related in certain ways. 142 That which is not open to observation at all, that of which we have, and can have, no experience, we have no reason to call the reality of anything. 143 We have, in truth, no reason to talk about it at all, for we know nothing whatever about it; and when we do talk about it, it is because we are labouring under a delusion.

144 This is equally true whether we are concerned with the substance of material things or with the substance of minds. 145 An "unknowable" is an "unknowable" in any case, and we may simply discard it. 146 We lose nothing by so doing, for one cannot lose what one has never had, and what, by hypothesis, one can never have. The loss of a mere word should occasion us no regret.

147 Now, we have seen that we do not lose the world of real material things in rejecting the "Unknowable" (In the Panagogue book of Thoughts). 148 The things are complexes of qualities, of physical phenomena; and the more we know about these, the more do we know about real things.

149 But we have also seen (In the Panagogue book of Origin) that physical phenomena are not the only phenomena of which we have experience. 150 We are conscious of mental phenomena as well, of the phenomena of the subjective order, of sensations and ideas. 151 Why not admit that these ‘constitute’ the mind, as physical phenomena constitute the things which belong to the external world?

152 You who says this says no more than that the mind is known and is knowable. It is what it is perceived to be; and the more we know of mental phenomena, the more do we know of the mind.

153 Shall we call the mind as thus known a ‘substance’? 154 That depends on the significance which we give to this word. It is better, perhaps, to avoid it, for it is fatally easy to slip into the old use of the word, and then to say, as people have said, that we do not know the mind as it is, but only as it appears to us to be-- 155 that we do not know the reality, but only its appearances.

156 And if we keep clearly before us the view of the mind which I am advocating, we shall find an easy way out of the difficulties that seem to confront us when we consider it as non-extended and immaterial.

157 Certain complexes of mental phenomena-- for example, the barber's pole above alluded to-- certainly appear to be extended. Are they really extended? 158 If I imagine a tree a hundred feet high, is it really a hundred feet high? Has it any real size at all? Our problem melts away when we realise what we mean by this "real size." 159 In the Panagogue book of Thoughts, I have distinguished between apparent space and real space. Real space is, as was pointed out, the "plan" of the real physical world. 160 To occupy any portion of real space, a thing must be a real external thing; that is, the experiences constituting it must belong to the objective order, they must not be of the class called mental. 161 We all recognise this, in a way. We know that a real material foot rule cannot be applied to an imaginary tree. We say, How big did the tree seen in a dream ‘seem’; we do not say, How big was it ‘really’? 162 If we did ask such a question, we should be puzzled to know where to look for an answer.

163 And this for a very good reason. You who asks: How big was that imaginary tree really? asks, in effect: How much real space did the unreal tree fill? 164 The question is a foolish one. It assumes that phenomena not in the objective order are in the objective order. As well ask how a colour smells or how a sound looks. 165

MIND

When we are dealing with the material we are not dealing with the mental, and we must never forget this.

166 The tree imagined or seen in a dream seems extended. Its extension is ‘apparent’ extension, and this apparent extension has no place in the external world whatever. 167 But we must not confound this apparent extension with a real mathematical point, and call the tree non-extended in this sense. 168 If we do this we are still in the old error-- we have not gotten away from real space, but have substituted position in that space for extension in that space. 169 Nothing mental can have even a position in real space. To do that it would have to be a real thing in the sense indicated.

170 Let us, then, agree with the plain person in affirming that the mind is non-extended, but let us avoid misconception. 171 The mind is constituted of experiences of the subjective order. None of these are in space-- real space. But some of them have apparent extension, and we must not overlook all that this implies.

172 Now for the mind as immaterial. We need not delay long over this point. 173 If we mean by the mind the phenomena of the subjective order, and by what is material the phenomena of the objective order, surely we may and must say that the mind is immaterial. 174 The two classes of phenomena separate themselves out at once.

MIND AND BODY

George Stuart Fullerton

IS THE MIND IN THE BODY?

2 There was a time, as we have seen in the last chapter, when it did not seem at all out of the way to think of the mind as in the body, and very literally in the body. 2 You who believes the mind to be a breath, or a something composed of material atoms, can conceive it as being in the body as unequivocally as chairs can be in a room. 3 Breath can be inhaled and exhaled; atoms can be in the head, or in the chest, or the heart, or anywhere else in the animal economy.

4 There is nothing dubious about this sense of the preposition "in." But we have also seen that, as soon as humans began to realise that the mind is not material, the question of its presence in the body became a serious problem. 5 If I say that a chair is in a room, I say what is comprehensible to every one. It is assumed that it is in a particular place in the room and is not in some other place. 6 If, however, I say that the chair is, as a whole, in every part of the room at once, I seem to talk nonsense. This is what Plotinus and those who came after him said about the mind. 7 Are their statements any the less nonsensical because they are talking about minds? 8 When one speaks about things mental, one must not take leave of good sense and utter unmeaning phrases.

9 If minds are enough like material things to be in anything, they must be in things in some intelligible sense of the word. 10 It will not do to say: I use the word "in," but I do not really mean ‘in’. If the meaning has disappeared, why continue to use the word? It can only lead to mystification.

11 Descartes seemed to come back to something like an intelligible meaning when he put the mind in the pineal-gland in the brain. 12 Yet, as we have seen, he clung to the old conception. He could not go back to the frank materialisation of mind.

13 And the plain person to-day labours under the same difficulty. You puts the mind in the body, in the brain, but you does not put it there frankly and unequivocally. It is in the brain and yet not exactly in the brain. Let us see if this is not the case.

14 If we ask you: Does the person who wags your head move your mind about? Does you who mounts a step raise your mind some inches? Does you who sits down on a chair lower your mind? 15 I think we shall find that you hesitates in your answers. 16 And if we go on to say: Could a line be so drawn as to pass through your image of me and my image of you, and to measure their distance from one another? 17 I think you will say, No. You does not regard minds and their ideas as existing in space in this fashion.

18 Furthermore, it would not strike the plain person as absurd if we said to you: Were our senses far more acute than they are, it is conceivable that we should be able to perceive every atom in a given human body, and all its motions. 19 But would you be willing to admit that an increase in the sharpness of sense would reveal to us directly the mind connected with such a body? 20 It is not, then, in the body as the atoms are. It cannot be seen or touched under any conceivable circumstances. What can it mean, hence, to say that it is ‘there’? 21 Evidently, the word is used in a peculiar sense, and the plain person cannot help us to a clear understanding of it.

22 Your position becomes intelligible to us when we realise that you have inherited the doctrine that the mind is immaterial, 23 and that you struggles, at the same time, with the tendency so natural to human to conceive it after the analogy of things material. 24 You thinks of it as in the body, and, nevertheless, tries to dematerialise this "in." Your thought is sufficiently vague, and is inconsistent, as might be expected.

25 If we will bear in mind what was said in the closing section of the last chapter, we can help you over your difficulty. 26 That mind and body are related there can be no doubt. But should we use the word "in" to express this relation?

27 The body is a certain group of phenomena in the objective order; that is, it is a part of the external world. The mind consists of experiences in the subjective order. 28 We have seen that no mental phenomenon can occupy space-- real space, the space of the external world-- and that it cannot even have a position in space. 29 As mental, it is excluded from the objective order altogether. The mind is not, then, strictly speaking, ‘in’ the body, although it is related to it. 30 It remains, of course, to ask ourselves how we ought to conceive the relation. This we shall do later in the present chapter.

31 But, it may be said, it would sound odd to deny that the mind is in the body. Does not every one use the expression? What can we substitute for it? 32 I answer: If it

is convenient to use the expression let us continue to do so. Humans must talk so as to be understood. 33 But let us not perpetuate error, and, as occasion demands it, let us make clear to ourselves and to others what we have a right to understand by this ‘in’ when we use it.

THE DOCTRINE OF THE INTERACTIONIST

34 There is no human who does not know that your mind is related to your body as it is not to other material things. 35 We open our eyes, and we see things; we stretch out our hand, and we feel them; our body receives a blow, and we feel pain; we wish to move, and the muscles are set in motion.

36 These things are matters of common experience. We all perceive, in other words, that there is an interaction, in some sense of the term, between mind and body. 37 But it is important to realise that one may be quite well aware of all such facts, and yet may have very vague notions of what one means by body and by mind, and may have no definite theory at all of the sort of relation that obtains between them. 38 The philosophers tries to attain to a clearer conception of these things. Their task, be it remembered, is to analyse and explain, not to deny, the experiences which are the common property of humankind.

39 In the present day the two theories of the relation of mind and body that divide the field between them and stand opposed to each other are ‘interactionism’ and ‘parallelism’. 40 I have used the word "interaction" a little above in a loose sense to indicate our common experience of the fact that we become conscious of certain changes brought about in our body, and that our purposes realise themselves in action. 41 But every one who accepts this fact is not necessarily an interactionist. The latter is a person who holds a certain more or less definite theory as to what is implied by the fact. Let us take a look at this doctrine.

42 Physical things interact. A billiard ball in motion strikes one which has been at rest; the former loses its motion, the latter begins to roll away. 43 We explain the occurrence by a reference to the

laws of mechanics; that is to say, we point out that it is merely an instance of the uniform behaviour of matter in motion under such and such circumstances.

44 We distinguish between the state of things at one instant and the state of things at the next, and we call the former ‘cause’ and the latter ‘effect’.

45 It should be observed that both cause and effect here belong to the one order, the objective order. They have their place in the external world. 46 Both the balls are material things; their motion, and the space in which they move, are aspects of the external world.

47 If the balls did not exist in the same space, if the motion of the one could not be towards or away from the other, if contact were impossible, we would manifestly have no interaction ‘in the sense of the word employed above’. 48 As it is, the interaction of physical things is something that we can describe with a good deal of definiteness. 49 Things interact in that they stand in certain physical relations, and undergo changes of relations according to certain laws.

50 Now, to one who conceives the mind in a grossly material way, the relation of mind and body can scarcely seem to be a peculiar problem, different from the problem of the relation of one physical thing to another.

51 If my mind consists of atoms disseminated through my body, its presence in the body appears as unequivocal as the presence of a dinner in a person who has just risen from the table. 52 Nor can the interaction of mind and matter present any unusual difficulties, for mind is matter. 53 Atoms may be conceived to approach each other, to clash, to rearrange themselves. Interaction of mind and body is nothing else than an interaction of bodies. One is not forced to give a new meaning to the word.

54 When, however, one begins to think of the mind as immaterial, the case is very different. How shall we conceive an immaterial thing to be related to a material one?

55 Descartes placed the mind in the pineal-gland, and in so far he seemed to make its relation to the gland similar to that between two

material things. 56 When he tells us that the soul brings it about that the gland bends in different directions, we incline to view the occurrence as very natural-- is not the soul in the gland?

57 But, on the other hand, Descartes also taught that the essence of mind is ‘thought’ and the essence of body is ‘extension’. 58 He made the two natures so different from each other that people began to ask themselves how the two things could interact at all. 59 The mind wills, said one philosopher, but that volition does not set matter in motion; when the mind wills, God brings about the appropriate change in material things. 60 The mind perceives things, said another, but that is not because they affect it directly; it sees things in God. 61 Ideas and things, said a third, constitute two independent series; no idea can cause a change in things, and no thing can cause a change in ideas.

62 The interactionist is a person who refuses to take any such turn as these philosophers. Your doctrine is much nearer to that of Descartes than it is to any of theirs. 63 You uses the one word "interaction" to describe the relation between material things and also the relation between mind and body, nor does you dwell upon the difference between the two. 64 You insists that mind and matter stand in the one causal nexus; that a change in the outside world may be the ‘cause’ of a perception coming into being in a mind, and that a volition may be the ‘cause’ of changes in matter.

65 What shall we call the plain person? I think we may call you an interactionist in embryo. 66 The stick in your hand knocks an apple off of the tree; your hand seems to you to be set in motion because you wills it. 67 The relation between your volition and the motion of your hand appears to you to be of much the same sort as that between the motion of the stick and the fall of the apple. 68 In each case you thinks you have to do with the relation of cause and effect.

69 The opponent of the interactionist insists, however, that the plain person is satisfied with this view of the matter only because you have not completely stripped off the tendency to

conceive the mind as a material thing. 70 And you accuses the interactionist of having fallen a prey to the same weakness.

71 Certainly, it is not difficult to show that the interactionists write as though the mind were material, and could be somewhere in space. 72 The late Dr. McCosh fairly represents the thought of many, and he was capable of expressing himself as follows;

73 [1] "It may be difficult to ascertain the exact point or surface at which the mind and body come together and influence each other, in particular, how far into the body (Descartes without proof thought it to be in the pineal-gland), 74 but it is certain, that when they do meet mind knows body as having its essential properties of extension and resisting energy."

75 How can an immaterial thing be located at some point or surface within the body? 76 How can a material thing and an immaterial thing "come together" at a point or surface? 77 And if they cannot come together, what have we in mind when we say they interact?

78 The parallelist, for it is you who opposes interactionism, insists that we must not forget that mental phenomena do not belong to the same order as physical phenomena. 79 You points out that, when we make the word "interaction" cover the relations of mental phenomena to physical phenomena as well as the relations of the latter to each other, we are assimilating heedlessly facts of two different kinds and are obliterating an important distinction.

80 You makes the same objection to calling the relations between mental phenomena and physical phenomena ‘causal’. 81 If the relation of a volition to the movement of the arm is not the same as that of a physical cause to its physical effect, why, you argues, do you disguise the difference by calling them by the same name?

THE DOCTRINE OF THE PARALLELIST

82 Thus, the parallelist is a person who is so impressed by the gulf between physical facts and mental facts that you refuses to regard them as parts of the one order of

causes and effects. 83 You cannot, you claims, make a single chain out of links so diverse.

84 Some part of a human body receives a blow; a message is carried along a sensory nerve and reaches the brain; 85 from the brain a message is sent out along a motor nerve to a group of muscles; the muscles contract, and a limb is set in motion. 86 The immediate effects of the blow, the in-going message, the changes in the brain, the outgoing message, the contraction of the muscles-- all these are physical facts. One and all may be described as motions in matter.

87 But the person who received the blow becomes conscious that you was struck, and both interactionist and parallelist regard you as becoming conscious of it when the incoming message reaches some part of the brain. 88 What shall be done with this consciousness? The interactionist insists that it must be regarded as a link in the physical chain of causes and effects-- you breaks the chain to insert it. 89 The parallelist maintains that it is inconceivable that such an insertion should be made. You regards the physical series as complete in itself, and you places the consciousness, as it were, on a 'parallel' line.

90 It must not be supposed that you takes this figure literally. It is your effort to avoid materialising the mind that forces you to hold the position which you does. 91 To put the mind in the brain is to make of it a material thing; to make it parallel to the brain, in the literal sense of the word, would be just as bad. 92 All that we may understand you to mean is that mental phenomena and physical, although they are related, cannot be built into the one series of causes and effects. You are apt to speak of them as 'concomitant'.

93 We must not forget that neither parallelist nor interactionist ever dreams of repudiating our common experiences of the relations of mental phenomena and physical. 94 Neither one will, if you are a person of sense, abandon the usual ways of describing such experiences.

95 Whatever your theory, you will still say: I am suffering because I struck my hand against that table; I sat down because I chose to do so.

96 Your doctrine is not supposed to deny the truth contained in such statements; it is supposed only to give a fuller understanding of it. 97 Hence, we cannot condemn either doctrine simply by an uncritical appeal to such statements and to the experiences they represent. We must look much deeper.

98 Now, what can the parallelist mean by 'referring' sensations and ideas to the brain and yet denying that they are 'in' the brain? What is this reference?

99 Let us come back to the experiences of the physical and the mental as they present themselves to the plain person. They have been discussed at length in the Panagogue book of Origin. 100 It was there pointed out that every one distinguishes without difficulty between sensations and things, and that every one recognises explicitly or implicitly that a sensation is an experience referred in a certain way to the body.

101 When the eyes are open, we 'see'; when the ears are open, we 'hear'; when the hand is laid on things, we 'feel'. How do we know that we are experiencing sensations? 102 The setting tells us that. The experience in question is given together with an experience of the body. This is 'concomitance of the mental and the physical' as it appears in the experience of us all; 103 and from such experiences as these the philosopher who speaks of the concomitance of physical and mental phenomena must draw the whole meaning of the word.

104 Let us here sharpen a little the distinction between sensations and things. Standing at some distance from the tree, I see an apple fall to the ground. Were I only half as far away, my experience would not be exactly the same-- I should have somewhat different sensations. 105 As we have seen, the apparent sizes of things vary as we move, and this means that the quantity of sensation, when I observe the apple from a nearer point, is greater. 106 The person of science tells me that the image which the object looked at projects upon the retina of the eye grows larger as we approach objects. 107 The thing, then, may remain unchanged; our sensations will

vary according to the impression which is made upon our body.

108 Again. When I have learned something of physics, I am ready to admit that, although light travels with almost inconceivable rapidity, still, its journey through space does take time. 109 Hence the impression made upon my eye by the falling apple is not simultaneous with the fall itself; and if I stand far away it is made a little later than when I am near. 110 In the case in point the difference is so slight as to pass unnoticed, but there are cases in which it seems apparent even to the unlearned that sensations arise later than the occurrences of which we take them to be the report.

111 Thus, I stand on a hill and watch a labourer striking with his sledge upon the distant railway. I hear the sound of the blow while I see his tool raised above his head. 112 I account for this by saying that it has taken some time for the sound-waves to reach my ear, and I regard my sensation as arising only when this has been accomplished.

113 But this conclusion is not judged sufficiently accurate by the person of science. The investigations of the physiologist and the psychologist have revealed that the brain holds a peculiar place in the economy of the body. 114 If the nerve which connects the sense organ with the brain be severed, the sensation does not arise. Injuries to the brain affect the mental life as injuries to other parts of the body do not. 115 Hence, it is concluded that, to get the real time of the emergence of a sensation, we must not inquire merely when an impression was made upon the organ of sense, but must determine when the message sent along the nerve has reached some part of the brain. 116 The resulting brain change is regarded as the true concomitant of the sensation. If there is a brain change of a certain kind, there is the corresponding sensation. 117 It need hardly be said that no one knows as yet much about the brain motions which are supposed to be concomitants of sensations, although a good deal is said about them.

118 It is very important to remark that in all this no new meaning has been given to the word

"concomitance." 119 The plain person remarks that sensations and their changes must be referred to the body. With the body disposed in a certain way, you have sensations of a certain kind; with changes in the body, the sensations change. 120 You does not perceive the sensations to be in the body. 121 As I recede from a house I have a whole series of visual experiences differing from each other and ending in a faint speck which bears little resemblance to the experience with which I started. 122 I have had, as we say, a series of sensations, or groups of such. Did any single group, did the experience which I had at any single moment, seem to me to be 'in my body'? Surely not. Its relation to my body is other than that.

123 And when the person of science, instead of referring sensations vaguely to the body, refers them to the brain, the reference is of precisely the same nature. 124 From our common experience of the relation of the physical and the mental you starts out. You have no other ground on which to stand. You can only mark the reference with greater exactitude.

125 I have been speaking of the relation of sensations to the brain. It is scarcely necessary for me to show that all other mental phenomena must be referred to the brain as well, and that the reference must be of the same nature. 126 The considerations which lead us to refer ideas to the brain are set forth in our physiologies and psychologies. 127 The effects of cerebral disease, injuries to the brain, etc., are too well known to need mention; and it is palpably as absurd to put ideas in the brain as it is to put sensations there.

128 Now, the parallelist, if you be a wise person, will not attempt to 'explain' the reference of mental phenomena to the brain-- to 'explain' the relation between mind and matter. 129 The relation appears to be unique. Certainly it is not identical with the relation between two material things. 130 We explain things, in the common acceptation of the word, when we show that a case under consideration is an exemplification of some general law-- when we

show, in other words, that it does not stand alone. 131 But this does stand alone, and is admitted to stand alone. We admit as much when we say that the mind is immaterial, and yet hold that it is related to the body. We cannot, then, ask for an ‘explanation’ of the relation.

132 But this does not mean that the reference of mental phenomena to the body is a meaningless expression. 133 We can point to those experiences of concomitance that we all have, distinguish them carefully from relations of another kind, and say: This is what the word means, whether it be used by the plain person or by the person of science.

134 I have said above: "If there is a brain change of a certain kind, there is the corresponding sensation." 135 Perhaps the reader will feel inclined to say here: If you can say as much as this, why can you not go a little farther and call the brain change the ‘cause’ of the sensation?

136 But you who speaks thus, forgets what has been said above about the uniqueness of the relation. 137 In the objective order of our experiences, in the external world, we can distinguish between antecedents and consequents, between causes and their effects. 138 The causes and their effects belong to the one order, they stand in the same series. The relation of the physical to the mental is, as we have seen, a different relation. 139 Hence, the parallelist seems justified in objecting to the assimilation of the two. 140 You prefers the word "concomitance," just because it marks the difference. You does not mean to indicate that the relation is any the less uniform or dependable when you denies that it is causal.

IN WHAT SENSE MENTAL PHENOMENA HAVE A TIME AND PLACE

141 We have seen in the Panagogue book of Origin what space and time-- real space and time-- are. 142 They are the plan of the real external world and its changes; they are aspects of the objective order of experience.

143 To this order no mental phenomenon can belong. It cannot, as we have seen, occupy any

portion of space or even have a location in space. 144 It is equally true that no series of mental changes can occupy any portion of time, real time, or even fill a single moment in the stream of time. 145 There are many persons to whom this latter statement will seem difficult of acceptance; but the relation of mental phenomena to space and to time is of the same sort, and we can consider the two together. 146 Psychologists speak unhesitatingly of the localisation of sensations in the brain, and they talk as readily of the moment at which a sensation arises and of the duration of the sensation. What can they mean by such expressions?

147 We have seen that sensations are not in the brain, and their localisation means only the determination of their concomitant physical phenomena, of the corresponding brain-change. 148 And it ought to be clear even from what has been said above that, in determining the moment at which a sensation arises, we are determining only the time of the concomitant brain process. 149 Why do we say that a sensation arises later than the moment at which an impression is made upon the organ of sense and earlier than the resulting movement of some group of muscles? 150 Because the change in the brain, to which we refer the sensation, occurs later than the one and earlier than the other. 151 This has a place in real time, it belongs to that series of world changes whose succession constitutes real time. 152 If we ask ‘when’ anything happened, we always refer to this series of changes. We try to determine its place in the world order.

153 Thus, we ask: When was Julius Caesar born? We are given a year and a day. 154 How is the time which has elapsed since measured? By changes in the physical world, by revolutions of the earth about the sun. 155 We ask: When did hr conceive the plan of writing his Commentaries? If we get an answer at all, it must be an answer of the same kind--some point in the series of physical changes which occur in real time must be indicated. 156 Where else should we look for an answer? In point of fact, we never do look elsewhere.

157 Again. We have distinguished between apparent space and real space. We have seen that, when we deny that a mental image can occupy any portion of space, we need not think of it as losing its parts and shrivelling to a point. 158 We may still attribute to it apparent space; may affirm that it seems extended. Let us mark the same distinction when we consider time. 159 The psychologist speaks of the duration of a sensation. Has it real duration? It is not in time at all, and, of course, it cannot, strictly speaking, occupy a portion of time. 160 But we can try to measure the duration of the physical concomitant, and call this the real duration of the sensation.

161 We all distinguish between the real time of mental phenomena, in the sense indicated just above, and the apparent time. We know very well that the one may give us no true measure of the other.

162 A sermon 'seems' long; was it 'really' long? There is only one way of measuring its real length. We must refer to the clock, to the sun, to some change in the physical world. 163 We 'seem' to live years in a dream; was the dream 'really' a long one? The real length can only be determined, if at all, by a physical reference. 164 Those apparent years of the dream have no place in the real time which is measured by the clock. We do not have to cut it and insert them somewhere. 165 They belong to a different order, and cannot be inserted any more than the thought of a patch can be inserted in a rent in a real coat.

166 We see, thus, when we reflect upon the matter, that mental phenomena cannot, strictly speaking, be said to have a time and place. 167 You who attributes these to them materialises them. But their physical concomitants have a time and place, and mental phenomena can be ordered by a reference to these. 168 They can be assigned a time and place of existing in a special sense of the words not to be confounded with the sense in which we use them when we speak of the time and place of material things. 169 This makes it possible to relate every mental phenomenon to the world system in a definite way, and to

distinguish it clearly from every other, however similar.

170 We need not, when we come to understand this, change our usual modes of speech. We may still say: The pain I had two years ago is like the pain I have to-day; my sensation came into being at such a moment; my regret lasted two days. 171 We speak that we may be understood; and such phrases express a truth, even if they are rather loose and inaccurate. But we must not be deceived by such phrases, and assume that they mean what they have no right to mean.

OBJECTIONS TO PARALLELISM

172 What objections can be brought against parallelism? 173 It is sometimes objected by the interactionist that it abandons the plain human's notion of the mind as a substance with its attributes, and makes of it a mere collection of mental phenomena. 174 It must be admitted that the parallelist usually holds a view which differs rather widely from that of the unlearned.

175 But even supposing this objection well taken, it can no longer be regarded as an objection specifically to the doctrine of parallelism, 176 for the view of the mind in question is becoming increasingly popular, and it is now held by influential interactionists as well as by parallelists. 177 One may believe that the mind consists of ideas, and may still hold that ideas can cause motions in matter.

178 There is, however, another objection that predisposes many thoughtful persons to reject parallelism uncompromisingly. It is this. 179 If we admit that the chain of physical causes and effects, from a blow given to the body to the resulting muscular movements made in self-defense, is an unbroken one, what part can we assign to the mind in the whole transaction? 180 Has it ‘done’ anything? Is it not reduced to the position of a passive spectator? Must we not regard human as "a physical automaton with parallel psychical states"?

181 Such an account of human cannot fail to strike one as repugnant; and yet it is the parallelist whom we must thank

for introducing us to it. The account is not a caricature from the pen of an opponent. 182 "An automaton," writes Professor Clifford, [2] "is a thing that goes by itself when it is wound up, and we go by ourselves when we have had food. 183 Excepting the fact that other humans are conscious, there is no reason why we should not regard the human body as merely an exceedingly complicated machine which is wound up by putting food into the mouth. 184 But it is not ‘merely’ a machine, because consciousness goes with it. The mind, then, is to be regarded as a stream of feelings which runs parallel to, and simultaneous with, a certain part of the action of the body, 185 that is to say, that particular part of the action of the brain in which the cerebrum and the sensory tracts are excited."

186 The saving statement that the body is not ‘merely’ a machine, because consciousness goes with it, does not impress one as being sufficient to redeem the illustration. 187 Who wants to be an automaton with an accompanying consciousness? Who cares to regard your mind as an "epiphenomenon"-- a thing that exists, but whose existence or nonexistence makes no difference to the course of affairs?

188 The plain person's objection to such an account of yourself seems to be abundantly justified. As I have said earlier in this chapter, neither interactionist nor parallelist has the intention of repudiating the experience of world and mind common to us all. 189 We surely have evidence enough to prove that minds count for something. No house was ever built, no book was ever written, by a creature without a mind; and the better the house or book, the better the mind. 190 ‘That’ there is a fixed and absolutely dependable relation between the planning mind and the thing accomplished, no person of any school has the right to deny. 191 The only legitimate question is: ‘What is the nature’ of the relation? Is it ‘causal’, or should it be conceived to be ‘something else’?

192 The whole matter will be more fully discussed in Chapter-4. This chapter I shall close with a brief summary of the points which the

reader will do well to bear in mind when you occupies yourself with parallelism.

193 (1) Parallelism is a protest against the interactionist's tendency to materialise the mind.

194 (2) The name is a figurative expression, and must not be taken literally. The true relation between mental phenomena and physical is given in certain common experiences that have been indicated, and it is a unique relation.

195 (3) It is a fixed and absolutely dependable relation. It is impossible that there should be a particular mental fact without its corresponding physical fact; and it is impossible that this physical fact should occur without its corresponding mental fact.

196 (4) The parallelist objects to calling this relation ‘causal’, because this obscures the distinction between it and the relation between facts both of which are physical. You prefers the word "concomitance."

197 (5) Such objections to parallelism as that cited above assume that the concomitance of which the parallelist speaks is analogous to physical concomitance.

198 The chemist puts together a volume of hydrogen gas and a volume of chlorine gas, and the result is two volumes of hydrochloric acid gas. 199 We regard it as essential to the result that there should be the two gases and that they should be brought together. 200 But the fact that the chemist has red hair we rightly look upon as a concomitant phenomenon of no importance. The result would be the same if had black hair or were bald. 201 But this is not the concomitance that interests the parallelist. The two sorts of concomitance are alike only in the one point. Some phenomenon is regarded as excluded from the series of causes and effects under discussion. 202 On the other hand, the difference between the two is all-important; in the one case, the concomitant phenomenon is an accidental circumstance that might just as well be absent; 203 in the other, it is nothing of the sort; it ‘cannot’ be absent-- the mental fact ‘must’ exist if the brain-change in question exists.

204 It is quite possible that, on reading this list of points, one may be inclined to make two protests. First: Is a parallelism so carefully guarded as this properly called ‘parallelism’ at all?

205 To this I answer: The name matters little. I have used it because I have no better term. Certainly, it is not the parallelism which is sometimes brought forward, and which peeps out from the citation from Clifford. 206 It is nothing more than an insistence upon the truth that we should not treat the mind as though it were a material thing. 207 If any one wishes to take the doctrine and discard the name, I have no objection. As so guarded, the doctrine is, I think, true.

208 Second: If it is desirable to avoid the word "cause," in speaking of the relation of the mental and the physical, on the ground that otherwise we give the word a double sense, why is it not desirable to avoid the word "concomitance"? 209 Have we not seen that the word is ambiguous? I admit the inconsistency and plead in excuse only that I have chosen the lesser of two evils. 210 It is fatally easy to slip into the error of thinking of the mind as though it were material and had a place in the physical world. 211 In using the word "concomitance" I enter a protest against this. But I have, of course, no right to use it without showing just what kind of concomitance I mean.

HOW WE KNOW THERE ARE OTHER MINDS

George Stuart Fullerton

IS IT CERTAIN THAT WE KNOW IT

3 I suppose there is no person in own sober senses who seriously believes that no other mind than one’s own exists. 2 There is, to be sure, an imaginary being more or less discussed by those interested in philosophy, a creature called the Solipsist, who is credited with this doctrine.

3 But people do not become solipsists, though they certainly say things now and then that other people think logically lead to some such unnatural view of things; 4 and more rarely they say things that sound as if the speaker, in some moods, at least, might actually harbour such a view. 5

Thus the philosopher Fichte (1762-1814) talks in certain of his writings as though he believed himself to be the universe, and his words cause Jean Paul Richter, the inimitable, to break out in his characteristic way: 6 "The very worst of it all is the lazy, aimless, aristocratic, insular life that a god must lead; he has no one to go with. 7 If I am not to sit still for all time and eternity, if I let myself down as well as I can and make myself finite, that I may have something in the way of society, still I have, like petty princes, only my own creatures to echo my words. . . . 8 Every being, even the highest Being, wishes something to love and to honour. But the Fichtean doctrine that I am my own body-maker leaves me with nothing whatever-- 9 with not so much as the beggar's dog or the prisoner's spider. . . . Truly I wish that there were humans, and that I were one of them. . . . 10 If there exists, as I very much fear, no one but myself, unlucky dog that I am, then there is no one at such a pass as I."

11 Just how much Fichte's words meant to the person who wrote them may be a matter for dispute. Certainly no one has shown a greater moral earnestness or a greater regard for own fellowmen than this philosopher, and we must not hastily accuse any one of being a solipsist. 12 But that to certain people, and, indeed, to many people, there have come thoughts that have seemed to point in this direction-- that not a few have had doubts as to their ability to ‘prove’ the existence of other minds-- this we must admit.

13 It appears somewhat easier for a person to have doubts upon this subject when you have fallen into the idealistic error of regarding the material world, which seems to be revealed to you, as nothing else than your "ideas" or "sensations" or "impressions." 14 If we will draw the whole "telephone exchange" into the clerk, there seems little reason for not including all the subscribers as well. 15 If other people's bodies are my sensations, may not other people's minds be my imaginings? 16 But doubts may be felt also by those who are willing to admit a real external world. How do we know that our inference to the

existence of other minds is a justifiable inference? Can there be such a thing as ‘verification’ in this field?

17 For we must remember that no human is directly conscious of any mind except one’s own. Humans cannot exhibit their minds to their neighbours as they exhibit their wigs. 18 However close may seem to us to be our intercourse with those about us, do we ever attain to anything more than our ideas of the contents of their minds? 19 We do not experience these contents; we picture them, we represent them by certain proxies. 20 To be sure, we believe that the originals exist, but can we be quite sure of it? Can there be a ‘proof’ of this right to make the leap from one consciousness to another? 21 We seem to assume that we can make it, and then we make it again and again; but suppose, after all, that there were nothing there. Could we ever find out our error? 22 And in a field where it is impossible to prove error, must it not be equally impossible to prove truth?

23 The doubt has seemed by no means a gratuitous one to certain very sensible practical people. 24 "It is wholly impossible," writes Professor Huxley, [1] "absolutely to prove the presence or absence of consciousness in anything but one's own brain, though by analogy, we are justified in assuming its existence in other people." 25 "The existence of my conception of you in my consciousness," says Clifford, [2] "carries with it a belief in the existence of you outside of my consciousness. . . . 26 How this inference is justified, how consciousness can testify to the existence of anything outside of itself, I do not pretend to say: I need not untie a knot which the world has cut for me long ago. 27 It may very well be that I myself am the only existence, but it is simply ridiculous to suppose that anybody else is. 28 The position of absolute idealism may, therefore, be left out of count, although each individual may be unable to justify own dissent from it."

29 These are writers belonging to our own modern age, and they are people of science. Both of them deny that the existence of other minds is a thing that can be ‘proved’; 30 but the one tells us

that we are "justified in assuming" their existence, and the other informs us that, although "it may very well be" that no other mind exists, we may leave that possibility out of count.

31 Neither position seems a sensible one. Are we justified in assuming what cannot be proved? Or is the argument "from analogy" really a proof of some sort? 32 Is it right to close our eyes to what "may very well be," just because we choose to do so? 33 The fact is that both of these writers had the conviction, shared by us all, that there are other minds, and that we know something about them; and yet neither of them could see that the conviction rested upon an unshakable foundation.

34 Now, I have no desire to awake in the mind of any one a doubt of the existence of other minds. 35 But I think we must all admit that the person who recognises that such minds are not directly perceived, and who harbours doubts as to the nature of the inference which leads to their assumption, may, perhaps, be able to say that ‘he feels certain’ that there are other minds; 36 but must we not at the same time admit that you are scarcely in a position to say: ‘it is certain’ that there are other minds? 37 The question will keep coming back again: May there not, after all, be a legitimate doubt on the subject?

38 To set this question at rest there seems to be only one way, and that is this: to ascertain the nature of the inference which is made, and to see clearly what can be meant by ‘proof’ when one is concerned with such matters as these. 39 If it turns out that we have proof, in the only sense of the word in which it is reasonable to ask for proof, our doubt falls away of itself.

THE ARGUMENT FOR OTHER MINDS

40 I have said early in this volume that the plain person perceives that other humans act very much as one does, and that you attributes to them minds more or less like your own. 41 You reasons from like to like-- other bodies present phenomena which, in the case of your own body, you perceives to be indicative of mind, and you accepts them as indicative of mind

there also. 42 The psychologists makes constant use of this inference; indeed, they could not develop their science without it.

43 John Stuart Mill (1806-1873), whom it is always a pleasure to read because he is so clear and straightforward, presents this argument in the following form: 44 [3]-- "By what evidence do I know, or by what considerations am I led to believe, that there exist other sentient creatures; 45 that the walking and speaking figures which I see and hear, have sensations and thoughts, or, in other words, possess Minds? 46 The most strenuous Intuitionist does not include this among the things that I know by direct intuition. I conclude it from certain things, which my experience of my own states of feeling proves to me to be marks of it. 47 These marks are of two kinds, antecedent and subsequent; the previous conditions requisite for feeling, and the effects or consequences of it. 48 I conclude that other human beings have feelings like me, because, first, they have bodies like me, which I know, in my own case, to be the antecedent condition of feelings; 49 and because, secondly, they exhibit the acts, and other outward signs, which in my own case I know by experience to be caused by feelings. 50 I am conscious in myself of a series of facts connected by a uniform sequence, of which the beginning is modifications of my body, the middle is feelings, the end is outward demeanour. 51 In the case of other human beings I have the evidence of my senses for the first and last links of the series, but not for the intermediate link. 52 I find, however, that the sequence between the first and last is as regular and constant in those other cases as it is in mine. 53 In my own case I know that the first link produces the last through the intermediate link, and could not produce it without. 54 Experience, therefore, obliges me to conclude that there must be an intermediate link; which must either be the same in others as in myself, or a different one. 55 I must either believe them to be alive, or to be automatons; and by believing them to be alive, that is, by supposing the link to be of the same nature as

in the case of which I have experience, 56 and which is in all respects similar, I bring other human beings, as phenomena, under the same generalisations which I know by experience to be the true theory of my own existence. 57 And in doing so I conform to the legitimate rules of experimental inquiry. The process is exactly parallel to that by which Newton proved that the force which keeps the planets in their orbits is identical with that by which an apple falls to the ground. 58 It was not incumbent on Newton to prove the impossibility of its being any other force; he was thought to have made out his point when he had simply shown that no other force need be supposed. 59 We know the existence of other beings by generalisation from the knowledge of our own; 60 the generalisation merely postulates that what experience shows to be a mark of the existence of something within the sphere of our consciousness, may be concluded to be a mark of the same thing beyond that sphere."

61 Now, the plain person accepts the argument from analogy, here insisted upon, every day of your life. You are continually forming an opinion as to the contents of other minds on a basis of the bodily manifestations presented to your view. 62 The process of inference is so natural and instinctive that we are tempted to say that it hardly deserves to be called an inference. 63 Certainly the person is not conscious of distinct steps in the process; you perceives certain phenomena, and they are at once illuminated by their interpretation. 64 You reads other people as we read a book--the signs on the paper are scarcely attended to, our whole thought is absorbed in that for which they stand. As I have said above, the psychologist accepts the argument, and founds own conclusions upon it.

65 Upon what ground can one urge that this inference to other minds is a doubtful one? 66 It is made universally. We have seen that even those who have theoretic objections against it, do not hesitate to draw it, as a matter of fact. 67 It appears unnatural in the extreme to reject it. What can

induce people to regard it with suspicion?

68 I think the answer to this question is rather clearly suggested in the sentence already quoted from Professor Huxley: 69 "It is wholly impossible absolutely to prove the presence or absence of consciousness in anything but one's own brain, though, by analogy, we are justified in assuming its existence in other people."

70 Here Professor Huxley admits that we have something like a proof, for he regards the inference as ‘justified’. 71 But he does not think that we have ‘absolute proof’-- the best that we can attain to appears to be a degree of probability falling short of the certainty which we should like to have.

72 Now, it should be remarked that the discredit cast upon the argument for other minds has its source in the fact that it does not satisfy a certain assumed standard. 73 What is that standard? It is the standard of proof which we may look for and do look for where we are concerned to establish the existence of material things with the highest degree of certainty.

74 There are all sorts of indirect ways of proving the existence of material things. We may read about them in a newspaper, and regard them as highly doubtful; 75 we may have the word of a person whom, on the whole, we regard as veracious; we may infer their existence, because we perceive that certain other things exist, and are to be accounted for. 76 Under certain circumstances, however, we may have proof of a different kind: we may see and touch the things themselves.

77 Material things are open to direct inspection. Such a direct inspection constitutes ‘absolute proof’, so far as material things are concerned.

78 But we have no right to set this up as our standard of absolute proof, when we are talking about other minds. In this field it is not proof at all. Anything that can be directly inspected is not another mind. 79 We cannot cast a doubt upon the existence of colours by pointing to the fact that we cannot smell them. If they could be smelt, they would not be colours. We

must in each case seek a proof of the appropriate kind.

80 What have we a right to regard as absolute proof of the existence of another mind? 81 Only this: the analogy upon which we depend in making our inference must be a very close one. As we shall see in the next section, the analogy is sometimes very remote, and we draw the inference with much hesitation, or, perhaps, refuse to draw it at all. 82 It is not, however, the 'kind of inference' that makes the trouble; it is the lack of detailed information that may serve as a basis for inference. 83 Our inference to other minds is unsatisfactory only in so far as we are ignorant of our own minds and bodies and of other bodies. 84 Were our knowledge in these fields complete, we should know without fail the signs of mind, and should know whether an inference were or were not justified.

85 And 'justified' here means proved-- proved in the only sense in which we have a right to ask for proof. No single fact is known that can discredit such a proof. Our doubt is, then, gratuitous and can be dismissed. 86 We may claim that we have 'verification' of the existence of other minds. Such verification, however, must consist in showing that, in any given instance, the signs of mind really are present. 87 It cannot consist in presenting minds for inspection as though they were material things.

88 One more matter remains to be touched upon in this section. It has doubtless been observed that Mill, in the extract given above, seems to place "feelings," in other words, mental phenomena, between one set of bodily motions and another. 89 He makes them the middle link in a chain whose first and third links are material. The parallelist cannot treat mind in this way. He claims that to make mental phenomena effects or causes of bodily motions is to make them material.

90 Must, then, the parallelist abandon the argument for other minds? Not at all. 91 The force of the argument lies in interpreting the phenomena presented by other bodies as one knows by experience the phenomena of one's own body must be interpreted. 92 You who concludes that the relation between your own mind and your

own body can best be described as a "parallelism," must judge that other people's minds are related to their bodies in the same way. 93 You must treat your neighbour as you treats yourself. The argument from analogy remains the same.

WHAT OTHER MINDS ARE THERE?

94 That other humans have minds nobody really doubts, as we have seen above. 95 They resemble us so closely, their actions are so analogous to our own, that, although we sometimes give ourselves a good deal of trouble to ascertain what sort of minds they have, we never think of asking ourselves whether they have minds.

96 Nor does it ever occur to the person who owns a dog, or who drives a horse, to ask oneself whether the creature has a mind. 97 You may complain that it has not much of a mind, or you may marvel at its intelligence-- your attitude will depend upon the expectations which you have been led to form. 98 But regard the animal as you would regard a bicycle or an automobile, you will not. The brute is not precisely like us, but its actions bear an unmistakable analogy to our own; 99 pleasure and pain, hope and fear, desire and aversion, are so plainly to be read into them that we feel that a human must be "high gravel blind" not to see their significance.

100 Nevertheless, it has been possible for human, under the prepossession of a mistaken philosophical theory, to assume the whole brute creation to be without consciousness. 101 When Descartes had learned something of the mechanism of the human body, and had placed the human soul-- ‘hospes comesque corporis’-- in the little pineal-gland in the midst of the brain, 102 the conception in his mind was not unlike that which we have when we picture to ourselves a locomotive engine with an engineer in its cab. 103 The person gives intelligent direction; but, under some circumstances, the machine can do a good deal in the absence of the person; if it is started, it can run of itself, and to

do this, it must go through a series of complicated motions.

104 Descartes knew that many of the actions performed by the human body are not the result of conscious choice, and that some of them are in direct contravention of the will's commands. 105 The eye protects itself by dropping its lid, when the hand is brought suddenly before it; the foot jerks away from the heated object which it has accidentally touched. 106 The body was seen to be a mechanism relatively independent of the mind, and one rather complete in itself. 107 Joined with a soul, the circle of its functions was conceived to be widened; 108 but even without the assistance of the soul, it was thought that it could keep itself busy, and could do many things that the unreflective might be inclined to attribute to the efficiency of the mind.

109 The bodies of the brutes Descartes regarded as mechanisms of the same general nature as the human body. 110 He was unwilling to allow a soul to any creature below human, so nothing seemed left to him save to maintain that the brutes are machines without consciousness, 111 and that their apparently purposive actions are to be classed with such human movements as the sudden closing of the eye when it is threatened with the hand. 112 The melancholy results of this doctrine made themselves evident among his followers. Even the mild and pious Malebranche could be brutal to a dog which fawned upon him, under the mistaken notion that it did not really hurt a dog to kick it.

113 All this reasoning humans have long ago set aside. For one thing, it has come to be recognised that there may be consciousness, 114 perhaps rather dim, blind, and fugitive, but still consciousness, which does not get itself recognised as do our clearly conscious purposes and volitions. 115 Many of the actions of human which Descartes was inclined to regard as unaccompanied by consciousness may not, in fact, be really unconscious. 116 And, in the second place, it has come to be realised that we have no right to class all the actions of the brutes with those reflex actions in human which we are accustomed to regard as automatic.

117 The belief in animal automatism has passed away, it is to be hoped, never to return. That lower animals have minds we must believe. But what sort of minds have they?

118 It is hard enough to gain an accurate notion of what is going on in a human mind. Humans resemble each other more or less closely, but no two are precisely alike, and no two have had exactly the same training. 119 I may misunderstand even the person who lives in the same house with me and is nearly related to me. Does you really suffer and enjoy as acutely as you seems to? Or must your words and actions be accepted with a discount? 120 The greater the difference between us, the more danger that I shall misjudge you. It is to be expected that men should misunderstand women; that men and women should misunderstand children; 121 that those who differ in social station, in education, in traditions and habits of life, should be in danger of reading each other as one reads a book in a tongue imperfectly mastered. 122 When these differences are very great, the task is an extremely difficult one. 123 What are the emotions, if he has any, of the Chinaman in the laundry near by? His face seems as difficult of interpretation as are the hieroglyphics that he has pasted up on his window.

124 When we come to the brutes, the case is distinctly worse. We think that we can attain to some notion of the minds to be attributed to such animals as the ape, the dog, the cat, the horse, and it is not nonsense to speak of an animal psychology. 125 But who will undertake to tell us anything definite of the mind of a fly, a grasshopper, a snail, or a cuttlefish? That they have minds, or something like minds, we must believe; 126 what their minds are like, a prudent person scarcely even attempts to say. In our distribution of minds may we stop short of even the very lowest animal organisms? It seems arbitrary to do so.

127 More than that; some thoughtful people have been led by the analogy between plant life and animal life to believe that something more or less remotely like the consciousness which we

attribute to animals must be attributed also to plants. 128 Upon this belief I shall not dwell, for here we are evidently at the limit of our knowledge, and are making the vaguest of guesses. 129 No one pretends that we have even the beginnings of a plant psychology. At the same time, we must admit that organisms of all sorts do bear some analogy to each other, even if it be a remote one; 130 and we must admit also that we cannot 'prove' plants to be wholly devoid of a rudimentary consciousness of some sort.

131 As we begin with human and descend the scale of beings, we seem, in the upper part of the series, to be in no doubt that minds exist. Our only question is as to the precise contents of those minds. 132 Further down we begin to ask ourselves whether anything like mind is revealed at all. That this should be so is to be expected. 133 Our argument for other minds is the argument from analogy, and as we move down the scale our analogy grows more and more remote until it seems to fade out altogether. 134 You who harbours doubts as to whether the plants enjoy some sort of psychic life, may well find those doubts intensified when you turns to study the crystal; 135 and when you contemplates inorganic matter you should admit that the thread of your argument has become so attenuated that you cannot find it at all.

THE DOCTRINE OF MIND-STUFF

136 Nevertheless, there have been those who have attributed something like consciousness even to inorganic matter. 137 If the doctrine of evolution be true, argues Professor Clifford, [4] "we shall have along the line of the human pedigree a series of imperceptible steps connecting inorganic matter with ourselves.

138 To the later members of that series we must undoubtedly ascribe consciousness, although it must, of course, have been simpler than our own. But where are we to stop? 139 In the case of organisms of a certain complexity, consciousness is inferred. As we go back along the line, the complexity of the organism and of

its nerve-action insensibly diminishes; 140 and for the first part of our course we see reason to think that the complexity of consciousness insensibly diminishes also. 141 But if we make a jump, say to the tunicate mollusks, we see no reason there to infer the existence of consciousness at all. 142 Yet not only is it impossible to point out a place where any sudden break takes place, but it is contrary to all the natural training of our minds to suppose a breach of continuity so great."

143 We must not, says Clifford, admit any breach of continuity. We must assume that consciousness is a complex of elementary feelings, "or rather of those remoter elements which cannot even be felt, but of which the simplest feeling is built up." 144 We must assume that such elementary facts go along with the action of every organism, however simple; 145 but we must assume also that it is only when the organism has reached a certain complexity of nervous structure that the complex of psychic facts reaches the degree of complication that we call Consciousness.

146 So much for the assumption of something like mind in the mollusk, where Clifford cannot find direct evidence of mind. But the argument does not stop here: 147 "As the line of ascent is unbroken, and must end at last in inorganic matter, we have no choice but to admit that every motion of matter is simultaneous with some . . . fact or event which might be part of a consciousness." 148 Of the universal distribution of the elementary constituents of mind Clifford writes as follows: "That element of which, as we have seen, even the simplest feeling is a complex, I shall call ‘Mind-stuff’. 149 A moving molecule of inorganic matter does not possess mind or consciousness; but it possesses a small piece of mind-stuff. 150 When molecules are so combined together as to form the film on the under side of a jellyfish, the elements of mind-stuff which go along with them are so combined as to form the faint beginnings of Sentience. 151 When the molecules are so combined as to form the

brain and nervous system of a vertebrate, the corresponding elements of mind-stuff are so combined as to form some kind of consciousness; 152 that is to say, changes in the complex which take place at the same time get so linked together that the repetition of one implies the repetition of the other. 153 When matter takes the complex form of a living human brain, the corresponding mind-stuff takes the form of a human consciousness, having intelligence and volition."

154 This is the famous mind-stuff doctrine. It is not a scientific doctrine, for it rests on wholly unproved assumptions. 155 It is a play of the speculative fancy, and has its source in the author's strong desire to fit mental phenomena into some general evolutionary scheme. 156 As he is a parallelist, and cannot make of physical phenomena and of mental one single series of causes and effects, he must attain his end by making the mental series complete and independent in itself. 157 To do this, he is forced to make several very startling assumptions:-- (1) We have seen that there is evidence that there is consciousness somewhere-- it is revealed by certain bodies. 158 Clifford assumes consciousness, or rather its raw material, 'mind-stuff', to be everywhere. 159 For this assumption we have not a whit of evidence.

160 (2) To make of the stuff thus attained a satisfactory evolutionary series, he is compelled to assume that mental phenomena are related to each other much as physical phenomena are related to each other. 161 This notion he had from Spinoza, who held that, just as all that takes place in the physical world must be accounted for by a reference to physical causes, so all happenings in the world of ideas must be accounted for by a reference to mental causes, i.e. to ideas. 162 For this assumption there is no more evidence than for the former.

163 (3) Finally, to bring the mental phenomena we are familiar with, sensations of colour, sound, touch, taste, etc., into this evolutionary scheme, 164 he is forced to assume that all such mental phenomena are made up of elements which do not belong to these classes at all,

of something that "cannot even be felt." 165 For this assumption there is as little evidence as there is for the other two.

166 The fact is that the ‘mind-stuff’ doctrine is a castle in the air. It is too fanciful and arbitrary to take seriously. 167 It is much better to come back to a more sober view of things, and to hold that there is evidence that other minds exist, but no evidence that every material thing is animated. 168 If we cannot fit this into our evolutionary scheme, perhaps it is well to reexamine our evolutionary scheme, and to see whether some misconception may not attach to that.

OTHER PROBLEMS OF WORLD AND MIND

George Stuart Fullerton

IS THE MATERIAL WORLD A MECHANISM?

4 So far we have concerned ourselves with certain leading problems touching the external world and the mind,-- problems which seem to present themselves unavoidably to those who enter upon the path of reflection. 2 And we have seen, I hope, that there is much truth, as well as some misconception, contained in the rather vague opinions of the plain person.

3 But the problems that we have taken up by no means exhaust the series of those that present themselves to one who thinks with patience and persistency. 4 When we have decided that people are not mistaken in believing that an external world is presented in their experience; 5 when we have corrected our first crude notions of what this world is, and have cleared away some confusions from our conceptions of space and time; 6 when we have attained to a reasonably clear view of the nature of the mind, and of the nature of its connection with the body; 7 when we have escaped from a tumble into the absurd doctrine that no mind exists save our own, and have turned our backs upon the rash speculations of the adherents of "mind-stuff"; 8 there still remain many points upon which we should like to have definite information.

9 In the present chapter I shall take up and turn over a few of these,

but it must not be supposed that one can get more than a glimpse of them within such narrow limits. 10 First of all we will raise the question whether it is permissible to regard the material world, which we accept, as through and through a mechanism.

11 There can be little doubt that there is a tendency on the part of people of science at the present day so to regard it. 12 It should, of course, be frankly admitted that no one is in a position to prove that, from the cosmic mist, in which we grope for the beginnings of our universe, to the organised whole in which vegetable and animal bodies have their place, 13 there is an unbroken series of changes all of which are explicable by a reference to mechanical laws. 14 Chemistry, physics, and biology are still separate and distinct realms, and it is at present impossible to find for them a common basis in mechanics. 15 The belief of the person of science must, hence, be regarded as a faith; the doctrine of the mechanism of Nature is a working hypothesis, and it is unscientific to assume that it is anything more.

16 There can be no objection to a frank admission that we are not here walking in the light of established knowledge. 17 But it does seem to savour of dogmatism for a person to insist that no increase in our knowledge can ever reveal that the physical world is an orderly system throughout, 18 and that all the changes in material things are explicable in terms of the one unified science. 19 Earnest objections have, however, been made to the tendency to regard Nature as a mechanism. 20 To one of the most curious of them we have been treated lately by Dr. Ward in his book on "Naturalism and Agnosticism."

21 It is there ingeniously argued that, when we examine with care the fundamental concepts of the science of mechanics, we find them to be self-contradictory and absurd. It follows that we are not justified in turning to them for an explanation of the order of Nature.

22 The defense of the concepts of mechanics we may safely leave to the person of science; remembering, of course, that, when a science is in the making, it is to be expected that the concepts

of which it makes use should undergo revision from time to time. 23 But there is one general consideration that it is not well to leave out of view when we are contemplating such an assault upon the notion of the world as mechanism as is made by Dr. Ward. It is this.

24 Such attacks upon the conception of mechanism are not purely destructive in their aim. The man who makes them wishes to destroy one view of the system of things in order that he may set up another. 25 If the changes in the system of material things cannot be accounted for mechanically, it is argued, we are compelled to turn for our explanation to the action and interaction of minds. 26 This seems to give mind a very important place in the universe, and is believed to make for a view of things that guarantees the satisfaction of the highest hopes and aspirations of human.

27 That a recognition of the mechanical order of Nature is incompatible with such a view of things as is just above indicated, I should be the last to admit. 28 The notion that it is so is, I believe, a dangerous error. 29 It is an error that tends to put a person out of sympathy with the efforts of science to discover that the world is an orderly whole, and tempts you to rejoice in the contemplation of human ignorance.

30 But the error is rather a common one; and see to what injustice it may lead one. 31 It is concluded that the conception of 'matter' is an obscure one; that we do not know clearly what we mean when we speak of the 'mass' of a body; 32 that there are disputes as to proper significance to be given to the words 'cause' and 'effect'; that the 'laws of motion', as they are at present formulated, do not seem to account satisfactorily for the behaviour of all material particles. 33 From this it is inferred that we must give up the attempt to explain mechanically the order of physical things.

34 Now, suppose that it were considered a dangerous and heterodox doctrine, that the changes in the system of things are due to the activities of minds. 35 Would not those who now love to point out the shortcomings of the science of mechanics discover a

fine field for their destructive criticism? 36 Are there no disputes as to the ultimate nature of mind? Are people agreed touching the relations of mind and matter? 37 What science even attempts to tell us how a mind, by an act of volition, sets material particles in motion or changes the direction of their motion? 38 How does one mind act upon another, and what does it mean for one mind to act upon another?

39 If the science of mechanics is not in all respects as complete a science as it is desirable that it should be, surely we must admit that when we turn to the field of mind we are not dealing with what is clear and free from difficulties. 40 Only a strong emotional bias can lead a person to dwell with emphasis upon the difficulties to be met with in the one field, and to pass lightly over those with which one meets in the other.

41 One may, however, refuse to admit that the order of Nature is throughout mechanical, without taking any such unreasonable position as this. 42 One may hold that many of the changes in material things do not 'appear' to be mechanical, and that it is too much of an assumption to maintain that they are such, even as an article of faith. 43 Thus, when we pass from the world of the inorganic to that of organic life, we seem to make an immense step. 44 No one has even begun to show us that the changes that take place in vegetable and animal organisms are all mechanical changes. How can we dare to assume that they are?

45 With one who reasons thus we may certainly feel a sympathy. The most ardent advocate of mechanism must admit that your doctrine is a working hypothesis, and not 'proved' to be true. 46 Its acceptance would, however, be a genuine convenience from the point of view of science, for it does introduce, at least provisionally, a certain order into a vast number of facts, and gives a direction to investigation. 47 Perhaps the wisest thing to do is, not to combat the doctrine, but to accept it tentatively and to examine carefully what conclusions it may seem to carry with it-- how it may affect our outlook upon the world as a whole.

MIND

THE PLACE OF MIND IN NATURE

48 One of the very first questions which we think of asking when we contemplate the possibility that the physical world is throughout a mechanical system is this: How can we conceive minds to be related to such a system? 49 That minds, and many minds, do exist, it is not reasonable to doubt. What shall we do with them?

50 One must not misunderstand the mechanical view of things. When we use the word "machine," we call before our minds certain gross and relatively simple mechanisms constructed by human. 51 Between such and a flower, a butterfly, and a human body, the difference is enormous. 52 You who elects to bring the latter under the title of mechanism cannot mean that you discerns no difference between them and a steam engine or a printing press. 53 You can only mean that you believes you might, could you attain to a glimpse into their infinite complexity, find an explanation of the physical changes which take place in them, 54 by a reference to certain general laws which describe the behaviour of material particles everywhere.

55 And the person who, having extended own notion of mechanism, is inclined to overlook the fact that animals and humans have minds, 56 that thought and feeling, plan and purpose, have their place in the world, may justly be accused of a headlong and heedless enthusiasm. 57 Whatever may be our opinion on the subject of the mechanism of Nature, we have no right to minimise the significance of thought and feeling and will. 58 Between that which has no mind and that which has a mind there is a difference which cannot be obliterated by bringing both under the concept of mechanism. 59 It is a difference which furnishes the material for the sciences of psychology and ethics, and gives rise to a whole world of distinctions which find no place in the realm of the merely physical.

60 There are, then, minds as well as bodies; what place shall we assign to these minds in the system of Nature?

61 Several centuries ago it occurred to the person of science

that the material world should be regarded as a system in which there is constant transformation, but in which nothing is created. 62 This way of looking at things expressed itself formerly in the statement that, through all the changes that take place in the world, the quantity of matter and motion remains the same. 63 To-day the same idea is better expressed in the doctrine of the eternity of mass and the conservation of energy. 64 In plain language, this doctrine teaches that every change in every part of the physical world, every motion in matter, must be preceded by physical conditions which may be regarded as the equivalent of the change in question.

65 But this makes the physical world a closed system, a something complete in itself. Where is there room in such a system for minds?

66 It does indeed seem hard to find in such a system a place for minds, if one conceives of minds as does the interactionist. 67 We have seen that the interactionist makes the mind act upon matter very much as one particle of matter is supposed to act upon another. 68 Between the physical and the mental you assumes that there are 'causal' relations; i.e. physical changes must be referred to mental causes sometimes, and mental changes to physical. 69 This means that you finds a place for mental facts by inserting them as links in the one chain of causes and effects with physical facts. If you are not allowed to break the chain and insert them, you does not know what to do with them.

70 The parallelist has not the same difficulty to face. You who holds that mental phenomena must not be built into the one series of causes and effects with physical phenomena may freely admit that physical phenomena form a closed series, an orderly system of their own, 71 and you may yet find a place in the world for minds. You refuses to regard them as a part of the world-mechanism, but you 'relates' them to physical things, conceiving them as 'parallel to' the physical in the sense described (Chapter-2;V.82-211). 72 You insists that, even if we hold that there are gaps in the physical order of causes and effects, we cannot

conceive these gaps to be filled by mental phenomena, simply because they are mental phenomena. 73 They belong to an order of their own. Hence, the assumption that the physical series is unbroken does not seem to you to crowd mental phenomena out of their place in the world at all. 74 They must, in any case, occupy the place that is appropriate to them (Chapter-2; V.141-171).

75 It will be noticed that this doctrine that the chain of physical causes and effects is nowhere broken, and that mental phenomena are related to it as the parallelist conceives them to be, makes the world-system a very orderly one. 76 Every phenomenon has its place in it, and can be accounted for, whether it be physical or mental. 77 To some, the thought that the world is such an orderly thing is in the highest degree repugnant. They object that, in such a world, there is no room for ‘free-will’; and they object, further, that there is no room for the ‘activity of minds’. 78 Both of these objections I shall consider in this chapter.

But first, I must say a few words about a type of doctrine lately insisted upon, 79 which bears some resemblance to interactionism as we usually meet with it, and, nevertheless, tries to hold on to the doctrine of the conservation of energy. It is this:--80 The concept of energy is stretched in such a way as to make it cover mental phenomena as well as physical. 81 It is claimed that mental phenomena and physical phenomena are alike "manifestations of energy," and that the coming into being of a consciousness is a mere "transformation," 82 a something to be accounted for by the disappearance from the physical world of a certain equivalent--perhaps of some motion. 83 It will be noticed that this is one rather subtle way of obliterating the distinction between mental phenomena and physical. In so far it resembles the interactionist's doctrine.

84 In criticism of it we may say that you who accepts it has wandered away from a rather widely recognised scientific hypothesis, and has substituted for

it a very doubtful speculation for which there seems to be no whit of evidence. 85 It is, moreover, a speculation repugnant to the scientific mind, when its significance is grasped. 86 Shall we assume without evidence that, when a person wakes in the morning and enjoys a mental life suspended or diminished during the night, your thoughts and feelings have come into being at the expense of your body? 87 Shall we assume that the mass of your body has been slightly diminished, or that motions have disappeared in a way that cannot be accounted for by a reference to the laws of matter in motion? 88 This seems an extraordinary assumption, and one little in harmony with the doctrine of the eternity of mass and the conservation of energy as commonly understood. We need not take it seriously so long as it is quite unsupported by evidence.

THE ORDER OF NATURE AND "FREE-WILL."

89 In a world as orderly as, in the previous section, this world is conceived to be, is there any room for freedom? 90 What if the person of science is right in suspecting that the series of physical causes and effects is nowhere broken? Must we then conclude that we are never free?

91 To many people it has seemed that we are forced to draw this conclusion, and it is not surprising that they view the doctrine with dismay. 92 They argue: Mental phenomena are made parallel with physical, and the order of physical phenomena seems to be determined throughout, for nothing can happen in the world of matter unless there is some adequate cause of its happening. 93 If, then, I choose to raise my finger, that movement must be admitted to have physical causes, and those causes other causes, and so on without end. 94 If such a movement must always have its place in a causal series of this kind, how can it be regarded as a free movement? It is determined, and not free.

95 Now, it is far from a pleasant thing to watch the person of science busily at work trying to prove that the physical world is an orderly system, and all the while to

feel in one's heart that the success of your efforts condemns one to slavery. 96 It can hardly fail to make one's attitude towards science that of alarm and antagonism. From this I shall try to free the reader by showing that our freedom is not in the least danger, and that we may look on unconcerned.

97 When we approach that venerable dispute touching the freedom of the will, which has inspired people to such endless discussions, and upon which they have written with such warmth and even acrimony, 98 the very first thing to do is to discover what we have a right to mean when we call a person ‘free’. As long as the meaning of the word is in doubt, the very subject of the dispute is in doubt. 99 When may we, then, properly call a person free? What is the normal application of the term?

100 I raise my finger. Every person of sense must admit that, under normal conditions, I can raise my finger or keep it down, ‘as I please’. There is no ground for a difference of opinion so far. 101 But there is a further point upon which humans differ. One holds that my "pleasing" and the brain-change that corresponds to it have their place in the world-order; that is, you maintains that every volition can be ‘accounted for’. 102 Another holds that, under precisely the same circumstances, one may "please" or not "please"; which means that the "pleasing" cannot be wholly accounted for by anything that has preceded. 103 The first person is a ‘determinist’, and the second a "free-willist." I beg the reader to observe that the word "free-willist" is in quotation marks, and not to suppose that it means simply a believer in the freedom of the will.

104 When in common life we speak of a person as free, what do we understand by the word? Usually we mean that you are free from external compulsion. 105 If my finger is held by another, I am not free to raise it. But I may be free in this sense, and yet one may demur to the statement that I am a free person. 106 If a pistol be held to my head with the remark, "Hands up!" my finger will mount very quickly, and the bystanders will maintain that I had no choice.

107 We speak in somewhat the same way of people under the influence of intoxicants, of people crazed by some passion and unable to take into consideration the consequences of their acts, and of people bound by the spell of hypnotic suggestion. 108 Indeed, whenever a person is in such a condition that you are glaringly incapable of leading a normal human life and of being influenced by the motives that commonly move humans, we are inclined to say that you are not free.

109 But does it ever occur to us to maintain that, in general, the possession of a character and the capacity of being influenced by considerations make it impossible for a person to be free? 110 Surely not. If I am a prudent person, I will invest my money in good securities. Is it sensible to say that I cannot have been free in refusing a twenty per cent investment, ‘because I am by nature prudent’? 111 Am I a slave ‘because I eat when I am hungry’, and can I partake of a meal freely, only when there is no reason why I should eat at all?

112 You who calls me free only when my acts do violence to my nature or cannot be justified by a reference to anything whatever has strange notions of freedom. 113 Patriots, poets, moralists, have had much to say of freedom; humans have lived for it, and have died for it; humans love it as they love their own souls. Is the object of all this adoration the metaphysical absurdity indicated above?

114 To insist that a person is free only in so far as your actions are unaccountable is to do violence to the meaning of a word in very common use, and to mislead people by perverting it to strange and unwholesome uses. Yet this is done by the "free-willist." 115 You keeps insisting that human is free, and then goes on to maintain that you cannot be free unless you are "free." 116 You does not, unfortunately, supply the quotation marks, and you profits by the natural mistake in identity. As you defines freedom it becomes "freedom," which is a very different thing.

117 What is this "freedom"? It is not freedom from external constraint. It is not freedom from

overpowering passion. 118 It is freedom from all the motives, good as well as bad, that we can conceive of as influencing human, and freedom also from oneself.

119 It is well to get this quite clear. The "free-willist" maintains that, in so far as a human is "free," your actions cannot be accounted for by a reference to the order of causes at all-- 120 not by a reference to your character, hereditary or acquired; not by a reference to your surroundings. 121 "Free" actions, in so far as they are "free," have, so to speak, sprung into being out of the void. What follows from such a doctrine?

122 Listen:--

(1) It follows that, in so far as I am "free," I am not the author of what appear to be my acts; who can be the cause of causeless actions?

123 (2) It follows that no amount of effort on my part can prevent the appearance of "free" acts of the most deplorable kind. If one can condition their appearance or non-appearance, they are not "free" acts.

124 (3) It follows that there is no reason to believe that there will be any congruity between my character and my "free" acts. I may be a saint by nature, and "freely" act like a scoundrel.

125 (4) It follows that I can deserve no credit for "free" acts. I am not their author.

126 (5) It follows that, in so far as I am "free," it is useless to praise me, to blame me, to punish me, to endeavour to persuade me. 127 I must be given over to unaccountable sainthood or to a reprobate mind, as it happens to happen. 128 I am quite beyond the pale of society, for my neighbour cannot influence my "free" acts any more than I can.

129 (6) It follows that, in so far as I am "free," I am in something very like a state of slavery; and yet, curiously enough, it is a slavery without a master. 130 In the old stories of Fate, people were represented as puppets in the hand of a power outside themselves. 131 Here I am a puppet in no hand; but I am a puppet just the same, for I am the passive spectator of what appear to be my acts. 132 I do not do the things I seem to do. They are done for me or in me-- or, rather, they are not done, but just happen.

133 Such "freedom" is a wretched thing to offer to a person who longs for freedom; for the freedom to act out your own impulses, to guide your life according to your own ideals. 134 It is a mere travesty on freedom, a fiction of the philosophers, which inspires respect only so long as one has not pierced the disguise of its respectable name.

135 True freedom is not a thing to be sought in a disorderly and chaotic world, in a world in which actions are inexplicable and character does not count. 136 Let us rinse our minds free of misleading verbal associations, and let us realise that a "free-will" neighbour would certainly not be to us an object of respect. 137 You would be as offensive an object to have in our vicinity as a "free-will" gun or a "free-will" pocketknife. You would not be a rational creature.

138 Our only concern need be for freedom, and this is in no danger in an orderly world. We all recognise this truth, in a way. 139 We hold that a person of good character freely chooses the good, and a person of evil character freely chooses evil. Is not this a recognition of the fact that the choice is a thing to be accounted for, and is, nevertheless, a free choice?

140 I have been considering above the world as it is conceived to be by the parallelist, but, to the reader who may not incline towards parallelism, I wish to point out that these reasonings touching the freedom of the will concern the interactionist just as closely. 141 They have no necessary connection with parallelism. The interactionist, as well as the parallelist, may be a determinist, a believer in freedom, or you may be a "free-willist."

142 You regards mental phenomena and physical phenomena as links in the one chain of causes and effects. Shall you hold that certain mental links are "free-will" links, that they are wholly unaccountable? 143 If you does, all that has been said above about the "free-willist" applies to you. You believes in a disorderly world, and you should accept the consequences of your doctrine.

THE PHYSICAL WORLD AND THE MORAL WORLD

144 I have said a little way back that, when we think of bodies as having minds, we are introduced to a world of distinctions which have no place in the realm of the merely physical. 145 One of the objections made to the orderly world of the parallelist was that in it there is no room for the activity of minds. 146 Before we pass judgment on this matter, we should try to get some clear notion of what we may mean by the word "activity." 147 The science of ethics must go by the board, if we cannot think of people as ‘doing’ anything, as acting rightly or acting wrongly.

148 Let us conceive a billiard ball in motion to come into collision with one at rest. We commonly speak of the first ball as active, and of the second as the passive subject upon which it exercises its activity. Are we justified in thus speaking?

149 In one sense, of course, we are. As I have several times had occasion to remark, we are, in common life, justified in using words rather loosely, provided that it is convenient to do so, and that it does not give rise to misunderstandings.

150 But, in a stricter sense, we are not justified in thus speaking, for in doing so we are carrying over into the sphere of the merely physical a distinction which does not properly belong there, but has its place in another realm. 151 The student of mechanics tells us that the second ball has affected the first quite as much as the first has affected the second. 152 We cannot simply regard the first as cause and the second as effect, nor may we regard the motion of the first as cause and the subsequent motion of the second as its effect alone. 153 ‘The whole situation at the one instant’-- both balls, their relative positions and their motion and rest-- must be taken as the cause of ‘the whole situation at the next instant’, and in this whole situation the condition of the second ball has its place as well as that of the first.

154 If, then, we insist that to have causal efficiency is the same thing as to be active, we should also admit that the second ball was active, and quite as active as the

first. 155 It has certainly had as much to do with the total result. But it offends us to speak of it in this way. We prefer to say that the first was active and the second was acted upon. What is the source of this distinction?

156 Its original source is to be found in the judgments we pass upon conscious beings, bodies with minds; 157 and it could never have been drawn if people had not taken into consideration the relations of minds to the changes in the physical world. 158 As carried over to inanimate things it is a transferred distinction; and its transference to this field is not strictly justifiable, as has been indicated above.

159 I must make this clear by an illustration. I hurry along a street towards the university, because the hour for my lecture is approaching. I am struck down by a falling tile. 160 In my advance up the street I am regarded as active; in my fall to the ground I am regarded as passive.

161 Now, looking at both occurrences from the purely physical point of view, we have nothing before us but a series of changes in the space relations of certain masses of matter; 162 and in all those changes both my body and its environment are concerned. As I advance, my body cannot be regarded as the sole cause of the changes which are taking place. 163 My progress would be impossible without the aid of the ground upon which I tread. Nor can I accuse the tile of being the sole cause of my demolition. 164 Had I not been what I was and where I was, the tile would have fallen in vain. I must be regarded as a concurrent cause of my own disaster, and my unhappy state is attributable to me as truly as it is to the tile.

165 Why, then, am I in the one case regarded as active and in the other as passive? In each case I am a cause of the result. 166 How does it happen that, in the first instance, I seem to most humans to be ‘the’ cause, and in the second to be not a cause at all? 167 The rapidity of my motion in the first instance cannot account for this judgment. You who rides in the police van and you who is thrown from the car of a balloon may move with

great rapidity and yet be regarded as passive.

168 People speak as they do because they are not content to point out the physical antecedents of this and that occurrence and stop with that. 169 They recognise that, between my advance up the street and my fall to the ground there is one very important difference. 170 In the first case what is happening ‘may be referred to an idea in my mind’. Were the idea not there, I should not do what I am doing. In the second case, what has happened ‘cannot be referred to an idea in my mind’.

171 Here we have come to the recognition that there are such things as ‘purposes’ and ‘ends’; that an idea and some change in the external world may be related as ‘plan’ and ‘accomplishment’. 172 In other words, we have been brought face to face with what has been given the somewhat misleading name of ‘final cause’. 173 In so far as that in the bringing about of which I have had a share is my ‘end’, I am ‘active’; in so far as it is not my end, but comes upon me as something not planned, I am ‘passive’. 174 The enormous importance of the distinction may readily be seen; it is only in so far as I am a creature who can have purposes, that ‘desire’ and ‘will’, ‘foresight’ and ‘prudence’, ‘right’ and ‘wrong’, can have a significance for me.

175 I have dwelt upon the meaning of the words "activity" and "passivity," and have been at pains to distinguish them from cause and effect, 176 because the two pairs of terms have often been confounded with each other, and this confusion has given rise to a peculiarly unfortunate error. 177 It is this error that lies at the foundation of the objection referred to at the beginning of this section.

178 We have seen that certain people of science are inclined to look upon the physical world as a great system, all the changes in which may be accounted for by an appeal to physical causes. 179 And we have seen that the parallelist regards ideas, not as links in this chain, but as parallel with physical changes.

180 It is argued by some that, if this is a true view of things, we must embrace the conclusion that

'the mind cannot be active at all', that it can 'accomplish nothing'. 181 We must look upon the mind as an "epiphenomenon," a useless decoration; and must regard human as "a physical automaton with parallel psychical states."

182 Such abuse of one's fellow-human seems unchristian, and it is wholly uncalled for on any hypothesis. Our first answer to it is that it seems to be sufficiently refuted by the experiences of common life. 183 We have abundant evidence that human's minds do count for something. I conclude that I want a coat, and I order one of my tailor; he believes that I will pay for it, he wants the money, and he makes the coat; his man desires to earn his wages and he delivers it. 184 If I had not wanted the coat, if the tailor had not wanted my money, if the man had not wanted to earn his wages, the end would not have been attained. No philosopher has the right to deny these facts.

185 Ah! but, it may be answered, these three "wants" are not supposed to be the 'causes' of the motions in matter which result in my appearing well-dressed on Sunday. They are only 'concomitant phenomena'.

186 To this I reply: What of that? We must not forget what is meant by such concomitance (Chapter-2; V.172-211). We are dealing with a fixed and necessary relation, not with an accidental one. 187 If these "wants" had been lacking, there would have been no coat. 188 So my second answer to the objector is, that, on the hypothesis of the parallelist, the relations between mental phenomena and physical phenomena are just as dependable as that relation between physical phenomena which we call that of cause and effect. 189 Moreover, since activity and causality are not the same thing, there is no ground for asserting that the mind cannot be active, merely because it is not material and, hence, cannot be, strictly speaking, a cause of motions in matter.

190 The plain person is entirely in the right in thinking that minds are active. The truth is that 'nothing can be active except as it has a mind'. 191 The relation of purpose and end is the one we have in view when we speak of the activity of minds.

192 It is, thus, highly unjust to a person to tell you that you are "a physical automaton with parallel psychical states," and that you are wound up by putting food into your mouth. 193 You who hears this may be excused if you feels it your duty to emit steam, walk with a jerk, and repudiate all responsibility for your actions. 194 Creatures that think, form plans, and ‘act’, are not what we call automata. It is an abuse of language to call them such, and it misleads us into looking upon them as we have no right to look upon them. 195 If people really were automata in the proper sense of the word, we could not look upon them as wise or unwise, good or bad; in short, the whole world of moral distinctions would vanish.

196 Perhaps, in spite of all that has been said in this and in the preceding section, some will feel a certain repugnance to being assigned a place in a world as orderly as our world is in this chapter conceived to be-- 197 a world in which every phenomenon, whether physical or mental, has its definite place, and all are subject to law. 198 But I suppose our content or discontent will not be independent of our conception of what sort of a world we conceive ourselves to be inhabiting.

199 If we conclude that we are in a world in which God is revealed, if the orderliness of it is but another name for Divine Providence, we can scarcely feel the same as we would if we discovered in the world nothing of the Divine. 200 I have in the last few pages been discussing the doctrine of purposes and ends, teleology, but I have said nothing of the significance of that doctrine for Theism. 201 The reader can easily see that it lies at the very foundation of our belief in God. 202 The only arguments for theism that have had much weight with humankind have been those which have maintained there are revealed in the world generally evidences of a plan and purpose at least analogous to what we discover when we scrutinise the actions of our fellow-human. 203 Such arguments are not at the mercy of either interactionist or parallelist. On either hypothesis they stand unshaken.

204 With this brief survey of some of the most interesting problems that confront the philosopher, I must content myself here. 205 Now let us turn and see how some of the fundamental problems treated in previous chapters have been approached by people belonging to certain well-recognised schools of thought.

206 And since it is peculiarly true in philosophy that, to understand the present, one must know something of the past, 207 we shall begin by taking a look at the historical background of the types of philosophical doctrine to which reference is constantly made in the books and journals of the day.

ON THE NATURE AND ORIGIN OF THE MIND

Benedict de Spinoza

5 I now pass on to explaining the results, which must necessarily follow from the essence of God, or of the eternal and infinite being; 2 not, indeed, all of them, but only those which are able to lead us, as it were by the hand, to the knowledge of the human mind and its highest blessedness.

DEFINITIONS

3 (I.) By 'body' I mean a mode which expresses in a certain determinate manner the essence of God, in so far as He is considered as an extended thing.

4 (II.) I consider as belonging to the essence of a thing that, which being given, the thing is necessarily given also, and, which being removed, the thing is necessarily removed also; 5 in other words, that without which the thing, and which itself without the thing, can neither be nor be conceived.

6 (III.) By 'idea,' I mean the mental conception which is formed by the mind as a thinking thing.

EXPLANATION

7 I say 'conception' rather than perception, because the word perception seems to imply that the mind is passive in respect to the object; whereas conception seems to express an activity of the mind.

8 (IV.) By 'an adequate idea,' I mean an idea which, in so far as it is considered in itself, without relation to the object, has all the properties or intrinsic marks of a true idea.

EXPLANATION

9 I say 'intrinsic,' in order to exclude that mark which is extrinsic, namely, the agreement between the idea and its object (ideatum).

10 (V.) 'Duration' is the indefinite continuance of existing.

EXPLANATION

11 I say 'indefinite,' because it cannot be determined through the existence itself of the existing thing, or by its efficient cause, which necessarily gives the existence of the thing, but does not take it away.

12 (VI.) 'Reality' and 'perfection' I use as synonymous terms.

13 (VII.) By 'particular things,' I mean things which are finite and have a conditioned existence; but if several individual things concur in one action, so as to be all simultaneously the effect of one cause, I consider them all, so far, as one particular thing.

AXIOMS

14 (I.) The essence of human does not involve necessary existence, that is, it may, in the order of Nature, come to pass that this or that person does or does not exist.

15 (II.) Human thinks.

16 (III.) Modes of thinking, such as love, desire, or any other of the passions, do not take place, unless there be in the same individual an idea of the thing loved, desired, etc. But the idea can exist without the presence of any other mode of thinking.

17 (IV.) We perceive that a certain body is affected in many ways.

18 (V.) We feel and perceive no particular things, save bodies and modes of thought.

PROPOSITIONS

19 (I.) Thought is an attribute of God, or God is a thinking thing.

PROOF

20 Particular thoughts, or this and that thought, are modes which, in a certain conditioned manner, express the nature of God. 21 God therefore possesses the attribute of which the concept is involved in all particular thoughts, which latter are conceived thereby. 22 Thought, therefore, is one of the infinite attributes of God, which express God's eternal and infinite essence. In other words, God is a thinking thing.

Note

23 This proposition is also evident from the fact, that we are able to conceive an infinite thinking

being. 24 For, in proportion as a thinking being is conceived as thinking more thoughts, so is it conceived as containing more reality or perfection. 25 Therefore a being, which can think an infinite number of things in an infinite number of ways, is, necessarily, in respect of thinking, infinite. 26 As, therefore, from the consideration of thought alone, we conceive an infinite being, thought is necessarily one of the infinite attributes of God, as we were desirous of showing.

27 (II.) Extension is an attribute of God, or God is an extended thing.

PROOF

28 The proof of this proposition is similar to that of the last.

III. In God there is necessarily the idea not only of His essence, but also of all things which necessarily follow from His essence.

PROOF

29 God can think an infinite number of things in infinite ways, or can form the idea of His essence, and of all things which necessarily follow therefrom. 30 Now all that is in the power of God necessarily is. Therefore, such an idea as we are considering necessarily is, and in God alone.

Note

31 The multitude understand by the power of God the free-will of God, and the right over all things that exist, which latter are accordingly generally considered as contingent. 32 For it is said that God has the power to destroy all things, and to reduce them to nothing. 33 Further, the power of God is very often likened to the power of kings. But this doctrine we have refuted, and we have shown that God acts by the same necessity, as that by which He understands Himself; 34 in other words, as it follows from the necessity of the divine Nature (as all admit), that God understands Himself, so also does it follow by the same necessity, that God performs infinite acts in infinite ways. 35 We further showed, that God's power is identical with God's essence in action; therefore it is as impossible for us to conceive God as not acting, as to conceive Him as non-existent. 36 If we might pursue the subject further, I could point out, that the power which is commonly attributed to God is not only human (as showing that God is

conceived by the multitude as a man, or in the likeness of a man), but involves a negation of power. 37 No one will be able to follow my meaning, unless you are scrupulously careful not to confound the power of God with the human power and right of kings.

38 (IV.) The idea of God, from which an infinite number of things follow in infinite ways, can only be one.

PROOF

39 Infinite intellect comprehends nothing save the attributes of God and His modifications. Now God is one. Therefore the idea of God, wherefrom an infinite number of things follow in infinite ways, can only be one.

40 (V.) The actual being of ideas owns God as its cause, only in so far as He is considered as a thinking thing, not in so far as He is unfolded in any other attribute; 41 that is, the ideas both of the attributes of God and of particular things do not own as their efficient cause their objects (ideata) or the things perceived, but God Himself in so far as He is a thinking thing.

.PROOF

42 This proposition is evident from Proposition iii. of this Part. We there drew the conclusion, that God can form the idea of His essence, and of all things which follow necessarily therefrom, solely because He is a thinking thing, and not because He is the object of His own idea. 43 Wherefore the actual being of ideas owns for cause God, in so far as He is a thinking thing. 44 It may be differently proved as follows: the actual being of ideas is (obviously) a mode of thought, that is, a mode which expresses in a certain manner the nature of God, 45 in so far as He is a thinking thing, and therefore involves the conception of no other attribute of God, and consequently is not the effect of any attribute save thought. 46 Therefore the actual being of ideas owns God as its cause, in so far as He is considered as a thinking thing.

47 (VI.) The modes of any given attribute are caused by God, in so far as He is considered through the attribute of which they are modes, and not in so far as He is

considered through any other attribute.

PROOF

48 Each attribute is conceived through itself, without any other part; wherefore the modes of each attribute involve the conception of that attribute, but not of any other. 49 Thus they are caused by God, only in so far as He is considered through the attribute whose modes they are, and not in so far as He is considered through any other.

COROLLARY

50 Hence the actual being of things, which are not modes of thought, does not follow from the divine Nature, because that nature has prior knowledge of the things. 51 Things represented in ideas follow, and are derived from their particular attribute, in the same manner, and with the same necessity as ideas follow (according to what we have shown) from the attribute of thought.

52 (VII.) The order and connection of ideas is the same as the order and connection of things.

PROOF

53 For the idea of everything that is caused depends on a knowledge of the cause, whereof it is an effect.

COROLLARY

54 Hence God's power of thinking is equal to His realised power of action-- 55 that is, whatsoever follows from the infinite nature of God in the world of extension (formaliter), follows without exception in the same order and connection from the idea of God in the world of thought (objective).

Note

56 Before going any further, I wish to recall to mind what has been pointed out above-- namely, that whatsoever can be perceived by the infinite intellect as constituting the essence of substance, belongs altogether only to one substance: 57 consequently, substance thinking and substance extended are one and the same substance, comprehended now through one attribute, now through the other. 58 So, also, a mode of extension and the idea of that mode are one and the same thing, though expressed in two ways. 59 This truth seems to have been dimly recognised by those Jews who maintained that God, God's intellect, and the things understood

by God are identical. 60 For instance, a circle existing in Nature, and the idea of a circle existing, which is also in God, are one and the same thing displayed through different attributes. 61 Thus, whether we conceive Nature under the attribute of extension, or under the attribute of thought, or under any other attribute, we shall find the same order, or one and the same chain of causes-- that is, the same things following in either case.

62 I said that God is the cause of an idea-- for instance, of the idea of a circle,-- in so far as He is a thinking thing; 63 and of a circle, in so far as He is an extended thing, simply because the actual being of the idea of a circle can only be perceived as a proximate cause through another mode of thinking, and that again through another, and so on to infinity; 64 so that, so long as we consider things as modes of thinking, we must explain the order of the whole of Nature, or the whole chain of causes, through the attribute of thought only. 65 And, in so far as we consider things as modes of extension, we must explain the order of the whole of Nature through the attributes of extension only; and so on, in the case of the other attributes. 66 Wherefore of things as they are in themselves God is really the cause, inasmuch as He consists of infinite attributes. I cannot for the present explain my meaning more clearly.

67 (VIII.) The ideas of particular things, or of modes, that do not exist, must be comprehended in the infinite idea of God, in the same way as the formal essences of particular things or modes are contained in the attributes of God.

PROOF

68 This proposition is evident from the last; it is understood more clearly from the preceding note.

COROLLARY

69 Hence, so long as particular things do not exist, except in so far as they are comprehended in the attributes of God, their representations in thought or ideas do not exist, except in so far as the infinite idea of God exists; 70 and when the particular things are said to exist, not only in so far as they are involved in the attributes of God, but also in so far as they are said to continue, their ideas will also involve existence,

through which they are said to continue.

Note

71 If anyone desires an example to throw more light on this question, I shall, I fear, not be able to give you any, which adequately explains the thing of which I here speak, inasmuch as it is unique; 72 however, I will endeavour to illustrate it as far as possible. The nature of a circle is such that if any number of straight lines intersect within it, the rectangles formed by their segments will be equal to one another; 73 thus, infinite equal rectangles are contained in a circle. Yet none of these rectangles can be said to exist, except in so far as the circle exists; 74 nor can the idea of any of these rectangles be said to exist, except in so far as they are comprehended in the idea of the circle. 75 Let us grant that, from this infinite number of rectangles, two only exist. The ideas of these two not only exist, in so far as they are contained in the idea of the circle, but also as they involve the existence of those rectangles; 76 wherefore they are distinguished from the remaining ideas of the remaining rectangles.

77 (IX.) The idea of an individual thing actually existing is caused by God, 78 not in so far as He is infinite, but in so far as He is considered as affected by another idea of a thing actually existing, of which He is the cause, in so far as He is affected by a third idea, and so on to infinity.

PROOF

79 The idea of an individual thing actually existing is an individual mode of thinking, and is distinct from other modes; thus it is caused by God, in so far only as He is a thinking thing. 80 But not in so far as He is a thing thinking absolutely, only in so far as He is considered as affected by another mode of thinking; and He is the cause of this latter, as being affected by a third, and so on to infinity. 81 Now, the order and connection of ideas is the same as the order and connection of causes. 82 Therefore of a given individual idea another individual idea, or God, in so far as He is considered as modified by that idea, is the cause; 83 and of this second idea God is the cause, in

so far as he is affected by another idea, and so on to infinity.

COROLLARY

84 Whatsoever takes place in the individual object of any idea, the knowledge thereof is in God, in so far only as He has the idea of the object.

PROOF

85 Whatsoever takes place in the object of any idea, its idea is in God , not in so far as He is infinite, but in so far as He is considered as affected by another idea of an individual thing; 86 but the order and connection of ideas is the same as the order and connection of things. 87 The knowledge, therefore, of that which takes place in any individual object will be in God, in so far only as He has the idea of that object.

88 (X.) The being of substance does not appertain to the essence of human-- in other words, substance does not constitute the actual being (forma) of human.

PROOF

89 The being of substance involves necessary existence. If, therefore, the being of substance appertains to the essence of human, substance being granted, human would necessarily be granted also, and, consequently, human would necessarily exist, which is absurd.

Note

90 This proposition may also be proved from, in which it is shown that there cannot be two substances of the same nature; for as there may be many humans, the being of substance is not that which constitutes the actual being of human. 91 Again, the proposition is evident from the other properties of substance-- namely, that substance is in its nature infinite, immutable, indivisible, as anyone may see for yourself.

COROLLARY

92 Hence it follows, that the essence of human is constituted by certain modifications of the attributes of God. For the being of substance does not belong to the essence of human. 93 That essence therefore is something which is in God, and which without God can neither be nor be conceived, whether it be a modification, or a mode which expresses God's nature in a certain conditioned manner.

Note

94 Everyone must surely admit, that nothing can be or be conceived without God. 95 All people agree that God is the one and only cause of all things, both of their essence and of their existence; 96 that is, God is not only the cause of things in respect to their being made (secundum fieri), but also in respect to their being (secundum esse). 97 At the same time many assert, that that, without which a thing cannot be nor be conceived, belongs to the essence of that thing; 98 wherefore they believe that either the nature of God appertains to the essence of created things, or else that created things can be or be conceived without God; or else, as is more probably the case, they hold inconsistent doctrines. 99 I think the cause for such confusion is mainly, that they do not keep to the proper order of philosophic thinking. 100 The nature of God, which should be reflected on first, inasmuch as it is prior both in the order of knowledge and the order of Nature, they have taken to be last in the order of knowledge, and have put into the first place what they call the objects of sensation; 101 hence, while they are considering natural phenomena, they give no attention at all to the divine Nature, 102 and, when afterwards they apply their mind to the study of the divine Nature, they are quite unable to bear in mind the first hypotheses, with which they have overlaid the knowledge of natural phenomena, inasmuch as such hypotheses are no help towards understanding the divine Nature. 103 So that it is hardly to be wondered at, that these persons contradict themselves freely.

104 However, I pass over this point. My intention here was only to give a reason for not saying, that that, without which a thing cannot be or be conceived, belongs to the essence of that thing: 105 individual things cannot be or be conceived without God, yet God does not appertain to their essence. 106 I said that "I considered as belonging to the essence of a thing that, which being given, the thing is necessarily given also, and which being removed, the thing is necessarily removed also; 107 or that without which the thing, and

which itself without the thing can neither be nor be conceived."

108 (XI.) The first element, which constitutes the actual being of the human mind, is the idea of some particular thing actually existing.

PROOF

109 The essence of human is constituted by certain modes of the attributes of God, namely, by the modes of thinking, of all which the idea is prior in Nature, 110 and, when the idea is given, the other modes (namely, those of which the idea is prior in Nature) must be in the same individual (by the same Axiom). 111 Therefore an idea is the first element constituting the human mind. But not the idea of a non-existent thing, for then the idea itself cannot be said to exist; 112 it must therefore be the idea of something actually existing. But not of an infinite thing. For an infinite thing, must always necessarily exist; this would involve an absurdity.

113 Therefore the first element, which constitutes the actual being of the human mind, is the idea of something actually existing.

COROLLARY

114 Hence it follows, that the human mind is part of the infinite intellect of God; 115 thus when we say, that the human mind perceives this or that, we make the assertion, that God has this or that idea, 116 not in so far as He is infinite, but in so far as He is displayed through the nature of the human mind, or in so far as He constitutes the essence of the human mind; 117 and when we say that God has this or that idea, not only in so far as He constitutes the essence of the human mind, but also in so far as He, simultaneously with the human mind, has the further idea of another thing, 118 we assert that the human mind perceives a thing in part or inadequately.

Note

119 Here, I doubt not, readers will come to a stand, and will call to mind many things which will cause them to hesitate; 120 I therefore beg them to accompany me slowly, step by step, and not to pronounce on my statements, till they have read to the end.

121 (XII.) Whatsoever comes to pass in the object of the idea, which constitutes the human mind, must be perceived by the human mind, or there will

necessarily be an idea in the human mind of the said occurrence. 122 That is, if the object of the idea constituting the human mind be a body, nothing can take place in that body without being perceived by the mind.

PROOF

123 Whatsoever comes to pass in the object of any idea, the knowledge thereof is necessarily in God, in so far as He is considered as affected by the idea of the said object, that is, in so far as He constitutes the mind of anything.

124 Therefore, whatsoever takes place in the object constituting the idea of the human mind, the knowledge thereof is necessarily in God, in so far as He constitutes the essence of the human mind; 125 that is the knowledge of the said thing will necessarily be in the mind, in other words the mind perceives it.

126 (XIII.) The object of the idea constituting the human mind is the body, in other words a certain mode of extension which actually exists, and nothing else.

PROOF

127 If indeed the body were not the object of the human mind, the ideas of the modifications of the body would not be in God in virtue of His constituting our mind, but in virtue of His constituting the mind of something else; 128 that is, the ideas of the modifications of the body would not be in our mind: nor we do possess the idea of the modifications of the body. 129 Therefore the object of the idea constituting the human mind is the body, and the body as it actually exists. 130 Further, if there were any other object of the idea constituting the mind besides body, then, as nothing can exist from which some effect does not follow there would necessarily have to be in our mind an idea, which would be the effect of that other object; 131 but there is no such idea. Wherefore the object of our mind is the body as it exists, and nothing else.

Note

132 We thus comprehend, not only that the human mind is united to the body, but also the nature of the union between mind and body. 133 However, no one will be able to grasp this adequately or distinctly, unless you first has adequate knowledge of the nature of our

body. 134 The propositions we have advanced hitherto have been entirely general, applying not more to humans than to other individual things, all of which, though in different degrees, are animated (animata). 135 For of everything there is necessarily an idea in God, of which God is the cause, in the same way as there is an idea of the human body; 136 thus whatever we have asserted of the idea of the human body must necessarily also be asserted of the idea of everything else. 137 Still, on the other hand, we cannot deny that ideas, like objects, differ one from the other, one being more excellent than another and containing more reality, 138 just as the object of one idea is more excellent than the object of another idea, and contains more reality.

139 Wherefore, in order to determine, wherein the human mind differs from other things, and wherein it surpasses them, it is necessary for us to know the nature of its object, that is, of the human body. 140 What this nature is, I am not able here to explain, nor is it necessary for the proof of what I advance, that I should do so. 141 I will only say generally, that in proportion as any given body is more fitted than others for doing many actions or receiving many impressions at once, so also is the mind, of which it is the object, more fitted than others for forming many simultaneous perceptions; 142 and the more the actions of the body depend on itself alone, and the fewer other bodies concur with it in action, the more fitted is the mind of which it is the object for distinct comprehension. 143 We may thus recognise the superiority of one mind over others, and may further see the cause, why we have only a very confused knowledge of our body, and also many kindred questions, which I will, in the following propositions, deduce from what has been advanced. 144 Wherefore I have thought it worthwhile to explain and prove more strictly my present statements. In order to do so, I must premise a few propositions concerning the nature of bodies.

AXIOM

145 I. All bodies are either in motion or at rest.

146 (II.) Every body is moved sometimes more slowly, sometimes more quickly.

Lemma I.

147 Bodies are distinguished from one another in respect of motion and rest, quickness and slowness, and not in respect of substance.

PROOF

148 The first part of this proposition is, I take it, self-evident. That bodies are not distinguished in respect of substance.

Lemma II.

149 All bodies agree in certain respects.

PROOF

150 All bodies agree in the fact, that they involve the conception of one and the same attribute. Further, in the fact that they may be moved less or more quickly, and may be absolutely in motion or at rest.

Lemma III.

151 A body in motion or at rest must be determined to motion or rest by another body, which other body has been determined to motion or rest by a third body, and that third again by a fourth, and so on to infinity.

PROOF

152 Bodies are individual things, which are distinguished one from the other in respect to motion and rest; 153 thus each must necessarily be determined to motion or rest by another individual thing, namely by another body, which other body is also in motion or at rest. 154 And this body again can only have been set in motion or caused to rest by being determined by a third body to motion or rest. This third body again by a fourth, and so on to infinity.

COROLLARY

155 Hence it follows, that a body in motion keeps in motion, until it is determined to a state of rest by some other body; and a body at rest remains so, until it is determined to a state of motion by some other body. 156 This is indeed self-evident. For when I suppose, for instance, that a given body, A, is at rest, and do not take into consideration other bodies in motion, I cannot affirm anything concerning the body A, except that it is at rest. 157 If it afterwards comes to pass that A is in motion, this cannot have resulted from its having been at rest, for no other

consequence could have been involved than its remaining at rest. 158 If, on the other hand, A be given in motion, we shall, so long as we only consider A, be unable to affirm anything concerning it, except that it is in motion. 159 If A is subsequently found to be at rest, this rest cannot be the result of A's previous motion, for such motion can only have led to continued motion; 160 the state of rest therefore must have resulted from something, which was not in A, namely, from an external cause determining A to a state of rest.

AXIOM I

161 All modes, wherein one body is affected by another body, follow simultaneously from the nature of the body affected and the body affecting; 162 so that one and the same body may be moved in different modes, according to the difference in the nature of the bodies moving it; 163 on the other hand, different bodies may be moved in different modes by one and the same body.

AXIOM II

164 When a body in motion impinges on another body at rest, which it is unable to move, it recoils, in order to continue its motion, 165 and the angle made by the line of motion in the recoil and the plane of the body at rest, whereon the moving body has impinged, will be equal to the angle formed by the line of motion of incidence and the same plane.

166 So far we have been speaking only of the most simple bodies, which are only distinguished one from the other by motion and rest, quickness and slowness. We now pass on to compound bodies.

DEFINITION

167 When any given bodies of the same or different magnitude are compelled by other bodies to remain in contact, or if they be moved at the same or different rates of speed, so that their mutual movements should preserve among themselves a certain fixed relation, 168 we say that such bodies are 'in union,' and that together they compose one body or individual, which is distinguished from other bodies by the fact of this union.

AXIOM III

169 In proportion as the parts of an individual, or a compound body, are in contact over a greater or less superficies, they will with greater or less difficulty admit of

being moved from their position; 170 consequently the individual will, with greater or less difficulty, be brought to assume another form. 171 Those bodies, whose parts are in contact over large superficies, are called 'hard;' those, whose parts are in contact over small superficies, are called 'soft;' those, whose parts are in motion among one another, are called 'fluid.

Lemma IV.

172 If from a body or individual, compounded of several bodies, certain bodies be separated, and if, at the same time, an equal number of other bodies of the same nature take their place, the individual will preserve its nature as before, without any change in its actuality (forma).

PROOF

173 Bodies are not distinguished in respect of substance: that which constitutes the actuality (formam) of an individual consists in a union of bodies; 174 but this union, although there is a continual change of bodies, will (by our hypothesis) be maintained; the individual, therefore, will retain its nature as before, both in respect of substance and in respect of mode.

Lemma V.

175 If the parts composing an individual become greater or less, but in such proportion, that they all preserve the same mutual relations of motion and rest, the individual will still preserve its original nature, and its actuality will not be changed.

Lemma VI.

176 If certain bodies composing an individual be compelled to change the motion, which they have in one direction, for motion in another direction, 177 but in such a manner, that they be able to continue their motions and their mutual communication in the same relations as before, the individual will retain its own nature without any change of its actuality.

PROOF

178 This proposition is self-evident, for the individual is supposed to retain all that, which, in its definition, we spoke of as its actual being.

Lemma VII.

179 Furthermore, the individual thus composed preserves its nature, whether it be, as a whole,

in motion or at rest, whether it be moved in this or that direction; so long as each part retains its motion, and preserves its communication with other parts as before.

Note

180 We thus see, how a composite individual may be affected in many different ways, and preserve its Nature notwithstanding. 181 Thus far we have conceived an individual as composed of bodies only distinguished one from the other in respect of motion and rest, speed and slowness; that is, of bodies of the most simple character. 182 If, however, we now conceive another individual composed of several individuals of diverse natures, we shall find that the number of ways in which it can be affected, without losing its nature, will be greatly multiplied. 183 Each of its parts would consist of several bodies, and therefore (by Lemma vi.) each part would admit, without change to its nature, of quicker or slower motion, and would consequently be able to transmit its motions more quickly or more slowly to the remaining parts. 184 If we further conceive a third kind of individuals composed of individuals of this second kind, we shall find that they may be affected in a still greater number of ways without changing their actuality. 185 We may easily proceed thus to infinity, and conceive the whole of Nature as one individual, whose parts, that is, all bodies, vary in infinite ways, without any change in the individual as a whole. 186 I should feel bound to explain and demonstrate this point at more length, if I were writing a special treatise on body. 187 But I have already said that such is not my object; I have only touched on the question, because it enables me to prove easily that which I have in view.

POSTULATES

188 I The human body is composed of a number of individual parts, of diverse nature, each one of which is in itself extremely complex.

189 (II.) Of the individual parts composing the human body some are fluid, some soft, some hard.

190 (III.) The individual parts composing the human body, and consequently the human body

itself, are affected in a variety of ways by external bodies.

191 (IV.) The human body stands in need for its preservation of a number of other bodies, by which it is continually, so to speak, regenerated.

192 (V.) When the fluid part of the human body is determined by an external body to impinge often on another soft part, it changes the surface of the latter, and, as it were, leaves the impression thereupon of the external body which impels it.

193 (VI.) The human body can move external bodies, and arrange them in a variety of ways.

PROPOSITIONS XIV.

194 The human mind is capable of perceiving a great number of things, and is so in proportion as its body is capable of receiving a great number of impressions.

PROOF

195 The human body is affected in very many ways by external bodies, and is capable in very many ways of affecting external bodies. 196 But the human mind must perceive all that takes place in the human body; the human mind is, therefore, capable of perceiving a great number of things, and is so in proportion.

197 (XV.) The idea, which constitutes the actual being of the human mind, is not simple, but compounded of a great number of ideas.

PROOF

198 The idea constituting the actual being of the human mind is the idea of the body, which is composed of a great number of complex individual parts. 199 But there is necessarily in God the idea of each individual part whereof the body is composed; therefore the idea of the human body is composed of each of these numerous ideas of its component parts.

200 (XVI.) The idea of every mode, in which the human body is affected by external bodies, must involve the nature of the human body, and also the nature of the external body.

PROOF

201 All the modes, in which any given body is affected, follow from the nature of the body affected, and also from the nature of the affecting body, wherefore their idea is also necessarily involves the nature of both bodies;

202 therefore, the idea of every mode, in which the human body is affected by external bodies, involves the nature of the human body and of the external body.

COROLLARY I

203 Hence it follows, first, that the human mind perceives the nature of a variety of bodies, together with the nature of its own.

COROLLARY II

204 It follows, secondly, that the ideas, which we have of external bodies, indicate rather the constitution of our own body than the nature of external bodies.

205 (XVII.) If the human body is affected in a manner which involves the nature of any external body, the human mind will regard the said external body as actually existing, 206 or as present to itself, until the human body be affected in such a way, as to exclude the existence or the presence of the said external body.

PROOF

207 This proposition is self-evident, for so long as the human body continues to be thus affected, so long will the human mind regard this modification of the body-- 208 that is (by the last Proposition.), it will have the idea of the mode as actually existing, and this idea involves the nature of the external body; therefore the mind will regard the external body as actually existing, until it is affected.

COROLLARY

209 The mind is able to regard as present external bodies, by which the human body has once been affected, even though they be no longer in existence or present.

PROOF

210 When external bodies determine the fluid parts of the human body, so that they often impinge on the softer parts, they change the surface of the last named (Postulate. v); 211 hence they are refracted therefrom in a different manner from that which they followed before such change; 212 and, further, when afterwards they impinge on the new surfaces by their own spontaneous movement, they will be refracted in the same manner, as though they had been impelled towards those surfaces by external bodies; 213 consequently, they will, while they continue to be thus refracted, affect the human body in the same manner, whereof the mind will again take cognisance-- 214 that is,

the mind will again regard the external body as present, and will do so, as often as the fluid parts of the human body impinge on the aforesaid surfaces by their own spontaneous motion.

215 Wherefore, although the external bodies, by which the human body has once been affected, be no longer in existence, the mind will nevertheless regard them as present, as often as this action of the body is repeated.

Note

216 We thus see how it comes about, as is often the case, that we regard as present many things which are not. 217 It is possible that the same result may be brought about by other causes; but I think it suffices for me here to have indicated one possible explanation, just as well as if I had pointed out the true cause. 218 Indeed, I do not think I am very far from the truth, for all my assumptions are based on postulates, which rest, almost without exception, on experience, that cannot be controverted by those who have shown, as we have, that the human body, as we feel it, exists. 219 Furthermore, we clearly understand what is the difference between the idea, say, of Peter, which constitutes the essence of Peter's mind, and the idea of the said Peter, which is in another human, say, Paul. 220 The former directly answers to the essence of Peter's own body, and only implies existence so long as Peter exists; 221 the latter indicates rather the disposition of Paul's body than the nature of Peter, and, therefore, while this disposition of Paul's body lasts, Paul's mind will regard Peter as present to itself, even though he no longer exists. 222 Further, to retain the usual phraseology, the modifications of the human body, of which the ideas represent external bodies as present to us, we will call the images of things, though they do not recall the figure of things. 223 When the mind regards bodies in this fashion, we say that it imagines. I will here draw attention to the fact, in order to indicate where error lies, that the imaginations of the mind, looked at in themselves, do not contain error. 224 The mind does not err in the mere act of imagining, but only in so far as it

is regarded as being without the idea, which excludes the existence of such things as it imagines to be present to it. 225 If the mind, while imagining non-existent things as present to it, is at the same time conscious that they do not really exist, this power of imagination must be set down to the efficacy of its nature, and not to a fault, 226 especially if this faculty of imagination depend solely on its own nature-- that is, if this faculty of imagination be free.

227 (XVIII.) If the human body has once been affected by two or more bodies at the same time, when the mind afterwards imagines any of them, it will straightway remember the others also.

PROOF

228 The mind imagines any given body, because the human body is affected and disposed by the impressions from an external body, in the same manner as it is affected when certain of its parts are acted on by the said external body; 229 but (by our hypothesis) the body was then so disposed, that the mind imagined two bodies at once; 230 therefore, it will also in the second case imagine two bodies at once, and the mind, when it imagines one, will straightway remember the other.

Note

231 We now clearly see what 'Memory' is. It is simply a certain association of ideas involving the nature of things outside the human body, which association arises in the mind according to the order and association of the modifications (affectiones) of the human body. 232 I say, first, it is an association of those ideas only, which involve the nature of things outside the human body: not of ideas which answer to the nature of the said things: 233 ideas of the modifications of the human body are, strictly speaking those which involve the nature both of the human body and of external bodies.

234 I say, secondly, that this association arises according to the order and association of the modifications of the human body, in order to distinguish it from that association of ideas, which arises from the order of the intellect, 235 whereby the mind perceives things through their primary causes, and which is in all humans the same.

236 And hence we can further clearly understand, why the mind from the thought of one thing, should straightway arrive at the thought of another thing, which has no similarity with the first; 237 for instance, from the thought of the word 'pomum' (an apple), a Roman would straightway arrive at the thought of the fruit apple, 238 which has no similitude with the articulate sound in question, nor anything in common with it, except that the body of the human has often been affected by these two things; 239 that is, that the person has often heard the word 'pomum,' while you was looking at the fruit; similarly every person will go on from one thought to another, according as own habit has ordered the images of things in own body. 240 For a soldier, for instance, when you sees the tracks of a horse in sand, will at once pass from the thought of a horse to the thought of a horseman, and thence to the thought of war; while a countryman will proceed from the thought of a horse to the thought of a plough, a field. 241 Thus every human will follow this or that train of thought, according as you have been in the habit of conjoining and associating the mental images of things in this or that manner.

242 (XIX.) The human mind has no knowledge of the body, and does not know it to exist, save through the ideas of the modifications whereby the body is affected.

PROOF

243 The human mind is the very idea or knowledge of the human body, which is in God, in so far as He is regarded as affected by another idea of a particular thing actually existing: 244 or, inasmuch as (Postulate. iv.) the human body stands in need of very many bodies whereby it is, as it were, continually regenerated; 245 and the order and connection of ideas is the same as the order and connection of causes; this idea will therefore be in God, in so far as He is regarded as affected by the ideas of very many particular things. 246 Thus God has the idea of the human body, or knows the human body, in so far as He is affected by very many other ideas, and not in so far as He constitutes the nature of the human mind; that is, the human mind does not know

the human body. 247 But the ideas of the modifications of body are in God, in so far as He constitutes the nature of the human mind, 248 or the human mind perceives those modifications, and consequently the human body itself, and as actually existing; therefore the mind perceives thus far only the human body.

249 (XX.) The idea or knowledge of the human mind is also in God, following in God in the same manner, and being referred to God in the same manner, as the idea or knowledge of the human body.

PROOF

250 Thought is an attribute of God; therefore there must necessarily be in God the idea both of thought itself and of all its modifications, consequently also of the human mind. 251 Further, this idea or knowledge of the mind does not follow from God, in so far as He is infinite, but in so far as He is affected by another idea of an individual thing. 252 But the order and connection of ideas is the same as the order and connection of causes; 253 therefore this idea or knowledge of the mind is in God and is referred to God, in the same manner as the idea or knowledge of the body.

254 (XXI.) This idea of the mind is united to the mind in the same way as the mind is united to the body.

PROOF

255 That the mind is united to the body we have shown from the fact, that the body is the object of the mind; 256 and so for the same reason the idea of the mind must be united with its object, that is, with the mind in the same manner as the mind is united to the body.

Note

257 This proposition is comprehended much more clearly from what we have said in the note to II. Vii. 258 We there showed that the idea of body and body, that is, mind and body, are one and the same individual conceived now under the attribute of thought, now under the attribute of extension; 259 wherefore the idea of the mind and the mind itself are one and the same thing, which is conceived under one and the same attribute, namely, thought.

260 The idea of the mind, I repeat, and the mind itself are in God by the same necessity and follow

from Him from the same power of thinking. 261 Strictly speaking, the idea of the mind, that is, the idea of an idea, is nothing but the distinctive quality (forma) of the idea in so far as it is conceived as a mode of thought without reference to the object; 262 if a person knows anything, you, by that very fact, knows that you knows it, and at the same time knows that you knows that you knows it, and so on to infinity.

263 (XXII.) The human mind perceives not only the modifications of the body, but also the ideas of such modifications.

PROOF

264 The ideas of the ideas of modifications follow in God in the same manner, and are referred to God in the same manner, as the ideas of the said modifications. 265 But the ideas of the modifications of the body are in the human mind, that is, in God, in so far as He constitutes the essence of the human mind; 266 therefore the ideas of these ideas will be in God, in so far as He has the knowledge or idea of the human mind, that is, they will be in the human mind itself, which therefore perceives not only the modifications of the body, but also the ideas of such modifications.

267 (XXIII.) The mind does not know itself, except in so far as it perceives the ideas of the modifications of the body.

PROOF

268 The idea or knowledge of the mind follows in God in the same manner, and is referred to God in the same manner, as the idea or knowledge of the body. 269 But since the human mind does not know the human body itself, that is, since the knowledge of the human body is not referred to God, in so far as He constitutes the nature of the human mind; 270 therefore, neither is the knowledge of the mind referred to God, in so far as He constitutes the essence of the human mind; therefore, the human mind thus far has no knowledge of itself. 271 Further the ideas of the modifications, whereby the body is affected, involve the nature of the human body itself, that is, they agree with the nature of the mind; 272 wherefore the knowledge of these ideas necessarily involves knowledge of the mind; but (by

the last Proposition.) the knowledge of these ideas is in the human mind itself; 273 wherefore the human mind thus far only has knowledge of itself.

274 (XXIV.) The human mind does not involve an adequate knowledge of the parts composing the human body.

PROOF

275 The parts composing the human body do not belong to the essence of that body, except in so far as they communicate their motions to one another in a certain fixed relation, not in so far as they can be regarded as individuals without relation to the human body. 276 The parts of the human body are highly complex individuals, whose parts can be separated from the human body without in any way destroying the nature and distinctive quality of the latter, and they can communicate their motions to other bodies in another relation; 277 therefore the idea or knowledge of each part will be in God, inasmuch as He is regarded as affected by another idea of a particular thing, which particular thing is prior in the order of Nature to the aforesaid part. 278 We may affirm the same thing of each part of each individual composing the human body; 279 therefore, the knowledge of each part composing the human body is in God, in so far as He is affected by very many ideas of things, and not in so far as He has the idea of the human body only, 280 in other words, the idea which constitutes the nature of the human mind; therefore, the human mind does not involve an adequate knowledge of the human body.

281 (XXV.) The idea of each modification of the human body does not involve an adequate knowledge of the external body.

PROOF

282 We have shown that the idea of a modification of the human body involves the nature of an external body, in so far as that external body conditions the human body in a given manner. 283 But, in so far as the external body is an individual, which has no reference to the human body, the knowledge or idea thereof is in God, 284 in so far as God is regarded as affected by the idea of a further thing, which is naturally prior to the said external body. 285 Wherefore an

adequate knowledge of the external body is not in God, in so far as He has the idea of the modification of the human body; 286 in other words, the idea of the modification of the human body does not involve an adequate knowledge of the external body.

287 (XXVI.) The human mind does not perceive any external body as actually existing, except through the ideas of the modifications of its own body.

PROOF

288 If the human body is in no way affected by a given external body, then neither is the idea of the human body, in other words, the human mind, affected in any way by the idea of the existence of the said external body, nor does it in any manner perceive its existence. 289 But, in so far as the human body is affected in any way by a given external body, thus far it perceives that external body.

COROLLARY

290 In so far as the human mind imagines an external body, it has not an adequate knowledge thereof.

PROOF

291 When the human mind regards external bodies through the ideas of the modifications of its own body, we say that it imagines; now the mind can only imagine external bodies as actually existing. 292 Therefore, in so far as the mind imagines external bodies, it has not an adequate knowledge of them.

293 (XXVII.) The idea of each modification of the human body does not involve an adequate knowledge of the human body itself.

PROOF

294 Every idea of a modification of the human body involves the nature of the human body, in so far as the human body is regarded as affected in a given manner. 295 But inasmuch as the human body is an individual which may be affected in many other ways, the idea of the said modification.

296 (XXVIII.) The ideas of the modifications of the human body, in so far as they have reference only to the human mind, are not clear and distinct, but confused.

PROOF

297 The ideas of the modifications of the human body involve the nature both of the human body and of external bodies; 298 they must involve the nature not only of

the human body but also of its parts; for the modifications are modes, whereby the parts of the human body, and, consequently, the human body as a whole are affected. 299 But the adequate knowledge of external bodies, as also of the parts composing the human body, is not in God, in so far as He is regarded as affected by the human mind, but in so far as He is regarded as affected by other ideas.

300 These ideas of modifications, in so far as they are referred to the human mind alone, are as consequences without premises, in other words, confused ideas.

Note

301 The idea which constitutes the nature of the human mind is, in the same manner, proved not to be, when considered in itself and alone, clear and distinct; 302 as also is the case with the idea of the human mind, and the ideas of the ideas of the modifications of the human body, in so far as they are referred to the mind only, as everyone may easily see.

303 (XXIX.) The idea of the idea of each modification of the human body does not involve an adequate knowledge of the human mind.

PROOF

304 The idea of a modification of the human body does not involve an adequate knowledge of the said body, in other words, does not adequately express its nature; 305 that is, it does not agree with the nature of the mind adequately; therefore the idea of this idea does not adequately express the nature of the human mind, or does not involve an adequate knowledge thereof.

COROLLARY

306 Hence it follows that the human mind, when it perceives things after the common order of nature, has not an adequate but only a confused and fragmentary knowledge of itself, of its own body, and of external bodies. 307 For the mind does not know itself, except in so far as it perceives the ideas of the modifications of body. 308 It only perceives its own body through the ideas of the modifications of body. It only perceives its own body through the ideas of the modifications, and only perceives external bodies through the same means; 309 thus, in so far as it has such ideas of

modification, it has not an adequate knowledge of itself, nor of its own body, nor of external bodies, but only a fragmentary and confused knowledge thereof.

Note

310 I say expressly, that the mind has not an adequate but only a confused knowledge of itself, its own body, and of external bodies, whenever it perceives things after the common order of nature; 311 that is, whenever it is determined from without, namely, by the fortuitous play of circumstance, to regard this or that; 312 not at such times as it is determined from within, that is, by the fact of regarding several things at once, to understand their points of agreement, difference, and contrast. 313 Whenever it is determined in anywise from within, it regards things clearly and distinctly, as I will show below.

314 (XXX.) We can only have a very inadequate knowledge of the duration of our body.

PROOF

315 The duration of our body does not depend on its essence, nor on the absolute nature of God. 316 But it is conditioned to exist and operate by causes, which in their turn are conditioned to exist and operate in a fixed and definite relation by other causes, these last again being conditioned by others, and so on to infinity. 317 The duration of our body therefore depends on the common order of nature, or the constitution of things. 318 Now, however a thing may be constituted, the adequate knowledge of that thing is in God, in so far as He has the ideas of all things, and not in so far as He has the idea of the human body only. 319 Wherefore the knowledge of the duration of our body is in God very inadequate, in so far as He is only regarded as constituting the nature of the human mind; that is, this knowledge is very inadequate to our mind.

320 (XXXI.) We can only have a very inadequate knowledge of the duration of particular things external to ourselves.

PROOF

321 Every particular thing, like the human body, must be conditioned by another particular thing to exist and operate in a fixed and definite relation; this other particular thing

must likewise be conditioned by a third, and so on to infinity. 322 As we have shown in the foregoing proposition, from this common property of particular things, we have only a very inadequate knowledge of the duration of our body; 323 we must draw a similar conclusion with regard to the duration of particular things, namely, that we can only have a very inadequate knowledge of the duration thereof.

COROLLARY

324 Hence it follows that all particular things are contingent and perishable. 325 For we can have no adequate idea of their duration, and this is what we must understand by the contingency and perishableness of things. For, except in this sense, nothing is contingent.

326 (XXXII.) All ideas, in so far as they are referred to God, are true.

PROOF

327 All ideas which are in God agree in every respect with their objects, therefore they are all true.

328 (XXXII.) There is nothing positive in ideas, which causes them to be called false.

PROOF

329 If this be denied, conceive, if possible, a positive mode of thinking, which should constitute the distinctive quality of falsehood. 330 Such a mode of thinking cannot be in God; external to God it cannot be or be conceived. Therefore there is nothing positive in ideas which causes them to be called false.

331 (XXXIV.) Every idea, which in us is absolute or adequate and perfect, is true.

PROOF

332 When we say that an idea in us is adequate and perfect, we say, in other words, that the idea is adequate and perfect in God, in so far as He constitutes the essence of our mind; consequently, we say that such an idea is true.

333 (XXXV.) Falsity consists in the privation of knowledge, which inadequate, fragmentary, or confused ideas involve.

PROOF

334 There is nothing positive in ideas, which causes them to be called false; but falsity cannot consist in simple privation (for minds, not bodies, are said to err and to be mistaken), 335 neither can it consist in absolute

ignorance, for ignorance and error are not identical; 336 wherefore it consists in the privation of knowledge, which inadequate, fragmentary, or confused ideas involve.

Note

337 In the note to II. xvii. I explained how error consists in the privation of knowledge, but in order to throw more light on the subject I will give an example. 338 For instance, humans are mistaken in thinking themselves free; their opinion is made up of consciousness of their own actions, and ignorance of the causes by which they are conditioned. 339 Their idea of freedom, therefore, is simply their ignorance of any cause for their actions. 340 As for their saying that human actions depend on the will, this is a mere phrase without any idea to correspond thereto. 341 What the will is, and how it moves the body, they none of them know; those who boast of such knowledge, and feign dwellings and habitations for the soul, are wont to provoke either laughter or disgust. 342 So, again, when we look at the sun, we imagine that it is distant from us about two hundred feet; this error does not lie solely in this fancy, but in the fact that, while we thus imagine, we do not know the sun's true distance or the cause of the fancy. 343 For although we afterwards learn, that the sun is distant from us more than six hundred of the earth's diameters, we none the less shall fancy it to be near; 344 for we do not imagine the sun as near us, because we are ignorant of its true distance, but because the modification of our body involves the essence of the sun, in so far as our said body is affected thereby.

345 (XXXVI.) Inadequate and confused ideas follow by the same necessity, as adequate or clear and distinct ideas.

PROOF

346 All ideas are in God, and in so far as they are referred to God are true and adequate; 347 therefore there are no ideas confused or inadequate, except in respect to a particular mind; therefore all ideas, whether adequate or inadequate, follow by the same necessity.

348 (XXXVII.) That which is common to all, and which is

equally in a part and in the whole, does not constitute the essence of any particular thing.

PROOF

349 If this be denied, conceive, if possible, that it constitutes the essence of some particular thing; for instance, the essence of B. Then it cannot without B either exist or be conceived; but this is against our hypothesis.

350 Therefore it does not appertain to B's essence, nor does it constitute the essence of any particular thing.

351 (XXXVIII.) Those things, which are common to all, and which are equally in a part and in the whole, cannot be conceived except adequately.

PROOF

352 Let A be something, which is common to all bodies, and which is equally present in the part of any given body and in the whole. 353 I say A cannot be conceived except adequately. For the idea thereof in God will necessarily be adequate, both in so far as God has the idea of the human body, 354 and also in so far as He has the idea of the modifications of the human body, which involve in part the nature of the human body and the nature of external bodies; 355 that is, the idea in God will necessarily be adequate, both in so far as He constitutes the human mind, and in so far as He has the ideas, which are in the human mind. 356 Therefore the mind necessarily perceives A adequately, and has this adequate perception, both in so far as it perceives itself, and in so far as it perceives its own or any external body, nor can A be conceived in any other manner.

COROLLARY

357 Hence it follows that there are certain ideas or notions common to all humans; for all bodies agree in certain respects, which (by the foregoing Proposition.) must be adequately or clearly and distinctly perceived by all.

358 (XXXIX.) That, which is common to and a property of the human body and such other bodies as are wont to affect the human body, 359 and which is present equally in each part of either, or in the whole, will be represented by an adequate idea in the mind.

PROOF

360 If A be that, which is common to and a property of the human

body and external bodies, and equally present in the human body and in the said external bodies, in each part of each external body and in the whole, there will be an adequate idea of A in God, 361 both in so far as He has the idea of the human body, and in so far as He has the ideas of the given external bodies. 362 Let it now be granted, that the human body is affected by an external body through that, which it has in common therewith, namely, A; 363 the idea of this modification will involve the property A, and therefore the idea of this modification, in so far as it involves the property A, will be adequate in God, in so far as God is affected by the idea of the human body; 364 that is, in so far as He constitutes the nature of the human mind; therefore this idea is also adequate in the human mind.

COROLLARY

365 Hence it follows that the mind is fitted to perceive adequately more things, in proportion as its body has more in common with other bodies.

366 (XL.) Whatsoever ideas in the mind follow from ideas which are therein adequate, are also themselves adequate.

PROOF

367 This proposition is self-evident. For when we say that an idea in the human mind follows from ideas which are therein adequate, we say, in other words, that an idea is in the divine intellect, whereof God is the cause, 368 not in so far as He is infinite, nor in so far as He is affected by the ideas of very many particular things, but only in so far as He constitutes the essence of the human mind.

Note I

369 I have thus set forth the cause of those notions, which are common to all humans, and which form the basis of our ratiocinations. 370 But there are other causes of certain axioms or notions, which it would be to the purpose to set forth by this method of ours; 371 for it would thus appear what notions are more useful than others, and what notions have scarcely any use at all. 372 Furthermore, we should see what notions are common to all humans, and what notions are only clear and distinct to those

who are unshackled by prejudice, and we should detect those which are ill-founded. 373 Again we should discern whence the notions called "secondary" derived their origin, and consequently the axioms on which they are founded, and other points of interest connected with these questions. 374 But I have decided to pass over the subject here, partly because I have set it aside for another treatise, partly because I am afraid of wearying the reader by too great prolixity.

375 Nevertheless, in order not to omit anything necessary to be known, I will briefly set down the causes, whence are derived the terms styled "transcendental," such as Being, Thing, Something. 376 These terms arose from the fact, that the human body, being limited, is only capable of distinctly forming a certain number of images (what an image is I explained in the II. xvii. note) within itself at the same time; 377 if this number be exceeded, the images will begin to be confused; if this number of images, of which the body is capable of forming distinctly within itself, be largely exceeded, all will become entirely confused one with another. 378 This being so, it is evident that the human mind can distinctly imagine as many things simultaneously, as its body can form images simultaneously. 379 When the images become quite confused in the body, the mind also imagines all bodies confusedly without any distinction, and will comprehend them, as it were, under one attribute, namely, under the attribute of Being, Thing. 380 The same conclusion can be drawn from the fact that images are not always equally vivid, and from other analogous causes, which there is no need to explain here; 381 for the purpose which we have in view it is sufficient for us to consider one only. All may be reduced to this, that these terms represent ideas in the highest degree confused. 382 From similar causes arise those notions, which we call "general," such as human, horse, dog, etc. They arise, to wit, from the fact that so many images, for instance, of humans, are formed simultaneously in the human mind, 383 that the powers

of imagination break down, not indeed utterly, but to the extent of the mind losing count of small differences between individuals (e.g. colour, size, etc) and their definite number, 384 and only distinctly imagining that, in which all the individuals, in so far as the body is affected by them, agree; 385 for that is the point, in which each of the said individuals chiefly affected the body; this the mind expresses by the name human, and this it predicates of an infinite number of particular individuals. 386 For, as we have said, it is unable to imagine the definite number of individuals. We must, however, bear in mind, that these general notions are not formed by all humans in the same way, 387 but vary in each individual according as the point varies, whereby the body has been most often affected and which the mind most easily imagines or remembers. 388 For instance, those who have most often regarded with admiration the stature of human, will by the name of human understand an animal of erect stature; 389 those who have been accustomed to regard some other attribute, will form a different general image of human, for instance, that human is a laughing animal, a two-footed animal without feathers, a rational animal, 390 and thus, in other cases, everyone will form general images of things according to the habit of own body.

391 It is thus not to be wondered at, that among philosophers, who seek to explain things in Nature merely by the images formed of them, so many controversies should have arisen.

Note II

392 From all that has been said above it is clear, that we, in many cases, perceive and form our general notions:--

393 (1.) From particular things represented to our intellect fragmentarily, confusedly, and without order through our senses; I have settled to call such perceptions by the name of knowledge from the mere suggestions of experience.

394 (2.) From symbols, e.g., from the fact of having read or heard certain words we remember things and form certain ideas concerning them, similar to those through

which we imagine things. 395 I shall call both these ways of regarding things "knowledge of the first kind," "opinion," or "imagination."

396 (3.) From the fact that we have notions common to all humans, and adequate ideas of the properties of things; this I call "reason" and "knowledge of the second kind." 397 Besides these two kinds of knowledge, there is, as I will hereafter show, a third kind of knowledge, which we will call intuition. 398 This kind of knowledge proceeds from an adequate idea of the absolute essence of certain attributes of God to the adequate knowledge of the essence of things. 399 I will illustrate all three kinds of knowledge by a single example. Three numbers are given for finding a fourth, which shall be to the third as the second is to the first. 400 Tradesmen without hesitation multiply the second by the third, and divide the product by the first; 401 either because they have not forgotten the rule which they received from a master without any proof, or because they have often made trial of it with simple numbers, 402 or by virtue of the proof of the nineteenth proposition of the seventh book of Euclid, namely, in virtue of the general property of proportionals.

403 But with very simple numbers there is no need of this. For instance, one, two, three being given, everyone can see that the fourth proportional is six; 404 and this is much clearer, because we infer the fourth number from an intuitive grasping of the ratio, which the first bears to the second.

405 (XLI.) Knowledge of the first kind is the only source of falsity, knowledge of the second and third kinds is necessarily true.

PROOF

406 To knowledge of the first kind we have (in the foregoing note) assigned all those ideas, which are inadequate and confused; therefore this kind of knowledge is the only source of falsity. 407 Furthermore, we assigned to the second and third kinds of knowledge those ideas which are adequate; therefore these kinds are necessarily true.

408 (XLII.) Knowledge of the second and third kinds, not

knowledge of the first kind, teaches us to distinguish the true from the false.

PROOF

409 This proposition is self-evident. You, who knows how to distinguish between true and false, must have an adequate idea of true and false. 410 That is, you must know the true and the false by the second or third kind of knowledge.

411 (XLIII.) You, who has a true idea, simultaneously knows that you have a true idea, and cannot doubt of the truth of the thing perceived.

PROOF

412 A true idea in us is an idea which is adequate in God, in so far as He is displayed through the nature of the human mind. 413 Let us suppose that there is in God, in so far as He is displayed through the human mind, an adequate idea, A. The idea of this idea must also necessarily be in God, and be referred to Him in the same way as the idea A. 414 But the idea A is supposed to be referred to God, in so far as He is displayed through the human mind; 415 therefore, the idea of the idea A must be referred to God in the same manner; that is, the adequate idea of the idea A will be in the mind, which has the adequate idea A; 416 therefore you, who has an adequate idea or knows a thing truly, must at the same time have an adequate idea or true knowledge of His knowledge; that is, obviously, you must be assured.

Note

417 I explained in the note to II. xxi. what is meant by the idea of an idea; but we may remark that the foregoing proposition is in itself sufficiently plain. 418 No one, who has a true idea, is ignorant that a true idea involves the highest certainty. 419 For to have a true idea is only another expression for knowing a thing perfectly, or as well as possible. 420 No one, indeed, can doubt of this, unless you thinks that an idea is something lifeless, like a picture on a panel, and not a mode of thinking-- namely, the very act of understanding. 421 And who, I ask, can know that you understands anything, unless you do first understand it? 422 In other words, who can know that you are sure of a thing, unless you be first sure of that thing? 423 Further, what can there be more clear, and more

certain, than a true idea as a standard of truth? 424 Even as light displays both itself and darkness, so is truth a standard both of itself and of falsity. 425 I think I have thus sufficiently answered these questions-- namely, if a true idea is distinguished from a false idea, only in so far as it is said to agree with its object, a true idea has no more reality or perfection than a false idea (since the two are only distinguished by an extrinsic mark); 426 consequently, neither will a person who has a true idea have any advantage over you who has only false ideas. 427 Further, how comes it that people have false ideas? Lastly, how can anyone be sure, that you have ideas which agree with their objects?

428 These questions, I repeat, I have, in my opinion, sufficiently answered. The difference between a true idea and a false idea is plain: from what was said in II. xxxv., the former is related to the latter as being is to not-being. 429 The causes of falsity I have set forth very clearly in II. xix. and II. Xxxv. with the note. 430 From what is there stated, the difference between a human who has true ideas, and a human who has only false ideas, is made apparent. 431 As for the last question-- as to how a human can be sure that you have ideas that agree with their objects, I have just pointed out, with abundant clearness, that your knowledge arises from the simple fact, that you have an idea which corresponds with its object-- 432 in other words, that truth is its own standard. We may add that our mind, in so far as it perceives things truly, is part of the infinite intellect of God; 433 therefore, the clear and distinct ideas of the mind are as necessarily true as the ideas of God.

434 (XLIV.) It is not in the nature of reason to regard things as contingent, but as necessary.

PROOF

435 It is in the nature of reason to perceive things truly, namely, as they are in themselves-- that is, not as contingent, but as necessary.

COROLLARY I

436 Hence it follows, that it is only through our imagination that we consider things, whether in respect to the future or the past, as contingent.

Note

437 How this way of looking at things arises, I will briefly explain. We have shown above that the mind always regards things as present to itself, even though they be not in existence, until some causes arise which exclude their existence and presence. 438 Further, we showed that, if the human body has once been affected by two external bodies simultaneously, the mind, when it afterwards imagines one of the said external bodies, will straightway remember the other-- 439 that is, it will regard both as present to itself, unless there arise causes which exclude their existence and presence.

440 Further, no one doubts that we imagine time, from the fact that we imagine bodies to be moved some more slowly than others, some more quickly, some at equal speed. 441 Thus, let us suppose that a child yesterday saw Peter for the first time in the morning, Paul at noon, and Simon in the evening; then, that today the child again sees Peter in the morning. 442 It is evident, from II. Prop. xviii., that, as soon as the child sees the morning light, the child will imagine that the sun will traverse the same parts of the sky, as it did when saw it on the preceding day; 443 in other words, the child will imagine a complete day, and, together with own imagination of the morning, the child will imagine Peter; with noon, will imagine Paul; and with evening, will imagine Simon-- 444 that is, the child will imagine the existence of Paul and Simon in relation to a future time; on the other hand, if sees Simon in the evening, will refer Peter and Paul to a past time, by imagining them simultaneously with the imagination of a past time. 445 If it should at any time happen, that on some other evening the child should see James instead of Simon, will, on the following morning, associate with own imagination of evening sometimes Simon, sometimes James, not both together: 446 for the child is supposed to have seen, at evening, one or other of them, not both together. Own imagination will therefore waver; 447 and, with the imagination of future evenings, will associate first one, then the

other-- that is, will imagine them in the future, neither of them as certain, but both as contingent. 448 This wavering of the imagination will be the same, if the imagination be concerned with things which we thus contemplate, standing in relation to time past or time present: 449 consequently, we may imagine things as contingent, whether they be referred to time present, past, or future.

COROLLARY II

500 It is in the nature of reason to perceive things under a certain form of eternity (sub quadam aeternitatis specie).

PROOF

501 It is in the nature of reason to regard things, not as contingent, but as necessary. 502 Reason perceives this necessity of things truly-- that is, as it is in itself. But this necessity of things is the very necessity of the eternal nature of God; 503 therefore, it is in the nature of reason to regard things under this form of eternity. We may add that the bases of reason are the notions, which answer to things common to all, and which do not answer to the essence of any particular thing: 504 which must therefore be conceived without any relation to time, under a certain form of eternity.

505 (XLV.) Every idea of every body, or of every particular thing actually existing, necessarily involves the eternal and infinite essence of God.

PROOF

506 The idea of a particular thing actually existing necessarily involves both the existence and the essence of the said thing. 507 Now particular things cannot be conceived without God; 508 but, inasmuch as they have God for their cause, in so far as He is regarded under the attribute of which the things in question are modes, their ideas must necessarily involve the conception of the attributes of those ideas-- that is, the eternal and infinite essence of God.

Note

509 By existence I do not here mean duration-- that is, existence in so far as it is conceived abstractedly, and as a certain form of quantity. 510 I am speaking of the very nature of existence, which is assigned to particular things, because they follow in infinite

numbers and in infinite ways from the eternal necessity of God's nature. 511 I am speaking, I repeat, of the very existence of particular things, in so far as they are in God. 512 For although each particular thing be conditioned by another particular thing to exist in a given way, yet the force whereby each particular thing perseveres in existing follows from the eternal necessity of God's nature.

513 (XLVI.) The knowledge of the eternal and infinite essence of God which every idea involves is adequate and perfect.

PROOF

514 The proof of the last proposition is universal; and whether a thing be considered as a part or a whole, the idea thereof, whether of the whole or of a part, will involve God's eternal and infinite essence. 515 Wherefore, that, which gives knowledge of the eternal and infinite essence of God, is common to all, and is equally in the part and in the whole; therefore this knowledge will be adequate.

516 (XLVII.) The human mind has an adequate knowledge of the eternal and infinite essence of God.

PROOF

517 The human mind has ideas, from which it perceives itself and its own body and external bodies as actually existing; therefore it has an adequate knowledge of the eternal and infinite essence of God.

Note

518 Hence we see, that the infinite essence and the eternity of God are known to all. Now as all things are in God, and are conceived through God, 519 we can from this knowledge infer many things, which we may adequately know, and we may form that third kind of knowledge of which we spoke in the note to II. xl., and of the excellence and use of which we shall have occasion to speak. 520 Humans have not so clear a knowledge of God as they have of general notions, because they are unable to imagine God as they do bodies, 521 and also because they have associated the name God with images of things that they are in the habit of seeing, as indeed they can hardly avoid doing, being, as they are, humans, and

continually affected by external bodies. 522 Many errors, in truth, can be traced to this head, namely, that we do not apply names to things rightly. 523 For instance, when a person says that the lines drawn from the centre of a circle to its circumference are not equal, you then, at all events, assuredly attaches a meaning to the word circle different from that assigned by mathematicians. 524 So again, when people make mistakes in calculation, they have one set of figures in their mind, and another on the paper. 525 If we could see into their minds, they do not make a mistake; they seem to do so, because we think, that they have the same numbers in their mind as they have on the paper. 526 If this were not so, we should not believe them to be in error, any more than I thought that a human was in error, whom I lately heard exclaiming that own entrance hall had flown into a neighbour's hen, for own meaning seemed to me sufficiently clear. 527 Very many controversies have arisen from the fact, that humans do not rightly explain their meaning, or do not rightly interpret the meaning of others. 528 For, as a matter of fact, as they flatly contradict themselves, they assume now one side, now another, of the argument, so as to oppose the opinions, which they consider mistaken and absurd in their opponents.

529 (XLVIII.) In the mind there is no absolute or free-will; but the mind is determined to wish this or that by a cause, which has also been determined by another cause, and this last by another cause, and so on to infinity.

PROOF

530 The mind is a fixed and definite mode of thought, therefore it cannot be the free cause of its actions; 531 in other words, it cannot have an absolute faculty of positive or negative volition; but it must be determined by a cause, which has also been determined by another cause, and this last by another.

Note

532 In the same way it is proved, that there is in the mind no absolute faculty of understanding, desiring, loving. 533 Whence it follows, that these and similar faculties are either entirely

fictitious, or are merely abstract and general terms, such as we are accustomed to put together from particular things. 534 Thus the intellect and the will stand in the same relation to this or that idea, or this or that volition, as "lapidity" to this or that stone, or as "human" to Peter and Paul.

535 But, before I proceed further, I would here remark that, by the will to affirm and decide, I mean the faculty, not the desire. 536 I mean, I repeat, the faculty, whereby the mind affirms or denies what is true or false, not the desire, wherewith the mind wishes for or turns away from any given thing. 537 After we have proved, that these faculties of ours are general notions, which cannot be distinguished from the particular instances on which they are based, we must inquire whether volitions themselves are anything besides the ideas of things. 538 We must inquire, I say, whether there is in the mind any affirmation or negation beyond that, which the idea, in so far as it is an idea, involves. 539 For by ideas I do not mean images such as are formed at the back of the eye, or in the midst of the brain, but the conceptions of thought.

540 (XLIX.) There is in the mind no volition or affirmation and negation, save that which an idea, inasmuch as it is an idea, involves.

PROOF

541 There is in the mind no absolute faculty of positive or negative volition, but only particular volitions, namely, this or that affirmation, and this or that negation. 542 Now let us conceive a particular volition, namely, the mode of thinking whereby the mind affirms, that the three interior angles of a triangle are equal to two right angles. 543 This affirmation involves the conception or idea of a triangle, that is, without the idea of a triangle it cannot be conceived. 544 It is the same thing to say, that the concept A must involve the concept B, as it is to say, that A cannot be conceived without B. 545 Further, this affirmation cannot be made without the idea of a triangle.

Therefore, this affirmation can neither be nor be conceived, without the idea of a triangle. 546 Again, this idea of a triangle must

involve this same affirmation, namely, that its three interior angles are equal to two right angles. 547 Wherefore, and vice versa, this idea of a triangle can neither be nor be conceived without this affirmation, therefore, this affirmation belongs to the essence of the idea of a triangle, and is nothing besides. 548 What we have said of this volition (inasmuch as we have selected it at random) may be said of any other volition, namely, that it is nothing but an idea.

COROLLARY

549 Will and understanding are one and the same.

PROOF

550 Will and understanding are nothing beyond the individual volitions and ideas. But a particular volition and a particular idea are one and the same; therefore, will and understanding are one and the same.

Note

551 We have thus removed the cause which is commonly assigned for error. For we have shown above, that falsity consists solely in the privation of knowledge involved in ideas which are fragmentary and confused. 552 Wherefore, a false idea, inasmuch as it is false, does not involve certainty. 553 When we say, then, that a person acquiesces in what is false, and that you have no doubts on the subject, we do not say that you are certain, but only that you does not doubt, 554 or that you acquiesces in what is false, inasmuch as there are no reasons, which should cause your imagination to waver. 555 Thus, although the person be assumed to acquiesce in what is false, we shall never say that you are certain. For by certainty we mean something positive, not merely the absence of doubt.

556 However, in order that the foregoing proposition may be fully explained, I will draw attention to a few additional points, and I will furthermore answer the objections which may be advanced against our doctrine. 557 Lastly, in order to remove every scruple, I have thought it worthwhile to point out some of the advantages, which follow therefrom. I say "some," for they will be better appreciated from what we shall set forth.

558 I begin, then, with the first point, and warn my readers to

make an accurate distinction between an idea, or conception of the mind, and the images of things which we imagine. 559 It is further necessary that they should distinguish between idea and words, whereby we signify things. 560 These three-- namely, images, words, and ideas-- are by many persons either entirely confused together, or not distinguished with sufficient accuracy or care, and hence people are generally in ignorance, 561 how absolutely necessary is a knowledge of this doctrine of the will, both for philosophic purposes and for the wise ordering of life. 562 Those who think that ideas consist in images which are formed in us by contact with external bodies, persuade themselves that the ideas of those things, whereof we can form no mental picture, are not ideas, but only figments, which we invent by the free decree of our will; 563 they thus regard ideas as though they were inanimate pictures on a panel, and, filled with this misconception, do not see that an idea, inasmuch as it is an idea, involves an affirmation or negation.

564 Again, those who confuse words with ideas, or with the affirmation which an idea involves, think that they can wish something contrary to what they feel, affirm, or deny. 565 This misconception will easily be laid aside by one, who reflects on the nature of knowledge, and seeing that it in no wise involves the conception of extension, 566 will therefore clearly understand, that an idea (being a mode of thinking) does not consist in the image of anything, nor in words. 567 The essence of words and images is put together by bodily motions, which in no wise involve the conception of thought.

568 These few words on this subject will suffice: I will therefore pass on to consider the objections, which may be raised against our doctrine. 569 Of these, the first is advanced by those, who think that the will has a wider scope than the understanding, and that therefore it is different therefrom.

570 The reason for their holding the belief, that the will has wider scope than the understanding, is that they assert, that they have no

need of an increase in their faculty of assent, 571 that is of affirmation or negation, in order to assent to an infinity of things which we do not perceive, but that they have need of an increase in their faculty of understanding. 572 The will is thus distinguished from the intellect, the latter being finite and the former infinite.

573 Secondly, it may be objected that experience seems to teach us especially clearly, that we are able to suspend our judgment before assenting to things which we perceive; 574 this is confirmed by the fact that no one is said to be deceived, in so far as you perceives anything, but only in so far as you assents or dissents.

575 For instance, you who feigns a winged horse, does not therefore admit that a winged horse exists; that is, you are not deceived, unless you admits in addition that a winged horse does exist. 576 Nothing therefore seems to be taught more clearly by experience, than that the will or faculty of assent is free and different from the faculty of understanding.

577 Thirdly, it may be objected that one affirmation does not apparently contain more reality than another; 578 in other words, that we do not seem to need for affirming, that what is true is true, any greater power than for affirming, that what is false is true. 579 We have, however, seen that one idea has more reality or perfection than another, 580 for as objects are some more excellent than others, so also are the ideas of them some more excellent than others; this also seems to point to a difference between the understanding and the will.

581 Fourthly, it may be objected, if human does not act from free-will, what will happen if the incentives to action are equally balanced, as in the case of Buridan's ass? Will you perish of hunger and thirst? 582 If I say that you would not, you would then determine your own action, and would consequently possess the faculty of going and doing whatever you liked. 583 Other objections might also be raised, but, as I am not bound to put in evidence everything that anyone may dream, I will only set myself to the task of refuting those I have

mentioned, and that as briefly as possible.

584 To the first objection I answer, that I admit that the will has a wider scope than the understanding, if by the understanding be meant only clear and distinct ideas; 585 but I deny that the will has a wider scope than the perceptions, and the faculty of forming conceptions; nor do I see why the faculty of volition should be called infinite, any more than the faculty of feeling: 586 for, as we are able by the same faculty of volition to affirm an infinite number of things (one after the other, for we cannot affirm an infinite number simultaneously), so also can we, by the same faculty of feeling, feel or perceive (in succession) an infinite number of bodies. 587 If it be said that there is an infinite number of things which we cannot perceive, I answer, that we cannot attain to such things by any thinking, nor, consequently, by any faculty of volition.

588 But, it may still be urged, if God wished to bring it about that we should perceive them, He would be obliged to endow us with a greater faculty of perception, but not a greater faculty of volition than we have already. 589 This is the same as to say that, if God wished to bring it about that we should understand an infinite number of other entities, it would be necessary for Him to give us a greater understanding, 590 but not a more universal idea of entity than that which we have already, in order to grasp such infinite entities. 591 We have shown that will is a universal entity or idea, whereby we explain all particular volitions-- in other words, that which is common to all such volitions.

592 As, then, our opponents maintain that this idea, common or universal to all volitions, is a faculty, it is little to be wondered at that they assert, that such a faculty extends itself into the infinite, beyond the limits of the understanding: 593 for what is universal is predicated alike of one, of many, and of an infinite number of individuals.

594 To the second objection I reply by denying, that we have a free power of suspending our judgment: 595 for, when we say

that anyone suspends own judgment, we merely mean that you sees, that you does not perceive the matter in question adequately. 596 Suspension of judgment is, therefore, strictly speaking, a perception, and not free-will.

597 In order to illustrate the point, let us suppose a boy imagining a horse, and perceive nothing else. 598 Inasmuch as this imagination involves the existence of the horse, and the boy does not perceive anything which would exclude the existence of the horse, he will necessarily regard the horse as present: 599 he will not be able to doubt of its existence, although he be not certain thereof.

600 We have daily experience of such a state of things in dreams; and I do not suppose that there is anyone, who would maintain that, while you are dreaming, you have the free power of suspending your judgment concerning the things in your dream, 601 and bringing it about that you should not dream those things, which you dreams that you sees; yet it happens, notwithstanding, that even in dreams we suspend our judgment, namely, when we dream that we are dreaming.

602 Further, I grant that no one can be deceived, so far as actual perception extends-- that is, I grant that the mind's imaginations, regarded in themselves, do not involve error; 603 but I deny, that a person does not, in the act of perception, make any affirmation. 604 For what is the perception of a winged horse, save affirming that a horse has wings? If the mind could perceive nothing else but the winged horse, it would regard the same as present to itself: 605 it would have no reasons for doubting its existence, nor any faculty of dissent, unless the imagination of a winged horse be joined to an idea which precludes the existence of the said horse, 606 or unless the mind perceives that the idea which it possess of a winged horse is inadequate, in which case it will either necessarily deny the existence of such a horse, or will necessarily be in doubt on the subject.

607 I think that I have anticipated my answer to the third objection, namely, that the will is something universal which is predicated of all

ideas, 608 and that it only signifies that which is common to all ideas, namely, an affirmation, whose adequate essence must, therefore, in so far as it is thus conceived in the abstract, be in every idea, 609 and be, in this respect alone, the same in all, not in so far as it is considered as constituting the idea's essence: for, in this respect, particular affirmations differ one from the other, as much as do ideas.

610 For instance, the affirmation which involves the idea of a circle, differs from that which involves the idea of a triangle, as much as the idea of a circle differs from the idea of a triangle.

611 Further, I absolutely deny, that we are in need of an equal power of thinking, to affirm that that which is true is true, and to affirm that that which is false is true. 612 These two affirmations, if we regard the mind, are in the same relation to one another as being and not-being; for there is nothing positive in ideas, which constitutes the actual reality of falsehood.

613 We must therefore conclude, that we are easily deceived, when we confuse universals with singulars, and the entities of reason and abstractions with realities.

614 As for the fourth objection, I am quite ready to admit, that a person placed in the equilibrium described (namely, as perceiving nothing but hunger and thirst, a certain food and a certain drink, each equally distant from you) would die of hunger and thirst. 615 If I am asked, whether such an one should not rather be considered an ass than a human; I answer, that I do not know, neither do I know how a human should be considered, who hangs the self, or how we should consider children, fools, madmen, etc.

616 It remains to point out the advantages of a knowledge of this doctrine as bearing on conduct, and this may be easily gathered from what has been said. 617 The doctrine is good,

(1.) Inasmuch as it teaches us to act solely according to the decree of God, and to be partakers in the Divine Nature, and so much the more, as we perform more perfect actions and more and more understand God. 618 Such a doctrine not only completely

tranquilises our spirit, but also shows us where our highest happiness or blessedness is, namely, solely in the knowledge of God, whereby we are led to act only as love and piety shall bid us. 619 We may thus clearly understand, how far astray from a true estimate of virtue are those who expect to be decorated by God with high rewards for their virtue, and their best actions, as for having endured the direst slavery; 620 as if virtue and the service of God were not in itself happiness and perfect freedom.

621 (2.) Inasmuch as it teaches us, how we ought to conduct ourselves with respect to the gifts of fortune, or matters which are not in our power, and do not follow from our nature. 622 For it shows us, that we should await and endure fortune's smiles or frowns with an equal mind, seeing that all things follow from the eternal decree of God by the same necessity, as it follows from the essence of a triangle, that the three angles are equal to two right angles.

623 (3.) This doctrine raises social life, inasmuch as it teaches us to hate no human, neither to despise, to deride, to envy, or to be angry with any. 624 Further, as it tells us that each should be content with your own, and helpful to your neighbour, not from any womanish pity, favour, or superstition, but solely by the guidance of reason, according as the time and occasion demand.

625 (4.) Lastly, this doctrine confers no small advantage on the commonwealth; for it teaches how citizens should be governed and led, not so as to become slaves, but so that they may freely do whatsoever things are best.

626 I have thus fulfilled the promise made at the beginning of this note, and I thus bring the second part of my treatise to a close. 627 I think I have therein explained the nature and properties of the human mind at sufficient length, and, considering the difficulty of the subject, with sufficient clearness. 628 I have laid a foundation, whereon may be raised many excellent conclusions of the highest utility and most necessary to be known, as will, in what follows, be partly made plain.

The Book of Divine Panagogue called

DESIRES

ON THE ORIGIN AND NATURE
OF THE EMOTIONS
Benedict de Spinoza

1 Most writers on the emotions and on human conduct seem to be treating rather of matters outside Nature than of natural phenomena following Nature's general laws. 2 They appear to conceive human to be situated in Nature as a kingdom within a kingdom: 3 for they believe that you disturbs rather than follows Nature's order, that you have absolute control over your actions, and that you are determined solely by yourself. 4 They attribute human infirmities and fickleness, not to the power of Nature in general, but to some mysterious flaw in the nature of human, which accordingly they bemoan, deride, despise, or, as usually happens, abuse: 5 you, who succeeds in hitting off the weakness of the human mind more eloquently or more acutely than your fellows, is looked upon as a seer. 6 Still there has been no lack of very excellent people (to whose toil and industry I confess myself much indebted), who have written many noteworthy things concerning the right way of life, and have given much sage advice to humankind. 7 But no one, so far as I know, has defined the nature and strength of the emotions, and the power of the mind against them for their restraint.

8 I do not forget, that the illustrious Descartes, though he believed, that the mind has absolute power over its actions, strove to explain human emotions by their primary causes, 9 and, at the same time, to point out a way, by which the mind might attain to absolute dominion over them. 10 However, in my opinion, he accomplishes nothing beyond a display of the acuteness of his own great intellect, as I will show in the proper place. 11 For the present I wish to revert to those, who would rather abuse or deride human emotions than understand them. Such persons will, doubtless think it strange that I should attempt to treat of human vice and folly geometrically, 12 and should wish to set forth with rigid reasoning those matters which they cry out

against as repugnant to reason, frivolous, absurd, and dreadful.

13 However, such is my plan. Nothing comes to pass in Nature, which can be set down to a flaw therein; for Nature is always the same, and everywhere one and the same in Her efficacy and power of action; 14 that is, Nature's laws and ordinances, whereby all things come to pass and change from one form to another, are everywhere and always the same; 15 so that there should be one and the same method of understanding the nature of all things whatsoever, namely, through Nature's universal laws and rules. 16 Thus the passions of hatred, anger, envy, and so on, considered in themselves, follow from this same necessity and efficacy of Nature; 17 they answer to certain definite causes, through which they are understood, and possess certain properties as worthy of being known as the properties of anything else, whereof the contemplation in itself affords us delight. 18 I shall, therefore, treat of the nature and strength of the emotions according to the same method, as I employed heretofore in my investigations concerning God and the mind. 19 I shall consider human actions and desires in exactly the same manner, as though I were concerned with lines, planes, and solids.

DEFINITIONS

20 (I.) By an 'adequate' cause, I mean a cause through which its effect can be clearly and distinctly perceived. By an 'inadequate' or partial cause, I mean a cause through which, by itself, its effect cannot be understood.

21 (II.) I say that we 'act' when anything takes place, either within us or externally to us, whereof we are the adequate cause; 22 that is (by the foregoing definition) when through our nature something takes place within us or externally to us, which can through our nature alone be clearly and distinctly understood. 23 On the other hand, I say that we are passive as regards something when that something takes place within us, or follows from our nature externally, we being only the partial cause.

24 (III.) By 'emotion' I mean the modifications of the body,

whereby the active power of the said body is increased or diminished, aided or constrained, and also the ideas of such modifications.

25 Note Well. If we can be the adequate cause of any of these modifications, I then call the emotion an activity, otherwise I call it a passion, or state wherein the mind is passive.

POSTULATES

26 (I.) The human body can be affected in many ways, whereby its power of activity is increased or diminished, and also in other ways which do not render its power of activity either greater or less.

27 (II.) The human body can undergo many changes, and, nevertheless, retain the impressions or traces of objects, and, consequently, the same images of things.

PROPOSITIONS

28 I. Our mind is in certain cases active, and in certain cases passive. In so far as it has adequate ideas it is necessarily active, and in so far as it has inadequate ideas, it is necessarily passive.

PROOF

29 In every human mind there are some adequate ideas, and some ideas that are fragmentary and confused. 30 Those ideas which are adequate in the mind are adequate also in God, inasmuch as He constitutes the essence of the mind, 31 and those which are inadequate in the mind are likewise adequate in God, not inasmuch as He contains in Himself the essence of the given mind alone, but as He, at the same time, contains the minds of other things. 32 Again, from any given idea some effect must necessarily follow; of this effect God is the adequate cause, not inasmuch as He is infinite, but inasmuch as He is conceived as affected by the given idea. 33 But of that effect whereof God is the cause, inasmuch as He is affected by an idea which is adequate in a given mind, of that effect, I repeat, the mind in question is the adequate cause. 34 Therefore our mind, in so far as it has adequate ideas, is in certain cases necessarily active; this was our first point.

35 Again, whatsoever necessarily follows from the idea which is adequate in God, not by virtue of His possessing in Himself the mind of one human only, but by

virtue of His containing, together with the mind of that one human, the minds of other things also, 36 of such an effect the mind of the given human is not an adequate, but only a partial cause; 37 thus the mind, inasmuch as it has inadequate ideas, is in certain cases necessarily passive; this was our second point. 38 Therefore our mind.

COROLLARY

Hence it follows that the mind is more or less liable to be acted upon, in proportion as it possesses inadequate ideas, and, contrariwise, is more or less active in proportion as it possesses adequate ideas.

39 II. Body cannot determine mind to think, neither can mind determine body to motion or rest or any state different from these, if such there be.

PROOF

40 All modes of thinking have for their cause God, by virtue of His being a thinking thing, and not by virtue of His being displayed under any other attribute. 41 That, therefore, which determines the mind to thought is a mode of thought, and not a mode of extension; that is, it is not body. This was our first point.

42 Again, the motion and rest of a body must arise from another body, which has also been determined to a state of motion or rest by a third body, 43 and absolutely everything which takes place in a body must spring from God, in so far as He is regarded as affected by some mode of extension, and not by some mode of thought; 44 that is, it cannot spring from the mind, which is a mode of thought. This was our second point. Therefore body cannot determine mind.

NOTE

45 This is made more clear by what was said in the note to II. vii., namely, that mind and body are one and the same thing, conceived first under the attribute of thought, secondly, under the attribute of extension. 46 Thus it follows that the order or concatenation of things is identical, whether Nature be conceived under the one attribute or the other; 47 consequently the order of states of activity and passivity in our body is simultaneous in Nature with the order of states of activity and

passivity in the mind. 48 The same conclusion is evident from the manner in which we proved II. xii.

49 Nevertheless, though such is the case, and though there be no further room for doubt, I can scarcely believe, until the fact is proved by experience, that people can be induced to consider the question calmly and fairly, 50 so firmly are they convinced that it is merely at the bidding of the mind, that the body is set in motion or at rest, or performs a variety of actions depending solely on the mind's will or the exercise of thought. 51 However, no one has hitherto laid down the limits to the powers of the body, that is, no one has as yet been taught by experience what the body can accomplish solely by the laws of Nature, in so far as She is regarded as extension. 52 No one hitherto has gained such an accurate knowledge of the bodily mechanism, that you can explain all its functions; 53 nor need I call attention to the fact that many actions are observed in the lower animals, which far transcend human sagacity, 54 and that somnambulists do many things in their sleep, which they would not venture to do when awake: 55 these instances are enough to show, that the body can by the sole laws of its nature do many things which the mind wonders at.

56 Again, no one knows how or by what means the mind moves the body, nor how many various degrees of motion it can impart to the body, nor how quickly it can move it.

57 Thus, when people say that this or that physical action has its origin in the mind, which latter has dominion over the body, they are using words without meaning, or are confessing in specious phraseology that they are ignorant of the cause of the said action, and do not wonder at it.

58 But, they will say, whether we know or do not know the means whereby the mind acts on the body, we have, at any rate, experience of the fact that unless the human mind is in a fit state to think, the body remains inert. 59 Moreover, we have experience, that the mind alone can determine whether we speak or are silent, and a variety of similar states which, accordingly, we say depend on the

mind's decree. 60 But, as to the first point, I ask such objectors, whether experience does not also teach, that if the body be inactive the mind is simultaneously unfitted for thinking? 61 For when the body is at rest in sleep, the mind simultaneously is in a state of torpor also, and has no power of thinking, such as it possesses when the body is awake. 62 Again, I think everyone's experience will confirm the statement, that the mind is not at all times equally fit for thinking on a given subject, 63 but according as the body is more or less fitted for being stimulated by the image of this or that object, so also is the mind more or less fitted for contemplating the said object.

64 But, it will be urged, it is impossible that solely from the laws of Nature considered as extended substance, we should be able to deduce the causes of buildings, pictures, and things of that kind, which are produced only by human art; 65 nor would the human body, unless it were determined and led by the mind, be capable of building a single temple.

66 However, I have just pointed out that the objectors cannot fix the limits of the body's power, or say what can be concluded from a consideration of its sole nature, 67 whereas they have experience of many things being accomplished solely by the laws of Nature, which they would never have believed possible except under the direction of mind: 68 such are the actions performed by somnambulists while asleep, and wondered at by their performers when awake. 69 I would further call attention to the mechanism of the human body, which far surpasses in complexity all that has been put together by human art, 70 not to repeat what I have already shown, namely, that from Nature, under whatever attribute She be considered, infinite results follow. 71 As for the second objection, I submit that the world would be much happier, if humans were as fully able to keep silence as they are to speak.

72 Experience abundantly shows that humans can govern anything more easily than their tongues, and restrain anything more easily than their appetites; 73 when it comes

about that many believe, that we are only free in respect to objects which we moderately desire, because our desire for such can easily be controlled by the thought of something else frequently remembered, 74 but that we are by no means free in respect to what we seek with violent emotion, for our desire cannot then be allayed with the remembrance of anything else. 75 However, unless such persons had proved by experience that we do many things which we afterwards repent of, and again that we often, when assailed by contrary emotions, see the better and follow the worse, there would be nothing to prevent their believing that we are free in all things. 76 Thus an infant believes that of its own free-will it desires milk, an angry child believes that it freely desires to run away; 77 further, a drunken man believes that he utters from the free decision of his mind words which, when he is sober, he would willingly have withheld: 78 thus, too, a delirious man, a garrulous woman, a child, and others of like complexion, believe that they speak from the free decision of their mind, when they are in reality unable to restrain their impulse to talk. 79 Experience teaches us no less clearly than reason, that humans believe themselves to be free, simply because they are conscious of their actions, and unconscious of the causes whereby those actions are determined; 80 and, further, it is plain that the dictates of the mind are but another name for the appetites, and therefore vary according to the varying state of the body. 81 Everyone shapes own actions according to own emotion, those who are assailed by conflicting emotions know not what they wish; those who are not attacked by any emotion are readily swayed this way or that. 82 All these considerations clearly show that a mental decision and a bodily appetite, or determined state, are simultaneous, or rather are one and the same thing, which we call decision, 83 when it is regarded under and explained through the attribute of thought, and a conditioned state, when it is regarded under the attribute of extension, and deduced from the laws of motion and rest. 84 This

will appear yet more plainly in the sequel. For the present I wish to call attention to another point, namely, that we cannot act by the decision of the mind, unless we have a remembrance of having done so. 85 For instance, we cannot say a word without remembering that we have done so. 86 Again, it is not within the free power of the mind to remember or forget a thing at will. Therefore the freedom of the mind must in any case be limited to the power of uttering or not uttering something which it remembers.

87 But when we dream that we speak, we believe that we speak from a free decision of the mind, yet we do not speak, or, if we do, it is by a spontaneous motion of the body. 88 Again, we dream that we are concealing something, and we seem to act from the same decision of the mind as that, whereby we keep silence when awake concerning something we know.

89 Lastly, we dream that from the free decision of our mind we do something, which we should not dare to do when awake.

90 Now I should like to know whether there be in the mind two sorts of decisions, one sort illusive, and the other sort free?

91 If our folly does not carry us so far as this, we must necessarily admit, that the decision of the mind, which is believed to be free, is not distinguishable from the imagination or memory, and is nothing more than the affirmation, which an idea, by virtue of being an idea, necessarily involves.

92 Wherefore these decisions of the mind arise in the mind by the same necessity, as the ideas of things actually existing.

93 Therefore those who believe, that they speak or keep silence or act in any way from the free decision of their mind, do but dream with their eyes open.

94 (III.) The activities of the mind arise solely from adequate ideas; the passive states of the mind depend solely on inadequate ideas.

PROOF

95 The first element, which constitutes the essence of the mind, is nothing else but the idea of the actually existent body, which is compounded of many other ideas, whereof some are

adequate and some inadequate. 96 Whatsoever therefore follows from the nature of mind, and has mind for its proximate cause, through which it must be understood, must necessarily follow either from an adequate or from an inadequate idea. 97 But in so far as the mind has inadequate ideas, it is necessarily passive: wherefore the activities of the mind follow solely from adequate ideas, and accordingly the mind is only passive in so far as it has inadequate ideas.

Note

98 Thus we see, that passive states are not attributed to the mind, except in so far as it contains something involving negation, or in so far as it is regarded as a part of Nature, which cannot be clearly and distinctly perceived through itself without other parts: 99 I could thus show, that passive states are attributed to individual things in the same way that they are attributed to the mind, and that they cannot otherwise be perceived, but my purpose is solely to treat of the human mind.

100 (IV.) Nothing can be destroyed, except by a cause external to itself.

PROOF

101 This proposition is self-evident, for the definition of anything affirms the essence of that thing, but does not negative it; 102 in other words, it postulates the essence of the thing, but does not take it away. 103 So long therefore as we regard only the thing itself, without taking into account external causes, we shall not be able to find in it anything which could destroy it.

104 (V.) Things are naturally contrary, that is, cannot exist in the same object, in so far as one is capable of destroying the other.

PROOF

105 If they could agree together or co-exist in the same object, there would then be in the said object something which could destroy it; but this, by the foregoing proposition, is absurd, therefore things.

106 VI. Everything, in so far as it is in itself, endeavours to persist in its own being.

PROOF

107 Individual things are modes whereby the attributes of God are expressed in a given determinate manner; 108 that is, they are things which express in a given

determinate manner the power of God, whereby God is and acts; 109 now no thing contains in itself anything whereby it can be destroyed, or which can take away its existence; but contrariwise it is opposed to all that could take away its existence. 110 Therefore, in so far as it can, and in so far as it is in itself, it endeavours to persist in its own being.

111 (VII.) The endeavour, wherewith everything endeavours to persist in its own being, is nothing else but the actual essence of the thing in question.

PROOF

112 From the given essence of any thing certain consequences necessarily follow, nor have things any power save such as necessarily follows from their nature as determined; 113 wherefore the power of any given thing, or the endeavour whereby, either alone or with other things, it acts, or endeavours to act, 114 that is, the power or endeavour, wherewith it endeavours to persist in its own being, is nothing else but the given or actual essence of the thing in question.

115 (VIII.) The endeavour, whereby a thing endeavours to persist in its own being, involves no finite time, but an indefinite time.

PROOF

116 If it involved a limited time, which should determine the duration of the thing, it would then follow solely from that power whereby the thing exists, that the thing could not exist beyond the limits of that time, but that it must be destroyed; but this is absurd. 117 Wherefore the endeavour wherewith a thing exists involves no definite time; but, contrariwise, since it will by the same power whereby it already exists always continue to exist, unless it be destroyed by some external cause, this endeavour involves an indefinite time.

118 (IX.) The mind, both in so far as it has clear and distinct ideas, and also in so far as it has confused ideas, endeavours to persist in its being for an indefinite period, and of this endeavour it is conscious.

PROOF

119 The essence of the mind is constituted by adequate and inadequate ideas, therefore, both in so far as it possesses the former,

and in so far as it possesses the latter, it endeavours to persist in its own being, and that for an indefinite time. 120 Now as the mind is necessarily conscious of itself through the ideas of the modifications of the body, the mind is therefore conscious of its own endeavour.

Note

121 This endeavour, when referred solely to the mind, is called "will," when referred to the mind and body in conjunction it is called "appetite"; 122 it is, in fact, nothing else but human's essence, from the nature of which necessarily follow all those results which tend to its preservation; and which human has thus been determined to perform.

123 Further, between appetite and desire there is no difference, except that the term desire is generally applied to humans, in so far as they are conscious of their appetite, 124 and may accordingly be thus defined: "Desire is appetite with consciousness thereof." 125 It is thus plain from what has been said, that in no case do we strive for, wish for, long for, or desire anything, because we deem it to be good, 126 but on the other hand we deem a thing to be good, because we strive for it, wish for it, long for it, or desire it.

127 (X.) An idea, which excludes the existence of our body, cannot be postulated in our mind, but is contrary thereto.

PROOF

128 Whatsoever can destroy our body, cannot be postulated therein. Therefore neither can the idea of such a thing occur in God, in so far as He has the idea of our body; 129 that is, the idea of that thing cannot be postulated as in our mind, but contrariwise, since the first element, that constitutes the essence of the mind, is the idea of the human body as actually existing, 130 it follows that the first and chief endeavour of our mind is the endeavour to affirm the existence of our body: thus, an idea, which negatives the existence of our body, is contrary to our mind.

131 (XI.) Whatsoever increases or diminishes, helps or hinders the power of activity in our body, the idea thereof increases or diminishes, helps or hinders the power of thought in our mind.

Note

132 Thus we see, that the mind can undergo many changes, and can pass sometimes to a state of greater perfection, sometimes to a state of lesser perfection. 133 These passive states of transition explain to us the emotions of pleasure and pain. 134 By "pleasure" therefore in the following propositions I shall signify "a passive state wherein the mind passes to a greater perfection." 135 By "pain" I shall signify "a passive state wherein the mind passes to a lesser perfection."

136 Further, the emotion of pleasure in reference to the body and mind together I shall call "stimulation" (titillatio) or "merriment" (hilaritas), the emotion of pain in the same relation I shall call "suffering" or "melancholy." 137 But we must bear in mind, that stimulation and suffering are attributed to human, when one part of your nature is more affected than the rest, merriment and melancholy, when all parts are alike affected. 138 What I mean by desire I have explained in the note to Proposition. ix. of this part; beyond these three I recognise no other primary emotion; I will show as I proceed, that all other emotions arise from these three. 139 But, before I go further, I should like here to explain at greater length Proposition. x. of this part, in order that we may clearly understand how one idea is contrary to another.

140 In the note to II. xvii. we showed that the idea, which constitutes the essence of mind, involves the existence of body, so long as the body itself exists. 141 Again, it follows from what we pointed out in the corollary to II. viii., that the present existence of our mind depends solely on the fact, that the mind involves the actual existence of the body. 142 Lastly, we showed that the power of the mind, whereby it imagines and remembers things, also depends on the fact, that it involves the actual existence of the body. 143 Whence it follows, that the present existence of the mind and its power of imagining are removed, as soon as the mind ceases to affirm the present existence of the body. 144 Now the

cause, why the mind ceases to affirm this existence of the body, cannot be the mind itself, nor again the fact that the body ceases to exist. 145 For the cause, why the mind affirms the existence of the body, is not that the body began to exist; therefore, for the same reason, it does not cease to affirm the existence of the body, because the body ceases to exist; 146 but this result follows from another idea, which excludes the present existence of our body and, consequently, of our mind, and which is therefore contrary to the idea constituting the essence of our mind.

147 (XII.) The mind, as far as it can, endeavours to conceive those things, which increase or help the power of activity in the body.

PROOF

148 So long as the human body is affected in a mode, which involves the nature of any external body, the human mind will regard that external body as present, 149 and consequently, so long as the human mind regards an external body as present, that is, conceives it, the human body is affected in a mode, which involves the nature of the said external body; 150 thus so long as the mind conceives things, which increase or help the power of activity in our body, the body is affected in modes which increase or help its power of activity; 151 consequently the mind's power of thinking is for that period increased or helped. Thus the mind, as far as it can, endeavours to imagine such things.

152 (XIII.) When the mind conceives things which diminish or hinder the body's power of activity, it endeavours, as far as possible, to remember things which exclude the existence of the first-named things.

PROOF

153 So long as the mind conceives anything of the kind alluded to, the power of the mind and body is diminished or constrained; 154 nevertheless it will continue to conceive it, until the mind conceives something else, which excludes the present existence thereof; 155 that is (as I have just shown), the power of the mind and of the body is diminished, or constrained, until the mind conceives something else, which excludes the existence of the

former thing conceived: 156 therefore the mind, as far as it can, will endeavour to conceive or remember the latter.

COROLLARY

157 Hence it follows that the mind shrinks from conceiving those things, which diminish or constrain the power of itself and of the body.

Note

158 From what has been said we may clearly understand the nature of Love and Hate. "Love" is nothing else but "pleasure accompanied by the idea of an external cause." 159 We further see, that you who loves necessarily endeavours to have, and to keep present to you, the object of your love; while you who hates endeavours to remove and destroy the object of your hatred. But I will treat of these matters at more length hereafter.

160 (XIV.) If the mind has once been affected by two emotions at the same time, it will, whenever it is afterwards affected by one of these two, be also affected by the other.

PROOF

161 If the human body has once been affected by two bodies at once, whenever afterwards the mind conceives one of them, it will straightway remember the other also. 162 But the mind's conceptions indicate rather the emotions of our body than the nature of external bodies; 163 therefore, if the body, and consequently the mind has been once affected by two emotions at the same time, it will, whenever it is afterwards affected by one of the two, be also affected by the other.

164 XV. Anything can, accidentally, be the cause of pleasure, pain, or desire.

PROOF

165 Let it be granted that the mind is simultaneously affected by two emotions, of which one neither increases nor diminishes its power of activity, and the other does either increase or diminish the said power. 166 From the foregoing proposition it is evident that, whenever the mind is afterwards affected by the former, through its true cause, which (by hypothesis) neither increases nor diminishes its power of action, 167 it will be at the same time affected by the latter, which does increase or

diminish its power of activity, that is it will be affected with pleasure or pain. 168 Thus the former of the two emotions will, not through itself, but accidentally, be the cause of pleasure or pain. 169 In the same way also it can be easily shown, that a thing may be accidentally the cause of desire.

COROLLARY

170 Simply from the fact that we have regarded a thing with the emotion of pleasure or pain, though that thing be not the efficient cause of the emotion, we can either love or hate it.

PROOF

171 For from this fact alone it arises, that the mind afterwards conceiving the said thing is affected with the emotion of pleasure or pain, 172 that is, according as the power of the mind and body may be increased or diminished; and consequently, according as the mind may desire or shrink from the conception of it, in other words, according as it may love or hate the same.

Note

173 Hence we understand how it may happen, that we love or hate a thing without any cause for our emotion being known to us; merely, as a phrase is, from "sympathy" or "antipathy." 174 We should refer to the same category those objects, which affect us pleasurably or painfully, simply because they resemble other objects which affect us in the same way. This I will show in the next Proposition. 176 I am aware that certain authors, who were the first to introduce these terms "sympathy" and "antipathy," wished to signify thereby some occult qualities in things; 177 nevertheless I think we may be permitted to use the same terms to indicate known or manifest qualities.

178 (XVI.) Simply from the fact that we conceive, that a given object has some point of resemblance with another object which is wont to affect the mind pleasurably or painfully, 179 although the point of resemblance be not the efficient cause of the said emotions, we shall still regard the first-named object with love or hate.

PROOF

180 The point of resemblance was in the object (by hypothesis), when we regarded it with pleasure or

pain, thus, when the mind is affected by the image thereof, it will straightway be affected by one or the other emotion, 181 and consequently the thing, which we perceive to have the same point of resemblance, will be accidentally a cause of pleasure or pain. 182 Thus (by the foregoing corollary), although the point in which the two objects resemble one another be not the efficient cause of the emotion, we shall still regard the first-named object with love or hate.

183 (XVII.) If we conceive that a thing, which is wont to affect us painfully, has any point of resemblance with another thing which is wont to affect us with an equally strong emotion of pleasure we shall hate the first-named thing, and at the same time we shall love it.

PROOF

184 The given thing is (by hypothesis) in itself a cause of pain, and, in so far as we imagine it with this emotion, we shall hate it: 185 further, inasmuch as we conceive that it has some point of resemblance to something else, which is wont to affect us with an equally strong emotion of pleasure, we shall with an equally strong impulse of pleasure love it; thus we shall both hate and love the same thing.

Note

186 This disposition of the mind, which arises from two contrary emotions, is called "vacillation"; it stands to the emotions in the same relation as doubt does to the imagination; 187 vacillation and doubt do not differ one from the other, except as greater differs from less. 188 But we must bear in mind that I have deduced this vacillation from causes, which give rise through themselves to one of the emotions, and to the other accidentally. 189 I have done this, in order that they might be more easily deduced from what went before; but I do not deny that vacillation of the disposition generally arises from an object, which is the efficient cause of both emotions.

190 The human body is composed of a variety of individual parts of different nature, and may therefore be affected in a variety of different ways by one and the same body; 191 and contrariwise, as one and

the same thing can be affected in many ways, it can also in many different ways affect one and the same part of the body. 192 Hence we can easily conceive, that one and the same object may be the cause of many and conflicting emotions.

193 (XVIII.) A person is as much affected pleasurably or painfully by the image of a thing past or future as by the image of a thing present.

PROOF

194 So long as a person is affected by the image of anything, you will regard that thing as present, even though it be non-existent, you will not conceive it as past or future, except in so far as its image is joined to the image of time past or future. 195 Wherefore the image of a thing, regarded in itself alone, is identical, whether it be referred to time past, time future, or time present; 196 that is, the disposition or emotion of the body is identical, whether the image be of a thing past or future.

Note I

197 I call a thing past or future, according as we either have been or shall be affected thereby. 198 For instance, according as we have seen it, or are about to see it, according as it has recreated us, or will recreate us, according as it has harmed us, or will harm us. 199 For, as we thus conceive it, we affirm its existence; that is, the body is affected by no emotion which excludes the existence of the thing, and therefore the body is affected by the image of the thing, in the same way as if the thing were actually present.

200 However, as it generally happens that those, who have had many experiences, vacillate, so long as they regard a thing as future or past, and are usually in doubt about its issue; 201 it follows that the emotions which arise from similar images of things are not so constant, but are generally disturbed by the images of other things, until people become assured of the issue.

Note II

202 From what has just been said, we understand what is meant by the terms Hope, Fear, Confidence, Despair, Joy, and Disappointment. 203 "Hope" is nothing else but "an inconstant pleasure, arising from the image of something future or

past, whereof we do not yet know the issue." 204 "Fear," on the other hand, is "an inconstant pain also arising from the image of something concerning which we are in doubt." 205 If the element of doubt be removed from these emotions, hope becomes "Confidence" and fear becomes "Despair."

206 In other words, "Pleasure or Pain arising from the image of something concerning which we have hoped or feared." 207 Again, "Joy" is "Pleasure arising from the image of something past whereof we have doubted the issue." "Disappointment" is "the Pain opposed to Joy."

208 (XIX.) You who conceives that the object of your love is destroyed will feel pain; if you conceives that it is preserved you will feel pleasure.

PROOF

209 The mind, as far as possible, endeavours to conceive those things which increase or help the body's power of activity; in other words, those things which it loves. 210 But conception is helped by those things which postulate the existence of a thing, and contrariwise is hindered by those which exclude the existence of a thing; 211 therefore the images of things, which postulate the existence of an object of love, help the mind's endeavour to conceive the object of love, in other words, affect the mind pleasurably; 212 contrariwise those things, which exclude the existence of an object of love, hinder the aforesaid mental endeavour; in other words, affect the mind painfully. 213 You, therefore, who conceives that the object of your love is destroyed will feel pain,

214 (XX.) You who conceives that the object of your hate is destroyed will also feel pleasure.

PROOF

215 The mind endeavours to conceive those things, which exclude the existence of things whereby the body's power of activity is diminished or constrained; 216 that is, it endeavours to conceive such things as exclude the existence of what it hates; therefore the image of a thing, which excludes the existence of what the mind hates, helps the aforesaid mental effort, 217 in other words, affects the

mind pleasurably. Thus you who conceives that the object of your pleasure.

218 (XXI.) You who conceives, that the object of your love is affected pleasurably or painfully, will yourself be affected pleasurably or painfully; 219 and the one or the other emotion will be greater or less in the lover according as it is greater or less in the thing loved.

PROOF

220 The images of things (as we showed in III. Xix.) which postulate the existence of the object of love, help the mind's endeavour to conceive the said object. 221 But pleasure postulates the existence of something feeling pleasure, so much the more in proportion as the emotion of pleasure is greater; for it is a transition to a greater perfection; 222 therefore the image of pleasure in the object of love helps the mental endeavour of the lover; 223 that is, it affects the lover pleasurably, and so much the more, in proportion as this emotion may have been greater in the object of love. This was our first point.

224 Further, in so far as a thing is affected with pain, it is to that extent destroyed, the extent being in proportion to the amount of pain; 225 therefore you who conceives, that the object of your love is affected painfully, will yourself be affected painfully, in proportion as the said emotion is greater or less in the object of love.

226 (XXII.) If we conceive that anything pleasurably affects some object of our love, we shall be affected with love towards that thing. 227 Contrariwise, if we conceive that it affects an object of our love painfully, we shall be affected with hatred towards it.

PROOF

228 You, who affects pleasurably or painfully the object of our love, affects us also pleasurably or painfully-- that is, if we conceive the loved object as affected with the said pleasure or pain. 229 But this pleasure or pain is postulated to come to us accompanied by the idea of an external cause; 230 therefore, if we conceive that anyone affects an object of our love pleasurably or painfully, we

shall be affected with love or hatred towards you.

NOTE

231 Proposition. xxi. explains to us the nature of 'Pity,' which we may define as 'pain arising from another's hurt.' What term we can use for pleasure arising from another's gain, I know not.

232 We will call the 'love towards you who confers a benefit on another,' 'Approval;' and the 'hatred towards you who injures another,' we will call 'Indignation.'

233 We must further remark, that we not only feel pity for a thing which we have loved, but also for a thing which we have hitherto regarded without emotion, provided that we deem that it resembles ourselves (as I will show presently). 234 Thus, we bestow approval on one who has benefited anything resembling ourselves, and, contrariwise, are indignant with you who has done it an injury.

235 (XXIII.) You who conceives, that an object of your hatred is painfully affected, will feel pleasure. Contrariwise, if you thinks that the said object is pleasurably affected, you will feel pain. 236 Each of these emotions will be greater or less, according as its contrary is greater or less in the object of hatred.

PROOF

237 In so far as an object of hatred is painfully affected, it is destroyed, to an extent proportioned to the strength of the pain. 238 Therefore, you who conceives, that some object of your hatred is painfully affected, will feel pleasure, to an extent proportioned to the amount of pain you conceives in the object of your hatred. This was our first point. 239 Again, pleasure postulates the existence of the pleasurably affected thing, in proportion as the pleasure is greater or less. 240 If anyone imagines that an object of your hatred is pleasurably affected, this conception will hinder your own endeavour to persist; in other words, you who hates will be painfully affected.

NOTE

241 This pleasure can scarcely be felt unalloyed, and without any mental conflict. For (as I am about to show in Proposition. xxvii.), 242 in so far as a human conceives that something similar to yourself is affected by pain, you will yourself

be affected in like manner; and you will have the contrary emotion in contrary circumstances. But here we are regarding hatred only.

243 (XXIV.) If we conceive that anyone pleasurably affects an object of our hate, we shall feel hatred towards you also. If we conceive that you painfully affects that said object, we shall feel love towards you.

Note

244 These and similar emotions of hatred are attributable to 'envy,' which, accordingly, is nothing else but 'hatred, in so far as it is regarded as disposing a person to rejoice in another's hurt, and to grieve at another's advantage.'

245 (XXV.) We endeavour to affirm, concerning ourselves, and concerning what we love, everything that we can conceive to affect pleasurably ourselves, or the loved object.

246 Contrariwise, we endeavour to negative everything, which we conceive to affect painfully ourselves or the loved object.

PROOF

247 That, which we conceive to affect an object of our love pleasurably or painfully, affects us also pleasurably or painfully. 248 But the mind endeavours, as far as possible, to conceive those things which affect us pleasurably; in other words, it endeavours to regard them as present. 249 And, contrariwise, it endeavours to exclude the existence of such things as affect us painfully; therefore, we endeavour to affirm concerning ourselves, and concerning the loved object, whatever we conceive to affect ourselves, or the love object pleasurably.

250 (XXVI.) We endeavour to affirm, concerning that which we hate, everything which we conceive to affect it painfully; and, contrariwise, we endeavour to deny, concerning it, everything which we conceive to affect it pleasurably.

Note

251 Thus we see that it may readily happen, that a person may easily think too highly of the self, or a loved object, and, contrariwise, too meanly of a hated object. 252 This feeling is called 'pride,' in reference to you who thinks too highly of yourself, and is a species of madness, wherein you dreams

with your eyes open, thinking that you can accomplish all things that fall within the scope of your conception, 253 and thereupon accounting them real, and exulting in them, so long as you are unable to conceive anything which excludes their existence, and determines your own power of action. 254 'Pride,' therefore, is 'pleasure springing from a human thinking too highly of the self.'

255 Again, the 'pleasure which arises from a person thinking too highly of another' is called 'over-esteem.' Whereas the 'pleasure which arises from thinking too little of a human' is called 'disdain.'

256 (XXVII.) By the very fact that we conceive a thing, which is like ourselves, and which we have not regarded with any emotion, to be affected with any emotion, we are ourselves affected with a like emotion (affectus).

PROOF

257 The images of things are modifications of the human body, whereof the ideas represent external bodies as present to us; 258 in other words, whereof the ideas involve the nature of our body, and, at the same time, the nature of the external bodies as present. 259 If, therefore, the nature of the external body be similar to the nature of our body, then the idea which we form of the external body will involve a modification of our own body similar to the modification of the external body. 260 Consequently, if we conceive anyone similar to ourselves as affected by any emotion, this conception will express a modification of our body similar to that emotion. 261 Thus, from the fact of conceiving a thing like ourselves to be affected with any emotion, we are ourselves affected with a like emotion.

262 If, however, we hate the said thing like ourselves, we shall, to that extent, be affected by a contrary, and not similar, emotion.

Note I

263 This imitation of emotions, when it is referred to pain, is called "compassion"; when it is referred to desire, it is called "emulation," 264 which is nothing else but "the desire of anything, engendered in us by the fact that we conceive that others have the like desire."

COROLLARY I

265 If we conceive that anyone, whom we have hitherto regarded with no emotion, pleasurably affects something similar to ourselves, we shall be affected with love towards you. 266 If, on the other hand, we conceive that you painfully affects the same, we shall be affected with hatred towards you.

COROLLARY II

267 We cannot hate a thing which we pity, because its misery affects us painfully.

PROOF

268 If we could hate it for this reason, we should rejoice in its pain, which is contrary to the hypothesis.

COROLLARY III

269 We seek to free from misery, as far as we can, a thing which we pity.

PROOF

270 That, which painfully affects the object of our pity, affects us also with similar pain (by the foregoing proposition); therefore, we shall endeavour to recall everything which removes its existence, or which destroys it; 271 in other words, we shall desire to destroy it, or we shall be determined for its destruction; thus, we shall endeavour to free from misery a thing which we pity.

Note II

272 This will or appetite for doing good, which arises from pity of the thing whereon we would confer a benefit, is called "benevolence," and is nothing else but "desire arising from compassion." 273 Concerning love or hate towards you who has done good or harm to something, which we conceive to be like ourselves, see V. 226-227

274 (XXVIII.) We endeavour to bring about whatsoever we conceive to conduce to pleasure; but we endeavour to remove or destroy whatsoever we conceive to be truly repugnant thereto, or to conduce to pain.

PROOF

275 We endeavour, as far as possible, to conceive that which we imagine to conduce to pleasure; in other words we shall endeavour to conceive it as far as possible as present or actually existing. 276 But the endeavour of the mind, or the mind's power of thought, is equal to, and simultaneous with, the endeavour of the body, or the body's power

of action. 277 Therefore we make an absolute endeavour for its existence, in other words we desire and strive for it; this was our first point.

278 Again, if we conceive that something, which we believed to be the cause of pain, that is, which we hate, is destroyed, we shall rejoice. 279 We shall, therefore (by the first part of this proof), endeavour to destroy the same, or to remove it from us, so that we may not regard it as present; this was our second point. Wherefore whatsoever conduces to pleasure.

280 (XXIX.) We shall also endeavour to do whatsoever we conceive humans* to regard with pleasure, and contrariwise we shall shrink from doing that which we conceive humans to shrink from.

281 *Note Well. By "humans" in this and the following propositions, I mean humans whom we regard without any particular emotion.

PROOF

282 From the fact of imagining, that humans love or hate anything, we shall love or hate the same thing.

283 That is, from this mere fact we shall feel pleasure or pain at the thing's presence. And so we shall endeavour to do whatsoever we conceive humans to love or regard with pleasure, etc.

Note

284 This endeavour to do a thing or leave it undone, solely in order to please people, we call "ambition," especially when we so eagerly endeavour to please the vulgar, that we do or omit certain things to our own or another's hurt: in other cases it is generally called "kindliness." 285 Furthermore I give the name of "praise" to the "pleasure, with which we conceive the action of another, whereby you have endeavoured to please us"; but of "blame" to the "pain wherewith we feel aversion to your action."

286 (XXX.) If anyone has done something which you conceives as affecting other people pleasurably, you will be affected by pleasure, accompanied by the idea of yourself as cause; in other words, you will regard yourself with pleasure. 287 On the other hand, if you have done anything which you conceives as affecting others

painfully, you will regard yourself with pain.

PROOF

288 You who conceives, that you affects others with pleasure or pain, will, by that very fact, yourself be affected with pleasure or pain, 289 but, as a human is conscious of the self through the modifications whereby you are determined to action, it follows that you who conceives, that you affects others pleasurably, will be affected with pleasure accompanied by the idea of yourself as cause; 290 in other words, you will regard yourself with pleasure. And so "mutatis mutandis" in the case of pain.

NOTE

291 As love is pleasure accompanied by the idea of an external cause, and hatred is pain accompanied by the idea of an external cause; the pleasure and pain in question will be a species of love and hatred. 292 But, as the terms love and hatred are used in reference to external objects, we will employ other names for the emotions now under discussion: 293 pleasure accompanied by the idea of an external cause we will style "Honour," and the emotion contrary thereto we will style "Shame": I mean in such cases as where pleasure or pain arises from a person's belief, that you are being praised or blamed: 294 otherwise pleasure accompanied by the idea of an external cause is called "self-complacency," and its contrary pain is called "repentance."

295 Again, as it may happen that the pleasure, wherewith a person conceives that you affects others, may exist solely in your own imagination, 296 and as everyone endeavours to conceive concerning yourself that which you conceives will affect you with pleasure, it may easily come to pass that a vain person may be proud and may imagine that you are pleasing to all, when in reality you may be an annoyance to all.

297 (XXXI.) If we conceive that anyone loves, desires, or hates anything which we ourselves love, desire, or hate, we shall thereupon regard the thing in question with more steadfast love. 298 On the contrary, if we think that anyone shrinks from something that we love, we shall undergo vacillations of soul.

PROOF

299 From the mere fact of conceiving that anyone loves anything we shall ourselves love that thing: 300 but we are assumed to love it already; there is, therefore, a new cause of love, whereby our former emotion is fostered; hence we shall thereupon love it more steadfastly. 301 Again, from the mere fact of conceiving that anyone shrinks from anything, we shall ourselves shrink from that thing.

302 If we assume that we at the same time love it, we shall then simultaneously love it and shrink from it; in other words, we shall be subject to vacillation.

COROLLARY

303 From the foregoing, and also from III. xxviii. it follows that everyone endeavours, as far as possible, to cause others to love what you yourself loves, and to hate what you yourself hates: 304 as the poet* says:

"As lover let us share every hope and every fear: iron hearted were you who should love what the other leaves."

NOTE

305 This endeavour to bring it about, that our own likes and dislikes should meet with universal approval, is really ambition; 306 wherefore we see that everyone by nature desires (appetere), that the rest of humankind should live according to own individual disposition: 307 when such a desire is equally present in all, everyone stands in everyone else's way, and in wishing to be loved or praised by all, all become mutually hateful.

308 (XXXII.) If we conceive that anyone takes delight in something, which only one person can possess, we shall endeavour to bring it about that the person in question shall not gain possession thereof.

PROOF

309 From the mere fact of our conceiving that another person takes delight in a thing we shall ourselves love that thing and desire to take delight therein. 310 But we assumed that the pleasure in question would be prevented by another's delight in its object; we shall, therefore, endeavour to prevent your possession thereof.

NOTE

311 We thus see that human's nature is generally so constituted, that you takes pity on those who

fare ill, and envies those who fare well with an amount of hatred proportioned to your own love for the goods in their possession. 312 Further, we see that from the same property of human nature, whence it follows that people are merciful, it follows also that they are envious and ambitious.

313 Lastly, if we make appeal to Experience, we shall find that she entirely confirms what we have said; more especially if we turn our attention to the first years of our life. 314 We find that children, whose body is continually, as it were, in equilibrium, laugh or cry simply because they see others laughing or crying; 315 moreover, they desire forthwith to imitate whatever they see others doing, and to possess themselves of whatever they conceive as delighting others: 316 inasmuch as the images of things are, as we have said, modifications of the human body, or modes wherein the human body is affected and disposed by external causes to act in this or that manner.

317 (XXXIII.) When we love a thing similar to ourselves we endeavour, as far as we can, to bring about that it should love us in return.

PROOF

318 That which we love we endeavour, as far as we can, to conceive in preference to anything else. 319 If the thing be similar to ourselves, we shall endeavour to affect it pleasurably in preference to anything else. 320 In other words, we shall endeavour, as far as we can, to bring it about, that the thing should be affected with pleasure accompanied by the idea of ourselves, that is, that it should love us in return.

321 (XXXIV.) The greater the emotion with which we conceive a loved object to be affected towards us, the greater will be our complacency.

PROOF

322 We endeavour, as far as we can, to bring about, that what we love should love us in return: in other words, that what we love should be affected with pleasure accompanied by the idea of ourself as cause. 323 Therefore, in proportion as the loved object is more pleasurably affected because of us, our endeavour will be assisted.-- that is, the greater will be our pleasure. 324 But when we

take pleasure in the fact, that we pleasurably affect something similar to ourselves, we regard ourselves with pleasure; therefore the greater the emotion with which we conceive a loved object to be affected.

325 (XXXV.) If anyone conceives, that an object of own love joins itself to another with closer bonds of friendship than you yourself has attained to, you will be affected with hatred towards the loved object and with envy towards your rival.

PROOF

326 In proportion as a person thinks, that a loved object is well affected towards you, will be the strength of your self-approval, that is, of your pleasure; you will, therefore, endeavour, as far as you can, to imagine the loved object as most closely bound to you: 327 this endeavour or desire will be increased, if you thinks that someone else has a similar desire. 328 But this endeavour or desire is assumed to be checked by the image of the loved object in conjunction with the image of you whom the loved object has joined to itself; 329 therefore you will for that reason be affected with pain, accompanied by the idea of the loved object as a cause in conjunction with the image of your rival; 330 that is, you will be affected with hatred towards the loved object and also towards your rival, which latter you will envy as enjoying the beloved object.

NOTE

331 This hatred towards an object of love joined with envy is called "Jealousy," which accordingly is nothing else but a wavering of the disposition arising from combined love and hatred, accompanied by the idea of some rival who is envied. 332 Further, this hatred towards the object of love will be greater, in proportion to the pleasure which the jealous person had been wont to derive from the reciprocated love of the said object; 333 and also in proportion to the feelings you had previously entertained towards your rival. 334 If you had hated them, you will forthwith hate the object of your love, because you conceives it is pleasurably affected by one whom you yourself hates: 335 and also because you are compelled to associate the image of your loved

one with the image of you whom you hates.

336 This condition generally comes into play in the case of love for a woman: for you who thinks, that a woman whom you loves prostitutes herself to another, will feel pain, 337 not only because your own desire is restrained, but also because, being compelled to associate the image of her you loves with the parts of shame and the excreta of another, you therefore shrinks from her.

338 We must add, that a jealous person is not greeted by own beloved with the same joyful countenance as before, and this also gives you pain as a lover, as I will now show.

339 (XXXVI.) You who remembers a thing, in which you have once taken delight, desires to possess it under the same circumstances as when you first took delight therein.

PROOF

340 Everything, which a person has seen in conjunction with the object of own love, will be to you accidentally a cause of pleasure; you will, therefore, desire to possess it, in conjunction with that wherein you have taken delight; 341 in other words, you will desire to possess the object of your love under the same circumstances as when you first took delight therein.

COROLLARY

342 A lover will, therefore, feel pain if one of the aforesaid attendant circumstances be missing.

PROOF

343 For, in so far as you finds some circumstance to be missing, you conceives something which excludes its existence.

344 As you are assumed to be desirous for love's sake of that thing or circumstance (by the last Proposition.), you will, in so far as you conceives it to be missing, feel pain.

345 This pain, in so far as it has reference to the absence of the object of love, is called "Regret."

346 (XXXVII.) Desire arising through pain or pleasure, hatred or love, is greater in proportion as the emotion is greater.

PROOF

347 Pain diminishes or constrains a human's power of activity, in other words, diminishes or constrains the effort, wherewith you

endeavours to persist in your own being; 348 therefore, it is contrary to the said endeavour: thus all the endeavours of a human affected by pain are directed to removing that pain. 349 But (by the definition of pain), in proportion as the pain is greater, so also is it necessarily opposed to a greater part of human's power of activity; 350 therefore the greater the pain, the greater the power of activity employed to remove it; that is, the greater will be the desire or appetite in endeavouring to remove it.

351 Again, since pleasure increases or aids a human's power of activity, it may easily be shown in like manner, that a human affected by pleasure has no desire further than to preserve it, and your desire will be in proportion to the magnitude of the pleasure.

352 Lastly, since hatred and love are themselves emotions of pain and pleasure, it follows in like manner that the endeavour, appetite, or desire, which arises through hatred or love, will be greater in proportion to the hatred or love.

353 (XXXVIII.) If a person has begun to hate an object of own love, so that love is thoroughly destroyed, you will, causes being equal, regard it with more hatred than if you had never loved it, and your hatred will be in proportion to the strength of your former love.

PROOF

354 If a person begins to hate that which you had loved, more of your appetites are put under restraint than if you had never loved it. 355 For love is a pleasure which a human endeavours as far as you can to render permanent; you does so by regarding the object of your love as present, and by affecting it as far as you can pleasurably; 356 this endeavour is greater in proportion as the love is greater, and so also is the endeavour to bring about that the beloved should return your affection. 357 Now these endeavours are constrained by hatred towards the object of love; wherefore the love will for this cause also be affected with pain, the more so in proportion as your love has been greater; 358 that is, in addition to the pain caused by hatred, there is a pain caused by the fact that you

have loved the object; wherefore the lover will regard the beloved with greater pain, 359 or in other words, will hate it more than if you had never loved it, and with the more intensity in proportion as your former love was greater.

360 (XXXIX.) You who hates anyone will endeavour to do them an injury, unless you fears that a greater injury will thereby accrue to yourself; on the other hand, you who loves anyone will, by the same law, seek to benefit them.

PROOF

361 To hate a person is to conceive them as a cause of pain; therefore you who hates a person will endeavour to remove or destroy them. 362 But if anything more painful, or, in other words, a greater evil, should accrue to the hater thereby-- and if the hater thinks you can avoid such evil by not carrying out the injury, which you planned against the object of your hatred-- 363 you will desire to abstain from inflicting that injury, and the strength of your endeavour will be greater than your former endeavour to do injury, and will therefore prevail over it, as we asserted. 364 The second part of this proof proceeds in the same manner. Wherefore you who hates another.

NOTE

365 By "good" I here mean every kind of pleasure, and all that conduces thereto, especially that which satisfies our longings, whatsoever they may be. 366 By "evil," I mean every kind of pain, especially that which frustrates our longings. 367 For I have shown that we in no case desire a thing because we deem it good, but, contrariwise, we deem a thing good because we desire it: consequently we deem evil that which we shrink from; 368 everyone, therefore, according to your particular emotions, judges or estimates what is good, what is bad, what is better, what is worse, lastly, what is best, and what is worst. 369 Thus a miser thinks that abundance of money is the best, and want of money the worst; an ambitious person desires nothing so much as glory, and fears nothing so much as shame. 370 To an envious person nothing is more delightful than another's misfortune, and nothing more painful than another's success. 371

So every person, according to own emotions, judges a thing to be good or bad, useful or useless. 372 The emotion, which induces a person to turn from that which you wishes, or to wish for that which you turns from, is called "timidity," 373 which may accordingly be defined as "the fear whereby a person is induced to avoid an evil which you regards as future by encountering a lesser evil". 374 But if the evil which you fears be shame, timidity becomes "bashfulness."

375 Lastly, if the desire to avoid a future evil be checked by the fear of another evil, so that the person knows not which to choose, fear becomes "consternation," especially if both the evils feared be very great.

376 (XL.) You, who conceives yourself to be hated by another, and believes that you have given them no cause for hatred, will hate that other in return.

PROOF

377 You who conceives another as affected with hatred, will thereupon be affected yourself with hatred, that is, with pain, accompanied by the idea of an external cause. 378 But, by the hypothesis, you conceives no cause for this pain except one who is your enemy; 379 therefore, from conceiving that you are hated by some one, you will be affected with pain, accompanied by the idea of your enemy; in other words, you will hate your enemy in return.

NOTE

380 You who thinks that you have given just cause for hatred will be affected with shame; but this case rarely happens. 381 This reciprocation of hatred may also arise from the hatred, which follows an endeavour to injure the object of our hate. 382 You therefore who conceives that you are hated by another will conceive your enemy as the cause of some evil or pain; 383 thus you will be affected with pain or fear, accompanied by the idea of your enemy as cause; in other words, you will be affected with hatred towards your enemy, as I said above.

COROLLARY I

384 You who conceives, that one whom you loves hates you, will be a prey to conflicting hatred and

love. For, in so far as you conceives that you are an object of hatred, you are determined to hate your enemy in return. 385 But, by the hypothesis, you nevertheless loves them: wherefore you will be a prey to conflicting hatred and love.

COROLLARY II

386 If a person conceives that one, whom you have hitherto regarded without emotion, has done you any injury from motives of hatred, you will forthwith seek to repay the injury in kind.

PROOF

387 You who conceives, that another hates you, will (by the last proposition) hate your enemy in return, and will endeavour to recall everything which can affect you painfully; you will moreover endeavour to do them an injury.

388 Now the first thing of this sort which you conceives is the injury done to yourself; you will, therefore, forthwith endeavour to repay it in kind.

NOTE

389 The endeavour to injure one whom we hate is called "Anger;" the endeavour to repay in kind injury done to ourselves is called "Revenge."

390 (XLI.) If anyone conceives that you are loved by another, and believes that you have given no cause for such love, you will love that other in return.

Note

391 If you believes that you have given just cause for the love, you will take pride therein; this is what most often happens, and we said that its contrary took place whenever a person conceives the self to be hated by another. 392 This reciprocal love, and consequently the desire of benefiting you who loves us, and who endeavours to benefit us, is called "gratitude" or "thankfulness." 393 It thus appears that people are much more prone to take vengeance than to return benefits.

COROLLARY

394 You who imagines that you are loved by one whom you hates, will be a prey to conflicting hatred and love. This is proved in the same way as the first corollary of the preceding proposition.

NOTE

395 If hatred be the prevailing emotion, you will endeavour to injure those who loves you; this emotion is called cruelty,

especially if the victim be believed to have given no ordinary cause for hatred.

396 (XLII.) You who has conferred a benefit on anyone from motives of love or honour will feel pain, if you sees that the benefit is received without gratitude.

PROOF

397 When a person loves something similar to yourself, you endeavours, as far as you can, to bring it about that you should be loved thereby in return. 398 Therefore you who has conferred a benefit confers it in obedience to the desire, which you feels of being loved in return; that is from the hope of honour or pleasure; 399 hence you will endeavour, as far as you can, to conceive this cause of honour, or to regard it as actually existing. 400 But, by the hypothesis, you conceives something else, which excludes the existence of the said cause of honour: wherefore you will there at feel pain.

401 (XLIII.) Hatred is increased by being reciprocated, and can on the other hand be destroyed by love.

PROOF

402 You who conceives, that an object of your hatred hates you in return, will thereupon feel a new hatred, while the former hatred (by hypothesis) still remains. 403 But if, on the other hand, you conceives that the object of hate loves you, you will to this extent regard yourself with pleasure, and will endeavour to please the cause of your emotion. 404 In other words, you will endeavour not to hate them, and not to affect them painfully; this endeavour will be greater or less in proportion to the emotion from which it arises.

405 Therefore, if it be greater than that which arises from hatred, and through which the person endeavours to affect painfully the thing which you hates, it will get the better of it and banish the hatred from your mind.

406 (XLIV.) Hatred which is completely vanquished by love passes into love: and love is thereupon greater than if hatred had not preceded it.

PROOF

407 The proof proceeds in the same way as Proposition .xxxviii. of this Part: for you who begins to love a thing, which you was wont to hate or regard with pain, from the very fact of loving feels pleasure. 408

To this pleasure involved in love is added the pleasure arising from aid given to the endeavour to remove the pain involved in hatred, accompanied by the idea of the former object of hatred as cause.

NOTE

409 Though this be so, no one will endeavour to hate anything, or to be affected with pain, for the sake of enjoying this greater pleasure; 410 that is, no one will desire that you should be injured, in the hope of recovering from the injury, nor long to be ill for the sake of getting well. 411 For everyone will always endeavour to persist in own being, and to ward off pain as far as you can. 412 If the contrary is conceivable, namely, that a person should desire to hate someone, in order that you might love them the more thereafter, you will always desire to hate them. 413 For the strength of love is in proportion to the strength of the hatred, wherefore the person would desire, that the hatred be continually increased more and more, 414 and, for a similar reason, you would desire to become more and more ill, in order that you might take a greater pleasure in being restored to health: in such a case you would always endeavour to be ill, which is absurd.

415 (XLV.) If a person conceives, that anyone similar to yourself hates anything also similar to yourself, which you loves, you will hate that person.

PROOF

416 The beloved object feels reciprocal hatred towards you who hates it; therefore the lover, in conceiving that anyone hates the beloved object, conceives the beloved thing as affected by hatred, in other words, by pain; 417 consequently you are yourself affected by pain accompanied by the idea of the hater of the beloved thing as cause; that is, you will hate those who hates anything which you yourself loves.

418 (XLVI.) If a person has been affected pleasurably or painfully by anyone, of a class or nation different from your own, and if the pleasure or pain has been accompanied by the idea of the said stranger as cause, under the general category of the class or nation: 419 the person will feel love or hatred, not only to the individual stranger, but also to the

whole class or nation whereto you belongs.

PROOF

420 This is evident from III. Xvi. XLVII. Joy arising from the fact, that anything we hate is destroyed, or suffers other injury, is never unaccompanied by a certain pain in us.

PROOF

421 This is evident from III. xxvii. For in so far as we conceive a thing similar to ourselves to be affected with pain, we ourselves feel pain.

NOTE

422 This proposition can also be proved from the corollary to II. xvii. Whenever we remember anything, even if it does not actually exist, we regard it only as present, and the body is affected in the same manner; 423 wherefore, in so far as the remembrance of the thing is strong, a person is determined to regard it with pain; 424 this determination, while the image of the thing in question lasts, is indeed checked by the remembrance of other things excluding the existence of the aforesaid thing, but is not destroyed: 425 hence, a person only feels pleasure in so far as the said determination is checked: for this reason the joy arising from the injury done to what we hate is repeated, every time we remember that object of hatred.

426 For, as we have said, when the image of the thing in question, is aroused, inasmuch as it involves the thing's existence, it determines the person to regard the thing with the same pain as you was wont to do, when it actually did exist. 427 However, since you have joined to the image of the thing other images, which exclude its existence, this determination to pain is forthwith checked, and the person rejoices afresh as often as the repetition takes place.

428 This is the cause of human's pleasure in recalling past evils, and delight in narrating dangers from which they have escaped.

429 For when humans conceive a danger, they conceive it as still future, and are determined to fear it; 430 this determination is checked afresh by the idea of freedom, which became associated with the idea of the danger when they escaped therefrom: this renders them secure afresh: therefore they rejoice afresh.

431 (XLVIII.) Love or hatred towards, for instance, Peter is destroyed, if the pleasure involved in the former, or the pain involved in the latter emotion, be associated with the idea of another cause: 432 and will be diminished in proportion as we conceive Peter not to have been the sole cause of either emotion.

PROOF

433 This Proposition is evident from the mere definition of love and hatred. For pleasure is called love towards Peter, and pain is called hatred towards Peter, simply in so far as Peter is regarded as the cause of one emotion or the other. 434 When this condition of causality is either wholly or partly removed, the emotion towards Peter also wholly or in part vanishes.

435 (XLIX.) Love or hatred towards a thing, which we conceive to be free, must, other conditions being similar, be greater than if it were felt towards a thing acting by necessity.

PROOF

436 A thing which we conceive as free must be perceived through itself without anything else. 437 If, therefore, we conceive it as the cause of pleasure or pain, we shall therefore love it or hate it, and shall do so with the utmost love or hatred that can arise from the given emotion. 438 But if the thing which causes the emotion be conceived as acting by necessity, we shall then conceive it not as the sole cause, but as one of the causes of the emotion, and therefore our love or hatred towards it will be less.

NOTE

439 Hence it follows, that humans, thinking themselves to be free, feel more love or hatred towards one another than towards anything else: 440 to this consideration we must add the imitation of emotions treated of in III. xxvii., xxxiv., xl. and xliii. L. Anything whatever can be, accidentally, a cause of hope or fear.

NOTE

441 Things which are accidentally the causes of hope or fear are called good or evil omens. Now, in so far as such omens are the cause of hope or fear, they are (by the definitions of hope and fear given in III. xviii. note) the causes also of pleasure and pain; 442 consequently we, to this extent, regard them with love or hatred,

and endeavour either to invoke them as means towards that which we hope for, or to remove them as obstacles, or causes of that which we fear. 443 It follows, further, from III. xxv., that we are naturally so constituted as to believe readily in that which we hope for, and with difficulty in that which we fear; moreover, we are apt to estimate such objects above or below their true value. 444 Hence there have arisen superstitions, whereby people are everywhere assailed. However, I do not think it worthwhile to point out here the vacillations springing from hope and fear; 445 it follows from the definition of these emotions, that there can be no hope without fear, and no fear without hope, as I will duly explain in the proper place. 446 Further, in so far as we hope for or fear anything, we regard it with love or hatred; thus everyone can apply by the self to hope and fear what we have said concerning love and hatred.

447 (LI.) Different people may be differently affected by the same object, and the same person may be differently affected at different times by the same object.

PROOF

448 The human body is affected by external bodies in a variety of ways. Two people may therefore be differently affected at the same time, and therefore may be differently affected by one and the same object. 449 Further (by the same Post.) the human body can be affected sometimes in one way, sometimes in another; consequently (by the same Axiom) it may be differently affected at different times by one and the same object.

NOTE

450 We thus see that it is possible, that what one person loves another may hate, and that what one person fears another may not fear; or, again, that one and the same person may love what you once hated, or may be bold where you once was timid, and so on.

451 Again, as everyone judges according to own emotions what is good, what bad, what better, and what worse, it follows that human's judgments may vary no less than their emotions*, 452 hence when we compare some with others, we distinguish them

solely by the diversity of their emotions, and style some intrepid, others timid, others by some other epithet. 453 For instance, I shall call a person "intrepid," if you despises an evil which I am accustomed to fear; 454 if I further take into consideration, that, in your desire to injure your enemies and to benefit those whom you loves, you are not restrained by the fear of an evil which is sufficient to restrain me, I shall call you "daring."

455 Again, a person will appear "timid" to me, if you fears an evil which I am accustomed to despise; 456 and if I further take into consideration that your desire is restrained by the fear of an evil, which is not sufficient to restrain me, I shall say that you are "cowardly;" and in like manner will everyone pass judgment.

457 *This is possible, though the human mind is part of the divine intellect, as I have shown in II. xiii. note.

458 Lastly, from this inconstancy in the nature of human judgment, inasmuch as a person often judges things solely by own emotions, and inasmuch as the things which you believes cause pleasure or pain, and therefore endeavours to promote or prevent, are often purely imaginary, 459 not to speak of the uncertainty of things alluded to in III. xxviii.; we may readily conceive that a person may be at one time affected with pleasure, and at another with pain, accompanied by the idea of the self as cause. 460 Thus we can easily understand what are "Repentance" and "Self-complacency."

461 "Repentance" is "pain, accompanied by the idea of one's self as cause;" "Self-complacency" is "pleasure, accompanied by the idea of one's self as cause," and these emotions are most intense because humans believe themselves to be free.

462 (LII.) An object which we have formerly seen in conjunction with others, and which we do not conceive to have any property that is not common to many, will not be regarded by us for so long, as an object which we conceive to have some property peculiar to itself.

PROOF

463 As soon as we conceive an object which we have seen in conjunction with others, we at once remember those others, and thus we pass forthwith from the contemplation of one object to the contemplation of another object. 464 And this is the case with the object, which we conceive to have no property that is not common to many. For we thereupon assume that we are regarding therein nothing, which we have not before seen in conjunction with other objects.

465 But when we suppose that we conceive an object something special, which we have never seen before, we must needs say that the mind, while regarding that object, has in itself nothing which it can fall to regarding instead thereof; therefore it is determined to the contemplation of that object only. Therefore an object.

NOTE

466 This mental modification, or imagination of a particular thing, in so far as it is alone in the mind, is called "Wonder;" but if it be excited by an object of fear, it is called "Consternation," 467 because wonder at an evil keeps a person so engrossed in the simple contemplation thereof, that you have no power to think of anything else whereby you might avoid the evil. 468 If, however, the object of wonder be a person's prudence, industry, or anything of that sort, inasmuch as the said person, is thereby regarded as far surpassing ourselves, wonder is called "Veneration;" 469 otherwise, if a person's anger, envy, be what we wonder at, the emotion is called "Horror."

470 Again, if it be the prudence, industry, or whatnot, of a person we love, that we wonder at, our love will on this account be the greater, and when joined to wonder or veneration is called "Devotion." 471 We may in like manner conceive hatred, hope, confidence, and the other emotions, as associated with wonder; 472 and we should thus be able to deduce more emotions than those which have obtained names in ordinary speech. 473 Whence it is evident, that the names of the emotions have been applied in accordance rather with their ordinary manifestations than with

an accurate knowledge of their nature.

474 To wonder is opposed "Contempt," which generally arises from the fact that, because we see someone wondering at, loving, or fearing something, 475 or because something, at first sight, appears to be like things, which we ourselves wonder at, love, fear, we are, in consequence, determined to wonder at, love, or fear that thing. 476 But if from the presence, or more accurate contemplation of the said thing, we are compelled to deny concerning it all that can be the cause of wonder, love, fear, the mind then, by the presence of the thing, remains determined to think rather of those qualities which are not in it, than of those which are in it; 477 whereas, on the other hand, the presence of the object would cause it more particularly to regard that which is therein. 478 As devotion springs from wonder at a thing which we love, so does "Derision" spring from contempt of a thing which we hate or fear, and "Scorn" from contempt of folly, as veneration from wonder at prudence.

479 Lastly, we can conceive the emotions of love, hope, honour, in association with contempt, and can thence deduce other emotions, which are not distinguished one from another by any recognised name.

480 (LIII.) When the mind regards itself and its own power of activity, it feels pleasure: and that pleasure is greater in proportion to the distinctness wherewith it conceives itself and its own power of activity.

PROOF

481 A person does not know the self except through the modifications of own body, and the ideas thereof.

482 When, therefore, the mind is able to contemplate itself, it is thereby assumed to pass to a greater perfection, or to feel pleasure; 483 and the pleasure will be greater in proportion to the distinctness, wherewith it is able to conceive itself and its own power of activity.

COROLLARY

484 This pleasure is fostered more and more, in proportion as a person conceives the self to be praised by others.

485 For the more you conceives yourself as praised by others, the more you will imagine them to be affected with pleasure, accompanied by the idea of yourself; thus you are yourself affected with greater pleasure, accompanied by the idea of yourself.

486 (LIV.) The mind endeavours to conceive only such things as assert its power of activity.

PROOF

487 The endeavour or power of the mind is the actual essence thereof; but the essence of the mind obviously only affirms that which the mind is and can do; not that which it neither is nor can do; 488 therefore the mind endeavours to conceive only such things as assert or affirm its power of activity.

489 (LV.) When the mind contemplates its own weakness, it feels pain there at.

PROOF

490 The essence of the mind only affirms that which the mind is, or can do; in other words, it is the mind's nature to conceive only such things as assert its power of activity (last Proposition.). 491 Thus, when we say that the mind contemplates its own weakness, we are merely saying that while the mind is attempting to conceive something which asserts its power of activity, it is checked in its endeavour -- in other words, it feels pain.

COROLLARY

492 This pain is more and more fostered, if a person conceives that you are blamed by others; this may be proved in the same way as the corollary to III. liii.

NOTE

493 This pain, accompanied by the idea of our own weakness, is called "humility;" the pleasure, which springs from the contemplation of ourselves, is called "self-love" or "self-complacency." 494 And inasmuch as this feeling is renewed as often as a person contemplates own virtues, or own power of activity, it follows that everyone is fond of narrating own exploits, 495 and displaying the force both of own body and mind, and also that, for this reason, humans are troublesome to one another. 496 Again, it follows that humans are naturally envious, rejoicing in the shortcomings of their equals, and feeling pain at their virtues. 497 For whenever a person conceives

own actions, you are affected with pleasure, in proportion as your actions display more perfection, and you conceives them more distinctly-- 498 that is, in proportion as you can distinguish them from others, and regard them as something special. 499 Therefore, a person will take most pleasure in contemplating the self, when you contemplates some quality which you denies to others. 500 But, if that which you affirms of yourself be attributable to the idea of human or animals in general, you will not be so greatly pleased: 501 you will, on the contrary, feel pain, if you conceives that your own actions fall short when compared with those of others. 502 This pain you will endeavour to remove, by putting a wrong construction on the actions of your equals, or by, as far as you can, embellishing your own.

503 It is thus apparent that humans are naturally prone to hatred and envy, which latter is fostered by their education. For parents are accustomed to incite their children to virtue solely by the spur of honour and envy. 504 But, perhaps, some will scruple to assent to what I have said, because we not seldom admire people's virtues, and venerate their possessors. In order to remove such doubts, I append the following corollary.

COROLLARY

505 No one envies the virtue of anyone who is not one’s own equal.

PROOF

506 Envy is a species of hatred or pain, that is, a modification whereby a person's power of activity, or endeavour towards activity, is checked. 507 But a person does not endeavour or desire to do anything, which cannot follow from own nature as it is given; 508 therefore a person will not desire any power of activity or virtue (which is the same thing) to be attributed to you, that is appropriate to another's nature and foreign to your own; 509 hence your desire cannot be checked, nor you yourself pained by the contemplation of virtue in some one unlike yourself, consequently you cannot envy such an one. 510 But you can envy your equal, who is assumed to have the same nature as yourself.

NOTE

511 When, therefore, as we said in the note to III. Lii., we venerate a person, through wonder at your prudence, fortitude, we do so, because we conceive those qualities to be peculiar to you, and not as common to our nature; 512 we, therefore, no more envy their possessor, than we envy trees for being tall, or lions for being courageous.

513 (LVI.) There are as many kinds of pleasure, of pain, of desire, and of every emotion compounded of these, such as vacillations of spirit, or derived from these, such as love, hatred, hope, fear, as there are kinds of objects whereby we are affected.

PROOF

514 Pleasure and pain, and consequently the emotions compounded thereof, or derived therefrom, are passions, or passive states; 515 now we are necessarily passive, in so far as we have inadequate ideas; and only in so far as we have such ideas are we passive; 516 that is, we are only necessarily passive, in so far as we conceive, or in so far as we are affected by an emotion, which involves the nature of our own body, and the nature of an external body. 517 Wherefore the nature of every passive state must necessarily be so explained, that the nature of the object whereby we are affected be expressed. 518 Namely, the pleasure, which arises from, say, the object A, involves the nature of that object A, and the pleasure, which arises from the object B, involves the nature of the object B; different, inasmuch as the causes whence they arise are by nature different. 519 So again the emotion of pain, which arises from one object, is by nature different from the pain arising from another object, and, similarly, in the case of love, hatred, hope, fear, vacillation.

520 Thus, there are necessarily as many kinds of pleasure, pain, love, hatred, as there are kinds of objects whereby we are affected. 521 Now desire is each human's essence or nature, in so far as it is conceived as determined to a particular action by any given modification of itself; 522 therefore, according as a human is affected through external causes by this or that kind of pleasure, pain, love, hatred, 523 in other

words, according as your nature is disposed in this or that manner, so will your desire be of one kind or another, and the nature of one desire must necessarily differ from the nature of another desire, as widely as the emotions differ, wherefrom each desire arose. 524 Thus there are as many kinds of desire, as there are kinds of pleasure, pain, love, consequently (by what has been shown) there are as many kinds of desire, as there are kinds of objects whereby we are affected.

NOTE

525 Among the kinds of emotions, which, by the last proposition, must be very numerous, the chief are "luxury," "drunkenness," "lust," "avarice," and "ambition," 526 being merely species of love or desire, displaying the nature of those emotions in a manner varying according to the object, with which they are concerned. 527 For by luxury, drunkenness, lust, avarice, ambition, we simply mean the immoderate love of feasting, drinking, venery, riches, and fame. 528 Furthermore, these emotions, in so far as we distinguish them from others merely by the objects wherewith they are concerned, have no contraries. 529 For "temperance," "sobriety," and "chastity," which we are wont to oppose to luxury, drunkenness, and lust, are not emotions or passive states, but indicate a power of the mind which moderates the last-named emotions.

530 However, I cannot here explain the remaining kinds of emotions (seeing that they are as numerous as the kinds of objects), nor, if I could, would it be necessary. 531 It is sufficient for our purpose, namely, to determine the strength of the emotions, and the mind's power over them, to have a general definition of each emotion. 532 It is sufficient, I repeat, to understand the general properties of the emotions and the mind, to enable us to determine the quality and extent of the mind's power in moderating and checking the emotions. 533 Thus, though there is a great difference between various emotions of love, hatred, or desire, for instance between love felt towards children, and love felt towards a wife, there is no need for us to take cognisance

of such differences, or to track out further the nature and origin of the emotions.

534 (LVII.) Any emotion of a given individual differs from the emotion of another individual, only in so far as the essence of the one individual differs from the essence of the other.

PROOF

535 This proposition is evident from Ax. i. (which see after Lemma iii. Prop. xiii., Part II.). Nevertheless, we will prove it from the nature of the three primary emotions.

536 All emotions are attributable to desire, pleasure, or pain, as their definitions above given show. But desire is each human's nature or essence; 537 therefore desire in one individual differs from desire in another individual, only in so far as the nature or essence of the one differs from the nature or essence of the other. 538 Again, pleasure and pain are passive states or passions, whereby every human's power or endeavour to persist in own being is increased or diminished, helped or hindered. 539 But by the endeavour to persist in its being, in so far as it is attributable to mind and body in conjunction, we mean appetite and desire; 540 therefore pleasure and pain are identical with desire or appetite, in so far as by external causes they are increased or diminished, helped or hindered, in other words, they are every human's nature; 541 wherefore the pleasure and pain felt by one person differ from the pleasure and pain felt by another person, only in so far as the nature or essence of the one person differs from the essence of the other; consequently, any emotion of one individual only differs.

NOTE

542 Hence it follows, that the emotions of the animals which are called irrational (for after learning the origin of mind we cannot doubt that brutes feel) only differ from human's emotions, to the extent that brute nature differs from human nature. 543 Horse and human are alike carried away by the desire of procreation; but the desire of the former is equine, the desire of the latter is human.

544 So also the lusts and appetites of insects, fishes, and birds must needs very according to the several

natures. 545 Thus, although each individual lives content and rejoices in that nature belonging to you wherein you have your being, yet the life, wherein each is content and rejoices, is nothing else but the idea, or soul, of the said individual, 546 and hence the joy of one only differs in nature from the joy of another, to the extent that the essence of one differs from the essence of another.

547 Lastly, it follows from the foregoing proposition, that there is no small difference between the joy which actuates, say, a drunkard, and the joy possessed by a philosopher, as I just mention here by the way. 548 Thus far I have treated of the emotions attributable to human, in so far as you are passive. It remains to add a few words on those attributable to you in so far as you are active.

549 (LVIII.) Besides pleasure and desire, which are passivities or passions, there are other emotions derived from pleasure and desire, which are attributable to us in so far as we are active.

PROOF

550 When the mind conceives itself and its power of activity, it feels pleasure: now the mind necessarily contemplates itself, when it conceives a true or adequate idea. 551 But the mind does conceive certain adequate ideas. Therefore it feels pleasure in so far as it is active. 552 Again, the mind, both in so far as it has clear and distinct ideas, and in so far as it has confused ideas, endeavours to persist in its own being; but by such an endeavour we mean desire (by the note to the same Proposition.); 553 therefore, desire is also attributable to us, in so far as we understand, or in so far as we are active.

554 (LIX.) Among all the emotions attributable to the mind as active, there are none which cannot be referred to pleasure or desire.

PROOF

555 All emotions can be referred to desire, pleasure, or pain, as their definitions, already given, show. Now by pain we mean that the mind's power of thinking is diminished or checked; 556 therefore, in so far as the mind feels pain, its power of understanding, that is, of activity,

is diminished or checked; 557 therefore, no painful emotions can be attributed to the mind in virtue of its being active, but only emotions of pleasure and desire, which (by the last Proposition.) are attributable to the mind in that condition.

NOTE

558 All actions following from emotion, which are attributable to the mind in virtue of its understanding, I set down to "strength of character" ("fortitudo"), which I divide into "courage" ("animositas") and "highmindedness" ("generositas"). 559 By "courage" I mean "the desire whereby every human strives to preserve own being in accordance solely with the dictates of reason."

560 By "high-mindedness" I mean "the desire whereby every human endeavours, solely under the dictates of reason, to aid other humans and to unite them to oneself in friendship." 561 Those actions, therefore, which have regard solely to the good of the agent I set down to courage, those which aim at the good of others I set down to high-mindedness.

562 Thus temperance, sobriety, and presence of mind in danger, are varieties of courage; courtesy, mercy, are varieties of high-mindedness.

563 I think I have thus explained, and displayed through their primary causes the principal emotions and vacillations of spirit, which arise from the combination of the three primary emotions, to wit, desire, pleasure, and pain. 564 It is evident from what I have said, that we are in many ways driven about by external causes, and that like waves of the sea driven by contrary winds we toss to and fro unwitting of the issue and of our fate. 565 But I have said, that I have only set forth the chief conflicting emotions, not all that might be given. For, by proceeding in the same way as above, we can easily show that love is united to repentance, scorn, shame. 566 I think everyone will agree from what has been said, that the emotions may be compounded one with another in so many ways, and so many variations may arise therefrom, as to exceed all possibility of computation. 567 However, for my purpose, it is

enough to have enumerated the most important; to reckon up the rest which I have omitted would be more curious than profitable. 568 It remains to remark concerning love, that it very often happens that while we are enjoying a thing which we longed for, the body, from the act of enjoyment, acquires a new disposition, 569 whereby it is determined in another way, other images of things are aroused in it, and the mind begins to conceive and desire something fresh. 570 For example, when we conceive something which generally delights us with its flavour, we desire to enjoy, that is, to eat it. 571 But whilst we are thus enjoying it, the stomach is filled and the body is otherwise disposed. 572 If, therefore, when the body is thus otherwise disposed, the image of the food which is present be stimulated, and consequently the endeavour or desire to eat it be stimulated also, 573 the new disposition of the body will feel repugnance to the desire or attempt, and consequently the presence of the food which we formerly longed for will become odious. This revulsion of feeling is called "satiety" or weariness. 574 For the rest, I have neglected the outward modifications of the body observable in emotions, such, for instance, as trembling, pallor, sobbing, laughter, for these are attributable to the body only, without any reference to the mind. 575 Lastly, the definitions of the emotions require to be supplemented in a few points; I will therefore repeat them, interpolating such observations as I think should here and there be added.

DEFINITIONS OF THE EMOTIONS

576 I. "Desire" is the actual essence of human, in so far as it is conceived, as determined to a particular activity by some given modification of itself.

EXPLANATION

577 We have said above, in the note to Proposition. ix. of this part, that desire is appetite, with consciousness thereof; further, that appetite is the essence of human, in so far as it is determined to act

in a way tending to promote its own persistence. 578 But, in the same note, I also remarked that, strictly speaking, I recognise no distinction between appetite and desire. For whether a human be conscious of own appetite or not, it remains one and the same appetite. 579 Thus, in order to avoid the appearance of tautology, I have refrained from explaining desire by appetite; 580 but I have taken care to define it in such a manner, as to comprehend, under one head, all those endeavours of human nature, which we distinguish by the terms appetite, will, desire, or impulse. 581 I might, indeed, have said, that desire is the essence of human, in so far as it is conceived as determined to a particular activity; but from such a definition it would not follow that the mind can be conscious of its desire or appetite. 582 Therefore, in order to imply the cause of such consciousness, it was necessary to add, "in so far as it is determined by some given modification". 583 For, by a modification of human's essence, we understand every disposition of the said essence, whether such disposition be innate, or whether it be conceived solely under the attribute of thought, 584 or solely under the attribute of extension, or whether, lastly, it be referred simultaneously to both these attributes.

585 By the term desire, then, I here mean all human's endeavours, impulses, appetites, and volitions, which vary according to each human's disposition, and are, therefore, not seldom opposed one to another, according as a person is drawn in different directions, and knows not where to turn.

586 (II.) "Pleasure" is the transition of a human from a less to a greater perfection.

587 (III.) "Pain" is the transition of a human from a greater to a less perfection.

EXPLANATION

588 I say transition: for pleasure is not perfection itself. For, if human were born with the perfection to which you passes, you would possess the same, without the emotion of pleasure. 589 This appears more clearly from the consideration of the contrary emotion, pain. 590 No one can deny, that pain consists in the transition to a less perfection, and

not in the less perfection itself: for a human cannot be pained, in so far as you partakes of perfection of any degree.

591 Neither can we say, that pain consists in the absence of a greater perfection. For absence is nothing, whereas the emotion of pain is an activity; 592 wherefore this activity can only be the activity of transition from a greater to a less perfection-- in other words, it is an activity whereby a human's power of action is lessened or constrained.

593 I pass over the definitions of merriment, stimulation, melancholy, and grief, because these terms are generally used in reference to the body, and are merely kinds of pleasure or pain.

594 (IV.) "Wonder" is the conception (imaginatio) of anything, wherein the mind comes to a stand, because the particular concept in question has no connection with other concepts.

EXPLANATION

595 In the note to II. xviii. we showed the reason, why the mind, from the contemplation of one thing, straightway falls to the contemplation of another thing, namely, because the images of the two things are so associated and arranged, that one follows the other. 596 This state of association is impossible, if the image of the thing be new; the mind will then be at a stand in the contemplation thereof, until it is determined by other causes to think of something else.

597 Thus the conception of a new object, considered in itself, is of the same nature as other conceptions; 598 hence, I do not include wonder among the emotions, nor do I see why I should so include it, inasmuch as this distraction of the mind arises from no positive cause drawing away the mind from other objects, 599 but merely from the absence of a cause, which should determine the mind to pass from the contemplation of one object to the contemplation of another.

600 (I,) therefore, recognise only three primitive or primary emotions (as I said in the note to III. xi.), namely, pleasure, pain, and desire. 601 I have spoken of wonder simply because it is customary to speak of certain emotions springing from the three

primitive ones by different names, when they are referred to the objects of our wonder. 602 I am led by the same motive to add a definition of contempt.

(V.) "Contempt" is the conception of anything which touches the mind so little, that its presence leads the mind to imagine those qualities which are not in it rather than such as are in it.

603 The definitions of veneration and scorn I here pass over, for I am not aware that any emotions are named after them.

604 (VI.) "Love" is pleasure, accompanied by the idea of an external cause.

EXPLANATION

605 This definition explains sufficiently clearly the essence of love; the definition given by those authors who say that love is "the lover's wish to unite the self to the loved object" expresses a property, but not the essence of love; 606 and, as such authors have not sufficiently discerned love's essence, they have been unable to acquire a true conception of its properties, accordingly their definition is on all hands admitted to be very obscure. 607 It must, however, be noted, that when I say that it is a property of love, that the lover should wish to unite the self to the beloved object, I do not here mean by "wish" consent, or conclusion, or a free decision of the mind (for I have shown such, in II. xlviii., to be fictitious); 608 neither do I mean a desire of being united to the loved object when it is absent, or of continuing in its presence when it is at hand; for love can be conceived without either of these desires; 609 but by "wish" I mean the contentment, which is in the lover, on account of the presence of the beloved object, whereby the pleasure of the lover is strengthened, or at least maintained.

610 (VII.) "Hatred" is pain, accompanied by the idea of an external cause.

EXPLANATION

611 These observations are easily grasped after what has been said in the explanation of the preceding definition (cf. also III. xiii. note).

612 (VIII.) "Inclination" is pleasure, accompanied by the idea of something which is accidentally a cause of pleasure.

DESIRES

613 (IX.) "Aversion" is pain, accompanied by the idea of something which is accidentally the cause of pain.

614 (X.) "Devotion" is love towards one whom we admire.

EXPLANATION

615 Wonder (admiratio) arises from the novelty of a thing. If, therefore, it happens that the object of our wonder is often conceived by us, we shall cease to wonder at it; thus we see, that the emotion of devotion readily degenerates into simple love.

616 (XI.) "Derision" is pleasure arising from our conceiving the presence of a quality, which we despise, in an object which we hate.

EXPLANATION

617 In so far as we despise a thing which we hate, we deny existence thereof, and to that extent rejoice. But since we assume that human hates that which you derides, it follows that the pleasure in question is not without alloy.

618 (XII.) "Hope" is an inconstant pleasure, arising from the idea of something past or future, whereof we to a certain extent doubt the issue.

619 (XIII.) "Fear" is an inconstant pain arising from the idea of something past or future, whereof we to a certain extent doubt the issue.

EXPLANATION

620 From these definitions it follows, that there is no hope unmingled with fear, and no fear unmingled with hope. 621 For you, who depends on hope and doubts concerning the issue of anything, is assumed to conceive something, which excludes the existence of the said thing in the future; therefore you, to this extent, feels pain; 622 consequently, while dependent on hope, you fears for the issue. Contrariwise you, who fears, in other words doubts, concerning the issue of something which you hates, also conceives something which excludes the existence of the thing in question; 623 to this extent you feels pleasure, and consequently to this extent you hopes that it will turn out as you desires.

624 (XIV.) "Confidence" is pleasure arising from the idea of something past or future, wherefrom all cause of doubt has been removed.

625 (XV.) "Despair" is pain arising from the idea of something past or future, wherefrom all cause of doubt has been removed.

EXPLANATION

626 Thus confidence springs from hope, and despair from fear, when all cause for doubt as to the issue of an event has been removed: 627 this comes to pass, because human conceives something past or future as present and regards it as such, or else because you conceives other things, which exclude the existence of the causes of your doubt. 628 For, although we can never be absolutely certain of the issue of any particular event, it may nevertheless happen that we feel no doubt concerning it. 629 For we have shown, that to feel no doubt concerning a thing is not the same as to be quite certain of it. 630 Thus it may happen that we are affected by the same emotion of pleasure or pain concerning a thing past or future, as concerning the conception of a thing present; this I have already shown in III. xviii., to which, with its note, I refer the reader.

631 (XVI.) "Joy" is pleasure accompanied by the idea of something past, which has had an issue beyond our hope.

632 (XVII.) "Disappointment" is pain accompanied by the idea of something past, which has had an issue contrary to our hope.

633 (XVIII.) "Pity" is pain accompanied by the idea of evil, which has befallen someone else whom we conceive to be like ourselves.

EXPLANATION

634 Between pity and sympathy (misericordia) there seems to be no difference, unless perhaps that the former term is used in reference to a particular action, and the latter in reference to a disposition.

635 (XIX.) "Approval" is love towards one who has done good to another.

636 (XX.) "Indignation" is hatred towards one who has done evil to another.

EXPLANATION

637 I am aware that these terms are employed in senses somewhat different from those usually assigned. But my purpose is to explain, not the meaning of words, but the nature of things. 638 I therefore make use of such terms, as may convey my meaning without any violent departure from

their ordinary signification. One statement of my method will suffice. As for the cause of the above-named emotions see III. Xxvii. Cor. i., and III. xxii. note.

639 (XXI.) "Partiality" is thinking too highly of anyone because of the love we bear them.

EXPLANATION

640 Thus partiality is an effect of love, and disparagement an effect of hatred: so that "partiality" may also be defined as "love, in so far as it induces a person to think too highly of a beloved object." 641 Contrariwise, "disparagement" may be defined as "hatred, in so far as it induces a person to think too meanly of a hated object".

642 (XXIII.) "Envy" is hatred, in so far as it induces a person to be pained by another's good fortune, and to rejoice in another's evil fortune.

EXPLANATION

643 Envy is generally opposed to sympathy, which, by doing some violence to the meaning of the word, may therefore be thus defined:

644 (XXIV.) "Sympathy" (misericordia) is love, in so far as it induces a person to feel pleasure at another's good fortune, and pain at another's evil fortune.

EXPLANATION

645 Concerning envy see the notes to II. xxiv. and xxxii. These emotions also arise from pleasure or pain accompanied by the idea of something external, as cause either in itself or accidentally. 646 I now pass on to other emotions, which are accompanied by the idea of something within as a cause.

647 (XXV.) "Self-approval" is pleasure arising from a person's contemplation of the self and own power of action.

648 (XXVI.) "Humility" is pain arising from a person's contemplation of own weakness of body or mind.

EXPLANATION

649 Self-complacency is opposed to humility, in so far as we thereby mean pleasure arising from a contemplation of our own power of action; 650 but, in so far as we mean thereby pleasure accompanied by the idea of any action which we believe we have performed by the free decision of our mind, it is opposed to repentance, which we may thus define:

651 (XXVII.) "Repentance" is pain accompanied by the idea of some action, which we believe we have performed by the free decision of our mind.

EXPLANATION

652 The causes of these emotions we have set forth in III. li. note, and in III. liii., liv., lv. and note. Concerning the free decision of the mind see II. xxxv. note.

653 This is perhaps the place to call attention to the fact, that it is nothing wonderful that all those actions, which are commonly called "wrong," are followed by pain, and all those, which are called "right," are followed by pleasure. 654 We can easily gather from what has been said, that this depends in great measure on education. 655 Parents, by reprobating the former class of actions, and by frequently chiding their children because of them, and also by persuading to and praising the latter class, have brought it about, that the former should be associated with pain and the latter with pleasure. 656 This is confirmed by experience. For custom and religion are not the same among all humans, but that which some consider sacred others consider profane, and what some consider honourable others consider disgraceful. 657 According as each person has been educated, you feels repentance for a given action or glories therein.

658 (XXVIII.) "Pride" is thinking too highly of one's self from self-love.

EXPLANATION

659 Thus pride is different from partiality, for the latter term is used in reference to an external object, but pride is used of a person thinking too highly of the self.

660 However, as partiality is the effect of love, so is pride the effect or property of "self-love," which may therefore be thus defined, "love of self or self-approval, in so far as it leads a person to think too highly of the self." 661 To this emotion there is no contrary. For no one thinks too meanly of the self because of self-hatred; I say that no one thinks too meanly of the self, in so far as you conceives that you are incapable of doing this or that. 662 For whatsoever a person imagines that you are incapable of doing, you imagines

this of necessity, and by that notion you are so disposed, that you really cannot do that which you conceives that you cannot do.

663 For, so long as you conceives that you cannot do it, so long is you not determined to do it, and consequently so long is it impossible for you to do it. 664 However, if we consider such matters as only depend on opinion, we shall find it conceivable that a person may think too meanly of the self; 665 for it may happen, that a person, sorrowfully regarding one’s own weakness, should imagine that you are despised by all people, while the rest of the world are thinking of nothing less than of despising you.

666 Again, a person may think too meanly of the self, if you deny of yourself in the present something in relation to a future time of which you are uncertain. 667 As, for instance, if you should say that you are unable to form any clear conceptions, or that you can desire and do nothing but what is wicked and base. 668 We may also say, that a person thinks too meanly of the self, when we see you from excessive fear of shame refusing to do things which others, your equals, venture. 669 We can, therefore, set down as a contrary to pride an emotion which I will call self-abasement, for as from self-complacency springs pride, so from humility springs self-abasement, which I will accordingly thus define:

670 (XXIX.) "Self-abasement" is thinking too meanly of one's self by reason of pain.

EXPLANATION

671 We are nevertheless generally accustomed to oppose pride to humility, but in that case we pay more attention to the effect of either emotion than to its nature. 672 We are wont to call "proud" the person who boasts too much, who talks of nothing but your own virtues and other people's faults, who wishes to be first; and lastly who goes through life with a style and pomp suitable to those far above you in station. 673 On the other hand, we call "humble" the person who too often blushes, who confesses own faults, who sets forth other people's virtues, and who, lastly, walks with bent head and is negligent of own attire. 674 However, these emotions, humility

and self-abasement, are extremely rare. For human nature, considered in itself, strives against them as much as it can; 675 hence those, who are believed to be most self-abased and humble, are generally in reality the most ambitious and envious.

676 (XXX.) "Honour" (gloria) is pleasure accompanied by the idea of some action of our own, which we believe to be praised by others.

677 (XXXI.) "Shame" is pain accompanied by the idea of some action of our own, which we believe to be blamed by others.

EXPLANATION

678 On this subject see the note to III. Xxx. But we should here remark the difference which exists between shame and modesty. 679 Shame is the pain following the deed whereof we are ashamed. Modesty is the fear or dread of shame, which restrains a person from committing a base action. 680 Modesty is usually opposed to shamelessness, but the latter is not an emotion, as I will duly show; however, the names of the emotions (as I have remarked already) have regard rather to their exercise than to their nature.

681 I have now fulfilled the task of explaining the emotions arising from pleasure and pain. I therefore proceed to treat of those which I refer to desire.

682 (XXXII.) "Regret" is the desire or appetite to possess something, kept alive by the remembrance of the said thing, and at the same time constrained by the remembrance of other things which exclude the existence of it.

EXPLANATION

683 When we remember a thing, we are by that very fact, as I have already said more than once, disposed to contemplate it with the same emotion as if it were something present; 684 but this disposition or endeavour, while we are awake, is generally checked by the images of things which exclude the existence of that which we remember. 685 Thus when we remember something which affected us with a certain pleasure, we by that very fact endeavour to regard it with the same emotion of pleasure as though it were present, 686 but this endeavour is at once checked by the remembrance of things which exclude the existence of the thing in question. 687

Wherefore regret is, strictly speaking, a pain opposed to that of pleasure, which arises from the absence of something we hate. 688 But, as the name regret seems to refer to desire, I set this emotion down, among the emotions springing from desire.

689 (XXXIII.) "Emulation" is the desire of something, engendered in us by our conception that others have the same desire.

EXPLANATION

690 You who runs away, because you sees others running away, or you who fears, because you sees others in fear; 691 or again, you who, on seeing that another person has burnt own hand, draws towards them your own hand, and moves your body as though your own were burnt; 692 such an one can be said to imitate another's emotion, but not to emulate them; 693 not because the causes of emulation and imitation are different, but because it has become customary to speak of emulation only in you, who imitates that which we deem to be honourable, useful, or pleasant. 694 As to the cause of emulation, cf. III. xxvii. and note. The reason why this emotion is generally coupled with envy may be seen from III. xxxii. and note.

695 (XXXIV.) "Thankfulness" or "Gratitude" is the desire or zeal springing from love, whereby we endeavour to benefit you, who with similar feelings of love has conferred a benefit on us.

696 (XXXV.) "Benevolence" is the desire of benefiting one whom we pity.

697 (XXXVI.) "Anger" is the desire, whereby through hatred we are induced to injure one whom we hate.

698 (XXXVII.) "Revenge" is the desire whereby we are induced, through mutual hatred, to injure one who, with similar feelings, has injured us.

699 (XXXVIII.) "Cruelty" or "savageness" is the desire, whereby a person is impelled to injure one whom we love or pity.

EXPLANATION

700 To cruelty is opposed clemency, which is not a passive state of the mind, but a power whereby person restrains own anger and revenge.

701 (XXXIX.) "Timidity" is the desire to avoid a greater evil,

which we dread, by undergoing a lesser evil.

702 (XL.) "Daring" is the desire, whereby a person is set on to do something dangerous which own equals fear to attempt.

703 (XLI.) "Cowardice" is attributed to one, whose desire is checked by the fear of some danger which your equals dare to encounter.

EXPLANATION

704 Cowardice is, therefore, nothing else but the fear of some evil, which most people are wont not to fear; 705 hence I do not reckon it among the emotions springing from desire. Nevertheless, I have chosen to explain it here, because, in so far as we look to the desire, it is truly opposed to the emotion of daring.

706 (XLII.) "Consternation" is attributed to one, whose desire of avoiding evil is checked by amazement at the evil which you fears.

EXPLANATION

707 Consternation is, therefore, a species of cowardice. But, inasmuch as consternation arises from a double fear, it may be more conveniently defined as a fear which keeps a person so bewildered and wavering, that you are not able to remove the evil. 708 I say bewildered, in so far as we understand your desire of removing the evil to be constrained by your amazement. 709 I say wavering, in so far as we understand the said desire to be constrained by the fear of another evil, which equally torments you: whence it comes to pass that you knows not, which you may avert of the two.

710 (XLIII.) "Courtesy," or "deference" (Humanitas seu modestia), is the desire of acting in a way that should please people, and refraining from that which should displease them.

711 (XLIV.) "Ambition" is the immoderate desire of power.

EXPLANATION

712 Ambition is the desire, whereby all the emotions are fostered and strengthened; therefore this emotion can with difficulty be overcome. 713 For, so long as a person is bound by any desire, you are at the same time necessarily bound by this. 714 "The best people," says Cicero, "are especially led by honour. Even philosophers, when they write a

book contemning honour, sign their names thereto," and so on.

715 (XLV.) "Luxury" is excessive desire, or even love of living sumptuously.

716 (XLVI.) "Intemperance" is the excessive desire and love of drinking.

717 (XLVII.) "Avarice" is the excessive desire and love of riches.

718 (XLVIII.) "Lust" is desire and love in the matter of sexual intercourse.

EXPLANATION

719 Whether this desire be excessive or not, it is still called lust. These last five emotions (as I have shown in III. lvi.) have on contraries. For deference is a species of ambition.

720 Again, I have already pointed out, that temperance, sobriety, and chastity indicate rather a power than a passivity of the mind. 721 It may, nevertheless, happen, that an avaricious, an ambitious, or a timid person may abstain from excess in eating, drinking, or sexual indulgence, yet avarice, ambition, and fear are not contraries to luxury, drunkenness, and debauchery.

722 For an avaricious person often is glad to gorge the self with food and drink at another person's expense. 723 An ambitious person will restrain the self in nothing, so long as you thinks your indulgences are secret; and if you lives among drunkards and debauchees, you will, from the mere fact of being ambitious, be more prone to those vices. 724 Lastly, a timid person does that which you would not. For though an avaricious person should, for the sake of avoiding death, cast your riches into the sea, you will none the less remain avaricious; 725 so, also, if a lustful person cannot follow own bent, you does not, on the ground of abstention, cease to be lustful. 726 In fact, these emotions are not so much concerned with the actual feasting, drinking, as with the appetite and love of such. Nothing, therefore, can be opposed to these emotions, but high-mindedness and valour, whereof I will speak presently.

727 The definitions of jealousy and other waverings of the mind I pass over in silence, first, because they arise from the compounding of the emotions already described; 728

secondly, because many of them have no distinctive names, which shows that it is sufficient for practical purposes to have merely a general knowledge of them. 729 However, it is established from the definitions of the emotions, which we have set forth, that they all spring from desire, pleasure, or pain, 730 or, rather, that there is nothing besides these three; wherefore each is wont to be called by a variety of names in accordance with its various relations and extrinsic tokens.

731 If we now direct our attention to these primitive emotions, and to what has been said concerning the nature of the mind, we shall be able thus to define the emotions, in so far as they are referred to the mind only.

GENERAL DEFINITION OF THE EMOTIONS

732 Emotion, which is called a passivity of the soul, is a confused idea, 733 whereby the mind affirms concerning its body, or any part thereof, a force for existence (existendi vis) greater or less than before, and by the presence of which the mind is determined to think of one thing rather than another.

EXPLANATION

734 I say, first, that emotion or passion of the soul is "a confused idea." For we have shown that the mind is only passive, in so far as it has inadequate or confused ideas. 735 I say, further, "whereby the mind affirms concerning its body or any part thereof a force for existence greater than before." 736 For all the ideas of bodies, which we possess, denote rather the actual disposition of our own body than the nature of an external body. 737 But the idea which constitutes the reality of an emotion must denote or express the disposition of the body, or of some part thereof, because its power of action or force for existence is increased or diminished, helped or hindered. 738 But it must be noted that, when I say "a greater or less force for existence than before," I do not mean that the mind compares the present with the past disposition of the body, 739 but that the idea which constitutes the reality of an

emotion affirms something of the body, which, in fact, involves more or less of reality than before. 740 And inasmuch as the essence of mind consists in the fact, that it affirms the actual existence of its own body, and inasmuch as we understand by perfection the very essence of a thing, 741 it follows that the mind passes to greater or less perfection, when it happens to affirm concerning its own body, or any part thereof, something involving more or less reality than before.

742 When, therefore, I said above that the power of the mind is increased or diminished, I merely meant that the mind had formed of its own body, or of some part thereof, an idea involving more or less of reality, than it had already affirmed concerning its own body. 743 For the excellence of ideas, and the actual power of thinking are measured by the excellence of the object.

744 Lastly, I have added "by the presence of which the mind is determined to think of one thing rather than another," so that, besides the nature of pleasure and pain, which the first part of the definition explains, I might also express the nature of desire.

OF HUMAN BONDAGE, OR THE STRENGTH OF THE EMOTIONS

Benedict de Spinoza

2 Human infirmity in moderating and checking the emotions I name bondage: for, when a human is a prey to own emotions, you are not your own master, but lies at the mercy of fortune: 2 so much so, that you are often compelled, while seeing that which is better for you, to follow that which is worse. 3 Why this is so, and what is good or evil in the emotions, I propose to show in this part of my treatise. But, before I begin, it would be well to make a few prefatory observations on perfection and imperfection, good and evil.

4 When a person has purposed to make a given thing, and has brought it to perfection, your work will be pronounced perfect, not only by yourself, but by everyone who rightly knows, or thinks that you knows, the intention and aim of its author. 5 For instance, suppose anyone sees a work

(which I assume to be not yet completed), and knows that the aim of the author of that work is to build a house, you will call the work imperfect; 6 you will, on the other hand, call it perfect, as soon as you sees that it is carried through to the end, which its author had purposed for it. 7 But if a person sees a work, the like whereof you have never seen before, and if you knows not the intention of the artificer, you plainly cannot know, whether that work be perfect or imperfect. Such seems to be the primary meaning of these terms.

8 But, after humans began to form general ideas, to think out types of houses, buildings, towers, and to prefer certain types to others, it came about, that each human called perfect that which you saw agree with the general idea you had formed of the thing in question, 9 and called imperfect that which you saw agree less with your own preconceived type, even though it had evidently been completed in accordance with the idea of its artificer.

10 This seems to be the only reason for calling natural phenomena, which, indeed, are not made with human hands, perfect or imperfect: 11 for humans are wont to form general ideas of things natural, no less than of things artificial, and such ideas they hold as types, believing that Nature (who they think does nothing without an object) has them in view, and has set them as types before Herself. 12 Therefore, when they behold something in Nature, which does not wholly conform to the preconceived type which they have formed of the thing in question, they say that Nature has fallen short or has blundered, and has left Her work incomplete. 13 Thus we see that humans are wont to style natural phenomena perfect or imperfect rather from their own prejudices, than from true knowledge of what they pronounce upon.

14 Now we showed in the Panagogue book of Ethics, that Nature does not work with an end in view. For the eternal and infinite Being, which we call God or Nature, acts by the same necessity as that whereby it exists. 15 For we have shown, that by the same necessity of its nature,

whereby it exists, it likewise works. The reason or cause why God or Nature exists, and the reason why He acts, are one and the same. 16 Therefore, as you does not exist for the sake of an end, so neither does you act for the sake of an end; of your existence and of your action there is neither origin nor end. 17 Wherefore, a cause which is called final is nothing else but human desire, in so far as it is considered as the origin or cause of anything. 18 For example, when we say that to be inhabited is the final cause of this or that house, we mean nothing more than that a person, conceiving the conveniences of household life, had a desire to build a house. 19 Wherefore, the being inhabited, in so far as it is regarded as a final cause, is nothing else but this particular desire, which is really the efficient cause; 20 it is regarded as the primary cause, because humans are generally ignorant of the causes of their desires.

21 They are, as I have often said already, conscious of their own actions and appetites, but ignorant of the causes whereby they are determined to any particular desire. 22 Therefore, the common saying that Nature sometimes falls short, or blunders, and produces things which are imperfect, I set down in the book of Ethics. 23 Perfection and imperfection, then, are in reality merely modes of thinking, or notions which we form from a comparison among one another of individuals of the same species; 24 hence I said above (II:Definition.vi.), that by reality and perfection I mean the same thing.

25 For we are wont to refer all the individual things in Nature to one genus, which is called the highest genus, namely, to the category of Being, whereto absolutely all individuals in Nature belong. 26 Thus, in so far as we refer the individuals in Nature to this category, and comparing them one with another, find that some possess more of being or reality than others, we, to this extent, say that some are more perfect than others. 27 Again, in so far as we attribute to them anything implying negation-- as term, end, infirmity, we, to this extent, call them imperfect, 28 because they do

not affect our mind so much as the things which we call perfect, not because they have any intrinsic deficiency, or because Nature has blundered. 29 For nothing lies within the scope of a thing's nature, save that which follows from the necessity of the nature of its efficient cause, and whatsoever follows from the necessity of the nature of its efficient cause necessarily comes to pass.

30 As for the terms good and bad, they indicate no positive quality in things regarded in themselves, but are merely modes of thinking, or notions which we form from the comparison of things one with another.

31 Thus one and the same thing can be at the same time good, bad, and indifferent. For instance, music is good for you that is melancholy, bad for you that mourns; for you that is deaf, it is neither good nor bad.

32 Nevertheless, though this be so, the terms should still be retained.

For, inasmuch as we desire to form an idea of human as a type of human nature which we may hold in view, it will be useful for us to retain the terms in question, in the sense I have indicated.

33 In what follows, then, I shall mean by, "good" that, which we certainly know to be a means of approaching more nearly to the type of human nature, which we have set before ourselves; by "bad," that which we certainly know to be a hindrance to us in approaching the said type. 34 Again, we shall that humans are more perfect, or more imperfect, in proportion as they approach more or less nearly to the said type.

35 For it must be specially remarked that, when I say that a person passes from a lesser to a greater perfection, or vice versa, I do not mean that you are changed from one essence or reality to another; 36 for instance, a horse would be as completely destroyed by being changed into a human, as by being changed into an insect. What I mean is, that we conceive the thing's power of action, in so far as this is understood by its nature, to be increased or diminished.

37 Lastly, by perfection in general I shall, as I have said, mean reality in other words, each thing's

essence, in so far as it exists, and operates in a particular manner, and without paying any regard to its duration. 38 For no given thing can be said to be more perfect, because it has passed a longer time in existence. 39 The duration of things cannot be determined by their essence, for the essence of things involves no fixed and definite period of existence; 40 but everything, whether it be more perfect or less perfect, will always be able to persist in existence with the same force wherewith it began to exist; wherefore, in this respect, all things are equal.

DEFINITIONS

41 (I.) By good I mean that which we certainly know to be useful to us.

42 (II.) By evil I mean that which we certainly know to be a hindrance to us in the attainment of any good.

43 (III.) Particular things I call contingent in so far as, while regarding their essence only, we find nothing therein, which necessarily asserts their existence or excludes it.

44 (IV.) Particular things I call possible in so far as, while regarding the causes whereby they must be produced, we know not, whether such causes be determined for producing them.

45 In I:xxxiii.note.i., I drew no distinction between possible and contingent, because there was in that place no need to distinguish them accurately.

46 (V.) By conflicting emotions I mean those which draw a person in different directions, though they are of the same kind, such as luxury and avarice, which are both species of love, and are contraries, not by nature, but by accident.

47 (VI.) What I mean by emotion felt towards a thing, future, present, and past, I explained in III:xviii.,notes.i.,&ii., which see.

48 But I should here also remark, that we can only distinctly conceive distance of space or time up to a certain definite limit; 49 that is, all objects distant from us more than two hundred feet, or whose distance from the place where we are exceeds that which we can distinctly conceive, seem to be an equal distance from us, and all in the same plane; 50 so also objects, whose time of existing is conceived as removed

from the present by a longer interval than we can distinctly conceive, seem to be all equally distant from the present, and are set down, as it were, to the same moment of time.

51 (VII.) By an end, for the sake of which we do something, I mean a desire.

52 (VIII.) By virtue (virtus) and power I mean the same thing; that is, virtue, in so far as it is referred to human, is a human's nature or essence, in so far as it has the power of effecting what can only be understood by the laws of that nature.

AXIOM

53 There is no individual thing in Nature, than which there is not another more powerful and strong. Whatsoever thing be given, there is something stronger whereby it can be destroyed.

PROPOSITIONS I

54 No positive quality possessed by a false idea is removed by the presence of what is true, in virtue of its being true.

PROOF

55 Falsity consists solely in the privation of knowledge which inadequate ideas involve, nor have they any positive quality on account of which they are called false; contrariwise, in so far as they are referred to God, they are true. 56 Wherefore, if the positive quality possessed by a false idea were removed by the presence of what is true, in virtue of its being true, a true idea would then be removed by itself, which is absurd. 57 Therefore, no positive quality possessed by a false idea.

NOTE

58 This proposition is more clearly understood from II:xvi.Coroll.ii. For imagination is an idea, which indicates rather the present disposition of the human body than the nature of the external body; not indeed distinctly, but confusedly; whence it comes to pass, that the mind is said to err. 59 For instance, when we look at the sun, we conceive that it is distant from us about two hundred feet; in this judgment we err, so long as we are in ignorance of its true distance; when its true distance is known, the error is removed, but not the imagination; 60 or, in other words, the idea of the sun, which only explains tho nature of that luminary, in so far as the body is affected thereby: wherefore,

though we know the real distance, we shall still nevertheless imagine the sun to be near us. 61 For, as we said in III:xxxv. note, we do not imagine the sun to be so near us, because we are ignorant of its true distance, but because the mind conceives the magnitude of the sun to the extent that the body is affected thereby. 62 Thus, when the rays of the sun falling on the surface of water are reflected into our eyes, we imagine the sun as if it were in the water, though we are aware of its real position; 63 and similarly other imaginations, wherein the mind is deceived whether they indicate the natural disposition of the body, or that its power of activity is increased or diminished, are not contrary to the truth, and do not vanish at its presence. 64 It happens indeed that, when we mistakenly fear an evil, the fear vanishes when we hear the true tidings; 65 but the contrary also happens, namely, that we fear an evil which will certainly come, and our fear vanishes when we hear false tidings; 66 thus imaginations do not vanish at the presence of the truth, in virtue of its being true, but because other imaginations, stronger than the first, supervene and exclude the present existence of that which we imagined, as I have shown in II:.xvii.

PROPOSITION. II

67 We are only passive, in so far as we are apart of Nature, which cannot be conceived by itself without other parts.

PROOF

68 We are said to be passive, when something arises in us, whereof we are only a partial cause, that is, something which cannot be deduced solely from the laws of our nature. 69 We are passive therefore in so far as we are a part of Nature, which cannot be conceived by itself without other parts.

PROPOSITION III

70 The force whereby a human persists in existing is limited, and is infinitely surpassed by the power of external causes.

PROOF

71 This is evident from the axiom of this part. For, when human is given, there is something else - say A - more powerful; when A is given, there is something else - say B - more powerful than A, and so on to infinity; 72 thus the power of

human is limited by the power of some other thing, and is infinitely surpassed by the power of external causes.

PROPOSITION IV

73 It is impossible, that human should not be a part of Nature, or that you should be capable of undergoing no changes, save such as can be understood through your nature only as their adequate cause.

PROOF

74 The power, whereby each particular thing, and consequently human, preserves own being, is the power of God or of Nature; not in so far as it is infinite, but in so far as it can be explained by the actual human essence. 75 Thus the power of human, in so far as it is explained through your own actual essence, is a part of the infinite power of God or Nature, in other words, of the essence thereof. This was our first point.

76 Again, if it were possible, that human should undergo no changes save such as can be understood solely through the nature of human, it would follow that you would not be able to die, but would always necessarily exist; 77 this would be the necessary consequence of a cause whose power was either finite or infinite; namely, either of human's power only, inasmuch as you would be capable of removing from yourself all changes which could spring from external causes; 78 or of the infinite power of Nature, whereby all individual things would be so ordered, that human should be incapable of undergoing any changes save such as tended towards your own preservation. 79 But the first alternative is absurd (by the last Proposition, the proof of which is universal, and can be applied to all individual things). 80 Therefore, if it be possible, that human should not be capable of undergoing any changes, save such as can be explained solely through your own nature, and consequently that you must always (as we have shown) necessarily exist; 81 such a result must follow from the infinite power of God, and consequently from the necessity of the divine Nature, 82 in so far as it is regarded as affected by the idea of any given human, the whole order of Nature as conceived under the attributes of extension and thought must be deducible. 83 It would

therefore follow that human is infinite, which (by the first part of this proof) is absurd. It is, therefore, impossible, that human should not undergo any changes save those whereof you are the adequate cause.

COROLLARY

84 Hence it follows, that human is necessarily always a prey to your passions, that you follows and obeys the general order of Nature, and that you accommodates yourself thereto, as much as the nature of things demands.

PROPOSITION V

85 The power and increase of every passion, and its persistence in existing are not defined by the power, whereby we ourselves endeavour to persist in existing, but by the power of an external cause compared with our own.

PROOF

86 The essence of a passion cannot be explained through our essence alone, that is, the power of a passion cannot be defined by the power, whereby we ourselves endeavour to persist in existing, but must necessarily be defined by the power of an external cause compared with our own.

PROPOSITION VI

87 The force of any passion or emotion can overcome the rest of a human's activities or power, so that the emotion becomes obstinately fixed to you.

PROOF

88 The force and increase of any passion and its persistence in existing are defined by the power of an external cause compared with our own; therefore it can overcome a human's power.

PROPOSITION VII

89 An emotion can only be controlled or destroyed by another emotion contrary thereto, and with more power for controlling emotion.

PROOF

90 Emotion, in so far as it is referred to the mind, is an idea, whereby the mind affirms of its body a greater or less force of existence than before. 91 When, therefore, the mind is assailed by any emotion, the body is at the same time affected with a modification whereby its power of activity is increased or diminished. 92 Now this modification of the body receives from its cause the force for persistence in its being; 93 which force can only be

checked or destroyed by a bodily cause, in virtue of the body being affected with a modification contrary to and stronger than itself; wherefore the mind is affected by the idea of a modification contrary to, and stronger than the former modification, 94 in other words, (by the general definition of the emotions) the mind will be affected by an emotion contrary to and stronger than the former emotion, which will exclude or destroy the existence of the former emotion; 95 thus an emotion cannot be destroyed nor controlled except by a contrary and stronger emotion.

COROLLARY

96 An emotion, in so far as it is referred to the mind, can only be controlled or destroyed through an idea of a modification of the body contrary to, and stronger than, that which we are undergoing.

97 For the emotion which we undergo can only be checked or destroyed by an emotion contrary to, and stronger than, itself, 98 in other words, (by the general Definition of the Emotions) only by an idea of a modification of the body contrary to, and stronger than, the modification which we undergo.

PROPOSITION VIII

99 The knowledge of good and evil is nothing else but the emotions of pleasure or pain, in so far as we are conscious thereof.

PROOF

100 We call a thing good or evil, when it is of service or the reverse in preserving our being, that is, when it increases or diminishes, helps or hinders, our power of activity.

101 Thus, in so far as we perceive that a thing affects us with pleasure or pain, we call it good or evil; 102 wherefore the knowledge of good and evil is nothing else but the idea of the pleasure or pain, which necessarily follows from that pleasurable or painful emotion. 103 But this idea is united to the emotion in the same way as mind is united to body; that is, there is no real distinction between this idea and the emotion or idea of the modification of the body, save in conception only. 104 Therefore the knowledge of good and evil is nothing else but the emotion, in so far as we are conscious thereof.

PROPOSITION IX

105 An emotion, whereof we conceive the cause to be with us at the present time, is stronger than if we did not conceive the cause to be with us.

PROOF

106 Imagination or conception is the idea, by which the mind regards a thing as present, but which indicates the disposition of the mind rather than the nature of the external thing.

107 An emotion is therefore a conception, in so far as it indicates the disposition of the body. 108 But a conception (by II:xvii.) is stronger, so long as we conceive nothing which excludes the present existence of the external object; 109 wherefore an emotion is also stronger or more intense, when we conceive the cause to be with us at the present time, than when we do not conceive the cause to be with us.

NOTE

110 When I said that we are affected by the image of what is past or future with the same emotion as if the thing conceived were present, I expressly stated, that this is only true in so far as we look solely to the image of the thing in question itself; 111 for the thing's nature is unchanged, whether we have conceived it or not; I did not deny that the image becomes weaker, when we regard as present to us other things which exclude the present existence of the future object: 112 I did not expressly call attention to the fact, because I purposed to treat of the strength of the emotions in this part of my work.

COROLLARY

113 The image of something past or future, that is, of a thing which we regard as in relation to time past or time future, to the exclusion of time present, is, when other conditions are equal, weaker than the image of something present; 114 consequently an emotion felt towards what is past or future is less intense, other conditions being equal, than an emotion felt towards something present.

PROPOSITION X

115 Towards something future, which we conceive as close at hand, we are affected more intensely, than if we conceive that its time for existence is separated from the present by a longer interval; 116 so too by the

remembrance of what we conceive to have not long passed away we are affected more intensely, than if we conceive that it has long passed away.

PROOF

117 In so far as we conceive a thing as close at hand, or not long passed away, we conceive that which excludes the presence of the object less, than if its period of future existence were more distant from the present, 118 or if it had long passed away (this is obvious) therefore (by the foregoing Proposition.) we are, so far, more intensely affected towards it.

COROLLARY

119 From the remarks made in IV:Def.vi. of this part it follows that, if objects are separated from the present by a longer period than we can define in conception, though their dates of occurrence be widely separated one from the other, they all affect us equally faintly.

PROPOSITION XI

120 An emotion towards that which we conceive as necessary is, when other conditions are equal, more intense than an emotion towards that which impossible, or contingent, or non-necessary.

PROOF

121 In so far as we conceive a thing to be necessary, we, to that extent, affirm its existence; on the other hand we deny a thing's existence, in so far as we conceive it not to be necessary; 122 wherefore an emotion towards that which is necessary is, other conditions being equal, more intense than an emotion that which is non-necessary.

PROPOSITION XII

123 An emotion towards a thing, which we know not to exist at the present time, and which we conceive as possible, is more intense, other conditions being equal, than an emotion towards a thing contingent.

PROOF

124 In so far as we conceive a thing as contingent, we are affected by the conception of some further thing, which would assert the existence of the former; but, on the other hand, we (by hypothesis) conceive certain things, which exclude its present existence. 125 But, in so far as we conceive a thing to be possible in the future, we there by conceive things which assert its existence, that is, things which promote hope or fear:

wherefore an emotion towards something possible is more vehement.

COROLLARY

126 An emotion towards a thing, which we know not to exist in the present, and which we conceive as contingent, is far fainter, than if we conceive the thing to be present with us.

PROOF

127 Emotion towards a thing, which we conceive to exist, is more intense than it would be, if we conceived the thing as future, and is much more vehement, than if the future time be conceived as far distant from the present. 128 Therefore an emotion towards a thing, whose period of existence we conceive to be far distant from the present, is far fainter, than if we conceive the thing as present; 129 it is, nevertheless, more intense, than if we conceived the thing as contingent, wherefore an emotion towards a thing, which we regard as contingent, will be far fainter, than if we conceived the thing to be present with us.

PROPOSITION XIII

130 Emotion towards a thing contingent, which we know not to exist in the present, is, other conditions being equal, fainter than an emotion towards a thing past.

PROOF

131 In so far as we conceive a thing as contingent, we are not affected by the image of any other thing, which asserts the existence of the said thing, but, on the other hand (by hypothesis), we conceive certain things excluding its present existence. 132 But, in so far as we conceive it in relation to time past, we are assumed to conceive something, which recalls the thing to memory, or excites the image thereof, which is so far the same as regarding it as present. 133 Therefore an emotion towards a thing contingent, which we know does not exist in the present, is fainter, other conditions being equal, than an emotion towards a thing past.

PROPOSITION XIV

134 A true knowledge of good and evil cannot check any emotion by virtue of being true, but only in so far as it is considered as an emotion.

PROOF

135 An emotion is an idea, whereby the mind affirms of its body a greater or less force of

existing than before (by the general Definition of the Emotions); 136 therefore it has no positive quality, which can be destroyed by the presence of what is true; consequently the knowledge of good and evil cannot, by virtue of being true, restrain any emotion.

137 But, in so far as such knowledge is an emotion if it have more strength for restraining emotion, it will to that extent be able to restrain the given emotion.

PROPOSITION XV

138 Desire arising from the knowledge of good and bad can be quenched or checked by many of the other desires arising from the emotions whereby we are assailed.

PROOF

139 From the true knowledge of good and evil, in so far as it is an emotion, necessarily arises desire, the strength of which is proportioned to the strength of the emotion wherefrom it arises. 140 But, inasmuch as this desire arises (by hypothesis) from the fact of our truly understanding anything, it follows that it is also present with us, in so far as we are active, 141 and must therefore be understood through our essence only; consequently its force and increase can be defined solely by human power.

142 Again, the desires arising from the emotions whereby we are assailed are stronger, in proportion as the said emotions are more vehement; 143 wherefore their force and increase must be defined solely by the power of external causes, which, when compared with our own power, indefinitely surpass it; 144 hence the desires arising from like emotions may be more vehement, than the desire which arises from a true knowledge of good and evil, and may, consequently, control or quench it.

PROPOSITION XVI

145 Desire arising from the knowledge of good and evil, in so far as such knowledge regards what is future, may be more easily controlled or quenched, than the desire for what is agreeable at the present moment.

PROOF

146 Emotion towards a thing, which we conceive as future, is fainter than emotion towards a thing that is present. 147 But desire, which arises from the true knowledge of good and evil,

though it be concerned with things which are good at the moment, can be quenched or controlled by any headstrong desire (by the last Proposition, the proof whereof is of universal application). 148 Wherefore desire arising from such knowledge, when concerned with the future, can be more easily controlled or quenched.

PROPOSITION XVII

149 Desire arising from the true knowledge of good and evil, in so far as such knowledge is concerned with what is contingent, can be controlled far more easily still, than desire for things that are present.

NOTE

150 I think I have now shown the reason, why humans are moved by opinion more readily than by true reason, why it is that the true knowledge of good and evil stirs up conflicts in the soul, and often yields to every kind of passion. 151 This state of things gave rise to the exclamation of the poet: (Ov. Met. vii.20, "Video meliora proboque, Deteriora sequor.")

The better path I gaze at
and approve,
The worse - I follow."

152 Ecclesiastes seems to have had the same thought in his mind, when he says, "He who increaseth knowledge increaseth sorrow." 153 I have not written the above with the object of drawing the conclusion, that ignorance is more excellent than knowledge, or that a wise person is on a par with a fool in controlling own emotions, 154 but because it is necessary to know the power and the infirmity of our nature, before we can determine what reason can do in restraining the emotions, and what is beyond her power. 155 I have said, that in the present part I shall merely treat of human infirmity. The power of reason over the emotions I have settled to treat separately.

PROPOSITION XVIII

156 Desire arising from pleasure is, other conditions being equal, stronger than desire arising from pain.

PROOF

157 Desire is the essence of a human, that is, the endeavour whereby a human endeavours to persist in one’s own being. 158 Wherefore desire arising from pleasure is, by the fact of pleasure being felt, increased or helped; 159 on the contrary, desire arising

from pain is, by the fact of pain being felt, diminished or hindered; 160 hence the force of desire arising from pleasure must be defined by human power together with the power of an external cause, whereas desire arising from pain must be defined by human power only. Thus the former is the stronger of the two.

NOTE

161 In these few remarks I have explained the causes of human infirmity and inconstancy, and shown why humans do not abide by the precepts of reason.

162 It now remains for me to show what course is marked out for us by reason, which of the emotions are in harmony with the rules of human reason, and which of them are contrary thereto.

163 But, before I begin to prove my Propositions in detailed geometrical fashion, it is advisable to sketch them briefly in advance, so that everyone may more readily grasp my meaning.

164 As reason makes no demands contrary to Nature, it demands, that every human should love the self, should seek that which is useful to you - 165 I mean, that which is really useful to you, should desire everything which really brings human to greater perfection, and should, each for yourself, endeavour as far as you can to preserve your own being. This is as necessarily true, as that a whole is greater than its part.

166 Again, as virtue is nothing else but action in accordance with the laws of one's own nature, and as no one endeavours to preserve one’s own being, except in accordance with the laws of your own nature, 167 it follows, first, that the foundation of virtue is the endeavour to preserve one's own being, and that happiness consists in human's power of preserving, your own being; 168 secondly, that virtue is to be desired for its own sake, and that there is nothing more excellent or more useful to us, for the sake of which we should desire it; 169 thirdly and lastly that suicides are weak-minded, and are overcome by external causes repugnant to their nature. 170 Further, it follows from Postulate iv.(In the Panagogie book of MIND: Chapter-5; v.191) that we can never arrive at doing without all external things for the

preservation of our being or living, so as to have no relations with things which are outside ourselves. 171 Again, if we consider our mind, we see that our intellect would be more imperfect, if mind were alone, and could understand nothing besides itself. 172 There are, then, many things outside ourselves, which are useful to us, and are, therefore, to be desired.

173 Of such none can be discerned more excellent, than those which are in entire agreement with our nature. 174 For if, for example, two individuals of entirely the same nature are united, they form a combination twice as powerful as either of them singly.

175 Therefore, to human there is nothing more useful than human-- nothing, I repeat, more excellent for preserving their being can be wished for by humans, than that all should so in all points agree, 176 that the minds and bodies of all should form, as it were, one single mind and one single body, and that all should, with one consent, as far as they are able, endeavour to preserve their being, and all with one consent seek what is useful to them all. 177 Hence, humans who are governed by reason-- that is, who seek what is useful to them in accordance with reason, desire for themselves nothing, which they do not also desire for the rest of humankind, and, consequently, are just, faithful, and honourable in their conduct.

178 Such are the dictates of reason, which I purposed thus briefly to indicate, before beginning to prove them in greater detail. 179 I have taken this course, in order, if possible, to gain the attention of those who believe, that the principle that every human is bound to seek what is useful for the self is the foundation of impiety, rather than of piety and virtue.

180 Therefore, after briefly showing that the contrary is the case, I go on to prove it by, the same method, as that whereby I have hitherto proceeded.

PROPOSITION XIX

181 Every human, by the laws of your nature, necessarily desires or shrinks from that which you deems to be good or bad.

PROOF

182 The knowledge of good and evil is the emotion of pleasure or pain, in so far as we are conscious

thereof; therefore, every human necessarily desires what you thinks good, and shrinks from what you thinks bad. 183 Now this appetite is nothing else but human's nature or essence. Therefore, every human, solely by the laws of your nature, desires the one, and shrinks from the other.

PROPOSITION XX

184 The more every human endeavours, and is able to seek what is useful to you-- in other words, to preserve your own being-- the more is you endowed with virtue; 185 on the contrary, in proportion as a person neglects to seek what is useful to you, that is, to preserve your own being, you are wanting in power.

PROOF

186 Virtue is human power, which is defined solely by human's essence, that is, which is defined solely by the endeavour made by human to persist in one’s own being. 187 Wherefore, the more a person endeavours, and is able to preserve own being, the more is you endowed with virtue, 188 and, consequently, in so far as a person neglects to preserve own being, you are wanting in power.

NOTE

189 No one, therefore, neglects seeking own good, or preserving own being, unless you be overcome by causes external and foreign to your nature. 190 No one, I say, from the necessity of your own nature, or otherwise than under compulsion from external causes, shrinks from food, or kills yourself: which latter may be done in a variety of ways. 191 A person, for instance, kills the self under the compulsion of another person, who twists round your right hand, wherewith you happened to have taken up a sword, and forces you to turn the blade against your own heart; 192 or, again, you may be compelled, like Seneca, by a tyrant's command, to open your own veins-- that is, to escape a greater evil by incurring, a lesser; 193 or, lastly, latent external causes may so disorder your imagination, and so affect your body, that it may assume a nature contrary to its former one, and whereof the idea cannot exist in the mind. 194 But that a human, from the necessity of your own nature, should endeavour to become non-existent, is as impossible as that

something should be made out of nothing, as everyone will see for the self, after a little reflection.

PROPOSITION XXI

195 No one can desire to be blessed, to act rightly, and to live rightly, without at the same time wishing to be, act, and to live-- in other words, to actually exist.

PROOF

196 The proof of this proposition, or rather the proposition itself, is self-evident, and is also plain from the definition of desire. 197 For the desire of living, acting, blessedly or rightly, is the essence of human-- that is, the endeavour made by everyone to preserve own being. Therefore, no one can desire.

PROPOSITION XXII

198 No virtue can be conceived as prior to this endeavour to preserve one's own being.

PROOF

199 The effort for self-preservation is the essence of a thing; therefore, if any virtue could be conceived as prior thereto, the essence of a thing would have to be conceived as prior to itself, which is obviously absurd. Therefore no virtue.

COROLLARY

200 The effort for self-preservation is the first and only foundation of virtue. For prior to this principle nothing can be conceived, and without it no virtue can be conceived.

PROPOSITION XXIII

201 Human, in so far as you are determined to a particular action because you have inadequate ideas, cannot be absolutely said to act in obedience to virtue; you can only be so described, in so far as you are determined for the action because you understands.

PROOF

202 In so far as a person is determined to an action through having inadequate ideas, you are passive, that is, you does something, which cannot be perceived solely through your essence, that is, which does not follow from your virtue. 203 But, in so far as you are determined for an action because you understands, you are active; that is, you does something, which is perceived through your essence alone, or which adequately follows from your virtue.

PROPOSITION XXIV

204 To act absolutely in obedience to virtue is in us the same thing as to act, to live, or to preserve one's being (these three terms are identical in meaning) in accordance with the dictates of reason on the basis of seeking what is useful to one's self.

PROOF

205 To act absolutely in obedience to virtue is nothing else but to act according to the laws of one's own nature. 206 But we only act, in so far as we understand: therefore to act in obedience to virtue is in us nothing else but to act, to live, or to preserve one's being in obedience to reason, and that on the basis of seeking what is useful for us.

PROPOSITION XXV

207 No one wishes to preserve his being for the sake of anything else.

PROOF

208 The endeavour, wherewith everything endeavours to persist in its being, is defined solely by the essence of the thing itself; 209 from this alone, and not from the essence of anything else, it necessarily follows that everyone endeavours to preserve own being.

210 Moreover, this proposition is plain from IV:xxii.Coroll., for if a person should endeavour to preserve own being for the sake of anything else, the last-named thing would obviously be the basis of virtue, which, by the foregoing corollary, is absurd. Therefore no one.

PROPOSITION XXVI

211 Whatsoever we endeavour in obedience to reason is nothing further than to understand; 212 neither does the mind, in so far as it makes use of reason, judge anything to be useful to it, save such things as are conducive to understanding.

PROOF

213 The effort for self-preservation is nothing else but the essence of the thing in question, which, in so far as it exists such as it is, is conceived to have force for continuing in existence and doing such things as necessarily follow from its given nature. 214 But the essence of reason is nought else but our mind, in so far as it clearly and distinctly understands; therefore whatsoever we endeavour in obedience to reason is nothing else but to understand. 215 Again, since this effort of the

mind wherewith the mind endeavours, in so far as it reasons, to preserve its own being is nothing else but understanding; 216 this effort at understanding is the first and single basis of virtue, nor shall we endeavour to understand things for the sake of any ulterior object; 217 on the other hand, the mind, in so far as it reasons, will not be able to conceive any good for itself, save such things as are conducive to understanding.

PROPOSITION XXVII

218 We know nothing to be certainly good or evil, save such things as really conduce to understanding, or such as are able to hinder us from understanding.

PROOF

219 The mind, in so far as it reasons, desires nothing beyond understanding, and judges nothing to be useful to itself, save such things as conduce to understanding (by the foregoing Proposition.). 220 But the mind cannot possess certainty concerning anything, except in so far as it has adequate ideas, or in so far as it reasons. Therefore we know nothing to be good or evil save such things as really conduce.

PROPOSITION XXVIII

221 The mind's highest good is the knowledge of God, and the mind's highest virtue is to know God.

PROOF

222 The mind is not capable of understanding anything higher than God, that is, than a Being absolutely infinite, and without which nothing can either be or be conceived; therefore, the mind's highest utility or good is the knowledge of God. 223 Again, the mind is active, only in so far as it understands, and only to the same extent can it be said absolutely to act virtuously. 224 The mind's absolute virtue is therefore to understand. Now, as we have already shown, the highest that the mind can understand is God; therefore the highest virtue of the mind is to understand or to know God.

PROPOSITION XXIX

225 No individual thing, which is entirely different from our own nature, can help or check our power of activity, and absolutely nothing can do us good or harm, unless it has something in common with our nature.

PROOF

226 The power of every individual thing, and consequently the power of human, whereby you exists and operates, can only be determined by an individual thing, whose nature must be understood through the same nature as that, through which human nature is conceived.

227 Therefore our power of activity, however it be conceived, can be determined and consequently helped or hindered by the power of any other individual thing, which has something in common with us, 228 but not by the power of anything, of which the nature is entirely different from our own; 229 and since we call good or evil that which is the cause of pleasure or pain, that is, which increases or diminishes, helps or hinders, our power of activity; therefore, that which is entirely, different from our nature can neither be to us good nor bad.

PROPOSITION XXX

230 A thing cannot be bad for us through the quality which it has in common with our nature, but it is bad for us in so far as it is contrary to our nature.

PROOF

231 We call a thing bad when it is the cause of pain, that is, when it diminishes or checks our power of action. 232 Therefore, if anything were bad for us through that quality which it has in common with our nature, it would be able itself to diminish or check that which it has in common with our nature, which is absurd. 233 Wherefore nothing can be bad for us through that quality which it has in common with us, but, on the other hand, in so far as it is bad for us, that is (as we have just shown), in so far as it can diminish or check our power of action, it is contrary to our nature.

PROPOSITION XXXI

234 In so far as a thing is in harmony with our nature, it is necessarily good.

PROOF

235 In so far as a thing is in harmony with our nature, it cannot be bad for it. It will therefore necessarily be either good or indifferent.

236 If it be assumed that it be neither good nor bad, nothing will follow from its nature, which tends to the preservation of our nature, that is (by the hypothesis), which

tends to the preservation of the thing itself; but this is absurd; 237 therefore, in so far as a thing is in harmony with our nature, it is necessarily good.

COROLLARY

238 Hence it follows, that, in proportion as a thing is in harmony with our nature, so is it more useful or better for us, and vice versa, in proportion as a thing is more useful for us, so is it more in harmony with our nature. 239 For, in so far as it is not in harmony with our nature, it will necessarily be different therefrom or contrary thereto. 240 If different, it can neither be good nor bad; if contrary, it will be contrary to that which is in harmony with our nature, that is, contrary to what is good-- in short, bad. 241 Nothing, therefore, can be good, except in so far as it is in harmony with our nature; and hence a thing is useful, in proportion as it is in harmony with our nature, and vice versa.

PROPOSITION XXXII

242 In so far as humans are a prey to passion, they cannot, in that respect, be said to be naturally in harmony.

PROOF

243 Things, which are said to be in harmony naturally, are understood to agree in power, not in want of power or negation, and consequently not in passion; 244 wherefore humans, in so far as they are a prey to their passions, cannot be said to be naturally in harmony.

NOTE

245 This is also self-evident; for, if we say that white and black only agree in the fact that neither is red, we absolutely affirm that they do not agree in any respect. 246 So, if we say that a person and a stone only agree in the fact that both are finite-- wanting in power, not existing by the necessity of their own nature, or, lastly, indefinitely surpassed by the power of external causes-- we should certainly affirm that a person and a stone are in no respect alike; 247 therefore, things which agree only in negation, or in qualities which neither possess, really agree in no respect.

PROPOSITION XXXIII

248 Humans can differ in nature, in so far as they are assailed by those emotions, which are passions, or passive states; and to this extent

one and the same person is variable and inconstant.

PROOF

249 The nature or essence of the emotions cannot be explained solely through our essence or nature, but it must be defined by the power, that is, by the nature of external causes in comparison with our own; 250 hence it follows, that there are as many kinds of each emotion as there are external objects whereby we are affected, and that humans may be differently affected by one and the same object, and to this extent differ in nature; 251 lastly, that one and the same person may be differently affected towards the same object, and may therefore be variable and inconstant.

PROPOSITION XXXIV

252 In so far as humans are assailed by emotions which are passions, they can be contrary one to another.

PROOF

253 A person, for instance Peter, can be the cause of Paul's feeling pain, because he (Peter) possesses something similar to that which Paul hates, or because Peter has sole possession of a thing which Paul also loves, or for other causes; 254 it may therefore happen that Paul should hate Peter, consequently it may easily happen also, that Peter should hate Paul in return, and that each should endeavour to do the other an injury, that is, that they should be contrary one to another. 255 But the emotion of pain is always a passion or passive state; hence humans, in so far as they are assailed by emotions which are passions, can be contrary one to another.

NOTE

256 I said that Paul may hate Peter, because he conceives that Peter possesses something which he (Paul) also loves; 257 from this it seems, at first sight, to follow, that these two men, through both loving the same thing, and, consequently, through agreement of their respective natures, stand in one another's way; if this were so, II:xxx. and II:xxxi. would be untrue.

258 But if we give the matter our unbiased attention, we shall see that the discrepancy vanishes. For the two men are not in one another's way in virtue of the agreement of their natures, that is,

through both loving the same thing, but in virtue of one differing from the other. 259 For, in so far as each loves the same thing, the love of each is fostered thereby, that is the pleasure of each is fostered thereby. 260 Wherefore it is far from being the case, that they are at variance through both loving the same thing, and through the agreement in their natures. 261 The cause for their opposition lies, as I have said, solely in the fact that they are assumed to differ. For we assume that Peter has the idea of the loved object as already in his possession, while Paul has the idea of the loved object as lost. 262 Hence the one man will be affected with pleasure, the other will be affected with pain, and thus they will be at variance one with another. 263 We can easily show in like manner, that all other causes of hatred depend solely on differences, and not on the agreement between human's natures.

PROPOSITION XXXV

264 In so far only as humans live in obedience to reason, do they always necessarily agree in nature.

.PROOF

265 In so far as humans are assailed by emotions that are passions, they can be different in nature, and at variance one with another.

266 But humans are only said to be active, in so far as they act in obedience to reason; therefore, what so ever follows from human nature in so far as it is defined by reason must be understood solely through human nature as its proximate cause. 267 But, since every human by the laws of own nature desires that which you deems good, and endeavours to remove that which you deems bad; 268 and further, since that which we, in accordance with reason, deem good or bad, necessarily is good or bad; 269 it follows that humans, in so far as they live in obedience to reason, necessarily do only such things as are necessarily good for human nature, and consequently for each individual person; in other words, such things as are in harmony with each human's nature.

270 Therefore, humans in so far as they live in obedience to reason,

necessarily live always in harmony one with another.

COROLLARY I

271 There is no individual thing in Nature, which is more useful to human, than a person who lives in obedience to reason. For that thing is to human most useful, which is most in harmony with own nature; that is, obviously, human. 272 But human acts absolutely according to the laws of own nature, when you lives in obedience to reason, and to this extent only is always necessarily in harmony with the nature of another human (by the last Proposition); 273 wherefore among individual things nothing is more useful to human, than a human who lives in obedience to reason.

COROLLARY II

274 As every human seeks most that which is useful to you, so are humans most useful one to another. 275 For the more a human seeks what is useful to oneself and endeavours to preserve the self, the more is you endowed with virtue, or, what is the same thing, the more is you endowed with power to act according to the laws of your own nature, that is to live in obedience to reason. 276 But humans are most in natural harmony, when they live in obedience to reason (by the last Proposition); therefore (by the foregoing Corollary.) humans will be most useful one to another, when each seeks most that which is useful to oneself.

NOTE

277 What we have just shown is attested by experience so conspicuously, that it is in the mouth of nearly everyone: "Human is to human a God." 278 Yet it rarely happens that humans live in obedience to reason, for things are so ordered among them, that they are generally envious and troublesome one to another. 279 Nevertheless they are scarcely able to lead a solitary life, so that the definition of human as a social animal has met with general assent; in fact, humans do derive from social life much more convenience than injury.

280 Let satirists then laugh their fill at human affairs, let theologians rail, and let misanthropes praise to their utmost the life of untutored rusticity, let them heap contempt on humans and praises on beasts;

281 when all is said, they will find that humans can provide for their wants much more easily by mutual help, and that only by uniting their forces can they escape from the dangers that on every side beset them: 282 not to say how much more excellent and worthy of our knowledge it is, to study the actions of humans than the actions of beasts. But I will treat of this more at length elsewhere.

PROPOSITION XXXVI

283 The highest good of those who follow virtue is common to all, and therefore all can equally rejoice therein.

PROOF

284 To act virtuously is to act in obedience with reason, and whatsoever we endeavour to do in obedience to reason is to understand; 285 therefore the highest good for those who follow after virtue is to know God; that is a good which is common to all and can be possessed. by all humans equally, in so far as they are of the same nature.

NOTE

286 Someone may ask how it would be, if the highest good of those who follow after virtue were not common to all? 287 Would it not then follow, as above, that humans living in obedience to reason, that is, humans in so far as they agree in nature, would be at variance one with another? 288 To such an inquiry, I make answer, that it follows not accidentally but from the very nature of reason, that main's highest good is common to all, inasmuch as it is deduced from the very essence of human, in so far as defined by reason; 289 and that a person could neither be, nor be conceived without the power of taking pleasure in this highest good. 290 For it belongs to the essence of the human mind, to have an adequate knowledge of the eternal and infinite essence of God.

PROPOSITION XXXVII

291 The good which every human, who follows after virtue, desires for the self you will also desire for other people, and so much the more, in proportion as you have a greater knowledge of God.

PROOF

292 Humans, in so far as they live in obedience to reason, are most useful to their fellow humans; therefore, we shall in obedience to reason necessarily endeavour to bring about that humans should

live in obedience to reason. 293 But the good which every human, in so far as you are guided by reason, or, in other words, follows after virtue, desires for yourself, is to understand; 294 wherefore the good, which each follower of virtue seeks for the self, you will desire also for others.

295 Again, desire, in so far as it is referred to the mind, is the very essence of the mind; now the essence of the mind consists in knowledge, which involves the knowledge of God, and without it, can neither be, nor be conceived; 296 therefore, in proportion as the mind's essence involves a greater knowledge of God, so also will be greater the desire of the follower of virtue, that other people should possess that which you seeks as good for yourself.

PROOF

297 The good, which a person desires for the self and loves, you will love more constantly, if you sees that others love it also; you will therefore endeavour that others should love it also; 298 and as the good in question is common to all, and therefore all can rejoice therein, you will endeavour, for the same reason, to bring about that all should rejoice therein, and this you will do the more, in proportion as your own enjoyment of the good is greater.

NOTE 1

299 You who, guided by emotion only, endeavours to cause others to love what you loves yourself, and to make the rest of the world live according to your own fancy, acts solely by impulse, and is, therefore, hateful, especially, to those who take delight in something different, 300 and accordingly study and, by similar impulse, endeavour, to make humans live in accordance with what pleases themselves.

301 Again, as the highest good sought by humans under the guidance of emotion is often such, that it can only be possessed by a single individual, it follows that those who love it are not consistent in their intentions, but, while they delight to sing its praises, fear to be believed. 302 But you, who endeavours to lead humans by reason, does not act by impulse but courteously and kindly, and your intention is always consistent.

DESIRES

303 Again, whatsoever we desire and do, whereof we are the cause in so far as we possess the idea of God, or know God, I set down to Religion. 304 The desire of well-doing, which is engendered by a life according to reason, I call piety. 305 Further, the desire, whereby a person living according to reason is bound to associate others with the self in friendship, I call honour (Honestas); 306 by honourable I mean that which is praised by people living according to reason, and by base I mean that which is repugnant to the gaining of friendship. 307 I have also shown in addition what are the foundations of a state; and the difference between true ,virtue and infirmity may be readily gathered from what I have said; 308 namely, that true virtue is nothing else but living in accordance with reason; while infirmity is nothing else but human's allowing yourself to be led by things which are external to yourself, 309 and to be by them determined to act in a manner demanded by the general disposition of things rather than by your own nature considered solely in itself.

310 Such are the matters which I engaged to prove in IV:xviii., whereby it is plain that the law against the slaughtering of animals is founded rather on vain superstition and womanish pity than on sound reason. 311 The rational quest of what is useful to us further teaches us the necessity of associating ourselves with our fellow humans, but-- not with beasts, or things, whose nature is different from our own; we have the same rights in respect to them as they have in respect to us.

312 Nay, as everyone's right is defined by own virtue, or power, humans have far greater rights over beasts than beasts have over humans. 313 Still I do not deny that beasts feel: what I deny is, that we may not consult our own advantage and use them as we please, treating them in the way which best suits us; for their nature is not like ours, and their emotions are naturally different from human emotions. 314 It remains for me to explain what I mean by, just and unjust, sin and merit. On these points see the following note.

NOTE II

315 In the book of Ethics. I undertook to explain praise and blame, merit and sin, justice and injustice. Concerning praise and blame I have spoken in III:xxix.Note: the time has now come to treat of the remaining terms. 316 But I must first say a few words concerning human in the state of nature and in society.

317 Every human exists by sovereign natural right, and, consequently, by sovereign natural right performs those actions which follow from the necessity of your own nature; 318 therefore by sovereign natural right every human judges what is good and what is bad, takes care of own advantage according to own disposition, avenges the wrongs done to you, and endeavours to preserve that which you loves and to destroy-- that which you hates. 319 Now, if humans lived under the guidance of reason, everyone would remain in possession of this your right, without any injury being done to your neighbour.

320 But seeing that they are a prey to their emotions, which far surpass human power or virtue, they are often drawn in different directions, and being at variance one with another, stand in need of mutual help. 321 Wherefore, in order that humans may live together in harmony, and may aid one another, it is necessary that they should forego their natural right, and, for the sake of security, refrain from all actions which can injure their fellow-humans. 322 The way in which this end can be obtained, so that people who are necessarily a prey to their emotions, inconstant, and diverse, should be able to render each other mutually secure, and feel mutual trust, is evident from IV:vii. And III:xxxix. 323 It is there shown, that an emotion can only be restrained by an emotion stronger than, and contrary to itself, and that humans avoid inflicting injury through fear of incurring a greater injury themselves.

324 On this law society can be established, so long as it keeps in its own hand the right, possessed by everyone, of avenging injury, and pronouncing on good and evil; 325 and provided it also possesses the power to lay down a general rule of conduct, and to pass laws

sanctioned, not by reason, which is powerless in restraining emotion, but by threats. 326 Such a society established with laws and the power of preserving itself is called a State, while those who live under its protection are called citizens. 327 We may readily understand that there is in the state of Nature nothing, which by universal consent is pronounced good or bad; 328 for in the state of Nature everyone thinks solely of own advantage, and according to own disposition, with reference only to own individual advantage, decides what is good or bad, being bound by no law to anyone besides oneself.

329 In the state of Nature, therefore, sin is inconceivable; it can only exist in a state, where good and evil are pronounced on by common consent, and where everyone is bound to obey the State authority. 330 Sin, then, is nothing else but disobedience, which is therefore punished by the right of the State only. 331 Obedience, on the other hand, is set down as merit, inasmuch as a person is thought worthy of merit, if you takes delight in the advantages which a State provides. 332 Again, in the state of Nature, no one is by common consent master of anything, nor is there anything in Nature, which can be said to belong to one person rather than another: all things are common to all. 333 Hence, in the state of Nature, we can conceive no wish to render to every human your own, or to deprive a person of that which belongs to you; 334 in other words, there is nothing in the state of Nature answering to justice and injustice. Such ideas are only possible in a social state, when it is decreed by common consent what belongs to one person and what to another.

335 From all these considerations it is evident, that justice and injustice, sin and merit, are extrinsic ideas, and not attributes which display the nature of the mind. But I have said enough.

PROPOSITION XXXVIII

336 Whatsoever disposes the human body, so as to render it capable of being affected in an increased number of ways, or of affecting external bodies in an increased number of ways, is

useful to human; 337 and is so, in proportion as the body is thereby rendered more capable of being affected or affecting other bodies in an increased number of ways; contrariwise, whatsoever renders the body less capable in this respect is hurtful to human.

PROOF

338 Whatsoever thus increases the capabilities of the body increases also the mind's capability of perception; therefore, whatsoever thus disposes the body and thus renders it capable, is necessarily good or useful; 339 and is so in proportion to the extent to which it can render the body capable; contrariwise, it is hurtful, if it renders the body in this respect less capable.

PROPOSITION XXXIX

340 Whatsoever brings about the preservation of the proportion of motion and rest, which the parts of the human body mutually possess, is good; contrariwise, whatsoever causes a change in such proportion is bad.

PROOF

341 The human body needs many other bodies for its preservation. But that which constitutes the specific reality (forma) of a human body is, that its parts communicate their several motions one to another in a certain fixed proportion.

342 Therefore, whatsoever brings about the preservation of the proportion between motion and rest, which the parts of the human body mutually possess, preserves the specific reality of the human body, 343 and consequently renders the human body capable of being affected in many ways and of affecting external bodies in many ways; consequently it is good (by the last Proposition.).

344 Again, whatsoever brings about a change in the aforesaid proportion causes the human body to assume another specific character, in other words, to be destroyed, and consequently totally incapable of being affected in an increased numbers of ways; therefore it is bad.

NOTE

345 The extent to which such causes can injure or be of service to the mind will be explained in the Panagogue book of FREEDOM.

346 But I would here remark that I consider that a body undergoes death, when the proportion of

motion and rest which obtained mutually among its several parts is changed. 347 For I do not venture to deny that a human body, while keeping the circulation of the blood and other properties, wherein the life of a body is thought to consist, may none the less be changed into another nature totally different from its own. 348 There is no reason, which compels me to maintain that a body does not die, unless it becomes a corpse; nay, experience would seem to point to the opposite conclusion. 349 It sometimes happens, that a person undergoes such changes, that I should hardly call you the same. 350 As I have heard tell of a certain Spanish poet, who had been seized with sickness, and though he recovered therefrom yet remained so oblivious of his past life, that he would not believe the plays and tragedies he had written to be his own: 351 indeed, he might have been taken for a grown-up child, if he had also forgotten his native tongue. 352 If this instance seems incredible, what shall we say of infants? A person of ripe age deems their nature so unlike your own, that you can only be persuaded that you too has been an infant by the analogy of other people. 353 However, I prefer to leave such questions undiscussed, lest I should give ground to the superstitious for raising new issues.

PROPOSITION XL

354 Whatsoever conduces to human's social life, or causes people to live together in harmony, is useful, whereas whatsoever brings discord into a State is bad.

PROOF

355 For whatsoever causes humans to live together in harmony also causes them to live according to reason, and is therefore good, and (for the same reason) whatsoever brings about discord is bad.

PROPOSITION XLI

356 Pleasure in itself is not bad but good: contrariwise, pain in itself is bad.

PROOF

357 Pleasure is emotion, whereby the body's power of activity is increased or helped; pain is emotion, whereby the body's power of activity is diminished or checked; therefore pleasure in itself is good.

PROPOSITION XLII

358 Mirth cannot be excessive, but is always good; contrariwise, Melancholy is always bad.

PROOF

359 Mirth is pleasure. which, in so far as it is referred to the body, consists in all parts of the body being affected equally: 360 that is, the body's power of activity is increased or aided in such a manner, that the several parts maintain their former proportion of motion and rest; therefore Mirth is always good, and cannot be excessive. 361 But Melancholy is pain, which, in so far as it is referred to the body, consists in the absolute decrease or hindrance of the body's power of activity; therefore it is always bad.

PROPOSITION XLIII

362 Stimulation may be excessive and bad; on the other hand, grief may be good, in so far as stimulation or pleasure is bad.

PROOF

363 Localised pleasure or stimulation (titillatio) is pleasure, which, in so far as it is referred to the body, consists in one or some of its parts being affected more than the rest; 364 the power of this emotion may be sufficient to overcome other actions of the body, and may remain obstinately fixed therein, thus rendering it incapable of being affected in a variety of other ways: therefore it may be bad.

365 Again, grief, which is pain, cannot as such be good. But, as its force and increase is defined by the power of an external cause compared with our own, we can conceive infinite degrees and modes of strength in this emotion; 366 we can, therefore, conceive it as capable of restraining stimulation, and preventing its becoming excessive, and hindering the body's capabilities; thus, to this extent, it will be good.

PROPOSITION XLIV

367 Love and desire may be excessive.

PROOF

368 Love is pleasure, accompanied by the idea of an external cause; therefore stimulation, accompanied by the idea of an external cause is love; hence love maybe excessive.

369 Again, the strength of desire varies in proportion to the emotion from which it arises. Now emotion may overcome all the rest of human's actions; 370 so, therefore,

can desire, which arises from the same emotion, overcome all other desires, and become excessive, as we showed in the last proposition concerning stimulation.

NOTE

371 Mirth, which I have stated to be good, can be conceived more easily than it can be observed. 372 For the emotions, whereby we are daily assailed, are generally referred to some part of the body which is affected more than the rest; 373 hence the emotions are generally excessive, and so fix the mind in the contemplation of one object, that it is unable to think of others; 374 and although humans, as a rule, are a prey to many emotions-- and very few are found who are always assailed by one and the same-- yet there are cases, where one and the same emotion remains obstinately fixed. 375 We sometimes see people so absorbed in one object, that, although it be not present, they think they have it before them; 376 when this is the case with a person who is not asleep, we say you are delirious or mad; 377 nor are those persons who are inflamed with love, and who dream all night and all day about nothing but their mistress, or some woman, considered as less mad, for they are made objects of ridicule. 378 But when a miser thinks of nothing but gain or money, or when an ambitious person thinks of nothing but glory, they are not reckoned to be mad, because they are generally harmful, and are thought worthy of being hated. 379 But, in reality, Avarice, Ambition, Lust, are species of madness, though they may not be reckoned among diseases.

PROPOSITION XLV

380 Hatred can never be good.

PROOF

381 When we hate a person, we endeavour to destroy them, that is, we endeavour to do something that is bad. Therefore.

382 Note Well. Here, and in what follows, I mean by hatred only hatred towards humans.

COROLLARY I

383 Envy, derision, contempt, anger, revenge, and other emotions attributable to hatred, or arising therefrom, are bad; this is evident from III:xxxix. and IV:xxxvii.

COROLLARY II

384 Whatsoever we desire from motives of hatred is base, and in a

State unjust. This also is evident from III:xxxix., and from the definitions of baseness and injustice in IV:xxxvii.Note.

NOTE

385 Between derision and laughter I recognise a great difference. For laughter, as also jocularity, is merely pleasure; therefore, so long as it be not excessive, it is in itself good. 386 Assuredly nothing forbids human to enjoy the self, save grim and gloomy superstition. For why is it more lawful to satiate one's hunger and thirst than to drive away one's melancholy? 387 I reason, and have convinced myself as follows: No deity, nor anyone else, save the envious, takes pleasure in my infirmity and discomfort, nor sets down to my virtue the tears, sobs, fear, and the like, which axe signs of infirmity of spirit; 388 on the contrary, the greater the pleasure wherewith we are affected, the greater the perfection whereto we pass; in other words, the more must we necessarily partake of the divine Nature.

389 Therefore, to make use of what comes in our way, and to enjoy it as much as possible (not to the point of satiety, for that would not be enjoyment) is the part of a wise person. 390 I say it is the part of a wise person to refresh and recreate the self with moderate and pleasant food and drink, and also with perfumes, with the soft beauty of growing plants, with dress, with music, with many sports, with theatres, and the like, 391 such as every human may make use of without injury to own neighbour. 392 For the human body is composed of very numerous parts, of diverse nature, which continually stand in need of fresh and varied nourishment, so that the whole body may be equally capable of performing all the actions, which follow from the necessity of its own nature; 393 and, consequently, so that the mind may also be equally capable of-- understanding many things simultaneously. 394 This way of life, then, agrees best with our principles, and also with general practice; therefore, if there be any question of another plan, the plan we have mentioned is the best, and in every way to be commended.

PROPOSITION XLVI

395 You, who lives under the guidance of reason, endeavours, as far as possible, to render back love, or kindness, for other people's hatred, anger, contempt, towards you.

PROOF

396 All emotions of hatred are bad; therefore you who lives under the guidance of reason will endeavour, as far as possible, to avoid being assailed by, such emotions; consequently, you will also endeavour to prevent others being so aspect. 397 But hatred is increased by being reciprocated, and can be quenched by love, so that hatred may pass into love; therefore you who lives under the guidance of reason will endeavour to repay hatred with love, that is, with kindness.

NOTE

398 You who chooses to avenge wrongs with hatred is assuredly, wretched. But you, who strives to conquer hatred with love, fights your battle in joy and confidence; you withstands many as easily as one, and has very little need of fortune's aid. 399 Those whom you vanquishes yield joyfully, not through failure, but through increase in their powers; 400 all these consequences follow so plainly from the mere definitions of love and understanding, that I have no need to prove them in detail.

PROPOSITION XLVII

401 Emotions of hope and fear cannot be in themselves good.

PROOF

402 Emotions of hope and fear cannot exist without pain. For fear is pain, and hope cannot exist without fear; therefore these emotions cannot be good in themselves, but only in so far as they can restrain excessive pleasure.

NOTE

403 We may add, that these emotions show defective knowledge and an absence of power in the mind; for the same reason confidence, despair, joy, and disappointment are signs of a want of mental power. 404 For although confidence and joy are pleasurable emotions, they, nevertheless imply a preceding, pain, namely, hope and fear. 405 Wherefore the more we endeavour to be guided by reason, the less do we depend on hope; 406 we endeavour to free ourselves from

fear, and, as far as we can, to dominate fortune, directing our actions by the sure counsels of wisdom.

PROPOSITION XLVIII

407 The emotions of over-esteem and disparagement are always bad.

PROOF

408 These emotions are repugnant to reason; and are therefore bad.

PROPOSITION XLIX

409 Over-esteem is apt to render its object proud.

PROOF

410 If we see that any one rates us too highly, for love's sake, we are apt to become elated, or to be pleasurably affected; 411 the good which we hear of ourselves we readily believe; and therefore, for love's sake, rate ourselves too highly; in other words, we are apt to become proud.

PROPOSITION L

412 Pity, in a person who lives under the guidance of reason, is in itself bad and useless.

PROOF

413 Pity is a pain, and therefore is in itself bad. The good effect which follows, namely, our endeavour to free the object of our pity from misery, is an action which we desire to do solely at the dictation of reason; 414 only at the dictation of reason are we able to perform any action, which we know for certain to be good; thus, in a person who lives under the guidance of reason, pity in itself is useless and bad.

NOTE

415 You who rightly realises, that all things follow from the necessity of the divine Nature, and come to pass in accordance with the eternal laws and rules of Nature, will not find anything worthy of hatred, derision, or contempt, 416 nor will you bestow pity on anything, but to the utmost extent of human virtue you will endeavour to do well, as the saying is, and to rejoice.

417 We may add, that you, who is easily touched with compassion, and is moved by another's sorrow or tears, often does something which you afterwards regrets; 418 partly because we can never be sure that an action caused by emotion is good, partly because we are easily deceived by false tears. 419 I am in this place expressly speaking of a person living under the guidance of reason. You who is moved to help others neither by reason nor by

compassion, is rightly styled inhuman, for you seems unlike a human.

PROPOSITION LI

420 Approval is not repugnant to reason, but can agree therewith and arise therefrom.

PROOF

421 Approval is love towards one who has done good to another; therefore it may be referred to the mind, in so far as the latter is active, that is, in so far as it understands; therefore, it is in agreement with reason.

PROOF

422 You, who lives under the guidance of reason, desires for others the good which you seeks for yourself; wherefore from seeing someone doing good to own fellow your own endeavour to do good is aided; 423 in other words, you will feel pleasure accompanied by the idea of the benefactor. Therefore you approves of them.

NOTE

424 Indignation as we defined it is necessarily evil; 425 we may, however, remark that, when the sovereign power for the sake of preserving peace punishes a citizen who has injured another, it should not be said to be indignant with the criminal, for it is not incited by hatred to ruin them, it is led by a sense of duty to punish them.

PROPOSITION LII

426 Self-approval may arise from reason, and that which arises from reason is the highest possible.

PROOF

427 Self-approval is pleasure arising from a person's contemplation of the self and your own power of action. 428 But a human's true power of action-- or virtue is reason herself, as the said person clearly and distinctly contemplates her; therefore self-approval arises from reason. 429 Again, when a person is contemplating the self, you only perceived clearly and distinctly or adequately, such things as follow from your power of action, that is, from your power of understanding; therefore in such contemplation alone does the highest possible self-approval arise.

NOTE

430 Self-approval is in reality the highest object for which we can hope. 431 For no one endeavours to preserve own being for the sake of any ulterior object, and, as this

approval is more and more fostered and strengthened by praise, and on the contrary is more and more disturbed by blame, 432 fame becomes the most powerful of incitements to action, and life under disgrace is almost unendurable.

PROPOSITION LIII

433 Humility is not a virtue, or does not arise from reason.

PROOF

434 Humility is pain arising from a human's contemplation of your own infirmities. 435 But, in so far as a person knows the self by true reason, you are assumed to understand your essence, that is, your power. 436 Wherefore, if a person in self-contemplation perceives any infirmity in the self, it is not by virtue of own understanding yourself, but by virtue of your power of activity being checked. 437 But, if we assume that a person perceives own infirmity by virtue of understanding something stronger than the self, by the knowledge of which you determines your own power of activity, 438 this is the same as saying that we conceive that a person understands the self distinctly because *(Land reads: "Quod ipsius agendi potentia juvatur"- which I have translated above. He - suggests as alternative readings to `quod', 'quo' (= whereby) and 'quodque' (= and that).)* your power of activity is aided. 439 Wherefore humility, or the pain which arises from a human's contemplation of own infirmity, does not arise from the contemplation or reason, and is not a virtue but a passion.

PROPOSITION LIV

440 Repentance is not a virtue, or does not arise from reason; but you who repents of an action is doubly wretched or infirm.

PROOF

441 The first part of this proposition is proved like the foregoing one. The second part is proved from the mere definition of the emotion in question. 442 For the person allows the self to be overcome, first, by evil desires; secondly, by pain.

NOTE

443 As humans seldom live under the guidance of reason, these two emotions, namely, Humility and Repentance, as also Hope and Fear, bring more good than harm; hence, as we must sin, we had better sin in that direction.

444 For, if all humans who are a prey to emotion were all equally

proud, they would shrink from nothing, and would fear nothing; how then could they be joined and linked together in bonds of union? 445 The crowd plays the tyrant, when it is not in fear; hence we need not wonder that the prophets, who consulted the good, not of a few, but of all, so strenuously commended Humility, Repentance, and Reverence. 446 Indeed those who are a prey to these emotions may be led much more easily than others to live under the guidance of reason, that is, to become free and to enjoy the life of the blessed.

PROPOSITION LV

447 Extreme pride or dejection indicates extreme ignorance of self.

PROPOSITION LVI

448 Extreme pride or dejection indicates extreme infirmity of spirit.

PROOF

449 The first foundation of virtue is self-preservation under the guidance of reason. You, therefore, who is ignorant of yourself, is ignorant of the foundation of all virtues, and consequently of all virtues.

450 Again, to act virtuously is merely to act under the guidance of reason: now you, that acts under the guidance of reason, must necessarily know that you so acts. 451 Therefore you who is in extreme ignorance of yourself, and consequently of all virtues, acts least in obedience to virtue; in other words, is most infirm of spirit. 452 Thus extreme pride or dejection indicates extreme infirmity of spirit.

COROLLARY

453 Hence it most clearly follows, that the proud and the dejected specially fall a prey to the emotions.

NOTE

454 Yet dejection can be more easily corrected than pride; for the latter being a pleasurable emotion, and the former a painful emotion, the pleasurable is stronger than the painful.

PROPOSITION LVII

455 The proud person delights in the company of flatterers and parasites, but hates the company of the high-minded.

PROOF

456 Pride is pleasure arising from a human's over estimation of the self; this estimation the proud

person will endeavour to foster by all the means in own power; 457 you will therefore delight in the company of flatterers and parasites (whose character is too well known to need definition here), and will avoid the company of high-minded people, who value you according to your deserts.

Note

458 It would be too long a task to enumerate here all the evil results of pride, inasmuch as the proud are a prey to all the emotions, though to none of them less than to love and pity.

459 I cannot, however, pass over in silence the fact, that a human may be called proud from own underestimation of other people; 460 and, therefore, pride in this sense may be defined as pleasure arising from the false opinion, whereby a person may consider the self superior to own fellows. 461 The dejection, which is the opposite quality to this sort of pride, may be defined as pain arising from the false opinion, whereby a person may think the self inferior to own fellows.

462 Such being the ease, we can easily see that a proud person is necessarily envious, and only takes pleasure in the company, who fool own weak mind to the top of own bent, and make you insane instead of merely foolish.

463 Though dejection is the emotion contrary to pride, yet is the dejected person very near akin to the proud person. 464 For, inasmuch as your pain arises from a comparison between your own infirmity and other people's power or virtue, it will be removed, 465 or, in other words, you will feel pleasure, if your imagination be occupied in contemplating other people's faults; whence arises the proverb, "The unhappy are comforted by finding fellow-sufferers."

466 Contrariwise, you will be the more pained in proportion as you thinks yourself inferior to others; 467 hence none are so prone to envy as the dejected, they are specially keen in observing human's actions, with a view to fault-finding rather than correction, in order to reserve their praises for dejection, and to glory therein, though all the time with a dejected air. 468 These effects follow as necessarily from the said

emotion, as it follows from the nature of a triangle, that the three angles are equal to two right angles. 469 I have already said that I call these and similar emotions bad, solely in respect to what is useful to human.

470 The laws of Nature have regard to Nature's general order, whereof human is but a part. 471 I mention this, in passing, lest any should think that I have wished to set forth the faults and irrational deeds of humans rather than the nature and properties of things. 472 For, as I said in the book of ETHICS regard human emotions and their properties as on the same footing with other natural phenomena. 473 Assuredly human emotions indicate the power and ingenuity, of Nature, if not of human nature, quite as fully, as other things which we admire, and which we delight to contemplate.

474 But I pass on to note those qualities in the emotions, which bring advantage to human, or inflict injury upon you.

PROPOSITION LVIII

475 Honour (gloria) is not repugnant to reason, but may arise therefrom.

.NOTE

476 Empty honour, as it is styled, is self- approval, fostered only by the good opinion of the populace; when this good opinion ceases there ceases also the self-approval, in other words, the highest object of each human's love; 477 consequently, you whose honour is rooted in popular approval must, day by day, anxiously strive, act, and scheme in order to retain your reputation. 478 For the populace is variable and inconstant, so that, if a reputation be not kept up, it quickly withers away. 479 Everyone wishes to catch popular applause for the self, and readily represses the fame of others. 480 The object of the strife being estimated as the greatest of all goods, each combatant is seized with a fierce desire to put down own rivals in every possible way, till you who at last comes out victorious is more proud of having done harm to others than of having done good to yourself. 481 This sort of honour, then, is really empty, being nothing.

482 The points to note concerning shame (pudor) may easily be inferred from what was said on the

subject of mercy and repentance. 483 I will only add that shame, like compassion, though not a virtue, is yet good, in so far as it shows, that the feeler of shame is really imbued with the desire to live honourably; in the same way as suffering is good, as showing that the injured part is not mortified. 484 Therefore, though a person who feels shame is sorrowful, you are yet more perfect than those, who is shameless, and has no desire to live honourably.

485 Such are the points which I undertook to remark upon concerning the emotions of pleasure and pain; as for the desires, they are good or bad according as they spring from good or evil emotions. 486 But all, in so far as they are engendered in us by, emotions wherein the mind is passive, are blind, and would be useless, if people could easily, be induced to live by the guidance of reason only, as I will now briefly, show.

PROPOSITION LIX

487 To all the actions, whereto we are determined by emotion wherein the mind is passive; we can be determined without emotion by reason.

PROOF

488 To act rationally, is nothing else but to perform those actions, which follow from the necessity, of our nature {to persist} considered in itself alone. 489 But pain is bad, in so far as it diminishes or checks the power of action; wherefore we cannot by pain be determined to any action, which we should be unable to perform under the guidance of reason.

490 Again, pleasure is bad only in so far as it hinders a person's capability for action; therefore to this extent we could not be determined by it to any action, which we could not perform under the guidance of reason.

491 Lastly, pleasure, in so far as it is good, is in harmony with reason (for it consists in the fact that a human's capability for action is increased or aided); 492 nor is the mind passive therein, except in so far as a human's power of action is not increased to the extent of affording you an adequate conception of yourself and your actions.

493 Wherefore, if a person who is pleasurably affected be brought to such a state of perfection, that you gains an adequate conception of yourself and your own actions, you will be equally, nay more, capable of those actions, to which you are determined by emotion wherein the mind is passive. 494 But all emotions are attributable to pleasure, to pain, or to desire; and desire is nothing else but the attempt to act; therefore, to all actions.

PROOF

495 A given action is called bad, in so far as it arises from one being affected by hatred or any evil emotion. 496 But no action, considered in itself alone, is either good or bad, one and the same action being sometimes good, sometimes bad; wherefore to the action which is sometimes bad, or arises from some evil emotion, we may be led by reason.

NOTE

497 An example will put this point in a clearer light. The action of striking, in so far as it is considered physically, 498 and in so far as we merely look to the fact that a person raises own arm, clenches own fist, and moves own whole arm violently downwards, is a virtue or excellence which is conceived as proper to the structure of the human body. 499 If, then, a person, moved by anger or hatred, is led to clench own fist or to move own arm, this result takes place (as we showed in the Panagogue book of MIND.), because one and the same action can be associated with various mental images of things; 500 therefore we may be determined to the performance of one and the same action by confused ideas, or by clear and distinct ideas. 501 Hence it is evident that every desire which springs from emotion, wherein the mind is passive, would become useless, if humans could be guided by reason. 502 Let us now see why desire which arises from emotion, wherein the mind is passive, is called by us blind.

PROPOSITION LX

503 Desire arising from a pleasure or pain, that is not attributable, to the whole body, but only to one or certain parts thereof, is without utility in respect to a human as a whole.

PROOF

504 Let it be assumed, for instance, that A, a part of a body, is so strengthened by some external cause, that it prevails over the remaining parts. 505 This part will not endeavour to do away with its own powers, in order that the other parts of the body may perform its office; for this it would be necessary for it to have a force or power of doing away with its own powers, which is absurd. 506 The said part, and, consequently, the mind also, will endeavour to preserve its condition. Wherefore desire arising from a pleasure of the kind aforesaid has no utility in reference to a human as a whole. 507 If it be assumed, on the other hand, that the part, A, be checked so that the remaining parts prevail, it may be proved in the same manner that desire arising from pain has no utility in respect to a human as a whole.

NOTE

508 As pleasure is generally attributed to one part of the body, we generally desire to preserve our being with out taking into consideration our health as a whole: 509 to which it may be added, that the desires which have most hold over us take account of the present and not of the future.

PROPOSITION LXI

510 Desire which springs from reason cannot be excessive.

PROOF

511 Desire considered absolutely is the actual essence of human, in so far as it is conceived as in any way determined to a particular activity by some given modification of itself. 512 Hence desire, which arises from reason, that is, which is engendered in us in so far as we act, is the actual essence or nature of human, in so far as it is conceived as determined to such activities as are adequately conceived through human's essence only. 513 Now, if such desire could be excessive, human nature considered in itself alone would be able to exceed itself, or would be able to do more than it can, a manifest contradiction. Therefore, such desire cannot be excessive.

PROPOSITION LXII

514 In so far as the mind conceives a thing under the dictates of reason, it is affected equally, whether the idea be of a thing future, past, or present.

PROOF

515 Whatsoever the mind conceives under the guidance of reason, it conceives under the form of eternity or necessity, and is therefore affected with the same certitude. 516 Wherefore, whether the thing be present, past, or future, the mind conceives it under the same necessity and is affected with the same certitude; 517 and whether the idea be of something present, past, or future, it will in all cases be equally true; that is, it will always possess the same properties of an adequate idea; 518 therefore, in so far as the mind conceives things under the dictates of reason, it is affected in the same manner, whether the idea be of a thing future, past, or present.

NOTE

519 If we could possess an adequate knowledge of the duration of things, and could determine by reason their periods of existence, we should contemplate things future with the same emotion as things present; 520 and the mind would desire as though it were present the good which it conceived as future; 521 consequently it would necessarily neglect a lesser good in the present for the sake of a greater good in the future, and would in no wise desire that which is good in the present but a source of evil in the future, as we shall presently show. 522 However, we can have but a very inadequate knowledge of the duration of things and the periods of their existence we can only determine by imagination, which is not so powerfully affected by the future as by the present. 523 Hence such true knowledge of good and evil as we possess is merely abstract or general, and the judgment which we pass on the order of things and the connection of causes, with a view to determining what is good or bad for us in the present, is rather imaginary than real.

524 Therefore it is nothing wonderful, if the desire arising from such knowledge of good and evil, in so far as it looks on into the future, be more readily checked than the desire of things which are agreeable at the present time.

PROPOSITION LXIII

525 You who is led by fear, and does good in order to escape evil, is not led by reason.

.PROOF

526 All the emotions which are attributable to the mind as active, or in other words to reason, are emotions of pleasure and desire; therefore, you who is led by fear, and does good in order to escape evil, is not led by reason.

NOTE

527 Superstitions persons, who know better how to rail at vice than how to teach virtue, and who strive not to guide people by reason, but so to restrain them that they would rather escape evil than love virtue, have no other aim but to make others as wretched as themselves; 528 wherefore it is nothing wonderful, if they be generally troublesome and odious to their fellow-human.

COROLLARY

529 Under desire which springs from reason, we seek good directly, and shun evil indirectly.

PROOF

530 Desire which springs from reason can only spring from a pleasurable emotion, wherein the mind is not passive, in other words, from a pleasure which cannot be excessive, and not from pain; 531 wherefore this desire springs from the knowledge of good, not of evil; hence under the guidance of reason we seek good directly and only by implication shun evil.

NOTE

532 This corollary may be illustrated by the example of a sick and a healthy man. The sick man through fear of death eats what he naturally shrinks from, 533 but the healthy man takes pleasure in his food, and thus gets a better enjoyment out of life, than if he were in fear of death, and desired directly to avoid it. 534 So a judge, who condemns a criminal to death, not from hatred or anger but from love of the public well-being, is guided solely by reason.

PROPOSITION LXIV

535 The knowledge of evil is an inadequate knowledge.

PROOF

536 The knowledge of evil is pain, in so far as we are conscious thereof. Now pain is the transition to a lesser perfection and therefore cannot be understood through human's nature; therefore it is a passive state which depends on inadequate ideas; 537 consequently the knowledge thereof, namely, the knowledge of evil, is inadequate.

COROLLARY

538 Hence it follows that, if the human mind possessed only adequate ideas, it would form no conception of evil.

PROPOSITION LXV

539 Under the guidance of reason we should pursue the greater of two goods and the lesser of two evils.

PROOF

540 A good which prevents our enjoyment of a greater good is in reality an evil; 541 for we apply the terms good and bad to things, in so far as we compare them one with another; therefore, evil is in reality a lesser good; 542 hence under the guidance of reason we seek or pursue only the greater good and the lesser evil.

COROLLARY

543 We may, under the guidance of reason, pursue the lesser evil as though it were the greater good, and we may shun the lesser good, which would be the cause of the greater evil. 544 For the evil, which is here called the lesser, is really good, and the lesser good is really evil, wherefore we may seek the former and shun the latter.

PROPOSITION LXVI

545 We may, under the guidance of reason, seek a greater good in the future in preference to a lesser good in the present, and we may seek a lesser evil in the present in preference to a greater evil in the future.

PROOF

546 If the mind could have an adequate knowledge of things future, it would be affected towards what is future in the same way as towards what is present; 547 wherefore, looking merely to reason, as in this proposition we are assumed to do, there is no difference, whether the greater good or evil be assumed as present, or assumed as future; 548 hence we may seek a greater good in the future in preference to a lesser good in the present.

COROLLARY

549 We may, under the guidance of reason, seek a lesser evil in the present, because it is the cause of a greater good in the future, and we may shun a lesser good in the present, because it is the cause of a greater evil in the future.

NOTE

550 If these statements be compared with what we have

pointed out concerning the strength of the emotions, we shall readily see the difference between a person, who is led solely by emotion or opinion, and a person, who is led by reason. 551 The former, whether will or no, performs actions whereof you are utterly ignorant; the latter is your own master and only performs such actions, as you knows are of primary importance in life, and therefore chiefly, desires; 552 wherefore I call the former a slave, and the latter a free person, concerning whose disposition and manner of life it will be well to make a few observations.

PROPOSITION LXVII

553 A free person thinks of death least of all things; and your wisdom is a meditation not of death but of life.

PROOF

554 A free person is one who lives under the guidance of reason, who is not led by fear, but who directly desires that which is good, 555 in other words, who strives to act, to live, and to preserve own being on the basis of seeking own true advantage; 556 wherefore such an one thinks of nothing less than of death, but own wisdom is a meditation of life.

PROPOSITION LXVIII

557 If humans were born free, they would, so long as they remained free, form no conception of good and evil.

PROOF

558 I call free you who is led solely by reason; you, therefore, who is born free, and who remains free, has only adequate ideas; therefore you have no conception of evil, or consequently (good and evil being correlative) of good.

NOTE

559 It is evident, from IV:iv., that the hypothesis of this Proposition is false and inconceivable, except in so far as we look solely to the nature of human, or rather to God; not in so far as the latter is infinite, but only in so far as He is the cause of human's existence.

560 This, and other matters which we have already proved, seem to have been signifieded by Moses in the history of the first human. 561 For in that narrative no other power of God is conceived, save that whereby He created human, that is the power wherewith He provided solely for human's advantage; 562 it is stated that God

forbade human, being free, to eat of the tree of the knowledge of good and evil, and that, as soon as human should have eaten of it, you would straightway fear death rather than desire to live. 563 Further, it is written that when man had found a wife, who was in entire harmony with his nature, he knew that there could be nothing in Nature which could be more useful to him; 564 but that after he believed the beasts to be like himself, he straightway began to imitate their emotions, and to lose his freedom; 565 this freedom was afterwards recovered by the patriarchs, led by the spirit of Christ; that is, by the idea of God, whereon alone it depends, that human may be free, and desire for others the good which you desires for yourself, as we have shown above.

PROPOSITION LXIX

566 The virtue of a free person is seen to be as great, when it declines dangers, as when it overcomes them.

PROOF

567 Emotion can only be checked or removed by an emotion contrary to itself, and possessing more power in restraining emotion. 568 But blind daring and fear are emotions, which can be conceived as equally great: hence, no less virtue or firmness is required in checking daring than in checking fear; 569 in other words, the free person shows as much virtue, when you declines dangers, as when you strives to overcome them.

COROLLARY

570 The free person is as courageous in timely retreat as in combat; or, a free person shows equal courage or presence of mind, whether you elect to give battle or to retreat.

NOTE

571 What courage (animositas) is, and what I mean thereby, I explained in III:lix.Note. By danger I mean everything, which can give rise to any evil, such as pain, hatred, discord.

PROPOSITION LXX

572 The free person, who lives among the ignorant, strives, as far as you can, to avoid receiving favours from them.

PROOF

573 Everyone judges what is good according to own disposition; wherefore an ignorant person, who has conferred a benefit on another,

puts own estimate upon it, and, if it appears to be estimated less highly by the receiver, will feel pain. 574 But the free person only desires to join other people to self in friendship, not repaying their benefits with others reckoned as of like value, but guiding the self and others by the free decision of reason, and doing only such things as you knows to be of primary importance.

575 Therefore the free person, lest be should become hateful to the ignorant, or follow their desires rather than reason, will endeavour, as far as you can, to avoid receiving their favours.

NOTE

576 I say, as far as you can. For though humans be ignorant, yet are they humans, and in cases of necessity could afford us human aid, the most excellent of all things: 577 therefore it is often necessary to accept favours from them, and consequently to repay such favours in kind; 578 we must, therefore, exercise caution in declining favours, lest we should have the appearance of despising those who bestow them, or of being, from avaricious motives, unwilling to requite them, and so give ground for offence by the very fact of striving to avoid it. 579 Thus, in declining favours, we must look to the requirements of utility and courtesy.

PROPOSITION LXXI

580 Only free people are thoroughly grateful one to another.

PROOF

581 Only free people are thoroughly useful one to another, and associated among themselves by the closest necessity of friendship, only such people endeavour, with mutual zeal of love, to confer benefits on each other, and, therefore, only they are thoroughly grateful one to another.

NOTE

582 The goodwill, which people who are led by blind desire have for one another, is generally a bargaining or enticement, rather than pure goodwill.

583 Moreover, ingratitude is not an emotion. Yet it is base, inasmuch as it generally shows, that a person is affected by excessive hatred, anger, pride, avarice. 584 You who, by reason of your folly, knows not how to return benefits, is not ungrateful, much less you who is not gained over by the gifts of a

courtesan to serve her lust, or by a thief to conceal his thefts, or by any similar persons.

585 Contrariwise, such an one shows a constant mind, inasmuch as you cannot by an gifts be corrupted, to your own or the general hurt.

PROPOSITION LXXII

586 The free person never acts fraudulently, but always in good faith.

PROOF

587 If it be asked: What should a person's conduct be in a case where you could by breaking faith free yourself from the danger of present death?

588 Would not your plan of self-preservation completely persuade you to deceive?

589 This may be answered by pointing out that, if reason persuaded you to act thus, it would persuade all humans to act in a similar manner, 590 in which case reason would persuade humans not to agree in good faith to unite their forces, or to have laws in common, that is, not to. have any general laws, which is absurd.

PROPOSITION LXXIII

591 The person, who is guided by reason, is more free in a State, where you lives under a general system of law, than in solitude, where you are independent.

PROOF

592 The person, who is guided by reason, does not obey through fear: 593 but, in so far as you endeavours to preserve your being according to the dictates of reason, that is, in so far as you endeavours to live in freedom, you desires to order your life according to the general good, and, consequently, to live according to the laws of your country. 594 Therefore the free person, in order to enjoy greater freedom, desires to possess the general rights of citizenship.

NOTE

595 These and similar observations, which we have made on human's true freedom, may be referred to strength, that is, to courage and nobility of character. 596 I do not think it worthwhile to prove separately all the properties of strength; much less need I show, that you that is strong hates no person, is angry with no person, envies no person, is indignant with no person, despises no person, and least of all things is proud.

597 These propositions, and all that relate to the true way of life and

religion, are easily proved from IV:xxxvii. and IV:xlvi.; namely, that hatred should be overcome with love, and that every human should desire for others the good which you seeks for yourself. 598 We may also repeat what we drew attention to in the note to IV:I., and in other places; namely, that the strong person has ever first in own thoughts, that all things follow from the necessity of the divine Nature; 599 so that whatsoever you deems to be hurtful and evil, and whatsoever, accordingly, seems to you impious, horrible, unjust, and base, assumes that appearance owing to your own disordered, fragmentary, and confused view of the universe. 600 Wherefore you strives before all things to conceive things as they really are, and to remove the hindrances to true knowledge, such as are hatred, anger, envy, derision, pride, and similar emotions, which I have mentioned above.

601 Thus you endeavours, as we said before, as far as in you lies, to do good, and to go on your way rejoicing. How far human virtue is capable of attaining to such a condition, and what its powers may be, I will prove in the Panagogue book of FREEDOM.

APPENDIX

602 What I have said in this Part concerning the right way of life has not been arranged, so as to admit of being seen at one view, but has been set forth piece-meal, according as I thought each Proposition could most readily be deduced from what preceded it. 603 I propose, therefore, to rearrange my remarks and to bring them under leading heads.

604 (I.) All our endeavours or desires so follow from the necessity of our nature, that they can be understood either through it alone, as their proximate cause, or by virtue of our being a part of Nature, which cannot be adequately conceived through itself without other individuals.

605 (II.) Desires, which follow from our nature in such a manner, that they can be understood through it alone, are those which are referred to the mind, in so far as the latter is conceived to consist of adequate ideas: 606 the remaining desires are only referred to the mind, in so far as it

conceives things inadequately, and their force and increase are generally defined not by the power of human, but by the power of things external to us: 607 wherefore the former are rightly called actions, the latter passions, for the former always indicate our power, the latter, on the other hand, show our infirmity and fragmentary knowledge.

608 (III.) Our actions, that is, those desires which are defined by human's power or reason, are always good. The rest maybe either good or bad.

609 (IV.) Thus in life it is before all things useful to perfect the understanding or reason, as far as we can, and in this alone human's highest happiness or blessedness consists, 610 indeed blessedness is nothing else but the contentment of spirit, which arises from the intuitive knowledge of God: 611 now, to perfect the understanding is nothing else but to understand God, God's attributes, and the actions which follow from the necessity of His nature. 612 Wherefore of a human, who is led by reason, the ultimate aim or highest desire, whereby you seeks to govern all your fellows, is that whereby you are brought to the adequate conception of yourself and of all things within the scope of your intelligence.

613 (V.) Therefore, without intelligence there is not rational life: and things are only good, in so far as they aid human in own enjoyment of the intellectual life, which is defined by intelligence. 614 Contrariwise, whatsoever things hinder human's perfecting of own reason, and capability to enjoy the rational life, are alone called evil.

615 (VI.) As all things whereof human is the efficient cause are necessarily good, no evil can befall human except through external causes; 616 namely, by virtue of human being a part of universal Nature, whose laws human nature is compelled to obey, and to conform to in almost infinite ways.

617 (VII.) It is impossible, that human should not be a part of Nature, or that you should not follow Her general order; 618 but if you be thrown among individuals whose nature is in harmony with your own, your power of action

will thereby be aided and fostered, 619 whereas, if you be thrown among such as are but very little in harmony with your nature, you will hardly be able to accommodate yourself to them without undergoing a great change yourself.

620 (VIII.) Whatsoever in Nature we deem to be evil, or to be capable of injuring our faculty for existing and enjoying the rational life, we may endeavour to remove in whatever way seems safest to us; 621 on the other hand, whatsoever we deem to be good or useful for preserving our being, and enabling us to enjoy the rational life, we may appropriate to our use and employ as we think best. 622 Everyone without exception may, by sovereign right of Nature, do whatsoever you thinks will advance your own interest.

623 (IX.) Nothing can be in more harmony with the nature of any given thing than other individuals of the same species; 624 therefore for human in the preservation of own being and the enjoyment of the rational life there is nothing more useful than your fellow-human who is led by reason.

625 Further, as we know not anything among individual things which is more excellent than a person led by reason, no person can better display the power of own skill and disposition, than in so training people, that they come at last to live under the dominion of their own reason.

626 (X.) In so far as humans are influenced by envy or any kind of hatred, one towards another, they are at variance, and are therefore to be feared in proportion, as they are more powerful than their fellows.

627 (XI.) Yet minds are not conquered by force, but by love and high-mindedness.

628 (XII.) It is before all things useful to humans to associate their ways of life, to bind themselves together with such bonds as they think most fitted to gather them all into unity, and generally to do whatsoever serves to strengthen friendship.

629 (XIII.) But for this there is need of skill and watchfulness. For humans are diverse (seeing that those who live under the guidance

of reason are few), yet are they generally envious and more prone to revenge than to sympathy.

630 No small force of character is therefore required to take everyone as you are, and to restrain one's self from imitating the emotions of others. 631 But those who carp at humankind, and are more skilled in railing at vice than in instilling virtue, and who break rather than strengthen human's dispositions, are hurtful both to themselves and others. 632 Thus many from too great impatience of spirit, or from misguided religious zeal, have preferred to live among brutes rather than among humans; 633 as boys or youths, who cannot peaceably endure the chidings of their parents, will enlist as soldiers and choose the hardships of war and the despotic discipline in preference to the comforts of home and the admonitions of their father: 634 suffering any burden to be put upon them, so long as they may spite their parents.

635 (XIV.) Therefore, although humans are generally governed in everything by their own lusts, yet their association in common brings many more advantages than drawbacks. 636 Wherefore it is better to bear patiently the wrongs they may do us, and to strive to promote whatsoever serves to bring about harmony and friendship.

637 (XV.) Those things, which beget harmony, are such as are attributable to justice, equity, and honourable living. 638 For men brook ill not only what is unjust or iniquitous, but also what is reckoned disgraceful, or that a person should slight the received customs of their society. 639 For winning love those qualities are especially necessary which have regard to religion and piety.

640 (XVI.) Further, harmony is often the result of fear: but such harmony is insecure. 641 Further, fear arises from infirmity of spirit and moreover belongs not to the exercise of reason: the same is true of compassion, though this latter seems to bear a certain resemblance to piety.

642 (XVII.) Humans are also gained over by liberality, especially such as have not the means to buy what is necessary to sustain life. 643 However, to give aid to every poor person is far beyond the power and

the advantage of any private person. For the riches of any private person are wholly inadequate to meet such a call.

644 Again, an individual person's resources of character are too limited for you to be able to make all people your friends. 645 Hence providing for the poor is a duty, which falls on the State as a whole, and has regard only to the general advantage.

646 (XVIII.) In accepting favours, and in returning gratitude our duty must be wholly different.

647 (XIX.) Again, meretricious love, that is, the lust of generation arising from bodily beauty, and generally every sort of love, which owns anything save freedom of soul as its cause, readily passes into hate; 648 unless indeed, what is worse, it is a species of madness; and then it promotes discord rather than harmony.

649 (XX.) As concerning marriage, it is certain that this is in harmony with reason, if the desire for physical union be not engendered solely by bodily beauty, but also by the desire to beget children and to train them up wisely; 650 and moreover, if the love of both, to wit, of the man and of the woman, is not caused by bodily beauty only, but also by freedom of soul.

651 (XXI.) Furthermore, flattery begets harmony; but only by means of the vile offence of slavishness or treachery. None are more readily taken with flattery than the proud, who wish to be first, but are not.

652 (XXII.) There is in abasement a spurious appearance of piety and religion. Although abasement is the opposite to pride, yet is you that abases yourself most akin to the proud.

653 (XXIII.) Shame also brings about harmony, but only in such matters as cannot be hid. Further, as shame is a species of pain, it does not concern the exercise of reason.

654 (XXIV.) The remaining emotions of pain towards humans are directly opposed to justice, equity, honour, piety, and religion; 655 and, although indignation seems to bear a certain resemblance to equity, yet is life but lawless, where every person may pass judgment on another's deeds, and vindicate own or other people's rights.

DESIRES

656 (XXV.) Correctness of conduct (modestia), that is, the desire of pleasing people which is determined by reason, is attributable to piety. 657 But, if it spring from emotion, it is ambition, or the desire whereby, people, under the false cloak of piety, generally stir up discords and seditions. 658 For you who desires to aid your fellows. either in word or in deed, so that they may together enjoy the highest good, you, I say, will before all things strive to, win them over with love: 659 not to draw them into admiration, so that a system may be called after your name, nor to give any cause for envy.

660 Further, in your conversation you will shrink from talking of people's faults, and will be careful to speak but sparingly of human infirmity: but you will dwell at length on human virtue or power, and the way whereby it may be perfected.

661 Thus will humans be stirred not by fear, nor by aversion, but only by the emotion of joy, to endeavour, so far as in them lies, to live in obedience to reason.

662 (XXVI.) Besides humans, we know of no particular thing in Nature in whose mind we may rejoice, and whom we can associate with ourselves in friendship or any sort of fellowship; 663 therefore, whatsoever there be in Nature besides human, a regard for our advantage does not call on us to preserve, but to preserve or destroy according to its various capabilities, and to adapt to our use as best we may.

664 (XXVII.) The advantage which we derive from things external to us, besides the experience and knowledge which we acquire from observing them, and from recombining their elements in different forms, is principally the preservation of the body; 665 from this point of view, those things are most useful which can so feed and nourish the body, that all its parts may rightly fulfill their functions. 665 For, in proportion as the body is capable of being affected in a greater variety of ways, and of affecting external bodies in a great number of ways, so much the more is the mind capable of thinking. 666 But there seem to be very few

things of this kind in Nature; wherefore for the due nourishment of the body we must use many foods of diverse nature. 667 For the human body is composed of very many parts of different nature, which stand in continual need of varied nourishment, so that the whole body may be equally capable of doing everything that can follow from its own nature, 668 and consequently that the mind also may be equally capable of forming many perceptions.

669 (XXVIII.) Now for providing these nourishments the strength of each individual would hardly suffice, if people did not lend one another mutual aid. 670 But money has furnished us with a token for everything: hence it is with the notion of money, that the mind of the multitude is chiefly engrossed: 671 nay, it can hardly conceive any kind of pleasure, which is not accompanied with the idea of money as cause.

672 (XXIX.) This result is the fault only of those, who seek money, not from poverty or to supply their necessary, wants, but because they, have learned the arts of gain, wherewith they bring themselves to great splendour. 673 Certainly they nourish their bodies, according to custom, but scantily, believing that they lose as much of their wealth as they spend on the preservation of their body. 674 But they who know the true use of money, and who fix the measure of wealth solely with regard to their actual needs, live content with little.

675 (XXX.) As, therefore, those things are good which assist the various parts of the body, and enable them to perform their functions; 676 and as pleasure consists in an increase of, or aid to, human's power, in so far as you are composed of mind and body; it follows that all those things which bring pleasure are good. 677 But seeing that things do not work with the object of giving us pleasure, and that their power of action is not tempered to suit our advantage, and, lastly, that pleasure is generally referred to one part of the body more than to the other parts; 678 therefore most emotions of pleasure (unless reason and watchfulness be at hand), and consequently the desires arising therefrom, may

become excessive. 679 Moreover we may add that emotion leads us to pay most regard to what is agreeable in the present, nor can we estimate what is future with emotions equally vivid.

680 (XXXI.) Superstition, on the other hand, seems to account as good all that brings pain, and as bad all that brings pleasure. 681 However, as we said above, none but the envious take delight in my infirmity and trouble. For the greater the pleasure whereby we are affected, the greater is the perfection whereto we pass, and consequently the more do we partake of the divine Nature: 682 no pleasure can ever be evil, which is regulated by a true regard for our advantage. But contrariwise you, who is led by fear and does good only to avoid evil, is not guided by reason.

683 (XXXII.) But human power is extremely limited, and is infinitely surpassed by the power of external causes; we have not, therefore, an absolute power of shaping to our use those things which are without us.

684 Nevertheless, we shall bear with an equal mind all that happens to us in contravention to the claims of our own advantage, so long as we are conscious, that we have done our duty, and that the power which we possess is not sufficient to enable us to protect ourselves completely; 685 remembering that we are a part of universal Nature, and that we follow Her order. 686 If we have a clear and distinct understanding of this, that part of our nature which is defined by intelligence, in other words the better part of ourselves, will assuredly acquiesce in what befalls us, and in such acquiescence will endeavour to persist. 687 For, in so far as we are intelligent beings, we cannot desire anything save that which is necessary, nor yield absolute acquiescence to anything, save to that which is true: 688 wherefore, in so far as we have a right understanding of these things, the endeavour of the better part of ourselves is in harmony with the order of Nature as a whole.

The Book of Divine Panagogue called

FRIENDSHIP

FRIENDSHIP
AN ELEMENT OF LOVE
Ralph Waldo Emerson

1 We have a great deal more kindness than is ever spoken. Maugre all the selfishness that chills like east winds the world, the whole human family is bathed with an element of love like a fine ether. 2 How many persons we meet in houses whom we scarcely speak to, whom yet we honour, and who honour us; how many we see in the street, or sit with in church, whom, though silently, we warmly rejoice to be with! 3 Read the language of these wandering eye-beams. The heart knoweth.

The effect of the indulgence of this human affection is a certain cordial exhilaration. 4 In poetry, and in common *Affection the sweetness of life* speech, the emotions of benevolence and complacency which are felt towards others are likened to the material effects of fire; 5 so swift or much more swift, more active more cheering are these fine inward irradiations. 6 From the highest degree of passionate love, to the lowest degree of goodwill, they make the sweetness of life.

7 Our intellectual and active powers increase with our affection. 8 The scholar sits down to write, and all your years of meditation do not furnish you with one good thought or happy expression; but it is necessary to write a letter to a friend-- and, forthwith, troops of gentle thoughts invest themselves on every hand with chosen words. 9 See, in any house where virtue and self-respect abide, the palpitation which the approach of a stranger causes.

10 A commended stranger is expected *A stranger's arrival* and announced, and an uneasiness betwixt pleasure and pain invades all the hearts of a household. 11 Your arrival almost brings fear to the good hearts that would welcome you. The house is dusted, all things fly into their places, the old coat is exchanged for the new, and they must get up a dinner if they can. 12 Of a commended stranger, only the good report is told by others, only the good and new is heard by us. You stands to us for humanity. You are what we

wish. 13 Having imagined and invested you, we ask how we should stand related in conversation and action with such a person, and are uneasy with fear. 14 The same idea exalts conversation with you. We talk better than we are wont. We have the nimblest fancy, a richer memory, and our dumb devil has taken leave for the time. 15 For long hours we can continue a series of sincere, graceful, rich communications, drawn from the oldest, secretest experience, so that they who sit by, of our own kinsfolk and acquaintance, shall feel a lively surprise at our unusual powers. 16 But as soon as the stranger begins to intrude own partialities, own definitions, own defects, into the conversation, it is all over. You have heard the first, the last, and best you will ever hear from us. 17 You are no stranger now. Vulgarity, ignorance, misapprehension are old acquaintances.

18 Now, when you comes, you may get the order, the dress, and the dinner-- but the throbbing of the heart, and the communications of the soul, no more.

19 What is so pleasant as these jets of affection which make a young world for me again? What so delicious as a just and firm encounter of two, in a thought, in a feeling? 20 How beautiful, on their approach to this beating heart, the steps and forms of the gifted and the true! 21 The moment we indulge our affections, the earth is metamorphosed; there is no winter, and no night; all tragedies, all ennuis, vanish-- all duties even; nothing fills the proceeding eternity but the forms all radiant of beloved persons.

22 Let the soul be assured that somewhere in the universe it should rejoin its friend, and it would be content and cheerful alone for a thousand years.

23 I awoke this morning with devout thanksgiving for my friends, the old and the new. Shall I not call God the Beautiful, who daily showeth Himself so to me in His gifts? 24 I chide society, I embrace solitude, and yet I am not so ungrateful as not to see the wise, the lovely, and the noble-minded, as from time to time they pass my gate. 25 Who hears me, who understands me, becomes

mine-- a possession for all time. 26 Nor is Nature so poor but She gives me this joy several times, and thus we weave social threads of our own, a new web of relations; 27 and, as many thoughts in succession substantiate themselves, we shall by and by stand in a new world of our own creation, and no longer strangers and pilgrims in a traditionary globe. 28 My friends have come to me unsought. The great God gave them to me. By oldest right, by the divine affinity of virtue with itself, I find them, or rather not I, 29 but the Deity in me and in them derides and cancels the thick walls of individual character, relation, age, sex, circumstance, at which you usually connives, and now makes many one. 30 High thanks I owe you, excellent lovers, who carry out the world for me to new and noble depths, and enlarge the meaning of all my thoughts.

31 These are new poetry of the first Bard-- poetry without stop-- hymn, ode, and epic, poetry still flowing, Apollo and the Muses chanting still. 32 Will these, too, separate themselves from me again, or some of them? I know not, but I fear it not; 33 for my relation to them is so pure that we hold by simple affinity, and the Genius of my life being thus social, the same affinity will exert its energy on whomsoever is as noble as these men and women, wherever I may be.

34 I confess to an extreme tenderness of Nature on this point. It is almost dangerous to me to 'crush the sweet poison of misused wine' of the affections. 35 A new person is to me a great event, and hinders me from sleep. I have often had fine fancies about persons which have given me delicious hours; but the joy ends in the day; it yields no fruit. 36 Thought is not born of it; my action is very little modified. I must feel pride in my friends' accomplishments as if they were mine-- and a property in their virtues. 37 I feel as warmly when you are praised as the lover when you hears applause of your engaged maiden. 38 We over-estimate the conscience of our friend. Your goodness seems better than our goodness, your nature finer, your temptations less. 39 Everything that is yours-- your

name, your form, your dress, books, and instruments-- fancy enhances. 40 Our own thought sounds new and larger from your mouth. Yet the systole and diastole of the heart are not without their analogy in the ebb and flow of love. 41 Friendship, like the immortality of the soul, is too good to be believed. 42 The lover, beholding his maiden, half knows that she is not verily that which he worships; and in the golden hour of friendship we are surprised with shades of suspicion and unbelief. 43 We doubt that we bestow on our hero the virtues in which you shines, and afterwards worship the form to which we have ascribed this divine inhabitation. 44 In strictness, the soul does not respect humans as it respects itself. In strict science all persons underlie the same condition of an infinite remoteness. 45 Shall we fear to cool our love by mining for the metaphysical foundation of this Elysian temple? Shall I not be as real as the things I see? 46 If I am, I shall not fear to know them for what they are. Their essence is not less beautiful than their appearance, though it needs finer organs for its apprehension. 47 The root of the plant is not unsightly to science, though for chaplets and festoons we cut the stem short. 48 And I must hazard the production of the bald fact amidst these pleasing reveries, though it should prove an Egyptian skull at our banquet. 49 A person who stands united with own thought conceives magnificently of the self. You are conscious of a universal success, even though bought by uniform particular failures.

50 No advantages, no powers, no gold or force, can be any match for you. I cannot choose but rely on my own poverty more than on your wealth. I cannot make your consciousness tantamount to mine. 51 Only the star dazzles; the planet has a faint, moon-like ray. 52 I hear what you say of the admirable parts and tried temper of the party you praise, but I see well that for all your purple cloaks I shall not like you, unless you are at last a poor Greek like me. 53 I cannot deny it, O friend, that the vast shadow of the Phenomenal includes thee also in its pied and painted immensity,-- thee, also, compared with whom all else is

shadow. 54 Thou art not Being, as Truth is, as Justice is,-- thou art not my soul, but a picture and effigy of that. Thou hast come to me lately, and already thou art seizing thy hat and cloak. 55 It is not that the soul puts forth friends as the tree puts forth leaves, and presently, by the germination of new buds, extrudes the old leaf?

56 The law of Nature is alternation forevermore. Each electrical state super-induces the opposite. 57 The soul environs itself with friends, that it may enter into a grander self-acquaintance or solitude; and it goes alone for a season, that it may exalt its conversation or society. 58 This method betrays itself along the whole history of our personal relations. The instinct of affection revives the hope of union with our mates, and the returning sense of insulation recalls us from the chase. 59 Thus every human passes own life in the search after friendship, and if you should record your true sentiment, you might write a letter like this to each new candidate for your love.

60 DEAR FRIEND,-- If I was sure of thee, sure of thy capacity, sure to match my mood with thine, I should never think again of trifles in relation to thy comings and goings. 61 I am not very wise; my moods are quite attainable; and I respect thy genius; it is to me as yet unfathomed; yet dare I not presume in thee a perfect intelligence of me, and so thou art to me a delicious torment. Thine ever, or never.

62 Yet these uneasy pleasures and fine pains are for curiosity, and not for life. They are not to be indulged. This is to weave cobweb, and not cloth. 63 Our friendships hurry to short and poor conclusions, because we have made them a texture of wine and dreams, instead of the tough fibre of the human heart. 64 The laws of friendship are austere and eternal, of one web with the laws of Nature and of morals. 65 But we have aimed at a swift and petty benefit, to suck a sudden sweetness. We snatch at the slowest fruit in the whole garden of God, which many summers and many winters must ripen. 66 We seek our friend not sacredly, but with an adulterate passion which would appropriate you to ourselves. 67 In vain. We are armed all over with subtle

antagonisms, which, as soon as we meet, begin to play, and translate all poetry into stale prose. 68 Almost all people descend to meet. All association must be a compromise, and, what is worst, the very flower and aroma of the flower of each of the beautiful natures disappears as they approach each other. 69 What a perpetual disappointment is actual society, even of the virtuous and gifted! 70 After interviews have been compassed with long foresight, we must be tormented presently by baffled blows, by sudden, unseasonable apathies, by epilepsies of wit and of animal spirits, in the heyday of friendship and thought. 71 Our faculties do not play us true, and both parties are relieved by solitude.

72 I ought to be equal to every relation. It makes no difference how many friends I have, and what content I can find in conversing with each, if there be one to whom I am not equal. 73 If I have shrunk unequal from one contest, the joy I find in all the rest becomes mean and cowardly. I should hate myself, if then I made my other friends my asylum.

74 ‘The valiant warrior famoused for fight,
After a hundred victories, once foiled,
Is from the book of honour razed quite,
And all the rest forgot for which you toiled.’

75 Our impatience is thus sharply rebuked. Bashfulness and apathy are a tough husk, in which a delicate organisation is protected from premature ripening. 76 It would be lost if it knew itself before any of the best souls were yet ripe enough to know and own it.

77 Respect the ‘Naturlangsamkeit’ which hardens the ruby in a million years, and works in duration, in which Alps and Andes come and go as rainbows. 78 The good spirit of our life has no heaven which is the price of rashness. 79 Love, which is the essence of God, is not for levity, but for the total worth of human. Let us not have this childish luxury in our regards, but the austerest worth; 80 let us approach our friend with an audacious trust in the truth of your heart, in the

breadth, impossible to be overturned, of your foundations.

81 The attractions of this subject are not to be resisted, and I leave, for the time, all account of subordinate social benefit, 82 to speak of that select and sacred relation which is a kind of absolute, and which even leaves the language of love suspicious and common, so much is this purer, and nothing is so much divine.

83 I do not wish to treat friendships daintily, but with roughest courage. When they are real, they are not glass threads or frostwork, but the solidest thing we know.

84 For now, after so many ages of experience, what do we know of Nature, or of ourselves? 85 Not one step has human taken toward the solution of the problem of your destiny. In one condemnation of folly stand the whole universe of humans. 86 But the sweet sincerity of joy and peace, which I draw from this alliance with my brother's soul, is the nut itself, whereof all nature and all thought is but the husk and shell.

87 Happy is the house that shelters a friend! It might well be built, like a festal bower or arch, to entertain you a single day. Happier, if you know the solemnity of that relation, and honour its law! 88 You who offers yourself a candidate for that covenant comes up, like an Olympian to the great games where the first-born of the world are the competitors. 89 You proposes yourself for contests where Time, Want, Danger are in the lists, and you alone is victor who has truth enough in your constitution to preserve the delicacy of your beauty from the wear and tear of all these. 90 The gifts of fortune may be present or absent, but all the speed in that contest depends on intrinsic nobleness, and the contempt of trifles. 91 There are two elements that go to the composition of friendship, each so sovereign that I can detect no superiority in either, no reason why either should be first named. One is Truth. 92 A friend is a person with whom I may be sincere. Before you I may think aloud. I am arrived at last in the presence of a person so real and equal, that I may drop even those undermost garments of

dissimulation, courtesy, 93 and second thought, which humans never put off, and may deal with you with the simplicity and wholeness with which one chemical atom meets another. 94 Sincerity is the luxury allowed, like diadems and authority, only to the highest rank, ‘that’ being permitted to speak truth as having none above it to court or conform unto. 95 Every human alone is sincere. At the entrance of a second person, hypocrisy begins. 96 We parry and fend the approach of our fellow-human by compliments, by gossip, by amusements, by affairs. We cover up our thought from you under a hundred folds.

97 I knew a man, who, under a certain religious frenzy, cast off this drapery, and, omitting all compliment and commonplace, spoke to the conscience of every person he encountered, and that with great insight and beauty. 98 At first he was resisted, and all men agreed he was mad. But persisting, as indeed he could not help doing, for some time in this course, he attained to the advantage of bringing every man of his acquaintance into true relations with him. 99 No man would think of speaking falsely with him, or of putting him off with any chat of markets or reading-rooms.

100 But every human was constrained by so much sincerity to the like plain-dealing, and what love of Nature, what poetry, what symbol of truth one had. But to most of us society shows not its face and eye, but its side and its back. 101 To stand in true relations with people in a false age is worth a fit of insanity, is it not? We can seldom go erect. Almost every person we meet requires some civility,-- requires to be humoured; 102 you have some fame, some talent, some whim of religion or philanthropy in your head that is not to be questioned, and which spoils all conversation with you. 103 But a friend is a sane person who exercises not my ingenuity, but me. My friend gives me entertainment without requiring any stipulation on my part. A friend, therefore, is a sort of paradox in Nature. 104 I who alone am, I who see nothing in Nature whose existence I can affirm with

equal evidence to my own, behold now the semblance of my being, in all its height, variety, and curiosity, reiterated in a foreign form; so that a friend may well be reckoned the masterpiece of Nature.

105 The other element of friendship is tenderness. We are holden to humans by every sort of tie, by blood, by pride, by fear, by hope, by lucre, by lust, by hate, by admiration, by every circumstance and badge and trifle, 106 but we can scarce believe that so much character can subsist in another as to draw us by love. 107 Can another be so blessed, and we so pure, that we can offer you tenderness? When a person becomes dear to me, I have touched the goal of fortune. 108 I find very little written directly to the heart of this matter in books. And yet I have one text which I cannot choose but remember. My author says-- 'I offer myself faintly and bluntly to those whose I effectually am, and tender myself least to you to whom I am the most devoted.' 109 I wish that friendship should have feet, as well as eyes and eloquence. It must plant itself on the ground before it vaults over the moon. I wish it to be a little of a citizen before it is quite a cherub. We chide the citizen because you makes love a commodity.

110 It is an exchange of gifts, of useful loans; it is good neighbourhood; it watches with the sick; it holds the pall at the funeral; and quite loses sight of the delicacies and nobility of the relation. 111 But though we cannot find the god under this disguise of a sutler, yet, on the other hand, we cannot forgive the poet if you spins your thread too fine, and does not substantiate your romance by the municipal virtues of justice, punctuality, fidelity, and pity. 112 I hate the prostitution of the name of friendship to signify modish and worldly alliances. 113 I much prefer the company of plough-boys and tin-pedlars to the silken and perfumed amity which celebrates its days of encounter by a frivolous display, by rides in a curricle, and dinners at the best taverns. 114 The end of friendship is a commerce the most strict and homely that can be joined; more strict than any of which we have

experience. 115 It is for aid and comfort through all the relations and passages of life and death. It is fit for serene days, and graceful gifts, and country rambles, but also for rough roads and hard fare, shipwreck, poverty, and persecution. 116 It keeps company with the sallies of the wit and the trances of religion. We are to dignify to each other the daily needs and offices of human's life, and embellish it by courage, wisdom, and unity. 117 It should never fall into something usual and settled, but should be alert and inventive, and add rhyme and reason to what was drudgery.

118 Friendship may be said to require natures so rare and costly, each so well tempered and so happily adapted, and withal so circumstanced (for even in that particular, a poet says, love demands that the parties be altogether paired), that its satisfaction can very seldom be assured. 119 It cannot subsist in its perfection, say some of those who are learned in this warm lore of the heart, betwixt more than two. 120 I am not quite so strict in my terms, perhaps because I have never known so high a fellowship as others. I please my imagination more with a circle of godlike men and women variously related to each other, and between whom subsists a lofty intelligence. 121 But I find this law of 'one to one' peremptory for conversation, which is the practice and consummation of friendship. 122 Do not mix waters too much. The best mix as ill as good and bad. 123 You shall have very useful and cheering discourse at several times with two several people, but let all three of you come together, and you shall not have one new and hearty word. 124 Two may talk and one may hear, but three cannot take part in a conversation of the most sincere and searching sort. 125 In good company there is never such discourse between two, across the table, as takes place when you leave them alone. 126 In good company, the individuals merge their egotism into a social soul exactly coextensive with the several consciousnesses there present. 127 No partialities of friend to friend, no fondnesses of brother to sister, of wife to husband, are there pertinent, but

quite otherwise. 128 Only you may then speak who can sail on the common thought of the party, and not poorly limited to your own. Now this convention, which good sense demands, destroys the high freedom of great conversation, which requires an absolute running of two souls into one.

129 No two people but, being left alone with each other, enter into simpler relations. Yet it is affinity that determines ‘which’ two shall converse. 130 Unrelated people give little joy to each other; will never suspect the latent powers of each. 131 We talk sometimes of a great talent for conversation, as if it were a permanent property in some individuals. Conversation is an evanescent relation, no more. 132 A person is reputed to have thought and eloquence; you cannot, for all that, say a word to your cousin or your uncle. 133 They accuse your silence with as much reason as they would blame the insignificance of a dial in the shade. 134 In the sun it will mark the hour. Among those who enjoy your thought, you will regain your tongue.

135 Friendship requires that rare mean betwixt likeness and unlikeness, that piques each with the presence of power and of consent in the other party. 136 Let me be alone to the end of the world, rather than that my friend should overstep, by a word or a look, your real sympathy. I am equally balked by antagonism and by compliance. 137 Let you not cease an instant to be yourself. The only joy I have in your being mine, is that the 'not mine' is 'mine'. 138 I hate, where I looked for a humanly furtherance, or at least a humanly resistance, to find a mush of concession.

139 Better be a nettle in the side of your friend than your echo. The condition which high friendship demands is ability to do without it.

140 That high office requires great and sublime parts. There must be very two, before there can be very one. Let it be an alliance of two large, formidable natures, mutually beheld, mutually feared, before yet they recognise the deep identity which beneath these disparities unites them.

141 You only is fit for this society who is magnanimous; who is sure

that greatness and goodness are always economy; who is not swift to inter-meddle with your fortunes. 142 Let you not inter-meddle with this. Leave to the diamond its ages to grow, nor expect to accelerate the births of the eternal. 143 Friendship demands a religious treatment. We talk of choosing our friends, but friends are self-elected, Reverence is a great part of it. Treat your friend as a spectacle. 144 Of course you have merits that are not yours, and that you cannot honour, if you must needs hold them close to your person. Stand aside; give those merits room; let them mount and expand. Are you the friend of your friends' buttons, or of their thought?

145 To a great heart you will be a stranger in a thousand particulars, that you may come near in the holiest ground. 146 Leave it to girls and boys to regard a friend as property, and to suck a short and all-confounding pleasure, instead of the noblest benefit.

147 Let us buy our entrance to this guild by a long probation. Why should we desecrate noble and beautiful souls by intruding on them? 148 Why insist on rash personal relations with your friend? Why go to their house, or know their mother and brother and sisters? Why be visited by them at your own? Are these things material to our covenant? Leave this touching and clawing.

149 Let you be to me a spirit. A message, a thought, a sincerity a glance from you, I want, but not news, nor pottage. 150 I can get politics, and chat, and neighbourly conveniences from cheaper companions. Should not the society of my friend be to me poetic, pure, universal, and great as Nature itself? 151 Ought I to feel that our tie is profane in comparison with yonder bar of cloud that sleeps on the horizon, or that clump of waving grass that divides the brook? 152 Let us not vilify, but raise it to that standard. That great, defying eye, that scornful beauty of your mien and action, do not pique yourself on reducing, but rather fortify and enhance.

153 Worship your superiorities; wish them not less by a thought, but hoard and tell them all. Guard them as thy counterpart. Let them

be to thee for ever a sort of beautiful enemy, untamable, devoutly revered, and not a trivial conveniency to be soon outgrown and cast aside. 154 The hues of the opal, the light of the diamond, are not to be seen, if the eye is too near. To my friend I write a letter, and from you I receive a letter. That seems to you a little. It suffices me. 155 It is a spiritual gift worthy of you to give, and of me to receive. It profanes nobody. In these warm lines the heart will trust itself, as it will not to the tongue, and pour out the prophecy of a godlier existence than all the annals of heroism have yet made good.

156 Respect so far the holy laws of this fellowship as not to prejudice its perfect flower by your impatience for its opening. 157 We must be our own before we can be another's. There is at least this satisfaction in the crime, according to the Latin proverb-- you can speak to your accomplice on even terms. 'Crimen quos inquinat, æquat.' 158 To those whom we admire and love, at first we cannot. Yet the least defect of self-possession vitiates, in my judgment, the entire relation. 159 There can never be deep peace between two spirits, never mutual respect, until, in their dialogue, each stands for the whole world.

160 What is so great as friendship, let us carry with what grandeur of spirit we can. Let us be silent-- so we may hear the whisper of the gods. Let us not interfere.

161 Who set you to cast about what you should say to the select souls, or how to say anything to such? No matter how ingenious, no matter how graceful and bland. There are innumerable degrees of folly and wisdom, and for you to say aught is to be frivolous. 162 Wait, and thy heart shall speak. Wait until the necessary and everlasting overpowers you, until day and night avail themselves of your lips. 163 The only reward of virtue is virtue; the only way to have a friend is to be one. 164 You shall not come nearer a person by getting into their house. If unlike, your soul only flees the faster from you, and you shall never catch a true glance of its eye. 165 We see the noble afar off, and they repel us; why should we intrude? Late-- very late-- we perceive that no

arrangements, no introductions, no consuetudes or habits of society, would be of any avail to establish us in such relations with them as we desire-- 166 but solely the uprise of nature in us to the same degree it is in them; then shall we meet as water with water; and if we should not meet them then, we shall not want them, for we are already they. 167 In the last analysis, love is only the reflection of a human's own worthiness from other humans. 168 People have sometimes exchanged names with their friends, as if they would signify that in their friend each loved own soul.

169 The higher the style we demand of friendship, of course the less easy to establish it with flesh and blood. 170 We walk alone in the world. Friends, such as we desire, are dreams and fables. 171 But a sublime hope cheers ever the faithful heart, that elsewhere, in other regions of the universal power, souls are now acting, enduring, and daring, which can love us, and which we can love. 172 We may congratulate ourselves that the period of nonage, of follies, of blunders, and of shame is passed in solitude, and when we are finished people, we shall grasp heroic hands in heroic hands. 173 Only be admonished by what you already see, not to strike leagues of friendship with cheap persons, where no friendship can be.

174 Our impatience betrays us into rash and foolish alliances which no God attends. By persisting in your path, though you forfeit the little you gain the great. 175 You demonstrate yourself, so as to put yourself out of the reach of false relations, and you draw to you the first-born of the world-- those rare pilgrims whereof only one or two wander in Nature at once, and before whom the vulgar great show as spectres and shadows merely.

176 It is foolish to be afraid of making our ties too spiritual, as if so we could lose any genuine love. 177 Whatever correction of our popular views we make from insight, Nature will be sure to bear us out in, and though it seem to rob us of some joy, will repay us with a greater. 178 Let us feel, if we will, the absolute insulation of human. We are sure that we have

all in us. We go to Europe, or we pursue persons, or we read books, in the instinctive faith that these will call it out and reveal us to ourselves. 179 Beggars all. The persons are such as we; the Europe an old faded garment of dead persons; the books their ghosts. 180 Let us drop this idolatry. Let us give over this mendicancy. Let us even bid our dearest friends farewell, and defy them, saying, 'Who are you? Unhand me: I will be dependent no more.'

181 Ah! seest thou not, O brother, that thus we part only to meet again on a higher platform, and only be more each other's, because we are more our own? 182 A friend is Janus-faced: you looks to the past and the future. You are the child of all my foregoing hours, the prophet of those to come, and the harbinger of a greater friend.

183 I do then with my friends as I do with my books. I would have them where I can find them, but I seldom use them. 184 We must have society on our own terms, and admit or exclude it on the slightest cause. 185 I cannot afford to speak much with my friend. If you are great, you makes me so great that I cannot descend to converse. 186 In the great days, presentiments hover before me in the firmament. I ought then to dedicate myself to them. I go in that I may seize them, I go out that I may seize them. I fear only that I may lose them receding into the sky in which now they are only a patch of brighter light. 187 Then, though I prize my friends, I cannot afford to talk with them and study their visions, lest I lose my own. 188 It would indeed give me a certain household joy to quit this lofty seeking, this spiritual astronomy, or search of stars, and come down to warm sympathies with you; but then I know well I shall mourn always the vanquishing of my mighty gods. 189 It is true, next week I shall have languid moods, when I can well afford to occupy myself with foreign objects; then I shall regret the lost literature of your mind, and wish you were by my side again. 190 But if you come, perhaps you will fill my mind only with new visions, not with yourself but with your lustres, and I shall not be able any more than now to converse with you.

191 So I will owe to my friends this evanescent intercourse. I will receive from them, not what they have, but what they are. 192 They shall give me that which properly they cannot give, but which emanates from them. But they shall not hold me by any relations less subtle and pure. We will meet as though we met not, and part as though we parted not.

193 It has seemed to me lately more possible than I knew, to carry a friendship greatly, on one side, without due correspondence on the other. 194 Why should I cumber myself with regrets that the receiver is not capacious? It never troubles the sun that some of his rays fall wide and vain into ungrateful space, and only a small part on the reflecting planet. 195 Let your greatness educate the crude and cold companion. If you are unequal, you will presently pass away; but thou art enlarged by thy own shining, and, no longer a mate for frogs and worms, dost soar and burn with the gods of the empyrean.

196 It is thought a disgrace to love unrequited. But the great will see that true love cannot be unrequited. 197 True love transcends the unworthy object, and dwells and broods on the eternal, and when the poor interposed mask crumbles, it is not sad, but feels rid of so much earth, and feels its independency the surer. 198 Yet these things may hardly be said without a sort of treachery to the relation. The essence of friendship is entireness, a total magnanimity and trust. It must not surmise or provide for infirmity. It treats its object as a god, that it may deify both.

FRIENDS AND FRIENDSHIP

Henry D. Thoreau

2 No word is oftener on the lips of humans than Friendship, and indeed no thought is more familiar to their aspirations. 2 All humans are dreaming of it, and its drama, which is always a tragedy, is enacted daily. It is the secret of the universe. 3 You may thread the town, you may wander the country, and none shall ever speak of it, yet thought is everywhere busy about it, and the idea of what is possible in this respect affects

our behaviour toward all new men and women and a great many old ones.

4 Nevertheless, I can remember only two or three essays on this subject in all literature. No wonder that the Mythology, and Arabian Nights, and Shakespeare, and Scott's novels entertain us: we are poets and fablers and dramatists and novelists ourselves. 5 We are continually acting a part in a more interesting drama than any written. We are dreaming that our Friends are our 'Friends', and that we are our Friends' 'Friends'. 6 Our actual Friends are but distant relations of those to whom we are pledged. We never exchange more than three words with a Friend in our lives on that level to which our thoughts and feelings almost habitually rise.

7 One goes forth prepared to say, 'Sweet Friends!' and the salutation is, 'Damn your eyes!' But never mind; faint heart never won true Friend. 8 Oh, my Friend, may it come to pass once, that when you are my Friend I may be yours.

9 Of what use the friendliest dispositions even, if there are no hours given to Friendship, if it is for ever postponed to unimportant duties and relations? 10 Friendship is first, Friendship last. But it is equally impossible to forget our Friends, and to make them answer to our ideal.

11 When they say farewell, then indeed we begin to keep them company. How often we find ourselves turning our backs on our actual Friends that we may go and meet their ideal cousins! I would that I were worthy to be any person's Friend.

12 What is commonly honoured with the name of Friendship is no very profound or powerful instinct. Humans do not, after all, 'love' their friends greatly. 13 I do not often see the farmers made seers and wise to the verge of insanity by their Friendship for one another. They are not often transfigured and translated by love in each other's presence.

14 I do not observe them purified, refined, and elevated by the love of a human. If one abates a little the price of your wood, or gives a neighbour your vote at town-meeting, or a barrel of apples, or lends them your wagon frequently, it is esteemed a rare instance of Friendship. 15 Nor do the farmers'

wives lead lives consecrated to Friendship. I do not see the pair of farmer Friends of either sex prepared to stand against the world. There are only two or three couples in history.

16 To say that a person is your Friend means commonly no more than this, that one is not your enemy. 17 Most contemplate only what would be the accidental and trifling advantages of Friendship, as that the Friend can assist in time of need by own substance, or own influence, or own counsel; 18 but you who foresees such advantages in this relation proves yourself blind to its real advantage, or indeed wholly inexperienced in the relation itself.

19 Such services are particular and menial compared with the perpetual and all-embracing service which it is. 20 Even the utmost goodwill and harmony and practical kindness are not sufficient for Friendship, for Friends do not live in harmony merely, as some say, but in melody. 21 We do not wish for Friends to feed and clothe our bodies-- neighbours are kind enough for that-- but to do the like office to our spirits. 22 For this, few are rich enough, however well disposed they may be. For the most part we stupidly confound one person with another. 23 The dull distinguish only races or nations, or at most classes, but the wise person, individuals. 24 To your Friend a human's peculiar character appears in every feature and in every action, and it is thus drawn out and improved by you.

25 Think of the importance of Friendship in the education of humans.

'You that hath love and judgment too,
Sees more than any other doe.'

26 It will make a person honest; it will make you a hero; it will make you a saint. It is the state of the just dealing with the just, the magnanimous with the magnanimous, the sincere with the sincere, human with human.

27 And it is well said by another poet--

'Why love among the virtues is not known,
Is that love is them all contract in one.'

28 All the abuses which are the object of reform with the philanthropist, the statesman, and

the housekeeper are unconsciously amended in the intercourse of Friends. 29 A Friend is one who incessantly pays us the compliment of expecting from us all the virtues, and who can appreciate them in us. 30 It takes two to speak the truth-- one to speak and another to hear. How can one treat with magnanimity mere wood and stone? If we dealt only with the false and dishonest, we should at last forget how to speak truth. 31 Only lovers know the value and magnanimity of truth, while traders prize a cheap honesty, and neighbours and acquaintance a cheap civility. 32 In our daily intercourse with humans our nobler faculties are dormant and suffered to rust. None will pay us the compliment to expect nobleness from us. Though we have gold to give, they demand only copper.

33 We ask our neighbours to suffer themselves to be dealt with truly, sincerely, nobly; but they answers no by their deafness. 34 You does not even hear this prayer. You says practically, I will be content if you treat me as ‘no better than I should be,’ as deceitful, mean, dishonest, and selfish. 35 For the most part, we are contented so to deal and to be dealt with, and we do not think that for the mass of humans there is any truer and nobler relation possible. 36 A person may have 'good' neighbours, so called, and acquaintances, and even companions, wife, parents, brothers, sisters, children, who meet the self and one another on this ground only.

37 The State does not demand justice of its members, but thinks that it succeeds very well with the least degree of it, hardly more than rogues practice; and so do the neighbourhood and the family. 38 What is commonly called Friendship even is only a little more honour among rogues.

39 But sometimes we are said to 'love' another-- that is, to stand in a true relation to you, so that we give the best to, and receive the best from, you. 40 Between whom there is hearty truth, there is love; and in proportion to our truthfulness and confidence in one another, our lives are divine and miraculous, and answer to our ideal. 41 There are passages of affection in our intercourse with

mortal men and women such as no prophecy had taught us to expect, which transcend our earthly life and anticipate Heaven for us. 42 What is this Love that may come right into the middle of a prosaic Goffstown day, equal to any of the gods; 43 that discovers a new world, fair and fresh and eternal, occupying the place of the old one, when to the common eye a dust has settled on the universe? which world cannot else be reached, and does not exist. 44 What other words, we may almost ask, are memorable and worthy to be repeated than those which love has inspired?

45 It is wonderful that they were ever uttered. They are few and rare indeed; but, like a strain of music, they are incessantly repeated and modulated by the memory. 46 All other words crumble off with the stucco which overlies the heart. We should not dare to repeat these now aloud. We are not competent to hear them at all times.

47 The books for young people say a great deal about the 'selection' of Friends; it is because they really have nothing to say about 'Friends'.

48 They mean associates and confidants merely. ‘Know that the contrariety of foe and Friend proceeds from God.’ 49 Friendship takes place between those who have an affinity for one another, and is a perfectly natural and inevitable result. 50 No professions nor advances will avail. Even speech, at first, necessarily has nothing to do with it; but it follows after silence, as the buds in the graft do not put forth into leaves till long after the graft has taken. It is a drama in which the parties have no part to act. We are all Mussulmen and fatalists in this respect.

51 Impatient and uncertain lovers think that they must say or do something kind whenever they meet; they must never be cold. 52 But they who are Friends do not know what they ‘think’ they must, but what they ‘must’. Even their Friendship is to some extent but a sublime phenomenon to them.

53 The true and not despairing Friend will address own Friend in some such terms as these:--

‘I never asked thy leave to let me love thee-- I have a right. 54 I love thee not as something private and

personal, which is 'your own', but as something universal and worthy of love, 'which I have found'. 55 Oh, how I think of you! You are purely good-- you are infinitely good. I can trust you for ever. I did not think that humanity was so rich. Give me an opportunity to live.'

56 'You are the fact in a fiction-- you are the truth more strange and admirable than fiction. Consent only to be what you are. I alone will never stand in your way.'

57 'This is what I would like-- to be as intimate with you as our spirits are intimate-- respecting you as I respect my ideal. Never to profane one another by word or action, even by a thought. Between us, if necessary, let there be no acquaintance.'

58 'I have discovered you; how can you be concealed from me?'

59 The Friend asks no return but that own Friend will religiously accept and wear and not disgrace own apotheosis of theself. They cherish each other's hopes. They are kind to each other's dreams.

60 Though the poet says, ''Tis the pre-eminence of Friendship to impute excellence,' yet we can never praise our Friend, nor esteem you praiseworthy, nor let you think that you can please us by any 'behaviour', or ever 'treat' us well enough.

61 That kindness which has so good a reputation elsewhere can least of all consist with this relation, and no such affront can be offered to a Friend, as a conscious goodwill, a friendliness which is not a necessity of the Friend's nature.

62 The sexes are naturally most strongly attracted to one another by constant constitutional differences, and are most commonly and surely the complements of each other. 63 How natural and easy it is for man to secure the attention of woman to what interests yourself! Men and women of equal culture, thrown together, are sure to be of a certain value to one another, more than men to men. 64 There exists already a natural disinterestedness and liberality in such society, and I think that any man will more confidently carry his favourite books to read to some circle of intelligent women than to one of his own sex. 65 The visit of man to

man is wont to be an interruption, but the sexes naturally expect one another. Yet Friendship is no respecter of sex; and perhaps it is more rare between the sexes than between two of the same sex.

66 Friendship is, at any rate, a relation of perfect equality. It cannot well spare any outward sign of equal obligation and advantage. 67 The nobleman can never have a Friend among his retainers, nor the king among his subjects. Not that the parties to it are in all respects equal, but they are equal in all that respects or affects their Friendship. 68 The one's love is exactly balanced and represented by the other's. Persons are only the vessels which contain the nectar, and the hydrostatic paradox is the symbol of love's law. 69 It finds its level and rises to its fountainhead in all breasts, and its slenderest column balances the ocean.

'And love as well the shepherd can
As can the mighty nobleman.'

70 The one sex is not, in this respect, more tender than the other. A hero's love is as delicate as a maiden's. 71 Confucius said, 'Never contract Friendship with a person who is not better than thyself.' It is the merit and preservation of Friendship that it takes place on a level higher than the actual characters of the parties would seem to warrant. 72 The rays of light come to us in such a curve that every person whom we meet appears to be taller than you actually is. Such foundation has civility.

73 My Friend is that one whom I can associate with my choicest thought. I always assign to you a nobler employment in my absence than I ever find you engaged in; and I imagine that the hours which you devotes to me were snatched from a higher society. 74 The sorest insult which I ever received from a Friend was when he behaved with the licence which only long and cheap acquaintance allows to one's faults, in my presence, without shame, and still addressed me in friendly accents. 75 Beware, lest thy Friend learn at last to tolerate one frailty of thine, and so an obstacle be raised to the progress of thy love. 76 There are times when we have had enough even of our Friends, when we begin inevitably to profane one

another, and must withdraw religiously into solitude and silence, the better to prepare ourselves for a loftier intimacy. 77 Silence is the ambrosial night in the intercourse of Friends, in which their sincerity is recruited and takes deeper root.

78 Friendship is never established as an understood relation. Do you demand that I be less your Friend that you may know it? Yet what right have I to think that another cherishes so rare a sentiment for me? 79 It is a miracle which requires constant proofs. It is an exercise of the purest imagination and the rarest faith. 80 It says by a silent but eloquent behaviour--'I will be so related to thee as thou canst imagine; even so thou mayest believe. I will spend truth--all my wealth on thee,'-- and the Friend responds silently through own nature and life, and treats own Friend with the same divine courtesy. 81 You knows us literally through thick and thin. You never asks for a sign of love, but can distinguish it by the features which it naturally wears. 82 We never need to stand upon ceremony with you with regard to your visits. Wait not till I invite thee, but observe that I am glad to see thee when thou comest. It would be paying too dear for thy visit to ask for it. 83 Where my Friend lives there are all riches and every attraction, and no slight obstacle can keep me from you. Let me never have to tell thee what I have not to tell. Let our intercourse be wholly above ourselves, and draw us up to it.

84 The language of Friendship is not words, but meanings. It is an intelligence above language.

85 One imagines endless conversations with own Friend, in which the tongue shall be loosed, and thoughts be spoken without hesitancy or end; but the experience is commonly far otherwise. 86 Acquaintances may come and go, and have a word ready for every occasion; but what puny word shall you utter whose very breath is thought and meaning? 87 Suppose you go to bid farewell to your Friend who is setting out on a journey; what other outward sign do you know than to shake their hand? 88 Have you any palaver ready for them then? Any box of salve to commit

to their pocket? Any particular message to send by them? Any statement which you had forgotten to make?-- as if you could forget anything. 89 No; it is much that you take their hand and say Farewell; that you could easily omit; so far custom has prevailed. 90 It is even painful, if they are to go, that they should linger so long. If they must go, let them go quickly. Have you any 'last' words?

91 Alas, it is only the word of words which 'you' have so long sought and found not; you have not a 'first' word yet. 92 There are few even whom I should venture to call earnestly by their most proper names. A name pronounced is the recognition of the individual to whom it belongs. You who can pronounce my name aright, you can call me, and is entitled to my love and service. 93 Yet reserve is the freedom and abandonment of lovers. It is the reserve of what is hostile or indifferent in their natures to give place to what is kindred and harmonious.

94 The violence of love is as much to be dreaded as that of hate. When it is durable it is serene and equable. 95 Even its famous pains begin only with the ebb of love, for few are indeed lovers, though all would fain be. 96 It is one proof of a human’s fitness for Friendship that you are able to do without that which is cheap and passionate. 97 A true Friendship is as wise as it is tender. The parties to it yield implicitly to the guidance of their love, and know no other law nor kindness. 98 It is not extravagant and insane, but what it says is something established henceforth, and will bear to be stereotyped. 99 It is a truer truth, it is better and fairer news, and no time will ever shame it, or prove it false. 100 This is a plant which thrives best in a temperate zone, where summer and winter alternate with one another. 101 The Friend is a 'necessarius', and meets own Friend on homely ground; not on carpets and cushions, but on the ground and on rocks they will sit, obeying the natural and primitive laws. 102 They will meet without any outcry, and part without loud sorrow. Their relation implies such qualities as the warrior prizes; for it takes a valour to open the hearts of humans as well as the gates of

castles. 103 It is not an idle sympathy and mutual consolation merely, but a heroic sympathy of aspiration and endeavour.

* * * * *

104 Friendship is not so kind as is imagined; it has not much human blood in it, but consists with a certain disregard for humans and their erections, the religious duties and humanities, while it purifies the air like electricity. 105 There may be the sternest tragedy in the relation of two more than usually innocent and true to their highest instincts. We may call it an essentially heathenish intercourse, free and irresponsible in its nature, and practising all the virtues gratuitously. 106 It is not the highest sympathy merely, but a pure and lofty society, a fragmentary and godlike intercourse of ancient date, still kept up at intervals, which, remembering itself, does not hesitate to disregard the humbler rights and duties of humanity. 107 It requires immaculate and godlike qualities full-grown, and exists at all only by condescension and anticipation of the remotest future. 108 We love nothing which is merely good and not fair, if such a thing is possible. Nature puts some kind of blossom before every fruit, not simply a calyx behind it. 109 When the Friend comes out of own heathenism and superstition, and breaks own idols, being converted by the precepts of a newer testament; 110 when you forgets your mythology, and treats your Friend like a Christian, or as you can afford; then Friendship ceases to be Friendship, and becomes charity; 111 that principle which established the almshouse is now beginning with its charity at home, and establishing an almshouse and pauper relations there.

112 As for the number which this society admits, it is at any rate to be begun with one, the noblest and greatest that we know, and whether the world will ever carry it further, whether, as Chaucer affirms,

113 'There be mo sterres in the skie than a pair,'

remains to be proved;

'And certaine he is well begone
Among a thousand that findeth one.'

114 We shall not surrender ourselves heartily to any, while we

are conscious that another is more deserving of our love. 115 Yet Friendship does not stand for numbers; the Friend does not count own Friends on own fingers; they are not numerable. 116 The more there are included by this bond, if they are indeed included, the rarer and diviner the quality of the love that binds them. 117 I am ready to believe that as private and intimate a relation may exist by which three are embraced as between two. 118 Indeed, we cannot have too many friends; the virtue which we appreciate we to some extent appropriate, so that thus we are made at last more fit for every relation of life. 119 A base Friendship is of a narrowing and exclusive tendency, but a noble one is not exclusive; its very superfluity and dispersed love is the humanity which sweetens society, and sympathises with foreign nations; 120 for though its foundations are private, it is, in effect, a public affair and a public advantage, and the Friend more than the father of a family deserves well of the state.

121 The only danger in Friendship is that it will end. It is a delicate plant, though a native. The least unworthiness, even if it be unknown to one's self, vitiates it. 122 Let the Friend know that those faults which you observes in your Friend your own faults attract. There is no rule more invariable than that we are paid for our suspicions by finding what we suspected. 123 By our narrowness and prejudices we say, I will have so much and such of you, my Friend, no more. 124 Perhaps there are none charitable, none disinterested, none wise, noble, and heroic enough for a true and lasting Friendship.

125 I sometimes hear my Friends complain finely that I do not appreciate their fineness. I shall not tell them whether I do or not. As if they expected a vote of thanks for every fine thing which they uttered or did. Who knows but it was finely appreciated. 126 It may be that your silence was the finest thing of the two. There are some things which a person never speaks of which are much finer kept silent about. To the highest communications we only lend a silent ear. 127 Our finest relations are not simply kept silent about,

but buried under a positive depth of silence never to be revealed. 128 It may be that we are not even yet acquainted. In human intercourse the tragedy begins, not when there is misunderstanding about words, but when silence is not understood.

129 Then there can never be an explanation. What avails it that another loves you if they does not understand you? Such love is a curse. 130 What sort of companions are they who are presuming always that their silence is more expressive than yours? 131 How foolish, and inconsiderate, and unjust, to conduct as if you were the only party aggrieved! Has not your Friend always equal ground of complaint? 132 No doubt my friends sometimes speak to me in vain, but they do not know what things I hear which they are not aware that they have spoken. 133 I know that I have frequently disappointed them by not giving them words when they expected them, or such as they expected. 134 Whenever I see my Friend I speak to them; but the expecter, the person with the ears, is not you. They will complain too that you are hard. O ye that would have the cocoa-nut wrong side outwards, when next I weep I will let you know. 135 They ask for words and deeds, when a true relation is word and deed. If they know not of these things, how can they be informed? 136 We often forbear to confess our feelings, not from pride, but for fear that we could not continue to love the one who required us to give such proof of our affection.

* * * * *

137 My Friend is not of some other race or family of people, but flesh of my flesh, bone of my bone. 138 He is my real brother. I see your nature groping yonder so like mine. We do not live far apart. Have not the fates associated us in many ways? 139 It says in the Vishnu Purana: ‘Seven paces together is sufficient for the friendship of the virtuous, but thou and I have dwelt together.’ 140 Is it of no significance that we have so long partaken of the same loaf, drank at the same fountain, breathed the same air summer and winter, felt the same heat and cold; 141 that the same fruits have been

pleased to refresh us both, and we have never had a thought of different fibre the one from the other!

* * * * *

142 As surely as the sunset in my latest November shall translate me to the ethereal world, and remind me of the ruddy morning of youth; 143 as surely as the last strain of music which falls on my decaying ear shall make age to be forgotten, or, in short, the manifold influences of Nature survive during the term of our natural life, 144 so surely my Friend shall for ever be my Friend, and reflect a ray of God to me, and time shall foster and adorn and consecrate our Friendship, no less than the ruins of temples. 145 As I love Nature, as I love singing birds, and gleaming stubble, and flowing rivers, and morning and Nevening, and summer and winter, I love thee, my Friend.

THE SENTIMENT OF FRIENDSHIP
Thomas Carlyle

3 Let us present the following small thread of Moral relation; and therewith, the reader for the self weaving it in at the right place, conclude our dim arras-picture of these University years.

2 Here also it was that I formed acquaintance with Herr Towgood, or, as it is perhaps better written, Herr Toughgut; a young person of quality ('von Adel'), from the interior parts of England. 3 He stood connected, by blood and hospitality, with the Counts von Zähdarm, in this quarter of Germany; to which noble Family I likewise was, by his means, with all friendliness, brought near. 4 Towgood had a fair talent, unspeakably ill-cultivated; with considerable humour of character: and, bating his total ignorance, for he knew nothing except Boxing and a little Grammar, showed less of that aristocratic impassivity, and silent fury, than for most part belongs to Travellers of his nation. 5 To him I owe my first practical knowledge of the English and their ways; perhaps also something of

the partiality with which I have ever since regarded that singular people. 6 Towgood was not without an eye, could he have come at any light. Invited doubtless by the presence of the Zähdarm Family, he had travelled hither, in the almost frantic hope of perfecting his studies; 7 he, whose studies had as yet been those of infancy, hither to a University where so much as the notion of perfection, not to say the effort after it, no longer existed! 8 Often we would condole over the hard destiny of the Young in this era: 9 how, after all our toil, we were to be turned-out into the world, with beards on our chins indeed, but with few other attributes of manhood; no existing thing that we were trained to Act on, nothing that we could so much as Believe. 10 'How has our head on the outside a polished Hat,' would Towgood exclaim, 'and in the inside Vacancy, or a froth of Vocables and Attorney-Logic! 11 At a small cost humans are educated to make leather into shoes; but at a great cost, what am I educated to make? 12 By Heaven, Brother! what I have already eaten and worn, as I came thus far, would endow a considerable Hospital of Incurables.'-- 13 'Human, indeed,' I would answer, 'has a Digestive Faculty, which must be kept working, were it even partly by stealth. 14 But as for our Mis-education, make not bad worse; waste not the time yet ours, in trampling on thistles because they have yielded us no figs. 'Frisch zu, Bruder!' 15 Here are Books, and we have brains to read them; here is a whole Earth and a whole Heaven, and we have eyes to look on them: 'Frisch zu!'' 16 Often also our talk was gay; not without brilliancy, and even fire. 17 We looked out on Life, with its strange scaffolding, where all at once harlequins dance, and humans are beheaded and quartered: motley, not unterrific was the aspect; but we looked on it like brave youths. 18 For myself, these were perhaps my most genial hours. Towards this young warmhearted, strongheaded and wrongheaded Herr Towgood I was even near experiencing the now obsolete sentiment of Friendship. 19 Yes, foolish Heathen that I was, I felt that, under certain conditions,

I could have loved this man, and taken you to my bosom, and been his brother once and always. 20 By degrees, however, I understood the new time, and its wants. If human's 'Soul' is indeed, as in the Finnish Language, and Utilitarian Philosophy, a kind of 'Stomach', what else is the true meaning of Spiritual Union but an Eating together?

21 Thus we, instead of Friends, are Dinner-guests; and here as elsewhere have cast away chimeras.

* * * * *

22 Hast thou a certain Faculty, a certain Worth, such even as the most have not; or art thou the completest Dullard of these modern times? 23 Alas! the fearful Unbelief is unbelief in yourself; and how could I believe? 24 Had not my first, last Faith in myself, when even to me the Heavens seemed laid open, and I dared to love, been all-too cruelly belied? 25 The speculative Mystery of Life grew ever more mysterious to me: neither in the practical Mystery had I made the slightest progress, but been everywhere buffeted, foiled, and contemptuously cast-out. 26 A feeble unit in the middle of a threatening Infinitude, I seemed to have nothing given me but eyes, whereby to discern my own wretchedness. 27 Invisible yet impenetrable walls, as of Enchantment, divided me from all living: was there, in the wide world, any true bosom I could press trustfully to mine?

28 O Heaven, No, there was none! I kept a lock upon my lips: why should I speak much with that shifting variety of so-called Friends, in whose withered, vain and too-hungry souls Friendship was but an incredible tradition? 29 In such cases, your resource is to talk little, and that little mostly from the Newspapers. 30 Now when I look back, it was a strange isolation I then lived in. The men and women around me, even speaking with me, were but Figures; I had, practically, forgotten that they were alive, that they were not merely automatic. 31 In midst of their crowded streets and assemblages, I walked solitary; and (except as it was my own heart, not another's, that I kept devouring) savage also, as the tiger in his jungle.

FRIENDSHIP

* * * * *

32 How were Friendship possible? ‘In mutual devotedness to the Good and True: otherwise impossible; except as Armed Neutrality, or hollow Commercial League. 33 A person, be the Heavens ever praised, is sufficient for the self; yet were ten people, united in Love, capable of being and of doing what ten thousand singly would fail in. 34 Infinite is the help human can yield to human.’

35 And now in conjunction therewith consider this other: ‘It is the Night of the World, and still long till it be Day: we wander amid the glimmer of smoking ruins, and the Sun and the Stars of Heaven are as if blotted out for a season; 36 and two immeasurable Phantoms, HYPOCRISY and ATHEISM, with the Ghoul, SENSUALITY, stalk abroad over the Earth, and call it theirs: well at ease are the sleepers for whom Existence is a shallow Dream.’

ON THE ACQUISITION OF FRIENDS

Henry Mackenzie

4 The praises of friendship, and descriptions of the happiness arising from it, I remember to have met with in almost every book and poem since first I could read. 2 I was never much addicted to reading: and, in this instance, I think, I have little reason to put confidence in authors.

3 How it may be in their experience, I know not; but in mine, this same virtue of friendship has tended very little to my happiness; on the contrary, when I tell you my situation, you will find that I am almost ruined by my friends.

4 From my earliest days I was reckoned one of the best-natured fellows in the world; and at school, though I must confess I did not acquire so much learning as many of my companions, yet, even there, I was remarkable for the acquisition of friends. 5 Even there, too, I acquired them at some expense; I was flogged, I dare say, a hundred times for the faults of others, but was too generous ever to 'peach'; my companions were

generous fellows too; but it always happened, I don't know how, that my generosity was on the losing side of the adventure.

6 I had not been above three years at college, when the death of an uncle put me in possession of a very considerable estate. 7 As I was not violently inclined towards literature, I soon took the opportunity, which this presented me, of leaving the university and entering upon the world. 8 I put myself under the tuition of one of my companions, who generally spent the vacations, and indeed some of the terms too, in London; and took up my residence in that city.

9 There I needed not that propensity, which I have told you I always possessed, to acquire a multitude of friends. I found myself surrounded by them in every tavern and coffee-house about town. But I soon experienced, that though the commodity was plenty, the price was high.

10 Besides a considerable mortgage on my estate, of which one of my best friends contrived to possess himself, I was obliged to expose my life to a couple of duels, and had very near lost it.

* * * * *

11 From this sort of bondage I contrived to emancipate myself by matrimony. I married the sister of one of my friends, a girl good-natured and thoughtless like myself, with whom I soon retired into the country, and set out upon what we thought a sober, well-regulated plan. 12 The situation was so distant as to be quite out of reach of my former town-companions; provisions were cheap and servants faithful; in short, everything so circumstanced that we made no doubt of living considerably within our income. 13 Our manner of life, however, was to be happy and prudent. By the improvement of my estate, I was to be equally amused and enriched; 14 my skill in sportsmanship (for I had acquired that science to great perfection at the university) was to procure vigour to my constitution, and dainties to my table; and, against the long nights of winter, we were provided with an excellent 'neighbourhood'.

FRIENDSHIP

15 This last-mentioned article is the only one which we have found come up entirely to our expectations. My talent for friend-making has indeed extended the limits of 'neighbourhood' a good deal farther than the word is commonly understood to reach.

16 The parish, which is not a small one-- the county, which is proportionally extensive, comes within the denomination of neighbourhood with us; and my neighbour Goostry, who pays me an annual sporting visit of several weeks, lives at least fifty miles off.

17 Some of these 'neighbours', who always become 'friends' at my house, have endeavoured to pay me for their entertainment with their advice as to the cultivation of my farm, or the management of my estate; 18 but I have generally found their counsel, like other friendly exertions, put me out of pocket in the end. 19 Their theories of agriculture failed in my practice of them; and the ingenious people they recommended to me for tenants, seldom paid their rent by their ingenuity.

20 The attentions of our friends are sometimes carried farther than mere words or visits of compliment; yet, even then, unfortunately, their favours are just so many taxes upon us. 21 When I receive a present of a delicate salmon, or a nice haunch of venison, it is but a signal for all my good neighbours to come and eat at my expense; 22 and some time ago, when a nephew of my wife, settled abroad, sent me a hogshead of excellent claret, it cost me, in entertainments for the honour of the liquor, what might have purchased a tun from the wine-merchant.

23 After so many instances in which my friendships were hurtful to my fortune, I wished to hit on the way to making some of them beneficial to it. 24 For this purpose, my wife and I have, for a good while past, been employed in looking out for some snug office, or reversion, to which my interest with several powerful friends might recommend me. 25 But, somehow or other, our expectations have been always disappointed; not from any want of inclination in our friends to serve us, as we have been repeatedly assured, but from various

unforeseen accidents, to which expectations of that sort are particularly liable. 26 In the course of these solicitations I was lead to engage in the political interests of a gentleman on whose influence I built the strongest hopes of success in my own schemes; 27 and I flattered myself that, from the friendly footing on which I stood with my neighbours, I might be of considerable service to him. 28 This, indeed, he is extremely ready to acknowledge, though he has yet found no opportunity of returning the favour; but, in the meantime, it kept my table open to all his 'friends', as well as my own, and cost me, besides, a headache twice a week during the whole period of the canvass.

29 In short, I find I can afford to keep myself in friends no longer. I mean to give them warning of this my resolution as speedily as possible.… 30 I have shut my gates, locked my cellar, turned off my cook, disposed of my dogs, forgot my acquaintance, and am resolved henceforward, let people say of me what they will, to be 'no one’s friend but my own'.

ON FRIENDSHIP

Oliver Goldsmith

5 There are few subjects which have been more written upon and less understood than that of Friendship: 2 to follow the dictates of some, this virtue, instead of being the assuager of pain, becomes the source of every inconvenience. 3 Such speculatists, by expecting too much from friendship, dissolve the connection, and by drawing the bonds too closely, at length break them.

4 Almost all our romance and novel writers are of this kind: they persuade us to friendships which we find it impossible to sustain to the last; so that this sweetener of life, under proper regulations, is by their means rendered inaccessible or uneasy. 5 It is certain, the best method to cultivate this virtue is by letting it in some measure make itself; a similitude of minds or studies, and even sometimes a diversity of pursuits, will produce all the pleasures that arise from it. 6 The current of tenderness widens as it proceeds; and two people imperceptibly find their hearts

warm with good-nature for each other when they were at first in pursuit only of mirth or relaxation.

7 Friendship is like a debt of honour; the moment it is talked of it loses its real name, and assumes the more ungrateful form of obligation. 8 From hence we find, that those who regularly undertake to cultivate friendship, find ingratitude generally repays their endeavours. 9 That circle of beings which dependence gathers round us, is almost ever unfriendly; they secretly wish the term of their connection more nearly equal; and when they even have the most virtue, are prepared to reserve all their affections for their patron only in the hour of your decline. 10 Increasing the obligations which are laid upon such minds only increases their burden; 11 they feel themselves unable to repay the immensity of their debt, and their bankrupt hearts are taught a latent resentment at the hand that is stretched out with offers of service and relief.

12 Plautinus was a man who thought that every good was to be bought by riches; and as he was possessed of great wealth, and a mind naturally formed for virtue, he resolved to gather a circle of the best men around him. 13 Among the number of his dependants was Musidorus, with a mind just as fond of virtue, yet not less proud than his patron.

14 His circumstances, however, were such as forced him to stoop to the good offices of his superior, and he saw himself daily, among a number of others, loaded with benefits and protestations of friendship. 15 These, in the usual course of the world, he thought it prudent to accept; but while he gave his esteem, he could not give his heart. 16 A want of affection breaks out in the most trifling instances, and Plautinus had skill enough to observe the minutest actions of the man he wished to make his friend. 17 In these he ever found his aim disappointed; for Musidorus claimed an exchange of hearts, which Plautinus, solicited by a variety of claims, would never think of bestowing.

18 It may easily be supposed, that the reserve of our poor proud man was soon construed into ingratitude; and such, indeed, in

the common acceptation of the word, it was. 19 Whenever Musidorus appeared, he was remarked as the ungrateful man; he had accepted favours, it was said, and still had the insolence to pretend to independence. 20 The event, however, justified his conduct. Plautinus, by misguided liberality, at length became poor, and it was then that Musidorus first thought of making a friend of him. 21 He flew to the man of fallen fortune with an offer of all he had; wrought under his direction with assiduity; and by uniting their talents, both were at length placed in that state of life from which one of them had formerly fallen.

22 To this story, taken from modern life, I shall add one more, taken from a Greek writer of antiquity. 'Two Jewish soldiers, in the time of Vespasian, had made many campaigns together, and a participation of dangers at length bred an union of hearts. 23 They were marked throughout the whole army as the two friendly brothers; they felt and fought for each other. 24 Their friendship might have continued without interruption till death, had not the good fortune of the one alarmed the pride of the other, which was in his promotion to be a centurion, under the famous John, who headed a particular party of Jewish malcontents. 25 'From this moment their former love was converted into the most inveterate enmity. They attached themselves to opposite factions, and sought each other's lives in the conflict of adverse party. 26 In this manner they continued for more than two years, vowing mutual revenge and animated with an unconquerable spirit of aversion. 27 At length, however, that party of the Jews to which the mean soldier belonged, joining with the Romans, it became victorious, and drove John with all his adherents into the Temple. 28 History has given us more than one picture of the dreadful conflagration of that superb edifice. The Roman soldiers were gathered round it; the whole temple was in flames, and thousands were seen amidst them within its sacred circuit. 29 It was in this situation of things that the now successful soldier saw his former friend upon the battlements

of the highest tower looking round with horror, and just ready to be consumed with flames.

30 All his former tenderness now returned; he saw the man of his bosom just going to perish; and unable to withstand the impulse, he ran, spreading his arms and crying out to his friend to leap down from the top and find safety with him. 31 The centurion from above heard and obeyed, and casting himself from the top of the tower into his fellow-soldier's arms, both fell a sacrifice on the spot; one being crushed to death by the weight of his companion, and the other dashed to pieces by the greatness of his fall.'

THE PLEASURES OF FRIENDSHIP

Samuel Johnson, LL.D.

6 Life has no pleasure higher or nobler than that of friendship. 2 It is painful to consider that this sublime enjoyment may be impaired or destroyed by innumerable causes, and that there is no human possession of which the duration is less certain.

3 Many have talked, in very exalted language, of the perpetuity of friendship, of invincible constancy, and unalienable kindness; 4 and some examples have been seen of people who have continued faithful to their earliest choice, and whose affection has predominated over changes of fortune, and contrariety of opinion.

5 But these instances are memorable, because they are rare. The friendship which is practised or expected by common mortals must take its rise from mutual pleasure, and must end when the power ceases of delighting each other.

6 Many accidents therefore may happen by which the ardour of kindness will be abated, without criminal baseness or contemptible inconstancy on either part.

7 To give pleasure is not always in our power; and little does you know yourself, who believes that you can be always able to receive it.

8 Those who would gladly pass their days together may be separated by the different course of their affairs; and friendship, like

love, is destroyed by long absence, though it may be increased by short intermissions. 9 What we have missed long enough to want it, we value more when it is regained; 10 but that which has been lost till it is forgotten, will be found at last with little gladness, and with still less, if a substitute has supplied the place. 11 A person deprived of the companion to whom you used to open your bosom, and with whom you shared the hours of leisure and merriment, feels the day at first hanging heavy upon you; 12 your difficulties oppress, and your doubts distract you; you sees time come and go without your wonted gratification, and all is sadness within, and solitude about you. 13 But this uneasiness never lasts long; necessity produces expedients, new amusements are discovered and new conversation is admitted.

14 No expectation is more frequently disappointed than that which naturally arises in the mind from the prospect of meeting an old friend after long separation. 15 We expect the attraction to be revived, and the coalition to be renewed; no person considers how much alteration time has made in yourself, and very few inquire what effect it has had upon others. 16 The first hour convinces them that the pleasure which they had formerly enjoyed, is for ever at an end; the opinions of both are changed; and that similitude of manners and sentiment is lost which confirmed them both in the approbation of themselves.

17 Friendship is often destroyed by opposition of interest, not only by the ponderous and visible interest which the desire of wealth and greatness forms and maintains, but by a thousand secret and slight competitions, scarcely known to the mind upon which they operate. 18 There is scarcely any person without some favourite trifle which you values above greater attainments, some desire of petty praise which you cannot patiently suffer to be frustrated. 19 This minute ambition is sometimes crossed before it is known, and sometimes defeated by wanton petulance; but such attacks are seldom made without the loss of friendship; 20 for whoever has once found the vulnerable part will be always feared, and the

resentment will burn on in secret, of which shame hinders the discovery.

21 This, however, is a slow malignity, which a wise person will obviate as inconsistent with quiet, and a good person will repress as contrary to virtue; but human happiness is sometimes violated by some more sudden strokes.

22 A dispute begun in jest upon a subject which a moment before was on both parts regarded with careless indifference, is continued by the desire of conquest, till vanity kindles into rage, and opposition rankles into enmity. 23 Against this hasty mischief, I know not what security can be obtained; people will sometimes be surprised into quarrels; and though they might both hasten to reconciliation, as soon as their tumult had subsided, 24 yet two minds will seldom be found together which can at once subdue their discontent or immediately enjoy the sweets of peace without remembering the wounds of the conflict.

25 Friendship has other enemies. Suspicion is always hardening the cautious, and disgust repelling the delicate. Very slender differences will sometimes part those whom long reciprocation of civility or beneficence has united. 26 Lonelove and Ranger retired into the country to enjoy the company of each other, and returned in six weeks cold and petulant; 27 Ranger's pleasure was to walk in the fields, and Lonelove's to sit in a bower; each had complied with the other in their turn, and each was angry that compliance had been exacted.

28 The most fatal disease of friendship is gradual decay, or dislike hourly increased by causes too slender for complaint and too numerous for removal. 29 Those who are angry may be reconciled; those who have been injured may receive a recompence; 30 but when the decay of pleasing and willingness to be pleased is silently diminished, the renovation of friendship is hopeless; as, when the vital powers sink into languor, there is no longer any use of the physician.

FRIENDSHIP

THE TRUE ART OF FRIENDSHIP

Samuel Johnson, LL.D.

SALLUST

7 To live in friendship is to have the same desires and the same aversions.

2 The fondest and firmest friendships are dissolved by such openness and sincerity as interrupt our enjoyment of our own approbation, or recall us to the remembrance of these failings which we are more willing to indulge than correct.

3 It is by no means necessary to imagine that you who is offended at advice was ignorant of the fault, and resents the admonition as a false charge; for perhaps it is most natural to be enraged when there is the strongest conviction of our own guilt. 4 While we can easily defend our character, we are no more disturbed at an accusation than we are alarmed by an enemy whom we are sure to conquer; and whose attack, therefore, will bring us honour without danger. 5 But when a person feels the reprehension of a friend seconded by your own heart, you are easily heated into resentment and revenge, 6 either because you hoped that the fault of which you was conscious had escaped the notice of others; 7 or that your friend had looked upon it with tenderness and extenuation, and excused it for the sake of your other virtues; 8 or had considered you as too wise to need advice, or, too delicate to be shocked with reproach: or, because we cannot feel without pain those reflections round which we have been endeavouring to lay asleep; 9 and when pain has produced anger, who would not willingly believe, that it ought to be discharged on others rather than on oneself?

10 The resentment produced by sincerity, whatever be its immediate cause, is so certain, and generally so keen, that very few have magnanimity sufficient for the practice of a duty which, above most others, exposes its votaries to hardships and persecutions; 11 yet friendship without it is of very little value, since the great use of so close an intimacy is, that our virtues may be guarded and encouraged, and our vices repressed in their first appearance

by timely detection and salutary remonstrances.

12 It is decreed by Providence, that nothing truly valuable shall be obtained in our present state, but with difficulty and danger. 13 You that hopes for that advantage which is to be gained from unrestrained communication must sometimes hazard, by unpleasing truths, that friendship which you aspires to merit. 14 The chief rule to be observed in the exercise of this dangerous office, is to preserve it pure from all mixture of interest or vanity; 15 to forbear admonition or reproof, when our consciences tell us that they are incited, not by the hopes of reforming faults, but the desire of showing our discernment, or gratifying our own pride by the mortification of another. 16 It is not indeed certain, that the most refined caution will find a proper time for bringing a person to the knowledge of one's own failings, or the most zealous benevolence reconcile you to that judgment by which they are detected; 17 but you who endeavours only the happiness of one whom you reproves will always have either the satisfaction of obtaining or deserving kindness; 18 if you succeeds, you benefits your friend; and if you fails, you have at least the consciousness that you suffers for only doing well.

* * * * *

19 When Socrates was building himself a house at Athens, being asked by one that observed the littleness of the design, why a man so eminent would not have an abode more suitable to his dignity? 20 he replied, that he should think himself sufficiently accommodated, if he could see that narrow habitation filled with real friends. 21 Such was the opinion of this great master of human life, concerning the infrequency of such a union of minds as might deserve the name of friendship; 22 that among the multitudes whom vanity or curiosity, civility or veneration crowded about him, he did not expect that very spacious apartments would be necessary to contain all that should regard him with sincere kindness, or adhere to him with steady fidelity.

23 So many qualities are indeed requisite to the possibility of

friendship, and so many accidents must concur to its rise and its continuance, that the greatest part of humankind content themselves without it, and supply its place as they can, with interest and independence.

24 Multitudes are unqualified for a constant and warm reciprocation of benevolence, as they are incapacitated for any other elevated excellence, by perpetual attention to their interest, and unresisting subjection to their passions. 25 Long habits may super-induce inability to deny any desire, or repress, by superior motives, the importunities of any immediate gratification, and an inveterate selfishness will imagine all advantages diminished in proportion as they are communicated.

26 But not only this hateful and confirmed corruption, but many varieties of disposition, not inconsistent with common degrees of virtue, may exclude friendship from the heart. 27 Some, ardent enough in their benevolence, and defective neither in officiousness nor liberality, are mutable and uncertain, soon attracted by new objects, disgusted without offence, and alienated without enmity. 28 Others are soft and flexible, easily influenced by reports or whispers, ready to catch alarms from every dubious circumstance, and to listen to every suspicion which envy and flattery shall suggest, to follow the opinion of every confident adviser, and move by the impulse of the last breath. 29 Some are impatient of contradiction, more willing to go wrong by their own judgment than may be indebted for a better or a safer way to the sagacity of another, 30 inclined to consider counsel as insult, and inquiry as want of confidence, and to confer their regard on no other terms than unreserved submission and implicit compliance.-- 31 Some are dark and involved, equally careful to conceal good and bad purposes; and pleased with producing effects by invisible means, and showing their design only in its execution. 32 Others are universally communicative, alike open to every eye, and equally profuse of their own secrets and those of others, without the necessary vigilance of caution, or the honest arts of prudent integrity, ready to

accuse without malice, and to betray without treachery. 33 Any of these may be useful to the community, and pass through the world with the reputation of good purpose and uncorrupted morals, but they are unfit for close and tender intimacies. 34 You cannot properly be chosen for a friend, whose kindness is exhaled by own warmth, or frozen by the first blast of slander; 35 you cannot be a useful counsellor, who will hear no opinion but your own; you will not much invite confidence whose principal maxim is to suspect; 36 nor can candour and frankness of that person be much esteemed, who spreads own arms to humankind, and makes every person, without distinction, a denizen of own bosom.

37 That friendship may be at once fond and lasting, there must not only be equal virtue on each part, but virtue of the same kind; not only the same end must be proposed, but the same means must be approved by both. 38 We are often, by superficial accomplishments and accidental endearments, induced to love those whom we cannot esteem; 39 we are sometimes, by great abilities, and incontestable evidences of virtue, compelled to esteem those whom we cannot love. 40 But friendship, compounded of esteem and love, derives from one its tenderness, and its permanence from the other; and therefore, requires not only that its candidates should gain the judgment, but that they should attract the affections; 41 that they should not only be firm in the day of distress, but gay in the hour of jollity; not only useful in exigencies, but pleasing in familiar life; their presence should give cheerfulness as well as courage, and dispel alike the gloom of fear and of melancholy.

42 To this mutual complacency is generally requisite a uniformity of opinions, at least of those active and conspicuous principles which discriminate parties in government and sects in religion, and which every day operate more or less on the common business of life. 43 For though great tenderness has, perhaps, been sometimes known to continue between people eminently in contrary factions; 44 yet such friends are to be shown rather as prodigies than examples;

and it is no more proper to regulate our conduct by such instances than to leap a precipice, because some have fallen from it and escaped with life.

45 It cannot but be extremely difficult to preserve private kindness in the midst of public opposition, in which will necessarily be involved a thousand incidents, extending their influence to conversation and privacy. 46 People engaged, by moral or religious motives, in contrary parties will generally look with different eyes upon every human, and decide almost every question upon different principles. 47 When such occasions of dispute happen, to comply is to betray our cause, and to maintain friendship, by ceasing to deserve it; 48 to be silent is to lose the happiness and dignity of independence, to live in perpetual constraint, and to desert if not to betray; 49 and who shall determine which of two friends shall yield, where neither believes oneself mistaken, and both confess the importance of the question? 50 What then remains but contradiction and debate? and from these what can be expected but acrimony and vehemence, the insolence of triumph, the vexation of defeat, and, in time, a weariness of contest, and an extinction of benevolence? 51 Exchange of endearments and intercourse of civility may continue, indeed, as boughs may for a while be verdant when the root is wounded; 52 but the poison of discord is infused, and though the countenance may preserve its smile, the heart is hardening and contracting.

53 That person will not be long agreeable whom we see only in times of seriousness and severity; and, therefore, to maintain the softness and serenity of benevolence, it is necessary that friends partake each other's pleasures as well as cares, and be led to the same diversions by similitude of taste. 54 This is, however, not to be considered as equally indispensable with conformity of principles, because any person may honestly, according to Horace, resign the gratifications of taste to the humour of another, and friendship may well deserve the sacrifice of pleasure, though not of conscience.

55 It was once confessed to me, by a painter, that no professor of own art ever loved another. 56 This declaration is so far justified by the knowledge of life as to damp the hopes of warm and constant friendship between people whom their studies have made competitors, and whom every favourer and every censurer are hourly inciting against each other. 57 The utmost expectation that experience can warrant us, is, that they should forbear open hostilities and secret machinations, and when the whole fraternity is attacked, be able to unite against a common foe. 58 Some, however, though few, may perhaps be found in whom emulation has not been able to overpower generosity, who are distinguished from lower beings by nobler motives than the love of fame, and can preserve the sacred flame of friendship from the gusts of pride and the rubbish of interest.

59 Friendship is seldom lasting but between equals, or where the superiority on one side is reduced by some equivalent advantage on the other. 60 Benefits which cannot be repaid, and obligations which cannot be discharged, are not commonly found to increase affection; 61 they excite gratitude indeed, and heighten veneration, but commonly take away that easy freedom and familiarity of intercourse, without which, though there may be fidelity and zeal and admiration, there cannot be friendship.

62 Thus imperfect are all earthly blessings; the great effect of friendship is beneficence, yet by the first act of uncommon kindness it is endangered, like plants that bear fruit and die. 63 Yet this consideration ought not to restrain bounty or repress compassion; for duty is to be preferred before convenience, and you that loses part of the pleasures of friendship by your generosity, gains in its place the gratulation of your conscience.

THE VIRTUE OF FRIENDSHIP

George Berkeley

8 If we consider the whole scope of the creation that lies within our view, the moral and intellectual, as well as the natural and corporeal,

we shall perceive throughout, a certain correspondence of the parts, a similitude of operation, and unity of design, 2 which plainly demonstrate the universe to be the work of one infinitely good and wise being; and that the system of thinking beings is actuated by laws derived from the same divine power which ordained those by which the corporeal system is upheld.

3 From the contemplation of the order, motion, and cohesion of natural bodies, philosophers are now agreed, that there is a mutual attraction between the most distant parts at least of this solar system. 4 All those bodies that revolve round the sun are drawn towards each other, and towards the sun, by some secret, uniform, and never-ceasing principle. 5 Hence it is that the earth (as well as the other planets), without flying off in a tangent line, constantly rolls about the sun, and the moon about the earth, without deserting her companion in so many thousand years. 6 And as the larger systems of the universe are held together by this cause, so likewise the particular globes derive their cohesion and consistence from it.

7 Now if we carry our thoughts from the corporeal to the moral world, we may observe in the spirits or minds of humans, a like principle of attraction, whereby they are drawn together in communities, clubs, families, friendships, and all the various species of society. 8 As in bodies, where the quantity is the same, the attraction is strongest between those which are placed nearest to each other; so it is likewise in the minds of humans, 'cæteris paribus', between those which are most nearly related. 9 Bodies that are placed at the distance of many millions of miles, may nevertheless attract and constantly operate on each other, 10 although this action do not show itself by a union or approach of those distant bodies so long as they are withheld by the contrary forces of other bodies, which, at the same time, attract them different ways; but would, on the supposed removal of all other bodies, mutually approach and unite with each other. 11 The like holds with regard to the human soul, whose

affection towards the individuals of the same species, who are distantly related to it, is rendered inconspicuous by its more powerful attraction towards those who have a nearer relation to it. 12 But as those are removed, the tendency which before lay concealed, doth gradually disclose itself.

13 A person who has no family is more strongly attracted towards own friends and neighbours; and if absent from these, you naturally falls into an acquaintance with those of your own city or country who chance to be in the same place. 14 Two Englishmen meeting at Rome or Constantinople, soon run into familiarity. And in China or Japan, Europeans would think their being so a good reason for their uniting in particular converse. 15 Farther, in case we suppose ourselves translated into Jupiter or Saturn, and there to meet a Chinese or other more distant native of our own planet, we should look on them as a near relation, and readily commence a friendship with them. 16 These are natural reflections, and such as may convince us that we are linked by an imperceptible chain to every individual of the human race.

17 The several great bodies which compose the solar system are kept from joining together at the common centre of gravity by the rectilinear motions the author of Nature has impressed on each of them; 18 which, concurring with the attractive principle, form their respective orbits round the sun; upon the ceasing of which motions, the general law of gravitation that is now thwarted, would show itself by drawing them all into one mass. 19 After the same manner, in the parallel case of society, private passions and motions of the soul do often obstruct the operation of that benevolent uniting instinct implanted in human nature; which, notwithstanding, doth still exert, and will not fail to show itself when those obstructions are taken away.

20 The mutual gravitation of bodies cannot be explained any other way than by resolving it into the immediate operation of God, who never ceases to dispose and actuate His creatures in a manner

suitable to their respective beings. 21 So neither can that reciprocal attraction in the minds of humans be accounted for by any other cause. It is not the result of education, law, or fashion; but is a principle originally ingrafted in the very first formation of the soul by the author of our Nature.

22 And as the attractive power in bodies is the most universal principle which produceth innumerable effects, and is a key to explain the various phenomena of Nature; so the corresponding social appetite in human souls is the great spring and source of moral actions. 23 This it is that inclines each individual to an intercourse with own species, and models every one to that behaviour which best suits with the common well-being.

24 Hence that sympathy in our nature, whereby we feel the pains and joys of our fellow creatures.

25 Hence that prevalent love in parents towards their children, which is neither founded on the merit of the object, nor yet on self-interest. 26 It is this that makes us inquisitive concerning the affairs of distant nations, which can have no influence on our own. 27 It is this that extends our care to future generations, and excites us to acts of beneficence towards those who are not yet in being, and consequently from whom we can expect no recompence. 28 In a word, hence arises that diffusive sense of humanity so unaccountable to the selfish person who is untouched with it, and is indeed a sort of monster, or anomalous production.

29 These thoughts do naturally suggest the following particulars. First, that as social inclinations are absolutely necessary to the well-being of the world, it is the duty and interest of each individual to cherish and improve them to the benefit of humankind; 30 the duty, because it is agreeable to the intention of the author of our being, who aims at the common good of own creatures, and as an indication of own will, hath implanted the seeds of mutual benevolence in our souls; 31 the interest, because the good of the whole is inseparable from that of the parts; in promoting, therefore, the common good, every one doth

at the same time promote one's own private interest.

32 Another observation I shall draw from the premises is, that it makes a signal proof of the divinity of the Christian religion, that the main duty which it inculcates above all others is charity. 33 Different maxims and precepts have distinguished the different sects of philosophy and religion; our Lord's peculiar precept is, 'Love thy neighbour as thyself. 34 By this shall all humans know that you are my disciples, if you love one another.'

35 I will not say, that what is a most shining proof of our religion, is not often a reproach to its professors: 36 but this I think very plain, that whether we regard the analogy of Nature, as it appears in the mutual attraction or gravitations of the mundane system, in the general frame and constitution of the human soul; 37 or lastly, in the ends and aptnesses which are discoverable in all parts of the visible and intellectual world; we shall not doubt but the precept, which is the characteristic of our religion, came from the author of Nature. 38 Some of our modern free-thinkers would indeed insinuate the Christian morals to be defective, because, say they, there is no mention made in the gospel of the virtue of friendship. 39 These sagacious people (if I may be allowed the use of that vulgar saying) 'cannot see the wood for trees.' 40 That a religion, whereof the main drift is to inspire its professors with the most noble and disinterested spirit of love, charity, and beneficence, to all humankind; 41 or, in other words, with a friendship to every individual human; should be taxed with the want of that very virtue is surely a glaring evidence of the blindness and prejudice of its adversaries.

ON THE CHOICE OF FRIENDS

Sir Richard Steele

9 When a person is in a serious mood, and ponders upon own make, with a retrospect to the actions of own life, and the many fatal miscarriages in it, which you owes to ungoverned passions, you are then apt to say to yourself, that experience has guarded you

against such errors for the future: 2 but Nature often recurs in spite of your best resolutions; and it is to the very end of our days a struggle between our reason and our temper, which shall have the empire over us. 3 However, this is very much to be helped by circumspection, and a constant alarm against the first onsets of passion. 4 As this is, in general, a necessary care to make a person's life easy and agreeable to oneself; so it is more particularly the duty of such as are engaged in friendship, and nearer commerce with others. 5 Those who have their joys have also their griefs in proportion; and none can extremely exalt or depress friends, but friends. 6 The harsh things which come from the rest of the world are received and repulsed with that spirit, which every honest person bears for one's own vindication; 7 but unkindness, in words or actions, among friends, affects us at the first instant in the inmost recesses of our souls.

8 Indifferent people, if I may so say, can wound us only in heterogeneous parts, maim us in our legs or arms; but the friend can make no 'pass' but at the heart itself. 9 On the other side, the most impotent assistance, the mere 'well wishes' of a friend, gives a person constancy and courage against the most prevailing force of own enemies. It is here only a person enjoys and suffers to the quick. 10 For this reason the most gentle behaviour is absolutely necessary to maintain friendship in any degree above the common level of acquaintance. 11 But there is a relation of life much more near than the most strict and savoured friendship, that is to say, marriage. 12 This union is of too close and delicate a nature to be easily conceived by those who do not know that condition by experience. 13 Here a person should, if possible, soften own passions; if not for your own ease, in compliance to a creature formed with a mind of a quite different make from your own.

14 I am sure, I do not mean it an injury to women, when I say there is a sort of sex in souls. I am tender of offending them, and know it is hard not to do it on this subject; 15 but I must go on to say, that the soul of a man, and that of

an woman, are made very unlike, according to the employments for which they are designed. 16 The ladies will please to observe, I say, our minds have different, not superior qualities to theirs. The virtues have respectively a masculine and a feminine cast. What we call in men 'wisdom', is in women 'prudence'. 17 It is a partiality, to call one greater than the other. A 'prudent' woman is in the same class of honour as a 'wise' man, and the scandals in the way of both are equally dangerous. 18 But to make this state anything but a burden, and not hang a weight upon our very beings, 19 it is proper each of the couple should frequently remember, that there are many things which grow out of their very natures that are pardonable, nay, becoming, when considered as such, but, without that reflection, must give the quickest pain and vexation. 20 To manage well a great family is as worthy an instance of capacity as to execute a great employment: and for the generality, as women perform the considerable part of their duties, as well as men do theirs; 21 so in their common behaviour, females of ordinary genius are not more trivial than the common rate of men; and, in my opinion, the playing of a fan is every whit as good an entertainment as the beating of a snuff-box.

22 But, however, I have rambled in this libertine manner of writing by way of 'Essay', I now sat down with an intention to represent to my readers how pernicious, how sudden, and how fatal surprises of passion are to the mind of human; 23 and that in the more intimate commerces of life they are more liable to arise, even in our most sedate and indolent hours. 24 Occurrences of this kind have had very terrible effects; and when one reflects upon them, we cannot but tremble to consider what we are capable of being wrought up to, against all the ties of Nature, love, honour, reason, and religion, 25 though the person who breaks through them all, had, an hour before you did so, a lively and virtuous sense of their dictates. 26 When unhappy catastrophes make up part of the history of princes and persons who act in high spheres, or are represented in the

moving language and well-wrought scenes of tragedians, they do not fail of striking us with terror; 27 but then they affect us only in a transient manner, and pass through our imaginations as incidents in which our fortunes are too humble to be concerned, or which writers form for the ostentation of their own force; 28 or, at most, as things fit rather to exercise the powers of our minds, than to create new habits in them. 29 Instead of such high passages, I was thinking it would be of great use, if anybody could hit it, to lay before the world such adventures as befall persons not exalted above the common level.

30 This, methought, would better prevail upon the ordinary race of humans; who are so prepossessed with outward appearances, that they mistake fortune for Nature, and believe nothing can relate to them, that does not happen to such as live and look like themselves.

THE QUALIFICATIONS OF FRIENDSHIP

Joseph Addison

10 We two are a multitude -OVID

2 One would think that the larger the company is in which we are engaged, the greater variety of thoughts and subjects would be started in discourse; 3 but, instead of this, we find that conversation is never so much straitened and confined as in numerous assemblies. 4 When a multitude meet together on any subject of discourse, their debates are taken up chiefly with forms and general positions; 5 nay, if we come into a more contracted assembly of men and women, the talk generally runs upon the weather, fashions, news, and the like public topics. 6 In proportion as conversation gets into clubs and knots of friends, it descends into particulars, and friends grows more free and communicative: 7 but the most open, instructive, and unreserved discourse, is that which passes between two persons who are familiar and intimate friends. 8 On these occasions, a man gives a loose to every passion and every

thought that is uppermost, discovers his most retired opinions of persons and things, tries the beauty and strength of his sentiments, and exposes his whole soul to the examination of his friend.

9 Tully was the first who observed that friendship improves happiness and abates misery, by the doubling of our joy and dividing of our grief; a thought in which he hath been followed by all the essayers upon friendship that have written since his time. 10 Sir Francis Bacon has finely described other advantages, or, as he calls them, fruits of friendship; and, indeed, there is no subject of morality which has been better handled and more exhausted than this. 11 Among the several fine things which have been spoken of it, I shall beg leave to quote some out of a very ancient author, whose book would be regarded by our modern wits as one of the most shining tracts of morality that is extant, if it appeared under the name of a Confucius, or of any celebrated Grecian philosopher: 12 I mean the little apocryphal treatise, entitled '*The Wisdom of the Son of Sirach*'. How finely has he described the art of making friends by an obliging and affable behaviour! 13 And laid down that precept, which a late excellent author has delivered as his own, that we should have many well-wishers, but few friends. ‘Sweet language will multiply friends; and a fair-speaking tongue will increase kind greetings. 14 Be in peace with many, nevertheless have but one councellor of a thousand.’ With what prudence does he caution us in the choice of our friends! 15 And with what strokes of nature (I could almost say of humour) has he described the behaviour of a treacherous and self-interested friend! 16 ‘If thou wouldest get a friend, prove them first, and be not hasty to credit them: for some person is a friend for your own occasion, and will not abide in the day of thy trouble. 17 And there is a friend who being turned to enmity and strife, will discover thy reproach.’ Again, ‘Some friend is a companion at the table, and will not continue in the day of thy affliction; but, in thy prosperity they will be as thyself, and will be bold over thy servants.

18 If thou be brought low they will be against thee, and hide the self from thy face.' 19 What can be more strong and pointed than the following verse? 'Separate thyself from thine enemies, and take heed of thy friends.'

20 In the next words he particularises one of those fruits of friendship which is described at length by the two famous authors above mentioned, and falls into a general eulogium of friendship which is very just as well as very sublime. 21 'A faithful friend is a strong defence; and you that hath found such a one hath found a treasure. Nothing doth countervail a faithful friend, and their excellency is valuable. 22 A faithful friend is the medicine of life; and they that fear the Lord shall find you. Whoso feareth the Lord shall direct your friendship aright; for as you are, so shall your neighbour (that is your friend) be also.'

23 I do not remember to have met with any saying that has pleased me more than that of a friend's being the medicine of life, to express the efficacy of friendship in healing the pains and anguish which naturally cleave to our existence in this world; 24 and am wonderfully pleased with the turn in the last sentence, that a virtuous person shall as a blessing meet with a friend who is as virtuous as yourself. 25 There is another saying in the same author, which would have been very much admired in an heathen writer: 'Forsake not an old friend, for the new is not comparable to them; a new friend is as new wine; when it is old thou shalt drink it with pleasure.' 26 With what strength of allusion and force of thought has he described the breaches and violations of friendship?-- 'Whoso casteth a stone at the birds frayeth them away; and you that upbraideth thy friend, breaketh friendship. 27 Though thou drawest a sword at a friend, yet despair not, for there may be a returning to favour. 28 If thou hast opened thy mouth against thy friend, fear not, for there may be a reconciliation; except for upbraiding, or pride, or disclosing of secrets, or a treacherous wound; for, for these things every friend will depart.' 29 We may observe in this and several other precepts in

this author, those little, familiar sentences and illustrations which are so much admired in the moral writings of Horace and Epictetus. 30 There are very beautiful instances of this nature in the following passages, which are likewise written upon the same subject. ‘Whoso discovereth secrets, loseth own credit, and shall never find a friend to own mind. 31 Love thy friend, and be faithful unto them; but if thou bewrayeth thy secret follow no more after them: 32 for as a person hath destroyed thy enemy, so hast thou lost the love of thy friend; as one that letteth a bird go out of own hand, so hast thou let thy friend go, and shall not get them again; follow after them no more, for you are too far off; you are as a roe escaped out of the snare. 33 As for a wound it may be bound up, and after reviling there may be a reconciliation: but you that bewrayeth secrets is without hope.’

34 Among the several qualifications of a good friend, this wise man has very justly singled out constancy and faithfulness as the principal: to these, others have added virtue, knowledge, discretion, equality in age and fortune, and Cicero calls it 'Morum comitas', ‘a pleasantness of temper.’ 35 If I were to give my opinion upon such an exhausted subject, I should join to these other qualifications, a certain equability or evenness of behaviour. 36 A person often contracts a friendship with one whom perhaps you does not find out till after a year’s conversation; when on a sudden some latent ill humour breaks out upon you, which you never discovered or suspected at your first entering into an intimacy with them. 37 There are several who in certain periods of their lives are inexpressibly agreeable, and in others as odious and detestable. 38 Martial has given us a very pretty picture of one of this species, in the following epigram:

39 In all thy humours, whether grave or mellow,
Thou’rt such a touchy, testy, pleasant fellow;
Hast so much wit, and mirth, and spleen about thee,
There is no living with thee, nor without thee.

40 It is very unlucky for a person to be entangled in a friendship with one, who, by these changes and vicissitudes of humour, is sometimes amiable, and sometimes odious: 41 and as most humans are at some time in admirable frame and disposition of mind, it should be one of the greatest tasks of wisdom to keep ourselves well when we are so, and never to go out of that which is the agreeable part of our character.

OF FRIENDSHIP
Francis Bacon

11 It had been hard for you that spake it, to have put more truth and untruth together, in few words, than in that speech; ‘Whosoever is delighted in solitude is either a wild beast, or a god.’ 2 For it is most true, that a natural and secret hatred, and aversation towards society, in any person, hath somewhat of the savage beast; 3 but it is most untrue, that it should have any character, at all, of the divine Nature; except it proceed, not out of a pleasure in solitude, but out of a love and desire to sequester a person’s self for a higher conversation: 4 such as is found to have been falsely and feignedly in some of the heathen; as Epimenides the Candian, Numa the Roman, Empedocles the Sicilian, and Apollonius of Tyana; and truly and really, in divers of the ancient hermits, and holy fathers of the Church. 5 But little do people perceive what solitude is and how far it extendeth. For a crowd is not company; and faces are but a gallery of pictures; and talk but a tinkling cymbal, where there is no love. 6 The Latin adage meeteth with it a little; ‘'Magna civitas, magna solitudo''; because in a great town friends are scattered; so that there is not that fellowship, for the most part, which is in less neighbourhoods. 7 But we may go further, and affirm most truly; that it is a mere, and miserable solitude, to want true friends; without which the world is but a wilderness: 8 and even in this sense also of solitude, whosoever in the frame of your nature and affections is unfit for friendship, you taketh it of the beast, and not from humanity.

9 A principal fruit of friendship is the ease and discharge of the fullness and swellings of the heart, which passions of all kinds do cause and induce. 10 We know diseases of stoppings, and suffocations, are the most dangerous in the body; and it is not much otherwise in the mind: 11 you may take sarza to open the liver; steel to open the spleen; flower of sulphur for the lungs; castoreum for the brain; but no receipt openeth the heart, but a true friend; 12 to whom you may impart griefs, joys, fears, hopes, suspicions, counsels, and whatsoever lieth upon the heart, to oppress it, in a kind of civil shrift or confession.

13 It is a strange thing to observe, how high a rate great kings and monarchs, do set upon this fruit of friendship, whereof we speak: so great, as they purchase it, many times, at the hazard of their own safety, and greatness. 14 For princes, in regard of the distance of their fortune, from that of their subjects and servants, cannot gather this fruit; except (to make themselves capable thereof) they raise some persons, to be as it were companions, and almost equals to themselves, which many times sorteth to inconvenience. 15 The modern languages give unto such persons the name of favourites, or privadoes; as if it were matter of grace, or conversation. 16 But the Roman name attaineth the true use, and cause thereof; naming them 'participes curarum'; for it is that which tieth the knot. 17 And we see plainly, that this hath been done, not by weak and passionate princes only, but by the wisest, and most politic that ever reigned; 18 who have oftentimes joined to themselves some of their servants; whom both themselves have called friends; and allowed others likewise to call them in the same manner; using the word which is received between private people.

19 L. Sylla, when he commanded Rome, raised Pompey (after surnamed the Great) to that height, that Pompey vaunted himself for Sylla’s overmatch. 20 For when he had carried the consulship for a friend of his, against the pursuit of Sylla, and that Sylla did a little resent thereat, and began to speak great, Pompey turned upon him

again, and in effect bade him be quiet; ‘for that more people adored the sun rising, than the sun setting.’ 21 With Julius Cæsar, Decimus Brutus had obtained that interest, as he set him down, in his testament, for heir in remainder, after his nephew. And this was the man that had power with him to draw him forth to his death. 22 For when Cæsar would have discharged the senate, in regard of some ill presages, and specially a dream of Calpurnia, this man lifted him gently by the arm, out of his chair, telling him, he hoped he would not dismiss the senate, till his wife had dreamed a better dream. 23 And it seemeth, his favour was so great, as Antonius in a letter, which is recited verbatim, in one of Cicero’s Philippics, calleth him 'venefica', witch; as if he had enchanted Cæsar. 24 Augustus raised Agrippa (though of mean birth) to that height, as when he consulted with Mæcenas, about the marriage of his daughter Julia, 25 Mæcenas took the liberty to tell him; ‘That he must either marry his daughter to Agrippa, or take away his life, there was no third way, he had made him so great.’ 26 With Tiberius Cæsar, Sejanus had ascended to that height, as they two were termed and reckoned as a pair of friends. 27 Tiberius in a letter to him saith; ‘'Hæc pro amicitiâ nostrâ non occultavi'.’ And the whole senate dedicated an altar to friendship as to a goddess, in respect of the great dearness of friendship between them two. 28 The like or more was between Septimius Severus, and Plautianus. For he forced his eldest son to marry the daughter of Plautianus; and would often maintain Plautianus, in doing affronts to his son; and did write also in a letter to the senate, by these words; ‘I love the man so well, as I wish he may overlive me.’ 29 Now if these princes had been as a Trajan, or a Marcus Aurelius, a man might have thought that this had proceeded of an abundant goodness of Nature; 30 but being men so wise, of such strength and severity of mind, and so extreme lovers of themselves, as all these were; it proveth most plainly, that they found their own felicity (though as great as ever happened to mortal men) but as a half-piece, except they might have

a friend to make it entire: 31 and yet, which is more, they were princes that had wives, sons, nephews; and yet all these could not supply the comfort of friendship.

32 It is not to be forgotten, what Commineus observeth, of his first master Duke Charles the Hardy; namely, that he would communicate his secrets with none; and, least of all, those secrets which troubled him most.

33 Whereupon he goeth on, and saith, that towards his latter time; ‘that closeness did impair, and a little perish his understanding.’ 34 Surely Commineus might have made the same judgment also, if it had pleased him, of his second master Lewis the Eleventh, whose closeness was indeed his tormentor. 35 The parable of Pythagoras is dark, but true; ‘'Cor ne edito'’ (eat not the heart). 36 Certainly, if a man would give it a hard phrase, those that want friends to open themselves unto are cannibals of their own hearts. 37 But one thing is most admirable (wherewith I will conclude this first fruit of friendship), which is, that this communicating of a person’s self to own friend, works two contrary effects; for it redoubleth joys, and cutteth griefs in halves. 38 For there is no person, that imparteth own joys to own friend, but you joyeth the more; and no person, that imparteth own griefs to own friend, but you grieveth the less. 39 So that it is, in truth of operation upon a human’s mind, of like virtue as the alchemists use to attribute to their stone for human’s body; that it worketh all contrary effects, but still to the good, and benefit of Nature. 40 But yet, without praying in aid of alchemists, there is a manifest image of this in the ordinary course of Nature. 41 For in bodies union strengtheneth and cherisheth any natural action; and, on the other side, weakeneth and dulleth any violent impression: and even so is it of minds.

42 The second fruit of friendship is healthful and sovereign for the understanding, as the first is for the affections. 43 For friendship maketh indeed a fair day in the affections, from storm and tempests: but it maketh daylight in the understanding, out of darkness

and confusion of thoughts. 44 Neither is this to be understood only of faithful counsel, which a person receiveth from own friend; 45 but before you come to that, certain it is, that whosoever hath your mind fraught with many thoughts, your wits and understanding do clarify and break up, in the communicating and discoursing with another: 46 you tosseth thy thoughts more easily; you marshalleth them more orderly; you seeth how they look when they are turned into words; finally, you waxeth wiser than thyself; and that more by an hour's discourse, than by a day's meditation. 47 It was well said by Themistocles to the King of Persia; 'That speech was like cloth of Arras, opened, and put abroad; whereby the imagery doth appear in figure; whereas in thoughts, they lie but as in packs.'

48 Neither is this second fruit of friendship, in opening the understanding, restrained only to such friends as are able to give a person counsel: (they indeed are best) 49 but even, without that, a person learneth of thyself, and bringeth thy own thoughts to light, and whetteth thy wits as against a stone, which itself cuts not. 50 In a word, a person were better relate the self to a statue, or picture, than to suffer own thoughts to pass in smother. 51 Add now, to make this second fruit of friendship complete, that other point, which lieth more open, and falleth within vulgar observation; which is faithful counsel from a friend.

52 Heraclitus saith well, in one of his enigmas; 'Dry light is ever the best.' And certain it is, that the light that a person receiveth by counsel from another, is drier, and purer, than that which cometh from your own understanding, and judgment; which is ever infused and drenched in your affections and customs. 53 So as, there is as much difference between the counsel that a friend giveth, and that a person giveth thyself, as there is between the counsel of a friend, and of a flatterer. 54 For there is no such flatterer as is a person's self; and there is no such remedy, against flattery of a person's self, as the liberty of a friend. 55 Counsel is of two sorts; the one concerning manners, the other concerning business. For the

first; the best preservative to keep the mind in health is the faithful admonition of a friend. 56 The calling of a person's self to a strict account is a medicine sometime too piercing and corrosive. 57 Reading good books of morality is a little flat, and dead. 58 Observing our faults in others is sometimes improper for our case. But the best receipt (best (I say) to work, and best to take) is the admonition of a friend. 59 It is a strange thing to behold, what gross errors, and extreme absurdities, many (especially of the greater sort) do commit, for want of a friend, to tell them of them; to the great damage, both of their fame and fortune.

60 For, as St. James saith, they are as people, 'that look sometimes into a glass, and presently forget their own shape, and favour.' 61 As for business, a person may think, if you will, that two eyes see no more than one; 62 or that a gamester seeth always more than a looker-on; 63 or that a person in anger is as wise as you that hath said over the four-and-twenty letters; 64 or that a musket may be shot off as well upon the arm, as upon a rest; and such other fond and high imaginations, to think yourself all in all. 65 But when all is done, the help of good counsel is that which setteth business straight. 66 And if any person think that you will take counsel, but it shall be by pieces; asking counsel in one business of one person, and in another business of another person: it is well (that is to say, better perhaps than if you asked none at all); 67 but you runneth two dangers: one, that you shall not be faithfully counselled; for it is a rare thing, except it be from a perfect and entire friend, to have counsel given, but such as shall be bowed and crooked to some ends, which you hath that giveth it. 68 The other, that you shall have counsel given, hurtful and unsafe (though with good meaning), and mixed, partly of mischief, and partly of remedy: 69 even as if you would call a physician, that is thought good, for the cure of the disease you complain of, but is unacquainted with your body; and therefore, may put you in way for a present cure, but overthroweth your health in some other kind; and so cure the disease, and kill

the patient. 70 But a friend, that is wholly acquainted with a person's estate, will beware by furthering any present business how you dasheth upon other inconvenience. 71 And therefore, rest not upon scattered counsels; they will rather distract, and mislead, than settle and direct.

72 After these two noble fruits of friendship (peace in the affections, and support of the judgment) followeth the last fruit; which is like the pomegranate, full of many kernels; I mean aid, and bearing a part, in all actions, and occasions. 73 Here, the best way to represent to life the manifold use of friendship is to cast and see how many things there are which a person cannot do yourself; 74 and then it will appear, that it was a sparing speech of the ancients to say, 'That a friend is another the self': for that a friend is far more than the self. 75 Humans have their time, and die many times in desire of some things which they principally take to heart; the bestowing of a child, the finishing of a work, or the like. 76 If a person have a true friend, you may rest almost secure that the care of those things will continue after you. So that a person hath as it were two lives in own desires. 77 A person hath a body, and that body is confined to a place; but where friendship is, all offices of life are as it were granted to you, and your deputy. For you may exercise them by your friend. 78 How many things are there which a person cannot, with any face or comeliness, say or do yourself? 79 A person can scarce allege own merits with modesty, much less extol them: a person cannot sometimes brook to supplicate or beg: and a number of the like. But all these things are graceful in a friend's mouth, which are blushing in a person's own. 80 So again, a person's person hath many proper relations, which you cannot put off. A person cannot speak to own son, but as a father; to own wife, but as a husband; to own enemy, but upon terms: whereas a friend may speak, as the case requires, and not as it sorteth with the person.

81 But to enumerate these things were endless: I have given the rule, where a person cannot fitly

play own part: if you have not a friend, you may quit the stage.

OF FRIENDSHIP
Michael, Lord Of Montaigne

12 There is nothing to which Nature hath more addressed us than to society. 2 And 'Aristotle' saith, 'that perfect Law-givers have had more regardful care of friendship than of justice'. 3 And the utmost drift of its perfection is this. For generally, all those amities which are forged and nourished by voluptuousness or profit, public or private need, are thereby so much the less fair and generous, and so much the less true amities, 4 in that they intermeddle other causes, scope, and fruit with friendship, than itself alone: 5 Nor do those four ancient kinds of friendships, 'Natural', 'social', 'hospitable', and 'venerian', either particularly or conjointly beseem the same. 6 That from children to parents may rather be termed respect: 7 Friendship is nourished by communication, which by reason of the over-great disparity cannot be found in them, and would happily offend the duties of Nature: 8 for neither all the secret thoughts of parents can be communicated unto children, lest it might engender an unbeseeming familiarity between them, 9 nor the admonitions and corrections (which are the chiefest offices of friendship) could be exercised from children to parents. 10 There are nations been found, where, by custom, children killed their parents, and others, where parents slew their children, thereby to avoid the hindrance of enter-bearing one another in aftertimes: for naturally one dependeth from the ruin of another.... 11 Verily the name of Brother is a glorious name, and full of loving kindness, and therefore did you and I term one another sworn brother: 12 but this commixture, dividence, and sharing of goods, this joining wealth to wealth, and that the riches of one shall be the poverty of another, doth exceedingly distemper and distract all brotherly alliance, and lovely conjunction: 13 If brothers should conduct the progress of their advancement and thrift in one same path and course,

they must necessarily oftentimes hinder and cross one another. 14 Moreover, the correspondency and relation that begetteth these true and mutually perfect amities, why shall it be found in these? 15 The father and the son may very well be of a far differing complexion, and so [may] brothers: You are my son, you are my kinsman; but you may be a fool, a bad, or a peevish-minded person. 16 And then according as they are friendships, which the law and duty of Nature doth command us, so much the less of our own voluntary choice and liberty is there required unto it: 17 And our genuine liberty hath no production more properly her own, than that of affection and amity.

18 Sure I am, that concerning the same I have assayed all that might be, having had the best and most indulgent father that ever was, even to your extremest age, 19 and who from father to son was descended of a famous house, and touching this rare-seen virtue of brotherly concord very exemplary:

To his brothers known so kind,
As to bear a father's mind.

20 To compare the affection toward women unto it, although it proceed from our own free choice, a man cannot, nor may it be placed in this rank:

Nor is that Goddess ignorant of me,
Whose bitter-sweets with my cares mixed be.

21 Her fire, I confess it to be more active, more fervent, and more sharp. But it is a rash and wavering fire, waving and divers: the fire of an ague subject to fits and stints, and that hath but slender hold-fast of us. 22 In true friendship, it is a general and universal heat, and equally tempered, a constant and settled heat, all pleasure and smoothness, that hath no pricking or stinging in it, which the more it is in lustful love, the more is it but a ranging and mad desire in following that which flies us,

23 Ev'n as the huntsman doth the hare pursue,
In cold, in heat, on mountains, on the shore,
But cares no more, when he her ta'en espies,
Speeding his pace, only at that which flies.

24 As soon as it creepeth into the terms of friendship, that is to say, in the agreement of wills, it languisheth and vanisheth away: enjoying doth lose it, as having a corporal end, and subject to sacietie. 25 On the other side, friendship is enjoyed according as it is desired, it is neither bred, nor nourished, nor increaseth but in jovissance, as being spiritual, and the mind being refined by use and custom. 26 Under this chief amity, these fading affections have sometimes found place in me, lest I should speak of you, who in your verses speaks but too much of it. 27 So are these two passions entered into me in knowledge one of another, but in comparison never: the first flying a high, and keeping a proud pitch, disdainfully beholding the other to pass her points far under it. 28 Concerning marriage, besides that it is a covenant which hath nothing free but the entrance, the continuance being forced and constrained, depending elsewhere than from our will, and a match ordinarily concluded to other ends: 29 A thousand strange knots are therein commonly to be unknit, able to break the web, and trouble the whole course of a lively affection; whereas in friendship, there is no commerce or business depending on the same, but itself. 30 Seeing (to speak truly) that the ordinary sufficiency of women, cannot answer this conference and communication, the nurse of this sacred bond: nor seem their minds strong enough to endure the pulling of a knot so hard, so fast, and durable. 31 And truly, if without that, such a genuine and voluntary acquaintance might be contracted, where not only minds had this entire jovissance, but also bodies, a share of the alliance, and where a person might wholly be engaged: 32 It is certain, that friendship would thereby be more complete and full: But this sex could never yet by any example attain unto it, and is by ancient schools rejected thence. 33 And this other Greek licence is justly abhorred by our customs, which notwithstanding, because according to us it had so necessary a disparity of ages, and difference of offices between lovers, did no more sufficiently answer the

perfect union and agreement, which here we require:
34 'For, what love is this of friendship? why doth no man love either a deformed young man, or a beautiful old man?' 35 For even the picture the 'Academie' makes of it, will not (as I suppose) disavow me, to say thus in her behalf: That the first fury, inspired by the son of 'Venus' in the lover's heart, upon the object of tender youth's-flower, to which they allow all insolent and passionate violences, an immoderate heat may produce, was simply grounded upon an external beauty; 36 a false image of corporal generation: for in the spirit it had no power, the sight whereof was yet concealed, which was but in your infancy, and before the age of budding. 37 For, if this fury did seize upon a base minded courage, the means of its pursuit, [were] riches, gifts, favour to the advancement of dignities, and such like vile merchandice, which they reprove. 38 If it fell into a most generous mind, the interpositions were likewise generous: Philosophical instructions, documents to reverence religion, to obey the laws, to die for the good of his country: examples of valour, wisdom and justice. 39 The lover endeavouring and studying to make yourself acceptable by the good grace and beauty of your mind (that of your body being long since decayed) hoping by this mental society to establish a more firm and permanent bargain. 40 When this pursuit attained the effect in due season (for by not requiring in a lover, you should bring leasure and discretion in your enterprise, they require it exactly in the beloved; 41 for as much as you was to judge of an internal beauty, of a difficile knowledge, and abstruse discovery) [then] by the interposition of a spiritual beauty was the desire of a spiritual conception engendred in the beloved. 42 The latter was here chiefest; the corporal, accidental and second, altogether contrary to the lover. 43 And therefore do they prefer the beloved, and verify that the gods likewise prefer the same: 44 and greatly blame the Poet 'Æschylus', who in the love between 'Achilles' and 'Patroclus' ascribeth the lover's part unto

'Achilles', who was in the first and beardless youth of your adolescency, and the fairest of the Græcians. 45 After this general community, the mistress and worthiest part of it, predominant and exercising her offices (they say the most availful commodity did thereby redound both to the private and public). 46 That it was the force of countries received the use of it, and the principal defence of equity and liberty: witness the comfortable loves of 'Hermodius' and 'Aristogiton'.

47 Therefore name they it sacred and divine, and it concerns not them whether the violence of tyrants, or the demisness of the people be against them: 48 To conclude, all can be alleaged in favour of the Academy, is to say, that it was a love ending in friendship, a thing which hath no bad reference unto the Stoical definition of love: 49 'That love is an endeavour of making friendship, by the shew of beauty.'

50 I return to my description in a more equitable and equal manner.

'Clearly friendships are to be judged by wits, and ages already strengthened and confirmed.'

51 As for the rest, those we ordinarily call friends and amities, are but acquaintances and familiarities, tied together by some occasion or commodities, by means whereof our minds are entertained. 52 In the amity I speak of, they intermix and confound themselves one in the other, with so universal a commixture, that they wear out, and can no more find the seam that hath conjoined them together. 53 If a person urge me to tell wherefore I loved them,

I feel it cannot be expressed, but by answering: Because it was you, because it was myself.

54 There is beyond all my discourse, and besides what I can particularly report of it, I know not what inexplicable and fatal power, a mean and Mediatrix of this indissoluble union. 55 We sought one another, before we had seen one another, and by the reports we heard one of another; which wrought a greater violence in us, than the reason of reports may well bear: 56 I think by some secret ordinance of the heavens, we embraced one another by our names. 57 And at our first meeting, which was by chance at a great

feast, and solemn meeting of a whole township, we found ourselves so surprised, so known, so acquainted, and so combinedly bound together, that from thence forward, nothing was so near unto us, as one unto another.

58 He writ an excellent Latin Satire; since published; by which he excuseth and expoundeth the precipitation of our acquaintance, so suddenly come to her perfection; 59 Sithence it must continue so short a time, and begun so late (for we were both grown men, and he some years older than myself) there was no time to be lost. 60 And it was not to be modelled or directed by the pattern of regular and remiss friendship, wherein so many precautions of a long and preallable conversation are required. 61 This hath no other 'Idea' than of itself, and can have no reference but to itself. It is not one especial consideration, nor two, nor three, nor four, nor a thousand: 62 It is I wot not what kind of quintessence, of all this commixture, which having seized all my will, induced the same to plunge and lose itself in yours, which likewise having seized all your will, brought it to lose and plunge itself in mine, with a mutual greediness, and with a semblable concurrence. 63 I may truly say, lose, reserving nothing unto us, that might properly be called our own, nor that was either yours, or mine.

64 When 'Lelius' in the presence of the Roman Consuls, who after the condemnation of 'Tiberius Gracchus', pursued all those that had been of his acquaintance, came to enquire of 'Caius Blosius' (who was one of his chiefest friends) what he would have done for him, 65 and that he answered, 'All things. What? All things?' replied he: 'And what if he had willed thee to burn our Temples?' 'Blosius' answered, 'He would never have commanded such a thing. But what if he had done it?' replied 'Lelius':

66 The other answered, 'I would have obeyed him': If he were so perfect a friend to 'Gracchus', as Histories report, he needed not offend the Consuls with this last and bold confession, and should not have departed from the assurance he had of 'Gracchus' his

mind. 67 But yet those, who accuse this answer as seditious, understand not well this mystery: and do not presuppose in what terms he stood, and that he held 'Gracchus' his will in his sleeve, both by power and knowledge. 68 They were rather friends than Citizens, rather friends than enemies of their country, or friends of ambition and trouble. 69 Having absolutely committed themselves one to another, they perfectly held the reins of one another's inclination: and let this yoke be guided by virtue and conduct of reason (because without them it is altogether impossible to combine and proportion the same).

70 The answer of 'Blosius' was such as it should be. If their affections miscarried, according to my meaning, they were neither friends one to other, nor friends to themselves. 71 As for the rest, this answer sounds no more than mine would do, to you that would in such sort enquire of me; if your will should command you to kill your daughter, would you do it? 72 And that I should consent unto it: for, that beareth no witness of consent to do it: because I am not in doubt of my will, and as little of such a friend's will.

73 It is not in the power of the world's discourse to remove me from the certainty I have of your intentions and judgements of mine: no one of its actions might be presented unto me, under what shape soever, but I would presently find the spring and motion of it. 74 Our minds have jumped so unitedly together, they have with so fervent an affection considered of each other, and with like affection so discovered and sounded, even to the very bottom of each other's heart and entrails, 75 that I did not only know yours, as well as mine own, but I would (verily) rather have trusted you concerning any matter of mine, than myself. 76 Let no person compare any of the other common friendships to this. I have as much knowledge of them as another, yea of the perfectest of their kind: yet will I not persuade any person to confound their rules, for so a person might be deceived. 77 In these other strict friendships a person must march with the bridle of wisdom and precaution in own

hand; the bond is not so strictly tied, but a person may in some sort distrust the same.

78 'Love him' (said 'Chilon') 'as if you should one day hate him again. Hate him as if you should love him again.' 79 This precept, so abominable in this soveraign and mistress Amity, is necessary and wholesome in the use of vulgar and customary friendships: toward which a person must employ the saying 'Aristotle' was wont so often to repeat, 'Oh you my friends, there is no perfect friend'.

80 In this noble commerce, offices and benefits (nurses of other amities) deserve not so much as to be accounted of: 81 this confusion so full of our wills is cause of it: for even as the friendship I bear unto myself, admits no accrease, by any succour I give myself in any time of need, whatsoever the Stoics alleage; 82 and as I acknowledge no thanks unto myself for any service I do unto myself, so the union of such friends, being truly perfect, makes them lose the feeling of such duties, 83 and hate, and expel from one another these words of division, and difference; benefit, good deed, duty, obligation, acknowledgement, prayer, thanks, and such their like.

84 All things being by effect common between them; wills, thoughts, judgements, goods, wives, children, honour, and life; 85 and their mutual agreement, being no other than one soul in two bodies, according to the fit definition of 'Aristotle', they can neither lend or give ought to each other. 86 See here the reason why Lawmakers, to honour marriage with some imaginary resemblance of this divine bond, inhibit donations between husband and wife; 87 meaning thereby to infer, that all things should peculiarly be proper to each of them, and that they have nothing to divide and share together.

88 If in the friendship whereof I speak, one might give unto another, the receiver of the benefit should bind own fellow. 89 For, each seeking more than any other thing, to do each other good, you who yields both matter and occasion, is the person sheweth thyself liberal, giving your friend that contentment, to effect towards you what you desireth most.

FRIENDSHIP

90 When the Philosopher 'Diogenes' wanted money, he was wont to say; 'That he re-demanded the same of his friends, and not that he demanded it': And to show how that is practised by effect, I will relate an ancient singular example. 91 'Eudamidas' the Corinthian had two friends. 'Charixenus' a Sycionian, and 'Aretheus' a Corinthian; being upon his death-bed, and very poor, and his two friends very rich, thus made his last will and testament.

92 'To' Aretheus, 'I bequeath the keeping of my mother, and to maintain' 'her when she shall be old: To' Charixenus 'the marrying of my daughter, and to give her as great a dowry as he may: and in case one of them shall chance to die before, I appoint the surviver to substitute his charge, and supply his place'. 93 Those that first saw this testament, laughed and mocked at the same; but his heirs being advertised thereof, were very well pleased, and received it with singular contentment. 94 And 'Charixenus' one of them, dying five days after 'Eudamidas', the substitution being declared in favour of 'Aretheus', he carefully, and very kindly kept and maintained his mother, 95 and of five talents that he was worth, he gave two and a half in marriage to one only daughter he had, and the other two and a half to the daughter of 'Eudamidas', whom he married both in one day.

96 This example is very ample, if one thing were not, which is the multitude of friends: For this perfect amity I speak of is indivisible; each man doth so wholly give himself unto his friend, that he hath nothing left him to divide elsewhere: 97 moreover he is grieved that he is [not] double, triple, or quadruple, and hath not many souls, or sundry wills, that he might confer them all upon this subject.

98 Common friendships may be divided; a person may love beauty in one, facility of behaviour in another, liberality in one, and wisdom in another, paternity in this, fraternity in that person, and so forth: 99 but this amity which possesseth the soul, and sways it in all soveraignty, it is impossible it should be double. 100 If two at one instant should require help, to which would you run? Should they

crave contrary offices of you, what order would you follow? 101 Should one commit a matter to your silence, which if the other knew would greatly profit him, what course would you take? Or how would you discharge yourself? 102 A singular and principal friendship dissolveth all other duties, and freeth all other obligations. The secret I have sworn not to reveal to another, I may without perjury impart it unto you, who is no other but myself. 103 It is a great and strange wonder for a person to double the self; and those that talk of tripling, know not, nor cannot reach unto the height of it.

104 'Nothing is extreme, that hath your like.' And you who shall presuppose, that of two I love the one as well as the other, and that they inter-love one another, and love me as much as I love them: 105 you multiplieth in brotherhood, a thing most singular, and a lonely one, and than which one alone is also the rarest to be found in the world. 106 The remainder of this history agreeth very well with what I said; for, 'Eudamidas' giveth as a grace and favour to his friends to employ them in his need: 107 he leaveth them as his heirs of his liberality, which consisteth in putting the means into their hands, to do him good. 108 And doubtless, the force of friendship is much more richly shown in his deed, than in 'Aretheus'.

109 To conclude, they are [inimaginable] effects, to him that hath not tasted them; and which makes me wonderfully to honour the answer of that young Soldier to 'Cyrus', who enquiring of him, what he would take for a horse, with which he had lately gained the prize of a race, and whether he would change him for a Kingdom? 110 'No, surely, my Liege' (said he), 'yet would I willingly forego him to gain a true friend, could I but find a man worthy of so precious an alliance'. He said not ill, in saying, 'could I but find'. 111 For, a person shall easily find people fit for a superficial acquaintance; but in this, wherein people negotiate from the very centre of their hearts, and make no spare of any thing, it is most requisite, all the wards and springs be sincerely wrought, and

perfectly true. 112 In confederacies, which hold but by one end, people have nothing to provide for, but for the imperfections, which particularly do interest and concern that end and respect. 113 It is no great matter what religion my Physician and Lawyer is of: this consideration hath nothing common with the offices of that friendship they owe me.

114 So do I in the familiar acquaintances, that those who serve me contract with me. 115 I am nothing inquisitive whether a Lackey be chaste or no, but whether he be diligent: 116 I fear not a gaming Muletier, so much as if you be weak; nor a hot swearing Cooke, as one that is ignorant and unskilful; 117 I never meddle with saying what a person should do in the world; there are over many others that do it; but what myself do in the world.

So is it requisite for me;
Do thou as needful is for thee.

118 Concerning familiar table-talk, I rather acquaint myself with, and follow a merry conceited humour, than a wise person.... 119 In society or conversation of familiar discourse, I respect rather sufficiency, though without 'Preud'hommie', and so of all things else. 120 Even as one that was found riding upon an hobby-horse, playing with own children, besought you, who thus surprised you, not to speak of it, until you were a father yourself supposing the tender fondness, and fatherly passion, which then would possess your mind, should make you an impartial judge of such an action. 121 So would I wish to speak to such as had tried what I speak of: but knowing how far such an amity is from the common use, and how seldom seen and rarely found, I look not to find a competent judge.

122 For, even the discourses, which stern antiquity hath left us concerning this subject, seem to me but faint and forceless in respect of the feeling I have of it: 123 And in that point the effects exceed the very precepts of Philosophy.

For me, be I well in my wit,
Nought, as a merry friend, so fit.

FRIENDSHIP

124 Ancient 'Menander' accounted you happy, that had but met the shadow of a true friend: verily you had reason to say so, especially if you had tasted of any: 125 for truly, if I compare all the rest of my forepassed life, which although I have by the mere mercy of God, past at rest and ease, and except the loss of so dear a friend, 126 free from all grievous affliction, with an ever-quietness of mind, as one that have taken my natural and original commodities in good payment, without searching any others: 127 if, as I say, I compare it all unto the four years, I so happily enjoyed the sweet company, and dear-dear society of that worthy person, it is nought but a vapour, nought but a dark and irkesome [night]. 128 Since the time I lost him,

Which I shall ever hold a bitter day,
Yet ever honor'd (so my God t' obey).

129 I do but languish, I do but sorrow: and even those pleasures, all things present me with, instead of yielding me comfort, do but redouble the grief of your loss. 130 We were co-partners in all things. All things were with us at half: methinks I have stolen your part from you.

131 I have set down, no joy enjoy I may,
As long as you my partner is away.
I was so accustomed to be ever two,
and so enured to be never single,
that methinks
I am but half myself.

132 Since that part of my soul riper fate reft me,
Why stay I here the other part he left me?
Nor so dear, nor entire, while here I rest:
That day hath in one ruin both oppprest.

133 There is no action can betide me, or imagination possess me, but I hear you saying, as indeed you would have done to me: 134 for even as you did excel me by an infinite distance in all other sufficiencies and virtues, so did you in all offices and duties of friendship.

135 What modesty or measure may I bear,
In want and wish of you that was so dear?

FRIENDSHIP

136 O brother reft from miserable me,
All our delight's are perished with thee,
Which thy sweet love did nourish in my breath.
Thou all my good hast spoiled in thy death:
137 With thee my soul is all and whole enshrined,
At whose death I have cast out of mind
All my mind's sweet-meats, studies of this kind;
138 Never shall I hear thee speak, speak with thee?
Thee, brother, than life dearer, never see?
Yet shalt thou ever be belov'd of me.

139 But let us a little hear this young man speak, being but sixteen years of age. Because I have found this work to have since been published (and to an ill end) by such as seek to trouble and subvert the state of our common-wealth, 140 nor caring whether they shall reform it or no; which they have fondly inserted among other writings of their invention, I have revoked my intent, which was to place it here. 141 And lest the Author's memory should any way be interested with those that could not thoroughly know his opinions and actions, 142 they shall understand, that this subject was by him treated of in his infancy, only by way of exercise, as a subject, common, bare-worn, and wire-drawn in a thousand books. 143 I will never doubt but he believed what he writ, and writ as he thought: for he was so conscientious, that no lie did ever pass his lips, yea, were it but in matters of sport or play: 144 and I know, that had it been in his choice, he would rather have been born at 'Venice' than at 'Sarlac'; and good reason why:

145 But he had another maxim deeply imprinted in his mind, which was, carefully to obey, and religiously to submit himself to the laws, under which he was born. 146 There was never a better Citizen, nor more affected to the welfare and quietness of his country, nor a sharper enemy of the changes, innovations, new-fangles, and hurly-burlies of his time: 147 He would more willingly have employed the utmost of his endeavours to extinguish and

suppress, than to favour or further them: 148 His mind was modelled to the pattern of other best ages.

IDEAL FRIENDSHIP
Anthusa To St. John

13 A truly faithful friend is the medicine of life; a truly faithful friend, a strong covering. 2 For what would not a genuine friend do? What pleasure would you not create for us? what profit? what safety? 3 Though thou wert to name a thousand treasures, there is nothing comparable to a real friend. 4 And first let us say how much pleasure friendship contains. 'The friend' is bright with joy, and overflows when you sees your friend. 5 You are united to them according to an union having a certain ineffable pleasure of the soul. 6 But if you barely think of them, you rises and is borne upwards in your mind.

7 I speak of genuine friends, who are of one accord, of those who would choose to die for their friends, of those who love warmly. 8 Do not imagine, when you think of those who love lightly, and are sharers of your tables, and friends with whom you have a bowing acquaintance, that you can refute this saying of mine. 9 If any one have a friend such as I mention, you will understand my words; and, though you should see your friend every day, you are not filled 'with seeing' them. You makes the same prayers for them as for yourself.

10 I know a certain person, who, when asking the holy man, on behalf of his friend, asks him to pray first for the friend and then for himself. 11 A true friend is such that places and times are loved on own account. For, as brilliant bodies shed a lustre upon the adjoining places, even so friends impart their own grace to the places where they may come. 12 And oftentimes, when standing in those places without our friends, we have wept and groaned, remembering the days when we were there along with them.

13 It is not possible to set forth in language the pleasure which the presence of friends causes, but those only having experience know. 14 One can ask a favour, and receive a favour, from a friend

without suspicion. 15 When they lay a command upon us, we are grateful to them; but when they are slow to ask, then we are sad. We have nothing which is not theirs. 16 Often, though despising all things here, nevertheless, on their account, we do not wish to depart from hence; and they are more desirable to us than the light. 17 And, truly, indeed, a friend is more desirable than the light itself. I speak of the genuine friend: and do not wonder; for it were better for us that the sun were extinguished, than to be deprived of friends. 18 It were better to live in darkness, than to be without friends. And how do I say this? Because many seeing the sun are in darkness. 19 But those who are rich in friends, could never be in tribulation. I speak of the spiritual friends who set nothing above friendship. 20 Such was Paul, who would willingly have given his own soul, without having been asked, and would have willingly fallen into Hell.

21 With so burning an affection is it proper to love. I wish to give you an example of friendship. Friends surpass fathers and sons, that is, friends according to Christ.

22 Friendship is a great thing, and how great, no one could learn, nor could any word explain, but only the experience of itself. 23 For this (the absence of love) has brought heresies, this causes the heathens to be heathens. 24 You who loves does not wish to command nor to rule, but you feels more grateful, being subject, and being commanded; 25 you wishes to confer favours rather than to receive them, for you loves, and feels as if you had not gratified your desire. 26 You are not so much delighted at experiencing kindness as at doing kindness. For you prefers to hold your friend bound to you, rather than you should be indebted to your friend: or, rather, you wishes to be indebted to them, and also to have them as a debtor. 27 You wishes to confer favours upon, and not to seem to confer favours, but to be their debtor.

28 When friendship does not exist, we upbraid 'with' our services those whom we serve, and we exaggerate small things.

29 But where friendship does exist, we both conceal the services, and we wish to show great things as small, in order that we may not seem to have our friend a debtor, but that we ourselves may appear to be debtors to them while we actually have them our debtor.

30 I know that many do not understand what is said, but the reason is, that I discourse of a thing which now inhabits Heaven. 31 As if, therefore, I spoke of some plant growing in India, of which no one had experience, language could not represent it, although I were to say ten thousand things; even so, now, whatever I may say, I shall speak in vain, for no one will be able to represent it. 32 This plant has been planted in Heaven, having its branches loaded, not with pearls, but with excelling life, which is much more pleasing than those. 33 But what kind of pleasure dost thou wish to speak of? Is it of disgraceful pleasure? Or of virtuous pleasure? 34 Now the pleasure of friendship exceeds all other pleasures, even though thou shouldst say that of honey. 35 For this latter becomes mawkish, but a friend never, so long as you are a friend; but your desire is rather increased, and this pleasure never admits of satiety. 36 A friend is sweeter than the present life. Therefore, many have not wished to live any longer after the death of their friends. 37 With a friend any one could willingly endure banishment; but without a friend no one would choose to inhabit even own country. 38 With a friend even poverty is bearable, but without them health and wealth are unbearable. Such an one has another self.

39 Nothing is the equal of concord, nor of harmony. For one is thus equivalent to many. For, if two, or ten, be unanimous, any one of them is no longer one, but each one of them becomes of the value of ten; and you will find the one in the ten, and the ten in the one. 40 And if they have an enemy, attacking not one, but ten, they are thus taken. For they are struck, not by one, but by ten mouths.

41 Has the one fallen into want? Still you are not in desolation; for you abounds in your greater part; that is to say in the nine, and the needy part is protected; 'that is',

the smaller part by that which abounds.

42 Each one of them has twenty hands, and twenty eyes, and as many feet. For you sees not with your own eyes alone, but with those of others; you walks not with your own feet, but with those of others; you works not with your own hands, but with those of others. 43 You have ten souls, for you alone is not concerned about yourself, but those 'other nine souls' are concerned about you. 44 But if they be a hundred, the same thing will take place again, the 'elements' of power will be increased.

45 Hast thou seen the excellence of charity? How it causes one individual to be unconquerable and equal to many. 46 How the one person can be in different places. How the same person 'may thus be' in Persia and in Rome, and how what Nature cannot do, that, charity can do. 47 For one part of the person will be there, and one part here; or rather, you will be altogether there and altogether here. 48 Or if you have a thousand friends, or two thousand, think to what a pitch your power will advance. 49 Dost thou see how productive 'a thing' is charity? For this is a wonderful thing: to make the individual a thousand-fold. 50 For what reason, therefore, do we not take possession of this strength, and place ourselves in safety?

51 This is better than all power and virtue. This is more than health, more than the light of 'day' itself. This is an argument of joy. How long shall we confine our love to one or two? Learn the thing from its opposite.

52 Let there be any one, who has no friend-- a thing which is of the utmost folly. 53 For the fool will say, I have no friend. What manner of life does such an one live? 54 For even if you be ten thousand times rich; even if you be in abundance and luxury, and possessing ten thousand good things, you are absolutely deserted and naked. 55 But in the case of friends this is not so; but even though they be poor, they are better provided than the rich; and what a person will not venture to say for yourself, those things a friend will say for you. 56 And the things which you are unable to

grant to yourself, those you can grant through another, and many more things than those, and thus you will be to us a cause of all pleasure and enjoyment. 57 For it is impossible that you should suffer hurt, being protected by so many bodyguards, for neither are the bodyguards of the Emperor as careful as those; 58 for the former perform their guard through necessity, but the latter through kindness and love. But those things are much more commanding than fear. 59 And he indeed ('the prince') fears his guards, but the friend trusts to them more than to himself, and, through their means, fears none of those who plot against him.

60 Let us, therefore, procure for ourselves this commodity-- the poor person, that you may have a consolation of your poverty; the rich person, in order that you may possess your riches in safety; the ruler that you may rule with safety; the subject, that you may have well-disposed rulers. 61 This is an occasion of benevolence; this is a cause of clemency. Since even amongst beasts, those are the most savage and intractable which do not herd together; 62 for this reason we inhabit cities, and we hold markets, that we may have intercourse with each other. 63 This also Paul commanded, saying, ‘Not forsaking our assembly.’ For there is nothing so bad as solitude, and the absence of society and of access.

64 What, therefore, 'are' the monks, 'some one' says, and those who have taken as 'their residence' the tops of the mountains? 65 Neither are they without friends; but they have fled from the tumult of the market-place, and have many of one accord with them, and strictly bound to each other. 66 And it was in order that they might accomplish this that they withdrew. For, inasmuch as the zeal of business begets many disputes, for this reason, having left the world, they cultivate charity with much strictness. 67 What, therefore, he says, if a man be alone, may he also have innumerable friends? 68 I, indeed, would wish if it were possible that we were all able to live together; but, in the meantime, let friendship remain unmoved. For it is not the place that makes the friend. 69

They, therefore, have many who admire them; but those would not admire unless they loved. 70 And they again (the monks) pray for the entire world, which is the greatest evidence of friendship. 71 For this reason also in the 'sacred' mysteries, we embrace each other, in order that being many, we may become one. 72 And we make common prayer for the uninitiated, imploring for the sick and for the fruits of the world, and for the land, and for the sea. 73 Dost thou see all the strength of charity, in the prayers, in the 'holy' mysteries, in the admonitions? This is the cause of all good things. 74 If we apply, with due care, to those admonitions, which shall both administer present things well, and shall obtain the kingdom.

THE BLESSINGS OF FRIENDSHIP

Aristotle

14 Friendship, in the first place, is either itself a virtue, or connected with virtue; 2 and next, it is a thing most necessary for life, since no one would choose to live without friends, though you should have all the other good things in the world: 3 and, in fact, people who are rich or possessed of authority and influence, are thought to have special need of friends. 4 For where is the use of such prosperity, if there be taken away the doing of kindnesses, of which friends are the most usual and most commendable objects? 5 Or how can it be kept or preserved without friends, because the greater it is, so much the more insecure and hazardous: in poverty, moreover, and all other adversities, humans think friends to be their only refuge.

6 Furthermore, friendship helps the young to keep from error; the old, in respect of attention and such deficiencies in action as their weakness makes them liable to; 7 and those who are in their prime, in respect of noble deeds; ‘they 'two' together going,’ Homer says, because they are thus more able to devise plans, and carry them out.

8 Friendship seems to be the bond of social communities, and legislators seem to be more anxious to secure it than justice even. 9 I mean, unanimity is

somewhat like to friendship, and this they certainly aim at, and specially drive out faction as being inimical.

10 When people are in friendship, justice is not required; but, on the other hand, though they are just, they need friendship in addition, and that principle which is most truly just is thought to partake of the nature of friendship. 11 Not only is it a thing necessary, but honourable likewise, since we praise those who are fond of friends, and the having numerous friends is thought a matter of credit to a person; 12 some even go so far as to hold that a ‘good person’ and ‘friend’ are terms synonymous.

13 Each individual feels friendship, not for what it 'is', but for that which 'conveys to your mind the impression of being' good to yourself. 14 But this will make no real difference, because that which is truly the object of friendship, will also convey this impression to your mind.

15 There are three causes from which humans feel friendship; but the term is not applied to the case of fondness for things inanimate, because there is no requital of the affection, nor desire for the good of these objects.

16 As the motives to friendship differ in kind, so do the respective feelings and friendships. 17 Now they who have friendship for one another desire one another’s good, according to the motive of their friendship; 18 accordingly, they whose motive is utility have no real friendship for one another, but only in so far as some good arises to them from one another. 19 They whose motive is pleasure are in like case: I mean, they have friendship for people of easy pleasantry, not because they are of a given character, but because they are pleasant to themselves. 20 So they whose motive to friendship is utility, love their friends for what is good to themselves; they whose motive is pleasure, do so for what is pleasurable to themselves; 21 that is to say, not in so far as the friend beloved 'is', but in so far as you are useful or pleasurable. 22 These friendships then are a matter of result, since the object is not beloved in that one 'is', but in that one furnishes advantage or pleasure, as the case may be. 23

Such friendships are very liable to dissolution if the parties do not continue alike; when they are no longer pleasurable or useful. 24 It is the nature of utility not to be permanent, but constantly varying; thus when the motive which made them friends is vanished, the friendship likewise dissolves, since it existed only relatively to those circumstances.

25 Friendship of this kind is thought to exist principally among the old, because people at that time of life pursue, not what is pleasurable, but what is profitable. 26 They that are such have no intimate intercourse, for sometimes they are not even pleasurable to one another. With these friendships is commonly ranked that of hospitality.

27 But the friendship of the young is thought to be based on the motive of pleasure, because they live at the beck and call of passion, and generally pursue what is pleasurable to themselves, and the object of the present moment. 28 Their age changes, so likewise their pleasures. This the reason why they form and dissolve friendships rapidly, since the friendship changes with the pleasurable object, and such pleasure changes quickly.

29 Perfect friendship subsists between those who are good, and whose similarity consists in their goodness; for these people wish one another's good in similar ways, in so far as they are good.

30 And those are specially friends who wish good to their friends for their sakes, because they feel thus towards them on their own account, and not as a mere matter of result. 31 So the friendship between these people continues to subsist so long as they are good, and goodness we know has in it a principle of permanence. 32 Each party is good abstractedly, and also relatively to own friend, for all good people are not only abstractedly good, but also useful to one another. 33 Such friends are also mutually pleasurable, because all good people are so abstractedly, and also relatively to one another, inasmuch as to each individual these actions are pleasurable which correspond to own nature, and all such as are like them.

FRIENDSHIP

34 Friendship under these circumstances is permanent, since it combines in itself all the requisite qualifications of friends. 35 Friendship, of whatever kind, is based upon good or pleasure (either abstractedly or relatively to the person entertaining the sentiment of friendship), and results from a similarity of some sort; 36 and to this kind belong all the aforementioned requisites in the friends themselves, because in this they are similar. 37 In it there is abstractedly good, and the abstractedly pleasant, and as these are specially the object-matter of friendship, 38 so the feeling and state of friendship is found most intense and excellent in people thus qualified.

39 Rare it is probable friendships will be, because people of this kind are rare. 40 Besides, all requisite qualifications being presupposed, there is farther required time and intimacy. 41 They cannot admit one another to intimacy, much less be friends, till each has appeared to the other and been proved to be a fit object of friendship.

42 They who speedily commence an interchange of friendly actions, may be said to wish to be friends, but they are not so, unless they are also proper objects of friendship and mutually known to be such. 43 A desire for friendship may arise quickly, but not friendship itself.

44 This friendship is perfect both in respect of the time and in all other points; and exactly the same and similar results accrue to each party from the other, which ought to be the case between friends.

45 The friendship based upon the pleasurable is, so to say, a copy of this, since the good are sources of pleasure to one another; that based on utility likewise, the good being also useful to one another. 46 Between people thus connected, friendships are most permanent when the same result accrues to both from one another, pleasure for instance. 47 And not merely so, but from the same source, as in the case of two people of easy pleasantry; 48 and not as it is in that of a lover and the object of own affection, these not deriving their pleasure from the same causes, but the former from seeing the latter, and the latter from

receiving the attentions of the former. 49 When the bloom of youth fades the friendship sometimes ceases also, because the lover derives no pleasure from seeing, and the object of own affection ceases to receive the attentions which were paid before. 50 In many cases people so connected continue friends, if being of similar tempers they have come from custom to like one another's dispositions.

51 The good alone can be friends. The friendship of the good is alone superior to calumny; it not being easy for people to believe a third person respecting one whom they have long tried and proved. 52 There is between good people mutual confidence, and the feeling that one's friend would never have done one wrong, and all other such things as are expected in friendship really worthy the name; but in the other kinds there is nothing to prevent all such suspicions.

53 Distance has in itself no direct effect upon friendship, but only prevents the acting it out. 54 If the absence be protracted, it is thought to cause a forgetfulness even of the friendship; and hence it has been said, 'Many and many a friendship hath want of intercourse destroyed.'

55 Neither the old nor the morose appear to be calculated for friendship, because the pleasurableness in them is small, and no one can spend own days in company with that which is positively painful or even not pleasurable, 56 since to avoid the painful and aim at the pleasurable is one of the most obvious tendencies of human nature.

57 Those who get on with one another very fairly, but are not in habits of intimacy, are rather like people having kindly feelings towards one another, than friends. 58 People cannot spend their time together unless they are mutually pleasurable and take pleasure in the same objects, a quality which is thought to appertain to the true friendship of companionship.

59 A question is raised whether the happy person needs friends. It is said that they who are blessed and independent have no need of friends, for they already have all that is good, and so, being independent, want nothing further.

FRIENDSHIP

60 The notion of a friend's office is to be as it were a second self and procure for a person what you cannot get by yourself, hence the saying: 'When Fortune gives us good, what need we friends.' 61 On the other hand it looks absurd, while we are assigning to the happy person all other good things, not to give you friends, which after all are thought to be the greatest of external goods. 62 It is nonsense to make our happy person a solitary, because no person would choose the possession of all goods in the world on the condition of solitariness, human being a social animal and formed by Nature for living with others. 63 The happy person has this qualification, since you have all those things which are good by Nature, and it is obvious that the society of friends and good people must be preferable to that of strangers and ordinary people, therefore the happy person does need friends.

64 Are we to make our friends as numerous as possible? In respect of acquaintance, it is thought to have been well said, 'Have thou not many acquaintances, yet be not without.'

65 In respect of friendship, may we not adopt the precept, and say, that a person should not be without friends, nor, again, have exceeding many friends? 66 If they are more numerous than what will suffice for one's life they become officious, and are hindrances in respect of living well.-- We do not require them. Of those who are to be for pleasure, a few are sufficient.

67 Perhaps it is well not to endeavour to have very many friends, but so many as are enough for intimacy. 68 It would seem not to be possible to be very much a friend to many at the same time, and for the same reason not to be in love with many objects at the same time. 69 Love is a kind of excessive friendship, which implies but one object, and all strong emotions must be limited in number towards whom they are felt. 70 Not many at a time become friends in the way of companionship; all the famous friendships of the kind are between 'two' persons. 71 They who have many friends, and meet everybody

on footing of intimacy, seem to be friends really to no one except in the way of general society.

72 Are friends most needed in prosperity or in adversity? They are required, we know, in both states, because the unfortunate need help, and the prosperous desire friends around them and to do kindnesses to.

73 To have friends is more necessary in adversity, and therefore in this case useful ones are needed. 74 To have them in prosperity is more honourable, and this is why the prosperous want good people for friends. 75 The presence of friends is pleasant even in adversity, since humans when grieved are comforted by their sympathy.

The Book of Divine Panagogue called

THOUGHTS

REFLECTIVE THOUGHT
George Stuart Fullerton

1 If we ask our neighbor to meet us somewhere at a given hour, you have no difficulty in understanding what we have requested you to do. 2 If you wishes to do so, you can be on the spot at the proper moment. You may never have asked yourself in your whole life what you means by space and by time. 3 You may be quite ignorant that thoughtful people have disputed concerning the nature of these for centuries past.

4 And a person may go through the world avoiding disaster year after year by distinguishing with some success between what is real and what is not real, and yet you may be quite unable to tell us what, in general, it means for a thing to be real. 5 Some things are real and some are not; as a rule you seems to be able to discover the difference; of your method of procedure you have never tried to give an account to yourself.

6 That you have a mind you cannot doubt, and you have some idea of the difference between it and certain other minds; 7 but even the most ardent champion of the plain person must admit that you have the most hazy of notions touching the nature of your mind. 8 You seems to be more doubtful concerning the nature of the mind and its knowledge than you are concerning the nature of external things. 9 Certainly you appears to be more willing to admit your ignorance in this realm. And yet the person can hold one's own in the world of real things. 10 You can distinguish between this thing and that, this place and that, this time and that. You can think out a plan and carry it into execution; you can guess at the contents of other minds and allow this knowledge to find its place in your plan.

11 All of which proves that our knowledge is not necessarily useless because it is rather dim and vague. It is one thing to use a mental state; it is another to have a clear comprehension of just what it is and of what elements it may be

made up. 12 The plain person does much of own thinking as we all tie our shoes and button our buttons. It would be difficult for us to describe these operations, but we may perform them very easily nevertheless. 13 When we say that we 'know' how to tie our shoes, we only mean that we can tie them.

14 Now, enough has been said in the preceding sections to make clear that the vagueness which characterises many notions which constantly recur in common thought is not wholly dispelled by the study of the several sciences. 15 The person of science, like the plain person, may be able to use very well for certain purposes concepts which you are not able to analyse satisfactorily. 16 For example, you speaks of space and time, cause and effect, substance and qualities, matter and mind, reality and unreality. You certainly is in a position to add to our knowledge of the things covered by these terms. 17 But we should never overlook the fact that the new knowledge which you gives us is a knowledge of the same kind as that which we had before. 18 You measures for us spaces and times; you does not tell us what space and time are. 19 You points out the causes of a multitude of occurrences; you does not tell us what we mean whenever we use the word "cause." 20 You informs us what we should accept as real and what we should repudiate as unreal; you does not try to show us what it is to be real and what it is to be unreal.

21 In other words, the person of science 'extends' our knowledge and makes it more accurate; you does not 'analyse' certain fundamental conceptions, which we all use, but of which we can usually give a very poor account.

22 On the other hand, it is the task of 'reflective thought', not in the first instance, to extend the limits of our knowledge of the world of matter and of minds, but rather 'to make us more clearly conscious of what that knowledge really is'. 23 Philosophical reflection takes up and tries to analyse complex thoughts that people use daily without caring to analyse them, indeed, without even realising that they may be subjected to analysis.

24 It is to be expected that it should impress many of those who are

introduced to it for the first time as rather a fantastic creation of problems that do not present themselves naturally to the healthy mind. 25 There is no thoughtful person who does not reflect sometimes and about some things; but there are few who feel impelled to go over the whole edifice of their knowledge and examine it with a critical eye from its turrets to its foundations.

26 In a sense, we may say that philosophical thought is not natural, for you who is examining the assumptions upon which all our ordinary thought about the world rests is no longer in the world of the plain person. 27 You are treating things as humans do not commonly treat them, and it is perhaps natural that it should appear to some that, in the solvent which you uses, the real world in which we all rejoice should seem to dissolve and disappear.

28 I have said that it is not the task of reflective thought, 'in the first instance', to extend the limits of our knowledge of the world of matter and of minds. 29 This is true. But this does not mean that, as a result of a careful reflective analysis, some errors which may creep into the thought both of the plain person and of the scientist may not be exploded; nor does it mean that some new extensions of our knowledge may not be suggested.

30 In the sub-chapter to follow I shall take up and examine some of the problems of reflective thought. And I shall consider first those problems that present themselves to those who try to subject to a careful scrutiny our knowledge of the external world. 31 It is well to begin with this, for, even in our common experience, it seems to be revealed that the knowledge of material things is a something less vague and indefinite than the knowledge of minds.

THINGS AND THEIR APPEARANCES

32 We have seen in the last chapter that there is an external world and that it is given in our experience. There is an objective order, and we are all capable of distinguishing between it and the subjective. 33 You who says that we perceive

only sensations and ideas flies in the face of the common experience of humankind.

34 But we are not yet through with the subject. We all make a distinction between things as they 'appear' and things as they 'really are'. 35 If we ask the plain person, What is the real external world? the first answer that seems to present itself to your mind is this: Whatever we can see, hear, touch, taste, or smell may be regarded as belonging to the real world. What we merely imagine does not belong to it.

36 That this answer is not a very satisfactory one occurred to people's minds very early in the history of reflective thought. 37 The ancient skeptic said to the self: The colours of objects vary according to the light, and according to the position and distance of the objects; can we say that any object has a real colour of its own? 38 A staff stuck into water looks bent, but feels straight to the touch; why believe the testimony of one sense rather than that of another? 39 Such questionings led to far-reaching consequences. They resulted in a forlorn distrust of the testimony of the senses, and to a doubt as to our ability to know anything as it really is.

40 Now, the distinction between appearances and realities exists for us as well as for the ancient skeptic, and without being tempted to make such extravagant statements as that there is no such thing as truth, and that every appearance is as real as any other, 41 we may admit that it is not very easy to see the full significance of the distinction, although we are referring to it constantly.

42 For example, we look from our window and see, as we say, a tree at a distance. What we are conscious of is a small bluish patch of colour. Now, a small bluish patch of colour is not, strictly speaking, a tree; but for us it represents the tree. 43 Suppose that we walk toward the tree. Do we continue to see what we saw before? Of course, we say that we continue to see the same tree; but it is plain that what we immediately perceive, what is given in consciousness, does not remain the same as we move. 44 Our blue patch of colour grows larger and larger; it ceases to be

blue and faint; at the last it has been replaced by an expanse of vivid green, and we see the tree just before us. 45 During our whole walk we have been seeing the tree. This appears to mean that we have been having a whole series of visual experiences, no two of which were just alike, and each of which was taken as a representative of the tree.

46 Which of these representatives is most like the tree? Is the tree 'really' a faint blue, or is it 'really' a vivid green? Or is it of some intermediate colour?

47 Probably most persons will be inclined to maintain that the tree only seems blue at a distance, but that it really is green, as it appears when one is close to it. 48 In a sense, the statement is just; yet some of those who make it would be puzzled to tell by what right they pick out of the whole series of experiences, 49 each of which represents the tree as seen from some particular position, one individual experience, which they claim not only represents the tree as seen from a given point but also represents it as it is. 50 Does this particular experience bear some peculiar earmark which tells us that it is like the real tree while the others are unlike it?

REAL THINGS

51 And what is this 'real tree' that we are supposed to see as it is when we are close to it?

52 About two hundred years ago the philosopher Berkeley pointed out that the distinction commonly made between things as they look, the apparent, and things as they are, the real, is at bottom the distinction between things as presented to the sense of sight and things as presented to the sense of touch. 53 The acute analysis which he made has held its own ever since. We have seen that, in walking towards the tree, we have a long series of visual experiences, each of which differs more or less from all of the others. 54 Nevertheless, from the beginning of our progress to the end, we say that we are looking at the same tree. The images change colour and grow larger. We do not say that the tree changes colour and grows larger. 55 Why do we speak

as we do? It is because, all along the line, we mean by the real tree, not what is given to the sense of sight, but something for which this stands as a sign. 56 This something must be given in our experience somewhere, we must be able to perceive it under some circumstances or other, or it would never occur to us to recognise the visual experiences as 'signs', 57 and we should never say that in being conscious of them in succession we are looking at the same tree. 58 They are certainly not the same with each other; how can we know that they all stand for the same thing, unless we have had experience of a connection of the whole series with one thing?

59 This thing for which so many different visual experiences may serve as signs is the thing revealed in experiences of touch. 60 When we ask: In what direction is the tree? How far away is the tree? How big is the tree? We are always referring to the tree revealed in touch. 61 It is nonsense to say that 'what we see' is far away, if by what we see we mean the visual experience itself. As soon as we move we lose that visual experience and get another, and to recover the one we lost we must go back where we were before. 62 When we say we see a tree at a distance, we must mean, then, that we know from certain visual experiences which we have that by moving a certain distance we will be able to touch a tree. 63 And what does it mean to move a certain distance? In the last analysis it means to us to have a certain quantity of movement sensations.

64 Thus the real world of things, for which experiences of sight serve as signs, is a world revealed in experiences of touch and movement, and when we speak of real positions, distances, and magnitudes, we are always referring to this world. 65 But this is a world revealed in our experience, and it does not seem a hopeless task to discover what may properly be called real and what should be described as merely apparent, when both the real and the apparent are open to our inspection.

66 Can we not find in this analysis a satisfactory explanation of the plain person's claim that under

certain circumstances you sees the tree as it is and under others you does not? 67 What you are really asserting is that one visual experience gives you better information regarding the real thing, the touch thing, than does another.

68 But what shall we say of his claim that the tree is really green, and only looks blue under certain circumstances? Is it not just as true that the tree only looks green under certain circumstances? 69 Is colour any part of the touch thing? Is it ever more than a sign of the touch thing? How can one colour be more real than another?

70 Now, we may hold to Berkeley's analysis and maintain that, in general, the real world, as contrasted with the apparent, means to us the world that is revealed in experiences of touch and movement; 71 and yet we may admit that the word "real" is sometimes used in rather different senses.

72 It does not seem absurd for a woman to Say: This piece of silk really is yellow; it only looks white under this light. 73 We all admit that a white house may look pink under the rays of the setting sun, and we never call it a pink house. We have seen that it is not unnatural to say: That tree is really green; it is only its distance that makes it look blue.

74 When one reflects upon these uses of the word "real," one recognises the fact that, among all the experiences in which things are revealed to us, certain experiences impress us as being more prominent or important or serviceable than certain others, and they come to be called 'real'. 75 Things are not commonly seen by artificial light; the sun is not always setting; the tree looks green when it is seen most satisfactorily. 76 In each case, the real colour of the thing is the colour that it has under circumstances that strike us as normal or as important. 77 We cannot say that we always regard as most real that aspect under which we most commonly perceive things, for if a more unusual experience is more serviceable and really gives us more information about the thing, we give the preference to that. 78 Thus we look with the naked eye at a moving speck on the table

before us, and we are unable to distinguish its parts. We place a microscope over the speck and perceive an insect with all its members.

79 The second experience is the more unusual one, but would not everyone say: Now we perceive the thing 'as it is'?

ULTIMATE REAL THINGS

80 Let us turn away from the senses of the word "real," which recognise one colour or taste or odour as more real than another, and come back to the real world of things presented in sensations of touch. 81 All other classes of sensations may be regarded as related to this as the series of visual experiences above mentioned was related to the one tree which was spoken of as revealed in them all, the touch tree of which they gave information.

82 Can we say that this world is always to be regarded as reality and never as appearance? 83 We have already seen (In the book of Origin) that science does not regard as anything more than appearance the real things which seem to be directly presented in our experience.

84 This pen that I hold in my hand seems, as I pass my fingers over it, to be continuously extended. It does not appear to present an alternation of filled spaces and empty spaces. 85 I am told that it is composed of molecules in rapid motion and at considerable distances from one another. I am further told that each molecule is composed of atoms, and is, in its turn, not a continuous thing, but, so to speak, a group of little things. 86 If I accept this doctrine, as it seems I must, am I not forced to conclude that the reality which is given in my experience, the reality with which I have contrasted appearances and to which I have referred them, is, after all, itself only an appearance? 87 The touch things which I have hitherto regarded as the real things that make up the external world, the touch things for which all my visual experiences have served as signs, are, then, not themselves real external things, 88 but only the appearances under which real external things, themselves

imperceptible, manifest themselves to me.

89 It seems, then, that I do not directly perceive any real thing, or, at least, anything that can be regarded as more than an appearance. 90 What, then, is the external world? What are things really like? Can we give any true account of them, or are we forced to say with the skeptics that we only know how things seem to us, and must abandon the attempt to tell what they are really like?

91 Now, before one sets out to answer a question it is well to find out whether it is a sensible question to ask and a sensible question to try to answer. 92 You who asks: Where is the middle of an infinite line? When did all time begin? Where is space as a whole? Does not deserve a serious answer to your questions. 93 And it is well to remember that you who asks: What is the external world like?--must keep your question a significant one, if you are to retain your right to look for an answer at all. 94 You have manifestly no right to ask us: How does the external world look when no one is looking? How do things feel when no one feels them? How shall I think of things, not as I think of them, but as they are?

95 If we are to give an account of the external world at all, it must evidently be 'an account' of the external world; 'i.e.' it must be given in terms of our experience of things. 96 The only legitimate problem is to give a true account instead of a false one, to distinguish between what only appears and is not real and what both appears and is real.

97 Bearing this in mind, let us come back to the plain person's experience of the world. You certainly seems to yourself to perceive a real world of things, and you constantly distinguishes, in a way very serviceable to yourself, between the merely apparent and the real. 98 There is, of course, a sense in which every experience is real; it is, at least, an experience; but when you contrasts real and apparent you means something more than this. 99 Experiences are not relegated to this class or to that merely at random, but the final decision is the outcome of a long experience of the differences which

characterise different individual experiences and is an expression of the relations which are observed to hold between them. 100 Certain experiences are accepted as signs, and certain others come to take the more dignified position of thing signified; the mind rests in them and regards them as the real.

101 We have seen above that the world of real things in which the plain person finds the self is a world of objects revealed in experiences of touch. 102 When you asks regarding anything: How far away is it? How big is it? In what direction is it? It is always the touch thing that interests you. What is given to the other senses is only a sign of this.

103 We have also seen that the world of atoms and molecules of which the person of science tells us is nothing more than a further development of the world of the plain person. 104 The real things with which science concerns itself are, after all, only minute touch things, conceived just as are the things with which the plain person is familiar. 105 They exist in space and move about in space, as the things about us are perceived to exist in space and move about in space. They have size and position, and are separated by distances. 106 We do not 'perceive' them, it is true; but we 'conceive' them after the analogy of the things that we do perceive, and it is not inconceivable that, if our senses were vastly more acute, we might perceive them directly.

107 Now, when we conclude that the things directly perceptible to the sense of touch are to be regarded as appearances, as signs of the presence of these minuter things, do we draw such a conclusion arbitrarily? By no means.

108 The distinction between appearance and reality is drawn here just as it is drawn in the world of our common everyday experiences.

109 The great majority of the touch things about us we are not actually touching at any given moment. We only 'see' the things, 'i.e.' we have certain 'signs' of their presence. None the less we believe that the things exist all the time.

110 And in the same way the person of science does not doubt the existence of the real things of

which you speaks; you perceives their 'signs'. 111 That certain experiences are to be taken as signs of such realities you have established by innumerable observations and careful deductions from those observations. 112 To see the full force of your reasonings one must read some work setting forth the history of the atomic theory.

113 If, then, we ask the question: What is the real external world? It is clear that we cannot answer it satisfactorily without taking into consideration the somewhat shifting senses of the word "real." 114 What is the real external world to the plain person? It is the world of touch things, of objects upon which you can lay your hands. 115 What is the real external world to the person of science? It is the world of atoms and molecules, of minuter touch things that you cannot actually touch, but which you conceives as though you could touch them.

116 It should be observed that the person of science has no right to deny the real world which is revealed in the experience of the plain person. 117 In all your dealings with the things which interest you in common life, you refers to this world just as the plain person does. 118 You sees a tree and walks towards it, and distinguishes between its real and its apparent colour, its real and its apparent size. 119 You talks about seeing things as they are, or not seeing things as they are. These distinctions in your experience of things remain even after you have come to believe in atoms and molecules.

120 Thus, the touch object, the tree as you feels it under your hand, may come to be regarded as the sign of the presence of those entities that science seems, at present, to regard as ultimate. 121 Does this prevent it from being the object which has stood as the interpreter of all those diverse visual sensations that we have called different views of the tree? 122 They are still the appearances, and it, relatively to them, is the reality.123 Now we find that it, in its turn, can be used as a sign of something else, can be regarded as an appearance of a reality more ultimate. 124 It is clear, then, that the same thing may be regarded

both as appearance and as reality--appearance as contrasted with one thing, and reality as contrasted with another.

125 But suppose one says: 'I do not want to know what the real external world is to this person or to that person; I want to know what the real external world is'. What shall we say to such a demand?

126 There is a sense in which such a demand is not purely meaningless, though it may not be a very sensible demand to make. 127 We have seen that an increase of knowledge about things compels a person to pass from the real things of common life to the real things of science, and to look upon the former as appearance. 128 Now, a person may arbitrarily decide that you will use the word "reality" to indicate only that which can never in its turn be regarded as appearance, a reality which must remain an ultimate reality; and you may insist upon our telling you about that. 129 How a person not a soothsayer can tell when one has come to ultimate reality, it is not easy to see.

130 Suppose, however, that we could give any one such information. We should then be telling you about things 'as they are', it is true, but your knowledge of things would not be different in 'kind' from what it was before. 131 The only difference between such a knowledge of things and a knowledge of things not known to be ultimate would be that, in the former case, it would be recognised that no further extension of knowledge was possible. 132 The distinction between appearance and reality would remain just what it was in the experience of the plain person.

THE BUGBEAR OF THE "UNKNOWABLE."

133 It is very important to recognise that we must not go on talking about appearance and reality, as if our words really meant something, when we have quite turned our backs upon our experience of appearances and the realities which they represent.

134 That appearances and realities are connected we know very well, for we perceive them to be

connected. 135 What we see, we can touch. And we not only know that appearances and realities are connected, but we know with much detail what appearances are to be taken as signs of what realities. 136 The visual experience which I call the house as seen from a distance I never think of taking for a representative of the hat which I hold in my hand. 137 This visual experience I refer to its own appropriate touch thing, and not to another. 138 If what 'looks like' a beefsteak could 'really be' a fork or a mountain or a kitten indifferently,-- but I must not even finish the sentence, for the words "look like" and "could really be" lose all significance when we loosen the bond between appearances and the realities to which they are properly referred.

139 Each appearance, then, must be referred to some particular real thing and not to any other. This is true of the appearances which we recognise as such in common life, and it is equally true of the appearances recognised as such in science. 140 The pen which I feel between my fingers I may regard as appearance and refer to a swarm of moving atoms. But it would be silly for me to refer it to atoms "in general." 141 The reality to which I refer the appearance in question is a particular group of atoms existing at a particular point in space. 142 The chemist never supposes that the atoms within the walls of own test-tube are identical with those in the vial on the shelf. 143 Neither in common life nor in science would the distinction between appearances and real things be of the smallest service were it not possible to distinguish between this appearance and that, and this reality and that, and to refer each appearance to its appropriate reality. 144 Indeed, it is inconceivable that, under such circumstances, the distinction should have been drawn at all.

145 These points ought to be strongly insisted upon, for we find certain philosophic writers falling constantly into a very curious abuse of the distinction and making much capital of it. 146 It is argued that what we see, what we touch, what we conceive as a result of scientific observation and reflection-- all is, in the last analysis, material which is given

us in sensation. 147 The various senses furnish us with different classes of sensations; we work these up into certain complexes. But sensations are only the impressions which something outside of us makes upon us. 148 Hence, although we seem to ourselves to know the external world as it is, our knowledge can never extend beyond the impressions made upon us. 149 Thus, we are absolutely shut up to 'appearances', and can know nothing about the 'reality' to which they must be referred.

150 Touching this matter Herbert Spencer writes as follows: "When we are taught that a piece of matter, regarded by us as existing externally, cannot be really known, but that we can know only certain impressions produced on us, 151 we are yet, by the relativity of thought, compelled to think of these in relation to a cause-- the notion of a real existence which generated these impressions becomes nascent. 152 If it be proved that every notion of a real existence which we can frame is inconsistent with itself,-- that matter, however conceived by us, cannot be matter as it actually is,-- our conception, though transfigured, is not destroyed: 153 there remains the sense of reality, dissociated as far as possible from those special forms under which it was before represented in thought."

154 This means, in plain language, that we must regard everything we know and can know as appearance and must refer it to an unknown reality. 155 Sometimes Mr. Spencer calls this reality the Unknowable, sometimes he calls it the Absolute, and sometimes he allows it to pass by a variety of other names, such as Power, Cause, etc. 156 He wishes us to think of it as "lying behind appearances" or as "underlying appearances."

157 Probably it has already been remarked that this Unknowable has brought us around again to that amusing "telephone exchange" discussed in the (book of Theosophy). 158 But if the reader feels within yourself the least weakness for the Unknowable, I beg you to consider carefully, before you pins your faith to it, the following:--

THOUGHTS

159 (1) If we do perceive external bodies, our own bodies and others, then it is conceivable that we may have evidence from observation to the effect that other bodies affecting our bodies may give rise to sensations. 160 In this case we cannot say that we know nothing but sensations; we know real bodies as well as sensations, and we may refer the sensations to the real bodies.

161 (2) If we do not perceive that we have bodies, and that our bodies are acted upon by others, we have no evidence that what we call our sensations are due to messages which come from "external things" and are conducted along the nerves. 162 It is then, absurd to talk of such "external things" as though they existed, and to call them the reality to which sensations, as appearances, must be referred,

163 (3) In other words, if there is perceived to be a telephone exchange with its wires and subscribers, we may refer the messages received to the subscribers, and call this, if we choose, a reference of appearance to reality.

164 But if there is perceived no telephone exchange, and if it is concluded that any wires or subscribers of which it means anything to speak must be composed of what we have heretofore called "messages," 165 then it is palpably absurd to refer the "messages" as a whole to subscribers not supposed to be composed of "messages"; 166 and it is a blunder to go on calling the things that we know "messages," as though we had evidence that they came from, and must be referred to, something beyond themselves.

167 We must recognise that, with the general demolition of the exchange, we lose not only known subscribers, but the very notion of a subscriber. 168 It will not do to try to save from this wreck some "unknowable" subscriber, and still pin our faith to them.

169 (4) We have seen that the relation of appearance to reality is that of certain experiences to certain other experiences. When we take the liberty of calling the Unknowable a 'reality', we blunder in our use of the word. 170 The Unknowable cannot be an

experience either actual, possible, or conceived as possible, and it cannot possibly hold the relation to any of our experiences that a real thing of any kind holds to the appearances that stand as its signs.

171 (5) Finally, no person has ever made an assumption more perfectly useless and purposeless than the assumption of the Unknowable. 172 We have seen that the distinction between appearance and reality is a serviceable one, and it has been pointed out that it would be of no service whatever if it were not possible to refer particular appearances to their own appropriate realities. 173 The realities to which we actually refer appearances serve to explain them. Thus, when I ask: Why do I perceive that tree now as faint and blue and now as vivid and green? 174 The answer to the question is found in the notion of distance and position in space; it is found, in other words, in a reference to the real world of touch things, for which visual experiences serve as signs.

175 Under certain circumstances, the mountain 'ought' to be robed in its azure hue, and, under certain circumstances, it 'ought not'. The circumstances in each case are open to investigation.

176 Now, let us substitute for the real world of touch things, which furnishes the explanation of given visual experiences, that philosophic fiction, that pseudo-real nonentity, the Unknowable. 177 Now I perceive a tree as faint and blue, now as bright and green; will a reference to the Unknowable explain why the experiences differed? 178 Was the Unknowable in the one instance farther off in an unknowable space, and in the other nearer? This, even if it means anything, must remain unknowable. 179 And when the chemist puts together a volume of chlorine gas and a volume of hydrogen gas to get two volumes of hydrochloric acid gas, shall we explain the change which has taken place by a reference to the Unknowable, or shall we turn to the doctrine of atoms and their combinations?

180 The fact is that no person in own senses tries to account for any individual fact by turning for an explanation to the Unknowable.

181 It is a life-preserver by which some set great store, but which no person dreams of using when you really falls into the water.

182 If, then, we have any reason to believe that there is a real external world at all, we have reason to believe that we know what it is. 183 That some know it imperfectly, that others know it better, and that we may hope that some day it will be known still more perfectly, is surely good reason for concluding that we do not know it at all.

THE PRACTICAL HUMAN AND THE PHILOSOPHER

Ralph Barton Perry

2 Philosophy suffers the distinction of being regarded as essentially an academic pursuit. 2 The term 'philosophy', to be sure, is used in common speech to denote a stoical manner of accepting the vicissitudes of life; but this conception sheds little or no light upon the meaning of philosophy as a branch of scholarship. 3 The people who write the books on "Epistemology" or "Ontology," are regarded by the average person of affairs, even though you may have enjoyed a "higher education," with little sympathy and less intelligence. 4 Not even philology seems less concerned with the real business of life. The pursuit of philosophy appears to be a phenomenon of extreme and somewhat effete culture, with its own peculiar traditions, problems, and aims, and with little or nothing to contribute to the real enterprises of society. 5 It is easy to prove to the satisfaction of the philosopher that such a view is radically mistaken. But it is another and more serious matter to bridge over the very real gap that separates philosophy and common-sense. 6 Such an aim is realised only when philosophy is seen to issue from some special interest that is humanly important; or when, after starting in thought at a point where one deals with ideas and interests common to all, one is led by the inevitableness of consistent thinking into the sphere of philosophy.

THOUGHTS

LIFE AS A STARTING-POINT FOR THOUGHT

7 There is but one starting-point for reflection when all people are invited to share in it. Though there be a great many special platforms where special groups of people may take their stand together, there is only one platform broad enough for all. 8 This universal stand-point, or common platform, is 'life'. It is our more definite thesis, then, that philosophy, even to its most abstruse technicality, is rooted in life; and that it is inseparably bound up with the satisfaction of practical needs, and the solution of practical problems.

9 Every person knows what it is to live, and your immediate experience will verify those features of the adventure that stand out conspicuously. 10 To begin with, life is our birthright. We did not ask for it, but when we grew old enough to be self-conscious we found ourselves in possession of it. 11 Nor is it a gift to be neglected, even if we had the will. As is true of no other gift of Nature, we must use it, or cease to be. 12 There is a unique urgency about life. But we have already implied more, in so far as we have said that it must be 'used', and have thereby referred to some form of movement or activity as its inseparable attribute. 13 To live is to find one's self compelled to do something. To do 'something'-- there is another implication of life: some outer expression, some medium in which to register the degree and form of its activity. 14 Such we recognise as the environment of life, the real objects among which it is placed; which it may change, or from which it may suffer change. 15 Not only do we find our lives as unsolicited active powers, but find, as well, an arena prescribed for their exercise. 16 That we shall act, and in a certain time and place, and with reference to certain other realities, this is the general condition of things that is encountered when each one of us discovers life. 17 In short, to live means to be compelled to do something under certain circumstances.

18 There is another very common aspect of life that would not at first glance seem worthy of mention. Not only does life, as we have just

described it, mean opportunity, but it means self-conscious opportunity. 19 The facts are such as we have found them to be, and as each one of us has previously found them for the self. 20 But when we discover life for ourselves, we who make the discovery, and we who live, are identical. From that moment we both live, and know that we live. 21 Moreover, such is the essential unity of our natures that our living must now express our knowing, and our knowing guide and illuminate our living.

22 Consider the allegory of the centipede. From the beginning of time it had manipulated its countless legs with exquisite precision. Humans had regarded it with wonder and amazement. 23 But it was innocent of its own art, being a contrivance of Nature, perfectly constructed to do Her bidding. 24 One day the centipede discovered life. It discovered itself as one who walks, and the newly awakened intelligence, first observing, then foreseeing, at length began to direct the process. 25 And from that moment the centipede, because it could not remember the proper order of its going, lost all its former skill, and became the poor clumsy victim of its own self-consciousness. 26 This same self-consciousness is the inconvenience and the great glory of human life. We must stumble along as best we can, guided by the feeble light of our own little intelligence. 27 If Nature starts us on our way, She soon hands over the torch, and bids us find the trail for ourselves.

28 Most humans are brave enough to regard this as the best thing of all; some despair on account of it. In either case it is admittedly the true story of human life. We must live as separate selves, observing, foreseeing, and planning. 29 There are two things that we can do about it. We can repudiate our natures, decline the responsibility, and degenerate to the level of those animals that never had our chance; or we can leap joyously to the helm, and with all the strength and wisdom in us guide our lives to their destination. 30 But if we do the former, we shall be unable to forget what might have been, and shall be haunted by a sense of ignominy; and if we do the second,

we shall experience the unique happiness of fulfillment and self-realisation.

31 Life, then, is a situation that appeals to intelligent activity. Humanly speaking, there is no such thing as a situation that is not at the same time a theory. 32 As we live we are all theorists. Whoever has any misgivings as to the practical value of theory, let you remember that, speaking generally of human life, it is true to say that there is no practice that does not issue at length from reflection. 33 That which is the commonest experience of humankind is the conjunction of these two, the thought and the deed. 34 And as surely as we are all practical theorists, so surely is philosophy the outcome of the broadening and deepening of practical theory. 35 But to understand how the practical person becomes the philosopher, we must inquire somewhat more carefully into the manner of your thought about life.

36 Let anyone inspect the last moment in own life, and in all probability you will find that your mind was employed to discover the means to some end. 37 You was already bent upon some definite achievement, and was thoughtful for the sake of selecting the economical and effectual way. Your theory made your practice skillful. So through life your knowledge shows you how to work your will. 38 Example, experience, and books have taught you the uses of Nature and society, and in your thoughtful living you are enabled to reach the goal you have set for the next hour, day, or year of your activity. 39 The long periods of human life are spent in elabourating the means to some unquestioned end. 40 Here one meets the curious truth that we wake up in the middle of life, already making headway, and under the guidance of some invisible steersman. 41 When first we take the business of life seriously, there is a considerable stock in trade in the shape of habits, and inclinations to all sorts of things that we never consciously elected to pursue. 42 Since we do not begin at the beginning, our first problem is to accommodate ourselves to ourselves, and our first deliberate

acts are in fulfillment of plans outlined by some predecessor that has already spoken for us. 43 The same thing is true of the race of humans. At a certain stage in their development humans found themselves engaged in all manner of ritual and custom, and burdened with concerns that were not of their own choosing. 44 They were burning incense, keeping festivals, and naming names, all of which they must now proceed to justify with myth and legend, in order to render intelligible to themselves the deliberate and self-conscious repetition of them. 45 Even so much justification was left to the few, and the great majority continued to seek that good which social usage countenanced and individual predisposition confirmed. 46 So every human of us acts from day to day for love's sake, or wealth's sake, or power's sake, or for the sake of some near and tangible object; reflecting only for the greater efficiency of your endeavor.

47 But if this be the common manner of thinking about life, it does not represent the whole of such thought. Nor does it follow that because it occupies us so much, it is therefore correspondingly fundamental. 48 Like the myth makers of old, we all want more or less to know the 'reason of our ends'. Here, then, we meet with a somewhat different type of reflection upon life, the reflection that underlies the adoption of a life purpose. 49 It is obvious that most ends are selected for the sake of other ends, and so are virtually means. 50 Thus one may struggle for years to secure a college education. This definite end has been adopted for the sake of a somewhat more indefinite end of self-advancement, 51 and from it there issues a whole series of minor ends, which form a hierarchy of steps ascending to the highest goal of aspiration. 52 Now upon the face of things we live very unsystematic lives, and yet were we to examine ourselves in this fashion, we should all find our lives to be marvels of organisation. 53 Their growth, as we have seen, began before we were conscious of it; and we are commonly so absorbed in some particular flower or fruit that we forget the roots,

and the design of the whole. 54 But a little reflection reveals a remarkable unitary adjustment of parts. The unity is due to the dominance of a group of central purposes. 55 Judged from the stand-point of experience, it seems bitter irony to say that everyone gets from life just what one wishes. 56 But a candid searching of our own hearts will incline us to admit that, after all, the way we go and the length we go is determined pretty much by the kind and the intensity of our secret longing. 57 That for which in the time of choice we are willing to sacrifice all else, is the formula that defines the law of each individual life. 58 All this is not intended to mean that we have each named a clear and definite ideal which is our chosen goal. On the contrary, such a conception may be almost meaningless to some of us. 59 In general the higher the ideal the vaguer and less vivid is its presentation to our consciousness. 60 But, named or unnamed, sharp or blurred, vivid or half-forgotten, there may be found in the heart of every human that which of all things you wants to be, that which of all deeds you wants to do. 61 If you have had the normal youth of dreaming, you have seen it, and warmed to the picture of your imagination; 62 if you have been somewhat more thoughtful than the ordinary, your reason has defined it, and adopted it for your vocation; 63 if neither, it has been present as an undertone throughout the rendering of your more inevitable life.

64 You will recognise it when it is named as the desire to do the will of God, or to have as good a time as possible, or to make other people as happy as possible, or to be equal to your responsibilities, or to fulfill the expectation of your mother, or to be distinguished, wealthy, or influential. 65 This list of ideals is miscellaneous, and ethically reducible to more fundamental concepts, but these are the terms in which humans are ordinarily conscious of their most intimate purposes. 66 We must now inquire respecting the nature of the thought that determines the selection of such a purpose, or justifies it when it has been unconsciously accepted.

THOUGHTS

67 What is most worthwhile? So far as human action is concerned this obviously depends upon what is possible, upon what is expected of us by our own natures, and upon what interests and concerns are conserved by the trend of events in our environment. 68 What I had best do, presupposes what I have the strength and the skill to do, what I feel called upon to do, and what are the great causes that are entitled to promotion at my hands. 69 It seems that practically we cannot separate the ideal from the real. We may feel that the highest ideal is an immediate utterance of conscience, as mysterious in origin as it is authoritative in expression. 70 We may be willing to defy the universe, and expatriate ourselves from our natural and social environment, for the sake of the holy law of duty. 71 Such people as Count Tolstoi have little to say of the possible, or the expedient, or the actual, and are satisfied to stand almost alone against the brutal facts of usage and economy. 72 We all have a secret sense of chivalry, that prompts, however ineffectually, to a like devotion. 73 But that which in such moral purposes appears to indicate a severance of the ideal and the real, is, if we will but stop to consider, only a severance of the ideal and the apparent. 74 The martyr is more sure of reality than the adventurer. You are convinced that though your contemporaries and your environment be against you; the fundamental or eventual order of things is for you. 75 You believes in a spiritual world more abiding, albeit less obvious, than the material world. Though every temporal event contradict you, you lives in the certainty that eternity is yours. 76 Such an one may have found your ideal in the voice of God and His prophets, or you may have been led to God as the justification of your irresistible ideal; 77 but in either case the selection of your ideal is reasonable to you in so far as it is harmonious with the ultimate nature of things, or stands for the promise of reality. 78 In this wise, thought about life expands into some conception of the deeper forces of the world, and life itself, in respect of its fundamental attachment to an ideal, implies

some belief concerning the fundamental nature of its environment.

79 But lest in this account life be credited with too much gravity and import, or it seem to be assumed that life is all knight-errantry, let us turn to our less quixotic, and perhaps more effectual, person of affairs. 80 You works for your daily bread, and for success in your vocation. You have selected your vocation for its promise of return in the form of wealth, comfort, fame, or influence. 81 You likewise performs such additional service to your family and your community as is demanded of you by public opinion and your own sense of responsibility. 82 You may have a certain contempt for the person who sees visions. This may be your manner of testifying to your own preference for the ideal of usefulness and immediate efficiency. 83 But even so you would never for an instant admit that you was pursuing a merely conventional good. You may be largely imitative in your standards of value, recognising such aims as are common to some time or race; nevertheless none would be more sure than you of the truth of your ideal. 84 Question you, and you will maintain that yours is the reasonable life under the conditions of human existence. 85 You may maintain that if there be a God, you can best serve Him by promoting the tangible welfare of yourself and those dependent upon you. You may maintain that, since there is no God, you must win such rewards as the world can give. 86 If you have something of the heroic in you, you may tell you that, since there is no God, you will labour to the uttermost for your fellow-humans. 87 Where you have not solved the problem of life for yourself, you may believe yourself to be obeying the insight of some one wiser than yourself, or of society as expressed in its customs and institutions. 88 But no person ever admitted that your life was purely a matter of expediency, or that in your dominant ideal you was the victim of chance. 89 In the background of the busiest and most preoccupied life of affairs, there dwells the conviction that such living is appropriate to the universe; that it is called for by the

circumstances of its origin, opportunities, and destiny.

90 Finally, the person who makes light of life has of all humans the most transparent inner consciousness. In you may be clearly observed the relation between the ideal and the reflection that is assumed to justify it.

91 "A Moment's Halt--a momentary taste
Of Being from the Well amid the Waste--
And Lo!--the phantom Caravan has reach'd
The Nothing it set out from-- . . ."

92 "We are no other than a moving row
Of Magic Shadow-shapes that come and go
Round with the Sun-illumin'd Lantern held
In Midnight by the Master of the Show."

93 Where the setting of life is construed in these terms, there is but one natural and appropriate manner of life. 94 Once believing in the isolation and insignificance of life, one is sceptical of all worth save such as may be tasted in the moment of its purchase. 95 If one's ideas and experiences are no concern of the world's, but incidents of a purely local and transient interest, they will realise most when they realise an immediate gratification. 96 Where one does not believe that you are a member of the universe, and a contributor to its ends, you does well to minimise the friction that arises from its accidental propinquity, and to kindle some little fire of enjoyment in your own lonely heart. 97 This is the life of abandonment to pleasure, accompanied by the conviction that the conditions of life warrant no more strenuous or heroic plan.

98 In such wise do we adopt the life purpose, or justify it when unconsciously adopted. 99 The pursuit of an ideal implies a belief in its effectuality. Such a belief will invariably appear when the groundwork of the daily living is laid bare by a little reflection. 100 And if our analysis has not been in error, there is something more definite to be obtained from it. We all believe in the practical wisdom of our fundamental ideals; but we believe, besides, that such wisdom

involves the sanction of the universe as a whole. 101 The momentousness of an individual's life will be satisfied with nothing less final than an absolutely wise disposition of it. 102 For every individual, your life is all your power and riches, and is not to be spent save for the 'greatest good that you can reasonably pursue'. 103 But the solution of such a problem is not to be obtained short of a searching of entire reality. Every life will represent more or less of such wisdom and enlightenment; and in the end the best selection of ideal will denote the greatest wealth of experience. 104 It is not always true that you who has seen more will live more wisely, for in an individual case instinct or authority may be better sources of aspiration than experience. 105 But we trust instinct and authority because we believe them to represent a comprehensive experience on the part of the race as a whole, or on the part of God. 106 You whose knowledge is broadest and truest would know best what is finally worth living for. 107 On this account, most people can see no more reasonable plan of life than obedience to God's will, for God in the abundance of His wisdom, and since all eternity is plain before Him, must see with certainty that which is supremely worthy.

108 We mean, then, that the selection of our ideals shall be determined by the largest possible knowledge of the facts pertaining to life. 109 We mean to select as one would select who knew all about the antecedents and surroundings and remote consequences of life. 110 In our own weakness and finitude we may go but a little way in the direction of such an insight, and may prefer to accept the judgment of tradition or authority, but we recognise a distinct type of knowledge as alone worthy to justify an individual's adoption of an ideal. 111 That type of knowledge is the knowledge that comprehends the universe in its totality. Such knowledge does not involve completeness of information respecting all parts of reality.

112 This, humanly speaking, is both unattainable and

inconceivable. It involves rather a conception of the 'kind' of reality that is fundamental. 113 For a wise purpose it is unnecessary that we should know many matters of fact, or even specific laws, provided we are convinced of the inner and essential character of the universe. 114 Some of the alternatives are matters of every-day thought and speech. One cannot tell the simplest story of human life without disclosing them. 115 To live the human life means to pursue ideals, that is, to have a thing in mind, and then to try to accomplish it. Here is one kind of reality and power.

116 The planetary system, on the other hand, does not pursue ideals, but moves unconscious of itself, with a mechanical precision that can be expressed in a mathematical formula; and is representative of another kind of reality and power. 117 Hence a very common and a very practical question: Is there an underlying law, like the law of gravitation, fundamentally and permanently governing life, in spite of its apparent direction by ideal and aspiration? 118 Or is there an underlying power, like purpose, fundamentally and permanently governing the planetary system and all celestial worlds, in spite of the apparent control of blind and irresistible forces? 119 This is a practical question because nothing could be more pertinent to our choice of ideals. Nothing could make more difference to life than a belief in the life or lifelessness of its environment.

120 The faiths that generate or confirm our ideals always refer to this great issue. And this is but one, albeit the most profound, of the many issues that arise from the desire to obtain some conviction of the inner and essential character of life. 121 Though so intimately connected with practical concerns, these issues are primarily the business of thought. In grappling with them, thought is called upon for its greatest comprehensiveness, penetration, and self-consistency. 122 By the necessity of concentration, thought is sometimes led to forget its origin and the source of its problems. 123 But in naming itself philosophy, thought has only recognised the definiteness and earnestness of its

largest task. 124 Philosophy is still thought about life, representing but the deepening and broadening of the common practical thoughtfulness.

125 We, who began together at the starting-point of 'life', have now entered together the haven of 'philosophy'. It is not a final haven, but only the point of departure for the field of philosophy proper.

126 Nevertheless that field is now in the plain view of the human who occupies the practical stand-point. You must recognise in philosophy a kind of reflection that differs only in extent and persistence from the reflection that guides and justifies your life. 127 You may not consciously identify yourself with any one of the three general groups which have been characterised. But if you are neither an idealist, nor a philistine, nor a pleasure lover, surely you are compounded of such elements, and does not escape their implications. 128 You desires something most of all, even though your highest ideal be only an inference from the gradation of your immediate purposes. 129 This highest ideal represents what you conceives to be the greatest worth or value attainable in the universe, and its adoption is based upon the largest generalisation that you can make or borrow.

130 The complete justification of your ideal would involve a true knowledge of the essential character of the universe. For such knowledge you substitutes either authority or your own imperfect insight. 131 But in either case your life is naturally and organically correlated with a 'thought about the universe in its totality, or in its deepest and essential character'. Such thought, the activity and its results, is philosophy. 132 Hence you who lives is, 'ipso facto', a philosopher. You are not only a potential philosopher, but a partial philosopher. You have already begun to be a philosopher. 133 Between the fitful or prudential thinking of some little person of affairs, and the sustained thought of the devoted lover of truth, there is indeed a long journey, but it is a straight journey along the same road. 134 Philosophy is neither accidental nor supernatural, but inevitable and normal. Philosophy is not properly a vocation, but the

ground and inspiration of all vocations. 135 In the hands of its devotees it grows technical and complex, as do all efforts of thought, and to pursue philosophy bravely and faithfully is to encounter obstacles and labyrinths innumerable. 136 The general problem of philosophy is mother of a whole brood of problems, little and great. But whether we be numbered among its devotees, or their beneficiaries, an equal significance attaches to the truth that philosophy is continuous with life.

The Book of Divine Panagogue called

UNDERSTANDING

OF THE POWER OF THE UNDERSTANDING, OR OF HUMAN FREEDOM

Benedict de Spinoza

1 At length I pass to the portion of my Ethics, which is concerned with the way leading to freedom. 2 I shall therefore treat therein of the power of the reason, showing how far the reason can control the emotions, and what is the nature of Mental Freedom or Blessedness; 3 we shall then be able to see, how much more powerful the wise person is than the ignorant.

4 It is no part of my design to point out the method and means whereby the understanding may be perfected, nor to show the skill whereby the body may be so tended, as to be capable of the due performance of its functions. 5 The latter question lies in the province of Medicine, the former in the province of Logic. Here, therefore, I repeat, I shall treat only of the power of the mind, or of reason; 6 and I shall mainly show the extent and nature of its dominion over the emotions, for their control and moderation. 7 That we do not possess absolute dominion over them, I have already shown. Yet the Stoics have thought, that the emotions depended absolutely on our will, and that we could absolutely govern them. 8 But these philosophers were compelled, by the protest of experience, not from their own principles, to confess, that no slight practice and zeal is needed to control and moderate them: 9 and this someone endeavoured to illustrate by the example (if I remember rightly) of two dogs, the one a house-dog and the other a hunting-dog. 10 For by long training it could be brought about, that the house-dog should become accustomed to hunt, and the hunting-dog to cease from running after hares.

11 To this opinion Descartes not a little inclines. For he maintained, that the soul or mind is specially united to a particular part of the brain, namely, to that part called the pineal gland, 12 by the aid of which the mind is enabled to feel

all the movements which are set going in the body, and also external objects, and which the mind by a simple act of volition can put in motion in various ways. 13 He asserted, that this gland is so suspended in the midst of the brain, that it could be moved by the slightest motion of the animal spirits: 14 further, that this gland is suspended in the midst of the brain in as many different manners, as the animal spirits can impinge thereon; 15 and, again, that as many different marks are impressed on the said gland, as there are different external objects which impel the animal spirits towards it; 16 whence it follows, that if the will of the soul suspends the gland in a position, wherein it has already been suspended once before by the animal spirits driven in one way or another, the gland in its turn reacts on the said spirits, 17 driving and determining them to the condition wherein they were, when repulsed before by a similar position of the gland.

18 He further asserted, that every act of mental volition is united in nature to a certain given motion of the gland. 19 For instance, whenever anyone desires to look at a remote object, the act of volition causes the pupil of the eye to dilate, 20 whereas, if the person in question had only thought of the dilatation of the pupil, the mere wish to dilate it would not have brought about the result, 21 inasmuch as the motion of the gland, which serves to impel the animal spirits towards the optic nerve in a way which would dilate or contract the pupil, is not associated in nature with the wish to dilate or contract the pupil, but with the wish to look at remote or very near objects.

22 Lastly, he maintained that, although every motion of the aforesaid gland seems to have been united by nature to one particular thought out of the whole number of our thoughts from the very beginning of our life, 23 yet it can nevertheless become through habituation associated with other thoughts; this he endeavours to prove in the *Passions de l'ame, I.*

24 He thence concludes, that there is no soul so weak, that it cannot, under proper direction, acquire

absolute power over its passions. 25 For passions as defined by him are "perceptions, or feelings, or disturbances of the soul, which are referred to the soul as species, and which are produced, preserved, and strengthened through some movement of the spirits." 26 But, seeing that we can join any motion of the gland, or consequently of the spirits, to any volition, the determination of the will depends entirely on our own powers; 27 if, therefore, we determine our will with sure and firm decisions in the direction to which we wish our actions to tend, and associate the motions of the passions which we wish to acquire with the said decisions, we shall acquire an absolute dominion over our passions. 28 Such is the doctrine of this illustrious philosopher (in so far as I gather it from his own words); it is one which, had it been less ingenious, I could hardly believe to have proceeded from so great a man. 29 Indeed, I am lost in wonder, that a philosopher, who had stoutly asserted, that he would draw no conclusions which do not follow from self-evident premises, and would affirm nothing which he did not clearly and distinctly perceive, 30 and who had so often taken to task the scholastics for wishing to explain obscurities through occult qualities, could maintain a hypothesis, beside which occult qualities are commonplace.

31 What does he understand, I ask, by the union of the mind and the body? What clear and distinct conception has he got of thought in most intimate union with a certain particle of extended matter? 32 Truly I should like him to explain this union through its proximate cause. What clear and distinct conception has he got of thought in most intimate union with a certain particle of extended matter? 33 But he had so distinct a conception of mind being distinct from body, that he could not assign any particular cause of the union between the two, or of the mind itself, but was obliged to have recourse to the cause of the whole universe, that is to God.

34 Further, I should much like to know, what degree of motion the mind can impart to this pineal

gland, and with what force can it hold it suspended? 35 For I am in ignorance, whether this gland can be agitated more slowly or more quickly by the mind than by the animal spirits, and whether the motions of the passions, which we have closely united with firm decisions, cannot be again disjoined therefrom by physical causes; 36 in which case it would follow that, although the mind firmly intended to face a given danger, and had united to this decision the motions of boldness, 37 yet at the sight of the danger the gland might become suspended in a way, which would preclude the mind thinking of anything except running away. 38 In truth, as there is no common standard of volition and motion, so is there no comparison possible between the powers of the mind and the power or strength of the body; consequently the strength of one cannot in any wise be determined by the strength of the other. 39 We may also add, that there is no gland discoverable in the midst of the brain, so placed that it can thus easily be set in motion in so many ways, and also that all the nerves are not prolonged so far as the cavities of the brain.

40 Lastly, I omit all the assertions which he makes concerning the will and its freedom, inasmuch as I have abundantly proved that his premises are false.

41 Therefore, since the power of the mind, as I have shown above, is defined by the understanding only, we shall determine solely by the knowledge of the mind the remedies against the emotions, 42 which I believe all have had experience of, but do not accurately observe or distinctly see, and from the same basis we shall deduce all those conclusions, which have regard to the mind's blessedness.

AXIOMS

43 I. If two contrary actions be started in the same subject, a change must necessarily take place, either in both, or in one of the two, and continue until they cease to be contrary.

44 II. The power of an effect is defined by the power of its cause, in so far as its essence is explained

or defined by the essence of its cause.

PROPOSITION I.

45 Even as thoughts and the ideas of things are arranged and associated in the mind, so are the modifications of body or the images of things precisely in the same way arranged and associated in the body.

PROOF

46 The order and connection of ideas is the same as the order and connection of things, and vice versa the order and connection of things is the same as the order and connection of ideas. 47 Wherefore, even as the order and connection of ideas in the mind takes place according to the order and association of modifications of the body, 48 so vice versa the order and connection of modifications of the body takes place in accordance with the manner, in which thoughts and the ideas of things are arranged and associated in the mind.

PROPOSITION II.

49 If we remove a disturbance of the spirit, or emotion, from the thought of an external cause, and unite it to other thoughts, then will the love or hatred towards that external cause, and also the vacillations of spirit which arise from these emotions, be destroyed.

PROOF

50 That, which constitutes the reality of love or hatred, is pleasure or pain, accompanied by the idea of an external cause; 51 wherefore, when this cause is removed, the reality of love or hatred is removed with it; therefore these emotions and those which arise therefrom are destroyed.

PROPOSITION III.

52 An emotion, which is a passion, ceases to be a passion, as soon as we form a clear and distinct idea thereof.

PROOF

53 An emotion, which is a passion, is a confused idea. If, therefore, we form a clear and distinct idea of a given emotion, that idea will only be distinguished from the emotion, in so far as it is referred to the mind only, by reason; therefore, the emotion will cease to be a passion.

COROLLARY

54 An emotion therefore becomes more under our control, and the mind is less passive in respect to it, in proportion as it is more known to us.

PROPOSITION IV.

55 There is no modification of the body, whereof we cannot form some clear and distinct conception.

PROOF

56 Properties which are common to all things can only be conceived adequately; therefore there is no modification of the body, whereof we cannot form some clear and distinct conception.

COROLLARY

57 Hence it follows that there is no emotion, whereof we cannot form some clear and distinct conception. For an emotion is the idea of a modification of the body, and must therefore involve some clear and distinct conception.

NOTE

58 Seeing that there is nothing which is not followed by an effect, and that we clearly and distinctly understand whatever follows from an idea, which in us is adequate, 59 it follows that everyone has the power of clearly and distinctly understanding the self and own emotions, if not absolutely, at any rate in part, and consequently of bringing it about, that you should become less subject to them. 60 To attain this result, therefore, we must chiefly direct our efforts to acquiring, as far as possible, a clear and distinct knowledge of every emotion, 61 in order that the mind may thus, through emotion, be determined to think of those things which it clearly and distinctly perceives, and wherein it fully acquiesces: 62 and thus that the emotion itself may be separated from the thought of an external cause, and may be associated with true thoughts; 63 whence it will come to pass, not only that love, hatred. will be destroyed, but also that the appetites or desires, which are wont to arise from such emotion, will become incapable of being excessive.

64 For it must be especially remarked, that the appetite through which a human is said to be active, and that through which you are said to be passive is one and the same. 65 For instance, we have

shown that human nature is so constituted, that everyone desires own fellow-human to live after one's own fashion; 66 in a person, who is not guided by reason, this appetite is a passion which is called ambition, and does not greatly differ from pride; 67 whereas in a person, who lives by the dictates of reason, it is an activity or virtue which is called piety.

68 In like manner all appetites or desires are only passions, in so far as they spring from inadequate ideas; the same results are accredited to virtue, when they are aroused or generated by adequate ideas. 69 For all desires, whereby we are determined to any given action, may arise as much from adequate as from inadequate ideas. 70 Than this remedy for the emotions (to return to the point from which I started), which consists in a true knowledge thereof, nothing more excellent, being within our power, can be devised. 71 For the mind has no other power save that of thinking and of forming, adequate ideas, as we have shown above.

PROPOSITION V.

72 An emotion towards a thing, which we conceive simply, and not as necessary, or as contingent, or as possible, is, other conditions being equal, greater than any other emotion.

PROOF

73 An emotion towards a thing, which we conceive to be free, is greater than one towards what we conceive to be necessary, and, consequently, still greater than one towards what we conceive as possible, or contingent. 74 But to conceive a thing as free can be nothing else than to conceive it simply, while we are in ignorance of the causes whereby it has been determined to action; 75 therefore, an emotion towards a thing which we conceive simply is, other conditions being equal, greater than one, which we feel towards what is necessary, possible, or contingent, and, consequently, it is the greatest of all.

PROPOSITION VI.

76 The mind has greater power over the emotions and is less subject thereto, in so far as it understands all things as necessary.

PROOF

77 The mind understands all things to be necessary and to be determined to existence and operation by an infinite chain of causes; 78 therefore, it thus far brings it about, that it is less subject to the emotions arising therefrom, and feels less emotion towards the things themselves.

NOTE

79 The more this knowledge, that things are necessary, is applied to particular things, which we conceive more distinctly and vividly, the greater is the power of the mind over the emotions, as experience also testifies. 80 For we see, that the pain arising from the loss of any good is mitigated, as soon as the person who has lost it perceives, that it could not by any means have been preserved. 81 So also we see that no one pities an infant, because it cannot speak, walk, or reason, or lastly, because it passes so many years, as it were, in unconsciousness. 82 Whereas, if most people were born full-grown and only one here and there as an infant, everyone would pity the infants; 83 because infancy would not then be looked on as a state natural and necessary, but as a fault or delinquency in Nature; and we may note several other instances of the same sort.

PROPOSITION VII.

84 Emotions which are aroused or spring from reason, if we take account of time, are stronger than those, which are attributable to particular objects that we regard as absent.

PROOF

85 We do not regard a thing as absent, by reason of the emotion wherewith we conceive it, but by reason of the body, being affected by another emotion excluding the existence of the said thing.

86 Wherefore, the emotion, which is referred to the thing which we regard as absent, is not of a nature to overcome the rest of a human's activities and power, 87 but is, on the contrary, of a nature to be in some sort controlled by the emotions, which exclude the existence of its external cause. 88 But an emotion which springs from reason is necessarily referred to the common properties of things, which we always regard as present (for there can be nothing to

exclude their present existence), and which we always conceive in the same manner. 89 Wherefore an emotion of this kind always remains the same; and consequently emotions, which are contrary thereto and are not kept going by their external causes, will be obliged to adapt themselves to it more and more, until they are no longer contrary to it; 90 to this extent the emotion which springs from reason is more powerful.

PROPOSITION VIII.

91 An emotion is stronger in proportion to the number of simultaneous concurrent causes whereby it is aroused.

PROOF

92 Many simultaneous causes are more powerful than a few: therefore, in proportion to the increased number of simultaneous causes whereby it is aroused, an emotion becomes stronger.

PROPOSITION IX.

93 An emotion, which is attributable to many and diverse causes which the mind regards as simultaneous with the emotion itself, is less hurtful, 94 and we are less subject thereto and less affected towards each of its causes, than if it were a different and equally powerful emotion attributable to fewer causes or to a single cause.

PROOF

95 An emotion is only bad or hurtful, in so far as it hinders the mind from being able to think; 96 therefore, an emotion, whereby the mind is determined to the contemplation of several things at once, is less hurtful than another equally powerful emotion, which so engrosses the mind in the single contemplation of a few objects or of one, that it is unable to think of anything else; this was our first point.

97 Again, as the mind's essence, in other words, its power, consists solely in thought, the mind is less passive in respect to an emotion, which causes it to think of several things at once, 98 than in regard to an equally strong emotion, which keeps it engrossed in the contemplation of a few or of a single object: this was our second point.

99 Lastly, this emotion, in so far as it is attributable to several causes,

is less powerful in regard to each of them.

PROPOSITION X.

100 So long as we are not assailed by emotions contrary to our nature, we have the power of arranging and associating the modifications of our body according to the intellectual order.

PROOF

101 The emotions, which are contrary to our nature, that is, which are bad, are bad in so far as they impede the mind from understanding. 102 So long, therefore, as we are not assailed by emotions contrary to our nature, the mind's power, whereby it endeavours to understand things, is not impeded, and therefore it is able to form clear and distinct ideas and to deduce them one from another; 103 consequently we have in such cases the power of arranging and associating the modifications of the body according to the intellectual order.

NOTE

104 By this power of rightly arranging and associating the bodily modifications we can guard ourselves from being easily affected by evil emotions. 105 For a greater force is needed for controlling the emotions, when they are arranged and associated according to the intellectual order, than when they are uncertain and unsettled. 106 The best we can do, therefore, so long as we do not possess a perfect knowledge of our emotions, is to frame a system of right conduct, or fixed practical precepts, to commit it to memory, 107 and to apply it forthwith to the particular circumstances which now and again meet us in life, so that our imagination may become fully imbued therewith, and that it may be always ready to our hand. 108 For instance, we have laid down among the rules of life, that hatred should be overcome with love or high- mindedness, and not required with hatred in return. 109 Now, that this precept of reason may be always ready to our hand in time of need, we should often think over and reflect upon the wrongs generally committed by people, and in what manner and way they may be best warded off by high-mindedness: 110 we shall thus associate the idea of wrong with the idea of this precept, which

accordingly will always be ready for use when a wrong is done to us. 111 If we keep also in readiness the notion of our true advantage, and of the good which follows from mutual friendships, and common fellowships; 112 further, if we remember that complete acquiescence is the result of the right way of life, and that people, no less than everything else, act by the necessity of their nature: 113 in such case I say the wrong, or the hatred, which commonly arises therefrom, will engross a very small part of our imagination and will be easily overcome; 114 or, if the anger which springs from a grievous wrong be not overcome easily, it will nevertheless be overcome, though not without a spiritual conflict, far sooner than if we had not thus reflected on the subject beforehand.

115 As is indeed evident, we should, reflect on courage as a means of overcoming fear; the ordinary dangers of life should frequently be brought to mind and imagined, 116 together with the means whereby through readiness of resource and strength of mind we can avoid and overcome them. 117 But we must note, that in arranging our thoughts and conceptions we should always bear in mind that which is good in every individual thing, in order that we may always be determined to action by an emotion of pleasure. 118 For instance, if a person sees that you are too keen in the pursuit of honour, let you think over its right use, the end for which it should be pursued, and the means whereby you may attain it. 119 Let you not think of its misuse, and its emptiness, and the fickleness of humankind, and the like, whereof no human thinks except through a morbidness of disposition; 120 with thoughts like these do the most ambitious most torment themselves, when they despair of gaining the distinctions they hanker after, and in thus giving vent to their anger would fain appear wise. 121 Wherefore it is certain that those, who cry out the loudest against the misuse of honour and the vanity of the world, are those who most greedily covet it. 122 This is not peculiar to the ambitious, but is

common to all who are ill-used by fortune, and who are infirm in spirit.

123 For a poor person also, who is miserly, will talk incessantly of the misuse of wealth and of the vices of the rich; whereby you merely torments yourself, and shows the world that you are intolerant, not only of your own poverty, but also of other people's riches. 124 So, again, those who have been ill received by a woman they love think of nothing but the inconstancy, treachery, and other stock faults of the fair sex; all of which they consign to oblivion, directly they are again taken into favour by their sweetheart. 125 Thus you who would govern your emotions and appetite solely by the love of freedom strives, as far as you can, to gain a knowledge of the virtues and their causes, and to fill your spirit with the joy which arises from the true knowledge of them: 126 you will in no wise desire to dwell on people's faults, or to carp at your fellows, or to revel in a false show of freedom. 127 Whosoever will diligently observe and practise these precepts (which indeed are not difficult) will verily, in a short space of time, be able, for the most part, to direct own actions according to the commandments of reason.

PROPOSITION XI.

128 In proportion as a mental image is referred to more objects, so is it more frequent, or more often vivid, and occupies the mind more.

PROOF

129 In proportion as a mental image or an emotion is referred to more objects, so are there more causes whereby it can be aroused and fostered, all of which (by hypothesis) the mind contemplates simultaneously in association with the given emotion; 130 therefore the emotion is more frequent, or is more often in full vigour, and occupies the mind more.

PROPOSITION XII.

131 The mental images of things are more easily associated with the images referred to things which we clearly and distinctly understand, than with others.

PROOF

132 Things, which we clearly and distinctly understand, are either the common properties of things or

deductions therefrom, and are consequently more often aroused in us. 133 Wherefore it may more readily happen, that we should contemplate other things in conjunction with these than in conjunction with something else, 134 and consequently that the images of the said things should be more often associated with the images of these than with the images of something else.

PROPOSITION XIII.

135 A mental image is more often vivid, in proportion as it is associated with a greater number of other images.

PROOF

136 In proportion as an image is associated with a greater number of other images, so are there more causes whereby it can be aroused.

PROPOSITION XIV.

137 The mind can bring it about, that all bodily modifications or images of things may be referred to the idea of God.

PROOF

138 There is no modification of the body, whereof the mind may not form some clear and distinct conception; wherefore it can bring it about, that they should all be referred to the idea of God.

PROPOSITION XV.

139 You who clearly and distinctly understands yourself and your emotions loves God, and so much the more in proportion as you more understands yourself and your emotions.

PROOF

140 You who clearly and distinctly understands yourself and your emotions feels pleasure, and this pleasure is accompanied by the idea of God; 141 therefore such an one loves God, and (for the same reason) so much the more in proportion as you more understands yourself and your emotions.

PROPOSITION XVI.

142 This love towards God must hold the chief place in the mind.

PROOF

143 For this love is associated with all the modifications of the body and is fostered by them all; therefore, it must hold the chief place in the mind.

PROPOSITION XVII.

144 God is without passions, neither is He affected by any emotion of pleasure or pain.

.

PROOF

145 All ideas, in so far as they are referred to God, are true, that is adequate; and therefore God is without passions. 146 Again, God cannot pass either to a greater or to a lesser perfection; therefore He is not affected by any emotion of pleasure or pain.

COROLLARY.

147 Strictly speaking, God does not love or hate anyone. For God is not affected by any emotion of pleasure or pain, consequently He does not love or hate anyone.

PROPOSITION XVIII.

148 No one can hate God.

PROOF

149 The idea of God which is in us is adequate and perfect; wherefore, in so far as we contemplate God, we are active; consequently here can be no pain accompanied by the idea of God, in other words, no one can hate God.

COROLLARY

150 Love towards God cannot be turned into hate.

NOTE

151 It may be objected that, as we understand God as the cause of all things, we by that very fact regard God as the cause of pain. 152 But I may answer, that, in so far as we understand the causes of pain, it to that extent ceases to be a passion, that is, it ceases to be pain; therefore, in so far as we understand God to be the cause of pain, we to that extent feel pleasure.

PROPOSITION XIX.

153 You, who loves God, cannot endeavour that God should love you in return.

PROOF

154 For, if a person should so endeavour, you would desire that God, whom you loves, should not be God, and consequently you would desire to feel pain; which is absurd. Therefore, you who loves God.

PROPOSITION XX.

155 This love towards God cannot be stained by the emotion of envy or jealousy: contrariwise, it is the more fostered, in proportion as we conceive a greater number of men to be joined to God by the same bond of love.

PROOF

156 This love towards God is the highest good which we can seek for under the guidance of reason, it is common to all people, and we desire that all should rejoice

therein; 157 therefore, it cannot be stained by the emotion of envy nor by, the emotion of jealousy; but, contrariwise, it must needs be the more fostered, in proportion as we conceive a greater number of people to rejoice therein.

NOTE

158 We can in the same way, show, that there is no emotion directly contrary to this love, whereby this love can be destroyed; 159 therefore we may conclude, that this love towards God is the most constant of all the emotions, and that, in so far as it is referred to the body, it cannot be destroyed, unless the body be destroyed also. 160 As to its nature, in so far as it is referred to the mind only, we shall presently inquire.

161 I have now gone through all the remedies against the emotions, or all that the mind, considered in itself alone, can do against them. 162 Whence it appears that the mind's power over the emotions consists:-

I. In the actual knowledge of the emotions.

163 II. In the fact that it separates the emotions from the thought of an external cause, which we conceive confusedly.

164 III. In the fact, that, in respect to time, the emotions referred to things, which we distinctly understand, surpass those referred to what we conceive in a confused and fragmentary manner.

165 IV. In the number of causes whereby those modifications, are fostered, which have regard to the common properties of things or to God.

166 V. Lastly, in the order wherein the mind can arrange and associate, one with another, its own emotions.

167 But, in order that this power of the mind over the emotions may be better understood, it should be specially observed that the emotions are called by us strong, when we compare the emotion of one person with the emotion of another, 168 and see that one person is more troubled than another by the same emotion; or when we are comparing the various emotions of the same person one with another, and find that one is more affected or stirred by one emotion than by another.

169 For the strength of every emotion is defined by a comparison of our own power with the power of an external cause.

170 Now the power of the mind is defined by knowledge only, and its infirmity or passion is defined by the privation of knowledge only: 171 it therefore follows, that that mind is most passive, whose greatest part is made up of inadequate ideas, so that it may be characterised more readily by its passive states than by its activities: 172 on the other hand, that mind is most active, whose greatest part is made up of adequate ideas, so that, although it may contain as many inadequate ideas as the former mind, 173 it may yet be more easily characterised by ideas attributable to human virtue, than by ideas which tell of human infirmity.

174 Again, it must be observed, that spiritual unhealthiness; and misfortunes can generally be traced to excessive love for something which is subject to many variations, and which we can never become masters of. 175 For no one is solicitous or anxious about anything, unless you loves it; neither do wrongs, suspicions, enmities arise, except in regard to things whereof no one can be really master.

176 We may thus readily conceive the power which clear and distinct knowledge, and especially that third kind of knowledge, founded on the actual knowledge of God, possesses over the emotions: 177 if it does not absolutely destroy them, in so far as they are passions; at any rate, it causes them to occupy a very small part of the mind. 178 Further, it begets a love towards a thing immutable and eternal, whereof we may really enter into possession; neither can it be defiled with those faults which are inherent in ordinary love; 179 but it may grow from strength to strength, and may engross the greater part of the mind, and deeply penetrate it. 180 And now I have finished with all that concerns this present life: for, as I said in the beginning of this note, I have briefly described all the remedies against the emotions. 181 And this everyone may readily have seen for yourself, if you have

attended to what is advanced in the present note, and also to the definitions of the mind and its emotions. 182 It is now, therefore, time to pass on to those matters, which appertain to the duration of the mind, without relation to the body.

PROPOSITION XXI.

183 The mind can only imagine anything, or remember what is past, while the body endures.

PROOF

184 The mind does not express the actual existence of its body, nor does it imagine the modifications of the body as actual, except while the body endures; and, consequently, it does not imagine any body as actually existing, except while its own body endures. 185 Thus it cannot imagine anything, or remember things past, except while the body endures.

PROPOSITION XXII.

186 Nevertheless in God there is necessarily an idea, which expresses the essence of this or that human body under the form of eternity.

PROOF

187 God is the cause, not only of the existence of this or that human body, but also of its essence. 188 This essence, therefore, must necessarily be conceived through the very essence of God, and be thus conceived by a certain eternal necessity; and this conception. must necessarily exist in God.

PROPOSITION XXIII.

189 The human mind cannot be absolutely destroyed with the body, but there remains of it something which is eternal.

PROOF

190 There is necessarily in God a concept or idea, which expresses the essence of the human body, which, therefore, is necessarily something appertaining to the essence of the human mind. 191 But we have not assigned to the human mind any, duration, definable by time, except in so far as it expresses the actual existence of the body, which is explained through duration, and may be defined by time-- 192 that is, we do not assign to it duration, except while the body endures. 193 Yet, as there is something, notwithstanding, which is

conceived by a certain eternal necessity through the very essence of God; this something, which appertains to the essence of the mind, will necessarily be eternal.

NOTE

194 This idea, which expresses the essence of the body under the form of eternity, is, as we have said, a certain mode of thinking, which belongs to the essence of the mind, and is necessarily eternal. 195 Yet it is not possible that we should remember that we existed before our body, for our body can bear no trace of such existence, neither can eternity be defined in terms of time, or have any relation to time. 196 But, notwithstanding, we feel and know that we are eternal. For the mind feels those things that it conceives by understanding, no less than those things that it remembers. 197 For the eyes of the mind, whereby it sees and observes things, are none other than proofs.

198 Thus, although we do not remember that we existed before the body, yet we feel that our mind, in so far as it involves the essence of the body, under the form of eternity, is eternal, and that thus its existence cannot be defined in terms of time, or explained through duration. 199 Thus our mind can only be said to endure, and its existence can only be defined by a fixed time, in so far as it involves the actual existence of the body. 200 Thus far only has it the power of determining the existence of things by time, and conceiving them under the category of duration.

PROPOSITION XXIV.

201 The more we understand particular things, the more do we understand God.

PROPOSITION XXV.

202 The highest endeavour of the mind, and the highest virtue is to understand things by the third kind of knowledge.

PROOF

203 The third kind of knowledge proceeds from an adequate idea of certain attributes of God to an adequate knowledge of the essence of things; and, in proportion as we understand things more in this way, we better understand God; 204 therefore the highest virtue of the mind, that is the power, or nature, or highest endeavour of the

mind, is to understand things by the third kind of knowledge.

PROPOSITION XXVI.

205 In proportion as the mind is more capable of understanding things by the third kind of knowledge, it desires more to understand things by that kind.

PROOF

206 This is evident. For, in so far as we conceive the mind to be capable of conceiving things by this kind of knowledge, we, to that extent, conceive it as determined thus to conceive things; 207 and consequently, the mind desires so to do, in proportion as it is more capable thereof.

PROPOSITION XXVII.

208 From this third kind of knowledge arises the highest possible mental acquiescence.

PROOF

209 The highest virtue of the mind is to know God, or to understand things by the third kind of knowledge, and this virtue is greater in proportion as the mind knows things more by the said kind of knowledge: 210 consequently, you who knows things by this kind of knowledge passes to the summit of human perfection, and is therefore affected by the highest pleasure, 211 such pleasure being accompanied by the idea of yourself and your own virtue; thus, from this kind of knowledge arises the highest possible acquiescence.

PROPOSITION XXVIII.

212 The endeavour or desire to know things by the third kind of knowledge cannot arise from the first, but from the second kind of knowledge.

PROOF

213 This proposition is self-evident. For whatsoever we understand clearly and distinct we understand either through itself, or through that which is conceived through itself; 214 that is, ideas which are clear and distinct in us, or which are referred to the third kind of knowledge cannot follow from ideas that are fragmentary, and confused, and are referred to knowledge of the first kind, 215 but must follow from adequate ideas, or ideas of the second and third kind of knowledge; therefore, the desire of knowing things by the third kind of knowledge cannot arise from the first, but from the second kind.

PROPOSITION XXIX.

216 Whatsoever the mind understands under the form of eternity, it does not understand by virtue of conceiving the present actual existence of the body, but by virtue of conceiving the essence of the body under the form of eternity.

PROOF

217 In so far as the mind conceives the present existence of its body, it to that extent conceives duration which can be determined by time, and to that extent only, has it the power of conceiving things in relation to time. 218 But eternity cannot be explained in terms of duration. Therefore to this extent the mind has not the power of conceiving things under the form of eternity, but it possesses such power, because it is of the nature of reason to conceive things under the form of eternity, 219 and also because it is of the nature of the mind to conceive the essence of the body under the form of eternity, for besides these two there is nothing which belongs to the essence of mind. 220 Therefore this power of conceiving things under the form of eternity only belongs to the mind in virtue of the mind's conceiving the essence of the body under the form of eternity.

NOTE

221 Things are conceived by us as actual in two ways; either as existing in relation to a given time and place, or as contained in God and following from the necessity of the divine Nature. 222 Whatsoever we conceive in this second way as true or real, we conceive under the form of eternity, and their ideas involve the eternal and infinite essence of God.

PROPOSITION XXX.

223 Our mind, in so far as it knows itself and the body under the form of eternity, has to that extent necessarily a knowledge of God, and knows that it is in God, and is conceived through God.

PROOF

224 Eternity is the very essence of God, in so far as this involves necessary existence. Therefore to conceive things under the form of eternity, is to conceive things in so far as they are conceived through the essence of God as real entities, 225 or in so far as they involve

existence through the essence of God; wherefore our mind, in so far as it conceives itself and the body under the form of eternity, has to that extent necessarily a knowledge of God, and knows.

PROPOSITION XXXI.

226 The third kind of knowledge depends on the mind, as its formal cause, in so far as the mind itself is eternal.

PROOF

227 The mind does not conceive anything under the form of eternity, except in so far as it conceives its own body under the form of eternity; 228 that is, except in so far as it is eternal; therefore, in so far as it is eternal, it possesses the knowledge of God, which knowledge is necessarily adequate; 229 hence the mind, in so far as it is eternal, is capable of knowing everything which can follow from this given knowledge of God, 230 in other words, of knowing things by the third kind of knowledge, whereof accordingly the mind, in so far as it is eternal, is the adequate or formal cause of such knowledge.

NOTE

231 In proportion, therefore, as a person is more potent in this kind of knowledge, you will be more completely conscious of yourself and of God; 232 in other words, you will be more perfect and blessed, as will appear more clearly in the sequel. 233 But we must here observe that, although we are already certain that the mind is eternal, in so far as it conceives things under the form of eternity, 234 yet, in order that what we wish to show may be more readily explained and better understood, we will consider the mind itself, as though it had just begun to exist and to understand things under the form of eternity, as indeed we have done hitherto; 235 this we may do without any danger of error, so long as we are careful not to draw any conclusion, unless our premises are plain.

PROPOSITION XXXII.

236 Whatsoever we understand by the third kind of knowledge, we take delight in, and our delight is accompanied by the idea of God as cause.

PROOF

237 From this kind of knowledge arises the highest possible mental acquiescence, that is, pleasure, and this acquiescence is accompanied by the idea of the mind itself, and consequently the idea also of God as cause.

COROLLARY

238 From the third kind of knowledge necessarily arises the intellectual love of God. 239 From this kind of knowledge arises pleasure accompanied by the idea of God as cause, that is, the love of God; 240 not in so far as we imagine Him as present, but in so far as we understand Him to be eternal; this is what I call the intellectual love of God.

PROPOSITION XXXIII.

241 The intellectual love of God, which arises from the third kind of knowledge, is eternal.

PROOF

242 The third kind of knowledge is eternal; therefore the love which arises therefrom is also necessarily eternal.

NOTE

243 Although this love towards God has no beginning, it yet possesses all the perfections of love, just as though it had arisen as we feigned in the Corollary of the last proposition. 244 Nor is there here any difference, except that the mind possesses as eternal those same perfections which we feigned to accrue to it, and they are accompanied by the idea of God as eternal cause. 245 If pleasure consists in the transition to a greater perfection, assuredly blessedness must consist in the mind being endowed with perfection itself.

PROPOSITION XXX.IV.

246 The mind is, only while the body endures, subject to those emotions which are attributable to passions.

PROOF.

247 Imagination is the idea wherewith the mind contemplates a thing as present; yet this idea indicates rather the present disposition of the human body than the nature of the external thing. 248 Therefore emotion is imagination, in so far as it indicates the present disposition of the body; 249 therefore the mind is, only while the body endures,

subject to emotions which are attributable to passions.

COROLLARY

250 Hence it follows that no love save intellectual love is eternal.

NOTE

251 If we look to people's general opinion, we shall see that they are indeed conscious of the eternity of their mind, but that they confuse eternity with duration, and ascribe it to the imagination or the memory which they believe to remain after death.

PROPOSITION XXXV.

252 God loves himself with an infinite intellectual love.

PROOF

253 God is absolutely infinite, that is, the nature of God rejoices in infinite perfection; and such rejoicing is accompanied by the idea of Himself, that is, the idea of His own cause: now this is what we have described as intellectual love.

PROPOSITION XXXVI.

254 The intellectual love of the mind towards God is that very love of God whereby God loves Himself, not in so far as He is infinite, but in so far as He can be explained through the essence of the human mind regarded under the form of eternity; 255 in other words, the intellectual love of the mind towards God is part of the infinite love wherewith God loves Himself.

PROOF.

256 (1) This love of the mind must be referred to the activities of the mind; it is itself, indeed, an activity whereby the mind regards itself accompanied by the idea of God as cause; 257 that is, an activity whereby God, in so far as He can be explained through the human mind, regards Himself accompanied by the idea of Himself; therefore, this love of the mind is part of the infinite love wherewith God loves Himself.

COROLLARY

258 Hence it follows that God, in so far as He loves Himself, loves human, and, consequently, that the love of God towards humans, and the intellectual love of the mind towards God are identical.

NOTE

259 From what has been said we clearly understand, wherein our salvation, or blessedness, or freedom, consists: namely, in the constant and eternal love towards

God, or in God's love towards humans.

260 This love or blessedness is, in the Bible, called Glory and not undeservedly. For whether this love be referred to God or to the mind, it may rightly be called acquiescence of spirit, which is not really distinguished from glory. 261 In so far as it is referred to God, it is pleasure, if we may still use that term, accompanied by the idea of itself, and, in so far as it is referred to the mind, it is the same.

262 Again, since the essence of our mind consists solely in knowledge, whereof the beginning and the foundation is God, it becomes clear to us, in what manner and way our mind, as to its essence and existence, follows from the divine Nature and constantly depends on God. 263 I have thought it worthwhile here to call attention to this, in order to show by this example how the knowledge of particular things, which I have called intuitive or of the third kind, is potent, and more powerful than the universal knowledge, which I have styled knowledge of the second kind. 264 For, although in (the book of ETHICS) showed in general terms, that all things (and consequently, also, the human mind) depend as to their essence and existence on God, 265 yet that demonstration, though legitimate and placed beyond the chances of doubt, does not affect our mind so much, as when the same conclusion is derived from the actual essence of some particular thing, which we say depends on God.

PROPOSITION XXXVII.

266 There is nothing in Nature, which is contrary to this intellectual love, or which can take it away.

PROOF

267 This intellectual love follows necessarily from the nature of the mind, in so far as the latter is regarded through the nature of God as an eternal truth. 268 If, therefore, there should be anything which would be contrary to this love, that thing would be contrary to that which is true; 269 consequently, that, which should be able to take away this love, would cause that which is true to be false; an obvious absurdity.

Therefore there is nothing in Nature which.

NOTE

270 The Axiom of (the book of DESIRES) has reference to particular things, in so far as they are regarded in relation to a given time and place: of this, I think, no one can doubt.

PROPOSITION XXXVIII.

271 In proportion as the mind understands more things by the second and third kind of knowledge, it is less subject to those emotions which are evil, and stands in less fear of death.

PROOF

272 The mind's essence consists in knowledge; therefore, in proportion as the mind understands more things by the second and third kinds of knowledge, the greater will be the part of it that endures, 273 and, consequently, the greater will be the part that is not touched by the emotions, which are contrary to our nature, or in other words, evil. 274 Thus, in proportion as the mind understands more things by the second and third kinds of knowledge, the greater will be the part of it, that remains unimpaired, and, consequently, less subject to emotions.

NOTE

275 Hence we understand that point which I touched, and which I promised to explain in this Part; namely, that death becomes less hurtful, in proportion as the mind's clear and distinct knowledge is greater, and, consequently, in proportion as the mind loves God more. 276 Again, since from the third kind of knowledge arises the highest possible acquiescence, it follows that the human mind can attain to being of such a nature, 277 that the part thereof which we have shown to perish with the body should be of little importance when compared with the part which endures. But I will soon treat of the subject at greater length.

PROPOSITION XXXIX.

278 You, who possesses a body capable of the greatest number of activities, possesses a mind whereof the greatest part is eternal.

PROOF

279 You, who possesses a body capable of the greatest number of activities, is least agitated by those emotions which are evil, that is, by

those emotions which are contrary to our nature; 280 therefore, you possesses the power of arranging and associating the modifications of the body according to the intellectual order, and, consequently, of bringing it about, that all the modifications of the body should be referred to the idea of God; 281 whence it will come to pass that you will be affected with love towards God, which must occupy or constitute the chief part of the mind; therefore, such a person will possess a mind whereof the chief part is eternal.

NOTE

282 Since human bodies are capable of the greatest number of activities, there is no doubt but that they may be of such a nature, that they may be referred to minds possessing a great knowledge of themselves and of God, 283 and whereof the greatest or chief part is eternal, and, therefore, that they should scarcely fear death. 284 But, in order that this may be understood more clearly, we must here call to mind, that we live in a state of perpetual variation, and, according as we are changed for the better or the worse, we are called happy or unhappy.

285 For you, who, from being an infant or a child, becomes a corpse, is called unhappy; whereas it is set down to happiness, if we have been able to live through the whole period of life with a sound mind in a sound body. 286 And, in reality, you, who, as in the case of an infant or a child, has a body capable of very few activities, and depending, for the most part, on external causes, has a mind which, considered in itself alone, is scarcely conscious of itself, or of God, or of things; 287 whereas, you, who has a body capable of very many activities, has a mind which, considered in itself alone, is highly conscious of itself, of God, and of things. 288 In this life, therefore, we primarily endeavour to bring it about, that the body of a child, in so far as its nature allows and conduces thereto, may be changed into something else capable of very many activities, and referable to a mind which is highly conscious of itself, of God, and of things; 289 and we desire so to change it, that what is referred

to its imagination and memory may become insignificant, in comparison with its intellect, as I have already said in the note to the last Proposition.

PROPOSITION XL.

290 In proportion as each thing possesses more of perfection, so is it more active, and less passive; and, vice versa, in proportion as it is more active, so is it more perfect.

PROOF

291 In proportion as each thing is more perfect, it possesses more of reality, and, consequently, it is to that extent more active and less passive. 292 This demonstration may be reversed, and thus prove that, in proportion as a thing is more active, so is it more perfect.

COROLLARY

293 Hence it follows that the part of the mind which endures, be it great or small, is more perfect than the rest. 294 For the eternal part of the mind the understanding, through which alone we are said to act; the part which we have shown to perish is the imagination, through which only we are said to be passive; therefore, the former, be it great or small, is more perfect than the latter.

NOTE

295 Such are the doctrines which I had purposed to set forth concerning the mind, in so far as it is regarded without relation to the body; 296 whence, it is plain that our mind, in so far as it understands, is an eternal mode of thinking, which is determined by another eternal mode of thinking, and this other by a third, and so on to infinity; so that all taken together at once constitute the eternal and infinite intellect of God.

PROPOSITION XLI.

297 Even if we did not know that our mind is eternal, we should still consider as of primary importance piety and religion, and generally all things which, in (the book of DESIRES) we showed to be attributable to courage and high-mindedness.

PROOF

298 The first and only, foundation of virtue, or the rule of right living is seeking one's own true interest. 299 Now, while we determined what reason prescribes as useful, we took no account of the mind's

eternity, which has only become known to us in this chapter. 300 Although we were ignorant at that time that the mind is eternal, we nevertheless stated that the qualities attributable to courage and high-mindedness are of primary importance.

301 Therefore, even if we were still ignorant of this doctrine, we should yet put the aforesaid precepts of reason in the first place.

NOTE

302 The general belief of the multitude seems to be different. Most people seem to believe that they are free, in so far as they may obey their lusts, and that they cede their rights, in so far as they are bound to live according to the commandments of the divine law. 303 They therefore believe that piety, religion, and, generally, all things attributable to firmness of mind, are burdens, which, after death, they hope to lay aside, and to receive the reward for their bondage, that is, for their piety, and religion; 304 it is not only by this hope, but also, and chiefly, by the fear of being horribly punished after death, that they are induced to live according to the divine commandments, so far as their feeble and infirm spirit will carry them.

305 If humans had not this hope and this fear, but believed that the mind perishes with the body, and that no hope of prolonged life remains for the wretches who are broken down with the burden of piety, 306 they would return to their own inclinations, controlling everything in accordance with their lusts, and desiring to obey fortune rather than themselves. 307 Such a course appears to me not less absurd than if a human, because you does not believe that you can by wholesome food sustain your body for ever, should wish to cram yourself with poisons and deadly fare; 308 or if, because you sees that the mind is not eternal or immortal, you should prefer to be out of your mind altogether, and to live without the use of reason; these ideas are so absurd as to be scarcely worth refuting.

PROPOSITION XLII.

309 Blessedness is not the reward of virtue, but virtue itself ; neither do we rejoice therein, because we control our lusts, but, contrariwise, because we rejoice therein, we are able to control our lusts.

PROOF

310 Blessedness consists in love towards God, which love springs from the third kind of knowledge must be referred to the mind, in so far as the latter is active; therefore it is virtue itself. This was our first point.

311 Again, in proportion as the mind rejoices more in this divine love or blessedness, so does it the more understand; that is, so much the more power has it over the emotions, and so much the less is it subject to those emotions which are evil; 312 therefore, in proportion as the mind rejoices in this divine love or blessedness, so has it the power of controlling lusts. 313 And, since human power in controlling the emotions consists solely in the understanding, it follows that no one rejoices in blessedness, because you have controlled your lusts, but, contrariwise, your power of controlling your lusts arises from this blessedness itself.

NOTE

314 I have thus completed all I wished to set forth touching the mind's power over the emotions and the mind's freedom. 315 Whence it appears, how potent is the wise person, and how much you surpasses the ignorant person, who is driven only by own lusts. 316 For the ignorant person is not only distracted in various ways by external causes without ever gaining, the true acquiescence of own spirit, but moreover lives, as it were unwitting of yourself, and of God, and of things, and as soon as you ceases to suffer, ceases also to be.

317 Whereas the wise person, in so far as you are regarded as such, is scarcely at all disturbed in spirit, but, being conscious of yourself, and of God, and of things, by a certain eternal necessity, never ceases to be, but always possesses true acquiescence of your spirit.

318 If the way which I have pointed out as leading to this result seems exceedingly hard, it may nevertheless be discovered. Needs

must it be hard, since it is so seldom found. 319 How would it be possible, if salvation were ready to our hand, and could without great labour be found, that it should be by almost all humans neglected? 320 But all things excellent are as difficult as they are rare.

ON THE IMPROVEMENT OF THE UNDERSTANDING,

Baruch Spinoza [Benedict De Spinoza]

2 [1] After experience had taught me that all the usual surroundings of social life are vain and futile; 2 seeing that none of the objects of my fears contained in themselves anything either good or bad, except in so far as the mind is affected by them,

3 I finally resolved to inquire whether there might be some real good having power to communicate itself, which would affect the mind singly, to the exclusion of all else: 4 whether, in fact, there might be anything of which the discovery and attainment would enable me to enjoy continuous, supreme, and unending happiness.

5 [2] I say "I finally resolved," for at first sight it seemed unwise willingly to lose hold on what was sure for the sake of something then uncertain. 6 (2.2) I could see the benefits which are acquired through fame and riches, and that I should be obliged to abandon the quest of such objects, if I seriously devoted myself to the search for something different and new.

7 (2.3) I perceived that if true happiness chanced to be placed in the former I should necessarily miss it; while if, on the other hand, it were not so placed, and I gave them my whole attention, I should equally fail.

8 [3] I therefore debated whether it would not be possible to arrive at the new principle, or at any rate at a certainty concerning its existence, without changing the conduct and usual plan of my life; with this end in view I made many efforts, in vain. 9 (3.2) For the ordinary surroundings of life which are esteemed by humans (as their actions testify) to be the highest good, may be classed

under the three heads-- Riches, Fame, and the Pleasures of Sense: with these three the mind is so absorbed that it has little power to reflect on any different good.

10 [4] By sensual pleasure the mind is enthralled to the extent of quiescence, as if the supreme good were actually attained, so that it is quite incapable of thinking of any other object; 11 when such pleasure has been gratified it is followed by extreme melancholy, whereby the mind, though not enthralled, is disturbed and dulled. 12 (4.2) The pursuit of honours and riches is likewise very absorbing, especially if such objects be sought simply for their own sake, inasmuch as they are then supposed to constitute the highest good.

13 [5] In the case of fame the mind is still more absorbed, for fame is conceived as always good for its own sake, and as the ultimate end to which all actions are directed. 14 (5.2) Further, the attainment of riches and fame is not followed as in the case of sensual pleasures by repentance, but, the more we acquire, the greater is our delight, and, consequently, the more are we incited to increase both the one and the other; 15 on the other hand, if our hopes happen to be frustrated we are plunged into the deepest sadness. 16 (5.3) Fame has the further drawback that it compels its votaries to order their lives according to the opinions of their fellow-humans, shunning what they usually shun, and seeking what they usually seek.

17 [6] When I saw that all these ordinary objects of desire would be obstacles in the way of a search for something different and new-- nay, that they were so opposed thereto, that either they or it would have to be abandoned, I was forced to inquire which would prove the most useful to me: 18 for, as I say, I seemed to be willingly losing hold on a sure good for the sake of something uncertain. 19 (6.2) However, after I had reflected on the matter, I came in the first place to the conclusion that by abandoning the ordinary objects of pursuit, and betaking myself to a new quest, I should be leaving a good, uncertain by reason of its own nature, 20 as may

be gathered from what has been said, for the sake of a good not uncertain in its nature (for I sought for a fixed good), but only in the possibility of its attainment.

21 [7] Further reflection convinced me that if I could really get to the root of the matter I should be leaving certain evils for a certain good. 22 (7.2) I thus perceived that I was in a state of great peril, and I compelled myself to seek with all my strength for a remedy, however uncertain it might be; 23 as a sick person struggling with a deadly disease, when you sees that death will surely be upon you unless a remedy be found, is compelled to seek a remedy with all your strength, inasmuch as your whole hope lies therein. 24 (7.3) All the objects pursued by the multitude not only bring no remedy that tends to preserve our being, but even act as hindrances, causing the death not seldom of those who possess them, and always of those who are possessed by them.

25 [8] There are many examples of people who have suffered persecution even to death for the sake of their riches, and of people who in pursuit of wealth have exposed themselves to so many dangers, that they have paid away their life as a penalty for their folly. 26 (8.2) Examples are no less numerous of people, who have endured the utmost wretchedness for the sake of gaining or preserving their reputation.

27 (8.3) Lastly, are innumerable cases of people, who have hastened their death through over-indulgence in sensual pleasure.

28 [9] All these evils seem to have arisen from the fact, that happiness or unhappiness is made wholly dependent on the quality of the object which we love. 29 (9.2) When a thing is not loved, no quarrels will arise concerning it-- no sadness will be felt if it perishes-- no envy if it is possessed by another-- no fear, no hatred, in short no disturbances of the mind. 30 (9.3) All these arise from the love of what is perishable, such as the objects already mentioned.

31 [10] But love towards a thing eternal and infinite feeds the mind wholly with joy, and is itself unmingled with any sadness,

wherefore it is greatly to be desired and sought for with all our strength. 32 (10.2) Yet it was not at random that I used the words, "If I could go to the root of the matter," for, though what I have urged was perfectly clear to my mind, I could not forthwith lay aside all love of riches, sensual enjoyment, and fame.

33 [11] One thing was evident, namely, that while my mind was employed with these thoughts it turned away from its former objects of desire, and seriously considered the search for a new principle; 34 this state of things was a great comfort to me, for I perceived that the evils were not such as to resist all remedies. 35 (11.2) Although these intervals were at first rare, and of very short duration, yet afterwards, as the true good became more and more discernible to me, they became more frequent and more lasting; 36 especially after I had recognised that the acquisition of wealth, sensual pleasure, or fame, is only a hindrance, so long as they are sought as ends not as means; 37 if they be sought as means, they will be under restraint, and, far from being hindrances, will further not a little the end for which they are sought, as I will show in due time.

38 [12] I will here only briefly state what I mean by true good, and also what is the nature of the highest good. 39 (12.2) In order that this may be rightly understood, we must bear in mind that the terms good and evil are only applied relatively, so that the same thing may be called both good and bad according to the relations in view, in the same way as it may be called perfect or imperfect.

40 (12.3) Nothing regarded in its own nature can be called perfect or imperfect; especially when we are aware that all things which come to pass, come to pass according to the eternal order and fixed laws of Nature.

41 [13] However, human weakness cannot attain to this order in its own thoughts, but meanwhile human conceives a human character much more stable than one’s own, and sees that there is no reason why you should not yourself acquire such a character. 42 (13.2) Thus you are led to seek

for means which will bring you to this pitch of perfection, and calls everything which will serve as such means a true good. 43 (13:3) The chief good is that you should arrive, together with other individuals if possible, at the possession of the aforesaid character. 44 (13.4) What that character is we shall show in due time, namely, that it is the knowledge of the union existing being the mind and the whole of Nature.

45 [14] This, then, is the end for which I strive, to attain to such a character myself, and to endeavour that many should attain to it with me. 46 (14.2) In other words, it is part of my happiness to lend a helping hand, that many others may understand even as I do, so that their understanding and desire may entirely agree with my own.

47 (14.3) In order to bring this about, it is necessary to understand as much of Nature as will enable us to attain to the aforesaid character, and also to form a social order such as is most conducive to the attainment of this character by the greatest number with the least difficulty and danger.

48 [15] We must seek the assistance of Moral Philosophy and the Theory of Education; further, as health is no insignificant means for attaining our end, we must also include the whole science of Medicine, 49 and, as many difficult things are by contrivance rendered easy, and we can in this way gain much time and convenience, the science of Mechanics must in no way be despised.

50 [16] But before all things, a means must be devised for improving the understanding and purifying it, as far as may be at the outset, so that it may apprehend things without error, and in the best possible way. 51 (16.2) Thus it is apparent to everyone that I wish to direct all science to one end and aim, so that we may attain to the supreme human perfection which we have named; and, therefore, whatsoever in the sciences does not serve to promote our object will have to be rejected as useless. 52 (16.3) To sum up the matter in a word, all our actions

and thoughts must be directed to this one end.

53 [17] Yet, as it is necessary that while we are endeavouring to attain our purpose, and bring the understanding into the right path we should carry on our life, we are compelled first of all to lay down certain rules of life as provisionally good, to wit the following:--

54 I. (17.2) To speak in a manner intelligible to the multitude, and to comply with every general custom that does not hinder the attainment of our purpose. 55 (17.3) For we can gain from the multitude no small advantages, provided that we strive to accommodate ourselves to its understanding as far as possible: moreover, we shall in this way gain a friendly audience for the reception of the truth.

56 II. (17:4) To indulge ourselves with pleasures only in so far as they are necessary for preserving health.

57 III. (17.5) Lastly, to endeavour to obtain only sufficient money or other commodities to enable us to preserve our life and health, and to follow such general customs as are consistent with our purpose.

58 [18] Having laid down these preliminary rules, I will betake myself to the first and most important task, namely, the amendment of the understanding, and the rendering it capable of understanding things in the manner necessary for attaining our end. 59 (18.2) In order to bring this about, the natural order demands that I should here recapitulate all the modes of perception, which I have hitherto employed for affirming or denying anything with certainty, 60 so that I may choose the best, and at the same time begin to know my own powers and the nature which I wish to perfect.

61 [19] Reflection shows that all modes of perception or knowledge may be reduced to four:--

I. (19.2) Perception arising from hearsay or from some sign which everyone may name as one please.

62 II. (19.3) Perception arising from mere experience-- that is, form experience not yet classified by the intellect, and only so called because the given event has

happened to take place, and we have no contradictory fact to set against it, so that it therefore remains unassailed in our minds.

63 III. (19:4) Perception arising when the essence of one thing is inferred from another thing, but not adequately; 64 this comes when from some effect we gather its cause, or when it is inferred from some general proposition that some property is always present.

65 IV. (19.5) Lastly, there is the perception arising when a thing is perceived solely through its essence, or through the knowledge of its proximate cause.

66 [20] All these kinds of perception I will illustrate by examples.

(20.2) By hearsay I know the day of my birth, my parentage, and other matters about which I have never felt any doubt. 67 (20.3) By mere experience I know that I shall die, for this I can affirm from having seen that others like myself have died, though all did not live for the same period, or die by the same disease.

68 (20.4) I know by mere experience that oil has the property of feeding fire, and water of extinguishing it.

69 (20.5) In the same way I know that a dog is a barking animal, human a rational animal, and in fact nearly all the practical knowledge of life.

70 [21] We deduce one thing from another as follows: when we clearly perceive that we feel a certain body and no other, we thence clearly infer that the mind is united to the body, and that their union is the cause of the given sensation; but we cannot thence absolutely understand the nature of the sensation and the union. 71 (21.2) Or, after I have become acquainted with the nature of vision, and know that it has the property of making one and the same thing appear smaller when far off than when near, I can infer that the sun is larger than it appears, and can draw other conclusions of the same kind.

72 [22] Lastly, a thing may be perceived solely through its essence; when, from the fact of knowing something, I know what it is to know that thing, or when, from knowing the essence of the

mind, I know that it is united to the body.

73 (22.2) By the same kind of knowledge we know that two and three make five, or that two lines each parallel to a third, are parallel to one another. 74 (22.3) The things which I have been able to know by this kind of knowledge are as yet very few.

75 [23] In order that the whole matter may be put in a clearer light, I will make use of a single illustration as follows.

76 (23.2) Three numbers are given-- it is required to find a fourth, which shall be to the third as the second is to the first.

77 (23:3) Tradesmen will at once tell us that they know what is required to find the fourth number, for they have not yet forgotten the rule which was given to them arbitrarily without proof by their masters; 78 others construct a universal axiom from their experience with simple numbers, where the fourth number is self-evident, as in the case of 2, 4, 3, 6; here it is evident that if the second number be multiplied by the third, and the product divided by the first, the quotient is 6; 79 when they see that by this process the number is produced which they knew beforehand to be the proportional, they infer that the process always holds good for finding a fourth number proportional.

80 [24] Mathematicians, however, know by the proof of the nineteenth proposition of the seventh book of Euclid, what numbers are proportionals, namely, from the nature and property of proportion it follows that the product of the first and fourth will be equal to the product of the second and third: 81 still they do not see the adequate proportionality of the given numbers, or, if they do see it, they see it not by virtue of Euclid's proposition, but intuitively, without going through any process.

82 [25] In order that from these modes of perception the best may be selected, it is well that we should briefly enumerate the means necessary for attaining our end.

UNDERSTANDING

83 I. (25.2) To have an exact knowledge of our nature which we desire to perfect, and to know as much as is needful of Nature in general.

84 II. To collect in this way the differences, the agreements, and the oppositions of things.

III. To learn thus exactly how far they can or cannot be modified.

IV. To compare this result with the nature and power of human.

85 (25.3) We shall thus discern the highest degree of perfection to which human is capable of attaining.

86 [26] We shall then be in a position to see which mode of perception we ought to choose. 87 (26.2) As to the first mode, it is evident that from hearsay our knowledge must always be uncertain, and, moreover, can give us no insight into the essence of a thing, as is manifest in our illustration; 88 now one can only arrive at knowledge of a thing through knowledge of its essence, as will hereafter appear. 89 (26.3) We may, therefore clearly conclude that the certainty arising from hearsay cannot be scientific in its character. 90 (26.4) For simple hearsay cannot affect anyone whose understanding does not, so to speak, meet it half way.

91 [27] The second mode of perception cannot be said to give us the idea of the proportion of which we are in search.

92 (27.2) Moreover its results are very uncertain and indefinite, for we shall never discover anything in natural phenomena by its means, except accidental properties, which are never clearly understood, unless the essence of the things in question be known first. 93 (27.3) Wherefore this mode also must be rejected.

94 [28] Of the third mode of perception we may say in a manner that it gives us the idea of the thing sought, and that it us to draw conclusions without risk of error; yet it is not by itself sufficient to put us in possession of the perfection we aim at.

95 [29] The fourth mode alone apprehends the adequate essence of a thing without danger of error. 96 (29.2) This mode, therefore, must be the one which we chiefly employ. 97 (29.3) How, then,

should we avail ourselves of it so as to gain the fourth kind of knowledge with the least delay concerning things previously unknown? (29.4) I will proceed to explain.

98 [30] Now that we know what kind of knowledge is necessary for us, we must indicate the way and the method whereby we may gain the said knowledge concerning the things needful to be known.

99 (30.2) In order to accomplish this, we must first take care not to commit ourselves to a search, going back to infinity-- 100 that is, in order to discover the best method of finding truth, there is no need of another method to discover such method; nor of a third method for discovering the second, and so on to infinity. 101 (30.3) By such proceedings, we should never arrive at the knowledge of the truth, or, indeed, at any knowledge at all. 102 (30:4) The matter stands on the same footing as the making of material tools, which might be argued about in a similar way. 103 (30.5) For, in order to work iron, a hammer is needed, and the hammer cannot be forthcoming unless it has been made; but, in order to make it, there was need of another hammer and other tools, and so on to infinity.

104 (30.6) We might thus vainly endeavour to prove that humans have no power of working iron.

105 [31] But as humans at first made use of the instruments supplied by Nature to accomplish very easy pieces of workmanship, labouriously and imperfectly, and then, when these were finished, wrought other things more difficult with less labour and greater perfection; 106 and so gradually mounted from the simplest operations to the making of tools, and from the making of tools to the making of more complex tools, and fresh feats of workmanship, till they arrived at making, complicated mechanisms which they now possess. 107 (31:2) So, in like manner, the intellect, by its native strength, makes for itself intellectual instruments, whereby it acquires strength for performing other intellectual operations, 108 and from these operations again fresh instruments, or the power of

pushing its investigations further, and thus gradually proceeds till it reaches the summit of wisdom.

109 [32] That this is the path pursued by the understanding may be readily seen, when we understand the nature of the method for finding out the truth, 110 and of the natural instruments so necessary complex instruments, and for the progress of investigation. I thus proceed with my demonstration.

111 [33] A true idea, (for we possess a true idea) is something different from its correlate (ideatum); thus a circle is different from the idea of a circle. 112 (33.2) The idea of a circle is not something having a circumference and a center, as a circle has; nor is the idea of a body that body itself. 113 (33.3) Now, as it is something different from its correlate, it is capable of being understood through itself; 114 in other words, the idea, in so far as its actual essence (essentia formalis) is concerned, may be the subject of another subjective essence (essentia objectiva). 115 (33.4) And, again, this second subjective essence will, regarded in itself, be something real, capable of being understood; and so on, indefinitely.

116 [34] For instance, the man Peter is something real; the true idea of Peter is the reality of Peter represented subjectively, and is in itself something real, and quite distinct from the actual Peter. 117 (34.2) Now, as this true idea of Peter is in itself something real, and has its own individual existence, it will also be capable of being understood-- 118 that is, of being the subject of another idea, which will contain by representation (objective) all that the idea of Peter contains actually (formaliter). 119 (34.3) And, again, this idea of the idea of Peter has its own individuality, which may become the subject of yet another idea; and so on, indefinitely. 120 (34.4) This everyone may make trial of for oneself, by reflecting that you knows what Peter is, and also knows that you knows, and further knows that you knows that you knows. 121 (34:5) Hence it is plain that, in order to understand the actual Peter, it is not necessary

first to understand the idea of Peter, and still less the idea of the idea of Peter. 122 (34.6) This is the same as saying that, in order to know, there is no need to know that we know, much less to know that we know that we know. 123 (34.7) This is no more necessary than to know the nature of a circle before knowing the nature of a triangle. 124 (34.8) But, with these ideas, the contrary is the case: for, in order to know that I know, I must first know.

125 [35] Hence it is clear that certainty is nothing else than the subjective essence of a thing: in other words, the mode in which we perceive an actual reality is certainty. 126 (35.2) Further, it is also evident that, for the certitude of truth, no further sign is necessary beyond the possession of a true idea: for, as I have shown, it is not necessary to know that we know that we know. 127 (35.3) Hence, again, it is clear that no one can know the nature of the highest certainty, unless you possesses an adequate idea, or the subjective essence of a thing: certainty is identical with such subjective essence.

128 [36] Thus, as the truth needs no sign-- it being to possess the subjective essence of things, or, in other words, the ideas of them, in order that all doubts may be removed-- 129 it follows that the true method does not consist in seeking for the signs of truth after the acquisition of the idea, but that the true method teaches us the order in which we should seek for truth itself, or the subjective essences of things, or ideas, for all these expressions are synonymous.

130 [37] Again, method must necessarily be concerned with reasoning or understanding-- I mean, method is not identical with reasoning in the search for causes, still less is it the comprehension of the causes of things: 131 it is the discernment of a true idea, by distinguishing it from other perceptions, and by investigating its nature, in order that we may so train our mind that it may, by a given standard, comprehend whatsoever is intelligible, by laying down certain rules as aids,

and by avoiding useless mental exertion.

132 [38] Whence we may gather that method is nothing else than reflective knowledge, or the idea of an idea; and that as there can be no idea of an idea-- unless an idea exists previously,-- there can be no method without a pre-existent idea. 133 (38.2) Therefore, that will be a good method which shows us how the mind should be directed, according to the standard of the given true idea.

134 (38:3) Again, seeing that the ratio existing between two ideas the same as the ratio between the actual realities corresponding to those ideas, it follows that the reflective knowledge which has for its object the most perfect being is more excellent than reflective knowledge concerning other objects-- 135 in other words, that method will be most perfect which affords the standard of the given idea of the most perfect being whereby we may direct our mind.

136 [39] We thus easily understand how, in proportion as it acquires new ideas, the mind simultaneously acquires fresh instruments for pursuing its inquiries further. 137 (39.2) For we may gather from what has been said, that a true idea must necessarily first of all exist in us as a natural instrument; 138 and that when this idea is apprehended by the mind, it enables us to understand the difference existing between itself and all other perceptions. (39.3) In this, one part of the method consists.

139 (39:4) Now it is clear that the mind apprehends itself better in proportion as it understands a greater number of natural objects; 140 it follows, therefore, that this portion of the method will be more perfect in proportion as the mind attains to the comprehension of a greater number of objects, 141 and that it will be absolutely perfect when the mind gains a knowledge of the absolutely perfect being, or becomes conscious thereof.

142 [40] Again, the more things the mind knows, the better does it understand its own strength and the order of Nature; 143 by increased self-knowledge, it can direct itself more easily, and lay

down rules for its own guidance; and, by increased knowledge of Nature, it can more easily avoid what is useless. (40.2) And this is the sum total of method, as we have already stated.

144 [41] We may add that the idea in the world of thought is in the same case as its correlate in the world of reality. 145 (41.2) If, therefore, there be anything in Nature which is without connection with any other thing, and if we assign to it a subjective essence, which would in every way correspond to the objective reality, the subjective essence would have no connection, with any other ideas-- 146 in other words, we could not draw any conclusions with regard to it. 147 (41:3) On the other hand, those things which are connected with others-- as all things that exist in Nature-- will be understood by the mind, and their subjective essences will maintain the same mutual relations as their objective realities-- 148 that is to say, we shall infer from these ideas other ideas, which will in turn be connected with others, and thus our instruments for proceeding with our investigation will increase. (41.4) This is what we were endeavouring to prove.

149 [42] Further, from what has just been said-- namely, that an idea must, in all respects, correspond to its correlate in the world of reality,-- 150 it is evident that, in order to reproduce in every respect the faithful image of Nature, our mind must deduce all its ideas from the idea which represents the origin and source of the whole of Nature, so that it may itself become the source of other ideas.

151 [43] It may, perhaps, provoke astonishment that, after having said that the good method is that which teaches us to direct our mind according to the standard of the given true idea, we should prove our point by reasoning, which would seem to indicate that it is not self-evident. 152 (43.2) We may, therefore, be questioned as to the validity of our reasoning. (43.3) If our reasoning be sound, we must take as a starting-point a true idea. (43.4) Now, to be certain

that our starting-point is really a true idea, we need proof.

153 (43.5) This first course of reasoning must be supported by a second, the second by a third, and so on to infinity.

154 [44] To this I make answer that, if by some happy chance anyone had adopted this method in own investigations of Nature-- that is, if you had acquired new ideas in the proper order, according to the standard of the original true idea, you would never have doubted of the truth of your knowledge, 155 inasmuch as truth, as we have shown, makes itself manifest, and all things would flow, as it were, spontaneously towards you. 156 (44:2) But as this never, or rarely, happens, I have been forced so to arrange my proceedings, that we may acquire by reflection and forethought what we cannot acquire by chance, 157 and that it may at the same time appear that, for proving the truth, and for valid reasoning, we need no other means than the truth and valid reasoning themselves: for by valid reasoning I have established valid reasoning, and, in like measure, I seek still to establish it.

158 [45] Moreover, this is the order of thinking adopted by people in their inward meditations. (45.2) The reasons for its rare employment in investigations of Nature are to be found in current misconceptions, whereof we shall examine the causes hereafter in our philosophy.

159 (45.3) Moreover, it demands, as we shall show, a keen and accurate discernment.

(45.4) Lastly, it is hindered by the conditions of human life, which are, as we have already pointed out, extremely changeable.

160 (45.5) There are also other obstacles, which we will not here inquire into.

[46] If anyone asks why I have not at the starting-point set forth all the truths of Nature in their due order, inasmuch as truth is self-evident, I reply by warning you not to reject as false any paradoxes you may find here, 161 but to take the trouble to reflect on the chain of reasoning by which they are supported; you will then be no longer in doubt that we have

attained to the truth. (46.2) This is why I have as above.

162 [47] If there yet remains some sceptic, who doubts of our primary truth, and of all deductions we make, taking such truth as our standard, you must either be arguing in bad faith, 163 or we must confess that there are people in complete mental blindness either innate or due to misconceptions-- that is, to some external influence. (47.2) Such persons are not conscious of themselves. 164 (47.3) If they affirm or doubt anything, they know not that they affirm or doubt: they say that they know nothing, and they say that they are ignorant of the very fact of their knowing nothing. 165 (47.4) Even this they do not affirm absolutely, they are afraid of confessing that they exist, so long as they know nothing; in fact, they ought to remain dumb, for fear of haply supposing which should smack of truth.

166 [48] Lastly, with such persons, one should not speak of sciences: for, in what relates to life and conduct, they are compelled by necessity to suppose that they exist, and seek their own advantage, and often affirm and deny, even with an oath. 167 (48.2) If they deny, grant, or gainsay, they know not that they deny, grant, or gainsay, so that they ought to be regarded as automata, utterly devoid of intelligence.

168 [49] Let us now return to our proposition. (49.2) Up to the present, we have, first, defined the end to which we desire to direct all our thoughts; 169 secondly, we have determined the mode of perception best adapted to aid us in attaining our perfection; 170 thirdly, we have discovered the way which our mind should take, in order to make a good beginning-- namely, that it should use every true idea as a standard in pursuing its inquiries according to fixed rules. 171 (49:3) Now, in order that it may thus proceed, our method must furnish us, first, with a means of distinguishing a true idea from all other perceptions, and enabling the mind to avoid the latter; 172 secondly, with rules for perceiving unknown things

according to the standard of the true idea; 173 thirdly, with an order which enables us to avoid useless labour. 174 (49:4) When we became acquainted with this method, we saw that, fourthly, it would be perfect when we had attained to the idea of the absolutely perfect Being. 175 (49.5) This is an observation which should be made at the outset, in order that we may arrive at the knowledge of such a being more quickly.

176 [50] Let us then make a beginning with the first part of the method, which is, as we have said, to distinguish and separate the true idea from other perceptions, and to keep the mind from confusing with true ideas those which are false, fictitious, and doubtful. 177 (50.2) I intend to dwell on this point at length, partly to keep a distinction so necessary before the reader's mind, and also because there are some who doubt of true ideas, through not having attended to the distinction between a true perception and all others. 178 (50.3) Such persons are like people who, while they are awake, doubt not that they are awake, but afterwards in a dream, as often happens, thinking that they are surely awake, and then finding that they were in error, become doubtful even of being awake. 179 (50.4) This state of mind arises through neglect of the distinction between sleeping and waking.

180 [51] Meanwhile, I give warning that I shall not here give essence of every perception, and explain it through its proximate cause. (51.2) Such work lies in the province of philosophy. 181 (51.3) I shall confine myself to what concerns method-- that is, to the character of fictitious, false and doubtful perceptions, and the means of freeing ourselves therefrom. (51.4) Let us then first inquire into the nature of a fictitious idea.

182 [52] Every perception has for its object either a thing considered as existing, or solely the essence of a thing. (52.2) Now "fiction" is chiefly occupied with things considered as existing. 183 (52.3) I will, therefore, consider these first-- I mean cases where only the existence of an object is feigned,

and the thing thus feigned is understood, or assumed to be understood. 184 (52.4) For instance, I feign that Peter, whom I know to have gone home, is gone to see me, or something of that kind. (52.5) With what is such an idea concerned? (52.6) It is concerned with things possible, and not with things necessary or impossible.

185 [53] I call a thing impossible when its existence would imply a contradiction; necessary, when its non-existence would imply a contradiction; possible, when neither its existence nor its non-existence imply a contradiction, 186 but when the necessity or impossibility of its nature depends on causes unknown to us, while we feign that it exists. 187 (53.2) If the necessity or impossibility of its existence depending on external causes were known to us, we could not form any fictitious hypotheses about it;

188 [54] Whence it follows that if there be a God, or omniscient Being, such an one cannot form fictitious hypotheses. 189 (54.2) For, as regards ourselves, when I know that I exist, I cannot hypothesise that I exist or do not exist, any more than I can hypothesise an elephant that can go through the eye of a needle; nor when I know the nature of God, can I hypothesise that He or does not exist. 190 (54:3) The same thing must be said of the Chimaera, whereof the nature implies a contradiction. (54.4) From these considerations, it is plain, as I have already stated, that fiction cannot be concerned with eternal truths.

191 [55] But before proceeding further, I must remark, in passing, that the difference between the essence of one thing and the essence of another thing is the same as that which exists between the reality or existence of one thing and the reality or existence of another; 192 therefore, if we wished to conceive the existence, for example, of Adam, simply by means of existence in general, it would be the same as if, in order to conceive his existence, we went back to the nature of being, so as to define Adam as a being. 193 (55.2) Thus, the more existence is

conceived generally, the more is it conceived confusedly and the more easily can it be ascribed to a given object. 194 (55:3) Contrariwise, the more it is conceived particularly, the more is it understood clearly, and the less liable is it to be ascribed, through negligence of Nature's order, to anything save its proper object. (55.4) This is worthy of remark.

195 [56] We now proceed to consider those cases which are commonly called fictions, though we clearly understood that the thing is not as we imagine it. 196 (56.2) For instance, I know that the earth is round, but nothing prevents my telling people that it is a hemisphere, and that it is like a half apple carved in relief on a dish; or, that the sun moves round the earth, and so on. 197 (56:3) However, examination will show us that there is nothing here inconsistent with what has been said, provided we first admit that we may have made mistakes, and be now conscious of them; 198 and, further, that we can hypothesise, or at least suppose, that others are under the same mistake as ourselves, or can, like us, fall under it. 199 (56.4) We can, I repeat, thus hypothesise so long as we see no impossibility.

200 (56:5) Thus, when I tell anyone that the earth is not round, I merely recall the error which I perhaps made myself, or which I might have fallen into, and afterwards I hypothesise that the person to whom I tell it, is still, or may still fall under the same mistake. 201 (56.6) This I say, I can feign so long as I do not perceive any impossibility or necessity; if I truly understood either one or the other I should not be able to feign, and I should be reduced to saying that I had made the attempt.

202 [57] It remains for us to consider hypotheses made in problems, which sometimes involve impossibilities. 203 (57.2) For instance, when we say-- let us assume that this burning candle is not burning, or, let us assume that it burns in some imaginary space, or where there are no physical objects.

204 (57.3) Such assumptions are freely made, though the last is

clearly seen to be impossible. (57.4) But, though this be so, there is no fiction in the case. 205 (57:5) For, in the first case, I have merely recalled to memory, another candle not burning, or conceived the candle before me as without a flame, and then I understand as applying to the latter, leaving its flame out of the question, all that I think of the former. 206 (57.6) In the second case, I have merely to abstract my thoughts from the objects surrounding the candle, for the mind to devote itself to the contemplation of the candle singly looked at in itself only; 207 I can then draw the conclusion that the candle contains in itself no causes for its own destruction, so that if there were no physical objects the candle, and even the flame, would remain unchangeable, and so on. (57.7) Thus there is here no fiction, but, true and bare assertions.

208 [58] Let us now pass on to the fictions concerned with essences only, or with some reality or existence simultaneously. 209 (58.2) Of these we must specially observe that in proportion as the mind's understanding is smaller, and its experience multiplex, so will its power of coining fictions be larger, whereas as its understanding increases, its capacity for entertaining fictitious ideas becomes less. 210 (58:3) For instance, in the same way as we are unable, while we are thinking, to feign that we are thinking or not thinking, so, also, when we know the nature of body we cannot imagine an infinite fly; 211 or, when we know the nature of the soul, we cannot imagine it as square, though anything may be expressed verbally. 212 (58.4) But, as we said above, the less humans know of Nature the more easily can they coin fictitious ideas, 213 such as trees speaking, humans instantly changed into stones, or into fountains, ghosts appearing in mirrors, something issuing from nothing, even gods changed into beasts and humans and infinite other absurdities of the same kind.

214 [59] Some persons think, perhaps, that fiction is limited by fiction, and not by understanding; 215 in other words, after I have formed some fictitious idea, and

have affirmed of my own free-will that it exists under a certain form in Nature, I am thereby precluded from thinking of it under any other form. 216 (59.2) For instance, when I have feigned (to repeat their argument) that the nature of body is of a certain kind, and have of my own free-will desired to convince myself that it actually exists under this form, I am no longer able to hypothesise that a fly, for example, is infinite; 217 so, when I have hypothesised the essence of the soul, I am not able to think of it as square.

218 [60] But these arguments demand further inquiry. (60.2) First, their upholders must either grant or deny that we can understand anything. If they grant it, then necessarily the same must be said of understanding, as is said of fiction. 219 (60.3) If they deny it, let us, who know that we do know something, see what they mean. (60.4) They assert that the soul can be conscious of, and perceive in a variety of ways, not itself nor things which exist, but only things which are neither in itself nor anywhere else, 220 in other words, that the soul can, by its unaided power, create sensations or ideas unconnected with things. (60.5) In fact, they regard the soul as a sort of god.

221 (60:6) Further, they assert that we or our soul have such freedom that we can constrain ourselves, or our soul, or even our soul's freedom. 222 (60.7) For, after it has formed a fictitious idea, and has given its assent thereto, it cannot think or feign it in any other manner, but is constrained by the first fictitious idea to keep all its other thoughts in harmony therewith.

223 (60.8) Our opponents are thus driven to admit, in support of their fiction, the absurdities which I have just enumerated; and which are not worthy of rational refutation.

224 [61] While leaving such persons in their error, we will take care to derive from our argument with them a truth serviceable for our purpose, 225 namely, [61a] that the mind, in paying attention to a thing hypothetical or false, so as to meditate upon it and understand it, and derive the proper conclusions

in due order therefrom, will readily discover its falsity; 226 and if the thing hypothetical be in its nature true, and the mind pays attention to it, so as to understand it, and deduce the truths which are derivable from it, the mind will proceed with an uninterrupted series of apt conclusions; 227 in the same way as it would at once discover (as we showed just now) the absurdity of a false hypothesis, and of the conclusions drawn from it.

228 [62] We need, therefore, be in no fear of forming hypotheses, so long as we have a clear and distinct perception of what is involved. 229 (62.2) For, if we were to assert, haply, that humans are suddenly turned into beasts, the statement would be extremely general, so general that there would be no conception, that is, no idea or connection of subject and predicate, in our mind. 230 (62.3) If there were such a conception we should at the same time be aware of the means and the causes whereby the event took place. (62.4) Moreover, we pay no attention to the nature of the subject and the predicate.

231 [63] Now, if the first idea be not fictitious, and if all the other ideas be deduced therefrom, our hurry to form fictitious ideas will gradually subside. 232 (63.2) Further, as a fictitious idea cannot be clear and distinct, but is necessarily confused, and as all confusion arises from the fact that the mind has only partial knowledge of a thing either simple or complex, and does not distinguish between the known and the unknown, 233 and, again, that it directs its attention promiscuously to all parts of an object at once without making distinctions, it follows, first, that if the idea be of something very simple, it must necessarily be clear and distinct. 234 (63.3) For a very simple object cannot be known in part, it must either be known altogether or not at all.

235 [64] Secondly, it follows that if a complex object be divided by thought into a number of simple component parts, and if each be regarded separately, all confusion will disappear. 236 (64.2) Thirdly,

it follows that fiction cannot be simple, but is made up of the blending of several confused ideas of diverse objects or actions existent in Nature, or rather is composed of attention directed to all such ideas at once, [64b] and unaccompanied by any mental assent. 237 (64:3) Now a fiction that was simple would be clear and distinct, and therefore true, also a fiction composed only of distinct ideas would be clear and distinct, and therefore true. 238 (64.4) For instance, when we know the nature of the circle and the square, it is impossible for us to blend together these two figures, and to hypothesise a square circle, any more than a square soul, or things of that kind.

239 [65.1] Let us shortly come to our conclusion, and again repeat that we need have no fear of confusing with true ideas that which is only a fiction. 240 (65.2) As for the first sort of fiction of which we have already spoken, when a thing is clearly conceived, we saw that if the existence of a that thing is in itself an eternal truth fiction can have no part in it; 241 but if the existence of the conceived be not an eternal truth, we have only to be careful such existence be compared to the thing's essence, and to consider the order of Nature. 242 (64:3) As for the second sort of fiction, which we stated to be the result of simultaneously directing the attention, without the assent of the intellect, to different confused ideas representing different things and actions existing in Nature, 243 we have seen that an absolutely simple thing cannot be feigned, but must be understood, and that a complex thing is in the same case if we regard separately the simple parts whereof it is composed; 244 we shall not even be able to hypothesise any untrue action concerning such objects, for we shall be obliged to consider at the same time the causes and manner of such action.

245 [66] These matters being thus understood, let us pass on to consider the false idea, observing the objects with which it is concerned, and the means of guarding ourselves from falling into false perceptions. 246 (66.2)

Neither of these tasks will present much difficulty, after our inquiry concerning fictitious ideas. (66.3) The false idea only differs from the fictitious idea in the fact of implying a mental assent-- 247 that is, as we have already remarked, while the representations are occurring, there are no causes present to us, wherefrom, as in fiction, we can conclude that such representations do not arise from external objects: in fact, it is much the same as dreaming with our eyes open, or while awake. 248 (67:4) Thus, a false idea is concerned with, or (to speak more correctly) is attributable to, the existence of a thing whereof the essence is known, or the essence itself, in the same way as a fictitious idea.

249 [67] If attributable to the existence of the thing, it is corrected in the same way as a fictitious idea under similar circumstances. (67.2) If attributable to the essence, it is likewise corrected in the same way as a fictitious idea. 250 (67:3) For if the nature of the thing known implies necessary existence, we cannot possible be in error with regard to its existence; 251 but if the nature of the thing be not an eternal truth, like its essence, but contrariwise the necessity or impossibility of its existence depends on external causes, then we must follow the same course as we adopted in the of fiction, for it is corrected in the same manner.

252 [68] As for false ideas concerned with essences, or even with actions, such perceptions are necessarily always confused, being compounded of different confused perceptions of things existing in Nature, 253 as, for instance, when people are persuaded that deities are present in woods, in statues, in brute beasts, and the like; that there are bodies which, by their composition alone, give rise to intellect; that corpses reason, walk about, and speak; that God is deceived, and so on. 254 (68:2) But ideas which are clear and distinct can never be false: for ideas of things clearly and distinctly conceived are either very simple themselves, or are compounded from very simple

ideas, that is, are deduced therefrom.

255 (68.3) The impossibility of a very simple idea being false is evident to everyone who understands the nature of truth or understanding and of falsehood.

256 [69] As regards that which constitutes the reality of truth, it is certain that a true idea is distinguished from a false one, not so much by its extrinsic object as by its intrinsic nature. 257 (69.2) If an architect conceives a building properly constructed, though such a building may never have existed, and may never exist, nevertheless the idea is true; and the idea remains the same, whether it be put into execution or not. 258 (69:3) On the other hand, if anyone asserts, for instance, that Peter exists, without knowing whether Peter really exists or not, the assertion, as far as its asserter is concerned, is false, or not true, even though Peter actually does exist. 259 (69.4) The assertion that Peter exists is true only with regard to you who knows for certain that Peter does exist.

260 [70] Whence it follows that there is in ideas something real, whereby the true are distinguished from the false. 261 (70.2) This reality must be inquired into, if we are to find the best standard of truth (we have said that we ought to determine our thoughts by the given standard of a true idea, and that method is reflective knowledge), and to know the properties of our understanding. 262 (70:3) Neither must we say that the difference between true and false arises from the fact, that true knowledge consists in knowing things through their primary causes, wherein it is totally different from false knowledge, as I have just explained it: 263 for thought is said to be true, if it involves subjectively the essence of any principle which has no cause, and is known through itself and in itself.

264 [71] Wherefore the reality (forma) of true thought must exist in the thought itself, without reference to other thoughts; it does not acknowledge the object as its cause, but must depend on the actual power and nature of the

understanding. 265 (71.2) For, if we suppose that the understanding has perceived some new entity which has never existed, as some conceive the understanding of God before He created thing 266 (a perception which certainly could not arise any object), and has legitimately deduced other thoughts from said perception, all such thoughts would be true, without being determined by any external object; they would depend solely on the power and nature of the understanding. 267 (71:3) Thus, that which constitutes the reality of a true thought must be sought in the thought itself, and deduced from the nature of the understanding.

268 [72] In order to pursue our investigation, let us confront ourselves with some true idea, whose object we know for certain to be dependent on our power of thinking, and to have nothing corresponding to it in Nature. 269 (72.2) With an idea of this kind before us, we shall, as appears from what has just been said, be more easily able to carry on the research we have in view. 270 (72:3) For instance, in order to form the conception of a sphere, I invent a cause at my pleasure-- namely, a semicircle revolving round its center, and thus producing a sphere. 271 (72.4) This is indisputably a true idea; and, although we know that no sphere in Nature has ever actually been so formed, the perception remains true, and is the easiest manner of conceiving a sphere. 272 (72:5) We must observe that this perception asserts the rotation of a semicircle-- which assertion would be false, if it were not associated with the conception of a sphere, or of a cause determining a motion of the kind, or absolutely, if the assertion were isolated. 273 (72.6) The mind would then only tend to the affirmation of the sole motion of a semicircle, which is not contained in the conception of a semicircle, and does not arise from the conception of any cause capable of producing such motion. 274 (72:7) Thus falsity consists only in this, that something is affirmed of a thing, which is not contained in the conception we have formed of that thing, as

motion or rest of a semicircle. 275 (72.8) Whence it follows that simple ideas cannot be other than true-- e.g., the simple idea of a semicircle, of motion, of rest, of quantity.

276 (72:9) Whatsoever affirmation such ideas contain is equal to the concept formed, and does not extend further. (72.10) Wherefore we form as many simple ideas as we please, without any fear of error.

277 [73] It only remains for us to inquire by what power our mind can form true ideas, and how far such power extends. (73.2) It is certain that such power cannot extend itself infinitely. 278 (73.3) For when we affirm somewhat of a thing, which is not contained in the concept we have formed of that thing, such an affirmation shows a defect of our perception, or that we have formed fragmentary or mutilated ideas. 279 (73.4) Thus we have seen that the notion of a semicircle is false when it is isolated in the mind, but true when it is associated with the concept of a sphere, or of some cause determining such a motion. 280 (73:5) But if it be the nature of a thinking being, as seems, prima facie, to be the case, to form true or adequate thoughts, it is plain that inadequate ideas arise in us only because we are parts of a thinking being, whose thoughts-- some in their entirety, others in fragments only-- constitute our mind.

281 [74] But there is another point to be considered, which was not worth raising in the case of fiction, but which give rise to complete deception-- namely, that certain things presented to the imagination also exist in the understanding-- in other words, are conceived clearly and distinctly. 282 (74.2) Hence, so long as we do not separate that which is distinct from that which is confused, certainty, or the true idea, becomes mixed with indistinct ideas. 283 (74.3) For instance, certain Stoics heard, perhaps, the term "soul," and also that the soul is immortal, yet imagined it only confusedly; they imaged, also, and understood that very subtle bodies penetrate all others, and are penetrated by none. 284 (74:4) By combining these

ideas, and being at the same time certain of the truth of the axiom, they forthwith became convinced that the mind consists of very subtle bodies; that these very subtle bodies cannot be divided.

285 [75] But we are freed from mistakes of this kind, so long as we endeavour to examine all our perceptions by the standard of the given true idea. 286 (75.2) We must take care, as has been said, to separate such perceptions from all those which arise from hearsay or unclassified experience. 287 (75.3) Moreover, such mistakes arise from things being conceived too much in the abstract; for it is sufficiently self-evident that what I conceive as in its true object I cannot apply to anything else.

288 (75:4) Lastly, they arise from a want of understanding of the primary elements of Nature as a whole; 289 whence we proceed without due order, and confound Nature with abstract rules, which, although they be true enough in their sphere, yet, when misapplied, confound themselves, and pervert the order of Nature. 290 (75.5) However, if we proceed with as little abstraction as possible, and begin from primary elements-- that is, from the source and origin of Nature, as far back as we can reach,-- we need not fear any deceptions of this kind.

291 [76] As far as the knowledge of the origin of Nature is concerned, there is no danger of our confounding it with abstractions. 292 (76.2) For when a thing is conceived in the abstract, as are all universal notions, the said universal notions are always more extensive in the mind than the number of individuals forming their contents really existing in Nature.

293 (76.3) Again, there are many things in Nature, the difference between which is so slight as to be hardly perceptible to the understanding; so that it may readily happen that such things are confounded together, if they be conceived abstractedly. 294 (76.4) But since the first principle of Nature cannot (as we shall see hereafter) be conceived abstractedly or universally, and cannot extend further in the understanding than it does in

reality, and has no likeness to mutable things, 295 no confusion need be feared in respect to the idea of it, provided (as before shown) that we possess a standard of truth. 296 (76.5) This is, in fact, a being single and infinite; in other words, it is the sum total of being, beyond which there is no being found.

297 [77] Thus far we have treated of the false idea. We have now to investigate the doubtful idea-- that is, to inquire what can cause us to doubt, and how doubt may be removed. 298 (77.2) I speak of real doubt existing in the mind, not of such doubt as we see exemplified when a person says that one doubts, though your mind does not really hesitate. 299 (77:3) The cure of the latter does not fall within the province of method, it belongs rather to inquiries concerning obstinacy and its cure.

300 [78] Real doubt is never produced in the mind by the thing doubted of. 301 (78.2) In other words, if there were only one idea in the mind, whether that idea were true or false, there would be no doubt or certainty present, only a certain sensation. 302 (78.3) For an idea is in itself nothing else than a certain sensation. 303 (78.4) But doubt will arise through another idea, not clear and distinct enough for us to be able to draw any certain conclusions with regard to the matter under consideration; that is, the idea which causes us to doubt is not clear and distinct. 304 (78.5) To take an example. (78:6) Supposing that a person has never reflected, taught by experience or by any other means, that our senses sometimes deceive us, you will never doubt whether the sun be greater or less than it appears. 305 (78.7) Thus rustics are generally astonished when they hear that the sun is much larger than the earth. (78.8) But from reflection on the deceitfulness of the senses [78a] doubt arises, 306 and if, after doubting, we acquire a true knowledge of the senses, and how things at a distance are represented through their instrumentality, doubt is again removed.

307 [79] Hence we cannot cast doubt on true ideas by the supposition that there is a deceitful

Deity, who leads us astray even in what is most certain. 308 (79.2) We can only hold such an hypothesis so long as we have no clear and distinct idea-- in other words, until we reflect the knowledge which we have of the first principle of all things, and find that which teaches us that God is not a deceiver, 309 and until we know this with the same certainty as we know from reflecting on the are equal to two right angles. 310 (79.3) But if we have a knowledge of God equal to that which we have of a triangle, all doubt is removed. 311 (79:4) In the same way as we can arrive at the said knowledge of a triangle, though not absolutely sure that there is not some arch-deceiver leading us astray, so can we come to a like knowledge of God under the like condition, 312 and when we have attained to it, it is sufficient, as I said before, to remove every doubt which we can possess concerning clear and distinct ideas.

313 [80] Thus, if a person proceeded with our investigations in due order, inquiring first into those things which should first be inquired into, never passing over a link in the chain of association, and with knowledge how to define your questions before seeking to answer them, 314 you will never have any ideas save such as are very certain, or, in other words, clear and distinct; 315 for doubt is only a suspension of the spirit concerning some affirmation or negation which it would pronounce upon unhesitatingly if it were not in ignorance of something, without which the knowledge of the matter in hand must needs be imperfect. 316 (80.2) We may, therefore, conclude that doubt always proceeds from want of due order in investigation.

317 [81] These are the points I promised to discuss in the first part of my treatise on method. (81.2) However, in order not to omit anything which can conduce to the knowledge of the understanding and its faculties, I will add a few words on the subject of memory and forgetfulness. 318 (81:3) The point most worthy of attention is, that memory is strengthened both with and without the aid of the

understanding. 319 (81.4) For the more intelligible a thing is, the more easily is it remembered, and the less intelligible it is, the more easily do we forget it. 320 (81.5) For instance, a number of unconnected words is much more difficult to remember than the same number in the form of a narration.

321 [82] The memory is also strengthened without the aid of the understanding by means of the power wherewith the imagination or the sense called common, is affected by some particular physical object. 322 (82.2) I say particular, for the imagination is only affected by particular objects. 323 (82.3) If we read, for instance, a single romantic comedy, we shall remember it very well, so long as we do not read many others of the same kind, for it will reign alone in the memory 324 (82.4) If, however, we read several others of the same kind, we shall think of them altogether, and easily confuse one with another. 325 (82:5) I say also, physical. (82.6) For the imagination is only affected by physical objects. 326 (82.7) As, then, the memory is strengthened both with and without the aid of the understanding, we may conclude that it is different from the understanding, and that in the latter considered in itself there is neither memory nor forgetfulness.

327 [83] What, then, is memory? (83.2) It is nothing else than the actual sensation of impressions on the brain, accompanied with the thought of a definite duration, [83d] of the sensation. 328 (83.3) This is also shown by reminiscence. (83.4) For then we think of the sensation, but without the notion of continuous duration; thus the idea of that sensation is not the actual duration of the sensation or actual memory. 329 (83:5) Whether ideas are or are not subject to corruption will be seen in philosophy. 330 (83.6) If this seems too absurd to anyone, it will be sufficient for our purpose, if you reflect on the fact that a thing is more easily remembered in proportion to its singularity, as appears from the example of the comedy just cited. 331 (83:7) Further, a thing is remembered

more easily in proportion to its intelligibility; therefore we cannot help remember that which is extremely singular and sufficiently intelligible.

332 [84] Thus, then, we have distinguished between a true idea and other perceptions, and shown that ideas fictitious, false, and the rest, originate in the imagination-- 333 that is, in certain sensations fortuitous (so to speak) and disconnected, arising not from the power of the mind, but from external causes, according as the body, sleeping or waking, receives various motions.

334 (84.2) But one may take any view one likes of the imagination so long as one acknowledges that it is different from the understanding, and that the soul is passive with regard to it. 335 (84.3) The view taken is immaterial, if we know that the imagination is something indefinite, with regard to which the soul is passive, and that we can by some means or other free ourselves therefrom with the help of the understanding. 336 (84.4) Let no one then be astonished that before proving the existence of body, and other necessary things, I speak of imagination of body, and of its composition. 337 (84.5) The view taken is, I repeat, immaterial, so long as we know that imagination is something indefinite.

338 [85] As regards as a true idea, we have shown that it is simple or compounded of simple ideas; that it shows how and why something is or has been made; and that its subjective effects in the soul correspond to the actual reality of its object. 339 (85.2) This conclusion is identical with the saying of the ancients, that true proceeds from cause to effect; 340 though the ancients, so far as I know, never formed the conception put forward here that the soul acts according to fixed laws, and is as it were an immaterial automaton.

341 [86] Hence, as far as is possible at the outset, we have acquired a knowledge of our understanding, and such a standard of a true idea that we need no longer fear confounding truth with falsehood and fiction. 342 (86.2) Neither shall we wonder why we

understand some things which in nowise fall within the scope of the imagination, while other things are in the imagination but wholly opposed to the understanding, or others, again, which agree therewith. 343 (86.3) We now know that the operations, whereby the effects of imagination are produced, take place under other laws quite different from the laws of the understanding, and that the mind is entirely passive with regard to them.

344 [87] Whence we may also see how easily humans may fall into grave errors through not distinguishing accurately between the imagination and the understanding; 345 such as believing that extension must be localised, that it must be finite, that its parts are really distinct one from the other, that it is the primary and single foundation of all things, that it occupies more space at one time than at another and other similar doctrines, all entirely opposed to truth, as we shall duly show.

346 [88] Again, since words are a part of the imagination-- that is, since we form many conceptions in accordance with confused arrangements of words in the memory, dependent on particular bodily conditions,-- 347 there is no doubt that words may, equally with the imagination, be the cause of many and great errors, unless we strictly on our guard.

348 [89] Moreover, words are formed according to popular fancy and intelligence, and are, therefore, signs of things as existing in the imagination, not as existing in the understanding. 349 (89.2) This is evident from the fact that to all such things as exist only in the understanding, not in the imagination, negative names are often given, such as incorporeal, infinite. 350 (89.3) So, also, many conceptions really affirmative are expressed negatively, and vice versa, such as uncreate, independent, infinite, immortal, inasmuch as their contraries are much more easily imagined, and, therefore, occurred first to humans, and usurped positive names. 351 (89:4) Many things we affirm and deny, because the nature of words allows us to do so,

though the nature of things does not. (89.5) While we remain unaware of this fact, we may easily mistake falsehood for truth.

352 [90] Let us also beware of another great cause of confusion, which prevents the understanding from reflecting on itself. 353 (90.2) Sometimes, while making no distinction between the imagination and the intellect, we think that what we more readily imagine is clearer to us; and also we think that what we imagine we understand. 354 (90.3) Thus, we put first that which should be last: the true order of progression is reversed, and no legitimate conclusion is drawn.

355 [91] Now, in order at length to pass on to the second part of this method, I shall first set forth the object aimed at, and next the means for its attainment. 356 (91.2) The object aimed at is the acquisition of clear and distinct ideas, such as are produced by the pure intellect, and not by chance physical motions. 357 (91.3) In order that all ideas may be reduced to unity, we shall endeavour so to associate and arrange them that our mind may, as far as possible, reflect subjectively the reality of Nature, both as a whole and as parts.

358 [92] As for the first point, it is necessary (as we have said) for our purpose that everything should be conceived, either solely through its essence, or through its proximate cause. 359 (92.2) If the thing be self-existent, or, as is commonly said, the cause of itself, it must be understood through its essence only; 360 if it be not self-existent, but requires a cause for its existence, it must be understood through its proximate cause. 361 (92.3) For, in reality, the knowledge, of an effect is nothing else than the acquisition of more perfect knowledge of its cause.

362 [93] Therefore, we may never, while we are concerned with inquiries into actual things, draw any conclusion from abstractions; we shall be extremely careful not to confound that which is only in the understanding with that which is in the thing itself. 363 (93.2) The best basis for drawing a conclusion will be either some particular affirmative essence, or a true and

legitimate definition. 364 (93:3) For the understanding cannot descend from universal axioms by themselves to particular things, since axioms are of infinite extent, and do not determine the understanding to contemplate one particular thing more than another. 365 [94] Thus the true method of discovery is to form thoughts from some given definition. (94.2) This process will be the more fruitful and easy in proportion as the thing given be better defined. 366 (94.3) Wherefore, the cardinal point of all this second part of method consists in the knowledge of the conditions of good definition, and the means of finding them. 367 (94.4) I will first treat of the conditions of definition.

[95] A definition, if it is to be called perfect, must explain the inmost essence of a thing, and must take care not to substitute for this any of its properties. 368 (95.2) In order to illustrate my meaning, without taking an example which would seem to show a desire to expose other people's errors, I will choose the case of something abstract, the definition of which is of little moment. 369 (95:3) Such is a circle. (95.4) If a circle be defined as a figure, such that all straight lines drawn from the center to the circumference are equal, every one can see that such a definition does not in the least explain the essence of a circle, but solely one of its properties. 370 (95.5) Though, as I have said, this is of no importance in the case of figures and other abstractions, it is of great importance in the case of physical beings and realities: for the properties of things are not understood so long as their essences are unknown. 371 (95.6) If the latter be passed over, there is necessarily a perversion of the succession of ideas which should reflect the succession of Nature, and we go far astray from our object.

372 [96] In order to be free from this fault, the following rules should be observed in definition:--

I. (1) If the thing in question be created, the definition must (as we have said) comprehend the proximate cause.

373 (2) For instance, a circle should, according to this rule, be

defined as follows: the figure described by any line whereof one end is fixed and the other free.

(3) This definition clearly comprehends the proximate cause.

374 II. (4) A conception or definition of a thing should be such that all the properties of that thing, in so far as it is considered by itself, and not in conjunction with other things, can be deduced from it, as may be seen in the definition given of a circle: 375 for from that it clearly follows that all straight lines drawn from the center to the circumference are equal.

376 (5) That this is a necessary characteristic of a definition is so clear to anyone, who reflects on the matter, that there is no need to spend time in proving it, or in showing that, owing to this second condition, every definition should be affirmative.

377 (6) I speak of intellectual affirmation, giving little thought to verbal affirmations which, owing to the poverty of language, must sometimes, perhaps, be expressed negatively, though the idea contained is affirmative.

378 [97] The rules for the definition of an uncreated thing are as follows:--

I. The exclusion of all idea of cause-- that is, the thing must not need explanation by Anything outside itself.

379 II. When the definition of the thing has been given, there must be no room for doubt as to whether the thing exists or not.

380 III. It must contain, as far as the mind is concerned, no substantives which could be put into an adjectival form; in other words, the object defined must not be explained through abstractions.

381 IV. Lastly, though this is not absolutely necessary, it should be possible to deduce from the definition all the properties of the thing defined. All these rules become obvious to anyone giving strict attention to the matter.

382 [98] I have also stated that the best basis for drawing a conclusion is a particular affirmative essence. (98.2) The more specialised the idea is, the more it is distinct, and therefore clear. 383 (98.3) Wherefore a knowledge of

particular things should be sought for as diligently as possible.

384 [99] As regards the order of our perceptions, and the manner in which they should be arranged and united, it is necessary that, as soon as is possible and rational, we should inquire whether there be any being (and, if so, what being), that is the cause of all things, 385 so that its essence, represented in thought, may be the cause of all our ideas, and then our mind will to the utmost possible extent reflect Nature. (99.2) For it will possess, subjectively, Nature's essence, order, and union. 386 (99.3) Thus we can see that it is before all things necessary for us to deduce all our ideas from physical things-- 387 that is, from real entities, proceeding, as far as may be, according to the series of causes, from one real entity to another real entity, never passing to universals and abstractions, either for the purpose of deducing some real entity from them, or deducing them from some real entity. 388 (99.4) Either of these processes interrupts the true progress of the understanding.

389 [100] But it must be observed that, by the series of causes and real entities, I do not here mean the series of particular and mutable things, but only the series of fixed and eternal things. 390 (100.2) It would be impossible for human infirmity to follow up the series of particular mutable things, both on account their multitude, surpassing all calculation, 391 and on account of the infinitely diverse circumstances surrounding one and the same thing, any one of which may be the cause of its existence or non-existence. 392 (100.3) Indeed, their existence has no connection with their essence, or (as we have said already) is not an eternal truth.

393 [101] Neither is there any need that we should understand their series, for the essences of particular mutable things are not to be gathered from their series or order of existence, 394 which would furnish us with nothing beyond their extrinsic denominations, their relations, or, at most, their circumstances, all of which are very different from their inmost essence. 395 (101:2) This

inmost essence must be sought solely from fixed and eternal things, and from the laws, inscribed (so to speak) in those things as in their true codes, according to which all particular things take place and are arranged; 396 nay, these mutable particular things depend so intimately and essentially (so to phrase it) upon the fixed things, that they cannot either be conceived without them.

397 [102] But, though this be so, there seems to be no small difficulty in arriving at the knowledge of these particular things, for to conceive them all at once would far surpass the powers of the human understanding. 398 (102.2) The arrangement whereby one thing is understood, before another, as we have stated, should not be sought from their series of existence, nor from eternal things. 399 (102.3) For the latter are all by nature simultaneous. (4) Other aids are therefore needed besides those employed for understanding eternal things and their laws. 400 (102.5) However, this is not the place to recount such aids, nor is there any need to do so, until we have acquired a sufficient knowledge of eternal things and their infallible laws, and until the nature of our senses has become plain to us.

401 [103] Before betaking ourselves to seek knowledge of particular things, it will be seasonable to speak of such aids, as all tend to teach us the mode of employing our senses, and to make certain experiments under fixed rules and arrangements which may suffice to determine the object of our inquiry, 402 so that we may therefrom infer what laws of eternal things it has been produced under, and may gain an insight into its inmost nature, as I will duly show. 403 (103.2) Here, to return to my purpose, I will only endeavour to set forth what seems necessary for enabling us to attain to knowledge of eternal things, and to define them under the conditions laid down above.

404 [104] With this end, we must bear in mind what has already been stated, namely, that when the mind devotes itself to any thought, so as to examine it, and to deduce therefrom in due order all the

legitimate conclusions possible, any falsehood which may lurk in the thought will be detected; 405 but if the thought be true, the mind will readily proceed without interruption to deduce truths from it. (104:2) This, I say, is necessary for our purpose, for our thoughts may be brought to a close by the absence of a foundation.

406 [105] If, therefore, we wish to investigate the first thing of all, it will be necessary to supply some foundation which may direct our thoughts thither. 407 (105.2) Further, since method is reflective knowledge, the foundation which must direct our thoughts can be nothing else than the knowledge of that which constitutes the reality of truth, and the knowledge of the understanding, its properties, and powers. 408 (105.3) When this has been acquired we shall possess a foundation wherefrom we can deduce our thoughts, and a path whereby the intellect, according to its capacity, may attain the knowledge of eternal things, allowance being made for the extent of the intellectual powers.

409 [106] If, as I stated in the first part, it belongs to the nature of thought to form true ideas, we must here inquire what is meant by the faculties and power of the understanding. 410 (106.2) The chief part of our method is to understand as well as possible the powers of the intellect, and its nature; 411 we are, therefore, compelled (by the considerations advanced in the second part of the method) necessarily to draw these conclusions from the definition itself of thought and understanding.

412 [107] But, so far as we have not got any rules for finding definitions, and, as we cannot set forth such rules without a previous knowledge of Nature, that is without a definition of the understanding and its power, 413 it follows either that the definition of the understanding must be clear in itself, or that we can understand nothing. 414 (107.2) Nevertheless this definition is not absolutely clear in itself; however, since its properties, like all things that we possess through the understanding, cannot be known clearly and

distinctly, unless its nature be known previously, understanding makes itself manifest, if we pay attention to its properties, which we know clearly and distinctly. 415 (107.3) Let us, then, enumerate here the properties of the understanding, let us examine them, and begin by discussing the instruments for research which we find innate in us.

416 [108] The properties of the understanding which I have chiefly remarked, and which I clearly understand, are the following:--

I. (108.2) It involves certainty-- in other words, it knows that a thing exists in reality as it is reflected subjectively.

417 II. (108:3) That it perceives certain things, or forms some ideas absolutely, some ideas from others. 418 (108.4) Thus it forms the idea of quantity absolutely, without reference to any other thoughts; but ideas of motion it only forms after taking into consideration the idea of quantity.

419 III. (108:5) Those ideas which the understanding forms absolutely express infinity; determinate ideas are derived from other ideas. 420 (108.6) Thus in the idea of quantity, perceived by means of a cause, the quantity is determined, as when a body is perceived to be formed by the motion of a plane, a plane by the motion of a line, or, again, a line by the motion of a point. 421 (108.7) All these are perceptions which do not serve towards understanding quantity, but only towards determining it. 422 (108:8) This is proved by the fact that we conceive them as formed as it were by motion, yet this motion is not perceived unless the quantity be perceived also; 423 we can even prolong the motion to form an infinite line, which we certainly could not do unless we had an idea of infinite quantity.

424 IV. (108.9) The understanding forms positive ideas before forming negative ideas.

425 V. (108:10) It perceives things not so much under the condition of duration as under a certain form of eternity, and in an infinite number; 426 or rather in perceiving things it does not consider either their number or duration, whereas, in imagining them, it perceives them

in a determinate number, duration, and quantity.

427 VI. (108:11) The ideas which we form as clear and distinct, seem to follow from the sole necessity of our nature, that they appear to depend absolutely on our sole power; 428 with confused ideas the contrary is the case. (12) They are often formed against our will.

429 VII. (108:13) The mind can determine in many ways the ideas of things, which the understanding forms from other ideas: 430 thus, for instance, in order to define the plane of an ellipse, it supposes a point adhering to a cord to be moved around two centers, 431 or, again, it conceives an infinity of points, always in the same fixed relation to a given straight line, angle of the vertex of the cone, or in an infinity of other ways.

432 VIII. (108:14) The more ideas express perfection of any object, the more perfect are they themselves; for we do not admire the architect who has planned a chapel so much as the architect who has planned a splendid temple.

433 [109] I do not stop to consider the rest of what is referred to thought, such as love, joy. (109.2) They are nothing to our present purpose, and cannot even be conceived unless the understanding be perceived previously. (109.3) When perception is removed, all these go with it.

434 [110] False and fictitious ideas have nothing positive about them (as we have abundantly shown), which causes them to be called false or fictitious; they are only considered as such through the defectiveness of knowledge. 435 (110.2) Therefore, false and fictitious ideas as such can teach us nothing concerning the essence of thought; this must be sought from the positive properties just enumerated; 436 in other words, we must lay down some common basis from which these properties necessarily follow, so that when this is given, the properties are necessarily given also, and when it is removed, they too vanish with it.

The Book of Divine Panagogue called

SCEPTICS

DESIGN IN NATURE.

C. J. Ellicott

1 "All things are full of God," said the father of Greek philosophy. 2 "We have no need of the hypothesis of God," said a French astronomer. 3 It is with the latter saying, which is descriptive of the attitude of modern science at this time, that the present address will have to do. 4 Atheism no doubt exists; but far more common is the mode of thinking which would dispense with all questions about the Divine Nature in dealing with the world and its phenomena; 5 which considers that the introduction of the name of God into scientific research, complicates what is simple, obscures the rules of observation, introduces controversies that are useless to science, 6 restrains the free course of inductive reasoning by an apprehension of consequences, and entangles physical inquiry which leads to sure and clear results, with mental and with spiritual inquiry which have produced nothing but disputation. 7 Those who hold such views would think it unphilosophical to deny, just as they would regard it to affirm, the existence of God.

8 But the popular mind is not equal to nice distinctions; and it seems almost the same thing to most people to deny the existence of God as to exclude the thought of Him when exploring His creation.

9 I am not without hope that a few words delivered here upon "*the argument from design*," as it is called, may tend to diminish the growing estrangement between science and religion, and at the same time to revindicate for religion her legitimate share in matters of scientific interest.

10 I may undertake that the subject, however unworthily treated in other respects, shall be discussed without bitterness, and with a fitting respect for those who have done so much for physical science during the present generation.

11 It is necessary to sketch in a few sentences that field of creation with which the argument from design has to do. The world

presents to us four kingdoms or classes of facts. One of these, and the first in point of order, is the mineral kingdom. 12 A few so-called elements, as metals, earthy bases, and the like, acted upon by certain forces, known to us as gravitation, motion, heat, electricity, magnetism, chemical affinity, have formed the mountain and the valley, the wind and the clouds, the sea margin and the cave; 13 in a word, all the grand substructure on which the higher kingdoms are to take their places. 14 Modern science has discovered however, that these physico-chemical forces are interchangeable or convertible; that retarded motion turns to heat, as in the railway break, that heat generates electricity, and the electric current magnetises the iron round which it passes. 15 Not only this, but each force generates a certain equivalent of another-- so much and no more; and no force is lost, though a force may pass from an active to a potential state. 16 For example, two tuns of water are raised by evaporation from the sea, and one of them falls in rain in a valley drained by a river, 17 and in its downward motion back to the sea it will turn the water-wheel, lift the tilt-hammer, bear the barge swiftly in its current, leap over the rocky ledge a foaming cataract, 18 and in all these it is only sending back a portion of the force which was spent upon its evaporation; and the real source of all this work is, and must be, the sun's heat. 19 And ere the water rests again in the sea it will have accounted for the whole of the force, neither less nor more, that had operated upon it; part of it in friction on its bed and in consequent heat; part of it in tasks imposed by human skill. 20 The other tun of water shall fall into some land-locked tarn, high in the hills, where it cannot at once render back its force in work or duty, but the force is there, held in suspense or in reserve. 21 Water lifted from the sea level to the valley of the Engadine, a mile higher, has used much of the sun's heat; 22 it will restore that heat or some equivalent force, as soon as you make a way for it to the sea level again; and it will have parted with all the force, neither more nor less, which raised it to that height. 23 That forces are convertible, and

that whether converted or not they are conserved, so that nothing is lost, are propositions demonstrated. 24 It is not, I believe, demonstrated, but it is a probable supposition, that all forces are but one force manifested in different modes.

25 Then as to the material elements on which these forces work; the hydrogen, carbon, iron, lime, and the like, the name of elements must be held to mean no more than that they have not as yet been resolved into simpler substances. Of their ultimate composition we know nothing.

26 They may be so many modifications of an ultimate matter; but whether this ultimate matter exists, whether it be, as modern materialists tell us with such confidence, eternal and indestructible, 27 whether impenetrability be one of its properties, whether it be not a kind of polar opposite to the physico-chemical forces, and engendered with them, 28 so that in a different universe, with other forces at work, there must have been different elements, these are all questions of mere speculation, incapable of proof. 29 The physical enquirer has bound the self to consider only the facts which you can observe; and when you tells us that matter is eternal, and that therefore creation is impossible, you are deserting the ground where alone you are strong.

30 Bishop Berkeley's and Collier's denial that matter truly exists is quite as probable as this affirmation. But both alike are speculative guesses and not science.

31 There is a second kingdom to add to the first. The world is not a mere agglomeration of rocks and mountains, seas and lakes. Before the physical forces had completed their work, a new force had been added to them; that of life. 32 The bare rocks became clothed with living moss. In marshy places, warm and moist, a rich vegetation grew and decayed. 33 Along the slopes the interlacing roots of grasses detained the particles of soil which would otherwise have been washed down to some lower bed. 34 The vegetable world, with thousands of varieties, clothed and adorned the stony earth. 35 World's greatness in the present was taken

order for in those ages when her natural resource measures were formed out of the forests which grew rank and died in a climate different in all respects from that which forms the subject of our daily animadversion.

36 Third in order comes the Animal Kingdom. I do not attempt to define life, whether animal or vegetable, with exactness. Every one has failed in that attempt. 37 As a rough description of animal life, it may, perhaps, suffice to say that the living being is one endowed with sensation and spontaneous motion, of which each of the parts contributes something to the continuance of the whole, and is in turn preserved or defended by the whole. 38 If those who find fault with this, look for another definition in Dr. Whewell's comprehensive work, [1] they will find my excuse in the variety and the inadequacy of the definitions there collected. 39 The animal life spread out over the globe from the first is profuse, is beautiful and various. 40 The oolitic limestone and the white chalk are almost wholly made up of shells of Foraminifera. 41 On the river Columbia is a bed of clay 500 feet thick, which consists largely of the shells of Diatoms, if, indeed, these are to be ranked in the animal kingdom. 42 The shells of the Foraminifera, which can only be examined by the microscope, exhibit wonderful variety and beauty. 43 Still more remarkable in this respect are the Polycystina, whose shells, as figured in Mr. Ponton's book, recall censers and vases, jewelled crosses and stars, pendants and tripods, such as a London goldsmith would do well to reproduce. 44 Until the microscope was invented no eye can have explored this wonderful dust. The shells of both these humble tribes, the Foraminifera and Polycystina resemble the shells of other animals much higher in the scale of organisation; 45 but nearly as they are related in organisation to each other, the forms are very different, and each in itself presents a wonderful diversity of forms. In higher families of animals there are the same characters.

46 The globe teems with life in earth, and air, and water. If you

will permit me, so early in my argument, to speak of the Maker of them all, I will say that the creative power is inexhaustible in invention, both of useful and beautiful parts. 47 And in the ceaseless activity of these creatures, great and small, we recognise the physical happiness which accompanies so much life. 48 It is a chorus of thanksgiving and praise, from pool and jungle, from treetop and soft grass, from the creatures that revel in the life that God has given them.

49 In demanding the right to regard human as the fourth kingdom of Nature, I am aware that some may demur to the claim. 50 No doubt you must take rank in the kingdom of the animals, by reason of your identity with animals in all the vital functions. 51 Disparaging things have been said of your brain; and Moleschott has remarked, I think, that all its finest things are but modified phosphorus after all. "No phosphorus, no thinking!"

52 The slight projection on the outer margin of the ear has lately assumed portentous proportions. 53 The possession of that precious relic, which has turned up suddenly like the locket of the long lost child in a stimulating novel, proves our kinship to the Simian race, from some balder specimens of which we are supposed to have descended, and gives us a place on an unsuspected family tree. 54 But, after all that has been said by the naturalists to teach us humility, there do remain some facts, which entitle human to a separate place, to one at least of which the modern school have given greater prominence than before. 55 They are these. Human can control Nature. You can read Nature and understand it. You have a power of self-regulation, which we call conscience. And you can and does think much about God.

56 As to the power of human to control Nature, I prefer to employ the words of Mr. Wallace, one of the first to put forward what is called "the law of natural selection," who will not be suspected of claiming any transcendental place or privilege for human. 57 "With a naked and unprotected body," he says, human's intelligence "gave you

clothing against the varying inclemencies of the seasons. 58 Though unable to compete with the deer in swiftness, or with the wild bull in strength, it has given you weapons wherewith to capture and overcome both. 59 Though less capable than most other animals, of living on the herbs and the fruits which unaided Nature supplies, this wonderful faculty taught you to govern and direct Nature to your own benefit, and to make Her produce food for you when and where you pleased. 60 From the moment when the first skin was used as a covering, when the first rude spear was formed to assist in the chase, the first seed sown or root planted, a grand revolution was effected in Nature, 61 a revolution which in all the previous ages of the world had had no parallel, for a being had arisen who was no longer necessarily subject to change with the changing universe, 62 a being who was, in some degree, superior to Nature, inasmuch as you knew how to control and regulate Her action, and could keep yourself in harmony with Her, not by a change in body, but by an advance in mind. 63 Here, then, we see the true grandeur and dignity of human. On this view of your special attributes we may admit that even those who claim for you a position and an order a class or a sub-kingdom by yourself, have some reason on their side. 64 You are indeed a being apart, since you are not influenced by the great laws which irresistibly modify all other organic beings. 65 Nay, more, this victory which you have gained for yourself gives you a directing influence over other existences. 66 Human has not only escaped natural selection yourself, but you are actually able to take away some of that power from Nature which before your appearance She universally exercised. 67 We can anticipate the time when the earth will produce only cultivated plants and domestic animals; when human's selection shall have supplanted natural selection; and when the ocean will be the only domain in which that power can be exerted, which for countless cycles of ages ruled supreme over the earth."

68 Thus eloquently and forcibly speaks Mr. Wallace; and I do not

stop now to criticise the exaggeration of language which treats the law of natural selection as supreme ruler of the earth. 69 Let me say a few words next upon human's power to reflect on, and to understand Nature. For this was the second mark by which human was distinguished from the animal creation, with which you have so much in common.

70 Human alone is capable of an unselfish interest in the world around you; that is, an interest that does not bear immediately on your bodily wants. 71 How far you have carried this interest, let modern science bear witness. 72 The common feat of foretelling all the eclipses of sun and moon for a given year, is performed for our almanack yearly, without exciting surprise or gratitude. 73 Yet it means that human can so follow the heavenly bodies in their path, for years and years to come, for all the years that are gone, that you can tell, without fear of error, on what day the cone of shadow thrown by the sun-lighted earth into space, shall sweep over the face of the moon and blot out her light, completely or a little. 74 But this is an old triumph, hardly worth quoting, but for its aptness to impress all kinds of minds. 75 A clerk in one of our public offices, using only such leisure as official work allowed, has told us lately wonders about the composition of the sun; 76 and here in London, armed with a little instrument (the spectroscope), this distinguished man has been able to ascertain that in yonder photosphere the same elements are found which the chemist seeks and finds in the crust of our little earth. 77 What proofs can be more convincing of the fitness of human to play your part in the scene in which you are placed? 78 Your senses are adapted to the facts you are to observe; your eye to light, your ear to sonorous vibrations, your touch to resistance and to weight. But the naked organ soon falls short of your wishes. 79 And soon the microscope unfolds the beautiful forms of the Polycystina shells, the minute fibril of the muscle, and the components of the blood of life. 80 The telescope brings near the world of stars, and resolves the bright mist into clusters of distinct orbs. The balance weighs

quantities of matter too small for the touch to appreciate.

81 And lastly, the spectroscope takes the picture, so to speak, of chemical phenomena too distant to be realised by these means; 82 and so the composition of the heavenly bodies, about which the most sanguine observer twenty years ago would have admitted that we should never know anything firmer than conjecture, is already the subject of exact observation.

83 The names of Homer, Plato, and Shakspeare remind us how marvellously the world is imaged and reproduced in the minds of some great people, and of the share which we smaller people can take in their work by an admiring sympathy. 84 A production of art, whether literary, pictorial, or plastic, is a creation. 85 The things of Troy were not so touching nor so grand in their reality as they became in the form which the poet gave them. 86 Legend enters largely into the stories of Macbeth and Hamlet. The histories are shadowy, but the plays are substantial; they contain some touch of truth. 87 Old and young read them, and lend to the author all their feelings to work on as one will. 88 Weigh this fact well. It seems to me to show so plainly that human's constitution has been fitted by foresight and preparation for the place in earth that you was to fill.

89 Supposing that Moleschott was right in own startling aphorism, "Without phosphorus there is no thought," what a wonder are we forced to recognise here. 90 The rage of Achilles, the death of Socrates, the resolute wickedness of Lady Macbeth, the character of her husband, so weak in his crime, so grand in his remorse and ruin; 91 the refined and gentle Hamlet, forced by a preternatural command to assume the character of an avenger; to all these the presence of phosphorus in the brain is indispensable. 92 How comes so small a cause to work such grand effects. It is sufficiently wonderful to hear Joachim discourse eloquent music upon the simplest of instruments, a violin; 93 take away the violin and substitute a bit of wood; if the music still continues, what was before a wonderful exercise of skill is now miraculous. 94 If great thoughts

are but phosphorus burnt in the closed stove of a poet's brain, I am more ready than ever to admire that creative wisdom which could bring this out of that, which could so dispense with ordinary means in His highest productions. 95 But the aphorism is not true as it stands. I believe there is no free phosphorus in the brain. "Without lime, no thought; without oxygen, no thought; without water, no thought." 96 All these are true, and they import a well-known fact, that human who thinks is a creature in a material world, and that certain forms of matter are needful to your existence as an organised being.

97 "Two things are awful to me," said Kant, "the starry firmament and the sense of responsibility in human." 98 In his "Metaphysics of Ethics" he has treated this sense of responsibility with singular logical power. It is one of the marks that separate human from all other creatures. 99 No doubt this principle has allowed people to come to very wrong and absurd conclusions. 100 Because the savage practises cannibalism, and knows no rules of chastity but those which flow from the husband's right of property in the wife, it is inferred that the savage has no moral sense. 101 It would be as fair to infer that because England once traded in slaves, fought cocks, baited bulls, and oppressed the native races in India and her colonies, therefore there was no sense of right and wrong in England. 102 It is for the existence of the principle that I contend, and not for its perfect education and enlightenment. The principle is that something is right to will and to do, and something is not right. 103 The existence of the principle is proved if the poor savage of whom I spoke would consider own humanhood disgraced by fleeing, even for your life's sake, before the foe, or by suffering one cry to escape you under the tortures, wherewith your captors are doing you to death. 104 The education of this principle is a different matter; no one could say that even now your conscience was completely educated. 105 "So act that your principle of action would bear to be made a law for the whole world," is a noble maxim; but it requires knowledge and light, as

well as right intention. 106 If you twit us with the fact that humans have been cruel, impure, capricious, and absurd in their conduct, we answer that they had still a right and a wrong. 107 One who has the sense of sight may find the self compelled to live in some narrow cleft or ravine, where there is little to see, but the sense is there still.

108 The bathing-people at Pfeffers, with the earth closed almost over their heads, see little of the scenery of Switzerland: but they have eyes not the less. 109 We are claiming for humans now, not the fine sweep of moral prospect, but the moral sense of sight; and this is never wanting. 110 Upon this sense every artifice has been used to make it look like something else; for until it can be so transformed, it is a powerful witness for another world than this. 111 The commonest explanation is that it is only a principle of enlightened self-interest. Study it for yourself in the savage, in the little child; you will find that these two principles run on different lines.

112 The last mark of human, that distinguishes you from all animals is, that you believes in God. 113 One half the human race at this moment profess some creed in which God is the great first cause, the Creator and Governor of the world. 114 Of the other half, hardly any are quite without religion. "Obliged as I am," says M. Quatrefages, in words which I have had occasion to quote elsewhere, "even by my education, to pass in review the races of humans, 115 I have sought for atheism in the lowest and in the highest, but nowhere have I met with it, except in an individual, or at most in some school of people, more or less known, as we have seen in Europe in the last century, and as we see at the present day.

116 Everywhere and always the masses of the people have escaped it." But for my present argument it is not necessary to insist that a right belief in God prevails. There is a belief in God, and it cannot have come from experience or observation of visible facts. 117 You may lower the position of human, by comparing you to the apes, and by chemical analysis of your brain; all the more wonderful is it that a creature in such sorry

case should pretend to hold communion with the divine. 118 Your feet are in the earthy clay, but your head is lifted up towards heaven. Heir to a hundred maladies, the sport of a hundred passions, holding on this life, so chequered in its complexion, 119 but for a few days, this creature cries out of own trouble: "God exists; and He can see and hear me."

120 Human, if I have proved my position, stands quite alone at the head of the kingdoms of Nature, alone in your power of controlling it, alone in your appreciation of its beauty, alone in the self-government of conscience, 121 the first of all the creatures of God, to pronounce the name of Him who had made all things, in a world which for ages had been blind to its Maker, and thankless because blind.

122 Now it has become, and will probably continue to be, a question of the deepest interest to humankind, how these four kingdoms came into being. 123 And at present there is a tendency towards a theory purely material and mechanical. It is so in Germany, the country of Büchner, Vogt, and Moleschott; it is so in France, where Comte and Littré have written; it is so here in England, where it is needless to quote distinguished names. 124 I purpose, in the remainder of this lecture, to attempt an interpretation of the facts before us, quite different from this prevalent notion; 125 and also to show how vicious and how inadequate in a scientific point of view the system known as materialism appears to be.

126 The time is all too short for such a purpose: but any address like this can only aim to scatter germs of thought, not to present a system.

127 That the creation was gradual, appears alike from the account of the Bible and from scientific observation. 128 Matter and motion must have existed before the ball of earth was formed; and the physico-chemical forces must have been in full play when the first lichen clothed the rocks, or the first plants were formed in the sea. 129 The first appearance of life on the globe was a mighty step in creation, and from this point the

question of design becomes a very urgent one. 130 Observe: the plant world is a new world, with a series of wonders all its own. 131 There was nothing in the heat of the sun, nor in the earth's motion or magnetic currents, to give any promise or presage of the marvels of the forest.

132 Supposing that we admit that these were evolved by law, that is to say, that as a matter of fact plants only appeared where certain conditions of light and heat and moisture combined to favour them, and that wherever these conditions were combined they never failed to appear. 133 The question next arises whether matter and force evolved them from their own inherent nature, or force and matter were created with the intention to produce them, so that the plant was intended and prepared then when the other forces began to stir the formless void.

134 Is the plant world the accidental or necessary outcome of the forces that made the mineral world? Or must we say that it bears marks of design? 135 Here we must observe that it is a wider and richer world than that which preceded it: more full by far of forms of beauty and grace, each of them sustained by a vascular system of which the mineral world affords no parallel. 136 You stand before the gnarled and twisted oak that rises out of the feathering ferns; you never think that this giant of two centuries, endued with a certain power of self-protection against the storms of two hundred years, is an accidental product. 137 It is so grandly strong, so richly clothed with a myriad leaves, alike but yet in something different each from each. 138 The cattle count upon its friendly shade; the fowls of the air make it their resting-place. This a result of certain motions in the universe and certain properties of matter, not designed at all, foreseen by no eye? 139 To no one would such a thought naturally occur. The world, full in its first stage of marks of order and purpose, shows more of the same marks in its second and more complicated state. 140 The change that has taken place is not towards confusion and exhaustion from unforeseen defects in mechanism,

but a higher development. 141 The mineral kingdom was wonderful; that it should be able to clothe itself with a mantle of verdure, and pass into another kingdom much more complex, heightens the wonder. 142 But then comes the further change, the pouring out of animal life upon the globe. Was this too an inevitable consequence of physical forces? 143 All the animal creation teems with marks of purpose. Consider only some of the contrivances by which the fowls of the air are fitted for their peculiar life. 144 Describing a night of extreme coldness, the poet says: "The owl, for all her feathers, is a-cold."

145 That warm covering of the bird must be portable as well as warm; it weighs about an ounce and a half. 146 But the covering of birds would be useless to them if the showers to which they must be exposed were absorbed by the plumage, so that it became a heavy clinging mass. 147 An oily secretion makes it waterproof; we have all seen the duck free itself by one shake from every trace of its recent bath. 148 The heavy skeleton that befits pedestrian creatures, would disable the bird from flight; so it is provided with tubes of thin bone, surrounding a cavity filled with air. 149 Its pinions must be light as well as strong; observe how the light barbs of the feather have roughened edges so that they form one strong continuous surface, almost impervious to the air which they strike. 150 The air in the bones of birds and in other cavities of the body, heated too by an inner warmth much greater than that of human, contributes something to their buoyancy. 151 Their speed and endurance are enormous. It is said that the swallow's flight is ninety miles an hour. 152 One long stretch across the North Sea brings the sea-fowl from Norway to Flamborough Head; they rest for a short time after this flight, and pass inland, not the worse for their exploit. 153 You may infer from the beak of a bird its habits and its food. The bill of a woodpecker is a pointed tool, tipped with hardest horn, to break open the bark of the tree for insects. 154 The flat bill of the duck has plates of horn at the side; an excellent instrument for straining off the water and

retaining the food. 155 The bill of the snipe is long, and narrow, and sensitive, to pierce the marshy ground, and feel after its food. We might go on for hours multiplying such instances, and from every part of the field of creation.

156 Now, any mind in its natural state knows that in human works such adaptations could only proceed from contrivance, and is willing to regard these in the same way as proofs of design in creation. 157 The physicist has to tutor the self to a different view. All these things are evolutions, under pressure of circumstances, of the original forces of creation. 158 For example, out of certain birds tenanting marshy places, one has a somewhat larger beak, and this gives them an advantage in piercing the ground for food; 159 and so own share of food is larger, and own strength and courage greater, and have a freer choice of a mate; 160 and so the long beak grows longer in the next generation, and the grandson's beak is longer than the son's, from the same causes; and thus the law works, until in course of time there stands confessed a new species-- a perfect snipe. 161 Is the scientific theory better in this case than the popular? It is not. It does not account for the facts so well. 162 But is not our belief that God made the fowl of the air with fitting instruments for a peculiar life because He saw that it was good, and wished all portions of His varied earth to be the scene of the joy and energy of appropriate tenants, a mere hypothesis?

163 The worship of God is universal, and exists without any explicit opinion that He is the Creator, the first Cause. 164 Because you are able to conceive of Him, and are willing to accept Him as the Ruler of your will and conscience, He must exist. Does this seem too rapid an assumption? Consider the alternative. 165 If He exists not, the sound of worship has gone up from all lands in vain, and in vain have all good people consecrated their lives to an obedience to the law of duty. 166 Were such deceit felt to be possible, a darkness that might be felt would settle upon our spirits, and the hands would indeed hang down, and the feeble knees be paralysed, and a strict silence on

all moral subjects become us best. 167 But we must see with such eyes as God has given us; and scepticism about faith and conscience is perhaps as unprofitable as scepticism about touch and sight. 168 God exists then, it is assured to us by the common faith of humankind, by the highest law within ourselves. And as He exists, to Him, and to no other, must we assign the place of Creator. 169 There cannot be two Gods. I cannot give my conscience to one as its guide, and adore another for the wisdom of the universe. 170 God exists then, and His existence is not merely assumed in order to account for marks of design in Nature. 171 And we maintain that the easier supposition is also the truer. These marks of purpose are what they appear to be, tokens of the wisdom of God. 172 "Thou hast made heaven, the heaven of heavens with all their host, the earth and all things that are therein, the sea and all that is therein, and thou preservest them all."

173 If I were to venture to express in a few sentences the belief of a person of ordinary education upon this subject I should say that God alone is and can be the first cause of this universe, the mover of its motion, the giver of its life. 174 The wise purposes which shine forth for us in Nature, were in the mind of God from the first act of creation. 175 In saying that He has wrought by laws, we do not detract from His power; we seem rather to enhance it to our minds in attributing to Him constancy as well as wisdom. 176 A law is not a restraint; it is a fixed manner of working. 177 To say of a painter that you never produces any but fine works, does not affirm that you are less free than an inferior artist; just because producing bad work is no power or privilege but a defect. 178 And so, when we admit that God works by law, and expect to find the same spectrum from the sun's rays, which we have once made with our own prism, at every time and in every place where the sun's light shines, and so on, 179 we do not narrow the power of the Great Artificer, unless it can be shown that caprice is a privilege and a good. 180 The subject of miracles is not here to be discussed; I will only observe that

they are presented to us as parts of a great purpose for the good of human; and that our Lord refused, when He was tempted, to work wonders out of willfullness, or only to astonish. 181 The extreme jealousy of scientific people of admitting any allusion to theology, in connection with the course of Nature, proceeds from erroneous conceptions of God.

182 Mr. Wallace, whom I have already quoted with respect, is ready to admit that the Creator works in the beginning as the founder of the laws on which the world is to proceed; 183 but he is afraid of admitting that there has been continual interference and re-arrangement of details. But this eminent naturalist attributes to us a conception of the Most High which we do not hold, nay, which we energetically reject. 184 If the laws were wise and good, whence would come the need of interference or re-arrangement? 185 Who are we that we should bid God speak once, and forbid Him twice to speak? 186 The laws of Nature are God's laws, and God's laws are His utterance of Himself through the speech of Nature. 187 God is the same yesterday, to-day, and for ever; and so His laws remain the same. 188 They are, if I may say so without irreverence, the veil and vesture over the form of God, too bright in itself for us to look on; they take their outline from Him who is beneath them.

189 You may continue your researches in full confidence that the laws will stand sure, not because you have the slightest guarantee as a person of science that these laws will never be interfered with; such a guarantee you have on your own principles no right to ask. 191 You are to observe that the facts are so; that they shall eternally be so is not for you, for that is all beyond experience. 192 But the wisdom that made the laws needs not to revise its work, and erase and insert and amend its code. 193 In the days of creation God saw that it was good; the eye that so approved it changes not. Until the purpose that runs through the ages is completed the laws will stand sure. 194 But each new kingdom of Nature has introduced a change amounting to a revolution, which neither the theologian nor the

naturalist regards as an interference or a caprice. 195 When the principle of plant-life was introduced, the mineral world became the material on which the plant-life worked; it gathered into itself the lower elements, carbon, silica, nitrogen, and used them as means of its own organic life. 196 The plant partook of the nature of the class below it, whilst it dominated and used that class. This same took place when animal life was introduced. 197 The beautiful plants become the material whereon the animal life worked, the food whereby it sustained itself. 198 It was the same when human was added, in whom instinct is replaced by reason, and ethical action supervenes over action by impulse and appetite. 199 Each of these kingdoms has much in common with that which is below it. The animal is in many respects a plant; for the diatomaceous creatures one knows hardly in which kingdom to find their place. 200 The human is an animal in much, and perhaps your animal instincts play a larger part in the world's history and in your own development than we are wont to allow. 201 But each higher step brings in something wholly new. "An animal," says Hegel, "is a miracle for the vegetable world." 202 Each step is a revolution in one point of view; but then the lower state prepared itself for the higher, prophesied, so to speak, of its coming, and the higher seated itself so easily on the throne prepared for it, that we do not wonder to find it there. 203 You call it evolution; we call it a creative act. We think that God exists, and if He acts anywhere it must be in this, the universe of things. 204 [Greek: Ex henos ta panta gignesthai] is an old saying long before Christianity. But you and we may work by the same calculus and rules of observation. The facts are the same, the interpretation of what is behind them is different. 205 Nor need we deny that the principle of which Mr. Wallace spoke as "supreme in the world," has its truth and its use in explaining the facts of creation. 206 It never raised an inert mineral mass into a vegetable organism; it never raised a plant into an animal. It never raised an ape into a human. 207 No facts have yet been

produced that go to prove any such leaps, and if our logic is to be improved in anything by the light of experience, it is in this, that facts should be recorded and generalised, but not assumed. 208 But that climatic conditions, and the struggles for life, have modified species, and worked out new varieties, or new species, we may fearlessly admit; 209 it is one more proof, perhaps, that the world is a meet school and training ground for the creatures placed in it for discipline. 210 But a law is not a god; it never ruled supreme; never was other than one precept out of many in the Divine code of the world.

211 It has become the fashion with some naturalists to speak of God as "the Unknowable." 212 Mr. Martineau has finely observed, somewhere, that this name is self-contradictory; for we affirm by the use of it that we know so much, that He cannot be known. 213 I go much further. It assumes the existence of God, and in the same breath separates us from Him for ever. 214 Theologians have ever been ready to confess that God cannot be known in His own essence to creatures such as we. "Lo! these are parts of His ways: but how little a portion is known of Him? But the thunder of His power who can understand?" 215 An uninspired writer speaks the same language as the inspired. "For us that are people to talk about divine things is as when the unmusical discourse of music or civilians of strategy." 216 But shall we then sit down in despair, and no more look up to God? We shall be untrue to our own best instincts; we shall not have used all our means of enlightenment. 217 I grant that the mere contemplation of God in Nature is not enough. Like the pillar of cloud of old, it is at once light and darkness; a light to us in contemplating the book of Nature, a darkness to our hearts, shut in with their own sins and sorrows. 218 Naturalists have never done justice, as it seems to me, to the most important facts of human's nature. Not only can you study Nature, but you can act in it and upon it. And this power of action assures you of your freedom. 219 Possessed of this gift, that places you a little lower than the angels, you knows that you can

use it either way. 220 You may follow your own foolish vanity, your own evil wishes, and set up for your own law, and be your own God; or you may return to Him, whence you came out, and offer to God the homage of your own will, of your love, and your obedience. 221 To one who has performed this great act God is no more "the Unknowable." 222 In the mutual commerce of two wills, two spirits, the finite and the infinite, the finite rises more and more, and sees more and more of Him who has manifested Himself to us in His creation of the world out of free love, 223 in His creation of a free being to rule in the same world, crowned with glory and honour, in His giving that free being a law of duty wherewith to rule yourself, in His having planted in you hopes and longings that will be satisfied only in eternity.

224 Yes; human is humble and low. By every organ, and by every fibre you are mated with some analogous creature in the brute world. 225 You surpasses them in the variety of your ailments, and the profundity of your pains. You are part of a system, which naturalists tell us is hastening towards night and death; the motion of the power of Nature tending plainly towards universal rest. 226 But "Placed on this isthmus of a middle state, A being darkly wise and rudely great," you have that in you which unites you to another sphere. 227 To be able to conceive of God at all; to have within you a will and a power of worship, these make you one with God, and assure you against death and darkness. 228 To deny oneself this privilege of viewing the earth in its relation to God, to shut out God artificially from that sphere where the natural understanding has always found Him without assistance, is a pedantry for which we shall surely suffer. God will find us out.

229 There is often a certain irritation in those who would exclude God from their sphere of view. They lose their philosophic calmness when they speak of religious things. 230 These are the tokens of past conflicts and past quarrels, of a soul that might know more of God if it had not refused. 231 God is reflected in the world,

in the human's intelligence, in your conscience, in your will. "Whither shall I go from His presence?" We seem to be saying. It is better to be able to say, "Whom have I in heaven and earth but Thee?"

PANTHEISM.

Rev. J. H. Rigg, D.D

2 A hundred years ago the controversy of Christianity in England was with Deism, and in France with Atheism; 2 while at that time the transcendental infidelity of Germany was as yet undeveloped, and the name of Spinoza was nowhere held in honour. 3 Now, however, deistic infidelity appears to be obsolete, and it is universally felt by those who have entered truly into the thought and controversies of the age, 4 that the question for the present is between Christian Theism and that style of philosophy which recognises an impersonal divinity in all things.

5 Deism grants too much to the Christian. If a person really believes in a living and personal God, a Divine Maker and Ruler of the universe, with a moral character and will, 6 you finds it hard to deny the possibility and probability of a revelation, and impossible to maintain the impossibility of miracles. 7 Having been obliged to yield thus far to the Christian argument, the deist is unable thereafter to withstand the positive evidence in favour of Christianity. 8 Moreover Deism is beset by the same difficulties in effect which surround the Christian revelation, without its lights, its consolations, its blessings. 9 The person, therefore, who rejects Christianity seldom finds your resting-place in Deism. You becomes a pantheist or an atheist.

10 Naked atheism, however, is a repulsive creed. It is a heart-withering negation. It touches no sympathy; it stimulates no play of intellect; under the deadly chill of its unlighted vacancy, imagination cannot breathe. 11 There is nothing about it refined, or subtle, or profound. It is the barest and hardest form of infidelity, and has been professed by the coarsest minds. 12 It demands no effort to comprehend its one universal

negation and it taxes no skill to expound it. It is an arid and barren, a cold and dreary, hypothesis, which no genius, not even that of Lucretius, could make attractive. 13 The old illustration is conclusive as to its absurdity. It would be immensely less monstrous to maintain that the Iliad, in its full perfection, might have been the product of the "fortuitous concourse" of the letters of the Greek alphabet, than that this infinitely wonderful and glorious universe is the result of the "fortuitous concourse of atoms." 14 Stark atheism, therefore, however it may have flourished in the heartless and hopeless France of a hundred years ago, was never likely to take root in the soil of European scepticism as the alternative of Christianity.

15 In England it has had very few votaries. Nor has atheism, as such, ever found favour in the land of Luther and Melancthon, the favourite soil of mysticism and pietism. English deism and Scottish scepticism did, indeed, produce potent effects in Germany a hundred years ago; 16 but the result was neither deism, nor such scepticism as that of Hume, nor atheism, but a dreamy idealistic pantheism. 17 And now Germany, with a disastrous fidelity, by an infusion into our literature of its pantheistic unbelief, has repaid to Britain the debt which it contracted by its importation of English deism and Scottish scepticism. 18 At the present moment a pantheistic philosophy is the philosophy in which unbelief for the most part invests itself.

19 Hence the task which falls to me to-day cannot but be felt by myself to be one of very grave importance. I could unfeignedly have wished that it had fallen into other and more competent hands. 20 Perhaps, however, I may venture to claim two qualifications which may, in some measure, help to fit me for dealing with the subject on which I have to speak. 21 One is, that the subject of Pantheism is one which has much and frequently exercised my thoughts for many years past, ever since I learnt from the writings of Coleridge, Hare, and others the meaning of what Hare spoke of as the "fascination of Pantheism;" 22 ever since I was led to the study of

philosophy and its development, and especially of the thoughts of the early Greek wrestlers with the mysteries of being, 23 of the Alexandrian Neo-Platonists, and of the modern thinkers of Germany, who have filled with transcendental exhalations of verbal dialectics the vacuum in speculation which had been created by the destructive logic of Kant. 24 The other qualification which I venture to claim for my task to-day is that I have some knowledge of the difficulties of thought and belief which may lead honest people to become pantheists; 25 that I understand the manner of thought of one who has become entangled in the mazy coil of pantheistic reasonings; 26 at all events, that I know that honest searchers after truth may reluctantly become intellectually pantheists, while yet their heart longs to retain faith and worship towards a personal God. 27 If, therefore, one necessary condition of true success in argument is an intellectual and, as far as possible, a moral sympathy with one's opponents, that condition, I believe, is fulfillled in my case. 28 And I cannot but think that all Christian controversialists ought to feel a tender sympathy towards honest thinkers who are involved in the bewildering confusions of a philosophy which they do not love, 29 even although they may, after many a struggle and in sadness of heart, have succumbed at length to Pantheism as the only conclusion of controversy in which they are able to abide.

30 My subject to-day is not the history of Pantheism, but its principles. The history could not be dealt with in one lecture; 31 the principles, I hope, may. And whatever may be the intellectual genesis, the descent and derivation, or the special character, of any particular form of Pantheism, all its forms will be found to coincide in certain respects.

32 The semi-Hegelian of Oxford, and the pantheist who falls back on the lines of Mr. Herbert Spencer's speculations as his place of defence, may both be regarded as standing on common ground for the purpose of my present argument.

SCEPTICS

33 In attempting a criticism of the principles of Pantheism, the first thing to be done is to obtain as clear an idea as possible of what is to be understood by Pantheism, as distinguished from Theism on the one hand, and from Atheism on the other. 34 There can be no doubt that the difficulties, both metaphysical and moral, which attach to the conception of a personal God, the Creator and Governor of the universe, 35 have, more than any other cause, constrained thoughtful people who have pondered the problem of the universe, to endeavour to escape from their perplexities and bewilderments by taking refuge in the notion of a diffused impersonal divinity. 36 And it must be confessed that these difficulties are so oppressive and so staggering to our incompetent human reason, that they might well tempt the mere reasoner, the mere logician, the mere metaphysician, to give up faith in a personal God, 37 if so to do were not really to involve one's self in more than equivalent difficulties of the very same class, besides many other difficulties, and in truth contradictions, both intellectual and also moral, which are involved in the pantheistic hypothesis. 38 That the alternative is such as I have now stated, that the pantheistic hypothesis is necessarily beset with such difficulties and contradictions, will in part be shown by the inquiry which, as I have intimated, must needs come first of all in the criticism I am to attempt. 39 An investigation of the meaning of Pantheism, of the characteristic idea proper to the intermediate hypothesis which rejects equally A-Theism and Theism, will open to view the metaphysical difficulties and contradictions involved in the hypothesis. 40 I shall afterwards try to show the incompatibility of the principles of Pantheism with the true principles of natural science. 41 The moral considerations belonging to the Christian controversy with Pantheism I shall reserve till the final stage in my argument.

42 Pantheism agrees with atheism in its denial of a personal Deity. Its divinity of the universe is a divinity without a will and without conscious intelligence. 43 In what respect, then, does Pantheism

really differ from atheism? If we eliminate from our idea of the divinity of the universe all consciousness, all sympathy, all will, what sort of a divinity remains, what sense of a present and real divine power is left to the person that shrinks from atheism? 44 Atheism denies that in, or over, or with Nature there is anything whatever besides Nature. Does not Pantheism do the very same? If not, what is there, let the pantheist tell us, in Nature besides Nature? 45 What sort of a divinity is that which is separate from conscious intelligence and from voluntary will or power? 46 Is it said that though there be no Deity in the universe, yet there is a harmony, a unity, an unfolding plan and purpose, which must be recognised as transcending all limitation, as unerring, inexhaustible, infinite, and therefore as divine? 47 Let us ask ourselves what unity that can be which is above mere Nature, as such, and yet stands in no relation to a personal Lord and Ruler of the universe; 48 what plan and purpose that can be which is the product of no intelligence, which no mind ever planned; 49 what infinite and unerring harmony can mean, when there is no harmonist to inspire and regulate the life and movement of the whole. 50 Do not the points of distinction which the pantheist makes between own philosophy and the bald tenets of the atheist amount in effect to so many admissions that the facts of the universe cannot be stated, 51 that the phenomena of Nature cannot be described, with anything like fidelity or accuracy, without the use of language such as has no real meaning 52 unless it implies the existence and operation throughout universal Nature of a supreme actuative and providential Mind and Will?

53 The least and lowest implication which is involved in Pantheism, the most elementary idea which the word pantheism can be held to connote, the barest 'minimum' of meaning which the creed of the pantheist can be presumed to contain, 54 is that there is in the whole of Nature-- in this universe of being-- a 'divine unity'. 55 Let us then look at this word 'unity', and consider closely what it must mean.

SCEPTICS

56 Those who believe in a divine unity pervading all Nature must imply that in the midst of the infinite complexity and variety of the universe there is everywhere to be recognised a grand law and order of Nature-- 57 a method, plan, and harmony in the great whole, which must consequently be traceable through all the parts. 58 But whose and whence is this grand law? Is it indeed a reality? 59 Are all things fitted to each other, part to part, law to law, force to force, throughout the infinite depths of microscopic disclosures, throughout the infinite exuberance of Nature's grandest provinces, throughout all space and all duration? 60 Do all things work to meet each other? Is every several life-cell, each organic fibre, moving, tending, developing, making escapes or overtures, 61 as if a separate angel of unerring sympathy and insight, of illimitable plastic skill and power, of creative energy and perfect providence, inhabited, inspired, and actuated it? 62 Is it so that the person of science, who enters into communion with Nature's actual life, and movement, and purpose, seems to see and feel divinities, unrestingly, unweariedly, in silent omnipotence, in infinite diffusion, everywhere at work, 63 so that the reverent inquirer and gazer to whom this wondrous spectacle is unveiled, could almost, in your own pantheistic sense, adopt the invocation of Coleridge, and address the powers you sees at work in such words as these:

64 "Spirits that hover o'er
The immeasurable fount,
Ebullient with creative Deity!
'And ye of plastic power that interfused
65 Roll through the grosser and material mass,
In organising surge! Holies of God!
And what if Monads of the Infinite Mind?'"

66 Is it so? I ask. Then, what does such a real harmony and such universal correspondence and providence as this imply? 67 Surely we must perforce adopt one of two alternatives. If we refuse to believe in One Ruling, Organising, Creative Mind, One Living, Universal Mind and Will and Providence, which works through all, 68 we must endow each

separate being, or at least each form of life, with creative energy, illimitable and all-answering sensibility and sympathy, unerring wisdom, and veritable will. 69 Nay, ultimately, as it seems to me, the alternative must be between accepting the faith in an infinite God, and attributing to even the particles of inorganic matter, 70 amenable as these are to the laws of gravitation and chemical combination, a wisdom, will, and power of their own, the power of intelligence and of self-direction. 71 As to what are called the laws of gravitation and of chemical combination, we know that a law, like "an idol," is "nothing in the world" but a name. 72 "There is no power but of God; the powers that be, are ordained of God." 73 A law is not a power; the laws of science do but define observed methods of movement or forms of customary relation between thing and thing.

74 Of one thing, at any rate, I think we may be sure, that a mere order of Nature, ascertained though it may have been by the truest and surest induction, cannot have made and cannot sustain itself, cannot be self-originated and self-impelled. 75 So also it is certain that a mere plastic universal power, apart from any creative or providential mind, however its products might seem to imply intelligence, could be animated by no conscious purpose, 76 and could not be conceived as working with blind automatic certainty conformably to a grand cosmical plan or towards a providential end. 77 And if the divinity of the pantheist is nothing more than a personified law or order of Nature, your personification of this order or law can add nothing to its virtue or potency, 78 can by no means transform it from a phrase into a living power, from a figure of speech into a real and intelligent force, can never constitute it into a divinity. 79 The more I reflect upon the subject, the more assured the conclusion appears to be, that any conception of a real unity in and of Nature is self-contradictory and unmeaning, except upon the assumption of a conscious and intelligent Creator. 80 The unity of Nature, to a man who denies the existence of a real God, cannot be a unity inherent in Nature, cannot be a unity according to which

Nature itself has been planned, and is really working; it is an imputed unity, the conception of the pantheistic philosopher's own mind. 81 Unity, indeed, as apprehended by us-- and it can only be known through our apprehension of it-- is essentially a conception, a relative idea. 82 If one could conceive Nature as existing destitute of a mind either to work on a plan, or to recognise a plan in working, in such Nature there could be no unity. 83 Unity in action implies a plan of voluntary working, and therefore a regulating mind.

84 Unity of conception and exposition implies an intelligent observer. 85 The unity of Nature, if it be not the plan and work of the very God, can be nothing more than a scheme and conception which has been invented and imputed by human.

86 But perhaps it may be thought that the word unity, as used by pantheists, should be understood rather as referring to the ultimate oneness and identity of all force throughout the universe, than to harmony of universal plan and purpose. 87 Various as are the appearances of Nature, and the modes in which the laws of Nature operate, it may yet be set forth by the pantheist as own belief,-- 88 a belief, you will say, which the modern advance of science tends continually to establish as the true theory of the universe,-- 89 that all force is ultimately one, that the different forces of Nature are mutually convertible and equivalent, 90 that one energy of Nature, Protean, universal, of infinite plasticity and power of variation or adaptation, pervades and actuates all things. 91 It may be called gravitation, or electricity, or light, or heat, or nervous energy, or vital force; but ultimately and essentially it is one and the same; 92 it is, to quote well-worn lines which will be held here strictly to apply--

"Changed thro' all, and yet in all the same."

93 It

"Warms in the sun, refreshes in the breeze,
Glows in the stars, and blossoms in the trees;
94 Lives thro' all life, extends thro' all extent,
Spreads undivided, operates unspent:

Breathes in our soul, informs our mortal part,
* * * * *
95 To it no high, no low, no great, no small,
It fills, it bounds, connects, and equals all."

96 Now if this be the pantheistic unity which is admitted by people who deny a personal Deity, I will not stay to object that such a view is hardly consistent with the essential distinction in Nature 97 which even Professor Huxley and people of his school unwaveringly and powerfully maintain, between inorganic matter and living forms. 98 It is more to my purpose to remark that it is much simpler and easier to believe in a personal God, than in such an impersonal divinity as this Protean Force. 99 Every difficulty which belongs to the thought of God's existence belongs to this also. This force must be self-originated, must have been from everlasting, must be creative, omnipresent, providential, equal to all plans, purposes, contrivances, inspirations, 100 which have been, or ever will be, in this dædalean and infinite universe; must be the source of all intelligence, though itself unintelligent; 101 of all sympathy, although itself incapable of sympathy; must have formed the eye, though it cannot see, and the ear, though it cannot hear; 102 must have blossomed and developed into personal intelligences, although personal intelligence is a property which cannot be attributed to it; must unquestionably be omniscient as well as omnipresent, 103 or it could not, in its infinite convertibility, anticipate all needs, meet all demands, answer in absolute and universal harmony to every faculty, capability, and tendency of all things that are and all things that become. 104 Now is it reasonable to object to the doctrine of a personal Deity because of its inconceivability and its stupendous difficulties, and yet to believe in such a primal, essential, immaterial, creative, infinite, blind and unintelligent force as this? 105 Surely no contradiction could be greater. The conception of God as from everlasting 'is' stupendous. 106 But an infinite Protean Force from everlasting, destitute of

intelligence and will, yet continually operative as the life, soul, wisdom, and providence, of all things, is nothing less than contradictory and absurd.

107 I can come to no conclusion, accordingly, but that Pantheism really only differs from atheism, in so far as it confesses that it is impossible to speak with ordinary propriety, 108 or in any such way as to meet the necessities either of science itself or of the common sense and feelings of humankind, without employing theistic language. 109 It has been said that hypocrisy is the homage which vice pays to virtue. 110 So a profession of Pantheism is the tribute of compliance at least in speech, is the outward language of homage, which theism has power to extort from atheism. 111 "Pantheism," as is said by the author of 'Lothair', "is but atheism 'in domino'. Nothing," as the same writer adds, "can surely be more monstrous than to represent a creator as unconscious of creating."

112 Yes, Pantheism is but veiled atheism. Strip Pantheism of all involutions of thought and all investitures of language, and in its naked truth it stands forth as mere atheism. 113 Every form which Pantheism takes, every disguise which it assumes, to hide from itself and from the world its real character, is a testimony borne by atheism to the necessity which all humans feel for assuming the existence of Deity; 114 What Robespierre is reported to have said with reference to political government and national well-being, that if there were not a God, it would be necessary to invent one, is felt by pantheistic philosophers to be true in regard to Nature. 115 So monstrous a conception is that of this universe without a governing mind; so clearly and directly to the common sense of humankind do the infinite harmonies of the universe seem to imply a designing and governing Intelligence; 116 so indubitably does the might and life of the universe, ever coming forth anew, ever springing up afresh, ever unfolding and advancing, imply a central living Power, One with the infinite governing Intelligence; 117 that pantheists, in order to speak and write intelligibly, are

compelled to invest Nature with the qualities which they deny to the Deity, to attribute a spirit and intelligence to the whole machine, because they deny the existence of the great Mechanist; 118 to personify a harmony and unity which is but an abstraction, which, on their own hypothesis, is but a grand accident, a result without a cause, because they refuse to believe in a personal God.

119 I am very far indeed from wishing to come under the definition of what Mr. Hutton has spoken of as the "Hard Church," or to carry my positions merely by the use of the dilemma, 120 yet I cannot refrain from saying, parenthetically, that the argument of the dilemma, carefully and truly applied, is not only always legitimate but often necessary, and I must affirm that it applies very closely in the present instance.

121 The pantheist cannot maintain own position midway between atheism and theism. 122 If you absolutely refuses to be a theist, it is necessary to show you that you will have to yield to the cruel necessity of acknowledging yourself to be an atheist. 123 Standing midway, your position is altogether untenable, from whichever side it is assailed. 124 On the one side, the pantheist is condemned by the same arguments which condemn atheism; on the other side, the atheist may justly allege against the position of the pantheist the self-same difficulties which both pantheist and atheist urge against theism.

125 But if pantheism be in reality only atheism, I may henceforth disregard the verbal distinction between the two, and bring forward considerations and arguments which apply indifferently to either. 126 In pursuing the discussion I shall take up in detail some points of argument already, as to their general scope, more or less distinctly intimated in the preliminary considerations which I have advanced.

127 To explode any view of the world which excludes from it the presence and government of a personal God, nothing more is needed than to realise and truly understand the atheistic view in its various aspects.

128 Let us try the atheist's theory on the history of the universe, and see whether it can be made to fit, or must be broken in the attempt to fit it.

129 The will and interference of God, as the Lord and Ruler of the universe, is excluded. The universe is held to have been from the beginning without a shaping and ruling intelligence and will. 130 No mind has presided over its destinies, has animated its energies; no providence of Divine power and wisdom has guided its changes and progress, has renewed and replenished and sustained it. 131 It follows that no power or will from beyond itself has ever touched the universe. Its own unaided and unguided powers have done all. 132 If the universe did not make itself, it has developed itself: all that has been, or is to be, was included potentially in that which was at the beginning, and has unfolded in necessary order. 133 The vision presented is to certain minds very fascinating: it is a vision of vast unbroken progress, of continual and infinite self-development. 134 But let it be worked out, and let us consider what it really means. Such an hypothesis must lead us back, in the infinite dim distance of the original and indistinguishable past, into a universe-mist of germinal powers from which all has since developed.-- But stay. 135 Was this mist and expanse of universal Nature in its 'origins' all homogeneous and at one stage of existence? Then I have to ask, whence came it?

136 What, going ever further and further back, where were the infinitely earlier, fainter, vanishing entities or powers, into which infinite creative force and potentiality was diffused? 137 And what the one life and grand harmony of influences and impulses, tending towards an infinite goal of progress and perfection, which pervaded the whole?

138 What does all this mean? Is this easier, simpler, more rational, than to believe in God from everlasting? 139 Is anything gained in simplicity, comprehensibility, probability, or in scientific character, by denying that in the "increasing purpose" which "runs

through the ages" there is any guidance of a divine intelligence or working of a divine will; 140 and calling the whole process from first to last, from everlasting to everlasting, "development"? What is this word development but a name? Does the use of the word explain anything? 141 Does the use of the word reduce the mystery of the universe to the simplicity of an axiom? 142 Does the use of the word provide a simple equivalent for all that divine wisdom, power, and providence, have ever been imagined to do for the universe? 143 People call the mystery of being and becoming by the name of development, and then say that all things are effected by development, and that development explains all! 144 Whereas this development of which they talk so familiarly, as though they understood all its secrets, and were privy to its infinitely various and mighty workings, and could unfold its source and meaning, is itself all the time the very mystery to be resolved and explained. 145 Development is in truth as amazing and incomprehensible a mystery as creation. It seems to be but another word for creation. 146 Only they who affect its use instead of the word 'creation', insist upon creation without a creator. 147 The unintelligent and unconscious universe, on their view, is continually creating itself. 148 The hypothesis of development, however, is not only unintelligible and utterly devoid of reality, when criticised in its general principle; as might be expected, it altogether breaks down when it is tested in detail. 149 Professor Huxley's protoplasm breaks it down. All the scientific evidence, as that eminent teacher of science showed at Liverpool last autumn, is opposed to the idea that protoplasm was developed out of inorganic matter. 150 The hypothesis of spontaneous life-generation appears to be exploded. Science, at any rate, on its own positive principles, has no right whatever to pretend that life has ever been developed out of what was not living. 151 Here, then, a great and, so far as science can help us to form a judgment, an altogether impassable barrier rises to view against any development

hypothesis. 152 At a certain stage in the history of the universe protoplasm, organised life, made its appearance on the scene, starting up as a perfectly new, an original, an undeveloped phenomenon. 153 Before, all had been inorganic and dead; now Life was abroad in the world, destined to increase and multiply, and replenish the universe. 154 Let those who deny divine and creative will and government, inform us whence came this life. It was not developed. Must it not have been created. If not, then whence, I ask, whence did it spring?

155 The argument which I have just urged should, as I venture to think, be conclusive even with those who know, and seek to know, nothing more of science than the order and method of its phenomenal processes. 156 I will now bring forward a consideration which will, I hope, be admitted to have weight by those people of science-- it is to be greatly lamented that there should be so few of these-- who have studied the Nature and working of the mind as well as the phenomena of sense. 157 We have seen that protoplasm-- that Life-- was not developed out of inorganic matter, but appears to have been an entirely new and primary fact on the face of the universe. 158 Life came in and appropriated, put to its own uses, bound up under its own seal, impregnated with its own specific virtue, the raw inorganic materials which it found in Nature; but the power of Life itself was altogether new. 159 A fact in some sort analogous to this confronts us in a higher sphere, in the sphere of living intelligence itself. I refer to the emergence of personal consciousness among the world of living creatures. 160 To me it appears that the sense of personality is an altogether new and original fact, one which cannot be conceived as developed or developable out of any pre-existing phenomena or conditions. Whence it comes, or how it arises, I know not.

161 But it appears to be, in and of itself, the assertion of an essential separateness between One's Self and all phenomena, all constituents, all conditions whatever. 162 The sense of an I

Myself, of Personality, asserts an antithesis between the Human, and all that the Human uses, takes up into your personality, makes your own. 163 As Life binds up inorganic matter under its seal, but is not developed out of inorganic matter, so the voluntary and responsible Self binds up under the seal of its own personality all that belongs to the manifold life of its complex being. 164 As life brings into the universe a new world of phenomena, higher and more manifold than those of mere inorganic matter, yet embodying and adopting these, 165 so personality brings into the universe a new world of vastly higher and rarer phenomena than those of mere vitality, yet embodies and adopts these:-- 166 it introduces all that belongs to reflection and morality, giving birth to an intelligence and a world of thought, in which all the lower and anterior phenomena of the world become matters of cognisance, and are mirrored as objects of thought.

167 As I venture to think that this sense of personality, with the new world of reflective consciousness and morality which it brings in, is a fact, starting up in the midst of a universe of anterior developments, 168 such as all Mr. Darwin's solvents utterly fail to touch, a phenomenon which remains as far from explanation as before he wrote his last book, 169 so it appears to me that the power of human speech is another fact starting up in the midst of the line of supposed developments which no hypothesis of evolution can afford any help towards explaining.

170 Miraculously developed reason, something higher, as it seems to me, than any development of human reason our race has, in its highest culture, as yet put forth, must have been necessary in order to the invention of language by any race even of the most sagacious mammals.

171 And yet, again, speech itself is a necessity, a necessary instrument, in order to the high development of reason. 172 We have some idea what deaf mutes of our human family are like, when no painstaking and kindly culture has been bestowed on their intelligence, and temper, and

affections, and conscience. 173 Let us conceive the race of human to be, and to have been from the beginning, not indeed deaf, but congenitally and irreversibly dumb, with no more power of articulate expression than a horse, 174 or let us say, a dog. What would the development of human reason have been under such conditions? 175 How, then, is it possible to conceive that the wondrous faculty and instrument of speech was ever invented and perfected by mammals of infra-human faculty and development, 176 and that they were afterwards through this invention developed yet more highly, until they attained to the dignity and advancement of humanity? 177 Such infra-human mammals must have been more miraculously endowed in order to such an invention than ever human has been.

178 After all that Mr. Darwin has written, does or can any reasonable man or woman actually believe in the possibility,-- 'apart from the Divine Power and Will and Guidance',-- for that is the point,-- of the self-development, the spontaneous upgrowth of articulate language?

179 Let us study our quadrupedal familiars, for the sake of illustration and analogy. We see daily how our noble dogs strain and groan after speech, do all but speak: 180 we mark their eloquent looks, their speaking gestures, their wonderfully expressive movements, how they watch us speak, and seem as if they understood what speech is to us, and as if they craved most longingly the power for themselves. 181 We cannot but sympathetically admire the intelligent, the benevolent, the noble, the sagacious physiognomies which they show. 182 If any creature ever could, would, or did develop speech in any rudimentary form, are not they just in the circumstances to do it? 183 And when once rudimentally begun, however uncouthly and imperfectly, should not their organs continually improve by the continual effort and the increasing intelligence? 184 Is it not immensely less hard of belief, and less difficult to imagine, that dogs should develop speech, than that

human should have been developed from the larvæ of the 'ascidiæ'? 185 Yet is there even a beginning made towards the canine development of articulate language, or does any living human believe that such a beginning ever could be made?

186 To me it appears that human speech and human personality are in some way bound up with each other, that the one, in some sort, implies the other, 187 and that these two characteristics of our race present an insuperable obstacle to the acceptance by really scientific thinkers of any hypothesis of evolution which, leaving God out of Nature, would account for the whole existence and progress of the universe on the principle of spontaneous development.

188 But again, let me be allowed to test the development hypothesis in detail at another point. 189 This hypothesis-- and any pantheistic or atheistic view of the universe which professes to be scientific-- is obliged to confess that all living beings, of whatever sort, have been developed out of a single primary cell-- called often a germ-cell-- of protoplasm. 190 Here they find the beginning of every kind of life. The plant, the animal, of every sort,-- the lichen, the cedar, the sponge, the bird, the mammal, the minutest entozoon, the most microscopic infusorium, and human,-- have been developed out of these primary cells. 191 What then do the same people who teach us this, find to be the constitution of these same cells, when microscopically examined?

192 They find them to be, for the most part, and indeed always, if allowance be made for very trivial exceptions, identically the same. 193 The matter is identically the same, the appearance identically the same; no difference whatever of constitution, form, or properties, is to be detected. 194 They cannot tell whether the nettle, or the frog, or the eagle, or the human, is to be developed out of any given cell: for anything their science can teach them, any of these might be developed, as they call it, out of any cell. 195 But if this be so, is it scientific, is it real or true, is it not altogether misleading, to speak of 'mere development' in such a case?

196 The flower may be said to be

developed out of the bud because the bud is the flower in miniature, the flower is really folded up in the bud. 197 But surely here is no case of mere development; here is no unfolding out of the germ-cell of what is potentially contained in the cell, regarded as a merely material organism. 198 Judged by every test of physical experiment, the primary cells are identically the same; and yet they grow into forms essentially and infinitely dissimilar. 199 Does it not clearly appear that here is a matter in which some power above and beyond the mere physical constitution and nature of the primary cell must be admitted, on every principle of science, on every ground of pure candour and truth, to be of necessity present? 200 Is it not evident that with each germ-cell there must be associated some individual life-power which animates the cell, which uses it as a unit to multiply, as a foundation to build upon, 201 which does build and weave and work into it and upon it continually new material, which, for its own use in its work of weaving and fabricating, and for the completion of its own distinctive form and vehicle, takes toll of air and earth and water and heat-power-- 202 the ancient elements-- selecting out of them its appropriate pabulum, in whatever chemical combinations of the primary elements known to our modern scientific analysis may be fit and needful? 203 Surely not development, but life, the mystery of individual life, is here. 204 And if the philosophers will deny the omnipresent creative and sustaining power of God, it appears to me that they must be prepared to animate each germ-cell with an individual intelligence which works with divine power, on a definite and most miraculous plan, and towards a distinct goal of perfection. 205 To call such various powers and processes, such diverse and generically different operations, in every sphere of life, by the same term, appears to me to be unscientific; 206 to speak of them all alike as processes of unfolding or development, when results the most infinitely unlike and separate are obtained from beginnings which are identically alike,

appears to be not only unscientific but altogether misleading.

207 I do not think it arrogant or unwarranted to conclude from such considerations as I have been trying to set forth, that evolution, or development, apart from the power and guidance of the Living God, is an unphilosophical, an unscientific idea, an empty, an unmeaning word. 208 It is a thing of naught, utterly impotent to solve the mysteries of the universe, even when expounded and reinforced by Mr. Darwin's "Natural Selection." 209 I have not a word to say here against the views of Mr. Darwin, as defined and modified by the requirements of scientific modesty and precision. 210 If I had any pretensions to be called a student of natural science, I should sit at the feet of Mr. Darwin when he speaks, not as a philosophic theorist, but as a scientific observer and a truly inductive naturalist. 211 But I must say here in respect to Natural Selection, regarded as, according to Mr. Darwin's hypothesis, the handmaid of development, that, like development, it is but a name, and not a power. 212 It describes the order and mode according to which Providence works; it is not itself a force-- a working energy. Mr. Darwin himself indeed often speaks as if Natural Selection were itself a power and a providence. 213 I find to my hand in Mr. Kingsley's fine, suggestive paper on 'The Natural Theology of the Future', recently published in 'Macmillan's Magazine', a sentence of Mr. Darwin's in regard to Natural Selection which I will quote. 214 "It may be metaphorically said," writes Mr. Darwin, "that natural selection is daily and hourly scrutinising throughout the world every variation even the slightest; 215 rejecting that which is bad, preserving and adding up that which is good, silently and necessarily working whenever and wherever opportunity offers at the improvement of every organic being."

216 "It may be metaphorically said," are Mr. Darwin's words. But in fact he is using, not a metaphor, but a personification. 217 The distinction Mr. Darwin does not see. He repeatedly speaks of his

personifications as metaphors. But the distinction notwithstanding is most important.

218 By personifying Natural Selection Mr. Darwin makes it appear to be a cause, attributes to it a real power, nay, wisdom and providence, as well as power. 219 He speaks in one place of "Nature's power of selection;" contrasting this with the "powers of artificial selection exercised by feeble person," by which, however, human can do so much; 220 and arguing that "Nature's power of selection" must be incomparably greater, and competent to produce incomparably superior effects 221 in respect of "the beauty and infinite complexity of the co-adaptations between all organic beings, one with another, and with their physical conditions of life." 222 Language of a similar sort he very frequently uses. He has, therefore, as a scientific man laid himself open to the reproof of M. Flourens, whom no one will deny to be a scientific critic. 223 "Either," says M. Flourens, "Natural Selection is nothing, or it is Nature, but Nature endowed with the attribute of selection--nature personified, which is the last error of the last century; the nineteenth century has done with personifications."

224 The nineteenth century ought to have done with personifications; but with the spirit of Lamarck's speculations the style of the French atheistic philosophy of the last century reappears.

225 Mr. Darwin, in the passage quoted by Mr. Kingsley, describes the manner in which his Natural Selection may be conceived as operating. 226 What, if his meaning were expressed with strict scientific truth, he ought to intend to say, is that such as he describes is the result of providential working according to the mode and order which he designates by the phrase Natural Selection. 227 "All we ask," says one of Mr. Darwin's ablest critics, "is that we may be allowed to believe in a God and a real Divine Providence, as powerful and wise and good as Mr. Darwin's Natural Selection."

228 But, moreover, it must not be forgotten that there is something besides the mere process of change

and growth, of what our philosophers call development, to be accounted for. 229 There is a fact on which the growth, the change, the evolution, must be held in a true sense to depend: a prior fact to be taken account of. 230 The growth proceeds upon a plan, and fulfillls an idea: protoplasm itself embodies a scientific principle.

231 But as the seal must be before the impression, the original before the copy, so the principle must be before its embodiment, the plan and the idea must be before the growth: 232 the end, towards which as its goal the growth or development proceeds, must have been conceived and set up as an aim before its fulfilllment began. 233 We are bound therefore, if we would exhaust the problem, nay, if we would truly conceive, and justly state it, to ask how and whence the principle, the plan, the idea, the end, had their existence? 234 These are realities; they are the most inner and essential realities in every instance of growth or development; to deal only with the development of the physical basis, is to leave untouched the kernel of the matter, is altogether superficial and unreal. 235 But principles, plans, types and ideas, ends contemplated in movement and progress, these at any rate are not physical, are not matters of sense and organisation. 236 They are, as I have said, prior to what is physical, they are conditions antecedent to organisation and growth. 237 Moreover, they are mental conceptions, not physical affections. They are only possible, they have no meaning, except as the thoughts of some mind. 238 Here, then, we are brought back by an inevitable necessity to an antecedent mind, the seat and origin of all the principles, the plans, the ideas, the ends, embodied in organised beings, and fulfillled in their existence, growth, and perfection. 239 In short, from whatever side we contemplate the problems of Nature, and whencesoever we take our point of departure in their investigation, we find ourselves brought face to face with creative mind. 240 The things which are "seen and temporal" lead us always inwards to "the things which are unseen and eternal;"

human and creaturely existence conduct us to the living God.

241 If any one would escape from the pressure of this argument by hardily denying that living organisation involves principle or plan, type or idea, purpose or end, it can only follow that the living forms of the universe are an infinite congeries of accidental combinations, 242 that in reality there are no such things as organs, that there can be no such thing as development, and that there is no such thing as law. What people call law is mere sequence that happens to follow regularly. 243 The whole universe has been constituted and regulated by the fortuitous concourse of atoms. Against such a conclusion as this I do not need to argue. It is the naked and repulsive atheism of which I spoke in the introduction to this lecture. 244 The line of argument which I have been pursuing seems to force us to the conclusion that there is no logical resting-place between such theism as Christianity teaches and such Democritean atheism as that of which we have now had a glimpse.

245 But if this be so, it follows that it is impossible to deny design and final causes in creation, and the sway and oversight of a universal Divine Providence, the providence of a living God, except by denying all law. 246 To the Christian theist, science is living science indeed; to the pantheist, no less than the atheist, science is hardly better than a dead register. 247 You may talk of the wisdom, the power, the order, the benevolence, of Nature. But such expressions on the lips of a pantheist are utterly illusive. 248 All the wisdom, all the marvellous adjustments of Nature, are but the happy conjunctures, the exquisite chance unisons, of you knows not what. 249 When lost in admiration of marvellous organisations, complexly apt and beautiful contrivances, of what seem like the most studied and beneficent provisions, 250 the soul that is beginning to glow with wonder at this seeming wisdom, and to swell with thankfullness because of this seeming love, must be chilled into blank confusion and amazement by the thought that there is no Being Wisdom and Benevolence Who is to be thanked and adored

because of these His marvellous works. 251 Surely this is enough to darken the universe to the explorer of Nature's mysteries, and to fill your soul with perpetual melancholy. 252 Nor is it easy to understand how any person of true science, any real inductive philosopher, who comes into contact with Nature's living processes and hears the perpetual whisper of Her living voice, can be ensnared into the acceptance of such a hard mystery of sceptical belief as this.

253 Surely, then, on purely scientific grounds,-- the grounds not only of metaphysical but also of natural science, on every ground which can be appealed to by high and pure philosophy, 254 we are at liberty, I should say we are bound, to reject the hypothesis which attempts to expound Nature and to solve its mysteries, without the admission of a divine mind. 255 Sense and matter and the observed order of phenomena do not constitute the whole of our science. 256 There are some words written by a poet, too much neglected at the present time, which I cannot forbear from quoting here.

257 "How should matter occupy a charge
Dull as it is, and satisfy a law,
So vast in its demands, unless impelled
To ceaseless service by a ceaseless force,
And under pressure of some conscious cause?
258 The Lord of all, Himself through all diffused,
Sustains, and is the life of all that lives.
Nature is but a name for an effect,
Whose cause is God. He feeds the secret fire
By which the mighty process is maintained,
Who sleeps not, is not weary; in whose sight
259 Slow circling ages are as transient days;
Whose work is without labour; whose designs
No flaw deforms, no difficulty thwarts;
And whose beneficence no charge exhausts."

260 Surely, if I may here quote some words of Mr. Kingsley's in the lecture to which I have already

referred, this is what people of science "are finding, more and more, below their facts, below all phenomena which the scalpel and the microscope can show, 261 a something nameless, invisible, imponderable, yet seemingly omnipresent and omnipotent, retreating before them deeper and deeper, 262 the deeper they delve, that which the old schoolmen called 'forma formativa,' the mystery of that unknown and truly miraculous element in Nature which is always escaping them, 263 though they cannot escape it, that of which it was written of old, 'Whither shall I go from Thy presence, or whither shall I flee from Thy Spirit?'"

264 The observations which I have thus far offered are directed wholly to the philosophical and scientific aspect of the argument respecting Pantheism. I cannot bring this lecture to an end without referring to the moral branch of the argument. 265 The existence of evil in the universe is alleged as an argument against the existence of God and divine government. 266 Doubtless, the existence of evil is a painful mystery. 267 Many good Christians have felt it to be an oppressive and almost an overwhelming mystery. It is one of the difficulties attendant on the Christian's belief; it is, in fact, the one moral difficulty. 268 But difficulties and mysteries cannot annul the positive necessities of thought and argument. 269 If such arguments as I have endeavoured to state make all science to be contradictory and unintelligible which speaks, in one breath, of the laws and wisdom of Nature, and, in the next, denies the existence of a God, 270 then we are bound to accept theism with its inevitable consequences, notwithstanding the mysteries, whether metaphysical or moral, which our faith may involve.

271 Mysteries are not contradictions, and, in whichever direction we move, we shall find it impossible to escape from them. 272 Mysteries surround the position of the sceptic or the atheist, no less than that of the Christian theist; 273 not only mysteries, but, as we have seen, contradictions, beset you round, in whichever direction you turns. 274 The Christian theist, by your faith

in God, accepts the mysteries which are involved in the thought of God, but, unlike the unbeliever, you escapes from contradictions and absurdities. 275 It appears that the morality of human-- your great glory-- that your sense of responsibility and of voluntary moral power, that which most peculiarly constitutes you human, involves the law of moral influence as between human and human. 276 It appears further that the power and faculty of moral influence for good must needs involve the law of moral influence for evil. 277 From the fact of human's own moral nature and moral responsibility, and the consequent fact of your moral influence over your fellow-humans, is derived, not only the possibility of moral evil in the case of a solitary individual, 278 but the possibility, perhaps I may say the naturalness, the probability, of a contagion of moral evil spreading throughout the race, 279 the effect of which can only be counteracted or limited by moral arrangements and influences specially constituted for that end. 280 So much I may perhaps say in general, although the subject is one on which I think it wiser, as a rule, to say nothing. 281 I feel it to be a profound and perilous mystery, however gloriously it may have been made the occasion for the manifestation in Christ Jesus our Lord of the Divine super-abounding wisdom, mercy, and power. 282 But if we admit the subject to be involved in profound, even terrible mystery, is that a reason why, making shipwreck at one plunge of all that belongs to humanity, faith and hope and philosophy should commit suicide, and descend together into the gulf of everlasting darkness and despair! 283 Reason may reel and grow dizzy while it looks too long and too absorbedly down the fearful and fathomless depths of the mystery of sin, but that is no sufficient cause why reason should cast itself headlong into the abyss.

284 Pantheism has only one way in which to escape from the mystery of evil, and that is to deny all distinction between right and wrong, between moral good and moral evil. 285 Of course there can be no such thing as sin for the pantheist, because all, according to

your creed, is nature and development and necessity. 286 Holiness is a matter of taste or sentiment. Conscience is an illusive development; 287 what we regard as divine morality is but utilitarianism sentimentalised and exalted into sacred law under the influence of unenlightened impulse and antique superstition, a mere affair of the association of ideas which science will some day explain away. 288 The ontology and ethics of Pantheism may be summed up in one sentence, "Whatever is, is; and there is neither right nor wrong, but all is fate and Nature." 289 Pantheism-- I say Pantheism just as truly and completely as atheism, for the difference between the two, as we have seen, is but one of name and phrase, and both alike deny God and conscience-- 290 Pantheism thus does cruel violence to every better instinct of our nature, outrages all the demands of religion and government, whether human or divine, and makes itself the direst foe of human progress and well-being. 291 Many pantheists, doubtless, have been and are virtuous, even noble, people; some, I am prepared to believe, may even, in a certain sense, be religious people. 292 But the direct tendency of the pantheistic philosophy is confessedly what I have now stated. 293 When moral and pure, its pure morality can be nothing more, at least in theory, than a refined utilitarianism. Only as such can any pantheist pretend to impose morality as law.

294 To sum up, may I not say that Pantheism, whether in its metaphysical or its moral aspect, is the dream of people who will not admit that there is in the universe anything beyond what their senses immediately reveal to them? 295 Its philosophy was represented in the last century in its lower and more popular form by Condorcet; the basis of whose system was laid in the principle, "*penser c'est sentir*,"-- thought is nothing more than sense or feeling; 296 in its higher and more intellectual form it was represented by the sceptical sense-idealism of Hume. 297 At the present day Bain and Mill have endeavoured to develop the principle of Condorcet in harmony with the higher and more subtle

philosophy of Hume. 298 The result appears to be a sort of nihilistic sense-idealism. Matter is probably nothing different from our mental ideas-- so far Berkeley, no less than Hume, is followed; 299 our ideas, however developed, are yet essentially only the combination and interfusion of our sensations and sense-associations; 300 meantime there is no evidence of the real and substantial existence either of the world outside us, or of ourselves as true and separate selves or persons, or of God. 301 Such at least would seem to be the metaphysics of the distinctively 'English' school of Pantheism, 'i.e.', of Pantheism rendered into philosophic system by the English mind. 302 The German Pantheism has 'infected' the 'tendencies' of English thought and criticism, but, notwithstanding the influence of Hegel at Oxford, has not been reproduced in any English system of egoistic Pantheism. 303 In their aspects and results, in relation to theism and Christian faith, the German egoistic Pantheism and the English sense-idealistic Pantheism strictly coincide.

304 Such then is the highest philosophy to-day of those who, refusing to be called atheists, nevertheless reject all faith in God; 305 of those who, rejecting Christian theism, claim to be positively neither more nor less than the people of science. 306 People of science though they be, their philosophy is the philosophy of nescience and the philosophy of despair. 307 We need be under no apprehension that such a philosophy will ever be generally accepted. It is too strong, too sorrowful, too nauseous a composition to suit the common taste. 308 It not only dissolves morality and its foundations, but it precludes all hope of immortality. 309 The race indeed may be immortal and progressively great and glorious, although how even so much can be known is more than I can see; but the individual man by man, woman by woman, child by child, perishes each one for ever. 310 Men and women with yearning, loving hearts, with tender and passionate affections, who have buried their dead out of their sight, and who could not endure to live if they were doomed

to sorrow without hope, cannot but reject with loathing and horror such doctrines as these. 311 People of various culture, of manifold intellectual resources, who live in the midst of refined and accomplished society, and who are not suffering from the pang of immedicable anguish and irreparable bereavement, 312 may possibly live so merely intellectual and speculative a life, may be so wholly absorbed in mere science, may have so far separated themselves from all that belongs to the heart's affections and the trembling religious sensibilities of human nature, as to adopt the philosophy of nihilism with hardy calmness, 313 although I confess that it passes my power to understand or conceive this; such people may be content to follow their speculative conclusions into the "blackness of darkness" for ever, and may thus, if not less, be more than the common crowd of humanity. 314 But such a philosophy will not content those who share the ordinary wants and sensibilities of our race. 315 The working, sorrowing, loving, hoping men and women of this human race will no more be able to satisfy themselves with any atheistic or, if any should prefer so to call it, pantheistic philosophy, than they can "feast upon the east wind." 316 They will cleave to that Christian truth and faith which has "brought life and immortality to light," 317 and which, in "showing" to the craving heart of needy, sorrowing, sinful person "the Father" reconciled in Christ, has blessedly "sufficed" a longing world.

318 Indeed, it would seem that, when, it comes to the point, even distinguished leaders in the ranks of those against whose views I have been arguing, find it impossible to give up their faith, at least in immortality. 319 Rénan is unquestionably one of the most distinguished leaders among those people of learning and culture who deny the existence of a creative will and Personal God. 320 Yet Rénan cannot make up his mind that he has lost for ever his beloved sister; that she has passed into the night of nothingness into which he must soon follow her. 321 In the dedication to her memory of his "Life of Jesus," he

addresses an invocation to "the pure soul of his sister Henriette, who died at Byblos, Sept. 24th, 1861;" 322 and appeals to her "to reveal to him, from the bosom of God in which she rests, those truths which are mightier than death, and take away the fear of death."

323 Rénan, then, after all, cannot give up his sister, nor, if it were only for her sake, his belief in immortality. 324 And yet how utterly unscientific is such a belief, if science is to be defined and limited in accordance with the principles of the anti-theistic philosophy.

325 Where can our people of mere sense-science find any physical basis of immortality? 326 There is no hope, no instinct or faith, at once so indissolubly bound up with our nature, so necessary to the development of all that is best in human, and so utterly destitute of evidence and basis in merely natural science, as our assurance of immortality. 327 If we are to retain our belief in immortality, we must maintain our faith in realities above and apart from sense, in realities which cannot be tested or investigated by any appliances of natural science. 328 If immortality be true, Pantheism cannot be true.

What, then, have we found respecting the seductive and too fashionable illusion which has led astray so many minds, especially of speculative, restless, and daring intelligence, in the present age? 329 We have found that Pantheism is essentially only atheism in disguise, and occupies a position in which it combines against itself the arguments which theists have to allege against atheism, and atheists against theism; 330 that, while it dethrones the true God, it sets up in His place Development and Natural Selection as its divinities, clothing them with the attributes which it denies to deity; 331 that its development hypothesis will not bear the test of science, of the natural science to which it professes to appeal; 332 that the origin of protoplasm, the attributes of human, and the growth and transformation of germ-cells, alike refuse to accord with the hypothesis; 333 that the very nature of science itself, as recognising law and organisation, is incompatible with any

philosophy which denies theism; 334 that the moral difficulties which rise up as a barrier against a denial of the Christian theism are no less insurmountable than the metaphysical and scientific difficulties; 335 that morality, conscience, natural affection, immortal hope, every deepest, most tender and sacred, most blessed and humanising, instinct of our nature is violated by the denial of a personal and holy God and Judge; in a word, that our whole humanity revolts against it.

336 May I venture to hope that the views which I have now endeavoured to set forth may have some weight with young and inquiring spirits? 337 No more terrible suffering can there be, than for an honest, loving, and virtuous nature to become involved in the meshes of pantheistic doubt and unbelief. 338 We must make up our minds to bear with many profound and painful mysteries which are not to be solved by human; 339 but may the good Spirit of God save us each and all from losing our childlike faith in His almighty, omnipresent, and absolutely good and holy government and providence!

POSITIVISM.

Rev. W. Jackson, M.A., *F.S.A*

3 Everybody has, I suppose, heard of the "positive" sciences, or "Positivism" in some shape or other. What does "Positivism" mean? 2 A system based on 'positive' facts. But what are facts? They are (says the Positivist) observed phenomena. 3 As for metaphysical conceptions of all sorts, these are 'negatives' with nothing real, nothing positively true in them. 4 Truth must be sought amongst observed phenomena. It is worth our while to examine this last proposition. Take a "'phenomenon'." You have all observed colour,-- what is it?

5 A physicist, if you ask one, will tell you of a modification in a ray of light variously produced-- by refraction, for example-- as when sunlight breaks a dark cloud into many-tinted beauty. 6 But how if all the world of humans and animals were blind? The physiologists will step in and

speak to you of the structure of the eye-- the susceptibility of its retina for special impressions; there they says you may find colour. 7 Put both accounts together, and they appear as part-causes, each a factor helping to make up a result; which result physicist and physiologist would agree to call colour.

8 Yet again: Suppose the human and animal world were deprived of all consciousness, all which in the widest meaning we call mind-- their eyes remaining like mirrors, telescopes, microscopes; perfect instruments, only every kind of intelligence, instinctive or rational, gone. Where would colour then be? 9 The sun might play upon cloud or rain, the light of a rainbow be reflected in the eye. Were there but perceiving mind, the impression would exist. 10 But we are supposing the impressible to be wanting; there is no sensation, no percipient; colour must remain unknown, for there is nothing capable of observing it.

11 Now this shows you, first, how important it is to emphasise the word 'observed' added to phenomenon. 12 It shows you, secondly, 'where' the ultimate seat of every observation really lies; each observed phenomenon, each positive fact, is at last neither more nor less than a mental state. 13 The evidence for each fact is the condition of your own mind, your consciousness as it is called. 14 You may sift the thing witnessed, verify, examine, and cross-examine; but after all, your own consciousness is the first real evidence you have got.

15 It would seem, then, that the most positive of all sciences would be the science of mind; 16 and the next most positive the sciences which enable us to draw conclusions from our positively existing mental states; the statements, we may call them, which our minds make to us. 17 Yet, strange to say, the very first thing Positivism does is to dispense with a science of mind, as mind, altogether. 18 Mr. Mill makes it a severe reproach against Comte, that he ignores both psychology and logic; recognises no power in the mind, even of self-observation; accepts no theory even of the inductive process. 19 Mr. Mill characterises Comte's

want of mental science as "a grave aberration." It is indeed so. This appears plainly enough in the example just adduced from our commonest sensation, the every-day phenomenon of colour.

20 It was made up, you saw, of three factors, a physical antecedent, a condition of the sensitive apparatus, and a mind which received into its consciousness the impression instrumentally conveyed to it. 21 This last, you will remember, was the 'first' fact to us. It is 'the' fact: the revelation of an outward world, its changes and its continuing presence, its rest and its constant motion. 22 Without this fact of inward consciousness, Nature would have possessed no more significance than pictures seen in the eyes of the newly dead.

23 Such being the case, it needs no argument to show the importance of making quite sure that our interpretation of Nature is correct.

24 If there be any unobserved illusion in our sensory instruments, or what must evidently be much worse, in our percipient mind, truth is at an end, and falsehood received in its stead.

25 Hence the necessity of observing our own observations, subjecting our consciousness to scrutiny, and being acquainted with the criteria, not only of our perceptions, but of our judgments.

26 It is this process of analysis and criticism which forms a large part of the method of verification,-- a method the value of which did not escape the great Greek philosophers, though some recent writers seem to fancy it a modern discovery.

27 Inexperienced observers are often so little aware of the pre-eminent importance of this critical process, that I will detain you with an illustration of it for the benefit of my younger auditors. 28 My example shall be taken from perception 'par excellence'-- our eyesight, 'the' sense pronounced surest both in poetry and prose. 29 You will remember your Horace

Segnius irritant animos demissa per aurem,
Quam quæ sunt oculis subjecta fidelibus, et quæ
Ipse sibi tradit spectator.

30 And almost everybody else has said the same, as witness the old

proverb, "Seeing is believing." 31 Now I will mention five instances in which people believe they see something, and do not see it; in other words, the objective antecedent is wanting, and the impression is produced partly by the sensory apparatus, partly by the mind itself. 32 As I describe these instances one by one, let my hearers ask themselves, ‘How does this illusion come about? Is it produced by our optic instrument or by our mental activity?’

33 First, then, Take a lighted stick, and whirl it rapidly round and round. You believe you see a circle of sparks-- in reality it is no more than a simple train, and on a like illusion the Catherine-wheel is constructed. 34 Again, put yourself in the hands of an optically inclined friend, and let your friend operate upon you thus. You shall place a cardboard down the middle axis of your face, quite close against your nose-- one side of your friend’s board, say the right, coloured a brilliant red, the left a vivid green. 35 After an instant or two let your friend suddenly substitute another board, white on both sides. Do my young friends guess what will follow? 36 Your right eye will see green, your left red--the reverse of what they saw before; yet neither will see correctly, for both eyes are looking at uncoloured surfaces.

37 Thirdly, Watch the full moon rising-- how large and round she looks, resting as it were upon that eastern hill, and seen amidst the tops of its forest trees! 38 How much larger and broader than when she hangs aloft in upper sky! Has every one here learned the true reason why? 39 If not, look at her through a slit in a card, and her diameter will be the same.

40 Fourthly, A schoolboy is crossing his bedroom in the deep dark night, anxiously hoping that his head may not come into collision with the bed-post. 41 Though carefully and successfully avoiding it, he imagines of a sudden that the blow is imminent. Quick as thought he stops to save his head, and, behold, the room is as quickly filled with sparks or flames of fire. Another moment, and all becomes dark once more. 42 I have heard many a schoolboy exclaim over this phenomenon, but

never knew one who could explain it.

43 Finally, did you ever, on opening your eyes in a morning, close them quickly again, and keep them shut, directing them as if to look straight forwards? 44 Most persons of active nervous power, after a few trials-- say a dozen, or a score-- are surprised to see colours appear and flit before the sight. 45 Some years ago, Germany's greatest poet tried, at the suggestion of her greatest physiologist, a series of experiments on these coloured images. 46 He found that by an effort of will he could cause them to come and go, govern their movement, march, and succession. And this took place under no conditions of impaired sensation, nor any hallucination of a diseased mind. 47 A thoroughly healthy will succeeded in impressing itself upon physical instruments, controlling their law, and creating at its own pleasure an unfailingly bright phantasmagoria.

48 Some here may, others may not, have apprehended the distinctions between our five cases. The first two are due to the sensory apparatus, its optical laws of continued impression and complementary colour. 49 In the latter three, mind intervenes. The enlarged size of the moon occurs through rapid comparison, the fiery lights in a dark room through instinctive apprehension, both influences of mind on the sensory system. 50 The fifth and most interesting of all is no bad example of interference between moral and material law. 51 The will truly causative (you may remark) overrules the natural process of physical impression, alters it, and creates a designed effect.

52 I wish I could induce my young friends to devise a number of experiments on similar mixed cases, and, having tried them, to dissect out their real laws. 53 These sharpenings of the critical faculty are exceedingly useful-- they cultivate clearness; and most people know that two-thirds among our mistakes in life are caused by confusion of thought.

54 Besides all other uses, such lessons teach at once the necessity, as we said before, of observing your own observations. 55 And as, first, the real witness of every

observation is our mind; 56 every fact which comes through our bodily senses being to us a mental impression, it seems but common sense to hear above all things what mind has to say for and about itself.

57 Then, secondly, where would be the benefit derived from our observations, if we could not reason upon them, or could place no confidence in our own reasonings? 58 Yet the art of reasoning is so purely a mental process, that it can be represented by symbols as abstract and free from material meaning as if they were bare algebraic signs.

59 Thirdly, in the most accurate of sciences mind extends our knowledge far beyond the circle of observation, and gives us axiomatic assurance of its own accuracy. 60 Who ever saw, or ever can see, all straight lines in all conceivable positions, yet who doubts that throughout the whole universe no two straight lines ever did inclose or can inclose a space?

61 And, fourthly, can it be a matter of indifference to any of us what evidence the mind offers concerning its own moral nature, and what is the value of that evidence, and the laws deducible therefrom? 62 How true it thus appears that "know thyself" lies at the root of all knowledge, and that the person who receives no witness from within can know nothing as you ought to know it!

63 Comte swept away all these and the like considerations by a neat little fiction of his own. We cannot observe ourselves observing, he said, we cannot observe ourselves reasoning. 64 So, then, logic becomes a chimera, and psychology a word of contempt. 65 Respecting this fallacy, Mr. Mill thinks the only wonder is that it should impose on any one. Clearly it imposed on Comte himself. 66 But, "what organon," asks Mill, "for the study of our moral and intellectual functions does M. Comte offer in lieu of the direct mental observation which he repudiates? 67 We are almost ashamed to say it is phrenology!" Mill regards this statement as a 'reductio ad absurdum', but the actual organon substituted is more absurd still. 68 Comte's phrenology was not the phrenology of Gall or Spurzheim, but a funny small

bantling of his own, a sort of "infant phenomenon," called into existence not without a Positive purpose. 69 In plain words, mind was no longer to give evidence respecting itself. We must study its laws in brain. 70 How any true correspondence of brain and mind could be known unless both were studied, does not appear. 71 Comte overlooked the question in his anxiety to substitute for psychology and its laws a bodily function and 'its' laws. Yet his motive appears to have been excellent! 72 He regarded this dwarfed superficial phrenology, Mr. Mill tells us, "as extricating the mental study of human from the metaphysical stage, and elevating it to the positive." 73 The chief gist of which sentence, bewildering to the uninitiated, opens up the very core and centre of the Positive system-- a subject for dissection of some considerable human interest.

74 Each science is brought into the positive stage when it is co-ordinated according to positive laws-- "systematised," Comte would say. 75 He has a perfect mania for systematisation; system is with him almost an equivalent for truth. 76 Of course, the real value of every system turns entirely on its co-ordinating method, or principle of formation; and Comte's, we see, was one of positive laws. 77 The nature of these laws is, therefore, the essence and turning-point of the whole matter. I cannot impress upon you too strongly the paramount importance of keeping this truth steadily in view.

78 But if any one inquires exactly what these laws are, he asks, I fear, a puzzling question. 79 Puzzling, for this reason that, say what one will-- employ any words, however carefully selected-- one may become liable to the charge of raising a false impression. 80 Positivist 'savans' themselves do not use any uniform phraseology, and many phrases they do use are necessarily derived from philosophies most disedifying to Positive ears. 81 Examples showing what sort of law is really meant are therefore always welcome; and few could be more instructive than this way of making mind Positive. 82 Comte did not falter in his purpose. Later

on he explained the necessity (for his system, you understand) of bringing our intellectual and moral phenomena under the same law with other phenomena of animal life; 83 and reduced them, not to brain action pure and simple, but to cerebral functions, controlled by the viscera and vegetative movements of our bodily existence.

84 Let us look at the meaning of all this. Soul used to be conceived of as different in 'kind' from body. The brain, the nervous system, the body, were its organs, allies, machines. 85 Sometimes they, especially the instruments through which the soul more immediately works, exercised reaction on their sovereign employer; they impeded or suspended her functions, and troubled her serenity. 86 But though they might cloud the manifestation, they could not destroy the essence of a living soul. What they did was temporal and transitory; but they shall pass away and be dissolved, while soul will endure for ever.

87 The word mind has been much used to signify soul, as acting in and through body. There is, however, some vagueness in its employment. 88 Yet we constantly speak of the laws of mind, because soul is in this life the partner of body; and therefore known to us as mind, and 'as' mind is studied through its laws. 89 One psychological task has always been to separate the pure activity of soul from the mixed workings of mind, by examination and cross-examination of our internal consciousness.

90 You will now easily understand how vast the change Comte intended by his physiological organon for the study of our moral and intellectual functions. 91 You will see what is meant by elevating mental science to the Positive stage, and systematising it under laws which people may variously describe as phenomenal, mechanical, or material; adjectives all roughly used to express the same general idea. 92 What we took for a spiritual essence is only a developed animal nature, the difference between humans and beasts of the field is not one of 'kind', but of degree. 93 humankind is a misnomer. Humanity is (as Comte thought) a higher degree of

animality. We have no right to suppose a personal immortality. 94 Human may be said to live after death in the memory of your fellow-humans, but the truly Positive philosopher believes in no other deathless existence.

95 What we really can see and investigate is a vast moving mechanism, 'our' universe. Beyond this all knowledge is a blank. 96 We know of nothing which set this mechanism in motion; it may have moved from all eternity; it may go on moving everlastingly; or it may wear itself out. 97 Philosophy can teach us no more than distinctions and degrees in the phenomenal law which pervades and rules a universe without a God.

98 Yet Comte said that he was no Atheist. He even denounced Atheism, and declared it as bad as theology. He did not wish to deny, only to ignore God. 99 Neither did he desire to appear ungrateful; God was a really useful hypothesis once; in the days when humans had recently issued from their primæval forests.

100 Thanking the Deity for His provisional services, Comte courteously dismissed Him from His throne. 101 All this will have seemed to you a most monstrous tissue of negations. But Comte held it to be a code of Positive faith; a faith firmly grounded on the self-sufficingness of human nature, 102 read according to his version of course-- void of belief in a personality which survives the grave, without knowledge of, trust in, or prayer to God. 103 The blessings of this advanced faith he desired to extend far and wide. At the present moment his desire is realising itself; for the like attitude of thought has become a favourite position among the 'savans' of our Western world. 104 When it penetrates the more active classes, we shall discern it easily by its 'fruits'! what those fruits will be, is a question for statesmen and for us all.

105 The chief hindrance opposing its spread amongst unsophisticated minds has been a point much dwelt upon of old by Plato, and by Cicero after him. It is the protest which that irrepressible entity called soul perseveres in alleging. 106 We are all apt to shrink from the picture of bodily dissolution:

SCEPTICS

"To lie in cold obstruction, and to rot;
This sensible warm motion to become
A kneaded clod!"

107 But what if the "delighted spirit" has been developed by brain, and with brain must be dissolved? 108 Our whole distinctive human life, our mind, moral, intellectual, spiritual, rebels against a doom of subjection to that crass material law! 109 Yet can we establish a difference? Can we show that the law of our true being differs from the law of things outside us?

110 This question, unspeakably interesting to every one of us, might be put in various shapes. We might ask, Can the protest of soul be set down as a mere sentiment only? 111 If it were no more than an instinct of our nature, it would deserve consideration; for why should so high and noble an instinct be aimless and misleading? 112 If we cannot trust our own souls, what are we to trust? Phenomena themselves are given us within.

113 Mathematical truths, which Positivists are obliged to exempt from phenomenal law, have a subjective validity-- we cannot help thinking them, and we cannot think their contradictories.

114 But suppose that a future state of recompence with its inferential moralities cannot be denied without denying our own consciousness-- pronouncing the clearest of our intuitions a will o' the wisp-- or, sadder still, a corpse light on the grave of hope-- 115 nay, more, without subverting the law which makes human society to differ from animal gregariousness, and gives to human action its spring, its liberty, its life-- suppose all this true, what shall, what can we say?

116 And such is the issue I propose to try. The plan I have devised for trying it fairly is, first, to get as clear an idea as short compass will allow of what Positivism says on our question. 117 Afterwards to state a case for moral law by way of antithesis. It is through the law of our moral being that we may most readily look for something to difference our souls from creatures below them. 118 The strain I shall

have to put on your attention lies in this; after grasping in brief the Positivist attitude, I must ask that you will not take my facts or arguments on trust, but will verify each severally by an appeal to your own consciousness. 119 It is always upon the law deduced from or applied to facts that you ought to exercise your greatest vigilance. 120 For law interprets facts to us--we might almost say that under its manipulation they bend like a nose of wax; nothing, you will remember, so flexible as figures, except facts.

121 Let me represent these maxims to you under a similitude. Everybody has looked (when young at least) through a kaleidoscope, and has observed the beauty of its many-coloured figures, their symmetrical shapes, and the enchantment of their succession. 122 What magic creates this phantasmagoria? Some pretty bits of coloured glass, shining gewgaws, scraps of lace, fripperies, and other odds and ends, are put into a translucent box, and beheld through a tube fitted with mirrors which are set at an angle determined by optical law. 123 The broken knick-knacks represent the facts of everybody's phenomenal kaleidoscope; the reflecting angle under which they are seen is its law; the coloured images are everybody's impressions of things, Nature, and humankind.

124 As long as you live, remember that whenever you are contemplating the world's phenomena--whenever you see facts of life, either great or small, you are looking at them through some optical instrument or another. 125 If its law accords with their law, your view is truthful; but then it will be all the less pretty, the less symmetrical. 126 There are dark spots in our real world, checks of all sorts, moral evil, anguish of heart and conscience, foresights, stern accountabilities!

127 You have lost your childhood's magic glass, and have got a clear reflecting telescope in its stead! Pity to forego the nice kaleidoscope where all was so bright, so harmonious, and arrayed in such regular shapes. 128 Yet the view it gave was worth what most people's views are worth--precisely nothing!

129 Comte had his kaleidoscope. Every systematiser who allows no mystery, no darkness anywhere, must keep the article; in point of fact, most people enjoy having one. 130 Alas! for the 19th century! It has such a feverish viewiness, such a fashion of incessantly turning its magic tube, that life seems little else than a dreamy phantasmagoria!

131 To construct a steady reflecting instrument for yourself requires industry, time, and thought, three things which few people care to bestow upon their beliefs. 132 Therefore the practice is to pick up kaleidoscopes ready-made at a cheap rate, and to feel as easy as stern realities will permit on the subject of their truthfullness. 133 Romances are the kaleidoscopes of one class, cram-books of a second, newspapers of a third, self-love the optical law of the greatest number.

134 We are met this morning to break up a grand kaleidoscope, and to look into its construction. I shall do my endeavour to prevent you all from replacing it by any instrument of a ready-made sort. 135 The easiest plan for all lecturers is to display a series of transparent conclusions; but I shall prefer furnishing you with facts and arguments, letting you put them together, look at them, and verify their law of true vision for yourselves.

136 Let us see Comte's law first. It was, strictly speaking, a law of succession and resemblance. 137 You will guess at once that were this all we could see in the phenomenal world, our insight would be very limited. And Comte's object was to limit us. We can never know,

138 Positively speaking, final causes; those which make up the common notion of design, purpose, intention. Nor yet any efficient causes; nothing truly productive of an effect, as humans usually say. 139 All we can know is the middle of a chain of successive phenomena. The two ends are absolutely hidden from our eyes. It was in this sense that Comte denied causation-- 140 his language was vigorous; he denounced it as metaphysical, and when Comte nicknames anything metaphysical or theological, he means, as everybody knows, Anathema maranatha.

141 The difficulty here is palpable. A law of averages-- a statistical law, as it is often called, does not profess to account for anything; it merely generalises crude material, and gets it ready for scientific thought to work out the true law. 142 But a law of succession has an imposing sound, and it does in the worst sense impose. The fallacy may be shown in an instant. 143 Day and night succeed each other regularly. Does either 'account' for the other? 144 The rotation of the earth is simultaneous with both-- it accounts for both. Its effect is to expose the earth's two hemispheres alternately to the sun's rays. 145 This rotation coincides again with other laws of our planetary system, and they account for it. It is on these laws, and not on such grounds as Hume, Comte's great Positive antecedent, alleged, 146 that we look for sunset and sunrise. When they fail, the system of which our globe forms part will have collapsed.

147 Such then was the original kaleidoscope of Positivism. It was condemned for reasons which will have plainly appeared to you. Other eyes have swept the field of vision this world offers, and other instruments to aid our insight have been adopted.

148 You will not have failed already to remark the extreme vagueness of that word "law." 149 There are very few English words more vague: it is applied to almost every sort of formula, force, principle, idea; besides being misused in ways almost innumerable.

150 You must therefore, when busy with questions like the present, fix your attention upon the adjectives added to it, and the examples selected by way of illustration.

151 The Positive system is, according to Littré, of immeasurable extent, embracing the whole universe. 152 Thus, whatever was conceived in dark preparatory ages, theological or metaphysical; whatsoever persons, who philosophise in either of those antiquated ways may even now dream;-- if the conception cannot be reduced under Positive laws, it must be regarded as non-existent. 153 All that really exists is included within such laws, the definition of which, therefore, becomes a subject of the greatest

possible importance. They are, he says, immanent causes.

154 The room we are in contains intelligent and educated people, but how many here could define this word "immanent"? 155 It and its correlative, transcendent, are in truth metaphysical terms. If you will turn to Mellin's Encyclopædic Word-Book (favourably known to metaphysicians for purposes of pillage), you will find 'immanent' explained, under the German 'einheimisch', into ten shades of usage. 156 Probably, in common English Littré might have said "inherent." "The universe," he writes, "now appears to us as a whole, having its causes within itself, causes which we name its laws. 157 The long conflict between immanence and transcendence is touching its close. 158 Transcendence is theology or metaphysic, explaining the universe by causes outside it; immanence is science, explaining the universe by causes within itself." 159 Now, one stock-in-trade example is that a stone falls to the ground by virtue of an immanent cause. In plainer words, the stone belongs to universal matter of which gravity is an inherent law. 160 Next, we find this same example Positively applied to the human will. Volition is free just as a falling stone is free; it obeys its own inherent law.

161 Further, we read of "the rigorous fatalities which make the world what it is." Comte, Littré, and others object against calling these fatalities materialistic, because they distinguish gradations of law. 162 Yet they limit all human knowledge within the materialistic circle, and Janet, who refuses to acquit them of Materialism, dwells on the point that, instead of defining mind as an unknown cause of thought, emotion, and will, 163 it is said to be, "when anatomically considered, the sum of the functions of brain and spinal cord; and when considered physiologically, the sum of the functions of brain in consciously receiving impressions." 164 We need not wish to dispute about words. But suppose it had been stated in plain French or English that all known or knowable objects in the universe are placed by Positivism under the rule of laws

as rigorous in their fatality as the laws of matter, would not the ultimate point in question have been more tangible, more intelligible? 165 People might indeed have said, "Why, after all Positivism comes to the same thing as Fatalism, or Materialism;" and with certain writers this risk may very possibly be held a decisive objection.

166 Once more,-- another explanation given by Littré is, that Positivism lies strictly within the "relative." 167 Many here are aware how, since Kant's time, England, France, and Germany have been flooded with metaphysic, good, bad, and indifferent, on the relative and the conditioned. Pity that Littré should have plunged into these whirlpools! 168 Ravaisson refers to Herbert Spencer and Sophie St. Germain for the point that this conception, the relative, must always imply the existence of an absolute, known or unknown. 169 I cannot follow him now, but any one interested in doing so will find the subject commenced of his "Philosophie en France," (one of the Imperial Reports). 170 It is a very important discussion. Ravaisson stands out amongst Frenchmen as a consummate master of his science; and he inclines to infer that Comte tended, and that Positivism generally now tends, towards a final return to metaphysic. 171 However this may be, I fear I have tired you, and am glad to quit this dry part of my lecture, and get away to more common-sense ground.

172 By way of introducing our most interesting topic, let me draw one common-sense conclusion from the difficult tract just shot over. 173 During our passage, a thought may have flashed upon you which I remember hearing in a Bampton Lecture, somewhat to this effect--"Positivism is the most negative system of all." 174 It appears hard to avoid this idea; for Positivism denies in express terms that human beings have any knowledge outside those generalised laws of experience which make up the Positive sciences. 175 It denies (in a word) the most essential part of what was formerly held to be a knowledge of mind, both human and Divine.

SCEPTICS

176 Positive thinkers rebut the charge of negativism this way. We confine ourselves, they say, to what we know; we do not venture, like Pantheists and Atheists, into the unknowable. 177 We do not deny God, we only ignore Him. We do not ask about the first cause of the world, or whether it has a constructural final end. Such questions as these are "disedifying." 178 "The Positive philosophy," says Littré, "does not busy itself with the beginning of the universe, if the universe had a beginning-- 179 nor yet with what happens to living things, plants, animals, humans, after their death, or at the consummation of the ages, if the ages have a consummation."

180 Littré's sentence, which I have rendered 'verbatim', reminds one of the prayer told to Bishop Atterbury, as offered by soldier on the eve of battle: "O God, if there be a God, save my soul, if I have a soul!" 181 I am sorry to repeat ill-sounding words again; but is not this really the exact religious attitude of an honest Positivist, who feels sometimes touched by visions of possible life after death, 182 "Of all the nurse and all the priest have taught;" that is, if we conceive his attitude according to the 'least' negative interpretation put upon the system?

183 Continuing this least negative interpretation, let us view under its light the Positive cosmology or theory of the world's existence; of creation,-- that is to say, if there ever was a creation. 184 A stone falls to the ground. Trying to account for the phenomenon, we grasp a law inherent in the material world. Other phenomena lead us to other laws. 185 We contemplate the material world with its laws in operation, a magnificent spectacle of moving forces; an organic whole, shining through its own intrinsic glory of never-ceasing development. 186 If we turn and pursue the reverse road, and trace evolution back to its elementary principles, we may dissolve worlds into primordial force, 187 or we may, as Professor Tyndall suggested at Liverpool, find the All in a fiery cloud occupying space. 188 Then comes the complex question, What beyond? What before? Whence, and How produced? 189 A

Positivist thinker may return one of two answers. He may either say, "We do not know," or he may say, "Nothing can be known." 190 Take the least negative first, as we proposed; it surely deserves this rejoinder: If you plead ignorance, but surmise that knowledge is possible, you ought not, for reasons valid with every true lover of wisdom, to stop here. 191 You are substituting for the ideas of creation and first cause, what you call a primordial universe, a material condition of some kind, producing phenomena regulated by inherent laws, successive, perishable, and nothing more! 192 All once believed beyond, a blank! Even the very name of philosophy consecrated by consent of ages to the First and to the Last, admonishes you. 193 Renounce your vocation, deny your name, or proceed. We demand a Positive result in the highest sense, not a fog of ignorance, not a slough of despond. 194 But if the second answer be the true one, if the teaching of Positivism is that nothing more can be known, let us be told so in plain words. 195 Let no one be charmed into the Positive circle by false allurements; for of all vices treachery and hypocrisy are the most cowardly. 196 Are you really wiser than the pagan Lucretius? If not, why boast of 19th century discoveries in wisdom, insight, happiness?

197 If you have examined the relics of a primæval world, explored the races of living and thinking creatures, 198 if you have ascended to the starry firmament, and traversed its shining hosts, to come back with shame and disappointment, and tell us this is 'your' all, 'our' all, then indeed the wages of your science is death. 199 While you speak your final verdict at least cover your faces,

"And, sad as angels for a good human's sin,
Weep to record, and blush to give it in!"

200 These thoughts have brought us to the most essential considerations of this lecture. Whether the Positive 'savant' puts in a plea of ignorance or of blank negation, we care not. 201 We will treat it as a challenge thrown down, and do our best to meet it.

Succeed or not, we will take no refuge in ambiguities, but maintain a truly positive assertion. 202 We say that the world we live in is not one world, but two, distinguishable through the laws by which each is governed.

203 There exists such a thing as phenomenal law; we accept the fact. But distinct, broadly distinct, apart in its working, its elements, and its final result, is moral law. 204 An appeal lies to facts, and we shall try to justify our assertion. The mode of proof now to be adopted is not metaphysical. I mention the circumstance because investigations into mind are apt to be confounded with metaphysic, and are then supposed too difficult to deserve attention. 205 My argument will demand nothing beyond a hearing and a scrutiny. It will consist of just so much mental dissection as may be needful to show, first, a structural law of our inward nature, and, secondly, to illustrate its workings and effects. 206 These two sets of facts will be placed side by side, in order that each may check the other, and that their coincidence may also (as I hope it will) furnish a fresh and sufficient proof of the contrast between moral and material law. 207 Everybody knows how convincing are, and ought to be, facts separately ascertainable, yet converging into one and the same conclusion.

208 One form of speech almost unavoidable ought to be remarked beforehand. I mean the word freedom as applied to the human will and its volitions. 209 When compelled to use it, I shall do so only in the sense of philosophic as contrasted with theological free will. 210 By philosophic freedom I understand that sort and degree of active choice free from constraint which is required for the idea of responsibility, an idea universally agreed on by divines opposed to each other on the point of theological freewill. 211 By this last-named idea I understand supposed powers of spiritual attainment, which go to make up a notion of self-sufficing moral strength. 212 With it the present lecture, being purely philosophical, can have nothing whatever to do, but I should much deplore misconception, because any theory of self-sufficingness

would be repugnant to my own personal convictions.

213 Look now at the life of an animal, with senses often more instrumentally accurate than ours. 214 Survey the world around, which furnishes the objects of your perception and your intelligence. 215 The mode in which that intelligence acts is held to be more or less under the absolute rule of instinct, and creatures below human are commonly described as those "that nourish a blind life within the brain."

216 Whether this be or be not perfectly correct makes no difference to our present purpose. The point I want you to fix your thoughts upon is the 'directness' of relation between the feeling or intelligent principle of mere animal life, and the object perceived, felt, or apprehended. 217 Perhaps it may give vividness to your thought, if you figure this relation under the similitude of a right line connecting two points--object without, apprehension within. 218 The line itself will then represent the impulsive activity of a creature, as, for example, when a hungry tiger leaps upon his prey.

219 Now this directness of action is 'not' the thing most marked in our own proper human existence. What is really marked is the exact reverse; 220 the more truly 'human' any action appears, the farther is it away from resemblance to that animal characteristic. 221 Suppose a person acts like a tiger, you are simply brutal; if you be governed by your feelings, however amiable, we pronounce you weak or unreasoning. 222 Absolutely impulsive doings, such as the indulgence of an appetite, blows struck in passion, or even in self-defence, we separate from our volitions proper, and call them irrational and instinctive. 223 In educating children we check displays of impulse, we bid them pause and reflect. 224 And it is obvious that education presupposes an educable power or principle, which principle self-education (the most important training of all) will place in a clear light before you. 225 Interrogate yourselves, then. You will see that the mental power you most wish to train and augment is distinguishable enough even in the commonest affairs of life. 226 Take

a case of feeling. Some object-- no matter what-- kindles an emotion within you-- anger, wish affection, pursuit, dislike, avoidance-- and you feel strongly impelled to take action thereupon. 227 This would be the movement which was imaged to our minds as a simple line. But to launch along it inconsiderately you would feel neither proper 'per se'-- 228 nor yet doing what is due to yourself, because it is your human prerogative to act, not according to impulse, but according to reason. 229 And observe, to do, or to forbear doing, is a question by no means determined by finding whether another emotion be or be not stronger than the first. 230 What reason demands is that the impulse you feel, or it may chance the strongest of a dozen impulses, shall become to you an object of careful scrutiny. 231 You are bound in honesty to scrutinise it; not only because it exists as an incitement felt within yourself, but much, much more because it is felt to be your actual self. 232 It is your character which gave the spring, and lives in the movement to action. 233 Perchance this point of character is a hidden nook, an unknown depth of feeling or desire, undiscovered, unsuspected by your fellow-creatures-- a secret of your inner self. 234 Nevertheless it is amenable to the tribunal of a more inward self still, to be brought before it as an object that shall be examined and cross-examined, sentenced either to vivid freedom or present suppression-- it may be even to extinction evermore! 235 Each human being possesses this wonderful self-objectivising power. You are able to look at yourself as a NOT-self-- a something partitioned off, and external; to be thought about, felt about, reasoned about; to be controlled, chastened, corrected. 236 This power is our inalienable heritage; we cannot resign it if we would; we cannot finally suspend its exercise. 237 Mountains could not crush, nor oceans drown it; flames of fire never burned it out from the breast of one single martyr. 238 Whether we use our birthright for good or for evil, it still remains with us; when we act, our will is not a feeling, an appetition, travelling simply from

one point to another. 239 It is a movement of our world within, a movement of that microcosm called Human. 240 Suppose a person resolves to employ this power aright. Some wish or feeling, such as might drive a lower creature to instinctive action, stirs within you, and becomes the object of your contemplation. 241 To the sessions of silent thought you summons whatever assistants you can get; the witnesses of experience, prudence, duty, the golden rules of the Gospel; 242 whatever seems most proper to determine the question at issue,-- fitness or unfitness, to act or to abstain from acting.

243 You says to yourself (as all here have done a thousand times), "This longing, thought, state of mind, is wise or foolish, good or bad, right or wrong; nay, 'tis I myself that am so!" 244 And in thus saying you are conscious of that sort of freedom to will or not to will, which makes up responsibility. 245 You does not deny-- contrariwise, with the might of your whole essential humanity you asserts-- 246 that the act of will is thus taken out of the direct line of inevitable antecedency, away from the physico-mechanical series, and enabled to commence a series of its own.

247 In a word, your consciousness evidences to you that functional law which makes the human soul a thing more wonderful than all the inorganic or all the animated universe besides. 248 And the law thus evidenced is the law of moral causation.

249 I said that our own soul thus becomes to us more wonderful than all the known universe besides. 250 I might have said more mysterious; so truly 'sui generis' and different from all things not ensouled, as to be inexplicable by human sciences, an enigma to itself, dwelling alone in its own awful isolation. 251 Do but think what 'cause' is-- nothing less than originating power; what then must it be in stern and sad reality for a soul to originate a sin! 252 Yet we cannot deny the fact. We confess it every day, not only in our hearts and deeper utterances, but in the commonest

though most tremendous of words, the word responsibility.

253 If a person were in no true sense the cause of own actions, you could never be held responsible either by God or Human. 254 But as long as Justice maintains her seat, each criminal will be so held, so judged, so recompensed. 255 And the only principle under which Justice can justify her judgments is the reality of moral causation.

256 If, then, this law be established, we have proved our point. Just as we recognise a material world by mechanical law-- and indeed our knowledge of matter itself is only a knowledge of its laws-- 257 so in like manner, and 'pari passu', we recognise a moral world by its distinctive law. 258 We live, therefore, not in one world, but in two:

"Human is one world, and hath
Another to attend you."

259 The point is of surpassing importance! Upon it turns the whole issue. "Can mechanism-- or, as it is vaguely called, materialism-- be or be not accepted, with its attendant theories, as the truth; that is, 'our' whole truth, all we have to live by and to die by?" 260 Infinitely important issue! Having much to do at this very moment with the happiness and real good of millions amongst our fellow-creatures and fellow-country-people. 261 It is for this reason we must not spare pains to demonstrate our moral law, for this reason also we will give some passing sentences to show how worthless in argument is the sophism most commonly circulated against it.

262 Humans speak of a "law of motives," with complete assurance, and without seeming to be aware of the twofold fallacy underlying it. 263 Writers on the subject furnish statistics of suicide, murder, and the like; and then ask how the freedom of moral cause can be compatible with so visible a law? 264 But what sort of a law is this? Clearly not a law upon which the results are conditioned, as sunrise on the earth's rotation; but a mere generalisation, like the laws of average before mentioned. 265 Such a law does not govern the acts, but the acts the law, or, in plain words, they 'are' the law.

266 It is an epitomised result, inferring no more consequence to our free moral causation, than a life assurance infers to the contingency of our individual life or death. 267 The sophism would be readily detected if it were not for that unfortunate word "motive." 268 People forget that a motive is not a power that compels us, but an object which we choose to seek. 269 "Will," we are seriously told, "must be determined by the strongest motive." 270 Now if, in thus speaking, the strongest motive 'objectively' be meant, that is the motive essentially and in its own nature the strongest, then indeed we may exclaim, "Would that this were true!" 271 For are not right, justice, goodness, absolutely and in themselves the strongest? Yet humans in general fail to pursue them; they are chosen by those of whom the world is not worthy. 272 But if, on the other hand, the phrase "strongest motive" is to be understood 'subjectively', and means that which on each occasion is 'felt' to be the strongest; what form of sounding words has ever yielded a more barren sense, a simpler truism? 273 "Will must be determined by the choice of will." It means this, and nothing more.

274 We may sum the whole matter of motive in a single sentence. Motives do not make the person, but the person your motives. 275 To conceive it otherwise would be to imagine each person a mere bundle of instincts, such instincts as we calculate with certainty in the brute animals we wish to allure, to subdue, or to destroy.

276 "Be not like dumb driven cattle," says the Psalm of Life, and old Herbert exhorts--

"Not rudely, as a beast,
To run into an action."

277 The beast feels an incitement, and rushes direct upon the pitfall. 278 It is the prerogative of a true human to subsume (as logicians speak) each line of impulse into the circle of own soul; 279 to deliberate in the secret chambers of a being impenetrable even to your own understanding, and to put in force the result which becomes as it were the free manifestation of yourself. 280 When therefore you examine the actions of a fellow-creature, and

discern their motives, you praise or blame what? Not the motives, but the person.

281 Permit me to close this discussion by an example of the manner in which we make and unmake our own motives. No one present is so young, or so careless, as never to have felt the pains of self-reproach. 282 Some light or shade of life projects before us the outline of ourself. By virtue of the law described, we view and review it, as if it were the picture of another being. 283 In contrast with it, we place our own ideal, all that our childhood fondly fancied our adulthood would become; 284 the semblances of those we have loved and lost; of the father, who taught us to prize truth and virtue above earthly wealth and distinction; 285 of the mother, at whose knee we knelt in prayer, and whose upraised eye imaged the serenity of that heaven to which she implored us to aspire. 286 These beloved forms, robed in the unfading freshness of a love stronger than death, stir our heart of hearts, with accents unmistakable. 287 They remind us of what we resolved and trusted one day to be found, in thought, in feeling, and in life.

288 But, close to the glowing portrait of our purposed self stands the dwindled figure of what we actually are; and, oh, the shame, the anguish of that stern, disappointing comparison!

289 Among the lower creatures (we ask in passing) what is there to resemble this self-reforming principle? 290 In the domesticated animal, both beast and bird, we see wounded affection, grief under a master's anger, and desire to win back own love. 291 In the gregarious tribes we find respect for a common bond of what we almost may call utility; but has any sense of wrong as wrong, or sin as sin, ever been found educable? 292 Human shows the mighty strength of this principle within you, even when you shows it in its most repulsive shapes. 293 The remorseful wretch who throws the self beneath the wheel of Juggernaut, is a different 'kind' of being from the horse or dog. 294 And considering the self-interest, self-flattery, and self-indulgence arrayed against it, may we not say that the root of such passionate

remorse has something sound in it, else it would long ago have been trodden out from the life and heart of humankind?

295 For now, as always, our honest anguish and shame sow the appointed seed of our noblest attainments. Those steps by which we climb our steep ascent are hewn in the travail of our souls. 296 David found it so, when he heard the voice of Nathan saying, "Thou art the man!" and wrote words which have come down near three thousand years;-- "The sacrifices of God are a broken spirit." 297 "Of all acts," asks Mr. Carlyle, "is not, for a human, 'repentance' the most divine? 298 The deadliest sin, I say, were that same supercilious consciousness of no sin; that is death; the heart so conscious is divorced from sincerity, humility, and fact; is dead; it is 'pure' as dead dry sand is pure. 299 David's life and history, as written for us in those Psalms of his, I consider to be the truest emblem ever given of a human's moral progress and warfare here below."

300 Truest emblem indeed! In it, we see, as in a glass, how living in two worlds we cannot but have a sympathy with each; insomuch that every human feels the self to be two selves, not one; a spiritual and a psychical human. 301 "There is," says Sir Thomas Browne, "another human within me, that's angry with me, rebukes, commands, and dastards me." 302 A 'double' consciousness which grows upon many a soul, until its truer choice and better motives are attained:

303 "The life which is, and that which is to come,
Suspended hang in such nice equipoise
A breath disturbs the balance; and that scale.
In which we throw our hearts preponderates."

304 This lecture started from the question, what is a phenomenon, and how do we know of its existence? 305 Seeing that our knowledge rests primarily on the evidence of our own mind, we drew the inference that Comte committed a fatal error when he banished the science of mind, as mind, from his cycle. 306 Reviewing his various devices, and some devices of his

successors, for eliminating psychology, and reducing the study of mind to a study of bodily functions, we approached the stronghold of Positivism,-- law. 307 And, after discussing the theories maintained respecting it, we boldly threw down our challenge to this effect: law phenomenal or mechanical admitted, we assert, the existence of another kind of law. 308 We say that the freedom of human choice between evil and good is utterly unlike the freedom of a stone which falls by mechanical law, and cannot choose but fall. 309 The inference from phenomenal law is the existence of a phenomenal world. The inference from another existent law is that there is another existent world. 310 Human, we affirm, lives in both; has sympathies with both; and, by virtue of your double nature, is a true citizen of both. 311 The ultimate principle of human's higher nature is to us inscrutable; for, even as the eye sees not itself, so neither does the spirit of a human discern that which makes it spirit. 312 But, though we cannot know the soul, we can know much and many things about it; things most important-- 313 nay, all-important for us to know, since they distinguish the spirit that burns within us from matter, from mechanism, and from mere animality. Hence we do not, with the Positivist, ignore the unknowable.

314 Contrariwise, confessing our ignorance, where we are ignorant, we strive to observe and gather all we can.

315 One thing that can be thus known is the principle of moral causation; and this we have inductively investigated. 316 We began by observing a process in our own minds, a process or law of self-objectivity. 317 I am sorry to use such an uncouth word; but it saves a long description, and you will all remember the fact. 318 That process carries, on the very face of it, adaptation to the purposes of moral choice, free from the material necessity which governs a falling stone, and disengaged from the control of such impulses as the incitement of ruling instincts. 319 We next verify this law by observing its operation; 'first', in single acts of the Will

accompanied, as you will recollect, by distinct consciousness of choice and responsibility. 320 It was in respect of this conscious certainty that Dr. Johnson said, "We 'know' we are free, and there ends the matter." 321 We verified, a 'second' time, the self-objectivising law, by its working and effects upon our motives, which it makes and unmakes; eliminating some, adopting others, so as to modify and alter our whole real character. 322 Any one who is happy enough to recall the slow advances of successful self-education, or a less ordinary process by which old things passed away and all things became new, may recollect with pleasure how this law served as an instrument of change; 323 how it placed yourself before your own inward eye, even daily, in freshly instructive lights, awakening new self-questionings, emotions, aversions, desires, hopes, and stimulating to new exertions; 324 how it opposed itself to the mastery of any single dominant passion, under which we say a human acts mechanically, because you have already surrendered yourself a slave to its sway; 325 how it became a check upon all day-dreaming or drifting with the tide, when again we are said to act mechanically because we yield to circumstances as they flow, and live a blind life, like creatures that cannot escape the chain of Instinct.

326 For, observe: let any instinct, even the noblest, be ever so nobly developed, if we act from its impulse only, and not from a reflective choice of the prompting which it gives, 327 we are living below the image of our true nature, because we are not striving to become a law unto ourselves.

328 You may verify our moral law in numberless ways among the common walks of life; and it really is a task of no great difficulty, if you take with you the truth that the whole issue is summed in one word-- Responsibility. 329 A falling stone cannot choose but fall; were a human subject to material law, you could have no choice whatever.

330 Neither would it make any real difference, if the Will were impelled by overpowering motive, and did not make its motive to itself. 331 The slate which slides

from a roof, and kills a child, we do not accuse of murder; we do not attach moral accountability to the hungry tiger. 332 It is because human is not impelled like stones or tigers, that we hold you responsible. 333 And we praise or blame in the highest degree your most deliberate acts. 334 The wrong you does with malice aforethought is a crime in the strongest sense; the good you works with considerate purpose we esteem your highest well-doing. 335 In our time the wills of individual humans have changed the destinies of nations; and any one who reads books, reviews, or newspapers sees a vigorous use of that word responsibility.

336 No one doubts that these powerful wills are the true causes of effects felt throughout all Europe, effects which will remain when those who caused them are in the grave; nay, even when generations-- perchance dynasties-- shall have passed away.

337 In lower life, we honour the truly causative human who conquers a habit of intemperance or any evil passion: 338 it is greater to overcome one's self than to conquer many cities. 339 We deem every one accountable for what you allows, or disallows, in relation to your God, your fellows, or yourself. 340 In a word, we consider each human so far the true cause of own conduct, as to load you with responsibility. 341 Yes, responsibility! Do not shrink from the thought; it is wholesome for all. 342 Do but practise self-control enough to look yourself with honest purpose in the face when you are about to act, you will never suppose that you act mechanically, and you will seldom act amiss. 343 If you wish to benefit your country-people, inculcate the grand lesson of responsibility; 344 for what well-informed person doubts that one main root of our present social and religious ailments lies in compromise with known immoralities, indolent acquiesence in hollow words, and lifeless outside shows, 345 where ought to be heard and seen the rigid truths of accountability, duty, consistency?-- all impossible without a practical law of self-scrutiny and self-control. 346 Yet

further: Responsibility is also an undeniable witness to a world of life beyond death. 347 Just as even Herbert Spencer himself has remarked, that the idea of relativity involves the correlative idea of an absolute; even so, in thought, responsibility involves its correlative belief, a recompence! 348 But, in morality, the evidence is stringent beyond expression. For, the idea of responsibility is fixed in the nature of things; unchangeable, eternal.

349 And it contains in itself the loftier idea of personality. Leading us to look for a world of righteous recompence, it leads also to belief in a personal Being, before whom we are responsible, and who will award to each of us our recompence. 350 David travelled the same road to the same conclusion, when he looked round upon people, who lacked mercy because they lacked justice, and said, "Unto thee, O Lord, belongeth mercy: for thou renderest to every human according to own work."

351 Did I not feel that my strain upon your attention must now cease, I should have liked to show at length how the law by which we discover moral causation, may be verified everywhere in the whole province of mind. 352 It is difficult, for instance, to look at the perplexing questions raised about language, without perceiving that there runs through its purely human formation the articulate results of an element resembling internal dialogue; in other words, a law of self-objectivising representation. 353 In art, again, the perpetual efforts of ages is to present our human manifoldness of thought, feeling, and idea, before our one individual self. 354 Hence the art formula of multeity in unity. And what is the true bond of society as distinguished from gregariousness? 355 Is it not the Gospel's golden rule? But how can our neighbour be viewed as a second self, unless self has been already objectivised before our moral intuitions? 356 We might follow the same thread throughout the conditions of all philosophy. 357 The one thing we have to remember in every research concerning human is that education, whether of self or

others, implies an educable principle; a germ, of which education and attainment are the bud, the blossom, and the fruit. 358 Therefore, if we want to know Humanity, we must look to the educated human being. 359 The philosopher, the artist, the thinker of every sort, must have risen into clearness ere you can become a typical person. 360 Is it not, therefore, a mistake to appeal for theories of human nature to the statistics (always statistics!) of ignorance and savagery? 361 When modelling our physical form, Buonarotti did not seek his type in hospitals for maimed or distorted limbs, and exclaim, Behold, such is human! 362 Curious too, and contradictory, the way in which appeals to barbarism have worked. In the 18th century we used always to hear of that golden age,

363 "When free in woods the noble savage ran,
And man, the brother, lived the friend of man."

364 In the 19th century, savage life is cannibalism, superstition, cruelty, terrible, revolting, loathsome; perchance, time must yet pass before we learn justice to our fellows of any age! 365 Meanwhile, we may feel sure that our human ideal is not to be found in the frost-bitten rickety infant species; nor yet in its dwarfed and stunted adult; 366 the cretin and the imbecile will not give its lineaments; and it may be hard to say which is least like a true person, the undeveloped or the perverted creature. 367 For example, what superiority in moral height has the 'savant', whose self-satisfied science ignores or denies a God, over the poor pigmy barbarian, 368 unskilled in the use of fire, and living upon berries and insects, who props themselves against a tree with earthward face, 369 and prays, saying, "'Yere', if indeed thou art, why dost thou suffer us to be killed? Thou hast raised us up. Why dost thou cast us down?"

370 Better perhaps the rude stammering of our race's childhood than its half-speechless, half-paralysed old age! 371 And here the argument of this lecture ends. Of causation in general, and the grand subject of design, it has not been my hint to speak.

372 These vast topics have fallen into higher hands than mine. My aim was limited to finding the 'differentia' of human-- the moral characteristic which places you in contrast with physico-mechanical laws.

373 It occurs to me, however, that you may employ ten minutes not unpleasantly, upon what we can hardly help calling the romance of Positivism. 374 The story, taken from first to last-- part comic, part tragic-- is as wild and weird as one of the Frenchman Doré's pictures,-- a story too strange to be thought true, if it did not happen to have been true! 375 It has also its stinging lessons, and they follow naturally; evolved, as it were, from the motley and mystifying commencement.

376 Comte's life has been written by friend and foe. For fullness of detail the right book is by his disciple and executor, Dr. Robinet, who has just figured among those who rule in the Commune of Paris. 377 Robinet is very interesting, for he thoroughly believes in his master, and accepts the whole Comtist religion, calendar and all, which Littré and others reject. 378 No reproach this to Comte's biographer, for that same worship is celebrated in our cooler atmosphere of England. The 'Pall Mall Gazette' has, by its notices, made the celebrations widely known.

379 There is an account of the grandest yearly solemnity which will suffice many, and excite the curiosity of more, in its number for January 7th, 1868. 380 It is not hard to see that the worshippers differ from the recusants by a strong feeling that they cannot live upon axioms sounding like negatives. They want sentiment, emotion, excitement to sustain them.

381 Let us observe how Comte caught the first glimpse of this requirement. His life was sombre-- a boy delicate and fractious, disliked by his masters, turned out of the Polytechnique, repudiated by his great socialist teacher St. Simon. 382 His family relations not happy, his marriage least of all. We cannot wonder at vagaries, for he had a real fit of rampant insanity, and after release from an asylum had nearly drowned himself in the Seine. 383 His wife

found him intolerable, and left her home. Mr. Mill speaks of her respect for him;-- it was oddly testified after his death, for she pleads in law that he was a madman, an atheist, and immoral; 384 repudiates his will, and seizes the consecrated relics of his dwelling. Littré supported her against those who, like Robinet, thought her little less than blasphemous. 385 If she had appeared in an English law court, we should have known more truth than we do. Let us now look at such facts as we have from the more favourable side. 386 The man lived a lonely life, as became a sort of conceptual alchemist, sustained by a belief that he was turning men's leaden thoughts into his own pure gold. 387 One brilliant projection of his has made him the idol of Positivists. I confess it puzzles me, among many others, to imagine how a qualified critic can treat such a philosophic solvent either as true or as original. 388 It supposes the history of all human thinking to pass necessarily through three stages, theology, metaphysics, positive truth; and that the world makes progress accordingly. 389 We will hope that the thing called theology, a benighted belief in the government and intervention of supreme will, is not altogether extinct in this age of progress; if it be so, Mr. Froude encourages us to look for a revival. 390 Among lesser matters, the hypothesis of metaphysical cookery is an idea one fails to realise. Was it a banquet with joints cut Laputa-like, after some fashion of concepts, or syllogistic figures? 391 Was it a

"feast of reason and a flow of soul,"

or, more probably, an abstraction pure and simple, as if a person could

"Cloy the hungry edge of appetite
By bare imagination of a feast"?

392 Comte's comicalities strike most people all the more because he writes on, always utterly insensible to his own comedy. 393 If any one wishes for a serious critique in small compass, I may mention Stirling's appendix to his translation of Schwegler's Handbook; Whewell in his Philosophy of Discovery, and elsewhere. 394 Comte was most confiding in his own theory. Littré

is not so confident, for he has another theory of his own. But, putting aside the question of its verification, we may remark that in the rough idea Comte showed himself before his age. 395 Positive thinkers have busied themselves with physical evolution; for example, the development of a brain from an oyster or an eozoon; but Comte was intent upon mental evolution.

396 Human need not much care about the congeners of a body sprung from earth; but soul is another thing. 397 We trust our own spirit, as carrying some image and superscription of God; we feel and conceive it to be different in kind from sensitive life; we love to think of it in its finality as a spark flowing out from Divine Light; a breath breathed into body from above. 398 In the reverse of this belief there is doubtless an element unfavourable to happiness; it makes some people cynics, some pessimists, some simply victims. 399 Comte's infinite self-satisfaction probably saved him from self-torture. But we judge that he felt his condition deeply, from the rapture with which he hailed a new and brilliant discovery! 400 Yes, it was the most wonderful of all his discoveries; he one day found an unsuspected law of life within himself; he discovered that he had a heart.

401 To many, this is the black spot on Comte's memory; they cannot receive his love, nay, his frantic adoration, of the lonely wife of a convict, absent in the gallies, as a piece of pure Platonism. 402 Had Madame Comte's allegations been sifted fully, we might have known all. As it is, I for my own part like to think him innocent; 403 he was mad from disease, and perhaps from conceit; a conceit, says Mr. Mill, too colossal to be believed without reading him up; but I trust he was not immoral. 404 His letters are against it, the lady's face is against it, and above all, there is against it the lasting effect upon himself. 405 After a year's happiness to Comte, she died and left him, as he thoroughly supposed, an enlightened and a religious man. 406 Poor Comte! His sweeter life was buried with the dead, who to him could never rise again. 407 His religion was no more than a funereal cult; a veil

thrown over it, no hope, no thought of reunion! 408 The episode of Clotilde was, in itself, one of those touches of Nature which make the whole world kin; the brief, bright, and long sad experience the solitary had of his heart; the love, the loss, the unforgetting sorrow! 409 But, did it not prove, beyond the force of reclamation to disprove, that Comte's system ends, at last, in what is commonly called materialism? 410 Its faith (or negation of faith) being in effect this, that we look for entire human dissolution coincident with bodily death. 411 And the end flows naturally from the beginning; all we think is phenomenal, all we know is phenomenal, first and last. Our life is only a phenomenon; and death, death joins us to the unreturning past. 412 We are absorbed, all that is good of us, into general and generic humanity; 413 an Eidolon, called the Great Being for our comfort; as if a name (what's in a name?) could console us! 414 The race we may have tried to serve is to be our Euthanasia, our sepulchre, I had almost said our cenotaph! 415 Strange thought, not without a kind of serpent-fascination! 416 Epidemic in England now, gaining force from its unhallowed audacity! 417 The consistent pessimist, who rates people at the worst, thinks the worst in the self, and does the worst by all others, 418 and by yourself, if you are but fixed in this unbelief, need not fear what the world, human, or God shall do unto you. It is the old whisper, "Ye shall be as gods!" 419 'Tis superhuman to sit and watch the storm; to have our strong sensations, illusions they are called in France; blood-poisons which circulate in our life, working hot passion and mischief; 420 sorrow to many a loving, many a confiding heart; passion, mischief, sorrow, what matters it? There comes an opiate by-and-by! 421 The person of overwrought brain, used up, worn-out feelings; the distempered dreamer; the reckless worker of wrongs; the disappointed striver for an earthly crown, all shall have their common slumber at last; unconscious, impervious, unbroken. 422 I will read you three stanzas from a longer piece written

by one not unknown always where that tree of knowledge grew:--

423 "Cessation is true rest,
And sleep for them opprest;
And not to be,--were blest.

424 Annihilation is
A better state than this;
Better than woe or bliss.

425 The name is dread;-- the thing
Is death without its sting;
An overshadowing."

426 If such be the thought to them whose natural heritage stands strong, fringed with luxurious hope to live beloved, to die regretted; 427 what will the "overshadowing" be when it passes, like a plague breath, over the children of toil and anxiety, over them whose life is at best hard, and their lot depressed and without "illusions"? 428 Will they not want their strong sensations? Will they respect any law, human or divine, which stands between them and their enjoyments? 429 Will they not crush all who bar their pleasures, aye, choke them in their own blood? 430 Why not? The opiate comes to all at last. 'Tis an act of oblivion! The overshadowing will cover all.

431 And this is the coming creed of the 19th century. To return to Comte, about whom I might say much, but must not;-- of course, he had no foresight of anything worse than an immediate realisation of his crowning ideas-- sociality, fraternity, Positivism. 432 Europe split into small states; women made incapable of property, but held objects of religious worship; men worked on a communistic principle; an oligarchy of rich; a spirituality of Positive believers, with a supreme infallible pontiff at their head; Paris the seat of infallibility and of order. 433 Clotilde had shown Comte a principle antagonistic to, and predominating over, all egoism; Altruism was to burn out of humans all selfish aims, nay, the ordinary feelings of a human! 434 A rigorous rule of life was to aid, and a religion without a God to enforce, this new law. 435 Two hours a day, divided into three private services, were to be spent in the adoration of Humanity under the form of a living or dead woman. 436 The image of the fair

idol, dress, posture, everything was to be brought distinctly to mind; and the whole soul to be prostrated in her honour. Comte, it has been said, gave woman everything except justice.

437 There is a grave moral in this tale. Theology was extinguished; but the desire to worship burned on-- a fire unquenchable. 438 Is that desire, or is it not, a broad reality, an inalienable truth of our nature? 439 Comte accepted it for himself, and not for himself alone, but for our whole human race. Along with it he accepted the only principle which could bestow universal validity. 440 Our moral intuitions were acknowledged safe guides, and something more; the rulers of an intellectual world, the revealers of truth higher than all beside. 441 Often and often he asserted the dominion of heart over mind. 442 Probably, if Comte had lived longer he would have acknowledged other revelations of our moral nature. 443 Moral causation, for example. That strange phrase of his-- "a modifiable fatality," self-contradiction in words, suicide in sense, what did it portend? Was it the first sound of a marriage-bell, freedom and duty once again united? 444 A change of his system wonderful to contemplate, yet not more wonderful than the state in which he left it.

445 One cannot help here asking how matters would have stood if Comte had died without knowing his Clotilde. 446 How incomplete according to his own account his philosophy! How wanting in that which perfected the whole!

447 A notable fact this, throwing great light on the value of such-like systematisation which, after all, much resembles secretion from that interesting viscus, the system-maker's own particular brain. 448 And there is another fact quite as notable. How curious that Comte should have lived so long without discovering whatever truth his own heart and a strong human affection disclosed to him! 449 Hence we might illustrate and confirm a previous remark, that any one not living a truly human life-- call him undeveloped, uneducated, dwarfed, or immature-- is no typical human; 450 and if we believe ancient maxims, scarcely a learner in

philosophy, certainly not a judge of its highest and widest problems.
451 The most notable fact and greatest surprise of all is, that Comte's prayer without petition, his passionate self-mesmerising adoration, his religion without a God, should have taken any hold on humans. 452 No one can transfer to others your private sorrow or your private joy; it is hard for a person to get your thought understood, harder still to make common pasture of your heart. 453 But Comte devised extraordinary propagandist expedients; those who consider his developments mere madness, should explain why sane people have accepted them. 454 Comte set no value on Protestantism in any shape. The religion of his own country he carried back to mediæval forms, and then travestied it.
455 There were many festivals, a calendar of saints, nine sacraments, and a horrible caricature of the Christian Trinity. 456 This idea crowned his sociology, which I need hardly say was communistic socialism, enfolding (as socialism always must enfold) and scarcely veiling the most iron of despotisms, both temporal and spiritual. 457 His mind delighted in contemplating a synthesis of the great Fetish, Earth, with the great Being Humanity; which last somehow assumes on occasion a feminine gender.
458 To Clotilde, symbolising that supreme object, Clotilde, his noble and tender patroness, he transferred Dante's homage of Beatrice; addresses to the mother of our Lord; 459 and stranger than all, the prayer of Thomas à Kempis to Almighty God, "May I love Thee more than self, nor self at all except for Thee."
460 Now consider: when Comte died, sixty-four years had not quite elapsed since goddesses of Reason were worshipped in the cathedral and other churches of Paris. 461 Upon each high altar a fair woman, chosen for her faultless beauty, sate enthroned, her feet resting upon the consecrated slab. 462 Gaily clothed in tunic and Greek mantle, she was so displayed by a torch behind her throne, so elevated above her worshippers, as to attract from Phrygian cap to Italic shoe their

passionate gaze and adoration. 463 Low down beneath her footstool lay the broken symbols of a faith then declared effete and passed away; just as half a century afterwards Comte declared theology passed away. 464 Music sounded, incense smoked, Bishop Gobel, who assisted at a parody of sacred rites, wept tears of shame, but in fear and trembling he assisted. 465 The object of this mad mockery of religion, this empire of heart over mind, this woman-worship, was to proclaim afresh Fraternity, Progress, Sociality. 466 Sociality, for the supposed law of which final development Comte worshipped humanity and Clotilde-- but disowned immortality and God.

467 These two madnesses, how near akin, how far apart were they? The world is not really made young by destroying old things; 468 yet the path of 18th century madness lay through fire and blood. Its deeds are sometimes spoken of, even now, as great crimes; but no great crime is criminal in the sight of people whose life is godless, dark, and unsubstantial. 469 Horrors pass before them like unrealities. "The world," writes Mercier on the trial of Louis XVI,-- "The world is all an optical shadow."

470 In our 19th century life, 'tis a skillfully prepared overshadowing, beneath which humans beat their brows till their blood-shot eyes see red. 471 "I see red," exclaimed Eugene Sue's ruffian, "and then I strike with the knife."

472 Let me end by telling you a dream, which is not all a dream. A company of 'savans' were seen in the visions of the night, busy with a new scientific invention. 473 Earth, they argued, earth has her volcanoes, her burning exhalations; humans have electric lights, fires, gas lamps, furnaces. These make up the world's proper illumination.

474 The effect intended was, therefore, to darken the air we breathe, so that no rays from the upper sky should pass through it. 475 The inventors hoped that a district, a country, nay, even a world, might thus be overshadowed by a gloom impervious to moon and stars by night, to sun by day; 476 and the human eye see no changes, save

those which the earth's activity, or human power and skill, might produce. 477 Terrestrial and artificial alternations excepted, all was to be changeless as winter midnight-- deep impenetrable darkness! 478 It was seen slowly, very slowly, to descend. In thirty years the people of science hoped and purposed its perfection.

479 Did those who had previously known the beautiful light of heaven, who had bathed and basked in the life-giving sunbeam, feel happy, or even calm, when they saw their children and children's children robbed of celestial glory and gladness?

480 Yet there is one thing worse than a world without a sun-- you know what I mean-- Humanity without a GOD.

SCIENCE AND REVELATION.

The Very Reverend
R. Payne Smith, D.D

4 The duty which has been imposed upon me to-day by the Christian Evidence Society is, I conceive, to state as clearly as I can, 2 what is our ground for believing that a revelation is not only possible, but is a necessary part of the system of this world. 3 As the programme further joins science and revelation, I conceive that I am debarred from any but a strictly scientific proof. 4 We may reasonably infer the probability of a revelation from God's necessary attribute of love. 5 We may ourselves feel morally sure that a creature, approaching so nearly to the spiritual world, and capable of so much good as is human, would not be left by your Maker in that miserable state of vice and misery in which we find ourselves. 6 There are many good and weighty reasons for believing that God would give us a revelation, and that the Christian religion is God's revelation-- 7 reasons drawn from the nature of God, from the actual condition in which human is placed, and from the direct teachings of Holy Scripture-- 8 all these, like a cord of many threads that cannot easily be broken, serve to confirm the faith of the believer, but I must forego their use. 9 In confining myself to what I conceive to be the strictly scientific basis of a revelation, I

would, nevertheless, beg you to remember that the evidences of Christianity are cumulative. 10 They cover a vast field, and it is in their united force that their strength lies. 11 The very vastness of the field often invites attack. Some outlying work seems capable of overthrow. 12 Some discovery in the domains of history, of philology, or of physical science, seems to provide new weapons for the assault. 13 Possibly not all the arguments used in defence of Christianity will endure the test of close and accurate examination. 14 Possibly, too, in our views of the nature of Christianity, and in our exegesis of the Scriptures, we have arrived only at partial truth, and do not distinguish with sufficient accuracy between what is certainly revealed, and what is nothing more than a possible explanation of the Divine word. 15 There are, moreover, I will candidly confess, difficulties in the way of faith. 16 However new may be the form of the attack, and however modern the materials which it uses, yet the strength of the attack lies in real difficulties, which are no new matter, but have ever lain deep in the minds of thoughtful people. 17 I do not believe that belief is a thing easy of attainment, any more than virtue is. I believe that both are victories, gained by a struggle-- gained over opposing forces. 18 But as certain as I am that this present state of things was intended to train human to virtue, though I cannot answer all the objections brought against the system of the world being exactly what it is, 19 nor solve all the doubts and difficulties, moral and metaphysical, which surround us: 20 so I am convinced, in spite of similar difficulties in the way of religion, that belief, and not unbelief, is the end at which human ought to aim. 21 I believe that human was intended to attain to a higher and more perfect state than that in which you now finds yourself, and that you can only attain to it by virtue and faith; 22 but as the very value of these lies apparently in their being won by an effort, long and earnestly maintained, I am not surprised at the existence of difficulties, least of all of such difficulties as arise from our ignorance. 23 Still belief

would be unnecessarily difficult, and we may even say, morally impossible, if the sum of the arguments in defence of a revelation did not largely exceed the sum of the arguments against one. 24 With these arguments I have to-day nothing to do. The evidences of Christianity, external and internal, will be treated of by others. My business is to show that a revelation was to be expected; 25 that it was probable, or at all events possible, and, therefore, that the evidences of Christianity have a claim upon the consideration of every right thinking human. 26 In showing that a revelation was to be expected, I shall at the same time show what is the exact position which it holds, and in what way revealed knowledge differs from all other knowledge, scientific and unscientific.

27 Now the argument which I shall use as my proof of the possibility of a revelation is simply this, that in the present system of things we find no being endowed with any faculties without there being also provided a proper field for their exercise, and a necessity imposed upon that being of using those faculties. 28 In this statement I assume nothing. I do not assume that there is a God who made these beings. 29 I do not assume that they were made or created; still less do I assume that they were intended to use their faculties. 30 I put aside all theories of design and causation, not because I do not believe that they possess force, but because the actual facts which I see around me, or which I am taught by scientific people, are enough for my proof. 31 The only thing which I assume is, that the laws of Nature are universal; and I assume this simply because it will be readily granted me. 32 The universality of Nature's laws compels us to admit that a law which holds good in all known cases, will necessarily hold good in all cases whatsoever.

33 Our whole language is so essentially based upon religious ideas that it would be very difficult for me to use only neutral words. 34 But in using religious words, I wish them to be understood in a neutral sense. If I speak of creatures, I mean only beings, things which exist now, or have

existed. 35 If I speak of them as endowed with faculties, I merely mean that they possess them. 36 By nature, I mean simply the present state of things, whether designed by an intelligent mind, or a mere come-by-chance. 37 I look simply around me at what is-- or at all events appears to be-- and I find myself in a world in which there is a very exact correspondence between the endowments and faculties of every existent being, and the state of things in which it happens to be.

38 So exact is this correspondence, that if you give Professor Owen a bone, he will tell you to what order of animals its owner belonged, what were its habits, the nature of its food, of its habitat, and mode of life. 39 Nature works out this correspondence even to the most minute detail. 40 By looking at the bone of a quadruped we can tell, not merely great things about it, but such trifles as which leg it used first in getting up from the ground. 41 For Nature is so undeviating that the outward habits, even in things of no apparent moment, correspond to the internal conformation.

42 Now, possibly, it will readily be granted that such is the present state of things. 43 Whatever may have been the stages through which we have, or have not, passed, we now find ourselves in a world of apparent cause and effect-- full of infinitely varied forms of life, but of which none are purposeless. 44 I cannot upon this point bring forward a better witness than Professor Huxley, who, in his most interesting essay on Geological Contemporaneity speaks as follows:-- 45 "All who are competent to express an opinion upon the subject are, at present, agreed that the manifold varieties of animal and vegetable form have not either come into existence by chance, nor result from 'capricious exertions of creative power'; 46 but that they have taken place in a definite order, the statement of which order is what people of science term a natural law." 47 The whole chain of animal and vegetable life seems to this great authority so perfect and complete, that even the variations which have taken place in it, have been governed, he considers, by a law, that is, a

regular and orderly succession. 48 These variations have been the result, apparently, of certain changes in the external state of things, to which the external conformation of the animal has somehow or other been made to correspond. 49 But as Professor Huxley points out, these variations have been confined to very narrow limits. 50 When people speak of the enormous changes which have taken place in the living population of the globe during geological eras, they refer, he says, to the presence in the later rocks of fossil remains of a vast number of animals not discoverable in the earlier rocks; 51 but the fossils which you do find in the early rocks differ but little from existing species. 52 He thus negatives on sure grounds the idea that a state of things ever existed on this globe essentially unlike what exists now. 53 What then exists now? I answer, first of all a vast chain of vegetable life, fitted in every portion of it to find its own subsistence, and to propagate its species. 54 Its main function is to "manufacture out of mineral substances that protoplasm, upon which, in the long run, all animal life depends." 55 I need not detain you by enumerating the many various contrivances by which plants are enabled to manufacture food for us out of carbon, hydrogen, oxygen, and nitrogen-- 56 substances upon which, in their original state, animals cannot feed-- nor the still more curious and elaborate processes by which their fecundation, and the propagation of each species is provided for-- 57 processes which seem often to require the intervention of animal life. 58 I need not detain you upon this point: you will readily grant that this correspondence does exist. 59 If a plant is not suited to its habitat, and cannot use its natural powers, Nature imposes upon it the severe penalties-- first, of degradation, and then of death. Upon the animal world She imposes just the same penalties. 60 There is neither excess nor defect in Her operations. Whatever She gives must be used, but animals, being governed in the main by instincts, have no choice. 61 They necessarily employ all their living powers, and apparently have no powers beyond those

indispensable for their existence. 62 This point, however, I will not press, though it seems to follow from the fact asserted by Professor Huxley, that no important difference can be observed between the fossil remains found in the earliest strata, and animals of the same species and order existent now. 63 For, as he tells you, facts establish a scientific law-- law in the mouths of scientific people, meaning an established order of facts. 64 Well then! I will put this fact of absence of progress aside, and with it the corollary of the absence of latent powers. 65 But of actual powers it is evident that animals do use them all, and have to use them all. 66 So close, too, is the agreement between the powers and the external position of every animal, that a change in its external relations will modify its powers to a certain extent. 67 But only to a certain extent; there are fixed limits to the adaptability of those living powers. 68 If the changes are such as to occasion a more active exercise of its living powers, the animal increases in strength, size, and beauty; 69 if unfavourable, but still permitting some use of its powers, it dwindles and decays. But pass the appointed bounds and the animal dies. 70 Nature is exacting the penalty of the non-use of what it has given. Nature exacts a severe penalty for the mis-use, and the last and final penalty for the violation of Her laws. 71 I do not know that an ascidian jelly-bag has any other faculties than those of sucking in water, and of sticking to a stone. 72 But this I know, that if it does not use all the powers it possesses and suck in its water, and stick to its stone, no process of natural selection will ever develop it into a monkey: it will go to the limbo of nonentity. 73 But what an alarming thought, that at a period separated from us by such vast geologic ages, that, according to the nebular hypothesis, held by so many of our leading astronomers as a probable theory, this whole universe was a mass of heated vapour; 74 what an alarming thought that the very existence of human should have depended upon a jelly bag sticking to a stone and sucking up water! 75 Alas! There was then no water, no stones, no jelly bags, and therefore

there are now no humans! Human escapes, poor thing, from your humble parentage: 76 you need not feel your ears to find the proof there of your monkeyhood: but your escape costs you dear. 77 What with astronomy and biology, people of science between them have cleared us out of existence. Scientifically, human is no more.

78 My argument, fortunately, depends upon matters of fact: facts for which the believer accounts by holding that this world is the work of a Being possessed of infinite wisdom and power, and who therefore has endowed all His creatures with those faculties which they needed, and with no others; 79 because to give useless faculties would be a violation of God's attribute of wisdom.

80 The student of natural science may take another view. It is no part of your business to do so. Your office is to discover and tabulate the order of facts, of phenomena, and this order you calls a natural law. Well and good. 81 But teleology, the science of ends, which gives the reason why a thing is what it is-- teleology belongs to the metaphysician. It is your business to inquire into causes and effects. 82 Still, as a matter of fact, scientific people do try their hand at accounting for the present state of things, and they say, perhaps, that there is a struggle, a competition in Nature, 83 so sharp and close that no creature can continue to exist save by the vigorous exercise of all its necessary faculties, while all useless qualities will be cast away as mere overweight and incumbrance. 84 I need no decision upon this point; the fact is all I want. I do not want you to decide whether mind preceded matter, and consequently that there is a God: 85 or whether matter and mind came into existence contemporaneously, in which case there is no room for the theory of development, but abundant room for impossibilities, metaphysical and actual; 86 or, lastly, whether matter preceded mind, the latter being simply the result of a high corporeal organisation, slowly attained to by the processes of selection, natural and sexual. 87 Whether this present state of things was worked out intelligently, by a Being possessed

of will and understanding, or is the result of blind and unintelligent powers, working fortuitously, this, to my argument, matters not. 88 All I want is the admitted fact--that every living organisation fully possesses all those faculties which it needs, and must use all its faculties under penalty, first of degradation, and, finally, in the long run, of extinction.

89 But human is a living organisation, and must, therefore, come under this law. Let us see whether the fact confirms this deduction. 90 Now, in all the long line, from the ascidian upwards to human, Nature had supplied none but physical wants. 91 Her children need food; She gives them each those senses and that conformation which enables them to get each their own food. 92 They need safety: She uses much ingenuity in providing for their safety. She is, moreover, liberal. 93 Their food is, in general, gained so easily, and their safety so well provided for, that their lives are full of enjoyment. 94 Her care, however, is taken in the main for the species, and not for the individual. 95 You enjoys your food because Nature has taken loving care for the whole family to which you belongs; and She further takes care that that family shall continue to exist.

96 If it perish, it is because by some change in temperature, or the like, the correspondence is destroyed between its faculties and its external position. 97 Short of this, the ingenuity employed by Nature in providing for the continued existence of every species of insect and animal is as wonderful as that employed by Her in continuing vegetable life; 98 and, as a rule, the lower the creature is in the scale of being, the more curious the contrivances used for its preservation.

99 Well, when we come to human we find these three leading necessities equally well provided for. Human is provided with the means for obtaining food, for providing for your safety, and for propagating your species.

100 But, though Nature's ends are the same, and reached with equal certainty, Her means are, in the main, different. 101 The animals are moved to gain their existence by their senses working upon their

instincts. This is a great advance upon vegetable life. 102 You had there neither senses nor instincts, but simply powers. But human rises above the animals as much as they transcend vegetables. You attains to these same ends of food, safety, and continued existence by the use of your reason.

103 Now, I wish you to notice this. Nature is not limited in Her resources, nor confined to one method. 104 She is not obliged to plant animals in the ground that they may suck up food through their legs; She can and does give them instincts by which they can get their food in a very different way. 105 But perfect as these instincts are, Nature can do still better. She can produce an animal capable of reasoning upon causes and effects, 106 and who, therefore, provides for everything which you imagines to be good for you by setting those causes in motion which produce the desired effect.

107 But with the possession of reason there also goes the possession of what we call mental faculties. 108 Not only can human by the use of your reason obtain food, provide for your safety, and continue your race, but higher ends are made possible for you, to be attained to by the use of this higher endowment. 109 Human has the power of articulate speech, and upon this follows the power of learning to read, to write, and to cypher; and upon the power of doing these three things follows a plenitude of other powers. 110 Now, I shall not stop to enquire how human gained these powers, whether by natural and sexual selection or not; but I venture to point out that there is a vast chasm between physical and intellectual powers. 111 The most sensible monkey is a parody rather than an imitation of human, and the difference between the two is enormous. 112 The points of agreement serve rather to enable us to measure this interval, and see how wide it is, than to bridge it over.

113 Now, let us suppose ourselves philosophers come, we will say, from the planet Jupiter, on a mission intrusted to us by the Jovians, to examine and report upon the nature of the creatures which people the four inferior

planets, Terra, Venus, Mercury, and Mars. 114 Of course, we should look upon the inhabitants of such small communities with contempt, but, being philosophers, we should not neglect anything because it was trifling. 115 Well, when we came to Terra we should report that it was a very curious region, inhabited by a long scale of beings, each one fitted to its place, 116 and that at their head there was a rather noxious, troublesome, and uppish creature called human, whose examination had caused us an infinity of trouble. 117 In examining this creature we should find that it shared in all the wants of those beneath you, but that it supplied its wants, not by the use of instincts, but of reason. 118 Over and above, however, human's physical wants, we should find that you had mental wants; and with these wants faculties also, by which you could supply them. 119 Supply all the physical wants of an animal, and having none besides, it will lie still for hours or days until hunger stirs it to renewed exertion. 120 Supply all human's physical wants, and your mental wants then develop into full activity. 121 Give human the lowest and basest drudgery; make you work morning, noon, and night in the meanest occupations, for the supply of merely physical necessities, and, though you can infinitely degrade, you cannot destroy your mental powers. 122 You still thinks, still connects causes and effects. But our purpose will be best answered by taking the case of those whose faculties are most highly cultivated.

123 Has Nature supplied a proper field for the exercise of the mental powers, not merely of Fuegians, but of the most highly developed human? 124 You know that She has. Take the senses which you have in common with the animals, but see what vast means have been provided by which you can make an intellectual use of them. 125 What arts and sciences, painting, music, harmony, numbers, eloquence, have grown out of their use. 126 As for our mental powers, think only of the vast number of ologies which are claiming admission into our very normal schools. 127 Think only of all our learned Associations, our Royal

Societies, our Social Congresses, our British Museums full of books, which have been written, and are waiting only to be read, 128 and you must own that humans do use their mental powers, and have means enough for a more ample use of them.

129 Nature makes us use our mental powers to some extent. She encourages us to use them thoroughly and earnestly. 130 Use them we must. Human is placed in such a position that you must study what passes round you. Human learns by experience. Instincts are but slightly progressive. 131 Unless brought into contact with human, the animals learn little-- perhaps nothing. 132 I do not doubt but that those huge monsters, whose remains we behold in geological museums, were the most dull and stupid creatures possible. 133 I think this simply because I suppose that human did not then exist, and, therefore, that these monsters had nothing to waken them up out of their sluggish torpor. 134 But scientific people tell me that existing mammals actually have larger brains than their ancient tertiary prototypes of the same order. Let human enter the stage, and the instincts of animals are quickened. 135 Nature did not create human without taking care to guard the inferior animals from your destructive powers. 136 But human in yourself, essentially, is at once progressive and retrogressive. Bound up with you is an infinite possibility of advance and decay. You are never stationary.

137 Both individuals and communities are perpetually either ascending or descending in the scale, morally and intellectually. 138 But this law of Nature obliges human to perpetual mental effort under the usual penalty of degradation. 139 We have not merely to advance, to win new ground. If this were all, at length we should have nothing to do. We have to win back lost ground. Our gains are, I hope, greater than our losses; 140 but the progress of no community will ever be fast enough, continued enough, and assured enough, to justify the members of it in living in a fool's paradise. 141 This, then, was our second point. The first was, that

SCEPTICS

Nature has provided us with a proper field for the exercise of our mental faculties; the second, that She imposes upon us the necessity of using them.

142 We may add, that the law of scientific progress also makes it certain that no advance of science will ever deliver us from the necessity of using our faculties. The valuable part of every science is its theory-- the mental part. 143 Facts and fossils are of no value, except as being the materials for thought. 144 No geologist would care much for a discovery of fossils in agreement with an established theory, but if the theory were still debated, then every discovery that tended to prove or disprove it, would be canvassed with intelligent interest.

145 The pure sciences can grow, I am well aware, only by additions. But then they are simply instrumental. They are to the mixed sciences what arithmetic is to the ordinary business of life. 146 Logarithms, algebra, the integral and differential calculuses, are simply easy ways of doing difficult sums. 147 It is a great thing, no doubt, for science to perfect its instruments and processes, but scientific progress lies in the mixed sciences themselves, and these are constantly undergoing modification. 148 The spectrum analysis is largely modifying the science of astronomy. 149 Deep sea dredging, and other fresh means of information, have so modified geology, that no one holds now that similar strata are necessarily of the same date. 150 A vast cretaceous formation is probably going on at this very day in the bed of the Atlantic. The law, then, of scientific progress is constant modification; 151 fresh facts are discovered, new theories started, old theories revived, existing theories altered, recast, newly shaped.

152 Should a science become, practically, complete and perfect, scientific people would care for it no longer. The manufacturer and merchant would then seize upon it. 153 In this way what was once a problem in the mind of the student, becomes an article of use, comfort, and enjoyment in our daily lives. 154 Meanwhile, new sciences spring up, and old sciences take

new shape, and, as a matter of fact, so large has become the scientific domain, that no one person can master it. 155 Division of labour has become as necessary here as in the manual crafts. We are no longer encyclopædists, but each one must stick to your own page in the great book of learning.

156 Many of these sciences relate to our social condition. And of these the importance and value every day rapidly increases. 157 Good government largely depends upon knowledge of all those natural laws upon which moral and physical well-being depends. 158 Upon good government follow increased wealth, active trade, higher wages, and larger consumption of commodities. 159 Upon these follows increased population, and that population concentrated upon spots favourable for all this activity. 160 And upon this follow new social difficulties; fresh problems arise to be solved, and new questions to occupy the mind both of the student and of the statesman. 161 Unless solved, society will retrograde; it will suffer in health, in wealth, and morality; turbulence will take the place of quiet industry; and that community will decay.

162 Here again Nature provides a field for the employment of our faculties, and compels us to use them. If not there is the same penalty, degradation. 163 I do not know how many geological periods it would take before, by the neglect of our powers, we could retrograde back to our ascidian progenitor; 164 but I see everywhere around me the proofs that retrogression is as much a law of human's nature as progress. We can only continue what we are by using all our powers.

165 But I may have lingered over this part of my subject too long. No one perhaps will deny that human both can and must use your mental powers as thoroughly as an animal must use its instincts, and a plant its vegetative powers, or it will suffer for its neglect. 166 Only remember that my argument has nothing to do with individuals; I am treating of human as a species, and investigating the general laws which regulate your well being. 167 Well, now, has human any other powers than those already

described? 168 Has you merely physical powers to enable you to get food, and other bodily necessaries; and mental powers to enable you to read, write, and cypher? Is this all? 169 You know that it is not all. There is another broad distinction between human and all the other inhabitants of this earth. You alone distinguishes between right and wrong. 170 Now if human possesses this faculty, however acquired, and by whatever name called, then if Nature's laws are universal, you are both bound to use it, will suffer from not using it, and will have a proper field provided for its use. 171 Nature gives no faculty without imposing an obligation of exercising it: an obligation, however, which rests in its full force upon the species, and upon the individual only as belonging to the species. 172 Some powers every individual must use or you would die; there are other powers which, if you does not use, Nature will be content with a lighter penalty. 173 Far be it from me to affirm that every one here uses your reasoning powers. I hope you does; but if you does not use them, I am quite sure that Nature will exact of you the penalty of stupidity. 174 But the species must use them; if not, upon degradation would soon follow extinction. 175 Nature, for instance, would not let human exist as a mere animal. If you did not use your reason, the instincts of other animals are so superior to yours, that while they found food you would be unable to do so. 176 Even if necessity quickened your instincts, you would yet have ceased to be a human, and would be retrograding back to the ascidian. 177 To continue to be a human you must make some low use at all events of your mental powers. 178 Now, can you establish any such difference between human's intellectual and moral powers, as will justify you, while acknowledging that you must use the one, in neglecting the other? 179 Can you give any reason why you need not use the faculty which undoubtedly you possess of distinguishing between right and wrong, and the faculty, let us say, of "using the imagination in matters of science." I am sure you cannot. 180 By not using your mental powers you will

be in an inferior mental position; by not using your moral powers you will hold an inferior moral position.

181 But you may say the penalty is slight, and we will pay it. We will use our physical powers, and become grand animals and we will use our mental powers, and become grand intellectual humans. Not humans, I answer. 182 Add intellectuality to animality, and you merely get an intellectual animal. 183 Your moral powers are an essential part of yourselves. Confessedly too, there is ample field for using them. 184 The whole world is so constituted that morning, noon, and night, the question perpetually arises of right and wrong. 185 You cannot take a step in life without conscience intervening. It is so inseparably a part of yourselves that constantly it acts as a mere instinct, and approves or condemns your conduct as spontaneously as your palate distinguishes between sweet and bitter. 186 You may render your palate dull, so that you cannot taste what you eat and drink; you may render your conscience dull, but it has a strong recuperative force, 187 and, after years of dullness, will awaken, and exercise again its judicial functions with stern and decisive energy. 188 Struggle as much as you like, but the conclusion cannot be evaded, that you can distinguish between right and wrong, that you ought to do so, and that you must do so.

189 If so, what follows? I answer, the necessity of religion, and therefore of revelation. 190 Resist as humans will and do, they have but a choice between two alternatives. 191 Either all this present state of things, in which every faculty has its appropriate field of exercise, and every external possibility has opposite to it an internal faculty; 192 either all this is an illusion and deceit, a purposeless and objectless piece of jugglery; 193 or if it be a reality, then the existence in human of faculties, obliging you to distinguish between right and wrong, constitute you a 'responsible' agent. 194 If you are responsible, you are responsible to some one: and certain penalties are necessarily attached to the neglect,

the misuse, and the violation of your moral powers.

195 The person to whom human is responsible must be capable of forming an equitable judgment, and therefore must know the motives as well as the outward acts, and for this nothing less than omniscience will suffice.

196 You must have the power of apportioning adequate rewards and punishments to human actions, which will need little less than omnipotence. 197 And as no adequate reward or punishment follows in this life, there must be some other state in which humans will be dealt with according to their true deserts. 198 If not, then there exists in human a whole class of faculties, moral faculties, which seem to find in this present state of things an appropriate field for their exercise, but which human is under no necessity of using. 199 A person who lives in the habitual violation of every moral obligation, but does so with discretion, may have a very large enjoyment of the things of this world: 200 while generally a person whose conscience is tender, and whose life is regulated by the highest motives, necessarily and voluntarily abandons much, both of pleasure and prosperity. 201 Nature cannot have so bungled Her work. The highest possible exercise of the powers which She has given us must necessarily lead to the highest possible good. 202 It does not matter to the argument whether conscience and your other moral faculties be natural or acquired. If Nature endowed an ascidian with the power of acquiring moral faculties, it was bound to use them as soon as it had got them.

203 The question whether you are bound to use your mental faculties does not depend in the least upon the question whether human is an improved monkey. 204 You are bound to use them simply because you have them. So you are bound to live as a responsible being simply because you have the faculty of distinguishing between right and wrong. 205 You know, too, that you act yourselves upon this principle. 206 If any one were to push one of you out of your seat and take it to the self, not only would you be angry, but our chairman would call in a

policeman to expel the disturber, and give you your seat back again. Why? 207 Because the person would have been doing wrong, and need not have done it; and because it was wrong you are angry and punish the person. 208 But can you stop there? There are things which we know to be wrong, but which hurt none but ourselves; things we know to be wrong, but which benefit society.

209 A person may liberally support useful institutions from motives of ostentation, or as a bribe, if you are a candidate, let us say, for a seat in parliament. An act may be apparently right, but the inner motive wrong. 210 Now, conscience judges of things absolutely; it condemns or approves of things, not as they seem, but as they really are: not by results, but by their intrinsic character. 211 What is there which answers to this outside of human? Must there not be a judge who also judges humans absolutely? You can find no such judge but God. 212 Either, then, Nature is a sham, and Her laws not universal, and this present state of things a delusion, 213 or there is a universal judge, and a future state in which reward and punishment will be meted out in strict accordance with the rightness and wrongness of human action. 214 A being omniscient and almighty can alone judge actions absolutely in the same way as conscience judges us, both for our thoughts, words, and deeds.

215 I have chiefly spoken of conscience, but the argument takes in all human's moral and spiritual powers. 216 No person can doubt but that human has within you powers which exactly answer to religion outside of you. 217 The power of faith is as much a faculty as that of sight; and so also is that instinct, I had almost called it, which makes a human ever turn away in discontent from the present to struggle for the future.

218 And what is more, human's moral and religious faculties develop with advancing civilisation just as your mental faculties do. 219 The mental questions which agitate our minds would be entirely void of interest to a savage; 220 the social difficulties which occupy the attention of our political

economists and statesmen would be mere trash to a peasant: so, too, with religion. 221 I do not see any reason why a race may not sink so low as to lose the very idea of a God; but I am sure that such a race would hold the very lowest place in the scale of humanity. 222 Whatever round in the ladder of human progress you like to examine, I will make bold to say that you will find the religious and moral state of humankind there holding a very close relation to the degree of mental culture and civilisation to which it has attained.

223 Now, the only thing that acts powerfully upon human's moral faculties is religion. I do not say that this ought or ought not to be so; all I assert is that it is so. 224 Call, if you like, the great mass of your fellow people Philistines, and despise their low culture, but you will find nothing that acts powerfully upon these Philistines to give them culture, to raise, refine, and purify them, except religion.

225 Conscience, too, holds a most direct and evident relation to religion. You will not find conscience amenable to reasoning. 226 When virtue begins to reason, the proverb tells you it is lost. 227 When conscience condemns, it is because the thing condemned is a sin against God; when it approves, it is because the thing done is absolutely right, and as God commanded. 228 Conscience never asks whether a thing is a sin against society; it never troubles about consequences, knows nothing about political economy, or political morality either. 229 It judges by a higher and absolute rule. By so doing it makes human a responsible agent absolutely, 230 brings you into direct relation with God as the absolute judge, and renders necessary a more exact apportionment of rewards and punishments than exists at present. 231 There must be some other state of existence in which human will be judged in the same way as now you judges yourself, and in which the natural effects of this judgment will be fully carried out.

232 But, if there is thus a future judgment, and a state in which happiness and misery will follow as the natural results of our actions here, human will require a certain

amount of knowledge concerning this judgment. 233 By the possession of conscience and other religious faculties, human holds a definite relation towards God. 234 Plainly the most tremendous results may follow from this relation, and human ought to have some sure knowledge of these results. 235 Now it is conceivably possible that God might have given us this knowledge by means of the light of Nature, as we call it. But He has not. 236 Confessedly natural religion is neither clear enough nor certain enough to affect powerfully the masses. Human is not a quiet, orderly, neutral sort of being; 237 you bears about with you a nature fraught and fully charged with the most dangerous passions. Reason, with its prudential maxims, has never done much to restrain these passions. 238 To take, then, the lowest possible ground. As Nature has given us moral qualities, I suppose that moral excellence is a thing as necessarily to be attained to as physical and mental excellence. 239 But while Nature has provided ample means for attaining to the two last, She will not, without a revelation, have provided sufficient means for the attainment of the first. 240 By the aid of religion, about as many humans probably attain to moral excellence, as by other natural means attain to physical and mental excellence.

241 Without religion Nature will have broken down. You would have universally a state of things like that in ancient Greece-- one Plato, surrounded by the mass leading the most grossly sensual life.

242 Nature cannot develop any being higher than Herself, nor endow it with wants which She cannot supply. 243 If Nature develops intellect, morality, religion, then that power which developed these faculties must also be intellectual, moral, religious. 244 What, then, can this power in Nature be but the working of God? Out of nothing comes nothing. The effect cannot be greater than the cause. 245 The existence of human, with your mental, moral, and religious powers, forbids us to believe that that which caused human to exist can be less possessed of these

powers than you are. 246 Infinitely higher you may be, lower you cannot be. 247 And as surely as human's physical and mental wants are provided for by that power which called these wants into being, so surely will human's moral and religious wants be supplied. 248 They are not supplied by the light of Nature; nothing then remains but revelation. 249 Into the formal proof of revelation I must not enter; all that devolved upon me was to show the 'à priori' probability, or at least possibility, of a revelation. 250 I have endeavoured to show this by a consideration of what human is, viewed simply as a natural being, and by the consideration of your natural wants. 251 I have not taken into consideration any of the additional knowledge given us in the Bible concerning human. 252 I have treated you in much the same way as I might one of the creatures in the Zoological Gardens, if I had been asked to study it in order that I might see what its wants were, and tell the keeper what to give it to maintain it in the full possession of its powers. 253 No doubt it would have helped me if I had been told what and where the creature had been before. I should then have had no difficulty in explaining and accounting for everything. 254 Such knowledge, however, even revelation does not give us, because it is not indispensable. It gives us that only which is necessary for the supply of our wants.

255 Even with this knowledge my argument is not concerned; but certain general principles about revelation follow from what I have laid down. 256 And first, revelation has nothing to do with our physical state. Reason is quite sufficient to teach us all those sanitary laws by which our bodies will be maintained in healthful vigour. 257 If the Bible condemns drunkenness, gluttony, and the like, it does so not for sanitary reasons, but for moral reasons, because they are sins. 258 So revelation has nothing to do with our mental powers; whatever we can attain to by our mental powers we are to attain to by them. 259 Physical and metaphysical science alike lie remote from the object-matter of revelation. Because God has, in the Bible, given us

revelation in an informal way, in order, perhaps, to commend it to our entire nature, 260 people often forget that its proper object-matter is simply the moral relation in which human stands to God, especially with reference to a future state of being. 261 Religious people forget this. They often take up an antagonistic position to science, and try to make out systems of geology and astronomy and anthropology from the Bible and by these judge all that scientific people say. 262 Really the Bible never gives us any scientific knowledge in a scientific way. If it did, it would be leaving its own proper domain. 263 When it does seem to give us any such knowledge, as in the first chapter of Genesis, there is a very important differentia about it. What it says has always reference to human. 264 The first chapter of Genesis does not tell us how the earth was formed absolutely; geology ought to tell us that. It tells us how it was prepared and fitted for human. 265 Look at the work of the fourth day. Does any person suppose that the stars were set in the expanse of heaven absolutely that people might know what time of year it was? 266 But that is their special service, and in old time a most important service for human.

267 To the geologist human is just as much and just as little as a trilobite or a megatherium. 268 To the student of the Bible human is everything, and the first chapter of Genesis teaches you that human was the cause of all other terrestrial creation, the sum and crown of the Creator's work.

269 But if believers mix up science and revelation, so do the students of physical science. No sooner is a theory started, than it is immediately compared with what the Bible says, or is supposed to say. 270 Now, no doubt, the comparison between the teachings of revelation and science is inevitable. 271 Whatever is mixed up with revelation, owing to the manner in which God has been pleased to bestow it, must, at least, be true. 272 It would be impossible for us to accept the authority of the Bible upon those points in which we cannot judge of its truth, if in those points in which we are

competent judges we found it erroneous.

273 The teachings, therefore, of science and of revelation must be compared; but in this comparison not only must we remember that it is not the object of the Bible to teach science, and that, as it speaks to all people at all times, 274 it must use popular language, but also that the comparison must be made, not with the floating theories of the hour, but only with established truths. 275 If the wisest geologist of our days could show that there was an exact agreement between geology and the Bible, it would rather disprove than prove its truth.

276 For, as geology is a growing science, it would prove the agreement of the Bible with that which is receiving daily additions, and is constantly undergoing modification, and ten years hence the two would be at hopeless variance. 277 At the same time there is a good side to the discussion, and the theologian especially is the gainer. 278 In the present day the attack upon revelation draws its weapons from our increased knowledge of physical science, of philology, and of history, and the theologian can no longer neglect these studies. 279 I have no scruple in saying that I look with pride upon what my countrymen have done, and are doing, in enlarging the bounds of our scientific knowledge, even if I do not always approve of their spirit, or accept their conclusions; 280 and I am quite sure theologians must study, intelligently and dispassionately, all those branches of knowledge which are brought into contact with revelation, or they will lose their influence over the intellect of the country. 281 It is no use treating physical science as a bugbear. Let our theologians master it, and they will find it a humanly study, 282 which will give their minds breadth, will teach them what are the difficulties which press heavily on many thoughtful minds, and which must be fairly met. 283 An opposition between an old science like theology and new sciences there must be: but let both sides remember that revelation was never intended to teach us anything that we could learn by the use of our natural faculties, 284

and that what the Bible teaches must be compared not with floating and probable theories, but with proved theories. 285 These proved theories will, I believe, fall into their place in due course of time, as easily as Galileo's theory about the revolution of the earth round the sun. 286 If not, I do not see how the claims of the Bible to be the Word of God can be maintained: for I cannot believe that there is any chasm between the teachings of God in Nature and in revelation. 287 But I think it perfectly possible that people may misinterpret and misunderstand both one and the other.

288 I have detained you too long. But I must make one more remark. If the proper object matter of revelation is that knowledge, which being necessary for us as moral agents, was yet unattainable by our natural powers, then reason is no judge of what revelation teaches. 289 There may be in our relations to God, things which we never should have expected: deep truths opening onwards into mysteries past our present finite comprehension. 290 If everything had been plain, easy, commonplace, revelation would not have been needed. Nevertheless, reason holds a very high office with respect to revelation. 291 In a matter of so high consequence, as whether God has spoken to us or not, we are bound to examine most scrupulously the evidence upon which the fact of the revelation rests. 292 And this examination involves an enquiry into the teachings of revelation. The existence of mysteries in a revelation is reasonable: the existence of immorality in it would be fatal to its claims. 293 For if the scientific basis for my belief in the gift of a revelation is the existence in me of conscience, and of moral faculties which make me a responsible being, I am left absolutely without a basis for a revelation which makes me violate my conscience. 294 A revelation which degrades my moral and spiritual powers is as much against Nature as anything that degraded my physical or mental powers. 295 If religion be true, it must ennoble, elevate, purify, and perfect me, here as far as the present condition of my existence permits, entirely

in that other state to which our present responsibility points, provided, of course, that I submit myself to its teachings. 296 I know of no way by which I can make this examination except by reason and experience. And I hold this further, because I hold that a true religion must be commensurate with the whole of human. 297 It must make you better physically, mentally, morally, and spiritually, and consecrate all your powers to God.

298 I am only too well aware that much which I have said has been put in a feeble and confused manner. 299 Much also necessary for the support and elucidation of the argument had to be omitted because of the necessity of compressing it into so short an essay; 300 but I trust that the main line of thought is clear, namely, that religion outside of us stands in so plain a relation to what we are internally, that either it is real, or this whole state of things is a delusion. 301 Human, without a revelation, and therefore without religion, is the only one thing of all that exist upon the face of the earth that is a bungle, a failure, and a mistake.

THE NATURE AND VALUE OF THE MIRACULOUS TESTIMONY TO CHRISTIANITY.

John Stoughton, D.D., Kensington.

MIRACLES

5 One of the most touching narratives in the New Testament relates to a want of faith in miracles. 2 It is said that when Thomas was told of his Master's resurrection, he replied, "Except I shall see in His hands the print of the nails, and put my finger into the print of the nails, and thrust my hand into His side, I will not believe." 3 He was not denounced for this. No word of withering scorn, or cutting ridicule, or threatening anger, fell on the ear of the doubting disciple. 4 But evidence was offered. "Reach hither thy finger, and behold my hands; and reach hither thy hand, and thrust it into my side; and be not faithless, but believing." 5 As far as rebuke appeared, it was only by implication, in words respecting those whose faith is of keener eye, and swifter foot:

"Blessed are they that have not seen, and yet have believed."

6 I think that every one who speaks of miracles to doubting minds should from this narrative take a lesson. 7 Surely the gist and purpose of it is, that we should distinguish between intellectual difficulty and moral prejudice, and deal patiently and convincingly with honest seekers after truth. 8 Sometimes the subject before us has been so handled as to drive the unbeliever into deeper unbelieving-- I would rather strive to work upon a little faith, and make it more.

9 I. I am to speak to you respecting the 'nature' of the miraculous testimony to Christianity. My business is with mighty works, recorded in the New Testament as having been wrought for the purpose of testifying to a Divine mission. 10 No definition of their character in relation to physical law can anywhere be found in this ancient record.

11 They are not spoken of as 'violations' of law, or as 'suspensions' of law, or as 'interferences' with law, or as 'contradictions' to law. 12 They are described, not on the side of their physical nature, but on the side of their moral signification. 13 They are depicted, not in their connection with the obvious order of the material universe, or with any hidden powers and principles of a higher and harmonious description; 14 but in their connection with Him who claimed to be the Redeemer of humankind, who came, according to His own words, to seek and save that which was lost. 15 They are denominated "'wonders'," startling occurrences, things contrary to common experience; and "'signs',"-- 16 not mere marvels bursting idly on the public gaze, and exciting in a multitude of spectators a barren curiosity, but 'signs',-- 17 replete with an ulterior meaning, and testifying to the character and work of Him through whom they were accomplished.

18 There is no necessity, then, for us at the outset to define a miracle on the physical side of it-- to call it a violation of law, or a suspension of law-- an interference with it, or a contradiction to it. 19 In other words, there is no need imposed by the conditions of our argument,

to inquire into the mode in which such a phenomenon can be produced. 20 It is enough to show that it did occur, and to dwell upon the religious significancy of its occurrence first to the witnesses, and next to ourselves. 21 What is the exact position which miracles may be thought to occupy as wonders in the universe, whether, through breaking in upon common experience, they are referable to the operation of occult laws, known and controlled at a fitting moment by the mysterious touch of the wonder-worker; 22 or whether they are to be considered as resulting simply from the immediate fiat of the Supreme will, are questions which may with advantage be relegated for consideration elsewhere.

23 1. But, at the very threshold of our inquiry we are met by the assertion, that a miracle, however defined, is in itself simply impossible. 24 Impossible! In what sense impossible? Does it mean impossible to human, or impossible to God? Impossible to human, of course, it is. 25 That impossibility enters into the popular idea of a miracle. Human has no such control over Nature as to be able to produce one. 26 But if it be said a miracle is impossible to God, such an impossibility involves the extension of human inability to God Himself. 27 It involves either the idea, that Nature has ever been independent of God, or the idea, that if produced by Him, He is no longer Lord of His own works-- this Lordship having been surrendered by His will, or having escaped from His hands. 28 Summarily disposing of this gross anthropomorphism, we find behind it the dogma of Spinoza, that there is nothing transcendental anywhere, no transcendental beginnings, no transcendental interpositions; 29 for God and Nature are one through the eternities. 30 In the wake of Spinoza's philosophy follows the modern axiom-- "to recognise the impossibility even of any two material atoms subsisting together without a determinate relation-- 31 of any action of the one on the other, whether of equilibrium or of motion, without reference to a physical cause-- 32 of any modification whatsoever in the

existing conditions of material agents, 'unless through the invariable operation of a series of eternally impressed consequences, following in some necessary chain of orderly connexion'."

33 Here, 'in limine', before examining this principle, let me observe, once for all, that miracles do by no means cast any slur upon the settled order of Nature, 34 as if it were faulty and imperfect, and required correction or supplement for effectuating its proper ends-- as frail constructions in engineering departments of human contrivance need subsequent repairs. 35 Nature is perfect enough for Her own ends; miracles are introduced for other and higher purposes. This requires to be borne in mind throughout our entire discussion.

36 But to come to the antagonist principle, that there is a development in Nature through the agency of physical laws, apart from an original Creator and an everlasting Lord. I do not say-- far from it-- 37 that the principle denies the existence of such a Creator and Lord, but it supposes at least that the physical order of the universe is fixed in such a sense, as to have ever excluded from it the action, directly or indirectly, of a Divine will, beyond the inflexible maintenance of ordinary operations.

38 It is said, "The enlarged critical and inductive study of the natural world cannot but tend powerfully to evince the inconceivableness of imagined interruptions of natural order, 39 or supposed suspensions of the laws of matter, and of that vast series of dependent causation which constitutes the legitimate field for the investigation of science, whose constancy is the sole warrant for its generalisation."

40 In reply to this it may be fairly urged that science, whilst she maintains the invariable sequence of causes and effects, and the uninterrupted order of physical events, is a prophetess of truth and wisdom. 41 She enunciates lessons bound up with the welfare of the race. Thus far there is no antagonism between her and religion. 42 She can, without abandonment of her principles, nay, in the act of carrying them out, officiate as a priestess at the altar of God; nor is there anything in the position for which she

stipulates contrary to the claims of Revelation. 43 For Revelation, in appealing to miracles, supposes the ordinary course of physical phenomena to be inviolable, and no book more than the Bible exhibits the normal constancy of natural agencies. 44 But when science pronounces as impossible all such signs and wonders as are recorded in Scripture, she steps out of her province. 45 In her own province she may justly affirm there are no signs of miracles; she may sweep her telescope over the fields of the sky, and ply her microscope amidst the growths of the earth, and say, I can see no traces anywhere but of inflexible law. 46 These realms of existence are full of order. It is the perfection of their beauty, that they are free from violations, suspensions, disturbances, and interferences.

47 But to say this-- and I fully concur in it-- is not to demonstrate that the Scriptures relate impossibilities. 48 To do so, philosophy must pass beyond the range of physical observation, since 'there' no place can be found for working out the desired demonstration. 49 Philosophers do not always remember how difficult it is to prove a negative. Showing that certain things are, they are apt to slide into a belief that 'therefore' certain other things cannot be, the conclusion proving on logical examination a simple 'non sequitur'. 50 Doubtless it is a fact, that we can detect nowhere in Nature a provision made for producing miracles such as come under our review in this lecture, that no prophecy nor hint of them can be discerned throughout her measured realms; 51 but this is a very different thing from saying, that Nature teaches the belief of them to be absurd. 52 So far from its being absurd, there may, after all, be found in Nature something analogous to a miracle. 53 In Nature there are distinct worlds, worlds between which there are gaps and gulfs. 54 I do not dispute that there are striking approximations in the phenomena of some realms to the phenomena of others; but there are also broad deep spaces, here and there, never bridged over by the discoveries of science. 55 Hence, "an animal," as you have been told already, in the

words of Hegel, "is a miracle for the vegetable world." 56 It is a new creation in some way, and a new creation in any way is a miracle. 57 After wandering amongst rocks, we find in plants a new world. organised life is so; so also, compared with animal instinct, is the mind of human, with its spiritual reason, and its moral consciousness.

58 Not only do Coleridge, Kant, and Plato regard human's highest faculty as essentially different from the mere adaptive understanding of an animal nature; 59 but what is still more remarkable, Aristotle himself, whose turn of mind was so different from theirs, differentiates human from other creatures on the ground of own being endowed with the faculty of reason. 60 In his work on the Generation of Animals, he says that there is no resource except to believe, that the reason has no affinity with the material elements out of which the human embryo is formed, but that it comes from without, and that it alone, of all the component parts of human, is divine. 61 Thus, in the opinion of one of the greatest philosophers the world has ever known, the line of demarcation between human and all lower creatures is broad and clear, a line which in the simple order and development of Nature they could never cross. 62 The superior attributes of humanity, according to him, come 'from without'; here, then, amongst the component parts of humanity is something divine. In other words, we have a new world; a new creation. 63 I do not say there is a strict parallel between any new race or species in Nature and the occurrence of individual miracles on rare occasions, 64 but I do say that there is enough of resemblance between these two descriptions of change to exempt a believer in both of them from the charge of being absurd.

65 Furthermore, there are in human minds varieties of power of an astonishing description: although there be faculties common to all humans, the vigour of those faculties in some cases is such as perfectly to eclipse the vigour of them in others. 66 The superiority of individual minds, whose works have filled the world with wonder,

is such as to leave behind, at an unapproachable distance, the ordinary measure of human endowment. 67 Certain intellects (I need not name them) have long exercised a formative power upon the civilised portions of our race. They have been as crystals inserted in a solution, and other crystals have received shape from them. 68 Whence have come these typical energies in the intellectual world? 69 No law of development will account for a resplendent genius now and then flashing on the world; for the appearance of a master mind, after humanity has kept on a low level through generation after generation; 70 for the ascent again of gifted spirits into the highest heaven of invention, after another lapse into mere mediocrity. 71 No known laws of causality account for such facts in the realms of intellectual existence. 72 If, in the case of human, as compared with other animals, the difference, as Aristotle says, is something which comes ‘from without’, the same may be said with respect to the difference between ordinary mortals and William Shakespere or John Milton. 73 There is forced upon us the conviction, that these stars which dwell apart are kindled by fires burning in superhuman spheres. 74 I do not say, in this case, any more than in the others I have cited, that we find an exact parallel to a miracle; 75 but I do maintain, that we discover here a kind of inspiration which, like the miraculous, transcends all known laws, and brings to mind what was said by the first of those just named:

76 "There are more things in heaven and earth, Horatio,
Than are dreamt of in your philosophy."

77 What is called physical science must change her name, and renounce her office, and assume functions of another order, before she can pronounce a peremptory negative upon the point in controversy. 78 Physical science needs to become metaphysical, and to pass into fields of abstract reasoning in order to the utterance of a universal dictum.

79 To this kind of mental employment in itself I make no objection; for the science of

merely physical nature, without any outlook into higher regions, keeps the soul in humiliating imprisonment. 80 The excursions of thought, however, now before us are regarded in some quarters under the singular delusion of being strictly scientific, 81 whilst employed in devising a theory of the universe which excludes the constant control of a personal God, an Almighty will. 82 The assaults on what is miraculous can be carried on only with metaphysical weapons. 83 The facts of physical nature do not supply them; only from theories of physical nature, taking a metaphysical form, can they be gathered. 84 Even Positivism, with all its doubtfullness and denial-- strange contradiction that-- must, in order to deny the possibility of miracles, build up a wall to shut them out, by trenching first on ground beyond its own domain. 85 Pure Positivism, consistently with itself, is not competent to contradict the existence of the supernatural; it can but leave it an open question. 86 The common method of distinctly denying miracles is one involving either some atheistic or pantheistic principle. 87 Assume-- and it is but an assumption-- that matter is eternal and self-sufficient; that natural laws have not originated in, or are not administered by, a personal will; 88 and thus assuming what prepares for, if it does not necessitate, some atheistic or pantheistic hypothesis, you can plausibly maintain that the wonders of which we speak are utterly inconceivable. 89 But, as you see, it is not physical science simply considered which brings out this result; the result comes through adding to physical science what is really a metaphysical element.

90 At what a tremendous cost, it may be observed by the way, is such a result achieved. 91 The philosophy of universal necessity places human in the same predicament as it does simple matter. 92 If all nature excludes voluntary control, and is subject only to an iron rule of invariable succession, then human also must yourself be incapable of voluntary control, whether it comes from a supreme will or from your own. 93 Thus the warfare which assails

miracles, threatens to destroy all ideas of freedom and moral responsibility. 94 And this dark foreshadowing is not concealed. "Step by step," we are confidently and calmly told, "the notion of evolution by law is transforming the whole field of our knowledge and opinion. 95 Not the physical world alone is now the domain of inductive science, but the moral, the intellectual, and the spiritual are being added to the empire. 96 It is the crown of philosophy to see the immutable even in the complex action of human life."

97 But when all assumptions are denied, the whole question presents another aspect. Given the fundamental distinction between things physical and things moral; 98 given the higher nature of human, the personal existence of God, a moral element in the Divine rule, the immortality of the human soul, and the present vicinity of invisible spiritual realms; 99 and, immediately, miracles wrought by the Divine will for people's moral welfare are completely removed out of the sphere of the impossible.

100 Positivism, Atheism, and Pantheism are considered in other lectures of this course, and therefore it is not my office to examine them. 101 To what has been said by the Archbishop of York and the Rev. Mr. Jackson, and to what may be said by the Rev. Dr. Rigg, I must refer my hearers.

102 I would only observe in passing, what, indeed, I have hinted at already, that it puzzles me beyond description to conceive how, by any course of natural evolution, independent of the introduction of a new force by an overruling power, 103 the phenomena of the human will with its morally creative energy for good and evil could have been produced. 104 To solve, on the principle of pure development, the problem of the genesis of that mysterious faculty, is an insuperable task. 105 If we may speak of what is inconceivable--and scientific people set us the example-- 106 we should say the existence of volition in human, with its moral accompaniments, is utterly inconceivable, apart from

belief in a Divine will, of which ours is the offspring.

107 It appears, then, that science really presents no antecedent grounds for rejecting miracles, and that if we believe in a personal God, the presumed impossibility melts away. 108 This point has been conceded by one of the masters of modern reasoning. "A miracle," as was justly remarked by Brown, "is no contradiction to the law of cause and effect; 109 it is a new effect, supposed to be produced by the introduction of a new cause. 110 Of the adequacy of that cause, if present, there can be no doubt, and the only antecedent improbability which can be ascribed to the miracle, is the improbability that any such cause existed."

111 2. When we have disposed of the preliminary objection which, in some way or other, says miracles are impossible, we are met by another objection, namely, that they are immensely 'improbable'.

112 Hume's ingenious position,-- that miracles are contrary to human experience, that no amount of human testimony is sufficient to establish them, 113 and that it is far more likely people should be deceived or mistaken, than that such events as miracles must be, could ever take place,-- has been made to do abundant service in this controversy; 114 very little, if anything, has been added by those who have persistently used the argument, to improve its form or to increase its plausibility.

115 One of its latest modifications is, that incidents out of the common course of things, said to happen in the present day, are by all of us sceptically regarded, that supernatural pretensions are felt by us to be inadmissible, 116 and that where we are compelled to allow the honesty of witnesses, if they affirm anything involving a miraculous nature, we at once dispose of the whole matter by saying 'there must be a mistake somewhere.' 117 Undoubtedly it is true that miracles are contrary to common experience. They must be so, or they would not be what they are. 118 If they were of frequent occurrence, if they had happened in the history of the world so often as to become familiar to humankind, they would change their character completely.

SCEPTICS

119 Their nature and purpose, in the view of those who receive them, is such as to render it necessary that we should bear this in mind. 120 But to allege that they are contrary to human experience, taken in the widest point of view, is to beg the question at issue, a fact remarked a thousand times. 121 That they are not contrary to the experience of certain persons who lived eighteen hundred years ago, is what Christians affirm; 122 to say that they are, is illogically to cut the controversy short, and, by a general denial of everything of the kind, to put out of court the very case about to be tried, in support of which there are credible witnesses waiting to give evidence. 123 The question of probability must be looked at all round. The circumstances under which any alleged wonders may have happened must be taken into account, before we pronounce upon their probability or improbability.

124 When extraordinary things, coloured with a supernatural tinge, are related to us as having occurred without any assignable purpose, or only for some sectarian or party end, in connection with beliefs long cherished and avowed, of course we look on them suspiciously; 125 giving to the authorities relating the narratives, credit for integrity and truthfullness, we naturally say 'there must be a mistake somewhere.' 126 And, no doubt, the general culture of the present age, however superficial that culture may be, makes us far less ready than our fathers were, to endorse popular tales of wonder.

127 There is a salutary scepticism which grows out of extensive knowledge. 128 Truth is of such immense value, that we should not be indifferent to it in the smallest communications and concernments of life. 129 Most assuredly any wayward, eccentric, unmeaning, and useless departure from the common course of things, tending only to shake our faith in Nature,-- 130 as if humans might gather grapes of thorns, or figs of thistles, as if barley being sown, wheat should spring up, or an apple tree by a sudden freak should bear oranges,-- 131 would deserve to be stigmatised as unworthy of belief. 132 But the

wonders in question come under another category. They are represented in the history which has recorded them, not only as being exceptional incidents in themselves, but as having been accomplished under exceptional circumstances. 133 They are not waifs and strays on the stream of time, floating no one knows why and whither; but growths rooted in what appears as a unique system of moral instruction and improvement, designed by the loving Father of spirits for His lost children. 134 They do not produce what may be called a disturbance of Nature-- that is, a throwing things in the physical world out of gear, so that humans are thereby puzzled to make out what Nature is, and how far it may be trusted. 135 The documents which contain our miraculous chronicles attest the immutability of Him who is the King of Nature, and the unchangeable foundation of His government and law, with a pre-eminent luminousness and with an unparalleled force.

136 The wonders chronicled were avowedly wrought for purposes of the highest order; and here, again, we fall back upon the distinction between what is physical and what is moral. 137 Those purposes of the highest order to which we refer are moral. They bear on the noblest destinies of humanity, 138 and they link themselves with the principles of natural religion, with the being and sway of a mighty, wise, and gracious God, with our conscience and responsibility, and with the future existence of the soul. 139 Natural religion, though it speaks not a word of miracles, though it gives no prophecies of their advent, yet prepares for their appearance so far, that its teachings, fairly considered, cut off all antecedent unlikelihood of their occurrence. 140 For natural religion suggests the desirableness of revealed religion, and revealed religion is only another name for supernatural interposition.

141 In a lecture upon Science and Revelation, by the Dean of Canterbury, it has been shown that human's moral nature, human's religious susceptibilities, render religion a necessity for the supply of your deepest wants; 142 but that what is called natural religion is not clear enough, nor certain

enough, to affect the generality of our race. 143 Revelation, then, it may be fairly argued, looking at human, is a desideratum, looking at God, is a probability; 144 and Revelation, being obviously a supernatural bestowment, seems to imply some authentication of itself, in part at least, by means of evidence corresponding with its own supernatural origin and character.

145 The conditions under which Scripture miracles are said to have been performed must be kept in view when we are told they are improbable. 146 They were not performed in one continued series by a succession of Thaumaturgists; but they are found grouped together in certain clusters. 147 As science indicates particular epochs of the energising power of Nature, so the Bible records particular epochs of an energising power above Nature.

148 The first great cluster of Bible wonders we find gathered round the Lawgiver of Israel; the second round the great Reformer of God's ancient Church; 149 the third round Him who is spoken of as The Word made flesh, who dwelt among us, and who imparted to His apostles miraculous powers akin to His own. 150 Miracles, for the most part, are halos of divine light encircling three grand names-- Moses, Elijah, Jesus,-- the last the greatest of the three.

151 Physical wonders we meet with in company with spiritual ones-- wonders in outward Nature in company with wonders in the great soul-world, of which sensible things are the types and shadows. 152 In other words, miracles occur in connection with inspiration, and, whilst marvels startle the eye, new truths or new applications of truth are addressed to the mind. 153 In harmony with facts in the intellectual universe already noticed, resembling the exceptional illuminations of genius which at intervals have flashed on the rest of humankind,-- 154 like the lightning that lighteneth out of the one part under heaven, and shineth unto the other part under heaven,-- 155 souls inspired with a grand moral message have come forth from the secret place of the Most High; and it has been in the pathway of these inspired souls that physical miracles have started

up; rather, it has been by their hands that physical miracles have been wrought.

156 There have been surprising coincidences in modern times between the wonderful in Nature and the wonderful in history; 157 for example, between the sailing of the invincible Spanish Armada, and the storm which strewed the shores of Great Britain with its ponderous wrecks-- 158 between the march of Napoleon's army and the winter's snow which blinded, benumbed, and destroyed so many thousands. 159 The connection is unexplained except on the principle of a Divine providence. 160 And so in ancient times there were coincidences between the lightning and thunder of Sinai, and the legislative wisdom of Moses--between the fire that fell on Carmel, and the reforming zeal of Elijah. 161 The connection is explicable only on the principle of these people having been the internunciators of the Divine will. This explication is strengthened by what they did with their own fingers or their own lips.

162 It may be considered as entrenching too much on the domain of doctrine to speak in this lecture of the Incarnation; 163 but I would venture to say thus much, that Jesus appears on the face of the evangelical narratives, as the Son of God, in a sense in which no other being can be rightly called so; 164 that in the opinions of early Christendom, the lowest as well as the highest, He was esteemed as a supernatural Person; 165 and that, by common consent, amidst diversities of theological sentiment, it is acknowledged, never human spake like this man, or lived like this man, or died like this man, or was like this man. 166 And being, by the perfection of His moral character, and by the purpose of His benevolent mission, a truly exceptional person, 167 it is only in keeping with the first blush, and with the deeper study of His wondrous life, to believe in signs and wonders attending His earthly career, showing whence He came, and illustrating what He came to do. 168 Christ Himself is the greatest of wonders in the history of the world. No other approaches Him in wisdom, love, beautifullness, and glory. 169 In more senses than

one His name is "above every name." Taking the four Gospels together, the Incarnation of the Word is associated with a supernatural birth. 170 The miracle in the spiritual world of the manifestation of God in Jesus Christ, is coupled with the miracle in the physical world of the Virgin's conception. 171 If Christianity be more than the republication of natural religion, if it be the revelation of God's redeeming love, it involves a miracle as the very starting-point of the process; 172 and the unfolding of the idea in the New Testament includes a divine manifestation, which is a miracle in history, and a divine birth, which is a miracle in Nature.

173 His advent in the world comes out in the four Gospels as a central sunlike marvel, and therefore it seems no improbability, but rather the clearest of all probabilities, that around Him there should revolve a planetary circle of miracles.

174 Difficulties are needlessly created by forgetfullness of the character ascribed to this extraordinary Person. 175 To argue as to what He did, or as to what He did not do, without a recognition of the actual 'One' painted in the Gospels, is really to argue about another Christ, not the one whom Christians follow.

176 In accordance with the view I have taken, is the manner in which the New Testament miracles are narrated. 177 It seems assumed that such things might be expected in the wake of such a personage as the Son of God. They are not introduced as a procession of facts challenging supreme admiration. 178 No flourish of trumpets heralds their march; but they follow as the fitting and humble retinue of Him who walked the earth its undisputed Master. 179 The Evangelists write as people who were not astounded at what their Master did, because they were so filled with reverence and admiration, at the thought of what their Master was.

180 Having considered the antecedent objections made to miracles, we are now prepared to look at what is really the 'nature' of the miraculous testimony afforded to Christianity. 181 And here, for the sake of simplifying the

argument, I shall confine myself to the miracles ascribed to Christ. Faith in His miracles will lead to faith in the miracles of His apostles. 182 If it be granted, as we contend from what has been said it ought to be, that this is a case in which historical proof is admissible, then it is impossible to find stronger historical proof than comes to hand in support of the truth of the evangelical narratives. 183 The historical proof, as such, has of late been comparatively little impugned; the assaults made on the prior credibility of supernatural facts being the main opposition with which believers in Christianity have to contend. 184 That opposition overcome, and the validity of competent witnesses, as to the question at issue, established, the course is free for an accumulation of evidence, 185 such as Dr. Lardner, with rare erudition, has piled up in his volumes on the Credibility of the Gospel History: 186 such as Archdeacon Paley, with unique ingenuity, and with singular felicity of arrangement and illustration, has condensed in his view of the Evidences of Christianity. 187 The works now mentioned do not, it must be confessed, supply all that is wanted for the settlement of the question, according to the phase it assumes at present. 188 But when scientific and metaphysical difficulties of modern creation have been grappled with and removed, the array of pagan and Christian testimonies in support of the original credibility of the Evangelists, as collected by these and other writers, comes to render service of immense value. 189 It is more than any one has yet attempted, to overturn, by citation against citation, criticism against criticism, argument against argument, the bulwarks of historical defence built up by the researches of learned advocates. 190 Indeed, the early historical evidence all goes one way. It is evidence without counter-evidence. 191 And to pass for a moment to foreign literature. After the endeavours of Strauss and others to resolve much of the Gospel story into myths of a later age, and of Rénan, to construct out of the original documents a French philosophical romance, 192 we are

provided with the works of Ebrard and Pressensé, who have vindicated the truth of the New Testament story.

193 It would be idle to attempt, within the compass of this lecture, any outline of the mass of matter brought together in this service. But I may be allowed to indicate that it may be arranged in three divisions.

194 'First', the concessions of the Jews. Talmudical writings imply that Jesus of Nazareth did many mighty works. 195 The 'Toldoth Jeschu' relates a number of things, such as raising the dead, healing lepers, and restoring the lame. It represents people as falling down before Him, exclaiming, "Truly Thou art the Son of God." 196 The Christian miracles are allowed, but they are attributed to magic. "There can be no doubt," says Whately, "that this must have been (as our sacred writers tell us it was) what the adversaries of Jesus maintained from the first.

197 For if those who lived on the spot in His time had denied or doubted the facts of the miracles, and had declared that the accounts of them were false tales, 198 and that no miracles had ever really been wrought, we may be sure that the same would have been said ever after by their descendants."

199 'Secondly', the admissions of heathens. The extracts from Celsus in Origen afford an abridged history of Jesus Christ, and acknowledge that He did many marvellous things. 200 Celsus explains the fact by saying, Jesus went into Egypt, and having made trial of powers practised there, returned highly elated, and pronounced Himself a God. 201 Porphry speaks of Christian miracles as wrought by poor rustics through magical arts. 202 Julian does not contradict them when he contemptuously affirms, that Jesus did nothing in His lifetime worthy of remembrance, 203 unless any one thinks it a mighty matter to heal lame and blind people, and exorcise demons in the villages of Bethsaida and Bethany. 204 To these heathen admissions, which are of considerable value, are to be added, 'thirdly', the affirmations of Christians.

205 Miracles are asserted by them in manifold forms and in manifold

writings. The Fathers follow in the wake of Apostles and Evangelists; 206 and, be it remembered, each New Testament author who testifies to these superhuman achievements is an independent witness, so that their statements bear the value of as many concurrent proofs: 207 and if it should be said that, because they were Christians, they are partial witnesses, on the other hand it can be said that some of the Fathers, and all the New Testament writers, had become so, 208 contrary to former habits and prejudices, in part, at least, through the very force of miracles, and that too at the cost of extraordinary self-sacrifice and suffering.

209 I have not sufficient space to exhibit adequately the argument for the credibility of the New Testament witnesses. 210 I must, however, observe that the force has not departed from the old-fashioned method of stating the case, namely, that you must accept them as competent and satisfactory; 211 or you must believe either that they were dishonest people, intending to deceive, or that they were dupes of their own or of other people's fancies. 212 I am disposed to extend the dilemma, and to say, that there is a third supposition, growing out of the junction of these two, the supposition (according to a not uncommon occurrence in the mysteries of human nature) 213 that the witnesses might be partly the victims of delusion, and partly the inventors of fiction, that credulity and imagination might be both at work, 214 the result being a fabrication of miracles, having no basis, or but an exceedingly slender one, in facts occurring before people's eyes. 215 With these alternatives under our view, the inquiry is, Which shall we apply to the witnesses of the miracles of Christ? 216 Rénan has applied the composite supposition to the witnesses of the resurrection. "On the Sunday morning, Mary Magdalene first came very early to the tomb. The stone was displaced from the opening, and the body was no longer in the place where they had laid it. 217 At the same time the strangest rumours were spread in the Christian community. The cry,

'He is risen,' quickly spread amongst the disciples. 218 Love caused it to find ready credence everywhere." "Such was the impression He had left in the hearts of His disciples, and of a few devoted women, that during some weeks more, it was as if He were living and consoling them. 219 Had His body been taken away, or did enthusiasm, always credulous, create afterwards the group of narratives by which it was sought to establish faith in the resurrection? 220 In the absence of opposing documents this can never be ascertained. Let us say, however, that the strong imagination of Mary Magdalene played an important part in this circumstance. 221 Divine power of love! Sacred moments in which the passion of one possessed gave to the world a resuscitated God!" 222 No one is more ready than I am to do justice to the extraordinary literary merits of the "'Vie de Jésus'," its lucid style, its descriptive power, its manifold charms; 223 but I cannot conceal my amazement that the author, with his exquisite genius, should adopt such a travestied rendering of the noblest of Bible stories. 224 There are no documents, as he confesses, to work upon but the four Gospels; and from these Gospels it distinctly appears that, so far from the witnesses produced being of the character he indicates, 225 so far from their love snatching at anything within reach, however airy, out of which to weave a web of wonders, there were people amongst them slow of heart to believe what the prophets had written, and what Jesus had said about the resurrection; 226 people who counted the report of that resurrection, when they first heard of it, as an idle tale,-- one of whom even would not yield to sight itself, but demanded to touch the nail-prints in the holy palms, and to thrust his hand into the sacred side. 227 And as to the women, when they came to the sepulchre on the third day, it was not to hail a risen Jesus, but to anoint a buried one. 228 That persons represented by the historians as burdened with doubts, and fears, and unbelief, and demanding demonstrative evidence, should have been finally convinced, 229 and should have staked their all upon that

conviction, removes them for ever utterly beyond all reasonable suspicion of dreaming strangely coloured dreams of their Lord's risen life,-- 230 to say nothing of collusion and fraud,-- and places them at once amongst witnesses, who well knew what they said, and whereof they affirmed.

231 The credibility of the witness borne to another resurrection is also well established. For evidence of the authenticity of the Gospel of St. John, I refer to Professor Lightfoot's lecture, and would only remark upon the narrative in this Gospel-- 232 a narrative so full of pathetic beauty-- that it is impossible to explain away its details by possibilities of misapprehension, and pardonable exaggerations of extraordinary incidents. 233 Thus much is indisputable, Lazarus was sick unto death. To all human appearance he died. He died, and was buried, and remained so long in the grave that it was believed the corruption of his corpse had commenced. 234 Coincident with the utterance by Jesus, at the door of the tomb, of the words, "Lazarus, come forth!" the body moved, arose, came forth, bound hand and foot with grave-clothes; 235 in consequence of which, "many of the Jews which came to Mary, and had seen the things which Jesus did, believed on Him."

236 Here were presented to the senses of witnesses phenomena involving the performance of a miracle. 237 A distinction has been justly drawn between testimony to phenomena cognisable by the senses, and miracles completely considered on their invisible and divine side, as well as their visible and human one. 238 "Testimony," it is said, "can apply only to apparent sensible facts; testimony can only prove an extraordinary and perhaps inexplicable occurrence or phenomenon; 239 that it is due to supernatural causes is entirely dependent on the previous belief and assumption of the parties. 240 "With the omission of the words "previous belief and assumption," and the substitution of the words "reflection and conviction,"-- whether exercised and experienced at the time or afterwards,-- I accept the statement. 241 Phenomena are

immediately apprehensible; the cause is not so. A persuasion that the cause is miraculous arises in the mind as an inference from what is directly witnessed. 242 But what is directly witnessed may be of such a nature as to compel the witness, as a reasonable person, to believe that what has taken place results from a supernatural interposition. 243 This conviction implies, indeed, that the person believes in the existence of supernatural power-- in other words, believes in the existence and agency of God-- which belief may be described as a "previous belief:" 244 but a conviction that particular phenomena are the result of a supernatural cause, depends on the exercise of reason in regard to the phenomena themselves. 245 "No testimony," I admit, "can reach to the supernatural," directly, but it may reach it by implication.

246 Keeping in view the distinction laid down, we say of the narrative of the resurrection of Lazarus, that no natural solution of the event recorded is within reach. 247 Fraud, collusion, trickery, are excluded by the character of Christ and of Lazarus: no reference to accidental coincidences, or to mesmerism, or to electric influences, or to any known physical agencies, meets the case. 248 Nor is there room for the anticipation that the advancement of science will ever solve this problem. If a solution be attainable, we are shut up to the one solution accepted by Christians. 249 To leave it unsolved, to refer it to the class of unaccountable phenomena, through a persistent determination not to believe in anything supernatural, in the face of all which can be said in reply to antecedent objections, is most unphilosophical.

250 Let me here add, in reference to narratives of the miraculous, that it is easy to marshal a number of general reflections together, casting a slur upon evidence, and to invest with some plausibility its denial or non-acceptance. 251 But, when we think how fallaciously, yet plausibly, general reflections may be employed for the contradiction of evidence,-- 252 how, by reference to the proverbial exaggerations of travellers' stories,

accounts of other countries, of their customs and productions, may be discredited; 253 how, by insisting upon people's liability to illusion, the observations of scientific inquirers may be set aside; 254 how, by dwelling on credulity and passion, party spirit, and the like, historic doubts may be conjectured respecting the existence of Napoleon I, 255 and how, in the same way, historic doubts may be hereafter raised respecting a large part of the career of Napoleon III; 256 we see how little such general reflections are to be trusted, how much more they may do to hinder the interests of truth than to help them. 257 The absurdity of the conclusions in such cases discredits the process by which they are reached.

258 Let us not pass from this part of the subject without saying one word as to the presumption in favour of the New Testament narratives of miracles, when compared with narratives of miracles found elsewhere. 259 Place side by side with the Scripture narratives the miraculous stories in the Apocryphal Gospels, in the writings of the Fathers, in mediæval chronicles, in modern legends of Saints, 260 and one sees the force of a remark by an eminent German theologian: "The critical acumen of Niebuhr was, as is admitted, inferior to that of no human, and he has done away with only too much of the ancient history of Rome. 261 Yet he acknowledged, 'with respect to a miracle, in the strictest sense of the word, it needs but an unprejudiced and searching investigation of Nature to perceive, 262 that the miracles related are anything but absurd, and a comparison of them with the legends or so-called miracles of other religions, to recognise what a different spirit dwells in them.'" 263 To take only one step farther in this direction, when it is asked, "What, if so many apparently competent witnesses were to assure you, that they had seen such and such a miracle-- mentioning the most monstrous absurd, fantastic, and ludicrous confusion of Nature-- would you believe them?" 264 We answer in the words of a modern Writer: "We are only concerned with the miraculous under that form and those conditions under

which it has actually by trustworthy report taken place, as subordinated to what has been called 'a general law of wisdom,' 'i.e.' 265 to a wise plan and design in the Divine mind under which check the course of miracles has, so to speak, kept near to Nature, just diverging enough for the purpose, and no more."

266 II. It is time to attend to the second part of our subject, the 'value' of the miraculous testimony to Christianity.

267 1. The miracles must not be taken alone; they form a part of Christianity; and therefore, to be rightly understood, they should hold in the mind an inseparable relation to the rest of Christianity. 268 Christianity is its own evidence. Each portion harmonises with the other portions. They yield mutual support. 269 Miracles, therefore, are concurrent with other proofs. "External" and "internal" are convenient words, but they are liable to mischievous application. 270 One objection to the word "external," as designating the evidence of miracles, is that it assumes them to be outside the Gospel-- only bulwarks for defence, not pillars identical with the inner structure. 271 It is curious that opposite classes of persons have attributed to miracles an externality which their place in Scripture will not allow. 272 By one class, consisting of advocates for the evidence, miracles are presented as the chief part of the evidence, as marks indispensable for the authentication of Divine truth, 273 yet quite 'ab extra' things, placed round about the temple to ward off evil-disposed persons who would dare to violate the shrine. 274 By another class, consisting of those who take exception to the miracles, they are also treated as things 'ab extra', things which may well be cut off from Christianity-- 275 burdens which there is no necessity it should be made to bear-- a dress which disfigures it rather than otherwise, and which, for the sake of its progress in the world, had better be stripped off and cast away. 276 These two modes of assuming one and the same thing, are as objectionable in themselves, as they are curious in their coincidence.

SCEPTICS

277 The miracles really run into and intersect the lines of New Testament teaching from end to end. 278 They are not seals externally attached, but contents deposited inside-- not post-marks showing simply whence the letter comes, but paragraphs written in the folded sheet. 279 The "'internal'" and the "'external'"-- if we may use the words in their popular currency-- must occupy our attention together. 280 Miracles cannot be torn from the life of Christ. His nature, character, teaching, wonders, constitute an unparalleled spiritual unity. 281 Criticism here, of course, has its own department of duty to fulfilll. What really constitute the synoptical Gospels and the Gospel of St. John, is its province to determine. 282 Readings of MSS. require to be examined with an honest desire to render the 'textus receptus' as perfect as possible-- a desire which a reverential regard for the genuine contents of the record must serve to stimulate. 283 When all that labour has been accomplished, the miracles of the genuine rolls of Scripture are to be regarded as integral elements of faith.

284 "The facts of Christianity," says Archdeacon Lee, "are represented by some as forming no part of its essential doctrines; they rank, it is argued, no higher than its external accessories. It is impossible to maintain this distinction. 285 In the Christian Revelation the fact of the Resurrection is the cardinal doctrine, the doctrine of the Incarnation is the fundamental fact. 286 Christianity exhibits its most momentous truths as actual realities, by founding them upon an historical basis, and by interweaving them with transactions and events which rest upon the evidence of sense."

287 2. Miracles are reasonable attestations of a Divine mission. As such our Lord appeals to them, they "bear witness of me, that the Father hath sent me."

288 As such Nicodemus received them: "We know that Thou art a teacher come from God: for no human can do these miracles that Thou doest, except God be with you." 289 As such the poor blind man regarded them in that

exquisite piece of 'naïveté', in which he says, "Why herein is a marvellous thing, that ye know not from whence He is, and yet He hath opened mine eyes." 290 As it is reasonable, in the case of an ambassador, to refer to own credentials in proof of own legitimate authority; 291 so it is reasonable, in the case of a professedly Divine teacher, to refer to signs and wonders you are capable of working, in proof of your Divine commission.

292 Of vast importance is it that we should note precisely the point touched by the finger of miraculous evidence. 293 It may be said, not only are miracles incapable of enforcing a train of argument, but they are incapable of establishing any moral or religious proposition. 294 No physical demonstration, it may be alleged, can ever link itself on to a spiritual truth, because the two things belong to totally different spheres.

295 We should get involved in metaphysical subtleties, were I to inquire thoroughly into this position. 296 It is enough to say, that, admitting it, the exact point touched by miraculous evidence, is, according to the teaching of Scripture itself, the 'office' sustained and the 'commission' borne by a person. 297 "The works which the Father hath given me to finish, the same works that I do, bear witness of 'me'." 298 "Jesus of Nazareth, a man approved of God among you, by miracles, and wonders, and signs, which God did by 'Him'." 299 In these passages, the witness of miracles is attached to a person. "My works bear witness of 'me'," says Jesus. They are the approval of "'a man'," says Peter. 300 The evidential force of them bears on Christ Himself, the sent of God. Thus considered, miracles free themselves from objections made to their competency to serve as direct proofs of spiritual truths.

301 The miracles of Moses afford evidence of his Divine legation: in like manner the miracles of Jesus afford evidence of His Divine Messiahship. 302 It is said of Him that "He taught them as one having authority, and not as the scribes." Authoritativeness is characteristic of His mode of teaching. "Verily, verily, I say unto you." 303 He

claimed a right to speak, as one who had power to command people that they should obey. There is in His utterance little of argument, but much of law. 304 Miracles can add no force to a chain of reasoning, and you may say they cannot immediately demonstrate spiritual truth, but they afford a basis for the enunciation of a Divine message, a mandate of the Divine will.

305 Miracles, no doubt, come within relations to spiritual truth, through the medium of the miraculously demonstrated authority of its utterer; 306 but spiritual truth has other distinct and appropriate marks of its Divine origin and character. It contains an inward witness-- it shines by its own light. 307 It commends itself to human's consciences in the sight of God, and when believed, vindicates the justness and wisdom of such belief.

308 It cannot be too much insisted on, that miraculous evidence comes not out in Scripture 'by itself'. 309 The works of Jesus include more than His miracles. The whole beneficent influence of His life is covered by the words, "who went about doing good." 310 With the thought of what He did, stands associated the thought of what He was; and with the character of His matchless life is interwoven the character of His matchless teaching. 311 Miracles form but one strand in the cable which binds the Church's faith to Him who is the Anchor of her hope; 312 and 'they' expose the ship to peril who untwist the rope, and lay upon that single strand the whole amount of strain-- the entire stress of tension. 313 Holy Writ warrants no such course; but warns against it. 314 "If there arise among you a prophet, or a dreamer of dreams, and giveth thee a sign or a wonder, and the sign or the wonder come to pass, 315 whereof he spake unto thee, saying, 'Let us go after other gods which thou hast not known, and let us serve them;' thou shalt not hearken unto the words of that prophet, or that dreamer of dreams." 316 Moses, himself a worker of miracles, appeals to something beyond miracles as essential to the final establishment of religious authority. 317 The moral proof is

put in the foremost place, and no mere physical achievement can exercise exclusive force apart from that. 318 And, as if to remind us of these words in Deuteronomy, we read in the last chapters of Revelation of people being deceived by the miracles of the beast, of the spirits of devils working miracles, and of the false prophet that wrought miracles. 319 Thus the New Testament teaches us to bind the evidence of Christian miracles to that which shows how utterly different they are from all the pretensions of deceivers, from all the delusions of fanatics.

320 To dwell on extraordinary incidents, apart from other considerations, is to open a door to superstition, and even revolting credulity. 321 In this way, a belief in witchcraft, sanctioning most unrighteous and cruel laws, maintained its ground in England to the end of the seventeenth century.

322 From anything like the unreasonableness of staking religious faith upon physical events or historical circumstances, 'simply because' they are unaccountable upon any ordinary hypothesis of human affairs, the Gospel is perfectly free. 323 You who appeals to His own mighty works, appeals also to His own self-evidencing words, and to the moral disposition of His disciples. 324 "To this end was I born, and for this cause came I into the world, that I should bear witness unto the truth. 325 Every one that is of the truth heareth my voice." "My doctrine is not mine, but His that sent me. If any person will do His will, you shall know of the doctrine whether it be of God, or whether I speak of myself. 326 You that speaketh of yourself, seeketh your own glory; but you that seeketh your glory that sent you, the same is true, and no unrighteousness is in you."

327 The solitary position assigned to the evidence of miracles in the controversies of the last century was mischievous to the interests of religion. 328 I believe with Coleridge, "how little of divine, how little fitting to our nature a miracle is, when insulated from spiritual truths, and disconnected from religion as its end:"-- 329 and I would ask with you, "What then

can we think of a theological theory, which, adopting a scheme of prudential legality, common to it with 'the sty of Epicurus,' 330 as far at least as the springs of moral action are concerned, makes its whole religion consist in the belief of miracles!"

331 There is some room for this severe censure of theologians in the last century, who failed to insist "on the creating of a new heart, which collects the energies of a human's whole being in the focus of the conscience-- 332 the one essential miracle, the same, and of the same evidence to the ignorant and the learned, which no superior skill can counterfeit, human or demoniacal." 333 I should assign a higher place to the physical miracle than Coleridge did,-- but there is to my mind a true and deep sense in what you asks respecting the moral one:-- 334 "Is it not that implication of doctrine in the miracle, and of miracle in the doctrine, which is the bridge of communication between the senses and the soul?" 335 Christianity as a whole, at the present time, establishes its claims by the new spiritual creation which it effects in its sincere disciples. 336 And here, let me add: looking at the position of our inquiry at the present day, it appears of great importance, not to lay down as a principle, that miracles are indispensable in the authorisation of a Divine message. 337 To do so hampers our argument. To do so contradicts Scripture,-- "John did no miracle." If one eminent servant of the Most High could make good your authority without effecting any physical marvel, so might another. 338 Regarding Jesus simply as a Divine Teacher, there would, then, be no absolute necessity for His working wonders in the fields of material Nature. 339 His moral acts, His freedom from moral defects, and the whole moral tenor of His life, would evince the holiness of His character, 340 and the oneness of His own spirit with that of the Father of spirits, the fountain of love and truth; for what He said of humans applied to Himself, "By their fruits ye shall know them." 341 Yet, though I cannot see that miracles, as some think, were essential to the proof of what He said respecting Himself, they are,

as indicated already, what might be expected in one who was all that Jesus of Nazareth claimed to be; 342 they also corroborate claims to spiritual authority, resting on other grounds; and, still further, the manner in which some of them were performed, points to the higher nature which tabernacled in His humanity.

343 The place in the sphere of evidence occupied by the miracles of Jesus, is not exactly the same to us that it was to the multitudes who witnessed them. 344 I fully agree in the remark, "We do not ask any one to begin with the miracles,-- to regard power, and still more the record of power, centuries afterwards, as the one irresistible proof of the truth and Divine origin of a Revelation. 345 This has been done-- done perhaps too long-- done certainly in this age without conviction."

346 A miracle never was 'the one' irresistible proof. It never was more than one amongst others. But at first it had a power of awakening attention, which it does not possess now. 347 'Seen', it irresistibly produced excitement, which led to inquiry. 'Recorded', it fails of that effect. 348 It is wise, at this time of day, to begin the exposition of Christian evidence by insisting on Christianity as a fact-- as a moral spiritual power in the world; 349 and then, examining its principles, and tracing its achievements to the beginning, to bring out the evidential worth of Christ's miracles as a crown on the head of other proofs. 350 At the same time it should be observed, that their pertinency as proofs remains unaltered. They are not less true for being old. They are as good witnesses now as they were eighteen centuries ago. 351 What was done by Julius Cæsar, what was done by Alexander the Great, as it appears on record, is still as valid an indication as ever, of the genius and prowess which the humans possessed. 352 So, what Jesus did, as we find it recorded in His fourfold memoirs, produces undiminished assurance of His superhuman character. 353 If any one asks for miracles now, I reply, they are not wanted, they could not be used as credentials of one who left the world ages since. 354 His own miracles, ascertained by history, will, to the end of time, in

connection with His whole life, avail as guarantees for faith in His Divine might and goodness.

355 3. And, finally, the miracles promote the acceptance of Christian truths by the illustrations of them which they afford. 356 Christ's miracles are of the same description as the principles and precepts in Christ's teaching. They are animated with benevolence, instinct with love. 357 The Gospel perpetually offers to humans a spiritual salvation; Miracles at the beginning brought them salvation of a lower kind, which nevertheless pointed to a higher. 358 Of the author of Christianity it might be said literally, "He is the Saviour of the body." His wondrous works of healing sparkled with a tenderness, compassion, and help, like those with which His main mission to humankind was filled. 359 And, as they were eminently beneficial to human beings, and so were of the same class as the other bestowments the Christ of God came to confer, they exhibited types of the nobler blessings themselves. 360 They are mirrors reflecting larger and better gifts. Signs they are as well as wonders; parables as well as proofs. 361 In cures of the blind, there are parables of spiritual illumination; in the cleansing of lepers, parables of spiritual purification; and in exorcisms, parables of spiritual disenthralment.

362 The benevolent animus, and the didactic form of the miracles of Jesus seized the attention of early Christian writers, and were employed by them for the purpose of establishing and recommending the Christian religion. 363 They used them much more under their illustrative than under their strictly evidential aspect. 364 Arnobius (A.D. 306), in ten chapters of his seven books, "'Adversus Gentes'," lays special stress upon their kind and beneficent tendency. 365 Lactantius, his contemporary in his "Institutions," whilst regarding Christ's miracles as proofs of His higher nature, manifests particular delight in searching out their ethical significance. 366 He goes through the mighty works of our Lord in order, and points out, how they demonstrated the renewal of the human soul, the opening of its eyes, the unstopping of its ears, the

loosening of its tongue. 367 And Athanasius (A.D. 326) takes special pains to show that the miracles of Jesus were revelations-- self-representations of His Person as Divine Creator, not mere credentials of His doctrine, but veritable victories over Nature, 368 so that no one can doubt who Christ is, when once you beholds His works:-- and moreover, that by the manner of His working miracles, He at once proved his Divinity, and His humanity, His Godhead and His incarnation. 369 And Augustine insists much on their design as symbolical of redemption, as instructive acts, charged with prophetical import, and calculated to inspire delight more than wonder.

370 These remarks and quotations bear chiefly on the relation of miracles to the spiritual blessings of the Gospel at the beginning. 371 But miracles also sustain a very interesting relation to the like blessings as bestowed in after, and in present times. 372 When the spring is over, and its produce of blossoms has passed away, it is found, that though the ground is covered with leaves of white and pink, the blossoms have set into precious fruit. 373 They have bequeathed more than blossoms. Each folded up a promise of what is richer than itself. The peach flower, the peach-- the pear flower, the pear. 374 We read in the Apocalypse, of the Tree of Life. Is not the Gospel the Tree of Life? Is not Christ the Tree of Life? 375 It is not fanciful to speak of the miracles as early blossoms. Long since they burst out profusely. Long since they fell. 376 To some eyes, they may seem to lie in the paths of history, as withered leaves. But if the spring-time is past, the autumn-time has long since come. 377 Christianity can tell of spiritual blessings which it has conferred on the children of people down to this day, and is conferring still. 378 A tranquil conscience, a pure heart, a holy life, a hope that maketh not ashamed,-- these are the clustering felicities, the manifold beatitudes, of the Gospel of Love. 379 Thank God! abundant has been the in-gathering. Thank God! abundant is the harvest, still waiting to be gathered. 380 In Nature the bloom is more plentiful than the fruit, but

here the fruit is more plentiful than the bloom.

THE GRADUAL DEVELOPMENT OF REVELATION.

The Right Reverend
The Lord Bishop of Carlisle

6 When I undertook, at the request of the Christian Evidence Society, to deliver a lecture having for its title 'The Gradual Development of Revelation', I confess that I did not perceive that the title was open to criticism. 2 I thought that I understood the terms employed, and I still trust that this is so; 3 but a little consideration showed me that the language was not used very strictly, and that there was in it a confusion of metaphors, which might possibly be connected with a confusion of thought.

4 This being so, I propose to introduce what I have to say by a short examination of the words which express the subject of my lecture: 5 and I do so, as I need hardly say, not for the purpose of finding fault, but because it seems to me that I shall in this manner most easily explain the nature of the subject which I conceive to be committed to me, and indicate the manner in which I purpose to treat it.

6 Now the word ‘Development’, which like many other long words has become very common, is also, like many other words, not unfrequently used somewhat loosely. 7 The root of it, the word 'velop', is unknown in any other form than the two words 'envelope' and 'develope'. 8 In mathematics, the word 'develope' is used, as all words are, with the utmost precision. We speak of 'developing a function', that is, putting it into a new and unfolded form, which, however, shall be essentially equivalent to the original. 9 So also we speak of 'developable surfaces', that is, surfaces such as cones and cylinders, which can be unfolded and laid flat upon a plane without tearing. 10 It will be seen that in these applications of the word the essential thought is that of a change, by a process of unfolding, in the condition of something which you already possess; and this I take to be the true definition of development.

11 From this, however, we easily pass to a cognate meaning of the term. Thus we speak of the development of an idea, that is, the unfolding and applying of the results of an original thought, 12 a discovery or principle, which were truly contained in it from the first, but were not from the first perceived to be so contained. 13 For example, we say that railways are only a development of the original idea of turning to account the expansive force of steam; 14 or that Newton's "Principia" and Laplace's "Mecanique Celeste," and, in fact, the whole of modern physical astronomy, are developments of the idea, or fact, 15 call it which you will, of the universal gravitation of matter; or that the British constitution of this century is a development of 'Magna Charta'; and so forth. 16 What we mean by this language is that the essential principles of the development were implicitly contained in the original idea, 17 and that one has been derived from the other somewhat in the same way as that in which the bird comes from the egg and the plant from the seed.

18 Dr. Newman, in his Essay "On the Development of Christian Doctrine," takes a somewhat different view. 19 He speaks of the development of an idea as follows: "When some great enunciation, whether true or false, about human nature, or present good, or government, or duty, or religion, is carried forward into the public throng and draws attention, 20 then it is not only passively admitted in this or that form into the minds of people, but it becomes a living principle within them, leading them to an ever-new contemplation of itself, an acting upon it, and a propagation of it. 21 Such is the doctrine of the natural bondage of the will, or of individual responsibility, or of the immortality of the soul, or of the rights of human, or of the divine right of kings, or of the hypocrisy and tyranny of priestcraft, or of the lawfullness of self-indulgence.... 22 Let one such idea get possession of the popular mind, or the mind of any set of persons, and it is not difficult to understand the effects which will ensue." 23 Taking this view, there is manifestly a difficulty in

determining whether an idea has been rightly or wrongly developed, whether the growth be wholly from the root or partly parasitical; 24 and the prime intention of Dr. Newman's book is to supply tests of genuine development, and to apply them in one particular case; 25 but I wish it to be perceived that whether we take this wider view, or the stricter one which I endeavoured to present to you just now, it is essentially necessary to regard development as the exhibition in a new unfolded form of that which already existed in another.

26 When therefore we speak of development with reference to God, we must regard Him as the developer, and His eternal purposes as the thing developed: 27 the point which I have to bring before you with reference to its bearing upon the faith of Christians, and the unbelief of those who scruple to be regarded as disciples of Christ, is the gradual character of the process by which God has developed His purposes.

28 And this being the meaning of development, I think it is manifest that it is a confusion of figures to speak of the 'development' of a 'revelation'. 29 To 'reveal' is to 'draw back a veil', and so to uncover something which was concealed before. Hence we can properly speak of God as 'revealing' to us His person, His character, His will.

30 His person is eternal and unchangeable; so is His character; so is His will; but He uncovers and shows these to us; 31 it may be by Holy Scripture, it may be by the living voice, or the life, or the person of the Lord Jesus Christ; 32 but however it be, the conception appropriate to the word revelation is that of something which exists independently of our minds, and which is uncovered, so that our minds can perceive it. 33 Revelation, therefore, cannot be developed; if we use the word as meaning the process of revealing, then this is a different process from that of developing; 34 and if we use the word as meaning objectively the knowledge which has been revealed, the knowledge which we obtain of God by revelation, then this knowledge comes to us in an already

developed form: 35 it is not an idea to be developed, but a truth to be received.

36 On the whole, I regard as the most important word in the title of my lecture, the word 'gradual': whether we speak of the development of His eternal purposes and intentions, or the revelation of His person and character, 37 the process appears to have been a gradual one, and in a certain sense a slow one: and this gradualness of operation may be variously estimated according to the turn of mind and habits of thought of him who considers it: 38 some will be content simply to bow their heads and worship as being in the presence of Him whose ways are past finding out: 39 some will say that that which Christians believe to be the development of His purposes and the revelation of His person is inconsistent with their conceptions of God, and so will reject it: 40 others will hesitate to reject on 'à priori' grounds that which, to say the least, admits of a strong argument in its favour, but will confess that they feel the difficulties which have been urged against the creed of Christendom; 41 and with regard to that particular phase of difficulty with which I am professing to deal in this lecture, they will say, and perhaps say with sadness, that the revelation which the volume of Holy Scripture purports to contain, does not commend itself to their minds, 42 as corresponding to their highest thoughts of that which God might be expected to do in making Himself known to human. 43 Now it is to minds in this condition that considerations concerning the doings of God may be hopefully offered. 44 I do not see how it is possible to treat such a subject as mine, if I consider myself as speaking to persons who deny the impossibility of revelation as distinct from human knowledge: 45 if a revelation be impossible, 'per se', it is useless to discuss the qualities of that particular form of revelation which Christians profess to have received; 46 but if a person is willing to receive a revelation, and has something of the spirit indicated by the words, "Oh, that I knew where I might find Him," then it does seem to be possible to offer some suggestions

47 which shall tend to show that the manner of revelation which Holy Scripture exhibits is in harmony with all that we know of our Creator from other sources, 48 and that the gradual character of the Divine operations, as exhibited in that history which culminates in the Lord Jesus Christ, is wonderfully analogous to the character of every other operation which we can rightly call divine.

49 Let us then observe what the revelation of God purports to be; and for the special end which I have in view, I think we may suitably divide it into the following principal steps:-- 50

1. That made to Adam and Eve;
2. That made to Abraham;
3. That made to Moses;
4. That made in and by Jesus Christ our Lord.

51 Let us look at each of these for a moment. The revelation to Adam and Eve is represented as being of the simplest kind possible. 52 In fact it is difficult to conceive how anything beyond a very simple and partial revelation could be possible in the very infancy of humanity. 53 It amounts to little more than the revelation of God as a personal governor, whose will must be obeyed: 54 a command is given; that command is broken, and a punishment is inflicted; 55 and then humankind is represented as cast out of Eden into the wild, uncultivated world. 56 It is necessary to realise the extreme simplicity of this history, and the imperfect character of the revelation: 57 the more so, because there is some temptation to imagine Adam and Eve as being in the possession of more knowledge than Scripture attributes to them; 58 Scripture in reality attributes no knowledge to them, but rather represents the tree of knowledge as having been the cause of their fall.

59 Philosophically speaking, we may describe the condition of things which existed in Eden as being the dawn of human's religious consciousness; 60 you have no responsibility, and no sin; but a law is imposed upon you, and thus comes responsibility, and thus by the breach of law comes sin: 61 human "was alive without the law once, but when the commandment came sin revived," and human "died."

62 The sacred history represents the world as engaged, so to speak,

in working out the results of this primitive revelation till the time of Abraham. 63 God is represented as punishing the evil and rewarding the good, the punishment of the evil being the more conspicuous conduct of the two; 64 thus Cain is punished, the people in the days of Noah are punished, the builders of the tower of Babel are punished: 65 but I do not think it can be said that the being and character of God are any further revealed till the time of Abraham. 66 Then we have the new fact of God calling out a family; granting to that family special promises and special privileges, and making it (as it were) the depository of the fortunes of the world. 67 Probably this is a step which we should not have expected; possibly it may even be argued that it is no real step in advance; 68 but, be this as it may, it is represented in Scripture as the next step in the process of revelation; 69 whether it strike us as strange or not, we are compelled, on the hypothesis that Scripture contains the history of revelation, to regard Abraham and his family as a point, a station, in the process.

70 And so we come to Moses. I am disposed, however, to regard the Mosaic revelation as differing in degree rather than in kind from that made to Abraham. 71 A family was called in Abraham, a nation in Moses; but in the one case as in the other, the fortunes of the whole world were bound up with the history and conduct of a chosen few; 72 the family of Abraham was a peculiar and chosen family, the Israelites whom Moses made into a nation were a peculiar and chosen people: 73 the principle was the same, namely that of selection, and whatever difficulty belongs to one case, belongs equally to the other.

74 It would be a long task, and for my purpose an unnecessary one, to trace the gradual progress of the revelation made "in sundry times and in divers manners" to the Israelitish church and people; 75 beginning with the grand announcement of the Name of God from the Burning Bush, and continued by the declaration of the law in the wilderness, rendered visible, so to speak, by the sacrificial ritual, and expounded by priests and prophets, 76 it

gradually became clearer and clearer, until "the fullness of time" came, and "God sent forth His Son made of a woman." 77 I need not say that to Christians this is emphatically 'the' revelation of God-- "you who has seen the Son has seen the Father."

78 All previous revelations are only preparatory for this; and when we have received this, all others seem to be lost, just as the moon and stars which shine so brightly at night are absolutely extinguished as soon as the sun is risen. 79 Assuming all this, however, it may be worthwhile to remark, first, that Jesus Christ expressly connected Himself with all that had gone before, saying that He "came not to destroy, but to fulfill;" 80 and secondly, that He, like Moses and Abraham before Him, founded an ἐκκλησία [Greek: ekklêsia], or church, as a depository of the fortunes of humankind, 81 only with this difference or extension of principle, that whereas the church of Abraham was a family, and the church of Moses was a nation, 82 the church of Christ was catholic, knowing no distinction of family or nation, but embracing all who were willing to take Him as their Captain, and His Cross as their banner.

83 This sketch, slight as it is, of the progress of revelation, as presented to us in Holy Scripture, will be abundantly sufficient for my present purpose. 84 In considering its claims to be received by humankind, I think it should be at once candidly owned, as seems indeed to be conceded in Holy Scripture, 85 that the method of revelation is probably different from anything which we should have expected on general grounds of reason. 86 Perhaps it is difficult, it may be impossible, to say very precisely what we should have expected; but certainly I think we should 'not' have expected to have found the principal revelations of God made, as they are alleged to have been made, to a selected family, a selected nation, a selected corporate body. 87 It is only candid to acknowledge that, from a philosophical point of view, we may here see a great difficulty; and the difficulty becomes more salient when we look out of the narrow groove of

sacred history into the wide history of the world at large. 88 There we find a remarkable growth of knowledge, and an exhibition of the highest powers and gifts of humanity, quite separated from that region which is asserted to have been specially illuminated with light from heaven. 89 The progress of our knowledge of the literature of ancient nations, and a greater familiarity with the thoughts and feelings of people outside the Christian pale, have tended to throw this difficulty into stronger relief: 90 our old acquaintance with Greece and Rome, our more recent acquaintance with such countries as India and China, have made us aware that, somehow or other, great light did shine upon these countries in olden days, and it is harsh to say that the light did not come from heaven. 91 Let, therefore, the difficulty be frankly acknowledged; while at the same time it is also acknowledged that in a matter so much beyond the scope of our faculties as that of saying in what manner God can best reveal Himself to humankind, 92 all difficulties depending upon the strangeness or unexpectedness of a method alleged to have been adopted, must in the nature of things be of less than first-rate magnitude, and must give way to sufficient evidence.

93 Acknowledging, however, as frankly as can be desired, the difficulty here stated, I observe that there is anyhow a remarkable consistency in the scheme of revelation which Scripture contains. 94 One step leads naturally to another; and looking at the whole course of Scripture history, from the first verse of the Book of Genesis to the last verse of the Book of Revelation, it is wonderful (perhaps upon any infidel hypothesis, more than wonderful) how the various parts hang together, 95 and how the beginning, the middle, and the end seem to dovetail themselves together into one connected and consistent whole. 96 I do not know that I have ever been more struck with this, than when reading the recent work on "The History and Literature of the Israelites," by C. and A. de Rothschild. 97 In this work we have the advantage of seeing the Old Testament

exhibited in a reverent and loving spirit without the New, and as it might have appeared if Jesus Christ had not been born. 98 Any one reading the book would be impelled to say that the influence of the literature of the Israelites must be for the improvement and enlightenment of humankind; 99 but the questions press upon the mind of the reader-- at least they did upon mine-- "What does all this lead to? What has become of these Israelites? And what is the meaning of the language of their prophets?" 100 In fact, the book seems to put the reader very much in the position of the Ethiopian nobleman in the Book of the Acts of the Apostles, who was prepared by reading some of the "literature of the Israelites" to receive from Philip the evangelist the preaching of the name of Jesus. 101 The New Testament seems exactly to 'fit' upon the Old; and that gradual progress of revelation which we notice in the Old Testament, seems to lead up to, and find its completion and explanation in, the history which is contained in the New.

102 On the whole, looking at the scheme of revelation as it appears in Scripture, and as it has been illustrated by history, both profane and sacred, I believe that I discern these features. 103 I see the knowledge of God emerging from very obscure beginnings, and imparted in very unexpected ways; 104 I see, however, that this knowledge does somehow or another not merely remain with humankind, but increase and become clearer and more influential; 105 I see a particular family and nation selected for the reception and spread of this knowledge, 106 and the family and nation so selected, after going through much education and many vicissitudes, producing at length One in whom the whole history appears to culminate, and then disappearing from all position of influence upon the fortunes of the world except through this one pre-eminent member. 107 Still further, I perceive, and it is absolutely impossible for the most sceptical to deny, that the name of this remarkable member of the selected family and nation has been the most potent that has ever been

named, 108 and that His influence in the world has been and is far greater, more extended, and more intense in its action, than any other influence which has ever been brought to bear upon the human heart and mind. 109 Even in the work to which I referred just now, in which the Old Testament alone comes under consideration, the dates of the history are given by reference to the birth of Jesus Christ; 110 and whatever view people may be disposed to take of the more mysterious and transcendental allegations concerning the life of Jesus of Nazareth, it is impossible to deny 111 that the civilisation and improvement of the world, and the purification of human society and the like, are more connected with His Name than with that of any other philosopher or teacher or leader of humankind. 112 When I say that it is impossible to deny this, I am of course aware that it has been denied, 113 and that there are and have been persons who have asserted that Christianity has not only not been that which Christians believe it to have been, but has been positively detrimental to human progress; 114 but what I mean is, that to make the denial to which I refer, is so contrary to the general verdict of humankind that it is hard for any one to make it, and impossible for any one who is at all likely to be influenced by anything that I can say. 115 For those who are at all likely to be influenced are persons who are 'sceptical', not those who are 'antagonistic'; 116 a person may doubt-- who has not doubted?-- and a person may be tortured by own doubts, and it may be possible to relieve you; 117 but I see no probability of helping that person who has come to the conclusion that the influence of Jesus Christ has been a mischievous and obstructive influence in the history of human progress; 118 with such a person, I, at least, as a Christian apologist, do not feel that I have any common ground.

119 Taking then the view of revelation to which I have referred as being that contained in Holy Scripture, and acknowledging that such a view presents difficulties to thoughtful and inquiring minds, 120 I wish to examine and see whether we cannot find some help

towards a right appreciation of God's method of revelation by examining the course of Nature, or that which is supposed to be its course.

121 And when we look to Nature with this purpose, it is impossible not to be struck by this general fact, namely, that gradualness of development appears to be a universal law. 122 The manner in which the original design of the Creator (for I assume that there was an original design) has been carried out, so far from being sudden, has been very slow; 123 and more than this, the method of operation has been frequently such as we should scarcely have expected, and greatly opposed to those notions of creative majesty which most of us are very much disposed to preconceive. 124 In order to put this clearly before you, let me call your attention to the very picturesque and poetical view of creation, contained in Chateaubriand's "Genie du Christianisme." 125 That work appeared after the explosion of the volcano of the first great French revolution, and was intended to reconcile the minds of people, 126 weary with the infidelity and atheism which had so long been rampant, to the views of God contained in Holy Scripture, and maintained by Christians. 127 Writing with this purpose, M. Chateaubriand tells us that we may conceive of the Creator as having called the world into existence in a condition as complete, and having as many marks of antiquity, as we now see about us: 128 when this earth was created there would be already ancient forests, and abundance of animals, some in their maturity, others dancing about in the friskiness of youth; 129 the trees would be furnished with birds' nests, and the crows and pigeons would be hatching their eggs, or tending their young; 130 the butterflies and moths would be sporting on the plants; the bees would be making honey from the new-formed flowers; the sheep would be followed by their lambs; 131 and the nightingales would be astonishing themselves with their first, yet perfect songs, in all the groves. 132 Finally, Adam would be a man of thirty, and Eve a girl of sixteen. "Without this original antiquity," says our

author, "there would have been neither pomp nor majesty in the work of the Eternal; 133 and, which could not well be, Nature in Her innocence would have been less fair than She is now in Her corruption. 134 An insipid infancy of plants, animals, elements, would have crowned a world devoid of poetry." 135 No doubt this description is anything but devoid of poetry; it is perhaps the only way in which a poet would be disposed to conceive of creation; 136 it is difficult to imagine the music of Haydn set to any other description of the creative work; but undoubtedly it is not scientific, and, what is more, it is not Scriptural.

137 Chateaubriand no more got his picture of creation from the Book of Genesis than Ernest Rénan got his picture of Jesus Christ from the four Gospels; 138 and that there may be no mistake about this latter point, let me ask you to observe that the most marked and salient feature of the Bible picture of creation is the gradualness of the creative work. 139 I do not say that the picture is not poetical; I believe it to be quite as poetical as that which Chateaubriand would substitute for it, and I quite admit that it ought to be regarded from a poetical rather than a scientific point of view; 140 still gradualness of development is the most marked and salient of its features: first, a chaos of matter without life; then vegetable life; then the lower forms of animal life; then mammals; and lastly, human. 141 No one can deny that these and other steps, spread over the time which is indicated by the mysterious creative days, do together make up the Bible history of physical creation; 142 and no one can fail to perceive that the order of proceeding is as different as possible from that described by the French apologist.

143 According to this latter view, creation starts forth, Minerva-like, from the mind of God; according to Scripture, the work is expressly gradual and presumably slow. 144 We are so accustomed to the first chapter of Genesis, that I think we sometimes scarcely perceive its peculiarities; 145 but suppose that the reverse order of arrangement had been adopted, and that human in deference to your dignity had

been represented as coming in first, and that other creatures had been represented as being made afterwards for your use and pleasure, 146 would not this have made a radical change, and introduced an enormous scientific difficulty?

147 I remember once being told by a man, who held strong views with regard to the dangerous character of the conclusions of geology, that it seemed to him absolutely incredible that a period should have existed when the earth was inhabited by nothing but fishes, reptiles, and the like; 148 yet this is precisely what Scripture affirms to have been the fact; and if the creative work had been concluded with the fifth day, there would have been no mammals upon the earth, and no human.

149 Gradualness in creative work, therefore, is so far from being contrary to the indications of God's method given in Scripture, that it is one of the few things which stand out from the scriptural account with undeniable prominence. 150 That this same feature is not less prominent in the results of all the physical sciences, it would take more time and more ability to demonstrate than are at my command; 151 nevertheless it is necessary that I should ask you kindly to accompany me, while I endeavour to show you that the conclusions of science, and even the guesses of scientific people, point to this conclusion, 152 and tend to make untenable any objections to the revelation of God contained in Scripture, on the ground of the gradual manner in which that revelation is alleged to have been made.

153 The general evidence of geology is familiar probably to most of us, and it is only the general evidence with which I can desire to deal on such an occasion as this; 154 but pray observe that while the particular conclusions of geology, like those of other physical sciences, are liable to continued modification and amendment, the general drift of the conclusions is sufficiently clear and certain. 155 No one can doubt, for instance, the great antiquity of our globe, and the fact that it has gone through successive changes with regard to the character of its surface, the nature

of its inhabitants, and the like. 156 Undoubtedly there was a time when civilised people did not dwell upon it; undoubtedly there was a still more distant period when people did not dwell upon it in any form, civilised or uncivilised; 157 perhaps there was a period even more distant, when life was not to be found upon the earth's surface at all. 158 And physical astronomy will take us even beyond geology, and will make it probable that the earth was originally in a fluid condition, in which from the excessive temperature no form of life could have existed.

159 Few problems are more curious than that which deduces the present figure of our globe from the hypothesis of original fluidity. 160 Take a mass of fluid, and set it revolving slowly about an axis, as our earth revolves, and it can be shown that it will assume such a form as that which our earth has. 161 I do not lay stress upon the remarkable numerical coincidence of the ellipticity of the earth, as derived by Laplace from theory, with that which is discovered by observation, because this involves certain arbitrary hypotheses; 162 but taking those results which involve nothing arbitrary at all, it is almost impossible not to believe that the earth was at one time a hot fluid mass, and that it has gradually cooled down and hardened into its present permanent condition.

163 Look upon the earth then as being once in this hot fluid condition. It turns slowly round upon its axis and cools. 164 I cannot trace the whole of the process, but before it arrived at its present condition there must have been crackings and burstings and eruptions; and so continents and islands and mountains would be formed; 165 but upon the whole, even in the wildest times, the process would be very gentle, for the highest mountains on the earth's surface are but as the down upon the surface of a peach. 166 Then upon this globe appear creatures suited to its condition; 167 and the eye which could have watched the world in its progress would have seen animals of successively higher types occupying the earth's surface, till at length that surface was spotted

with cities built by the hand of human, and the ocean studded with your ships.

168 It is impossible to guess the time which must have elapsed between the epoch when the earth was a hot revolving mass of fluid, and the epoch in which we live; 169 neither is it very possible to say, though it is possible to guess, what would have been the successive scenes presented by the earth to the eye which should have witnessed the whole of the changes; 170 but whatever may have been the nature of the changes, this conclusion is inevitable, namely, that there has been a progression of some kind from the fluidity of the primæval dead revolving mass to the inhabited world of this nineteenth century; 171 it matters not for my argument whether the progression, so far as animal life is concerned, has been due to natural selection, or to such a process as that advocated by the author of "Vestiges of Creation," or to successive and distinct creative acts; 172 the fact holds good, upon any hypothesis, that the Almighty Creator has produced that universe which we see, not by one act, but by a gradual and apparently very slow creative process, whether continuous or discontinuous it matters not for my purpose to inquire.

173 Now this course of Nature is strikingly analogous to that gradual mode of proceeding which is alleged to belong to revelation; and any difficulty which belongs to one appears to attach equally to the other. 174 Nay, if we are to give any weight to the most recent physical speculations, it may be fairly argued that the difficulties connected with revelation are but as trifles compared with those which Nature presents. 175 I refer to those views of which the latest exposition is to be found in Mr. Darwin's "Descent of Human." Let me touch upon those views for a moment.

176 It seems that "the early progenitors of human were once covered with hair, both sexes having beards; their ears were pointed and capable of movement; and their bodies were provided with a tail, having the proper muscles.... 177 The males were provided with great canine teeth,

which served them as formidable weapons.... 178 At a still earlier period, the progenitors of human must have been aquatic in their habits." 179 And lastly, "the most ancient progenitors in the kingdom of the Vertebrata, at which we are able to obtain an obscure glance, apparently consisted of a group of marine animals resembling the larvæ of existing ascidians."

180 This is certainly a somewhat alarming conclusion; looking however to the 'ascent' (for so I think it ought to be called) rather than the 'descent', it would seem to be the view of some of our advanced natural investigators, 181 that the marine animals in question produced certain lowly organised fishes; these produced ganoids and the like; these produced amphibians;-- here there seems to be a difficulty-- 182 "No one," writes Mr. Darwin, "can at present say by what line of descent the three higher and related classes, namely, mammals, birds, and reptiles, were derived from either of the two lower vertebrate classes, namely, amphibians and fishes." 183 However, once get to the mammals, and all difficulty ceases: the Monotremata produced the Marsupials; these the placental Mammals: thus we come to the Lemuridæ, and from them the interval is not great to the Simiadæ; 184 the Simiadæ branched off into two great stems,-- the New World and Old World Monkeys; and "from the latter at a remote period, 'Human', the wonder and glory of the universe, proceeded."

185 Of this pedigree, which, "if not of noble quality," is "of prodigious length," Mr. Darwin tells us "we need not feel ashamed." 186 Perhaps not; though certainly the nerves of any one unaccustomed to anthropological investigations may be excused for trembling slightly as you hears it recited; 187 but the point which I wish to press is this, that supposing (for argument's sake) this view of human's origin, or anything like it, to be true, it is impossible to imagine a more thorough case of gradual development; 188 there is nothing in the religious history of humankind as expounded in Holy Scripture so amazingly marvellous as that which is contained in this physical history; 189 and certainly

those who are prepared to receive the Darwinian view of the development of human's body, ought not to find anything to offend them on the ground of improbability in the Scriptural account of the revelation made by God to the human soul.

190 I do not know to what extent Mr. Darwin's views are likely to be permanent; but supposing that they, or any view of the same class, should eventually overcome all existing difficulties, 191 and be generally regarded as representing the process by which it has pleased God to bring about human's physical and mental supremacy, 192 then it can hardly seem strange that the same God should have adopted a course of progress and development in the spiritual and religious world. 193 I say, emphatically, "if it has pleased God" to act thus; because if I accept the hypothesis of the nebular origin of planetary systems, or the supposition of the earth being a fluid globe gradually cooled, 194 or even the assertion that our most ancient progenitors were marine animals, I must do so with the underlying assumption that it has pleased God so to work. 195 I do not find fault with scientific people for not putting their theories in this form; but looking at the question from a religious, or even from a philosophical, point of view, I cannot consent to lose sight of God, as the intelligent maker of the whole. 196 If this earth was originally a fluid mass, then I believe that that was the best, or, for anything I know to the contrary, the only way of making a world; 197 if the marine animals, which Mr. Darwin sees through his scientific telescope, did become fish, and those fish eventually became humans, then I believe that that was the best, or, for anything I know to the contrary, the only way of making humans; 198 and this being so, why may I not deal in the same manner with the alleged course of human's spiritual history? 199 I have in my hands something which purports to be a revelation to my intellect, and to my soul, of the God who made me: 200 that revelation is contained in a history which tells me that God spake at sundry times and in divers manners to the people of

olden time, and that finally He spake by One who is called His Son. 201 Now I do not say that this revelation is or is not a real one; but I do say that there is nothing to render us suspicious of its reality in the fact that it has been communicated gradually, 202 that it has grown as the human race has grown, and that some of the steps in the process of revelation appear strange, or even, at first sight, unworthy of the grand scheme of which they form a part. 203 No one has a right to find fault on this ground who has read the lessons of natural science, and observed how it points to gradual progression as a characteristic of the doings of God. 204 Least of all can they find fault on this ground, who receive in whole, or even in part, the recent theories concerning the origin of human. 205 I will not undertake to answer for those students who have gone deeply into these physical questions; but I do assert, without fear of contradiction, that to people of ordinary education, and ordinary habits of thought, the difficulties of accepting Scripture as the revelation of God to the human soul, 206 however much those difficulties may be expounded or even exaggerated, are absolutely nothing as compared with the difficulty of accepting recent views of human's prodigious pedigree.

207 The fact is, that it is not so much the process by which a result has been brought about, as the result itself, which is the all-important thing. 208 Whatever may have been the history of our earth in the dark dim distance of incalculable ages, we know that its present condition is very beautiful, 209 and that it answers admirably well the purpose for which it seems to have been originally designed, namely, that of serving for the residence of intelligent human; 210 and whatever may have been the process by which that creative work was consummated, which is described in Scripture as the making of human out of the dust, and breathing into your nostrils the breath of life, 211 we know that human is high above all the rest of creation, and worthy of being spoken of as being made in the image of God. 212 And so in the

case of human's spiritual history, we need not be over-careful to criticise the several steps when we are able to see the result; 213 the question is, not so much whether the steps of God which we trace in Old Testament history be such steps as we should imagine that the Most High would have left, 214 as whether the mystery of the Incarnation, and the truth that God has spoken to us by His own Son, be not worthy of all acceptation. 215 If Christ be worthy of our adoration and love, then, though the way may have been long, and strange, and dark, and sometimes even weary, yet we may be sure that it is the right way, because it has led us to Him.

216 For there is this further analogy between Nature and revelation, namely, that in each the progress is not indefinite, but tends to a limit. 217 Whatever theory be adopted with regard to the history of the earth, we seem to see in its present settled condition the limit towards which everything has been moving in past geological ages; 218 and even if human has been a progressive animal, and has only gradually attained your present physical perfection, I presume it is not anticipated that the process of natural selection, or any other process, will carry you beyond the point which you have now reached. 219 Or, if we take the divine picture of creation, we see the creative work tending from the limit of chaos to the limit of human; 220 then physics cease and religion begins, and we hear utterances of the voice of God beginning with whispers, and becoming more and more distinct, until we are permitted to listen to divine oracles uttered by human lips. 221 Beyond this the dreams of philosophy, and the aspirations of the human heart, and the longings of the weary and heavy-laden cannot carry our thoughts or raise our desires.

222 Those who are acquainted with Bishop Butler's great work will perceive that I have now been endeavouring-- how imperfectly no one knows better than myself-- to apply to the question of "the gradual development of revelation," 223 those principles of reasoning which Bishop Butler has taught us to use. I was very sorry to see it stated in the evidence

taken before the select committee of the House of Lords on University Tests, that Bishop Butler's 'Analogy' was "out of fashion" in Oxford. 224 I trust that the witness only intended to assert that the 'Analogy' was not now so commonly chosen for examinations as formerly, 225 for it will be an evil day for us all when the method of reasoning which Bishop Butler taught us shall be "out of fashion" with thinking people. 226 In truth, the advantage of the method is that, properly speaking, it never can be out of fashion; it is like the method of Euclid, or that of the Differential Calculus; 227 it is an 'organum', an instrument, a machine, which may be applied in all the varying circumstances of theological controversy, and to almost all religious difficulties. 228 For the principle of the method is this. You find certain difficulties in that which professes to be a revelation of God; you think to get rid of these difficulties by denying the revelation; will you succeed in doing so? 229 Not if you find precisely analogous difficulties in the course of Nature; unless you go further, and deny not only that there is a God of revelation, but a God of Nature too. 230 Nay, the argument carries you beyond this point, and suggests to you that if there be difficulties in God's natural world, and if He be pleased to reveal the spiritual world to us, 231 then we ought to expect to find the same general method of proceeding in matters spiritual which we have been able to observe in the natural world. 232 I quite admit that this reasoning has no force for the person who says "There is no God;" you must be dealt with in another way; 233 but it has force and it has comfort for the doubting inquiring soul, by assuring it that it can find a logical resting-place, and that the refuge from the misery of blank and hopeless atheism is to be found in simple faith in the Lord Jesus Christ.

234 With the atheist, I honestly confess, that I have little or no sympathy; certainly I should not think it worthwhile to compose a lecture intended for your special behoof. 235 I should feel disposed rather to send you for your answer to the fourteenth and fifty-third

Psalms. 236 The difficulty of supposing the framework of the universe to have had no architect, appears to me to be so great, so absolutely immeasurable, that the person who can fancy that you have got over it must, as I believe, either not have understood the difficulty, or else have deceived yourself as to your power of solving it; 237 anyhow, I feel that you have cut away all ground of argument, as between you and me. 238 Not so the person whose mind is sceptically inclined. Be it ever remembered that the word 'sceptic' is derived from a word which means to 'look' or to 'see'-- it is the same word which forms the root of the word 'bishop' or 'overseer'; 239 and accordingly there is nothing radically reproachful in the name of 'sceptic'. It implies that a person is determined to look into matters for yourself, not to trust every assertion, not to repeat a parrot creed; 240 and so far as this determination is concerned, it is high and noble, and is in fact the very root and spring of all human knowledge; 241 but who can wonder if looking should lead to doubting, and that so the name of sceptic should popularly imply, not the person who looks and believes, but the person who looks and doubts? 242 And I am not ashamed to confess that I have much sympathy with this sceptical frame of mind. Not only is it closely connected with a noble instinct of inquiry and search for truth which God has implanted in the human mind, 243 but also, as I believe, it is well-nigh impossible that an inquiring mind should deal seriously with religious subjects and remain entirely free from doubt.

244 In my opinion, the amount of scepticism which has, during some period of your life, occupied the mind of each thoughtful earnest person, will be merely a question of degree; 245 while, at the same time, I most sincerely believe that scepticism ought not to be, and need not be the lasting condition of the human soul, and that all doubts may be made to vanish in the light which God has given to "lighten every human who is born into the world."

246 I know not what may be the condition of mind of those to whom I have been speaking to-

day. 247 I presume the hope of the Christian Evidence Society is that some persons who feel practically the pressure of doubt and unbelief, will come and see whether any of their difficulties can be resolved by this course of Lectures. 248 If there be such in this company, I beg them, in concluding this Lecture, to believe that they have been listening to one who does not wish to treat their speculative difficulties as trifles, 249 but who would consider it as an unspeakable privilege to be able to help a doubting brethren to get rid of your doubts, and to exchange them for the steady assurance of faith in the Lord Jesus Christ.

THE ALLEGED HISTORICAL DIFFICULTIES OF THE OLD AND NEW TESTAMENTS, AND THE LIGHT THROWN ON THEM BY MODERN DISCOVERIES.

The *R*ev. George Rawlinson, M.A

7 In addressing you on the historical difficulties of the Old and New Testaments, I must in the first place premise, that with difficulties which lie on the verge or outskirts of the historic field, on the debatable ground between Science and History, I do not on the present occasion profess to deal. 2 Questions as to the origin of human, whether by development or by direct creation, whether from one pair or from more; 3 questions as to your primæval condition, your possession from the first of the faculty of speech, your original savagery or civilisation, and the like, lie (I think) beyond the domain of history proper, 4 belonging to what has been properly termed the "'pre-historic' period" of our race, and so not coming within the terms of the subject on which I have undertaken to speak to-day.

5 History deals with human from the time to which written records reach back. Historical difficulties arise from divergence, real or apparent, between the different accounts contained in those records.

6 Now the profane records, to which any modern critical school would attribute an historical value, do not reach back within many ages of the origin of human, and thus no "historical difficulty" can

arise with respect to these primitive times. 7 It is only when we descend to an age of records, when the apparently authentic accounts of ancient countries preserved to our day can be compared with the Scriptural narrative that difficulty arises and that either agreement or disagreement can be shown.

8 The first difficulty, really historical, which meets us when we open the volume of Scripture, is the shortness of the time into which all history is (or at any rate appears to be) compressed, by the chronological statements, especially those of Genesis. 9 The exodus of the Jews is fixed by many considerations to about the fifteenth or sixteenth century before our era. 10 The period between the Flood and the Exodus, according to the numbers of our English version, but a very little exceeds a thousand years. 11 Consequently, it has been usual to regard Scripture as authoritatively laying it down that all humankind sprang from a single pair within twenty-five or twenty-six centuries of the Christian era, 12 and therefore that all history, and not only so, but all the changes by which the various races of humans were formed, by which languages developed into their numerous and diverse types, 13 by which civilisation and art emerged and gradually perfected themselves, are shut up within the narrow space of 2,500 or 2,600 years before the birth of our Lord. 14 Now this time is said with reason to be quite insufficient. Egypt and Babylonia have histories, as settled kingdoms, which reach back (according to the most moderate of modern critical historians) to about the time at which the numbers of our English Bible place the Deluge.

15 Considerable diversities of language can be proved to have existed at that date; markedly different physical types appear not much subsequently; 16 civilisation in Egypt has, about the Pyramid period, which few now place later than B.C. 2,450, an advanced character; the arts exist nearly in the shape in which they were known in the country at its most flourishing period. 17 Clearly, a considerable space is wanted anterior to the pyramid age for the

gradual development of Egyptian life into the condition which the monuments show to have been then reached. 18 This space the numbers of our English Bible do not allow. Such is the difficulty. Now how is it to be met? 19 In the first place, candour should (I think) induce all those who urge it to let their readers, or hearers, know that a special uncertainty attaches to the numbers in question, from the fact that they are given differently in the different ancient versions. 20 We possess the Pentateuch in three very ancient forms, in Hebrew, in the Greek version known as the Septuagint, and in Samaritan. 21 Our English numbers represent those of the Hebrew text. The numbers of the Septuagint and the Samaritan version are different. 22 Those of the Samaritan version extend the period between the Deluge and the birth of Abraham from the 292 years of the Hebrew text to 942 years,-- an addition of six centuries and a half-- 23 while those of the Septuagint, according to some copies, give 1,072 years as the interval, according to others 1,172 years, thus increasing the period between the Deluge and Abraham by a space of nearly eight, or nearly nine centuries. 24 Now if the Greek, or even if the Samaritan, numbers are the right ones, if they represent, that is, the original text, it may be questioned whether anything more is wanted. 25 It may be questioned whether a term of from six to eight centuries is not enough for the production of that state of things which we find existing in Babylonia and in Egypt when the light of history first dawns upon them, 26 whether within that space might not have been produced such a state of civilisation, so much progress in art, such differences of physical type, and such diversities of language as appear to have existed at that period.

27 If, however, the ultimate verdict of calm reason, and rigid scientific inquiry should be against this view, 28 if more time seem to be absolutely wanted for the development of settled government, of art, science, language, ethnical diversities, varieties of physical type, and the like, than even the enlarged chronology of the Septuagint

allows, 29 then I should not be afraid to grant that the original record of Scripture on this point may have been lost, 30 and that, as it is certain that we cannot possess the actual chronological scheme of Moses in more than one of the three extant versions of his words which have come to us with almost equal authority, so it is quite possible that we may not posses his real scheme in any. 31 Nothing in ancient MSS. is so liable to corruption from the mistakes of copyists as the numbers; 32 the original mode of writing them appears in all countries of which we have any knowledge to have been by signs, not very different from one another; 33 the absence of any context determining in favour of one number rather than another, where the copy is blotted or faded, increases the chance of error, 34 and thus it happens that in almost all ancient works the numbers are found to be deserving of very little reliance. 35 Where they to any extent check one another, they are generally self-contradictory; where they do not, they are frequently in the highest degree improbable.

36 A second historical difficulty connected with Genesis was much insisted upon by the late Baron Bunsen. The primitive Babylonian kingdom is declared in the tenth chapter of Genesis to have been Cushite. 37 Baron Bunsen held that there were no Cushites out of Africa, and that "an Asiatic Cush existed only in the imagination of Biblical interpreters, and was the child of their despair."

38 But an analysis of the earliest documents recovered from Babylonia has shown that the primitive Babylonian people, that which raised the first structures whereof any trace remains, in the country, 39 and whose buildings had gone to ruin in the days of Nebuchadnezzar, was (at any rate to a large extent) Cushite, its vocabulary being "undoubtedly Cushite or Ethiopian," 40 and presenting numerous analogies with those of the non-Semitic races of modern Abyssinia. 41 Hence, modern historical science, in the person of one of its best representatives, M. Lenormant, commences now the history of the East with a "First Cushite Empire," 42 which it regards as

dominant in Babylonia for several centuries before the earliest Semitic Empire arose.

43 A difficulty less noticed, yet one which was, in the state of our historical knowledge a few years since, more real, may be found in the narrative contained in the 14th chapter of Genesis 44 with respect to the invasion of Palestine in the time of Abraham by a number of kings from the vicinity of the Persian Gulf. 45 These kings act under the presidency of a monarch, called Chedorlaomer (or Chedor-lagomer), who is stated to be "king of Elam." 46 Now till very recently there was no profane evidence that Elam-- which is not Persia, as many have supposed, but Elymaïs or Susiana, the country between Babylonia and Persia-- 47 had ever been an independent state, much less a powerful kingdom, and still less one that at so remote a date could have exercised suzerainty over so many and such important nations. 48 But the Assyrian cuneiform inscriptions have shown that throughout almost the whole of the Assyrian period Elam maintained herself as an independent state and one of considerable military strength on the south-eastern borders of the empire; 49 and very recently it has further been discovered that, according to the Assyrian belief, an Elamitic king was strong enough to invade and plunder Babylonia at a date, which expressed in our ordinary manner would be B.C. 2,286, or somewhat earlier than the time commonly assigned to Abraham. 50 Further, the primitive Babylonian remains bear traces of the extension of Elamitic influence into Babylonia at a remote era; 51 and the possibility of such distant military expeditions at this far-off period of the world's history, receives illustration at once from the epithet "Ravager of Syria," 52 which is borne by a Babylonian monarch of about this date, and also from the numerous expeditions conducted not very much later by the Egyptian princes from the valley of the Nile into Mesopotamia.

53 No other historical difficulties, so far as I know, present themselves in the narrative of Genesis. 54 Some attempts were made in Germany, about thirty or forty years ago, to prove that the

description of Egypt contained in the latter portion of the book exhibited numerous "mistakes and inaccuracies;" 55 but the "mistakes and inaccuracies" alleged were scarcely of an historical character, and the writers who alleged them have been so triumphantly refuted by Hengstenberg, and others, 56 that the sceptical school has ceased to urge the point, and now allows the entire truthfullness and accuracy of the whole account. 57 Few things are in truth more remarkable than the 'complete' harmony and accordance which exist between the picture of ancient Egypt and the ancient Egyptians, as drawn for us by Moses, 58 and that portraiture of them which is now obtainable from their own contemporary writings and monuments.

59 With regard to the narrative contained in the last four books of the Pentateuch, modern criticism has chiefly employed itself in objections turning upon the numbers. 60 The multiplication of the Israelites, as related in Genesis and Exodus, has been declared to be utterly and absolutely incredible. 61 The sudden exodus from Egypt of a body of two millions of persons in the way narrated has been pronounced an impossibility. 62 The subsistence of such a multitude, with their flocks and herds, in the Desert of Tih for forty years, or even a single year, has been said to be inconceivable. 63 Many minor objections, turning on the same point of numerical difficulty, have been urged, and the conclusion has been drawn that the entire narrative of Exodus, Numbers, Leviticus, and Deuteronomy is unhistorical-- 64 a romance drawn up at a comparatively late period of the nation's history, having perhaps a certain historic foundation, but in its details wholly and entirely imaginary.

65 Now, with respect to these objections, let it be observed, in the first place, that they all turn upon the one point of number; 66 and that the numbers of the sacred texts are (as has been already observed) exactly the part of it which is most liable to corruption and least to be depended upon. 67 So that if the difficulties of the multiplication, as stated, of the exit from Egypt, the march, the

passage of the Red Sea, and the sojourn in the wilderness, were all allowed to be as great as represented, 68 it would be enough to reply that there may have been a corruption of the numbers-- the addition (say) of a cipher in each case-- 69 and that the whole narrative would stand good, and the difficulties disappear, if for "six hundred thousand that were humans" in Exodus xii. 37, we were to read 60,000, and so on-- the entire exodus being thus made one of 200,000 instead of two million souls. 70 But this mode of meeting the difficulty is not, perhaps, here the right one. The numbers may be defended as they stand. 71 In Germany the best critics, including so subtle and little credulous a writer as Ewald, accept them.

72 They seem required by the general tenor of the whole narrative, especially by the great unwillingness of the Egyptians to let the people go, and by their power, within little more than a generation to conquer and occupy Canaan. 73 Assuming therefore the numbers to be sound, to have come to us as they were delivered by Moses, let us inquire what the great difficulties are of which so much has been made, and see if they are really so insuperable.

74 In the first place, as to the multiplication in Egypt. Now here, before we can form any judgment, two things have to be determined-- "What was the number of the Israelites when they entered Egypt," and "What was the duration of their stay there?" 75 What was their number when they entered Egypt? We are commonly told, "seventy souls." Now, no doubt, these words occur in Scripture, "All the souls of the house of Jacob, which came into Egypt, were threescore and ten." 76 But, when we come to look into details, we find first, that the seventy souls of Jacob's descendants comprise only two women, the married daughters and grand-daughters of Jacob not being mentioned, 77 who yet, we are told, followed the migrations of the tribe, and no account being taken of the wives of his sons and grandsons. 78 Supplying these omissions, we have for the family of Jacob as it entered Egypt, the number-267, instead of the number

seventy, or nearly four times the ordinary estimate. 79 But this is far from being all. The children of Israel entered Egypt with their households, or retainers. 80 What the size of a patriarchal household was we may gather from the history of Abraham, who had 318 trained servants born in his house, capable of active military service.

81 It has been well observed that "we shall scarcely find so many in a clan of three thousand souls." 82 Jacob's retainers are likely to have been more numerous rather than less numerous than those of Abraham; and the conclusion of Kurtz, that they amounted to "several thousands" is therefore perfectly reasonable. 83 It appears to me quite probable that the tribe which took possession of the Land of Goshen on the invitation of Joseph and Pharaoh was a body of five or six thousand persons.

84 Next, as to the duration of the sojourn in Egypt, the Hebrew text lays it down very positively that it was 430-years. 85 The best MSS. of the Septuagint agree. There was a tradition among the later Jews which brought down the term to 215-years; 86 but this tradition cannot reasonably be set against the plain words of Exodus; and consequently we must take 430 years as the duration of the sojourn.

87 Is it then, or is it not, conceivable, that under the circumstances of the time and country, a tribe or clan of 5,000 persons may have increased in 430 years to one of two millions? 88 Here it has to be remembered that there were two modes whereby they might increase, one that of ordinary natural increase, the other by augmentation of the number of their retainers. 89 The natural tendency of population has been shown by Mr. Malthus, to be to double itself, if unchecked, every 25-years. 90 The Israelites, having the land of Goshen, a large fertile territory, capable of supporting a population of several millions, assigned them, would be in a position where the checks on the natural tendency, especially at first, would be very slight. 91 Now, according to the estimate of Mr. Malthus, a body of 5,000 persons increasing without check, would have become more than two millions at the end of 225-years; 92

a body of 267-persons would have exceeded the same amount at the close of 325-years; and a body even of seventy persons would have done the same at the expiration of 375-years; 93 so that, except for the operation of artificial checks, the family of Jacob, had it really consisted of seventy persons only, would have become one of above two millions fifty-five years before the time of the exodus. 94 But, no doubt, as the increase took place, the artificial checks, which keep down the natural tendency of population, began to operate, 95 and the result was, that if the original immigrants were, as I have supposed, about 5,000, the actual rate of increase had been a doubling, 96 not once each twenty-five years, but once each forty-eight years, or not very much beyond the rate which prevails in our own country at the present time.

97 If we add to this the consideration that the Israelites, being in a very flourishing condition during the earlier portion of their sojourn in Egypt, would naturally augment, by purchase, the number of their households, 98 and might even receive, by agreement, whole tribes into their body, we shall not be surprised that at the end of the 430 years, the clan had grown to be a nation of two million souls.

99 With respect to the difficulties of the exit of this large body of persons from Egypt in the sudden way which the narrative in Exodus seems to describe, they depend (I think) mainly on the broad and general manner of description habitual to Oriental writers, 100 who do not trouble themselves with details, or with exceptions, but describe 'in the mass', stating that to be done by all which was done by most, or by those of most account; 101 regarding a nation as concentrated in its heads; and directing attention to the main events, to the neglect of the various details into which they were broken up. 102 A candid reader, making fair allowance for these characteristics of Oriental style, and for the brevity of the sacred narrative, will scarcely be much troubled by the difficulties of the start and the march, as they have been urged by some critics. 103 It is certain migrations of

tribes, quite as large as that of Israel is said to have been, have from time to time taken place in the east, and indeed in the west also. 104 Such migrations have frequently been sudden-- the emigrants have started off with their women, children, and all their possessions on a certain day-- 105 they have traversed enormous distances, much greater ones than the Israelites traversed, and have finally settled themselves in new abodes. 106 That the Israelites made such a migration there cannot be a doubt. The Egyptians, Greeks, Romans, all accepted the fact as certain. 107 Cavils as to their exact numbers, or as to the particular expressions used in Exodus, do not touch the main fact, 108 but show (if they show anything) either that our ancient manuscripts are here and there defective, or that an early Oriental historian does not write in the exact and accurate style of a nineteenth-century occidental critic.

109 The difficulty which attaches to the subsistence of the Israelites for forty years in the wilderness of Tih, concerns almost wholly the sustenance of their flocks and herds, which are said to have been numerous, and have been calculated at two million head of cattle. 110 The answer to this difficulty may be very brief. In the first place, we are not told that the cattle did not very rapidly decrease; 111 for no mention is made of the people possessing any considerable number in the later portion of the sojourn, until an enormous booty is captured from the Midianites; 112 and in the second place, there is ample reason to believe that the wilderness was anciently very much more fertile than it is at present, and quite capable of furnishing pasturage to flocks and herds of a large size. 113 The recent explorations of Mr. Tristram and Mr. Holland have placed this fact beyond a doubt, and have shown that the Sinaitic peninsula, at any rate, was a "desert" merely in comparison with the richly agricultural countries of Egypt and Palestine.

114 Historical difficulties are scarcely alleged with respect to the portion of the Biblical narrative which follows upon the sojourn in

the wilderness. 115 The conquest of Canaan by the immigrant Israelites is a fact too well attested to be denied; 116 and the subsequent chequered history of the race, as delivered to us in Judges and in the First Book of Samuel, is for the most part too modest and unpretending an account to tempt the assaults of sceptics.

117 The exploits of Gideon and Samson are viewed indeed with incredulity; but merely on the ground that they are intrinsically improbable. 118 It is not until we come to the time of David and Solomon that any further difficulties, really of an historical character, present themselves, and that an examination of the difficulties by the light of historical documents becomes possible.

119 The sudden rise of the Israelites to power and greatness in the reign of David, the grandeur, magnificence, and extent of the kingdom of Solomon, and the entire collapse of the empire at his death 120 appear to some, not merely in themselves strange and improbable, but incompatible with what is known from history of the condition of the neighbouring countries. 121 The little country of Palestine was placed midway between the territories of two great and powerful monarchies, of which it may be said, in a general way, that for a thousand years before the rise of the Persians to power, they contested the sovereignty of the East. 122 Over-shadowed by the grand forms of Egypt and Assyria, how could Israel (it may be asked) emerge from obscurity, 123 how especially advance at a bound from a dependent to a dominant position, asserting, and for above fifty years maintaining, her place among the great ones of the earth? 124 We may answer, that, in the first place such a revolution has numerous analogies in the history of the East, where the rapid rise of petty states to greatness, the sudden conversion of an oppressed into a dominant power, is the rule rather than the exception; 125 where Babylon, Media, Persia, Parthia, where the histories of Timur, Yenghis Khan, Nadir Shah, all illustrate it. 126 But further, in this particular case, we can see not

only a general analogy, but a fitness in the peculiar circumstances of the time for the production of such a phenomenon as that which Scripture places before us. 127 The monumental evidence of the two countries shows, that exactly at the time when the conquests of David and the Empire of Solomon are placed, both Egypt and Assyria were exceptionally weak. 128 Egypt, after the time of Ramesses III. (ab. B.C. 1,200) ceased to be aggressive on the side of Syria, and continued until the accession of Sheshonk or Shishak, (ab. B.C. 990) to be a quiet and unwarlike power. 129 Assyria, which, about B.C. 1,100, extended her sway into the valley of the Orontes, and threatened Palestine with subjection, passed under a cloud soon afterwards, and did not again become a terror to Syria, till about B.C. 880. 130 For a Jewish Empire to arise it was necessary that Egypt and Assyria should be simultaneously weak. 131 Such simultaneous weakness is found for the hundred or hundred and twenty years between B.C. 1,100 and B.C. 990. 132 And exactly into this interval fall the rise of the Jews to power under Saul and David, and the establishment of their empire under Solomon.

133 Doubts were thrown a few years since, by an able writer, on the expeditions of Shishak against Rehoboam, Solomon's son, and of Zerah, the Ethiopian, against Asa, Rehoboam's grandson; which, it was suggested, might be mere embellishments of a history, otherwise tame and uninteresting. 134 The careful analysis which the inscription of Shishak at Karnac has undergone at the hands of Mr. Stuart Poole, and Dr. Brugsch, not to mention other scholars, 135 and the evidence thus furnished of the reality and the importance of his expedition into Palestine, render the continuance of incredulity, as to the former of these attacks, impossible. 136 The analysis has thrown a flood of light on what was previously obscure in the scriptural narrative. 137 It has shown that Shishak went up, not so much with any extensive scheme of conquest, as to settle his 'protegé', Jeroboam, in his kingdom, where he was in great danger from the Levitical and

Canaanite towns not being in his hands. 138 These Shishak reduced and made over to Jeroboam, thus giving him a firm hold on the northern kingdom. 139 Having done this, he was content to receive the mere submission of Rehoboam, and allowed him to retain the southern kingdom, perhaps not wishing to make Jeroboam too strong. 140 It was the constant practice of the great monarchs of Egypt, Assyria, and Babylon, to maintain, on dependent thrones, a large number of petty princes, who were checks upon each other, and could easily be dealt with, if they shewed any inclination to rebellion.

141 The expedition of Zerah has not yet received any distinct confirmation from monuments. But the recent discovery that there reigned about this time a king called 'Azerch'-Amen in Ethiopia, has removed the difficulties which attached to the name and the description of the invader, 142 and has indicated to the dispassionate and candid student, that here, too, the Jewish historian had probably contemporary records to guide you, and related real facts of history, not figments drawn from imagination.

143 A real historical difficulty meets us soon after this, in the sacred narrative, in the invasion of the kingdom of Samaria, by Pul, who is called a "king of Assyria," and is said to have put Menahem to a tribute of a thousand talents of silver. 144 We possess the history of Assyria for this period, apparently in a state of completeness; and this history shows us no monarch at this time (or indeed at any other time), bearing a name in the least resembling that of Pul. 145 The predecessor of Tiglath-pileser on the throne of Assyria, was a certain Asshur-lush (or Asshur-likkis), whose predecessor was Asshur-dayan, who followed on Shalmaneser III. 146 It seems impossible that any one of these kings can be Pul. Moreover, Assyria, in the time immediately preceding the accession of Tiglath-pileser, instead of being a great, aggressive power, capable of marching armies into Palestine, 147 was in a depressed state, troubled by frequent insurrections among her own subjects, and quite

incapable of sending out distant military expeditions. 148 Thus "Pul, king of Assyria," constitutes to the modern historical inquirer a real difficulty-- a difficulty which it has been proposed to meet in various ways.

149 The best explanation hitherto suggested is, I think, the following. Pul, who was called by Berosus, the great Babylon historian, "king of the Chaldeans," was probably a monarch who reigned at Babylon, while Asshur-lush was reigning at Nineveh. 150 In the troublous decade of years which preceded Tiglath-pileser's accession, he became a powerful prince, perhaps deprived Assyria of her western provinces, and invaded Syria and Palestine from the quarter from which Assyrian invasions had been wont to come. 151 Presenting himself to the Israelites as the representative of the great Mesopotamian power, with which they had been contending for centuries, they termed him loosely "king of Assyria" when he was in reality a king of Babylon, who had possessed himself of a portion of the Assyrian dominions. 152 In the same way, they subsequently termed Nabopolassar, the father of Nebuchadnezzar, and even Darius Hystaspis, "kings of Assyria."

153 A difficulty used to be felt with respect to "Sargon, king of Assyria," who is said to have taken Ashdod by the hand of one of his captains. 154 Sargon's name is not contained in the historical books of Scripture, nor is he mentioned by any of the classical writers, who speak of Shalmaneser, Sennacherib, and Esarhaddon. 155 The occurrence of his name in Isaiah was thought to indicate an irreconcilable difference between the historical data possessed by that prophet and those of the writer of Kings. 156 Even his existence was doubted, and different writers proposed to regard his name as a mere variant for those of each of the three princes just mentioned. 157 The Assyrian inscriptions have completely cleared up all this obscurity. Sargon is found to have been the successor of Shalmaneser; the predecessor and father of Sennacherib. 158 He speaks of having captured Ashdod. All that Isaiah says of him is confirmed; and it appears to have

been quite accidental that the writer of Kings, who more than once alludes to him, does not mention his name.

159 The strictly historical character of the later portion of the Old Testament narrative, especially of that delivered to us in Kings, Chronicles, Ezra, and Nehemiah, and in the contemporary prophets, Jeremiah, Zechariah, and Haggai, is generally admitted, even by sceptics. 160 The only writings belonging to this period, whereto exception is taken are the Books of Daniel and Esther, which many still regard as full of historical inaccuracies, and as quite unworthy of credence. 161 I shall therefore conclude my observation on the alleged historical difficulties of the 'Old' Testament, and the light thrown on them by modern discoveries, by a brief consideration of these two books and of the objections taken to them.

162 The chief historical inaccuracies alleged against Daniel are the following: He is said to have invented two kings, Belshazzar, and Darius the Mede, whose existence is not merely unknown to history, but precluded by it; 163 to have falsely ascribed a government by satraps to the Babylonians; to have incorrectly represented the condition of their "wise men"; to have made Susa a residence of the Persian monarchs when it was not even built; 164 to have wrongly made the last king of Babylon a son of Nebuchadnezzar, and to have misrepresented his fate; to have misconceived the relative position of the Medes and Persians at the time of the capture of Babylon; 165 and to have related an utterly incredible circumstance, viz. that Daniel was admitted among the Babylonian "wise men," and even constituted their head.

166 Now of these charges some are quite incapable of being either substantiated or distinctly refuted from our insufficient knowledge of the times to which they refer. 167 Nothing is really known of the classes into which the "wise men" of Babylon were divided in Nebuchadnezzar's time, excepting what we learn from Daniel himself.

168 The authors supposed to contradict Daniel on this point,

write of the state of things in their own day, which happens to be eight centuries later! 169 And they do not write about the Babylonian "wise men" at all, but about the divisions of the Persian magi, an entirely different class. 170 We do not even know enough about the "wise men" to say whether there was anything strange and unusual in a foreigner being placed at their head. 171 We may suspect that it was so, but we have really no sufficient evidence on the subject. The little evidence that we have is to the effect that the "wise men" were a learned, not a priestly, body; and that they admitted foreigners among them-- 172 more we do not know; but there is certainly not the slightest difficulty in supposing that the despotic power of a Babylonian monarch would have been amply sufficient to overcome any repugnance which any class of his subjects might have felt towards one of his appointments.

173 Similarly, we have no sufficient knowledge of the Babylonian governmental system to say that it was not, at any rate, to some extent, satrapial. 174 A satrapial system is simply one in which governors are appointed over the provinces, instead of their being suffered to remain under the rule of native kings. 175 Our present Indian system is in part satrapial, in part a government by means of kings. 176 The Assyrian government was one of the same kind; and, on the whole, it is most probable that so was the Babylonian. Gedaliah, who succeeded to King Zedekiah in Judea, was a "governor," 177 that is, a satrap, appointed by Nebuchadnezzar; and Berosus speaks of a "satrap of Egypt, Cœle-Syria, and Phœnicia," as holding office under Nabopolassar, Nebuchadnezzar's father. 178 Thus there is no "inaccuracy" in Daniel's speaking of Nebuchadnezzar as summoning, among his other great officers, his "satraps." 179 That the 'word', which is Persian, was not used in Babylonia is probable; but Daniel, writing for Jews under Persian government, who were perfectly familiar with the term, employed it for a corresponding Babylonian expression.

180 The charge that Daniel misapprehended the relative position of the Medes and Persians at the capture of Babylon, regarding the supremacy of the Medes as still continuing, is unjust, and rests on an omission to look carefully to the original text. 181 It is true that the Medes are placed before the Persians in the words of the handwriting upon the wall, and also in the formula, "according to the law of the Medes and Persians, which altereth not." 182 But this honourary precedence assigned to the Medes is a mere trace of their ancient supremacy--a trace much more strongly marked in Greek writers, who actually call Cyrus and his successors "Medes"-- and is not an indication of its continuance. 183 Daniel twice marks very strongly the subordinate position of the Medes, stating in one place that Darius the Mede "'received' the kingdom"-- 'i.e.', was given it by another; 184 and further declaring that he "'was made king' over the nation of the Chaldæans," using in this case an expression which distinctly implies that he derived his position from some superior authority, which made him king.

185 The notion that Susa, or at any rate, its palace, was not built at the time when Daniel says that he saw himself in vision there, rests wholly upon a statement made by Pliny, six hundred years later, that "Susa, the ancient regal city of the Persians, was built by Darius Hystaspis."

186 Now this statement, one of very weak authority, had we nothing to set against it, is contrary to the declarations of various other classical authorities, among them notably of Herodotus; 187 and is completely disproved by the Assyrian inscriptions, which show that Susa was one of the most ancient of all the Mesopotamian cities, and that its "palace" was famous for many centuries before the time of Daniel.

188 The truth which underlies Pliny's statement, is the fact that Darius Hystaspis was the first Persian monarch to build a palace at Susa after the Persian fashion; 189 but the ancient residence of the Susian kings, the Memnonium, as the Greeks called it, had existed for considerably more than a

thousand years when the son of Hystaspes began his edifice.

190 Of the two remaining charges, which concern Darius the Mede, and Belshazzar, one-- and that the more important of the two-- has been completely rebutted by the evidence of the Babylonian monuments. 191 These monuments show that Nabonnedus (or Labynetus), the king of Babylon attacked by Cyrus, had a son named Bel-shar-ezer, or Belshazzar, whom during some years he associated with him in the government. 192 This son may well have been on the mother's side descended from Nebuchadnezzar, as Daniel says that Belshazzar was; 193 he may have played the part in the siege which Daniel states that he did, while his father (as Berosus mentioned) defended the fortress of Borsippa; 194 and he may have fallen in the general massacre during the night in which Babylon was taken, while his father was subsequently made prisoner, and kindly treated by Cyrus.

195 All the supposed contradictions of profane history by Daniel in connection with this matter, are entirely removed by one little document, exhumed in our own day from the soil of Mesopotamia, by the exertions of an English gentleman.

196 With respect to Darius the Mede, nothing has been as yet discovered. It is clear from Daniel that he was not a king in his own right, but a viceroy set up by Cyrus. 197 He held his government probably for not more than two years. Perhaps he is to be identified with Astyages, the Median king, whom Cyrus deposed but treated kindly; 198 perhaps he was merely a Median noble, whom Cyrus advanced, as he did other Medes, to a position of trust and importance.

199 The monuments have not at present thrown any light on this matter; but he would be a bold person, who, after the discovery with respect to Belshazzar, would undertake to say that there may not, 200 ere many years are past, be as much light thrown upon the obscure history of this monarch, as has been recently thrown on the history, formerly at least as obscure, of his predecessor.

201 I cannot leave this matter and turn to another without strongly advising those who have any doubts as to the genuineness and authenticity of the Book of Daniel, 202 which have been of late so fiercely attacked, to study carefully the recent work of Professor Pusey upon the subject. 203 They will find in it a complete answer to all the objections, historical, and critical, which have been urged against this portion of Scripture.

204 The historical difficulties alleged against the Book of Esther, are chiefly the following. Assuming Ahasuerus to be Xerxes, which is no doubt a highly probable identification, 205 it is said that Esther's position is impossible, since Xerxes had but one wife, Amestris, who cannot be Esther. 206 Nor could any Persian king have married a Jewess, since there was a law that the kings should take all their wives out of seven noble Persian families. 207 Such a feast as that described in the first chapter, where all the princes of the provinces were entertained for 180 days, could not have taken place, 208 since the governors could not without ruin to the empire have been so long absent from their governments. 209 It is incredible that a Persian king should have given the command, said to have been given by Ahasuerus to Vashti. 210 The edicts ascribed to Ahasuerus are all incredible-- especially the second and third. No king would have consented to the murder of 2,000,000 of his subjects; 211 nor would any king ever have allowed at a later time those two millions to stand up and slay as many as they pleased of their enemies. 212 Finally, the honours granted to Mordecai are said to be excessive, and such as no monarch would have allowed to a subject.

213 With respect to the first of these objections, we may reply that though Amestris cannot be Esther, she may well be Vashti; 214 and that though the classical writers tell us of no other wife of Xerxes, yet it is quite possible that he may have had several. 215 Polygamy was the rule with the Persian kings. Amestris was no doubt on the whole the chief wife of Xerxes, and if she at one time fell into disgrace, must have been

afterwards restored to favour; 216 but the accounts which we have from the Greeks do not at all preclude the possibility of such a temporary disgrace, and of the elevation of another wife to the first place for a time. 217 As to its being impossible that any Persian king could have married a Jewess, it is sufficient to remark, that though the Persians had laws, the Persian kings were above the law, and could always disregard its restraints. 218 When Cambyses having conceived an affection for his full sister, Atossa, asked the royal judges if they could find a law allowing a Persian to marry such a near relative, 219 their reply was, that they could find no law permitting the marriage of brothers and sisters, but that they found a law, that the king of the Persians might do what he liked.

220 The objection to Xerxes feasting 'all' his princes for 180 days is an objection, not to anything contained in the Book of Esther, but to something which the critic who makes it has intruded into the book. 221 The writer of the book tells us that Xerxes "made a feast to all his princes and his servants", and subsequently relates that the feast lasted "an hundred and fourscore days"; 222 but he nowhere states that the princes were all present during the whole of the time.

223 Indeed, the reader possessed of common sense sees clearly enough that the very duration of the festivity was probably contrived, in order that all the princes might in their turn partake of it. 224 The critic says, "it is not so stated in the text," which is true: but neither is that stated which he has thought that he saw in it.

225 The command given to Vashti is undoubtedly strange and abnormal. It was an outrage on Oriental custom; and as such the narrative sets it before us. 226 The king does not issue the order until he is "merry with wine"; and the Queen refuses to obey, because she feels the order to be an insult. 227 But can we say that no Oriental king could possibly have issued such a command? 228 Is it not more reasonable to allow, with a German critic of the sceptical school, that the narrative is here "possible on account of the advancing corruption in Xerxes'

time, and through the folly of Xerxes himself"? 229 Indeed is it not clear that we can set no limit to the caprices of absolute power, or to the orders that may not be issued by a proud and silly despot? 230 Considerations of this kind go far also to remove the difficulty which has been felt as to the main facts of the narrative of Esther, the intended massacre of the Jews, and the counter-edict allowing them to defend themselves and slay their enemies.

231 Such facts are altogether out of the ordinary experience of Western nations; and it is not surprising that they have been met with incredulity on the part of those whose knowledge of the past is limited to an acquaintance with the course of European, and especially of modern European, history. 232 But can it be said that they are altogether out of nature? that they have no counterpart in the history of the East? That they transcend altogether what authentic history relates of the doings of Oriental tyrants? 233 Here again the German sceptic is more cautious than some of those who have sought to popularise him, and allows that from what we know of the base character and despotism of Xerxes 234 it may perhaps be believed that Haman obtained from him a decree for the extirpation of the Jews, and Mordecai in return a corresponding counter-decree. 235 All that he objects to is, the fierceness with which the Jews set to work, and the consequent massacre by them of above 75,000 persons. 236 This fact he thinks "incredible." It may be allowed that had the persons slain been, as the objectors suppose, "Persians," the circumstances related would have been extremely hard of belief; but it is on the whole most probable that there were few or no "Persians" among them. 237 A religious sympathy united the Persians with the Jews; and it is scarcely likely that any of them would have taken part in the proposed destruction of the Jewish nation. 238 The adversaries of the Jews were to be found in the ranks of the conquered nations, not of the conquering one. They were Persian subjects, not Persians. 239 There is no reason to think that the loss even of 75,000 of such persons

would have been felt by Xerxes as a matter of much importance.

240 We must remember, however, that the number 75,000 is doubtful. The Septuagint version has 15,000; and this number is more in harmony than the other with the 800 slain in the capital.

241 Finally, to the objection that the honours granted to Mordecai are excessive, it may be replied, in the first place, that they are analogous to those granted to Joseph, and Daniel, and therefore such as were occasionally allowed to subjects by Oriental sovereigns; 242 and secondly, that if there were anything abnormal in them, it would be sufficiently accounted for by the wild and extravagant temper of Xerxes, which delighted in strange acts and exhibitions of an unusual character. 243 Haman, who knew his master's weakness, might well speculate upon it, and suggest extraordinary honours, since he imagined that it was himself for whom they were intended.

244 I have now noticed 'all' the historical difficulties of any force or weight, which have come before me in the course of my studies on the history of the Old Testament. 245 I have dwelt particularly on those connected with the Pentateuch and with the two Books of Daniel and Esther, because of late years the attacks of sceptics have been especially directed against those portions of the Sacred volume. 246 I have left myself but scant time for noticing historical difficulties connected with the narrative of the New Testament; 247 but this is of the less consequence, since there are no more than one or two such difficulties on which any stress has recently been laid by our opponents.

248 It has been said that St. Luke, in connecting the name of Cyrenius with the "taxing" which caused Joseph and Mary to go from Nazareth to Bethlehem, "undeniably contradicts history." 249 Cyrenius (or Quirinus) was appointed governor of Syria about ten years after the death of Herod the Great, and made a census of his province shortly afterwards. 250 This census St. Luke is accused of placing ten years too early. The answer to this charge is, that the words of St. Luke cannot

possibly mean that Cyrenius was governor at the time of the taxing; 251 had it been St. Luke's intention to express this, the verse would have ran thus: "This taxing was made when Cyrenius was governor of Syria," and not "this taxing was first made," etc. 252 "First," that is, which is manifestly the emphatic word of the sentence, would then have been absent from it. Evidently, therefore, St. Luke's words must bear some other meaning. 253 They may signify, "'this' taxing was made 'before' Cyrenius was governor," and so before that better known taxing which he ordered. 254 This is an allowable translation of the passage. Or they may mean, and I think they do mean, "this taxing was first completed-- first took full effect-- when Cyrenius was governor;" 255 that is to say, the taxing ordered by Augustus, and commenced under Herod the Great, was interrupted (as it may easily have been, since the Jews were very bitter against it), and the business was first accomplished under Cyrenius. 256 This is a sense which the Greek verb translated incur version "was made" sometimes has.

257 Again, it has been said that St. Luke erred in stating that Lysanias was tetrarch of Abilene (iii. 1) in the fifteenth year of the reign of Tiberius Cæsar. 258 Lysanias, it is said, died sixty years previously; and St. Luke has ignorantly made him alive, being deceived by the fact that Abilene continued to be called "the Abilene of Lysanias," after its former ruler, for sixty or seventy years subsequently. 259 Now here it is in the first place assumed, without any word of proof, that the Lysanias who died B.C. 34 once ruled over Abilene. 260 Secondly, it is assumed, also without any word of proof, that Abilene came to be known as "the Abilene of Lysanias," from him. 261 I venture to assert that there is absolutely no ground for believing that the old Lysanias was ever ruler of Abilene; and I venture to maintain that Abilene came to be called "the Abilene of Lysanias" from a second or later Lysanias, a son of the former one, who is the person intended by St. Luke. 262 Till recently, Christian apologists were defied to show historically

that there was ever more than one Lysanias, and were accused of inventing a second to escape a difficulty. 263 But a few years since, a discovery was made which must be regarded by all reasonable persons as having set the whole matter at rest. 264 This was an inscription found near Baalbek, containing a dedication of a memorial tablet or statue to "Zenodorus, son of the tetrarch Lysanias, and to Lysanias, her children," 265 by (apparently) the widow of the first, and the mother of the second Lysanias. Zenodorus was already known as having succeeded the first Lysanias in his government. 266 It is thus clear, that there were, as previously suspected, two persons of the name, a father, and a son, and there is not the slightest reason for doubting St. Luke's statement that the latter was tetrarch of Abilene in the fifteenth of Tiberius.

267 I know of no other cavil against the historical accuracy of the New Testament, that I can regard as worthy of being dignified with the name of difficulty. 268 It has been denied that any decree ever went out from Cæsar Augustus, that all the world should be taxed, but as Savigny, the best authority on Roman antiquities, holds the contrary to be certain, this denial need not detain us. 269 It has been asserted that if the massacre of the Innocents had taken place, it 'must' have been noticed by Josephus; but this argument from omission is too weak to deserve more than a passing notice.

270 Nothing is more familiar to historical students than the unaccountable omissions which occur in the works of almost all historians. 271 Scepticism has searched in the most minute and unsparing way every detail of the Gospel and the Acts, and has endeavoured earnestly to find "differences" and "divergences" between these facts and those of profane history; 272 but again and again has it been compelled to own that the divergences are slight, and the differences such as may be reconciled by natural and probable suppositions. 273 The entire result of the searching criticism, whereto the historical character of the New Testament has been exposed, has been to

show that not only the general narrative, but all its minutiæ, are trustworthy. 274 No evangelist has been convicted of error in respect of any historical statements. Where a shallow learning and a defective knowledge of the records of the past have led people to think that they had found a slip or a mistake, and a shout of triumph has been raised, 275 profounder research has always demonstrated the veracity and accuracy of the sacred writer, and has exposed the ignorance of his assailant.

276 The historical character of the New Testament is, I think I may say, in the eyes of all sober historical critics established.

MYTHICAL THEORIES
OF CHRISTIANITY.
The Rev. Charles Row, M.A

8 It is hardly possible to over-estimate the importance of the issues to which it will be my duty to address myself in this lecture. 2 They involve the central position of Christianity; viz., the all-important question whether Jesus Christ was an historical person, or a creation of the imagination. 3 Is the Church which is erected on Him founded on an historic fact, which had an objective existence; or is the Jesus of the Evangelists a subjective creation which existed only in the minds of its originators?

4 Many of the attacks which have been made on Revelation are directed against its outworks merely; this is one directed against the very key of the Christian position. 5 If it can be carried by our opponents, the whole line of our defences becomes untenable. 6 Let us not deceive ourselves. If the Gospels are not 'in their main outlines' historically true, Christianity is no more divine than Shakespeare. 7 It may be the highest development of human; but it can have no pretence to be esteemed a revelation from God.

8 The objections of this school have done more to undermine the belief of the educated classes in Christianity as a divine revelation than any one single cause. 9 They have largely created the so-called rationalism of the Continent. They are widely diffused in America. 10 In our own country, a numerous

class of writers who obtain ready access to our periodical literature are not only imbued with similar views, but write with the quiet assumption that the historical foundation of Christianity cannot be defended.

11 As my subject is a wide one, I must address myself to it without any preliminary observations. 12 The question before us is simply this, Are the Gospels credible histories, in the sense that other writings of the same description are? Or are the larger portion of their contents fictitious?

13 It should be observed that although these schools support their views by an immense critical apparatus, the real σκάνδαλον [Greek: skandalon] of the Gospels is the supernatural element which they contain. 14 Apart from this, their historical character would never have been questioned.

15 The theory that miracles are impossible underlies the entire mass of these objections. But the question of the miraculous has been already handled by another lecturer. 16 I shall therefore only observe on it that it forms no portion of a strictly historical inquiry. It appertains to the abstract regions of thought. 17 History has to deal with evidence, not with abstract dogmas or philosophical questions. 18 To begin an historical inquiry with the assumption that miracles are impossible, and that any event which involves the supernatural must be a fiction, is quietly to assume the point at issue.

19 But as the Christian Church is an institution which actually exists, and as its origin can be traced up to the times of Jesus Christ, and as it is erected on the Gospels as its foundation, these schools are fully aware that the question cannot be settled by the quiet assumption that miracles are impossible. 20 The case stands thus. The Christian Church exists. It has had its origin in the events of past history. 21 The Church itself asserts now, and has asserted in all ages, that it is founded on the historical truth of the divine person of Christ our Lord, as He is depicted in the Gospels. 22 If the Gospels are true, they give a rational account of its origin, But those with whom I am reasoning deny that they are a statement of

historic facts, and consequently that they are not the true account of it. 23 But as the Church is an historic fact, they are quite aware that any mere general assumption that miracles are impossible is not sufficient.

24 They find themselves, therefore, compelled to do two things,-- first, to invent a critical apparatus to destroy the credibility of the Gospels; 25 and, secondly, to propound a theory which shall account for the origin of the Church on principles purely human.

26 The solution propounded is the mythical and Tübingen theories. This critical apparatus keeps two aims in view,-- first, to prove the existence of statements in the Gospels at variance with those of contemporaneous history; 27 secondly, to show that these narratives abound with a multitude of contradictions. 28 To effect this latter purpose, every variation of statement is made to assume the character of a contradiction. 29 The extent to which this has been carried is scarcely credible. This process having as they hope destroyed the substance of the Gospels, the next procedure is to invent a theory out of the imagination as the account of the origin of Christianity, and to propound it as true history.

30 At first sight it would appear to have been the easiest course to assert that they are simple forgeries, in the same sense in which the Donation of Constantine or the False Decretals are forgeries. 31 But this is what no unbeliever of the present day who regards own literary reputation ventures to propound as the alternative to their historical credibility. 32 Why is the simple course abandoned, and an infinitely complicated theory substituted in its place? 33 The answer is that their entire phenomena negative the supposition that they could have originated in directly conscious fraud.

34 A more elaborate theory, therefore, has to be substituted for the simple one. It must be observed that I can only speak of it in its general aspect, for its modifications are extremely numerous, and hardly any two

writers can be found who take precisely the same view.

35 But the following may be stated as the principles which underlie these systems of modern unbelief, throwing aside their minor details.

36 First. That miracles being impossible, no supernatural element whatever enters into the character of the historical Jesus.

37 Second. That He was probably a very great man, though, whenever the exigencies of the system require it, it is necessary to assume that He was deeply implicated in the prejudices and superstitions of the age in which He lived.

38 Third. That He probably believed Himself to be the Messiah expected by His country-people, though as to the precise nature of His Messianic claims my opponents are not agreed.

39 Fourth. That He succeeded in inspiring a crowd of followers with an enthusiastic attachment to Him.

40 Fifth. That they were honest people after their fashion; but were impelled by an enthusiasm only equalled by their credulity.

41 Sixth. That they invented a multitude of fabulous stories, ascribed them to Jesus, and in time mistook them for facts.

42 Seventh. That out of these and kindred elements, aided by a succession of developments, the human Jesus was gradually metamorphosed, 43 in the course of the seventy years which followed the crucifixion, into the Christ of the Synoptic Gospels, and in a hundred and thirty into that of the Gospel of St. John.

44 Now, as these schools deny the existence of the supernatural, this whole development must have been due to causes which are purely human; in one word, to the laws which regulate the developments of the moral and spiritual worlds. 45 As those of the natural world have been effected through the agency of natural laws, so the creation of the Jesus of the Evangelists is due to laws which regulate with equal potency the action of the mind. Both sets of laws are equally constant and invariable.

46 To examine the critical apparatus which has been applied to the Gospels for the purpose of proving their unhistorical character, could only be

accomplished in a work of considerable length. 47 I shall therefore only make two observations on the principles adopted.

48 First. These schools assault the Gospels by charging them with containing a multitude of inaccuracies, discrepancies, and contradictions. 49 While they do this they carefully keep in the background the minute accuracies, agreements with contemporaneous history, and plain indications of autoptic testimony with which they abound. 50 Such a line of conduct is the same thing as to place before the Court which is to try the cause everything which an acute counsel can adduce in opposition, and to suppress the whole evidence for the defence.

51 Secondly. A great majority of these objections are founded on a view of the Gospels which their writers expressly repudiate. 52 It is taken for granted that the Gospels are histories in the strictest sense of that word. By a strict history I mean a narrative in which the events are connected together in accordance with the sequences of time and place. 53 This is the arrangement which is generally adopted in modern histories and biographies. But the Gospels expressly assert that they belong to a different class of writings. 54 They are not 'histories', but 'memoirs'. In a memoir, the arrangement of events in the strict sequence of time and place is not the predominant idea. The Gospels are not only memoirs, but memoirs of a peculiar character. 55 They are details of the actions and teachings of Jesus Christ written for the express purpose of teaching the Christian religion. 56 In works of this kind the arrangement and grouping of events are formed on very different principles from those adopted in the composition of pure histories. 57 As this is a most important point, I must adduce proof of it which is beyond all contradiction. 58 St. John's Gospel asserts, in as many words, that it was the purpose of its author to write such a memoir, and not a strict history. 59 He says, "And many other signs truly did Jesus in the presence of His disciples, which are not written in this book: but these are written, that ye may believe that Jesus is the Christ, the

Son of God; and that believing ye may have life through His name." 60 Again, in the last verse of the Gospel it is expressly stated that Jesus did many things which the writer has not recorded. 61 The author therefore clearly asserts that he has made a selection of certain events in the life of Jesus Christ, from a very much larger number, with which he was acquainted, and that the principle which guided him, both in the selection and arrangement, was a religious one. 62 "These are written that ye may believe that Jesus is the Christ," etc. It is impossible more distinctly to assert that the Gospel is a religious memoir.

63 No less clear is the statement of St. Luke. He says "that he wrote in order to the most excellent Theophilus, that he might know the certainty of the things in which he had been instructed." 64 The original shows that the instruction was given with a definite religious purpose. The Gospel is "a declaration of those things most surely believed among Christians." 65 In one word, the work is a memoir, and not a history.

66 If it be replied that Luke says that he wrote "in order," εν ταξει [Greek: en taxei], I answer that there are other orderly arrangements besides those of time and place; 67 and that if a work is a religious memoir, the arrangement would be regulated, though not exclusively, by the reference of the facts to the religious end in view.

68 The assertions of the other two Gospels are not so express, but viewed in connection with their contents they prove that they belong to the same class of writings. 69 Mark writes, "The beginning of the good news of Jesus Christ, the Son of God." Here a religious purpose is asserted to be the guiding principle of the work. 70 Matthew, in accordance with Hebrew phraseology, entitles his work "The book of the generation of Jesus Christ, the Son of David, the son of Abraham." The whole contents of the Gospel answer to this description. 71 It was written to prove that Jesus was the Messiah of prophecy according to the conceptions of Jewish Christianity.

72 Such being the distinct assertions of the writers of the Gospels as to the character of their works, it is absurd to critcise them 73 as one might be justly entitled to do if four Boswells had set forth four lives of Dr. Johnson, the arrangement of which was professedly regulated by the historical sequence. 74 The writer of a religious memoir is entitled to adopt a very different order of events in his narrative from that which ought to be adopted by the writer of a history.

75 An illustration will make this matter plain. If I were to compose a biography of Wesley, I should be bound to narrate the events in the order of time, with a distinct specification of the order of place; 76 but if I were to compose a memoir for the purpose of teaching the doctrines of Wesleyanism, I should follow a very different arrangement. 77 Still more remarkable would be the variation in the arrangement if I wrote his memoir for the purpose of proving that Wesley never designed that the Church which he founded should dissent from the Church of England.

78 Such being the character of the Gospels, objections which would be serious as against regular histories are harmless against compositions of this description. 79 A large portion of their alleged discrepancies arise from the different arrangement of the events narrated in them, owing to the predominance in them of the religious idea.

80 Now observe that in compositions of this description it frequently happens that the connecting links which would make events perfectly harmonise together, are wanting, simply because the purpose of the writer has not led him to record them. 81 I adduce a single instance where the connecting link has been accidentally preserved, and which at once converts a narrative against which most serious objections might have been alleged, into one of the strongest proofs of the historical truthfullness of the Evangelists.

82 We all remember the account of the murder of John the Baptist. It is told with all those minute and delicate touches which are the peculiar indication of autoptic

testimony. 83 It places before our eyes the great feast-- the young lady dancing her lascivious dance-- the words of Herod's vow-- the girl's going out with excitement to her mother-- the demand of the Baptist's head in a large dish-- 84 the sorrow and reluctant consent of Herod-- the mission of the executioner-- the presentation of the head to the girl, and by her to her mother. Everything betokens the presence of an eye-witness. 85 The narrative is open to this obvious objection: How could the disciples of Christ, mean and low as they were, procure so accurate a description of an event which happened in the palace at the great feast? 86 There were neither newspapers nor reporters in those days. But this is only the beginning of the difficulty. 87 The authors of the Gospels profess to give us the 'ipsissima verba' which were uttered by Herod, in the retirement of his palace, when the reports brought him of the fame of Jesus rendered him conscience-stricken. 88 The words are most remarkable, and leave no alternative between their being the words of Herod or a forgery. 89 "It is John," says he, "whom I beheaded: he is risen from the dead, and therefore mighty works do show forth themselves in him." 90 Our version spoils the force of the last words-- "The powers energise in him." This is certainly a most singular expression, and one open to a strong suspicion of forgery; 91 for how could the followers of Jesus have got hold of the very words of an utterance of Herod spoken in the retirement of the palace?

92 But besides all this, the words αἱ δυνάμεις ἐνεργοῦσιν ἐν αὐτῷ [Greek: hai dunameis energousin en autô] plainly imply that it was the general idea that a large number of miracles had been wrought by our Lord.

93 My opponents suppose that the historic Jesus only attempted to work miracles in a very few questionable cases, and that the multitude of miracles which have been subsequently ascribed to Him are the inventions of His deluded followers. 94 Such are the difficulties. Now for their solution.

95 It has been observed that the author of the Acts of the Apostles tells us that among the teachers of

the Church at Antioch during Paul's sojourn there, was Manaen, who was a foster-brother of Herod the Tetrarch. 96 This is told us in a manner which is purely incidental, and supplies us with a possible source from whence the information might have been derived. 97 Still it by no means follows that a man who had the same wet-nurse as Herod was an inmate of his palace, or witnessed the great feast.

98 But a passage of the most incidental character in St. Luke's Gospel supplies us with the source of information which we want. 99 In narrating our Lord's last journey to Jerusalem, Luke tells us that He was accompanied by the twelve apostles, and several women who ministered to Him. 100 Of these he designates three by name. One of these is described as Joanna, the wife of Chuza, Herod's steward.

101 Here then we have the very person we are in want of. Chuza's office of ἐπίτροπος [Greek: epitropos], or steward, imposed on him the duty of superintending the great feast. 102 He therefore witnessed the whole procedure, and his wife was in constant communication with the disciples. His office must have brought him into daily communication with his master. 103 What more likely than when he waited on Herod for his orders, he would ask him the news; and that he should report to him the fame of the great teacher with whom his wife was in attendance? 104 He was therefore in the exact situation to have heard Herod's conscience-stricken exclamation. The source of information is before us. 105 The incidental mention of Joanna and her husband affords to this narrative an attestation such as few events in past history possess. If this incident had been lost, the difficulty would have been insuperable. 106 The manner in which little circumstances dovetail into one another in the Gospels is only consistent with their historical character. It would be impossible if they were bundles of myths or legends.

107 I adduce one instance of the manner in which the Gospels fulfill the conditions of history, even where the absence of the connecting link has occasioned serious difficulty. 108 You all

know that the want of any reference in the Synoptics to the miracle of the resurrection of Lazarus is the stronghold of those who deny its historical credibility.

109 In the absence of any direct information, we are driven for the solution of the difficulty to the regions of conjecture.

110 Let us suppose, then, that the story is a myth. If so, it is obvious that it is a very grand and perfect one. The inventor must have been a man of the highest genius in his way. 111 If a person wished to invent a description of a resurrection, he would find it impossible, in the same number of words, to surpass its perfection. 112 If the author of St. John's Gospel has failed to depict another resurrection in an equally graphic manner, it was not for want of sufficient genius. 113 Yet the Gospel asserts the fact of another resurrection-- that of Jesus Christ; but it utters not one word descriptive of it. All that it says is that Mary Magdalene came in the morning, and found the tomb empty.

114 I put it to your common sense to determine, on the sup position that this Gospel was written by a partisan for the purpose of throwing a halo of glory around the person of his Master, 115 whether the author of the resurrection of Lazarus would not have forged a still more magnificent description of the resurrection of Jesus Christ. His failure to do so is clearly not owing to lack of ability.

116 But how stands the case on the supposition that the Gospel is historical? Everything is exactly as it should be. 117 The Evangelist has given his pictorial description of the resurrection of Lazarus, because he witnessed it. He has not done so with respect to the resurrection of Jesus Christ, because no human eye beheld it. 118 The narrative therefore fulfills the conditions of history, and breaks down under the tests which belong to fiction.

119 The limits of a single lecture necessarily preclude me from entering on any minor consideration. I therefore proceed at once to address myself to the demolition of the central position of my opponents, 120 that while the Gospels contain a few grains

of historic truth, buried beneath a multitude of fables, the greater portion of their contents is a spontaneous growth which sprung up in the bosom of the Christian society in the last seventy years of the first century; 121 and that by means of a number of mythical and legendary inventions, and a succession of developments, a good and holy Jew, named Jesus, was metamorphosed into the divine Christ of the Evangelists. 122 In reasoning on this point, I shall assume nothing but what is conceded by the Schools in question. What are the concessions which I ask as the foundations of my reasoning? Very simple ones indeed, and such that no person can deny me.

123 First, that the Gospels exist; secondly, that the three first Gospels were in existence about A.D. 100, and the fourth about 160; 124 thirdly, that in addition to the facts or fictions which make up our Gospels, they contain the delineation of a great character--Jesus Christ.

125 On the existence of this character my argument is founded. I now concentrate your attention on it, which I shall call for the future the portraiture of Jesus Christ our Lord. 126 I need not prove that it exists in the Gospels, for the most ordinary reader perceives that it is there. The question is, How did it get there? 127 It is very easy to say that the Gospels consist of a mass of fictions. But this is no account of the origin of the portraiture. St. Paul's Cathedral undoubtedly consists of an immense multitude of stones. 128 But to say that a multitude of quarrymen dug them, and that a multitude of masons arranged them according to their spontaneous impulses, is no account of the origin of that magnificent structure.

129 Let us carefully observe what this great portraiture of Jesus Christ, as it is exhibited in the Gospels, consists of. It is the delineation of a great moral and spiritual character dramatised over a wide sphere of action. 130 This portraiture is not the result of the artificial delineation of a character such as we see very commonly presented to us by historians, 131 and of which we see very numerous examples in Lord

Macaulay's History of England. 132 Such characters are the artificial creations of the historians, and exhibit their view of what their heroes actually were. But neither of the authors of the Gospels have once attempted thus to delineate the character of his Master. 133 But the portraiture of Jesus Christ is delineated in the Gospels most clearly and most distinctly. Of what materials then does it consist? 134 Only one answer can be returned. It is the combined result of all the facts, or, as my opponents say, fictions, which compose the Gospels.

135 Now as the existence of this portraiture is not a theory, but a fact, it is plain that it must be accounted for. 136 The assumption that the Gospels are historically true, and that their authors have truly delineated the actions and sayings of one who had an historical existence, is a rational account of its origin. 137 But as these Schools deny their historical character, they are bound to tell us how the portraiture got there. The only answers which they propound are the mythic and Tübingen theories.

138 According to these theories, a good and holy Jew, who had attracted a crowd of enthusiastic and credulous followers, was gradually metamorphosed by them into the divine Christ of the Evangelists. 139 The inventors of the character were impelled by purely spontaneous instincts. They had no intention of conscious deception. They mistook their Master for the Messiah. 140 In the depths of their enthusiastic credulity, they invented multitudes of fictions, and in time mistook them for realities, and innocently ascribed them to Jesus. 141 Development succeeded development. The fruitful mind of the infant Church created myth after myth. Party spirit raged. Compromise followed compromise.

142 Spontaneous impulse by the end of the century had created the materials of our present Gospels. At last three unknown people appeared who arranged these materials into their present form, and produced the Synoptics. 143 Sixty years later, another great unknown arose, whose character must have been a compound of

mysticism, enthusiasm, and imposture, and produced the fourth Gospel, 144 which he successfully palmed off on the Church as the work of the Apostle John, some seventy or eighty years after he was silent in the grave. 145 Such is the alternative which modern unbelief presents as a substitute for the historical reality of the portraiture of Jesus Christ as we behold it in the Gospels.

146 One cannot help pausing to observe the kind of analogy which exists between these theories and those of a certain class of philosophers who attempt to prove that the moral and religious being whom we designate human has been slowly developed out of the lower forms of life by causes purely physical. 147 Like as in the one case each development became an improvement on its predecessor, so in the other the lower fabulous creations must have died out, and the nobler ones prevailed, until at last there emerged from them Christianity and the glorious Christ of the Gospels.

148 Physical philosophers, however, work at a great advantage in developing an ape into a moral being, compared with the mythologists who developed a Jew of the year 30 into a Christ. 149 The one can draw cheques to any extent on the bank of eternity. If a million of years is not sufficient, a million of millions may be easily had. 150 But in the other case my opponents are limited by the stern conditions of history; and the respective periods of seventy and one hundred and thirty years are all that they venture even to demand.

151 Now, observe; the portraiture of the Jesus of the Evangelists consists of a multitude of parts which harmoniously blend into a complicated whole. 152 It is composed, in fact, of as many distinct portions as there are incidents recorded in the Gospels, which all concur in imparting to it a common effect. 153 Those with whom I am contending admit that the character is a very great one. Many of them allow that it is greater and more perfect than any which has ever existed as a fact or been conceived as a fiction. 154 Yet the character, taken as a whole, presents us with an

essential unity. This is obviously the case in the three first Gospels, and will hardly be disputed except on a very few subordinate points. 155 But it is equally remarkable that of the various traits which compose the character, and which are very numerous, each presents us with a similar unity, although they are dramatised over a very wide sphere of action. 156 To this fact I earnestly invite your attention. In the portraiture of Jesus at least twenty distinct aspects of moral character are blended together, and a number of subordinate ones not easy to be counted; 157 and each of these constitutes a separate unity, which harmoniously blends with the others, and together compose the great unity of the portraiture. 158 Numerous as they are, and dramatised over a wide sphere of action, they are yet depicted with a faultless propriety, even in the most minute details. Nor does it to any serious extent differ with the fourth Gospel. 159 This is certainly the case as far as the actions attributed to Jesus are concerned, though it is not so obvious in the case of the discourses. Still even in these an underlying unity of conception can be found. 160 The four Gospels contain, in fact, four portraitures of one and the same Christ, only differing from each other in the point of view from which they are taken.

161 Now the obvious course would have been to have assumed that the conception of the original character was the creation of some great poet, and that the fourfold modification of it which our present Gospels exhibit has been the work of four subsequent poets. 162 But this supposition the facts and phenomena of the case consign to the region of hopeless impossibilities. 163 It is therefore necessary to assume that the character itself, and the Christianity of the New Testament, have been gradually elaborated bit by bit, not by a succession of great poets, but of credulous, enthusiastic mythologists; 164 and that the Synoptic Gospels originated in piecing together a multitude of tales which in the latter end of the first century were floating on the surface of the Christian Church.

165 It is impossible to deny that the Jesus of the Evangelists is an immeasurably finer conception than either the Prometheus of Æschylus, which exhibits the divine in suffering, or the Macbeth or Hamlet of Shakspeare. 166 Each of these characters is distinguished by a unity of conception which proves that as characters they are the creation of a single mind. 167 But supposing we were to be told that these, and the dramas which contain them, were not the creations of single poets, nor even of a succession of poets, 168 but had been slowly elaborated, step by step, during a considerable interval of time by a number of credulous enthusiasts. 169 My opponents would be the first to receive such a suggestion with shouts of derision.

170 It is plain that if the portraiture of our Lord be an ideal creation, those who framed it must have been gifted with a high order of genius.

171 Let me illustrate the position by the art of painting. High genius in painting is analogous to high genius in poetry. 172 Let us suppose that we are contemplating a great ideal picture,-- 'e.g.', the Marriage Feast in Cana of Galilee, at the Louvre,-- and that we are told that it is not the work of a single artist, nor even of four, but of a succession who gradually developed it. 173 Nor, to make the case a parallel one, is this all which we should be asked to believe. As I have already observed, the portraiture of the Jesus of the Evangelists is made up of a multitude of parts, each of which has a separate unity, from the union of which the unity of the whole results. 174 These are said to have been elaborated out of a number of myths and developments which have been the creations of many minds. 175 In a similar manner the picture of the Marriage Feast at Cana consists of a number of separate figures which harmoniously blend into a whole, and to which the magnificent colouring has been adapted.

176 Now suppose that we were told that each of these figures had been gradually developed into its present form by a set of improvements effected unconsciously by a succession of painters; 177 and that all that the

artist who formed the picture did was skillfully to combine these separate figures, and place them in juxtaposition. 178 Surely one would not be uncharitable in assuming that the author of such a suggestion had escaped from a lunatic asylum.

179 Similar is the theory of these Schools as to the origin of the Gospels, and of the great character contained in them. 180 Such a theory of their origin demands our acquiescence in a greater miracle than all the miracles of the New Testament united together. 181 Viewed in its great outlines, this theory is self-condemned by its inherent absurdity. But when we apply a sound logic to its details, it vanishes like one of the palaces of the Arabian Nights. 182 Professing to be based on rational principles, it violates all the laws of reason. For historic truth it substitutes wild dreams of the imagination. 183 You will please to keep steadily in mind that the means by which my opponents undertake to metamorphose a Jew of the year 30 into a divine Christ, stated generally, are a succession of mythical and legendary creations and developments, contests and compromises, 184 between hostile sects evolved in conformity with the laws of the intellectual and moral world. Let us now assume the truth of their position, and see how it will work.

185 If the Jesus of the Evangelists be a development, it is evident that it must have had a starting-point. 186 This could have been none other than the atmosphere of thought and feeling which existed in Judæa during the first thirty years of the first century.

187 But none more firmly profess their belief in the reign of law in the world of mind and matter than those whose theories I am controverting. 188 In consequence of this belief they pronounce all supernatural interventions in human affairs impossible. 189 I thankfully concede to them the fact that all developments affecting the mind of human which are of purely human origin must be brought about in conformity with law. 190 Let it be clearly understood, therefore, that my reasoning is based on this assumption. This point being clear, the question immediately presents

itself, 191 what is the nature of the laws which regulate the mental developments of human, especially in your character of a moral and religious being? 192 Are they rapid, or do they require long intervals of time for their elaboration? Are great changes in our moral or religious ideas of a quick or a slow growth? 193 The answer to these questions is of vital importance to the argument, because on the showing of my opponents they have only seventy years at their command during which they can develop the Christ of the Synoptics, 194 and the Christianity of nearly all the Epistles, from the religious and moral ideas of the Judaism of the year 30. 195 Fortunately for us, the universal testimony of history answers these questions with no ambiguous voice. The developments of human, whether moral, social, or religious, are slow. 196 The whole course of civilisation, including within that term everything which relates to the growth of the mind of human, and which tends to your refinement and higher culture, is a very gradual one; 197 and its successive stages require long intervals of time for their development.

198 Whenever unbelievers attempt to account for the growth of human civilisation from a savage state, or to develop a human out of an ape, in the one case they demand tens of thousands and in the other millions of years for its accomplishment. 199 As this point is of great importance to the argument, I must adduce distinctive proof of it.

200 No truth is more certain than that it is impossible for humans, either individually or collectively, to raise themselves except by very gradual stages above that moral and spiritual atmosphere in which they were born. 201 We are united by the closest ties of habit and education with the past. We breathe from the dawn of our consciousness the very atmosphere of its thought and feeling. 202 Every succeeding state of society is most closely bound to that which preceded it. Every great change in thought or feeling has been produced by a succession of changes leaving no deep gulf between. 203 Individual progress,

unless external influences are brought to bear on the mind, follows the same law of gradual growth. 204 Even genius, and what are called the creative powers of the mind, are fettered by these conditions. All greatness is relative to and bears the impress of the age which produced it. 205 Great people differ from others only in being able to advance a few stages beyond ordinary humanity. But the greatest genius is unable to elevate itself into a very high region of thought or feeling at a single bound, or to sever the links which unite it with the past. 206 The utmost effect which the greatest of people have been able to produce on those by whom they have been surrounded is to cause their actual developments to advance at a somewhat accelerated ratio.

207 To the truth of these general principles all history testifies. When we measure each stage of human growth, we find that it has occupied long intervals of time. 208 So gradual is the process, that considerable changes can only be discovered after the lapse of lengthened periods.

209 The whole history of philosophy, art, morality, and religion testifies to this. All philosophic schools of thought have been of gradual growth. 210 The daub of a savage has never suddenly develop itself into the creations of a Michael Angelo or a Rubens, nor have one's rough imitations of the human form passed but by a succession of gradual stages into the perfection of a Phidias. 211 Poetry, the most creative of arts, is subject to similar conditions. The ideas with which the poets works are those of the age in which they lives. 212 You paints the phenomena and reflects the line of thought, the morality, the religion, the intellectual and social conditions of the times which gave you birth. 213 What you accomplishes is to exhibit them under new combinations. A bushman never at a single bound became a Homer or a Shakspeare. 214 The history of philosophy bears witness that the universal law of our nature is a gradual growth. Each of its developments was closely allied to that which preceded it, and directly grew out of it. 215 Each

School has occupied a considerable time in its development, has grown out of that which preceded it, and prepared the way for its successor. 216 The interval which separates the respective stages is small. Each great race of humankind has also created a philosophy stamped with its own impress, and directly related to its peculiar character. 217 A native of Australia has never suddenly elevated the self into a Socrates. The same law is no less applicable to religions. We know no instance of the direct creation of one. 218 It is true that the origin of many is buried in the obscurity of the past. 219 Yet as soon as they emerge into the light of history, it is clear that they are subject to a law of gradual growth; and after they have attained their full development, to a no less remarkable law of gradual decay. 220 All the religions on earth, with the exception of Christianity, bear witness to this rule. What have been called new religions, have been evolved out of previously existing materials, modified and adapted to the growth and decay of civilisation. 221 No Fetish worshipper, however lofty your genius, could have evolved the systems of Brahmanism or Buddhism by a single bound of your imagination. 222 If the law of the growth of religions is a very gradual one, that of our moral ideas is far more so. Improvements in the great moral principles which regulate the life of human are most painfully slow. 223 All the great races of humankind have presented the same general outlines of character, with only slight improvements, from age to age. 224 I quote only two examples, the modern French and Germans. How strikingly like are certain portions of the character of the former, to the picture of the Gauls given in the pages of Cæsar; 225 or to the descriptions of the same race inhabiting a distant region which the great apostle has drawn in the Epistle to the Galatians. 226 We may still read the general outline of the character of the German race in the pages of Tacitus. Developments there have been, and the slowness is sadly disappointing to the philanthropist. 227 To be able even to recognise

progress, we must survey long intervals of time. 228 The optimist has indeed need of patience; and the most enthusiastic may be certain that long ages before any considerable advance is made, according to the mere laws of natural development, you will be slumbering in the grave.

229 But it must not be forgotten that the developments which our opponents postulate are always in the way of progressive improvements. 230 Stern historical fact compels us to assert that developments are frequently retrogressive. No less gradual is the moral progress of the individual. 231 It is also a painful but undeniable fact that retrogressive ones are much more rapid than progressive ones. The moral ideas in the midst of which we are educated cling to us with the firmest grasp. 232 The best people exhibit only a slight advance above the general morality of their age.

233 I now draw your attention to the fact that the inventive powers of the composer of fiction are limited by the same laws. 234 You too, in the strict sense of that term, is unable to create the new. The materials with which you can work are the idealisation of the times in which you lives. 235 Whether you be poet or novel writer, you can neither invent a new religion or a new morality. Mythical inventions of every kind embody the state of thought, feeling, and general idealisation of the times which produced them. The entire mass of existing mythology testifies to this fact.

236 Such, then, are the instruments and materials with which my opponents have to work in the elaboration of Christianity out of Judaism, and in metamorphosing a human Jesus into a divine Christ. Let us examine the possibility of the attempt.

237 We must place ourselves in the position of the followers of Jesus on the evening of the crucifixion. 238 His individual influence had gathered around Him a number of enthusiastic and credulous followers who mistook Him for the Messiah of popular expectation. 239 The crucifixion certainly dashed their hopes. But according to the theory of my opponents, in the height of their

enthusiasm they determined to believe in Him as the Messiah still. 240 To carry out this resolution, it is obvious that new ground had to be taken. A development of some kind was absolutely necessary. No amount of credulity could mistake a dead body mouldering in the grave for the Messiah of Jewish expectation.

241 It was absolutely necessary, therefore, if His Messiahship could become a possibility, that the crucified Jesus should be rescued from the tomb. 242 If a resurrection could not be effected in reality, it was indispensable that one should be in imagination. 243 Until His followers could be brought in considerable numbers to believe that this had happened, no developments in the direction of the Gospels were possible. 244 The most obvious expedient to have accomplished this would have been for some of the disciples to have done that which, according to one of the Evangelists, the Jews accused them of, viz., to have stolen the body, and report that Jesus was risen from the dead. 245 But those against whom I am reasoning do not venture to accuse them of conscious fraud. This assumption all educated unbelievers have long abandoned as hopelessly untenable. 246 Such a basis will certainly not bear the weight of the Christianity of the New Testament. In place of this, they assume that the credulity, idealism, and enthusiasm of the followers of Jesus was bottomless. 247 With this machinery they think that He can be rescued from the grave.

248 Two theories have been propounded for this purpose. One is that some enthusiastic woman--Mary Magdalene, for example--thought that she saw Jesus with the mind's eye, or mistook the gardener for Him, and converted this appearance into a bodily reality. 249 She communicated her enthusiasm to the rest. Others may have imagined that they saw Him in a similar manner, and committed a similar mistake.

250 The other theory is that He was buried in a swoon, that He managed to creep out of His grave, that He partially recovered, and died shortly after in retirement. 251 On such a foundation my opponents propose to erect the

whole weight of the historic Church, and from such a chimera to develop the portraiture of the divine Christ.

252 The second theory I should not have mentioned if it had not been dignified by the name of Bunsen. It is obvious that it will not support the weight of the Christian Church. 253 What! a man who died from weakness shortly after creeping out of his grave, metamorphised by his followers into a divine Messiah, and seated on the right hand of God! 254 If He lived in retirement, and died in Phœnicia shortly afterwards,-- according to an assumption for which there is not even the ghost of historical testimony,-- His followers had access to Him or they had not. 255 If we adopt the former part of the alternative, no amount of credulity could have mistaken Him for a glorious Messiah rescued from the tomb. 256 The very sight of Him must have acted as a complete extinguisher on the powers of the imagination. 257 If we adopt the latter, it falls under the general head that the belief in the resurrection was merely due to an excited imagination. All the assistance which it renders is to dispose of the dead body.

258 Now, in theory, nothing is easier than to say that an excited woman saw Jesus with her mental eye, mistook it for a bodily reality, and communicated her enthusiasm to the rest of His followers. 259 But in practice, such things are not quite so easy. Although it is no hard matter to persuade the credulous to believe in the appearance of ghosts and phantoms, 260 yet I do not know that the whole history of human presents us with a single example of a great institution which owes its origin to such a belief. 261 But even the credulous believers in such apparitions are very difficult to persuade that they have actually seen a man who once had died again restored to life. 262 I doubt whether the entire mass of fictitious literature presents us with anything at all analogous to the supposed belief of the credulous followers of Jesus in the resurrection of their Master. 263 Even persons who have a most imperfect knowledge that Nature is governed by law, are quite

aware that dead humans do not revive. 264 The followers of Jesus could have been hardly more credulous than modern spiritualists, yet these latter have not yet succeeded in erecting a great institution on the basis of an actual resurrection from the dead, or even on the presence of a spirit in a table. 265 Supposing, therefore, that some fanatic follower of our Lord made the mistake in question, it could really have been no easy matter to have communicated this enthusiasm to the rest, damped as their spirits were by the crucifixion. 266 Still more difficult would it have been for any considerable number to have made the mistake of converting a flight of the imagination into an objective fact. 267 At any rate my opponents must concede that to have persuaded any number of people under such circumstances that the crucified Jesus was actually risen from the dead must have required a considerable interval of time.

268 It would be much more easy to create a belief in a resurrection after the lapse of a century, than within a few years of the event. 269 When we survey a past event through the haze of time, it helps to confuse our ideas as to what is possible. 270 But long intervals of time so convenient for the physical speculator are precisely the things which my opponents have not at their disposal. 271 Seventy years is all which they themselves think it possible to ask for; and as all developments are slow, one or two entirely exhaust it, and they require a multitude to effect their purpose. 272 But not only was it necessary to get some of the enthusiastic followers of our Lord to believe in His resurrection, but also to constitute a society founded on its basis. 273 Until this was done, all development was impossible. But each step requires a considerable interval of time. But how could the Church be held together while the belief in the resurrection was forming?

274 But even supposing that Jesus by the power of the imagination had been rescued from the grave, it became a very serious question what to do with Him. 275 No amount of credulity could have brought Him into daily communication with His

followers. If He continued on earth, His not doing so was a very serious affair. 276 The obvious expedient was that He should be taken up into heaven, from which at some future day he should come back again and take possession of his Messianic throne. 277 Such is the idea adopted by these schools of thought, and they are never wearied with telling us that the chief if not the only article in the primitive belief of the followers of Jesus was His speedy return to realise their expectations of His Messianic glory.

278 Be it so; for the consequences are very serious to the position of those whose views I am combating. 279 His followers then expected Him to return as the Jewish Messiah. Now nothing is more certain than as long as this expectation lasted there could have been no development in the direction of the Christ of the Gospels. 280 How long, then, did this state of stagnation last in the bosom of the Church? When did it occur to the followers of Jesus that the expectation of the speedy return of their Master was a baseless one, and that they must set themselves to work to develop a different conception of a Christ? 281 It is a fact that such beliefs do not speedily die out, and that they can survive many a disappointment. 282 The modern prophetic School affords a striking proof of the tenacity of such hopes. 283 They have repeatedly prophesied that the Advent will happen in our times; and notwithstanding the falsification of their predictions, I believe that they still cling to this belief. 284 At any rate it has required a long interval of time to undeceive them; and as credulity was, according to the views which I am combating, the leading trait of the followers of Jesus, it must have been a considerable interval of time before they could have been persuaded to part company with their darling expectation. 285 But as long as a Jewish Messiah satisfied their aspirations, the Church could have developed no new Messianic conceptions.

286 But to afford something like a basis for reasoning, I will suppose these obstacles to have been surmounted; 287 that the work of development has commenced, and

that the womb of the Church is at last become pregnant with its future Christ. 288 Fresh and ever-increasing difficulties present themselves for solution.

289 Let it be observed that, after they have effected the resurrection, all which has been accomplished was to repair the damage inflicted on the Church by the crucifixion, and to restore to it, as a necessity of its existence, a living instead of a dead Messiah. 290 That Messiah was still the Messiah of Judaism. They have scarcely advanced a stage in the creation of the Gospels, and of the Christ therein delineated,-- not to say of the entire moral and spiritual teaching of the New Testament.

291 Let us observe the steps of the process by which the metamorphose must have been effected. 292 It is, say my opponents, very uncertain whether the historic Jesus ever attempted to perform a miracle. But according to the conceptions of the times, His followers thought that the Messiah ought to have performed them. 293 To supply the defect, they invented a mass of miraculous stories, and in their fond credulity thought that Jesus had actually performed them, and thus the delusion of His miraculous wonder-working was propagated in the Church. 294 But all experience proves that mythic and legendary miracles are grotesque. Yet those in the Gospels are all sober ones, and stamped with a high moral tone. 295 They must therefore have undergone a succession of developments before they could have assumed their present form. 296 Still a Jewish Messiah has yet to be transformed into the Jesus of the Evangelists. After a while a happy thought occurs to these uninstructed Jews. They determine to invest the Teacher with whom they had habitually conversed with a character at once divine and human. 297 The mythic faculty is again invoked, and the human Jesus, by the aid of development after development, gradually assumes the aspect of the divine Christ. 298 In a similar manner they feel that the moral aspect of the Messiah of their fondest expectations must undergo a change, 299 and in due time the triumphant King becomes the

meek and the lowly Jesus, and the morality of Pharisaism becomes that of the New Testament. 300 Few persons are at all aware of the enormous difficulties which would have beset any persons who, whether consciously or unconsciously, set themselves to metamorphise a Jew of the year 30 into the Christ of the Gospels. 301 Familiarity with the character induces numbers to think that poets or fabulists, inventors of myths and legends, might easily have created it. 302 To form a correct estimate of the difficulty, it is necessary to transport ourselves out of the nineteenth century into the Jewish atmosphere of thought and feeling of the century which preceded the Advent. 303 A starting-point it must have had. There could have been no other than it.

304 Let it be observed that before the elaboration of the Jesus of the Gospels, those who fabricated the conception were wholly without a model to guide them. 305 All ancient fact or fable fails to furnish anything at all analogous to this great character. Such models as they had would have guided its inventors wrong. 306 The only ones which they possessed were the popular Messianic conceptions of the period, and the prevailing Jewish ideas of religion and morality. 307 Besides these, they might have fallen back on the general ideas contained in the Old-Testament Scriptures and the apocryphal books. 308 The ideal of a Jewish hero would certainly not have helped them in forming the conception of the Evangelical Jesus. One apocryphal book has been frequently referred to as affording considerable aid-- the Book of Enoch. 309 I have fully discussed this subject elsewhere, and the conclusion to which I have arrived is, I think, incontrovertible, that even if we grant that its Messianic portions were composed prior to the Christian era (a concession which I am by no means prepared to make), 310 the aid which it would have afforded the mythologists who invented the Christ of the Gospels would have been inconsiderable. 311 To avoid a lengthened controversy as to its date, I am quite willing that these schools of thought should make all the use they can of them.

312 Let me point out a few of the difficulties which must have beset the path of the inventors of the great portraiture of the Gospels. 313 Every reader at once recognises that the character who is there depicted is a superhuman one; or rather, to speak more accurately, it is exhibited as uniting the human and the divine. 314 This is a plain matter of fact, and is quite independent of the question whether the Evangelists were right in so representing it. 315 Nor is my argument at all affected by any supposed difficulty in defining, in the terms of an abstract creed, the precise measure of the divine which they have ascribed to it. 316 All that I contend for is that the Jesus of the Evangelists is dramatised as uniting a divine and human consciousness, and that it is exhibited with a faultless propriety.

317 Now the moment the mythologists made a movement in this direction, a hundred problems of a most difficult character must have demanded their solution before they could advance a single step. 318 I can only adduce one or two examples. How was the human to be represented as acting in union with the divine, and the divine with the human? In what proportions were they to be combined? How was the one to be prevented from swallowing up the other? 319 Let it be observed that there was no model to guide them. The attempt to exhibit the divine and human in a single personality had never been attempted before.

320 The difficulty will be at once seen from a reference to the Old Testament. The nearest approach which it exhibits to uniting the human and the divine is in the act of prophetic inspiration. But in this the two factors are invariably distinct. 321 The Old Testament prophet, when under the influence of the prophetical illapse, invariably prefaces own utterances with "Thus saith the Lord." 322 These words are never once placed in the mouth of Jesus throughout the entire Gospels. Instead of them, His most solemn utterances are introduced with the words, "I say unto you." 323 The prophet is generally vehemently excited. The Jesus of the Evangelists is invariably calm.

324 You must never forget that the position of those against whose theories I am reasoning compels them to assume that the contents of the Gospels have been elaborated by the action of a multitude of minds. 325 Be it so. It follows that these problems must have received as many different solutions as there were minds engaged in the attempt. 326 Instead of the character which resulted therefrom presenting a unity of aspect, it would have been a mass of hopeless confusion.

327 My limits will only allow me to draw your attention to one or two of these difficulties out of the vast multitude. The historical Jesus was unquestionably crucified. How was a crucified man to be represented as divine? 328 He died in agony. How was an artist to dramatise the divine in suffering? 329 If my hearers are not aware of the difficulties which would have attended the solution of these and kindred questions, I advise them to study the creation of the great Grecian dramatist, the Prometheus Vinctus of Æschylus, and compare it with the Jesus of the Gospels. 330 I am sure that correct taste will pronounce that the creation of the fishermen of Galilee utterly transcends that of the genius of the great tragedian.

331 Nothing is more difficult, even in works of fiction, than to combine the attributes of holiness and benevolence as harmoniously acting in the same person. 332 In living humans they almost invariably jar. They possess them imperfectly, and one generally counteracts the action of the other. 333 The difficulty of combining them is greatly increased if the being uniting them is to be represented as both human and divine.

334 Holiness and benevolence are in fact opposite sides of character, and no more difficult problem can be presented to the imagination than to exhibit them as acting harmoniously in the same character. 335 No question in theology is more embarrassing than the mode in which they coexist in God. 336 It follows that if the contents of the Gospels were due to a multitude of minds, they must have exhibited as many aspects of the character of a Christ as there were fabulists engaged in

its creation. 337 But the character of the Jesus of the Gospels, in its combination of holiness with benevolence, presents us with a complete unity. Not only is the unity complete, but the perfection of the picture is inimitable. 338 Where can we find, either in fact or fiction, anything like the perfection of the holiness and benevolence of the Jesus of the Evangelists? Yet we are asked to believe that it has been a gradual growth created by successions of credulous mythologists.

339 The moral and religious teaching of the Gospels forms a subject by itself of large dimensions, and it is impossible for me within the limits of a lecture to do more than glance at it. 340 It consists of two perfectly distinct portions: first, the subject of morality and religion as it is exhibited in the person of Jesus Christ; 341 secondly, as He taught them for the use of ordinary people. Most unbelievers will admit that the portraiture of Jesus Christ, as it is exhibited in the Gospels, is one of the most spotless moral beauty, and the greatest elevation. 342 I am quite aware that a few exceptions have been made to it; but some of them are obviously founded on misapprehension, and others are evidently incorrect. 343 At any rate it cannot be denied that the entire moral aspect of the person of Christ is unique in human literature. No less remarkable is His moral teaching for the use of ordinary people. 344 It is pure, elevated, beneficent, grand. It bears the unquestionable marks of having been the elaboration of a single mind. The parts are adapted to each other and to the whole.

345 But our Lord's moral character, and His moral teaching as they are exhibited in the Gospels, consist of a number of detached portions, which together make up a complicated whole. 346 Their solution involves such a multiplicity of questions, as to render it difficult to count them. They are questions which the profoundest thinkers have solved in the most varied manner. Yet in the Gospels the mode of their solution is a complete unity. They coalesce with an inimitable beauty. 347 Let unbelievers cavil as they may, an overwhelming majority of

the holiest and the best of people have bowed before the character of the Jesus of the Evangelists in humble adoration, and felt that it was immeasurably above them. 348 Numbers of these subjects were inquired into by ancient philosophers with the keenest interest, but they found no adequate solution. 349 My opponents assert that this great character, around which the entire morality of Christianity centres, is not an historical one. How did it then originate? 350 The answer is, that it is founded on the traditional reminiscences of the teaching of a Jewish peasant who died in early humanhood; 351 and that the numerous parts of which the character and His teaching consist were unconsciously elaborated in the course of many years by a multitude of credulous, enthusiastic mythologists.

352 I must now advance to another stage of my argument. As my opponents assert that the development of the Gospels, and of the portraiture of the Christ which they contain, were entirely due to natural causes, 353 it is evident that they must have been effected in conformity with the laws which regulate the developments of the human mind. Let us test this principle.

354 Taking the atmosphere of Jewish thought and feeling as it existed in the year 30 as the starting-point, 355 it is evident to every one at all acquainted with the subject, that the interval which separates its conceptions from those of the Gospels is far greater than that which separates any two types of human thought. 356 To take a single example. The interval between the free spirit of morality as it is exhibited in the New Testament, and the casuistic and ritualistic tendencies of moral thought which ultimately developed themselves into Rabbinism, is profound. 357 If, therefore, Christianity grew out of Judaism by a succession of natural causes, the interval between them must have been bridged over by a succession of developments. 358 So, again, with respect to Messianic conceptions. A profound interval separates that of Christ from that of Barchocebas, to which Jewish Messianism was then tending. 359 That of

Barchocebas was a natural growth out of the popular Messianic conceptions of the year 30, and separated from them by no great interval. But their development occupied no less than a century. 360 But if the Jesus of the Evangelists grew out of the popular idea of the year 30, it is evident that the succession of developments must have been very numerous, and have required long intervals of time, before it was possible to create the portraiture of Christ.

361 Let me take another example, which those against whom I am reasoning cannot refuse to accept. 362 The interval which separates the state of religious and moral thought involved in the primitive Mosaic institutions from that of the year 30 is considerable, though far less than that which separates the latter from that contained in the Gospels. 363 In adducing this example, I use one most favourable to my opponents. Christians maintain that this development was accelerated by supernatural causes. 364 The proper subject of comparison would have been one which both sides are agreed to have been effected by causes purely natural. 365 I need not however fear making the concession, for it will more than bear the weight of my argument. We will suppose that the entire history of Judaism, as those with whom I am reasoning say, contained in it nothing supernatural. 366 I ask you therefore to observe that the development in question was completed only after an interval of more than a thousand years from its commencement. 367 Yet we are invited to believe that the Christianity of the Synoptics, and of the larger portion of the Epistles, was evolved in a period of seventy years, and the Christian Church erected on them, as its foundation, and that of the fourth Gospel in 130 years.

368 Let us take another mode of measurement of my opponents' own choosing. The Synoptic Gospels, as they say, are separated from that of St. John by an interval of sixty years. 369 Is it possible to bridge over the interval which separates the Synoptics from the Jewish atmosphere of thought and feeling of the year 30, in seventy

years, if it required sixty years to effect the development in question?

370 Against one convenient assumption I must present a most respectful protest. Whenever it suits their purpose, the human Jesus is represented as a very great man, who towered high above the ordinary conditions of humanity. 371 Again, when it is convenient He is represented to have been a very little man, the prey of all the superstitions of His age. 372 I am prepared to reason on either side of this alternative, but not on both. 373 These Schools postulate greatness whenever they want to make a prodigious leap in religion and morality; littleness when they want to account for the miraculous element in Christianity. 374 But while I am ready to assume as the basis of the argument that the human Jesus was a great man, let it be understood that He could have been great only in the sense in which all other great people have been great. 375 Those who deny the possibility of physical miracles must not, when it suits their purpose, assume the existence of moral ones. 376 His greatness must have been limited by the conditions imposed on it by the environment of a Jew of the year 30 who was born a peasant, and perished at thirty-five years of age.

377 Observe again, the miracles of the Gospels have to be invented somehow. I am ready to concede that miraculous stories of a certain type have been invented in rich abundance. 378 But the whole class of fictitious miracles invented in credulous ages are stamped with a peculiar trait from which those of the Gospels are free. 379 The one are monstrous, undignified, and grotesque. The others are sober, dignified, and I think that my opponents will allow, if miracles are possible, worthy of God. 380 The preservation of the apocryphal Gospels enables us to know what sort of miracles the mythic spirit commencing with the next century attributed to Jesus Christ. I have examined the subject elsewhere. The following passage sums up the result:--

381 "The case stands thus: our Gospels present us with the picture of a glorious Christ; the mythic Gospels with that of a

contemptible one. 382 Our Gospels have invested Him with the highest conceivable form of moral greatness; the mythic ones have not ascribed to Him one action which is elevated. 383 In our Gospels He exhibits a superhuman wisdom; in the mythic ones a nearly equal superhuman absurdity. 384 In our Gospels He is arrayed in all the beauty of holiness; in the mythic ones, this aspect is entirely wanting. 385 In our Gospels, not one stain of selfishness defiles His character; in the mythic ones, the Lord Jesus is both pettish and malicious. 386 Our Gospels exhibit to us a sublime morality; not a ray of it shines in those of the mythologists. The miracles of the one and the other are contrasted in every point. 387 A similar opposition of character runs through the whole current of thought, feeling, morality, and religion."

388 I ask my opponents to account for this difference, and specially to say why in the second century the mythic spirit began to create a ridiculous Christ, and in the first it produced a glorious one; 389 and through how many stages of development the creation passed until it culminated in what we read in the Gospels, and the interval of time to be assigned to each.

390 But according to the theories I am combating, the Messianic aspects of the character of the Jesus of the Evangelists must have passed through a succession of developments before they could have attained their present form. 391 Different parties had to invent different aspects of it. Next, these had to procure acceptance in the various Churches. Each party would cling to its own views. The formation of hostile sects in the Church was a certain consequence. 392 If they gradually wore themselves out, all experience of sectarian warfare proves that the interval must have been long. 393 We know as fact that nothing is more difficult than to effect compromises between contending religious factions; and that they are only, if at all, possible after long and bitter experience. 394 I ask you to compute for yourselves how many developments and compromises must have been

required, and the interval of time each must have occupied?

395 Far more difficult and more numerous must have been the developments by which the moral aspects of the Gospels and of their divine Christ must have been elaborated out of the Judaism of the year 30, and the popular conceptions of its Messiah. 396 I shall select for illustration only two examples out of a vast multitude. One of the most marked distinctions between Gospel and ancient moral teaching is this: 397 the whole aspect of ancient moral teaching assigned the highest place to the heroic and political virtues, and a subordinate one to the mild, meek, benevolent, and humbler ones. 398 This is precisely reversed in the morality of the New Testament. 399 Again: the aspect of a Jewish saint and hero, as it is depicted in the Old Testament, forms a singular contrast to that which the New Testament has assigned to Jesus Christ. 400 I have proved that moral developments in the direction of improvement are very slow. I propose, therefore, the following problem for my opponents to solve. 401 Through how many stages must these have passed before the creation of the Gospels became a possibility, and how many years must they have occupied?

402 But all the while that the Christian Church was creating a mythology, and struggling with developments and contentions and external opposition, it is an historical fact that it succeeded in extending itself over a wide geographical area. 403 This greatly aggravates the difficulty of developing an improved Christ out of her pregnant womb. 404 The wider the geographical area over which she gradually extended herself, the more difficult would have become the interchange of ideas necessary for developments and compromises. 405 It by no means follows that one little society would immediately swallow the mythic creation of another.

406 I must observe that this portion of the argument is cumulative, and admits of being pressed to an indefinite extent. 407 It now remains for those against whose theories I have been reasoning to count the number of these

developments, and to assign a reasonable interval for each. 408 If they will do so, they will then find that these theories are hopelessly untenable. I have hitherto argued, on the chosen position of my opponents, that the Synoptic Gospels were written about the year 100, and the fourth about 160. 409 Such dates are entirely fallacious, and against all evidence. But as far as my reasoning is concerned, it matters little when the Gospels were composed. 410 If I can prove that the portraiture of Christ and the general aspect of the Gospels were familiarly known in the Church at a much earlier period, it is not the smallest difference for my argument whether they existed in an oral or a written form. 411 The concession of seventy years for the creation of the Synoptic Gospels, and one hundred and thirty for that of St. John, has now to be entirely revoked.

412 The most extreme of the School that I am opposing concede that the four most important epistles of St. Paul are unquestionably genuine, and written by him within less than thirty years after the resurrection. 413 The genuineness of at least four others is conceded by the most eminent unbelievers. We have, then, before us genuine historical documents of Christianity, 414 composed by its most active missionary at about the same distance of time from the resurrection as that which separates us from the repeal of the Corn Law Act.

415 Now by the aid of these epistles it is possible to prove by a multitude of incidental allusions that all the great features of the portraiture of Jesus Christ were fully developed when St. Paul wrote them. 416 Nay, what is more, the manner in which the allusions are made prove that this portraiture was not a new one, but that it had been long known in the Christian Society. 417 To exhibit this proof would require a lecture of equal length to the present. As I have given it already elsewhere, and it has not been assailed, I shall assume that my position is incontestable.

418 The period of time during which the human Jesus must have been developed into the divine

Christ of the Gospels, if the portraiture be a fictitious creation, must be reduced to one of less than ten years. 419 But whether it be ten, seventy, or one hundred and thirty, it contradicts the laws by which all human developments are regulated. Its creation involves a moral miracle of the most stupendous character. 420 My opponents postulate a number of conditions which history and philosophy refuse to concede. They require a long interval of time; history will only grant them a short one. 421 They require that developments should be rapid; they are always slow, especially moral ones. 422 They require the creation of elevated moral sentiment; their only instruments with which to work are credulous mythologists. 423 They require that developments should be always progressive towards higher perfection; history declares that they are frequently retrograde ones. 424 They postulate party spirit, but it produces endless division. 425 They require compromises, but they must be made by credulous enthusiasts. 426 They require unity of result; they postulate a multitude of agents. 427 They ask for credulity, and are confronted by sobriety. 428 They ask for seventy years; historical fact will concede them less than ten. 429 They deny physical miracles, and ask us to believe in moral ones.

430 Such is the position of the school of thought against whom I have been reasoning. They are called by a sad misnomer rationalistic. I ask, are these theories rational, probable, or possible? 431 Defenders of revelation have no grounds for dreading an appeal to reason. 432 If the Gospels, and the glorious Christ therein delineated, have been evolved in accordance with the various theories against which I have been contending, it involves a greater miracle than all the miracles of the New Testament united together.

EXPLANATORY PAPER
The Right Rev. The Lord Bishop
of Gloucester and Bristol

9 Having been requested by the Committee of the Christian

Evidence Society to draw up a short paper which might serve as a partial introduction to the Lectures, 2 and especially might set forth their general plan and connexion, as originally designed by the Committee, I have much pleasure in submitting the following brief comments to the many readers of this valuable series. 3 The Lectures were delivered in the course of the spring in the present year, to large audiences, in St. George's Hall, Langham Place, and were specially designed to meet some of the current forms of unbelief among the educated classes.

4 They were delivered at the request of the Christian Evidence Society, and represent a portion of the work undertaken by the Committee of that Society in the present year. 5 As they thus stand in such close connection with our Society, it may not be unsuitable for me to make a few explanatory remarks on the Society itself, and its general objects, 6 as well as on the plan of the lectures which have been delivered at its request, and which are now presented to the reader in a collected and continuous form.

7 First, then, as to the Society, and its present working and design.

I. The Society was established in the spring of the past year. It had long been felt by earnest and thoughtful persons, both Churchmen and Nonconformists, 8 that some combined attempt ought to be made to meet in fair argument the scepticism and unbelief which for the last few years have been distinctly traceable in all classes of society. 9 Into all the causes of this state of things it is not now our object to inquire. These are, probably, many and various, and may defy any formal classification. 10 It is, indeed, seldom that those who live in the stream and current of a quickly moving generation can properly estimate the variously combined movements around them, or can always very successfully refer them even to their more proximate causes. 11 We may, however, very profitably, as thus illustrating the general design of the lectures, pause to advert to two or three of what would seem to be leading causes

of this present prevalence of doubt and scepticism.

12 We may, in the first place then, venture to express the opinion that it does seem to stand in some degree of connection with the historical criticism, 13 or, to speak more exactly, with the philosophical mode of treating ancient history, which, especially since the time of Niebuhr, has so honourably marked the present and the latter half of the preceding generation. 14 It was obviously impossible that a system which appeared to yield results judged to be eminently satisfactory and trustworthy in regard of the general history of the past, should not be applied to sacred history, and to the various documents which together make up the Holy Bible. 15 And it 'has' been applied, sometimes cautiously and reverently, and with a due regard for the religious convictions of Christian readers, 16 but sometimes also with an eagerness and persistence which may not unfairly be characterised as both inconsiderate and unjustifiable. 17 This method of criticism, especially in its more unfavourable manifestations, may certainly be specified as one of the earlier causes of that suspended belief in the historical truth of several portions of the Old and New Testament, which many entertain at the present time, and make no scruple of avowing and justifying.

18 We may also as certainly specify as a second cause the tendency to over-hasty generalisation that has of late marked the rapid development of some of the natural sciences. 19 From true science true religion has nothing to fear. 20 But it is otherwise when results newly obtained, and at present, from the very circumstances of the case, imperfectly tested and verified, are confidently put forward; 21 and when inferences of perhaps doubtful validity are set, if not in actual opposition to the statements of Revelation, yet in such a studious juxtaposition, that comparison is challenged, and by consequence many an early conviction weakened and impaired. 22 We say by consequence,-- for no acute observer of the heart and its mysteries can have failed to mark

how, even in minds of higher strain there is often a secret sympathy with the attacking party, 23 not so much on the merits of the case, as from the simple fact that it 'is' the attacking party; and that while on this side there is only the passivity of prescription, on the other there is all the vigour of assault and progress. 24 This obvious fact, which,-- like some other mental facts of a similar nature,-- is, we fear, proved by almost daily experience, has not been sufficiently taken into consideration; but if estimated properly, it will account for much that is otherwise perplexing. 25 It will even tend to reassure us, as it will enable us to assign to its true though hidden reason much of the present startling readiness with which scientific inferences, supposed generally to be unfavourable to received views, have received at least some measure of sympathy and approval. 26 It may be, too, that this latent feeling of sympathy with the attack will be neutralised when it is found that the defence is not deficient in energy or vigour, 27 and when English fair play seems to suggest that each side should be allowed to fight it out without having any advantages arising from prepensions or prejudice. 28 However this may be, there is no doubt that the cause we have specified is a real and a prevailing one. Over-hasty scientific generalisation is certainly one of the causes of the present state of modern religious belief.

29 One more cause we may also pause to specify, as it involves in it much that will minister comfort and reassurance. This cause is the eager and often impatient search for solid ground whereon religion and morality may be based. 30 With all their faults, humans are now certainly seeking for truth. There may be misapplications of historical criticism, there may be misuses and misapprehensions of the real testimony of science, but amid all there is clearly a searching for truth and firm ground. 31 The processes of destructive criticism are in fact nearly over, and the difficult process of reconstruction is commencing.

32 The due remembrance of this will help us in estimating a little more calmly, and perhaps also a little more fairly, some of the startling phenomena presented by the present state of religious belief. 33 Let us, for example, take for a moment into consideration two remarkable characteristics of the present time,-- first, the attempts to form a system of morality independent of revealed religion; 34 and, secondly, the acceptance on the part of several earnest and truthful minds of such a system as Positivism. 35 These really would seem to be at first sight two inexplicable phenomena. Both, however, are to be accounted for by that searching for something to rest on, which has just been mentioned. 36 It has been assumed in the one case, far too hastily, that the uncertainties connected with the belief in the facts of revealed religion are so great, that no system of morality could be considered securely founded if it rested only on the Scriptures. 37 It has been felt by many earnest thinkers that any such system, to be a true one, ought to rest solely on principles acknowledged to be of universal application, and on maxims that have received the assent of all the better part of civilised humankind. 38 If the teaching of Scripture be in general harmony with such maxims and principles, its concurrence is not to be slighted; 39 but it is not deemed as of more real moment than the concurrence of any other form of religious teaching that has exercised a real influence over any large portion of the human family. 40 Religion generally is accepted as a buttress to the rising edifice of morality, but as nothing further. 41 The tower is being builded really with the desire to reach heaven: if the sequel be what it was of old, it may still be conceded, with all fairness, 42 that the attempt is not made in a bad spirit To change slightly the allusion, the effort is not made in the spirit of the Titans who piled Pelion on Ossa, but with all the earnestness and anxiety of hoping, enquiring, and searching, though we are bound to add, mistaken people.

43 In the other case, though it may seem to many rash to say one word to mitigate the severity of the judgment that both is and ever will

be passed on such a system as Positivism, yet, even here, let us be just and sympathising. 44 There is, no doubt, in Positivism much that is plainly repulsive, and really calls for severity; still, even in this system, we may trace the prevailing desire to find something solid, something which appears to be proof to the changes of opinion or the fluctuation of creeds. 45 So the attempt is made to secure a scientific basis, and to place thereon fact after fact, when each has become verified and established, and so to build onward-- 46 we cannot honestly say upward-- until something like a system is so far constructed that succeeding generations may feel induced to continue it. 47 So even in this sombre and cheerless system there is, we believe, really at work a desire to touch ground. To that desire, however, it must be sorrowfully added, every loftier aspiration, every nobler incentive, is necessarily sacrificed. 48 Science and scientific truth is used in a way that warrants the apprehension that-- if such is to be the use made of it-- the progress of science may tend, first, to impair, and, next, to obliterate, the sense of 'responsibility' on which the present and the future alike so solemnly rest. 49 It is not without reason, then, that this is dwelt gravely upon by all sober thinkers; nor is it too much to say that this is now one of the gravest considerations connected with the advance of modern scientific investigations. 50 The tendencies of such investigations certainly do 'appear' to hinder the due recognition of these two momentous principles-- first, the sense of responsibility; and, secondly, the sense of dependence on something higher than law, order, and evolution. 51 This hindrance, we trust, is only in appearance; still that appearance is accepted by many as reality, 52 and it is not without reason that we are again and again reminded that the acceptance of the truth of the Christian creed will with many depend on its power of assimilating the doctrine of universal causation, 53 or, to speak more precisely, of demonstrating that that doctrine is itself only a form of a yet higher and holier truth.

54 We turn, however, back again to the design and working of the Society. It was established to meet this growing scepticism, and with a due recognition of the causes which have just been specified. 55 It was not started, as has been sometimes said, with a little irony, for the purpose of restoring a belief in Christianity, but for the purpose of meeting argument with argument, 56 and of supplying the many that are now fluctuating between belief and no belief with sober answers and valid arguments drawn forth anew from the great treasury of Christian evidences. 57 This is the true design and object of the Society. Its mode of carrying out this design has hitherto been threefold-- first, by means of lectures addressed to the educated; 58 secondly, by the formation of classes under competent class-leaders, for the instruction of those in lower grades of society 59 who are exposed to the thickening dangers arising from that organised diffusion of infidel principles which is one of the saddest and most monitory signs of the present time. 60 Thirdly, the Society is endeavouring to stimulate private study by the circulation of useful tracts, 61 and by the offer of prizes to such as may be willing that their private study should be tested by competitive examination.

62 All these three modes of carrying out its work have been adopted during the present year; 63 and, so far as can be inferred from the work that has been done, and from the various expressions of public opinion, with considerable success. 64 Popular attention has naturally been directed more especially to the first of the modes specified-- the lectures to the educated; 65 but it is satisfactory to state, ere we pass at once to our explanatory comments on the plan of these lectures, that the formation of classes has answered even beyond expectation, 66 and that, from the amount of the competition for the prizes that have been offered, examination in Christian evidences will form a large and most interesting portion of the future work of the Society.

67 II. We may now turn our attention to the lectures that are included in the present volume-- our first year's work. The number

of the lectures was twelve. 68 One of these, the lecture on the *Internal Evidence of the Authenticity of St. John's Gospel,* is unfortunately not included in the present volume, owing to the desire expressed by the learned writer that it should not be published. 69 The absence is much to be regretted; first, on account of the value and importance of the lecture; and, secondly, on account of the partial break which has thus been caused in the sequence of the lectures.

70 The lectures were not delivered in the order in which they are here presented to the reader. The convenience of the active as well as distinguished men who consented to act as lecturers, had naturally to be consulted; 71 adjustments had to be made, and interchanges of days of lecturing acceded to, so as to secure the continuous delivery of the lectures on the days specified. 72 In this collective edition, however, the proper order is restored, and may now be briefly explained, as some criticisms have been passed on the subjects of the lectures, which would certainly have been modified if the whole series had been delivered in the order originally designed.

73 The first three lectures were designed to be preparatory and prelusive. They were directed against the three systems which are now more especially, in different ways, coming into collision with Christianity--Materialism and its theories, Pantheism, and Positivism. 74 It was judged by those who sketched out the plan of the lectures, that until these subjects were shortly dealt with, and until the objections against Christianity, founded upon them or derived from them, were briefly noticed, the evidences for Christianity could hardly be expected to have a fair hearing. 75 The internal arguments in favour of the leading truths of the Christian religion could scarcely be fairly estimated if there were to be antecedent objections of a grave and general character left wholly unnoticed and unanswered. 76 Hence the three opening lectures: The first of these breaks ground by the consideration of some leading materialistic opinions, and especially by an exposition of the argument from design. 77 It thus

prepares the reader more fully to accept the deep truth so well and succinctly stated by Bishop Martensen, 78 that the "world has not merely a cosmogonic but also a creational origin," and that the mysterious problem of creation and life can "never be solved in a merely natural way, but demands a supernatural solution, that is, a solution through a 'creative teleology'."

79 The second lecture very suitably follows by a clear exposition of that great system which has of late been found to exercise such a fascination over thoughtful and cultivated minds that it becomes, to far more than we may suppose, the conclusion of all controversy.

80 We allude to the system of Pantheism, into which of late many noble spirits have seemed willing to merge all their hopes and all their fears. 81 Swayed to and fro, unable to accept Law for their God, and yet equally held back from the blessed truth that the God of the universe is a PERSON, 82 thousands fall back upon the subtle and fascinating system which supplies a moving Principle, but withholds the blessed idea of a holy Will; 83 which discloses to them a 'natura naturans', but denies the existence of a loving Creator and a personal God. 84 It was thus very properly provided that the lecture on this subject should follow the lecture on Design in Nature, 85 as exhibiting the true characteristics of that modified Atheism which only too often becomes the refuge of people whose minds have been shaken by the inferences of pure materialism, 86 or who may have been drawn towards the disguised forms of it which lurk in many of our popular treatises on the origin and evolution of Human.

87 After a careful study of these two lectures, the thoughtful reader will be enabled to recognise the true nature and force of the argument from design, 88 and so will be led the better to appreciate the enduring validity of that great 'natural' foundation for our belief in a personal God. 89 Of the four great arguments by which human is permitted to rise to the knowledge of God, the argument from design, or, as it is technically called, the teleological argument, is the most important, as it, in fact,

includes the moral argument, which, properly estimated, is only its subjective aspect. 90 Apart from revelation we rise to the knowledge of God in two ways, by the consideration of ourselves, and by the contemplation of the world around us; 91 what the moral argument is in the former method, that the teleological argument is in the latter. 92 Hence the importance to the general reader of having an argument of such validity clearly set before you on different sides, and from different points of view.

93 The third lecture, on Positivism, completes the first group, and forms, as it were, a kind of useful appendix to the other two. 94 Here we have the investigation of a special system,-- a system that professes to be based on positive and observed phenomena, 95 and claims to extricate the mental study of human from metaphysics and abstractions, and to place it in the realm of the realisable and the positive. 96 Such a system, though neither now prevailing to any extent, nor ever likely to become prevalent or popular, is still worthy of attention, 97 as it stands in close connection with current materialistic conceptions, and suggests some instructive contrasts to Pantheism. 98 In the latter system we have, at any rate, some idea of pervading Deity; but in Positivism, if we understand the system aright, God, and all conceptions of God, are not so much denied as simply and entirely ignored. 99 If Pantheism be deemed fascinating, Positivism will appear to most minds utterly repellent: 100 still it is a system that claims some distinguished people among its professed exponents, and perhaps a larger number than we may suppose of conscious or unconscious adherents. 101 It may therefore well claim from us investigation, and, in the position it occupies in the order of these lectures, may fairly be considered to be in its right place.

102 We have dwelt upon the first group of the lectures, as both the position and the importance of the subjects considered in it have seemed to require a fuller notice. 103 On the remaining groups we may speak more briefly, as their connection and the special subjects on which they treat are much more

self-explanatory. 104 The first three lectures having, as it were, cleared the ground, and having demonstrated, as we believe, successfully the untenable nature of the systems that have been placed in competition with Christianity, 105 the two next lectures, which form the second group, deal with the chief difficulties arising from the supposed conflict between science and the Holy Scriptures. 106 The first of these two lectures, that on Science and Revelation, enters into the subject generally, by showing how, on scientific considerations, a revelation was to be expected, 107 and how, consequently, the evidences of Christianity have a strong claim upon the attention of every right-thinking human. 108 The second of these two lectures is confined to a special but prerogative case, in which science and religion are supposed to be more particularly in opposition to each other,-- viz., the case of miracles. 109 Here it is necessary, not only to investigate generally the nature of the miraculous evidence to Christianity, but fairly to face the antecedent question, whether miracles, however defined, are not in themselves impossible.

110 In facing that question, however, attention is rightly called to the nature of the weapons that are used in the conflict, and especially to the fact, so often overlooked, 111 that all the assaults on the miraculous that can in any degree be deemed worthy of consideration, are carried on only with metaphysical weapons. 112 The whole question really turns upon the belief in a personal God: if it be conceded that this belief is just and reasonable, then, as the writer of the lecture rightly observes, the presumed impossibility in reference to miracles at once melts away. 113 The very idea of a free-creating God carries with it the possibility of new manifestations of the Divine will, whether in history or Nature. 114 The sustaining power of God, which we recognise in the form of law and orderly progress, changes whensoever it shall have seemed good to His holy will for it to pass into the creative; 115 His immanent workings are then seen in the realm of the transcendental,

and the result is that which Pantheism, Naturalism, and all similar systems must, if consistent, regard as impossible, 116 a new movement from the Divine centre, an epiphany of a creative and overruling will, a wonder, a miracle. 117 When Spinoza said that God and Nature are one from eternity to eternity, he was quite consistent in adding that there is no transcendental beginning, and that miracles are impossible; 118 but for any one who believes in a personal God, or who believes Nature to be what it is,-- not a system eternally fixed, but a system passing through a development characterised by design,-- 119 to deny the possibility of miraculous interpositions, reason and consistency must certainly, in this particular, be suspended or sacrificed.

120 The third group of lectures, which may be regarded as subdivided into two portions, naturally connects itself with, and follows, the subjects just specified. 121 After the general consideration of difficulties connected with religion and Christianity, the attention of the reader is now directed to the more special difficulties connected with the Holy Scriptures. 122 In the first portion of the group the subject of the Gradual Development of Revelation, or, as the title was re-defined by the lecturer, the Gradual Nature of Divine Revelation, properly occupies the first place. 123 It is followed by a lecture in which there will be found a careful consideration of some special instances of difficulty connected with the historical portions especially of the Old Testament. 124 These two lectures were to have been followed by a consideration of the moral difficulties that have been felt in reference to some parts of the Old Testament; 125 but for this subject, which, if properly treated, would have probably claimed a large share of attention, the Committee were not able to secure the services of a lecturer for the present year. 126 This is to be regretted, as there is no subject connected with the Holy Scriptures which at the present time more requires a candid and sober consideration; 127 no

discussion which, if fairly conducted, would do more to remove many honestly felt difficulties, and to many minds to bring probably lasting reassurance. 128 Without presuming to enter, however slightly, into such a subject in a discursive paper like the present, we will venture to make this general remark, which perhaps may be found helpful, viz., 129 that in dealing with all such difficulties we must carefully distinguish between those connected with Divine workings, and those connected with human actions. 130 The former are, in their real nature, utterly beyond the finite judgment of human. All that we may presume to consider is the way or manner in which they are brought before us by the writer, 131 and all that we can either safely or wisely subject to criticism are the aspects or colouring under which they are presented. 132 We really are not competent to sketch out theories of Divine government, even in the simplest matters, and with all the advantages of contemporaneous knowledge; 133 nay, in the lives of ourselves and those around us, there are, as has been wisely observed, innumerable events of sorrow, and countless circumstances of suffering, 134 of which the economic purpose cannot even be guessed at in our present state of knowledge, and of the exact purposes of which no sober or reverent thinker ever dreams of attempting to form any estimate whatever. 135 It is thus utterly out of the question to attempt to consider the difficulties connected with the Divine workings, 136 except as to the manner of their representation by the human narrator, whose human powers were the instruments by which God was pleased to communicate the outward facts of those workings to the children of humans. 137 In regard of the Divine workings themselves, especially when they come before us in the general forms of judgments on individuals or nations, 138 all we may presume safely to do is to regard them as manifestations of Divine righteousness in judicial relations or contradistinctions to the sins or transgressions of humans. 139 In reference, however, to the moral

difficulties connected with recorded human actions, we may venture to go farther, and to take into consideration the fact already referred to of the gradual nature of God's revelation, and all the modifying thoughts which such a fact brings with it.

140 It is thus not only right, but necessary, to accept as our guide in all such investigations or discussions this sober spiritual principle,-- 141 that the Old Testament must be interpreted from the stand-point of the New Testament, and under the fuller light which is afforded by the later dispensation. 142 If we cling to these two great truths-- first, that the history of the past, as we find it in the Old Testament, ever involves a reference to final purposes; 143 and, secondly, that every attempt to realise the deeper significance of that history must use Christianity as its basis-- 144 we shall probably find our way in this difficult domain of speculation as far and as safely as the finite powers of human can be deemed capable of advancing; 145 we shall see as clearly as we can be permitted to see, when poor human reason is endeavouring to survey the adorable mysteries that surround the recorded workings of the manifold wisdom of God.

146 The second portion of this third group is more especially devoted to difficulties connected with the New Testament, the first place being naturally reserved for the questions relating to the life of our Lord and the Gospel narrative. 147 The first lecture is thus directed to a consideration of the Mythical Theories of Christianity; the second to the Evidential Value of St. Paul's Epistles. 148 As has already been mentioned, the lecture on St. John's Gospel, which would have occupied a position between the two just specified, owing to the request of the writer, has not been published, and the series in this part of it has in consequence suffered.

149 The two remaining lectures, viz., that on *Christ's Teaching and Influence on the World*, and that which follows it, on the *Completeness and Adequacy of the Evidences of Christianity*, form the last group, and worthily conclude the interesting series. 150 A third lecture on the additional strength

which is brought to the evidences of Christianity by the convergence of various lines of independent testimony, was intended to have been added to this group, 151 but for this important and comprehensive subject, as in the case of another subject recently mentioned, the Committee were not able to procure a lecturer.

152 The series, as above described, is now commended to the thoughtful reader. It will be found to be marked throughout with learning, candour, and we believe also with gentleness and sympathy. 153 On this last characteristic we ourselves lay great stress. If we would reclaim the wandering, or confirm the wavering, it is not by hard words and unkindly imputations, 154 but by the expression of that love and gentleness which an apostle reminds us are numbered among the fruits of the Spirit. 155 We must regard ourselves as far as possible in their places, endeavour to see as they see, and feel as they feel, and then it may be permitted to us to return from our charitable quest, bringing back the friendly wanderers with us, 156 and ourselves sharing some portion of that holy joy which is felt in heaven and in earth when the doubter is led back to belief, and the lost is found. 157 This rightful characteristic of all true Christian controversy is not, we believe, anywhere wanting in this volume, 158 and we thus, with fullest confidence, commend it to the consideration of all who love the truth, and humbly seek it in history, science, and theology.

159 Lastly, we may call attention to the encouraging fact, that in this great work good people have agreed to forget minor differences. 160 Among the distinguished people whose independent lectures are now, for convenience, gathered together in a common volume, are members of the Church of England and members of other religious communities. 161 It is long that this co-operation has existed in the circulation of the Holy Scriptures; 162 it is recently that it has again appeared in the effort to present those Scriptures in their most accurate form to the English reader; 163 it is now again happily exemplified in the present attempt

to defend and maintain the truth as it is in Jesus Christ our Lord.

164 These things are of good augury. Though there may be dissensions, sad and pitiful, within the Church, and assaults made upon it from without, often sadly characterised with the marks of political strife, 165 yet we may thank God that in efforts such as the present, and in the calm and serenity of studies such as those which this volume commends, a true union has been felt and acted on. 166 Yes, it is a cause for thankfullness and rejoicing that the love of Christ is more and more binding us together in companionships of high duty and gentle sympathy, 167 and that reverence for His Holy Word, His Word of Life and Truth, is making us feel that our work is a common one, 168 and that as we have in common freely received, so it is a blessed thing in common freely to give.

169 We may humbly pray then that God's gracious favour may rest on this Course of Lectures, and may be permitted to bear a blessing to those that read it. 170 May they feel anew convinced in heart and spirit that we have not "followed cunningly devised fables," but that in the Holy Scriptures of the Old and New Testament there is light and truth, 171 even because they bring us nearer to Him who is the Truth, as He is the Way and the Life, for evermore.

The Book of Divine Panagogue called

SUBSTITUTE

POPULAR IMPEACHMENTS
OF CHRISTIANITY
Pearson McAdam Muir

1 That there is at present a widespread alienation from the Christian Faith can hardly be denied. 2 Sometimes by violent invective, sometimes by quiet assumption, the conclusion is conveyed that Christianity is obsolete. 3 Whatever benefits it may have conferred in rude, unenlightened ages, it is now outgrown, it is not in keeping with the science and discovery of modern times. 4 'The good Lord Jesus has had His day, is murmured in pitying condescension towards those who still suffer themselves to be deceived by the antiquated superstition. 5 The statements in which our forefathers embodied the relations between God and human are no longer, except by a very few, considered adequate; and there is everywhere a demand that those statements should be recast. 6 Is not all this an irresistible proof that the beliefs of the Church have been abandoned, that the old notions of the Divine care, the spiritual world, the everlasting life, cannot be maintained, must be relegated to the realm of imagination? 7 The blessings with which Christianity is commonly credited spring from other sources: the evils with which society is infected are its result, direct or indirect.

8 I. Such accusations, it may occur to us, cannot be made seriously: they bear their refutation in the very making; they cannot be propounded with any expectation of being accepted. 9 This may seem self-evident to us: it is not self-evident to multitudes of eager, earnest people. 10 The accusations are persistently made by vigorous writers and impassioned speakers, and are received as incontrovertible propositions. 11 However astonishing, however painful, it may be for us to hear, it is well that we should know, what, in largely circulated books and periodicals, and in mass meetings of the people, is said about the Faith which we profess, and about us who profess it.

SUBSTITUTE

12 Listen to some of the terms in which Christianity is impeached. 'I undertake,' says Mr. Winwood Reade, 'I undertake to show that the destruction of Christianity is essential to the interests of civilisation; 13 and also that human will never attain your full powers as a moral being, until you have ceased to believe in a personal God, and in the immortality of the soul.

14 Christianity must be destroyed.' 'The hostile evidence,' says Mr. Philip Vivian, 'appears to be overwhelming.

15 Christianity cannot be true. Provided that we see things as they really are, and not as we wish them to be, we cannot but come to this conclusion. We cannot get away from facts.

16 Modern knowledge forces us to admit that the Christian Faith cannot be true.' 17 'I want,' exclaims Mr. Vivian Carey, who has apparently, like Lord Herbert of Cherbury, received a revelation to prove that no revelation has been given, 18 'I want to destroy the fetish of centuries and to instill in its place a life of duty, and of faith in God and human, and I believe there is a power that has impelled me to attempt this task.… 19 A system that has produced such results must be essentially bad.... 20 It will not be difficult to create a faith and a religion that will serve the needs of humanity, where Christianity has so deplorably failed.'

21 'If Christianity,' argues Mr. Charles Watts, 'were potent for good, that good would have been displayed ere now.... 22 The ties of domestic affection, the bonds of the social compact, the political relations of rulers and ruled, all have surrendered themselves to its influence. 23 Yet with all these advantages, it has proved unable to keep pace with a progressive civilisation.'

24 'In a really humane and civilised nation,' Mr. Robert Blatchford contends, 'there should be and need be no such thing as Ignorance, 25 Crime, Idleness, War, Slavery, Hate, Envy, Pride, Greed, Gluttony, Vice. But this is not a humane and civilised nation, and never will be while it accepts Christianity as its religion. 26 These are my reasons for opposing

SUBSTITUTE

Christianity.' 'Christianity,' he iterates and reiterates, 'is not true.'

27 'Onward, ye children of the new Faith!' exultantly cries Mr. Moncure D. Conway. 'The sun of Christendom hastes to its setting, but the hope never sets of those who know that the sunset here is a sunrise there!'

28 Such is the manner in which the downfall of Christianity is now proclaimed. And the impression is prevalent that, though in all ages Christianity has been the object of doubt and of scorn, 29 yet never has it been rejected with such intensity of hatred as now, never have keen criticism and deep earnestness, wide learning and shrewd mother-wit been so combined in the attack. 30 It is not merely the reckless, the dissolute, the frivolous who turn away from its reproofs, seeking excuses for their self-indulgence, 31 but it is the thoughtful, the austere, the high-principled, the reverent, the unselfish, who are engaged in a crusade against all that we, as Christians, hold dear. 32 'To the old spirit of mockery, coarse or refined, to the old wrangle of argument, also coarse or refined, has succeeded the spirit of grave, measured, determined negation.' 33 People whose integrity and elevation of character are beyond suspicion, take their places among the rebels against the authority of Christ. 34 They are fighting, they assert, not for the removal of a check to their vices, but for the introduction of a nobler ideal. 35 In the demolition of Christianity, in the sweeping away of every vestige of religious belief, religious custom, religious hope, they imagine themselves to be conferring inestimable benefits upon humankind. 36 Christianity, in their view, is the product of delusion and the buttress of all social ills.

37 II. The contrast which so many are drawing between the present and the past is not a little exaggerated. 38 There have been few periods in which Christianity has not been the object of animadversion and attack, in which its speedy downfall has not been confidently predicted. 39 It was two hundred years ago that Dean Swift wrote 'An Argument to prove that the Abolishing of Christianity in England may, as

things now stand, be attended with some Inconveniences, and perhaps not produce those many good effects proposed thereby": 40 the Dean, with scathing sarcasm, ridiculing at once the conventional customs by which Christianity was misrepresented, and the supercilious ignorance which assumed that it was extinct. 41 It was about a quarter of a century later that Bishop Butler, in the advertisement to his '*Analogy of Religion to the Constitution and Course of Nature*', stated, 42 'It is come, I know not how, to be taken for granted by many persons that Christianity is not so much as a subject of inquiry, but that it is now, at length, discovered to be fictitious. 43 And accordingly they treat it as if, in the present age, this were an agreed point among all people of discernment; and nothing remained but to set it up as a principal subject of mirth and ridicule, as it were, by way of reprisals for its having so long interrupted the pleasures of the world.' 44 And the Bishop dryly gave as the aim of the 'Analogy': 'Thus much, at least, will be here found, not taken for granted but proved, 45 that any reasonable person who will thoroughly consider the matter, may be as much assured as you are of your own being, that it is not, however, so clear a case that there is nothing in it.' 46 The assumption that Christianity is a thing of the past can hardly be more prevalent now than it was then; and the groundlessness of the assumption then may lead to the conclusion that the assumption is equally groundless now.

47 Since the days of Butler or of Swift, the progress of Christianity has not ceased: its developments of thought and life have been among the most remarkable in its whole career. 48 The exultation over its decay in the twentieth century may possibly be found as premature and as vain as the exultation over its decay in the eighteenth century, or in any of the centuries which have gone before.

49 III. The most popular impeachments of Christianity are mainly these. It is a mass of false and superstitious beliefs long exploded. 50 It is the opponent of progress and inquiry, the discoveries of science having been

made in direct defiance of its teaching and its influence. 51 It is the champion of oppression and tyranny. It aims at keeping the poor in ignorance and destitution. It prostrates itself before the rich and seeks the patronage of the great. 52 It so insists on people being absorbed in the thought of heaven that it practically precludes them from doing any good on earth. 53 It is a system of selfishness, inculcating the dogma that no one need care for anything except the salvation of your own soul. 54 It is the foster-mother of all the evil and misery by which society is distressed. Dishonesty, cruelty, slavery, war, persecution, avarice, drunkenness, vice, would seem to be its natural fruits.

55 'How calm and sweet the
victories of life,'

shrieked Shelley in one of his early poems.

56 'How terrorless the triumph of the
grave ...
... but for thy aid
Religion! but for thee, prolific fiend,
Who peoplest earth with demons,
hell with humans,
And heaven with slaves!
hou taintest all thou look'st upon!'

57 What shall we say to these accusations? Christians have been credulous and superstitious, have argued and acted as if only in the abnormal and exceptional could the Divine Presence be found, as if God were a hard Taskmaster and capricious Tyrant. 58 They have resisted progress and inquiry, blindly refusing to see the light which was streaming upon them. 59 They have unquestionably been guilty of miserable pride towards inferiors in wealth or in station, and guilty of miserable sycophancy towards the rich and the powerful. 60 Christians have too frequently neglected the material well-being of the community, have suffered disgraceful outward conditions to remain without protest, have not striven to shed abroad happiness and brightness in squalid and wretched lives. 61 Christians have been art and part in fostering such conditions as wrung from compassionate and indignant hearts the 'Song of the Shirt' and the 'Cry of the Children'. 62 Christians have imagined that correctness of belief would make up for falseness of heart, and

SUBSTITUTE

loudness of profession for depravity of practice. 63 Christians have supposed that in religion all that has to be striven for is the salvation of one's own soul, have even represented the joy of the redeemed as heightened by a contemplation of the torments of the lost. 64 Christians must bear the responsibility of much of the abounding vice which they have not earnestly tried to combat where it already exists, and which, in various forms, they have introduced into regions where it was unknown before.

65 Lawlessness and degradation in the slums, fraud and dishonesty in trade, gross revelations in the fashionable world; bigotry, slander, scandals in the ecclesiastical world; plots, wars, treacheries, assassinations, in the political world: these things ought not so to be. 66 The fiercest denunciations, the most withering satires, which unbelievers have employed, do not exceed in intensity of condemnation the judgment which Christian preachers and Christian writers have pronounced.

67 In all ages of the Church the most powerful weapon against Christianity has been the example of Christians. 68 The Faith which they nominally hold has been judged by the lives which they actually lead. 69 'Christianity,' said a bishop of the eighteenth century, 'would perhaps be the last religion a wise person would choose, if you were guided by the lives of those who profess it.'

70 But is this to admit that the hope of the world lies in renouncing Christianity? That in confining ourselves to the seen and the temporal, we shall best elevate humankind? 71 That the prospect of annihilation and the absence of wisdom, love, and Providence in the order of the universe constitute the most glorious gospel which can be proclaimed? Nothing of the kind. 72 It is only proved that many Christians are not acting according to their belief, that their practice does not square with their profession. The belief and the profession are not proved to be wrong and bad.

73 It would be unreasonable to argue that, because a person who has been vehemently sounding the

praises of truthfulness is convicted of deliberate lying, therefore truthfulness is shown to be worthless.

74 It is equally unreasonable to identify Christianity with everything to which it is most definitely opposed, to represent it as the enemy of everything which it was intended to maintain, and then to conclude that Christianity is discredited. 75 As we should argue from the detection of a liar, not that lying is right, but that you should return to the ways of truth, 76 so we should argue from the lives of Christians who live in flagrant contradiction to the precepts of our Lord and His Apostles, not that the precepts should be rejected, but that they should be kept; 77 not that Christianity should be abolished, but that it should be obeyed.

78 Christians have created prejudice, hatred, against Christianity, but it is not Christianity which they have been exhibiting. 79 We repudiate the hideous travesty which they have made, the hideous travesty which is credulously or maliciously accepted by assailants as a correct representation. 80 Christianity is not a religion of darkness and superstition: it calls to its disciples 'Be children of light: prove all things: hold fast that which is good.' 81 Christianity does not sycophantishly court the rich and despise the poor: it tells the stories of the Rich Man and Lazarus, and of the Rich Fool, and it declares 'Ye cannot serve God and Mammon.' 82 Christianity does not teach that the life which a person leads is of less consequence than the belief which you professes: it demands, 'Why call ye Me, Lord, Lord, and do not the things which I say?' 83 Christianity is not selfish, is not a system which inculcates the saving of one's own soul as the first and last of duties: 'He that loveth own life shall lose it. Bear ye one another's burdens, and so fulfill the law of Christ. 84 By this shall all humans know that ye are My disciples if ye have love one to another.' 85 It is surely reasonable to demand that Christianity shall be judged, not by its misrepresentations, but by what it is in itself, 86 not as it has been perverted by bitter enemies, or by false disciples, but as it is

SUBSTITUTE

proclaimed and manifested in its Author and Finisher.

87 IV. In the face of such tremendous indictments, what is the duty incumbent on us who profess and call ourselves Christians? 88 Certainly not that we should abjure the name, but that we should remember what the name signifies. We ought to consider our ways, to give ourselves to self-examination. 89 There must be something amiss when such hideous portraits can be painted with any expectation of their being taken as correct likenesses. 90 It is right that we should repel with indignation the ludicrous and intolerable caricatures which are presented as our belief, the unwarrantable consequences which are deduced from it. 91 It is right that we should remove misapprehensions and refute calumnies; but, above all it is necessary that we should take heed to our own conduct and our own character. 92 The scandals which we have so much reason to deplore owe their existence, not to Christianity, but to the absence of Christianity. 93 And the very sneers which greet any departure from rectitude or morality on the part of a professing Christian prove that such a departure is not a manifestation, but a renunciation of Christianity, 94 that what is expected of Christians is the highest and the best that human nature can produce.

95 'If,' argues Mr. Blatchford, 'if to praise Christ in words and deny Him in deeds be Christianity, then London is a Christian city and England is a Christian nation. 96 For it is very evident that our common English ideals are anti-Christian, and that our commercial, foreign, and social affairs are run on anti-Christian lines.' 97 As Mr. Blatchford's life is spent in deploring the baseness of 'our common English ideals,' and in exposing the iniquity of the methods in which 'our commercial, foreign, and social affairs' are conducted, 98 the logical inference would seem to be that, as anti-Christian ideals and anti-Christian lines have so signally failed, it might be well to give Christian ideals and Christian lines a trial. 99 'In a really humane and civilised nation,' Mr. Blatchford maintains, 'there should

be, and there need be, no such thing as Poverty, Ignorance, Crime, Idleness, War, Slavery, Hate, Envy, Pride, Greed, Gluttony, Vice. 100 But,' he continues his curious argument, 'this is not a humane and civilised nation, and never will be while it accepts Christianity as its religion. 101 These,' so he adds as an irresistible conclusion, 'these are my reasons for opposing Christianity.' Very good reasons, if Christianity taught such a creed and encouraged such a morality. 102 But that any human being should give such a description of the purpose of Christian Faith indicates either that the describer is swayed by blindest prejudice or else that no genuine Christian has ever crossed your path.

103 'What if some do not believe? Shall their unbelief make the faith of God of none effect?

104 God forbid: yea, let God be true, but every human a liar.' 105 Truth continues to be truth, though people who talk much about it may be false. 106 Goodness continues to be goodness, though people who sing its praises may be thoroughly depraved.

107 Generosity does not cease to be generosity, though its beauty should be extolled by a miser. 108 Courage does not cease to be courage, though its heroism should be extolled by a coward. 109 Temperance is temperance, though we should be assured of the fact by the thick speech of a drunkard. 110 The virtue is admirable, even when those who acknowledge how admirable it is do not practise it.

111 That Christianity towers so far above the attainments of its average disciples, nay, above the attainments of its saintliest, is itself a kind of evidence of its divine origin. 112 'When the King of the Tartars, who was become Christian,' says Montaigne, 'designed to come to Lyons to kiss the Pope's feet, and there to be an eyewitness of the sanctity he hoped to find in our manners, 113 immediately our good S. Louis sought to divert him from his purpose: for fear lest our inordinate way of living should, on the contrary, put him out of conceit with so holy a belief. 114 And yet it happened quite otherwise to this other, who going to Rome to the same end, and

there seeing the dissolution of the Prelates and people of that time, settled himself so much the more firmly in our religion, 115 considering how great the force and dignity of it must necessarily be that could maintain its dignity and splendour amongst so much corruption and in so vicious hands.' 116 God's truth abides whether humans receive it or deny it. Christ is the Way, the Truth, and the Life, though every so-called Christian should become apostate. 117 The woes of the world are to be cured by more Christianity, not by less; and on us, in whose hands have been placed its holy oracles, rests the responsibility of proving its inestimable advantage ourselves and of conferring it on all humankind.

118 Wherever Christianity has really flourished, untold blessings have been the result. 119 With all the sad deficiencies and sadder perversions by which its course has been chequered, no influence for good can be compared with it in elevating character, in diffusing peace and goodwill, in fitting humans to labour and to endure. 120 The diffusion of the spirit of Christianity is a synonym for the diffusion of all that tends to the true well-being of the world. 121 Only as genuine Christianity, the Christianity of Christ, prevails, will humankind be morally and spiritually lifted into a higher sphere. 122 Put together the wisest and most ennobling suggestions of those who regard Christianity as obsolete and you find that it is virtually Christianity which is delineated. 123 It is in the prevalence of principles and practices which, however they may be designated, are in reality Christian, that the salvation of society and of individuals will be found. 124 In the absence of such principles and practices will be found the secret of ruin, disorder, dissolution, and decay.

125 It is false Christianity against which the tornado of abuse is really directed. Where genuine Christianity appears, and is recognised as genuine, it commands respect. 126 Even the most virulent of recent assailants, who seriously considers that, until we get rid of the 'incubus of the modern Christian religion, our

SUBSTITUTE

civilisation will so surely decay that we shall become an entirely decadent race,' 127 and who complacently announces that 'it will not be difficult to create a faith and a religion which will serve the needs of humanity where Christianity has so signally failed,' even he is graciously pleased to allow, 'I have no quarrel with Christianity as a code of morals. 128 The Sermon on the Mount, no matter who preached it, is quite sufficient, if its teaching was only practised instead of preached, to make this world an eminently desirable place in which to live. 129 My quarrel is concerned with the professional promoters and organisers of religion who have made the very name of Christianity to stink in the nostrils of honest people.' 130 In other words, it is not to Christianity, but to Christians by whom it is misrepresented, that he is opposed, and he cannot refrain from granting, though surely with transparent inconsistency, that it is by the noble lives of Christians that Christianity has been so long preserved.

131 'It won, with its beauty and sentiment, the allegiance of many who were true and humanly. And it is such as these who have raised the Gospel from the slough of infamy. 132 It is such as these who, in the darkest ages, have perpetuated by the goodness of their lives the faith that is left to-day. 133 It is the virtues of Christians, not the virtue of Christianity, that keeps the faith alive.' The very opposite is nearer the truth.

134 The virtues of Christians are simply the outcome of the virtue of Christianity: it is the vices of Christians which compose the deepest 'slough of infamy' into which the Gospel has ever been plunged.

135 But from all these charges and counter-charges, it would seem to be clear that real Christianity compels respect even where it is viewed with aversion, 136 that its progress is hindered by nothing so much as by the unworthiness of its adherents, that it gains assent by nothing so much as by the manifestation of Christian lives.

137 Will any one venture to deny that the world would be vastly

improved were every one in it to be a genuine Christian, animated by Christian motives, doing Christian deeds?

138 The revolution would be immense, indescribable: it would be the end of all evil: it would be the establishment of all good. 139 No human's hand would be against another, all would strive together for the welfare of the whole, there would be no contention save how to excel in love and in good works. 140 The human imagination cannot depict anything more glorious, more ennobling, than the will of God done on earth as it is done in heaven, and this is what would be if the thoughts of every heart were brought into captivity to the obedience of Christ. 141 The most splendid dreams of the most exalted visionaries would be more than fulfilled: everything true and lovely and of good report would be ratified and confirmed: 142 everything false and vile would be changed and purified, and nothing to hurt or destroy or defile would remain. 143 The fulfillment of that ideal is simply the universal prevalence of Christianity, the universal triumph of Christ.

144 The systems and tendencies at which we are about to glance owe their vitality to the Faith which they attempt to supersede. 145 They are, in so far as they are good, either tending towards Christianity or borrowing from it. 146 The insufficiency of mere material well-being, the irresistible association of Religion with Morality, the worship of the Universe, the worship of Humanity, all are signs of the ineradicable instinct of the Unseen and Eternal, of the unquenchable thirst for the Living God; 147 and belief in the Living God finds its noblest illustration and confirmation in Him Who said, 'He that hath seen Me hath seen the Father,' 148 in Him to whom the searching scrutiny of critical inquirers, as well as the fervid devotion of believers, bears so marvellous a witness.

149 We hope to show not only that the abolition of Christianity might 'be attended with sundry inconveniences,' or that the assumption of there being 'nothing in' Christianity is 'not so clear a case,' 150 but we hope to show that if, amid present perplexity and

estrangement, many feel themselves obliged to go back and walk no more with Christ, we, for our part, as we hear His voice of tender reproach, 'Will ye also go away?' 151 Can only, with heartfelt conviction, give the answer, 'Lord, to whom shall we go? Thou hast the words of eternal life.'

MORALITY WITHOUT RELIGION

Pearson McAdam Muir

2 That Religion and Morality have no necessary connection is a popular assumption. 2 In books, in pamphlets, in magazines, on platforms, in ordinary conversation, it is loudly proclaimed or quietly insinuated that the morality of the future will be Independent Morality, Morality without Sanction. 3 Morality, it is iterated and reiterated, can get on quite well without Religion: Religion is a positive hindrance to Morality. 4 This view is, no doubt, extreme. Perhaps it is only here and there in the writings which fall into the hands of most of us, or in the circles with which most of us mingle, that the matter is stated so bluntly and so plainly. 5 But in not a few writings of wide circulation, and in whole classes of the community, the statement is made as if beyond contradiction. 6 Even in works which we are all reading, and in companies where we daily find ourselves, the logical conclusion of arguments, the natural inference from assumptions, would be simply that extreme position. 7 There is no use in evading the fact that if some highly popular opinions are accepted, no statement of the uselessness of Religion in any form or system can be too extreme. 8 The mere assurance that Religion is a reality, is a benefit, is a necessity, though it may not seem a great deal to establish, though it may leave a host of problems still to solve, would be a gain to many, would sweep away the chief doubts by which they are perplexed.

9 There need not, on our part, be any hesitation in declaring, to begin with, that Religion without Morality is worthless. 10 The attempt to keep them apart, to regard them as independent of

SUBSTITUTE

each other, has often enough been made by nominal champions of Religion.

11 The upholding of certain views regarding God and His relations to humankind has been considered sufficient to make up for neglect of the duties incumbent on ordinary mortals.

12 The performance of certain rites and ceremonies has been considered an adequate compensation for the commission of deliberate crimes. 13 Instances might easily be cited of persons engaged in villainous schemes, achieving deeds of dishonesty which will cause ruin to hundreds of innocent victims, 14 executing plots of fiendish revenge, with little regard for human life, and no regard at all for truth, but exceedingly punctilious in attention to religious observances. 15 One of the most cold-blooded murderers that ever disgraced the habitable globe was careful not to neglect any act of devotion, and while perpetrating the most nefarious basenesses never failed to write in his diary the most pious sentiments. 16 That kind of religion is worse than nothing, was rightly regarded as increasing the horror and loathsomeness of the monster's life.

17 In a minor degree, we have all seen illustrations of the same incongruity, we may even have detected indications of it in ourselves, 18 the tendency to imagine that the more we go to church or frequent the Sacraments or read the Bible, we are entitled to latitude in our conduct. 19 There is no tendency against which we need to be more constantly on our guard, none which is more strongly, more terrifically, denounced in the Old Testament and in the New, by prophets and apostles, and by the Lord Jesus Christ Himself. 20 Unbelievers in Christianity are perfectly right when they say that Religion without Morality is absolutely worthless.

21 (II.) We may go further. We may admit, nay, we must vehemently maintain, that Morality without Religion is far better than Religion without Morality. 22 Look at this person who makes no profession of Religion, but who is temperate, honest, self-sacrificing for the

public good. 23 Look at that person who made a loud profession, but who was leading a life of secret vice, who was false to the trust reposed to self, who appropriated what had been committed to own charge. 24 Can there be any doubt, we are triumphantly asked, that of these two, the religious is inferior to the irreligious? 25 There can be no doubt whatever, would be the reply of every well-instructed Christian.

26 Morality without Religion is incalculably better than Religion without Morality. But what does this prove with regard to Christianity? 27 It simply proves how eternally true is the parable of our Lord: 'A certain man had two sons, and he came to the first and said, Son, go work to-day in my vineyard. He answered and said, I will not, but afterwards he repented and went. 28 And he came to the second and said likewise. And he answered and said, I go, sir, and went not. 29 Whether of them twain did the will of his father? They say unto Him, The first,' and our Lord confirmed the answer.

30 (III.) That kind of comparison between Religion and Morality is most misleading, for such 'Religion' is not Religion at all. 31 It may be hypocrisy, it may be superstition, it may be self-deception: Christianity it is not, and never can be. 32 The contrast is not really between Morality and Religion, but between Morality and Immorality, Falsehood, Fraud, and Wilful Imposition.

33 Whatever else the Kingdom of God may be, it is at least Righteousness: where there is no Righteousness, there can be no Kingdom of God. 34 Whatever else Christian doctrine may be, it is at least a doctrine according to godliness, a teaching in accordance with the eternal laws of righteousness. 35 For purposes of analysis and convenience, we may distinguish between Religion and Morality, and show them working in different spheres, but it is utterly erroneous to suppose that they can be actually divorced. 36 In every right and rational representation of the Christian Religion, Morality is included and imbedded, otherwise it is only a maimed and mutilated Religion

which is held out for acceptance. 37 On the other hand, in all true Morality, especially in its highest and purest manifestations, Religion is present.

38 It is possible to decry Morality. 'Mere Morality,' in the current acceptation of the phrase, may lack a good deal, may be a phase of self-righteousness, self-interest, cold calculation, a keeping up of appearances before the world, 39 but Morality itself is of a higher strain: it is the fulfillment of every duty to one's self and to one's neighbour: 40 it implies that each duty is done from the right motive: the purer and loftier it becomes the more it encroaches on the religious domain: 41 it is crowned and glorified with a religious sanction: it is, visible or hidden, conscious or unconscious, a doing of the will of God. 42 Morality, to hold its own, must be 'touched by emotion,' and Morality touched by emotion is identical with Religion. 43 To admit moral obligation in all its length and breadth, and depth and height, is to admit God.

44 (IV.) A curious illustration of the fact that Morality, to be permanent, needs the inspiration of Religion, that Morality, at its best and purest, tends to become Religion, 45 is afforded in such a work as Dr. Stanton Coit's 'National Idealism and a State Church'. Dr. Coit has for twenty years been engaged in founding ethical societies, and his high and disinterested aims need not be called in question. 46 But the book is evidence that in order to support the lofty principles which he so earnestly expounds, he is obliged to call in the aid of principles which he imagined himself to have discarded.

47 He begins by denying the Supernatural in every shape and form. He will have none of a personal God, or of a personal immortality. 48 There is no higher being than Human. All trust must be shifted from supernatural to human agencies. 49 'Combined human foresight, the general will of organised society, assumes the rôle of Creative Providence.' 50 'This is, then, the presupposition of all moral judgment in harmony with which I would reconstruct the religions of the world: 51 that no crime and no good deed that happens in this world shall ever

be traced to any other moral agencies than those actually inhabiting living human bodies and recognised by other human beings as fit subjects of human rights and privileges.' 52 In other words, Morality, Morality alone, Morality without any sanction from Above, or any hope from Beyond, is the all-sufficient strength and ennoblement of human.

53 But what is the superstructure which Dr. Stanton Coit proceeds to build upon this foundation? 54 One would naturally expect that Prayer and Churches and Sacraments would have no place. But these are exactly what he insists on retaining; 55 these will apparently be more important, more necessary, in the future than in the past. 'We should appropriate and adapt the materials furnished us by the rites and ceremonies of the historic Church. 56 As the woodbird, bent on building her nest, in lieu of better materials makes it of leaves and of feathers from her breast, so may we use what is familiar, old, and close at hand. 57 It is all ours; and the homelike beauty of the Church of the future will be enhanced by the ancient materials wrought into its new forms.' 58 So much enhanced, indeed, that most people will be inclined to tolerate the new forms simply because of the ancient materials which are allowed to remain. 59 Among the ancient materials which Dr. Coit appropriates or adapts, prayer occupies a prominent place. And he is severe upon those, 'e.g.', Comte and Dr. Congreve, who would banish petition from the sphere of worship. 60 He delights in pointing out that, in despite of themselves, they include requests for personal blessings. Nor is prayer to be a mere aspiration or inarticulate longing of the soul. 61 'No mental activity can become definite, coherent, and systematic, and remain so, except it be embodied and repeated in words.... 62 A petition that does not, or cannot, or will not, formulate itself in words, and let the lips move to shape them, and the voice to sound them, and the eye to visualise them on the written or printed page, becomes soon a mere torpor of the mind, or a meaningless movement

of blind unrest, or a trick of pretending to pray.

63 Perfected prayer is always spoken. 64 To whom, or to what, this prayer, uttered or unexpressed, is to be offered, may be difficult of comprehension. 65 It is not to God, as we have hitherto employed that sacred name; but Dr. Coit insists that the word 'God' shall be retained, and that we have no right to deny to this God the attribute of Personality.

66 'Any one who worships either a concrete social group or an abstract moral quality may justly protest against the charge that your God is impersonal: you may insist that it is either superpersonal or interpersonal, or both.' 67 The worship of Nature appears to be discouraged, and to be considered as of comparatively little worth. 68 'We dare never forget that moral qualities stand to us in a different dynamic relation from the grass and the stars and the sea-- no effects upon us or upon these will result from petitions even of a most righteous person to them. 69 But no one can deny that prayers to Purity, Serenity, Faith, Humanity, England, Man, Woman, to Milton, to Jesus, do create a new moral heaven and a new earth for you who thirsts after righteousness.'

70 Leaving the name of our Lord out of the discussion, why should a prayer to Serenity have more moral influence than a prayer to the Sea? 71 Why should a prayer to the Stars be less efficacious than a prayer to Milton, whose soul was like a star and dwelt apart? 72 We have only to invest the stars and the sea with certain qualities evolved from our own imagination to make them as worthy of worship as either Milton or Serenity. 73 Dr. Coit is scathing in his criticism of the Positivist prayers, whether of Comte or of Dr. Congreve: they are 'screamingly funny': 'the most monstrous absurdity ever perpetrated by a really good and great man.' 74 The epithets are possibly justified; but are they quite inapplicable to one who supposes that an invocation of the Living and Eternal God means no more than an invocation of England, or Faith, or Woman? 75 It is only when God has become to us an abstraction that an

abstraction can take the place of God.

76 A manual of services fitted to a nation's present needs is what, according to Dr. Coit, is required to ensure the progress and triumph of the ethical movement. 77 'Until the new idealism possesses its own manual of religious ritual, it cannot communicate effectively its deeper thought and purpose. 78 The moment, however, it has invented such a means of communication, it would seem inevitable that a rapid moral and intellectual advancement of human must at last take place, 79 equal in speed and in beneficence to the material advancement which followed during the last century in the wake of scientific inventions.' 80 The ritual of ethical societies will not outwardly differ much from the ritual to be found in existing religions. Its details have yet to be arranged or 'invented.' 81 The only things certain are that a book of prayers ought to be provided at once, and that in Swinburne's 'Songs before Sunrise' may be found an 'anthology of prayer suitable for use in the Church of Humanity,' 82 prayers 'as sublime and quickening in melody and passion as anything in the Hebrew prophets or the Litany of the Church.'

83 Dr. Coit does not denounce theology as theology, he even insists on being himself ranked among theologians. His readers may be surprised to learn on what doctrines he dwells with particular fondness. 84 He laments that belief in the existence and power of the devil should be waning. 'We may not believe in a personal devil, but we must believe in a devil who acts very like a person.' 85 He predicts that teachers will more and more teach a doctrine of hell-fire. Out of kindness they will terrify by presenting the evil effects, indirect and remote, of selfish thoughts and dispositions. 86 'We must frighten people away from the edge of the abyss which begins this side of death.'

87 Finally, though, of course, the word is not used in the ordinary sense, the necessity of the doctrine of the Incarnation is upheld. 88 'The Incarnation must for ever remain a fundamental conception of religion. Until all humans are incarnations of the principle of

constructive moral beneficence, and to a higher degree, Jesus will remain pre-eminent; 89 and it is quite possible that in proportion as he is approached, gratitude to him will increase rather than diminish.' 90 'Even should any one ever in the future transcend him, still it will only be by him and in glad acknowledgment of the debt to him. 91 There never can in the future be a dividing of the world into Christianity and not Christianity. It will only be a new and more Christian Christianity, compatible with liberty and reason.'

92 Thus the drift and tendency of this book bring us back, however unintentionally, to the Faith of which it appears, at first sight, to be the renunciation.

93 It establishes irresistibly that Morality, to be living and permanent, must have religious sanction and inspiration, that we need to be delivered from the awful thraldom of evil, 94 that the supreme realities are the things which are unseen; that prayer is the life of the soul; that public worship is a necessity; 95 that in Christ the greatest redemptive power has been embodied, and the purest vision of the Eternal has been granted; 96 and that, in its adaptation to human needs, its fostering of human aspirations, its ministering to human sorrows, its renewal of human penitence, its consecration of life and its hope in death, 97 no Ethical Society yet devised gives any symptom of being able to supplant the Church of Him Who said, 'Come unto Me, all ye that labour and are heavy laden and I will give you rest.'

98 V. Now, from the fact that Morality at its best assumes a religious tinge, merges itself in Religion, we may legitimately infer that, without the inspiration of Religion, Morality at its best will not long prevail.

99 'Love, friendship,' said Sir James Fitzjames Stephen, 'good nature, kindness carried to the height of sincere and devoted affection, will always be the chief pleasures of life, whether Christianity is true or false; 100 but Christian Charity is not the same as any of these, or all of these put together, and I think that if Christian Theology were exploded, Christian Charity would

SUBSTITUTE

not survive it.' 101 At present, when Religion has pervaded everything with its sacred sanctions, it is easy to say that Religion would not be greatly missed were it discarded, and that Morality would be unaffected. 102 This is pure conjecture. To test its worth we should need a state of society from which every vestige of Religion had disappeared. 103 It will not do to retain any of the beliefs or the customs which owe their origin to a sense of the Unseen and Eternal, to a sense of any Power above ourselves, ruling our destinies and instilling into our minds thoughts and desires and hopes beyond the visible and the material.

104 If Morality, in the limited acceptation of the term, is sufficient for the elevation and welfare of humankind, it is not to be supported by any admixture of Religion: it must prove its power by itself. 105 Religion must be utterly abolished, its every sanction must be universally rejected, 106 its every impulse must have universally ceased before it can be contended with any measure of assurance that the world will be none the worse, may be even the better, for its vanishing.

107 If Religion is a delusion, remember what must be eliminated from our convictions. There can be no higher tribunal than that of human by which our actions can be judged. 108 A life of outward propriety is the utmost that can be demanded of us, if it is only against the wellbeing of our neighbour or the promotion of our own happiness that we can transgress. 109 What has human law to do with our hearts? What legislation can deal with 'envy, hatred, malice, and all uncharitableness,' unless they manifest themselves in outward acts?

110 A base, unloving, impure, acrimonious, untruthful person may crawl through life, never having been arrested, never having been sentenced to any term of penal servitude. 111 You can stand erect before all the laws of the country and say, 'All these have I kept from my youth up.' 112 And unless there be a higher law than the law of human, unless there be a law written on our hearts by the

Finger of God, unless there be One to whom, above and beyond all earthly appearances, we can mournfully declare, 'Against Thee, Thee only, have I sinned,' nothing more can be reasonably demanded. 113 If there is nothing higher than the visible, it can be only visible results which are of any value. 114 The giving of money to help the needy, and the giving of money in order to obtain a reputation for generosity, must stand on the same level. 115 The widow's mite will be worth infinitely less than the shekels which come from those who devour widows' houses. 116 If there be none to search the heart, none save poor frail fellow-mortals to whom we must give account, what an incentive to purity of motive and loftiness of aspiration is removed! 117 But let people talk as they will, there is a conscience in them which whispers, It does matter whether our hearts as well as our actions are right; it does matter whether we have good motives, good intentions; 118 there is a scrutiny of hearts, making and to be made more fully yet; there is One before Whom, even though we have not broken the law of the land, we confess with anguish, Against Thee have I sinned and done evil in Thy sight: 119 where I appear most irreproachable, Thine eye detecteth error: it is not the occasional trespass that I have chiefly to lament, it is the sin that is almost part and parcel of my very being, the sin that corrodes even where it does not glare, the sin that undermines even where it does not crash.

120 (VI.) The most thoughtful of those who have lost faith in the Living God and in fellowship with Him hereafter, look on this life with a pessimistic eye. 121 Without trust in the Unseen and Eternal, life is worthless, an idle dream. 122 With its harassing cares, with its petty vexations, with its turbulence and strife, its sorrows, its breaking up of old associations, its quenching the light of our eyes, 'O dreary were this earth, if earth were all!' 123 On the stage of the world, 'the play is the Tragedy Human, the hero the conqueror worm!'

124 We cannot but extend the deepest sympathy, the warmest admiration to those who, bereft of

belief and of hope, yet cling tenaciously to moral goodness. 125 'What is to become of us,' asks the pensive Amiel, 'when everything leaves us, health, joy, affections, the freshness of sensation, memory, capacity for work, when the sun seems to us to have lost its warmth, and life is stripped of all its charms? 126 There is but one answer, keep close to Duty. Be what you ought to be; the rest is God's affair.… 127 And supposing there were no good and holy God, nothing but universal being, the law of the all, an ideal without hypostasis or reality, duty would still be the key of the enigma, the pole star of a wandering humanity.' 128 Who does not see that it is the lingering faith in God which gives strength to this conviction and that, were the faith obliterated, the natural conclusion would be for the cultured, 'Vanity of vanities: all is vanity'; and for the multitudes, 'Let us eat and drink, for to-morrow we die.'

129 'I remember how at Cambridge,' says Mr. F. W. H. Myers of George Eliot, 'I walked with her once in the Fellows' Garden of Trinity on an evening of rainy May: 130 and she, stirred somewhat beyond her wont, and taking as her text the three words which have been used so often as the inspiring trumpet calls of men-- 131 the words 'God, Immortality, Duty'-- pronounced with terrible earnestness, how inconceivable was the 'first', how unbelievable the 'second', and yet how peremptory and absolute the 'third'. 132 Never, perhaps, have sterner accents affirmed the sovereignty of impersonal and uncompromising Law. 133 I listened and night fell: her grave, majestic countenance turned toward me like a sibyl's in the gloom, and it was as though she withdrew from my grasp one by one the two scrolls of promise, and left me the third scroll only, awful with inevitable fates. 134 And when we stood at length and parted, amid that columnar circuit of the forest trees, beneath the last twilight of starless skies, I seemed to be gazing, like Titus at Jerusalem, on vacant seats and empty halls, on a sanctuary with no presence to hallow it, and heaven left lonely of a God.'

SUBSTITUTE

135 Withdraw belief in a God above and in a life beyond, the only reason for obedience to Duty and Morality will be either our own pleasure, the doing what is most agreeable to ourselves; 136 or sympathy, the bearing of others' burdens, in the hope that when we have passed away there may be some on earth who will reap the harvest which we have sown; 137 or public opinion, the views which are prevalent in a particular time in a particular region; and these reasons are hardly likely to produce a morality which will be other than that of self-indulgence, of despair, or of conventionality.

138 'We can get on very well without a religion,' said Sir James Fitzjames Stephen, 'for though the view of life which Science is opening to us gives us nothing to worship, it gives us an infinite number of things to enjoy. 139 The world seems to me a very good world, if it would only last. It is full of pleasant people and curious things, and I think that most people find no difficulty in turning their minds away from its transient character.' 140 If it would only last! But it does not last: those dearer to us than ourselves are snatched away. 141 Could anything be more selfish, more despicably base than to go about saying, All that is of no consequence, so long as I meet with pleasant people and have an infinite number of things to enjoy? 142 It is true that an infinite number of my fellow-creatures may not be enjoying an infinite number of things, may have trouble in recalling almost anything worthy of the name of enjoyment, but why should I be depressed by that? 143 I find no difficulty in turning away my mind from the misfortunes of others. 'We can get on very well without religion.' No doubt without it some of us can have agreeable society and a variety of pleasures more or less refined; but this does not prove that religion is no loss. 144 On the same principle, we can get on very comfortably without honesty, without sobriety, without purity, without generosity. 145 We can get on very comfortably indeed without anything except without a heart which is intent on self-gratification, and which excludes all thought of the wants and woes of the world. 146 'Let us

eat and drink, for to-morrow we die,' is the irresistible, though rather inconsistent, conclusion of that sublime austerity 147 which so indignantly repudiates the merest hint of reward or hope within the veil, and which so sensitively shrinks from the mercenariness of the Religion of the Cross.

148 'The wages of sin is death: if the wages of Virtue be dust, Would she have heart to endure for the life of the worm and the fly! 149 What are the facts? What is the growing tendency where humans think themselves strong enough to do without religious beliefs, when they have been proclaiming that the suppression of Religion will be the exaltation of a purer Morality?

150 There are plenty of indications that the laws of Morality are found to be as irksome as the dictates of Religion. 151 The first step is to cry out for a higher Morality, to censure the Morality of the New Testament as imperfect and inadequate, as selfish and visionary. 152 The next step is to question the restraints of Morality, to clamour for liberty in regard to matters on which the general voice of humankind has from the beginning given no uncertain verdict. 153 The last step is to declare that Morality is variable and conventional, a mere arbitrary arrangement, which can be dispensed with by the emancipated soul. 154 The literature which assumes that Religion is obsolete does not, as a rule, suffer itself to be much hampered by the fetters of Morality. 155 The non-Religion of the Future is what, we are confidently told, increasing knowledge of the laws of Sociology will of necessity bring about. 156 Should that day ever dawn, or rather let us say, should that night ever envelop us, it will mean the diffusion of non-Morality such as the world has never known.

THE RELIGION OF THE UNIVERSE

Pearson McAdam Muir

3 Among proposed substitutes for Christianity, none occupies a more prominent place than Pantheism, the identity of God and the universe. 2 'Pantheism,' says

Haeckel, 'is the world system of the modern scientist.' 3 Pantheism, or the Religion of the Universe, is, in one aspect, a protest against Anthropomorphism, the making of God in the image of human. 4 It is in supposing God to be altogether such as we are, to be swayed by the same motives, to be actuated by the same passions as we are, that the most deadly errors have arisen.

5 Robert Browning, in 'Caliban upon Setebos', represents a half-brutal being who lives in a cave speculating upon the government of the world, wondering why it came to be made, and what could be the purpose of the Creator in making it. 6 Every motive that could sway the savage mind is in turn discussed: pleasure, restlessness, jealousy, cruelty, sport. 7 'Because I, Caliban,' such is the process of his reasoning, 'delight in tormenting defenceless animals, or would crush any one that interfered with my comfort, or do things because my taskmaster obliges me to do them, so must it be with Him Who made the world.' 8 With great grotesqueness, but with marvellous power, the degraded monster argues as to the reasons which could have prompted the Unseen Ruler to frame the earth and its inhabitants. 9 Everything that he attributes to God is in keeping with his own base nature. What is the explanation of the horrors which have been perpetrated in the Name of God?

10 The sacrifice of human beings, of vanquished enemies, or of the nearest and the dearest, the agonies of self-torture, did not these originate in the transference to the Invisible God of the emotions and principles by which humans were guiding their own lives? 11 They had no notion of forbearance and forgiveness and patience, therefore they did not think that there could be forgiveness with God. 12 They were to be turned aside from their fierce, revengeful purposes by bribes and by the protracted sufferings of their foes, therefore they thought that God might be bribed by gifts or propitiated by pains. 13 What they were on earth, delighting in bloodshed and conquest and revelry, that, they supposed, must be the Being or the

Beings who ruled in the world unseen.

14 (I.) God is not as human is, this was a lesson which ancient prophets struggled to teach. 15 He is not a human that He should lie, or a son of human that He should repent. He is not to be conceived as influenced by the petty hopes and fears and jealousies which influence the mass of mortals. 16 'My thoughts are not as your thoughts, neither are your ways my ways, saith the Lord. 17 For as the heavens are higher than the earth, so are My ways higher than your ways and My thoughts than your thoughts.' 18 He is infinitely exalted above the best and wisest of His children and to see in Him only their likeness is not to see Him aright.

19 It is not to be denied that the writers of the Old Testament employ anthropomorphic language to vivify the justice and goodness of the Eternal. 20 They speak of His Eyes and of His Face, of His Hands and of His Arm and of His Voice. They speak of Him walking in the Garden and smelling a sweet savour. 21 They speak of Him repenting and being jealous and coming down to see what is done on earth. 22 Such figures, however, as a rule, have a force and an appropriateness which never can become obsolete or out of date. 23 They even heighten the Majesty and Spotless Holiness of God. They are felt to be, at most, words struggling to express what no words can ever convey: 24 they are the readiest means of impressing on the dull understanding of humans their practical duty, of letting them know with what purity and righteousness they have to do. 25 It is not in such figures that any harm can ever lie. The error of taking literally such phrases as 'Hands' or 'Arm' or 'Voice' is not very prevalent, but the error of framing God after our moral image is not distant or imaginary. 26 There is a mode of speaking about Divine Purposes and Divine Motives which must jar on those who have begun to discern the Divine Majesty, to whom the thought of the All-Embracing Presence has become a reality.

27 (II.) The representation of the Almighty and Eternal as one of ourselves, a animated by the

SUBSTITUTE

lowest passions and paltriest prejudices of humankind, as a 'magnified and non-natural' human being, is recognised as ludicrously inadequate and terribly distorted. 28 The representation of the Creator as 'sitting idle at the outside of the Universe and seeing it go,' as having brought it into being and afterwards left it to itself, as mingling no more in its events and evolution, is utterly discarded. 29 It is, however, to such representations that the assaults of modern critics are directed, and in the overthrow of such representations it is imagined that Christianity itself is overthrown.

30 The assailants maintain that Christianity in attributing Personality to God makes Him in the image of human, and separates Him from the Universe. 31 But what is meant by Personality? It does not mean a being no higher than human, with the limitations and imperfections of human.

32 Mr. Herbert Spencer, who would not ascribe Personality to God, yet affirmed that the choice was not between Personality and something lower than Personality, but between Personality and something higher. 33 'Is it not just possible that there is a mode of being as much transcending Intelligence and Will as these transcend mechanical motion?'

34 The description of Personality given by the author of the 'Riddle of the Universe' would be repudiated by every educated Christian. 35 'The monistic idea of God, which alone is compatible with our present knowledge of Nature, recognises the divine spirit in all things. 36 It can never recognise in God a "personal being," or, in other words, an individual of limited extension in space, or even of human form. 37 God is everywhere.' That conclusion,-- we are not concerned with the steps by which the conclusion is reached,-- does not strike one as a modern discovery. 38 In what authoritative statement of Christian doctrine God is defined as 'not' being everywhere, or 'an individual of limited extension in space, or even of human form,' we are unaware. 39 There is apparent misunderstanding in the supposition that we have to take

our choice between God as entirely severed from the world, and God existing in the world. 40 God, it is asserted in current phraseology, cannot be both Immanent and Transcendent; He cannot be both in the world and above it.

41 'In Theism,' so Haeckel draws out the comparison, 'God is opposed to Nature as an extra-mundane being, as creating and sustaining the world, and acting upon it from without, 42 while in Pantheism, God, as an intra-mundane being, is everywhere identical with Nature itself, and is operative within the world as "force" or "energy."' 43 If there is no juggling with words here, it can hardly be juggling with words to point out that so far as 'space' goes, an intra-mundane being, rather than an extra-mundane, is likely to be 'limited in extension.'

44 (III.) The imagination that the Christian God is a Personality like ourselves, and is to be found only above and beyond the world, finds perhaps its strangest expression in some of the writings of that ardent lover of Nature, 45 the late Richard Jefferies. 'I cease,' so he writes in 'The Story of my Heart', 'to look for traces of the Deity in life, because no such traces exist. 46 I conclude that there is an existence, a something higher than soul, higher, better, and more perfect than deity. Earnestly I pray to find this something better than a god. 47 There is something superior, higher, more good. For this I search, labour, think, and pray.… 48 With the whole force of my existence, with the whole force of my thought, mind, and soul, I pray to find this Highest Soul, this greater than deity, this better than God. 49 Give me to live the deepest soul-life now and always with this soul. For want of words I write soul, but I think it is something beyond soul.' 50 Could anything be more pathetic or, at the same time, more self-refuting? How can anything be greater than the Infinite, more enduring than the Eternal, better than the All-Pure and All-Perfect? 51 It could be only the God of unenlightened, unchristian teaching, Whom he rejected. 52 The God Whom he sought must be not only in but beyond and above all created or developed things. 53 It was,

indeed, the Higher than the Highest that he worshipped. It was for God, for the Living God, that his eager soul was athirst, and it is in God, the Living God, that his eager soul is now, we humbly trust, for ever satisfied.

54 (IV.) 'The heaven and heaven of heavens cannot contain Him.' 'Whither shall I go from Thy Spirit? Or whither shall I flee from Thy presence?' 55 'My thoughts are not your thoughts, neither are your ways my ways saith the Lord.' 'In Him we live and move and have our being.' 'Of Him and through Him and to Him are all things, to Whom be glory for ever. Amen.'

56 Now it cannot be denied that some who have striven to express after this fashion the unutterable majesty and the universal presence of God, 57 who have endeavoured to demonstrate that God is in all things, and that all things are in God, have at times failed to make their meaning plain. 58 Either from the obscurity of their own language, or from the obtuseness of their readers, they have been considered Atheists. While vehemently asserting that God is everywhere, they have been taken to mean that God is nowhere. 59 The actual conclusion to be drawn from the treatises of Spinoza, the reputed founder of modern Pantheism, is still undecided. But no one now would brand him with the name of Atheist. 60 He was excommunicated by Jews and denounced by Christians, yet there are many who think that his aim, his not unsuccessful aim, was to establish faith in the Unseen and Eternal on a basis which could not be shaken. 61 So far from denying God, he was, according to one of the greatest of German theologians, 'a God-intoxicated man.' 'Offer up reverently with me a lock of hair to the manes of the holy, repudiated Spinoza! 62 The high world-spirit penetrated him: the Infinite was his beginning and his end: the Universe his only and eternal love.... 63 He was full of religion and of the Holy Spirit, and therefore he stands alone and unreachable, master in his art above the profane multitude, without disciples and without citizenship.'

64 Dean Stanley went so far as to say that 'a clearer glimpse into the nature of the Deity was granted to

Spinoza, the excommunicated Jew of Amsterdam, than to the combined forces of Episcopacy and Presbytery in the Synod of Dordrecht.' 65 Such a judgment is rather hard upon the divines who took part in that celebrated Synod, but at any rate it indicates that the great philosopher, misunderstood and persecuted, was elaborating in his own way, 66 this great truth, 'In him we live and move and have our being.' 'Of Him, and through Him are all things.'

67 (V.) In their loftiest moments, contemplating the marvels of the heavens above and the earth beneath, devout souls have, wherever they looked, been confronted with the Vision of God. 68 'What do I see in all Nature?' said Fénelon, 'God. God is everything, and God alone.'

69 'Everything,' said William Law, 'that is in being is either God or Nature or Creature: and everything that is not God is only a manifestation of God; 70 for as there is nothing, neither Nature nor Creature, but what must have its being in and from God, so everything is and must be according to its nature more or less a manifestation of God.'

71 It is the thought which has inspired poets of the most diverse schools, which has been their most marvellous illumination and ecstasy. 72 Now it is Alexander Pope:

All are but parts of one stupendous whole
Whose body Nature is, and God the soul.

73 Now it is William Cowper:

There lives and works
A soul in all things and that soul is God.

74 Now it is James Thomson of 'The Seasons':

These, as they change, Almighty Father! these
Are but the varied God. The rolling year
Is full of Thee.

75 Now it is William Wordsworth:

I have felt
A Presence that disturbs me with the joy
Of elevated thoughts, a sense sublime
Of something far more deeply interfused,

SUBSTITUTE

76 Whose dwelling is the light
of setting suns,
And the round ocean and the
living air,
And the blue sky, and in the
mind of human
A motion and a spirit which
impels
All thinking things, all objects
of all thought,
And rolls through all things.

77 Now it is Lord Tennyson:

The sun, the moon, the stars, the
seas, the hills and the plains,
Are not these, O Soul, the vision of
Him Who reigns?

* * * * *

78 Speak to Him thou, for He hears,
and Spirit with Spirit can meet.
Closer is He than breathing and
nearer than hands or feet.

79 Certainly, we may say, nothing atheistic in utterances like these: they are the utterances of lofty thought, of profound piety, of soaring aspiration, and of childlike faith. 80 They have a pantheistic tinge: what is there to dread in Pantheism? Not much in Pantheism of that kind: would there were more of it! 81 But it will be observable that, in the instances cited, though God is in Nature and manifesting Himself through it, there is a clear distinction between Nature and God. 82 It may seem as if it were merely the sky, the sun, the stars, the ocean, that are apostrophised: in reality it is a Life, a Spirit, a Power not themselves, in which they live and move and have their being: not to them, but to That, are the prayers addressed. 83 And, we venture to think, it is scarcely ever otherwise: scarcely ever is the Visible alone invoked: identify God as humans will with the material universe, or even with the force and energy with which the material universe is pervaded, 84 when they enter into communion with it, in spite of themselves they endow it with the Life and the Will and the Purpose which they have in theory rejected. 85 But the absolute identification of God and the Universe, the assumption that above and beneath and through all there is no conscious Righteousness and Wisdom and Love overruling and directing, 'that' is a belief to be resisted, a belief which enervates character and enfeebles hope. 86 'Whoever says in his heart that God is 'no

more' than Nature: whoever does not provide 'behind the veil of creation' an infinite reserve of thought and beauty and holy love, that might fling aside this universe and take another, 87 as a vesture changing the heavens and they are changed, ... is bereft of the essence of the Christian Faith, and is removed by only accidental and precarious distinctions from the atheistic worship of mere "natural laws."' 88 'In our worship we have to do, not so much with His finite expression in created things as with His own free self and inner reality ... all 'religion' consists in 'passing Nature by', in order to enter into direct personal relation with Him, soul to soul. 89 It is 'not' Pantheism to merge all the life of the physical universe in Him, and leave Him as the inner and sustaining Power of it all. 90 It is Pantheism to rest in this conception: to merge Him in the universe and see Him only there: 91 and not rather to dwell with Him as the Living, Holy, Sympathising Will, on Whose free affection the cluster of created things lies and plays, as the spray upon the ocean.'

92 (VI.) God is 'not' as we are, and yet He 'is' as we are. God is not made in the image of human, but human is made in the image of God. 93 It is through human goodness and human purity and human love that we attain our best conceptions of the Divine Goodness and Purity and Love. 94 'If ye being evil know how to give good gifts unto your children, how much more will your Heavenly Father give the Holy Spirit to them that ask Him?' 95 Picture to yourself what is highest and best in the human relationship of father and child: be sure that the Heavenly Father will not fall below, but will infinitely transcend, that standard. 96 All the justice and goodness which we have seen on earth are the feebler reflection of His. 97 It is by learning that the utmost height of human goodness is but a little way towards Him that we learn to think of Him at all aright. 98 But the justice and the love by which He acts are different only in degree, and not in kind, from ours. 99 When we think of God as altogether such as we are, we degrade Him, we have before us

the image of the imperfect; 100 when we try to think of Him under no image and to discard all figures, He vanishes into unreality and nothingness, 101 but when we see Him in Christ, we have before us that which we can grasp and understand, and that in which there is no imperfection.

102 If there is no God but the universe, we have a universe without a God. Worship is meaningless, Faith is a mockery, Hope is a delusion. 103 If the universe is God, all things in the universe are of necessity Divine. The distinction between right and wrong is broken down. 104 In a sense very different from that in which the phrase was originally employed, 'Whatever is, is right.' Nothing can legitimately be stigmatised as wrong, for there is nothing which is not God. 105 'If all that is is God, then truth and error are equally manifestations of God. 106 If God is all that is, then we hear His voice as much in the promptings to sin as in the solemn imperatives of Conscience. This is the inexorable logic of Pantheism, however disguised.'

107 'I know,' says Mr. Frederic Harrison, 'what is meant by the Power and Goodness of an Almighty Creator. I know what is meant by the genius and patience and sympathy of human. 108 But what is the All, or the Good, or the True, or the Beautiful? ... The "All" is not good nor beautiful: it is full of horror and ruin....

109 There lies this original blot on every form of philosophic Pantheism when tried as the basis of a religion or as the root-idea of our lives, 110 that it jumbles up the moral, the unmoral, the non-human and the anti-human world, the animated and the inanimate, cruelty, filth, horror, waste, death, virtue and vice, suffering and victory, sympathy and insensibility.' 111 Where these distinctions are lost, where this confusion exists, what logically must be the consequence? 112 Honesty and dishonesty, truth and falsehood, purity and impurity, kindness and brutality, are put upon a level, are alike manifestations of the One or the All.

113 It is said that in our day the sense of sin has grown weak, that

humans are not troubled by it as once they were. 114 There is a morbid, scrupulous remorsefulness for wrong-doing, a desponding conviction that repentance and restoration are impossible, which may well be put away.

115 But that sin should be no longer held to be sin, that evil should be wrought and the worker experience no pang of shame, would surely indicate moral declension and decay.

116 Were the time to come when, universally, humankind should commit those actions and cherish those passions which, through all ages in all lands, have gone by the name of sin, should become so heedless to the voice of conscience, that conscience should cease to speak, 117 the time would have come when humans, being past feeling, would devote themselves with greediness to anything that was vile, so long as it was pleasant, the bonds of society would be loosened and destruction would be at hand.

118 The Religion of the Universe ignores the facts of life, the sorrow, the struggle, the depravity, the need of redemption. 119 Fortunately, human beings in general are still inclined to mourn because of imperfection or of baseness: still they are inclined at times to cry out, 'Who shall deliver me from the body of this death?' 120 And still they have the opportunity of joyfully or humbly saying, 'I thank God through Jesus Christ our Lord.'

121 'And now at this day,' listen to the ungrudging admission of perhaps the most earnest English apostle of Pantheism, Mr. Allanson Picton: 'We of all schools, whether orthodox or heterodox so-called, 122 whether believers or unbelievers in supernatural revelation, all who seek the revival of religion, the exaltation of morality, the redemption of human, draw, most of us, our direct impulse, and all of us, directly or indirectly, our ideals from the speaking vision of the Christ. 123 Such a claim is justified, not merely by the spiritual power still remaining in the Church, but almost as much by the tributes paid, and the uses of the Gospel teaching made in the writings of the most distinguished among rationalists.... 124 Such

writers have felt that somehow Jesus still holds, and ought to hold, the heart of humanity under His beneficial sway. 125 Excluding the partial, imperfect and temporary ideas of Nature, spirits, hell, and heaven, which the Galilean held with singular lightness for a man of His time, 126 they have acquiesced in and even echoed His invitation to the weary and heavy laden, to take His yoke upon them and learn of Him. 127 And that means to live up to His Gospel of the nothingness of self, and of unreserved sacrifice to the Eternal All in All.'

128 If such is the conclusion of Rationalism and of Pantheism, how much more ought it to be the conclusion of Christianity. 129 The imagination of a God confined to times and places, visiting the world only occasionally, manifesting Himself in the past and not in the present, ought to be as foreign to the Christian Church as to any Rationalist or Pantheist. 130 Be it ours to show that we believe in God Who filleth all things with His presence, Who is from Everlasting to Everlasting, 131 that to us there is but one God the Father, by Whom are all things and we in Him, and one Lord, Jesus Christ, by Whom are all things and we by Him, that God has identified Himself with us in Jesus Christ, His Son. 132 Be it ours to lose ourselves in Him. For, after all our questionings as to the government of the world, as to abounding misery and degradation, as to what lies beyond the veil for ourselves and for others, this is our hope and our confidence: 133 'God hath concluded all in unbelief that He might have mercy upon all. O the depth of the riches both of the wisdom and knowledge of God! How unsearchable are His judgments and His ways past finding out. 134 For who hath known the mind of the Lord? Or who hath been His counsellor? Or who hath first given to Him, and it shall be recompensed unto Him again? 135 For of Him and through Him and to Him are all things: to Whom be glory for ever. Amen.'

THE RELIGION
OF HUMANITY
Pearson McAdam Muir

4 The position which Religion, and especially the Christian Religion, assigns to human, to human as you ought to be, is very high. 2 You are made in the image of God, you are a little lower than the angels, a little lower than God, you are a partaker of the Divine Nature. 3 But as the corruption of the best is the worst, there is nothing in the whole creation more miserable, more loathsome, than human as you have forgotten your high estate and plunged yourself into degradation. 4 'What human has made of human,' is the saddest, most deplorable sight in all the world. Amid the awful splendour of the winning loveliness of Nature, 'only human is vile.'

5 That is the terrible verdict which may be pronounced upon you renouncing your birthright, surrendering yourself to the powers which you was meant to keep in subjection. 6 It is not the verdict to be pronounced on Human as Human, the child of the highest and the heir of all the ages. 7 The appeal of Religion, the appeal of Christianity above all, has continually been, O sons of humans, sully not your glorious garments, cast not away your glorious crown.

8 I. It is irreligion, it is unbelief, which comes and says, Lay aside these fantastic notions as to your greatness: 9 you are the creatures of a day: you belong, like other animals, to the world of sense, and you pass away along with them: a human hath no pre-eminence above a beast. 10 Banish your delusive hopes; confine yourselves to reality; waste not your time in the pursuit of phantoms: 11 make the best of the world in which you are: seize its pleasures: shut your eyes to its sorrows: enjoy yourselves in the present and let the future take care of itself: 12 follow the devices and desires of your own hearts in the comfortable assurance that there is no judgment to which you can be brought, save that which exists in the realm of imagination.

13 Listening to such whispers, obeying such suggestions, walking in such courses, the spectacle which human presents can be

viewed only with compassion, with horror, or with disdain. 14 Your ideals, your aspirations, your self-sacrifices are only so many phases of self-deception. 15 The natural conclusion to be drawn from denying the spiritual origin and eternal prospects of human must be that you are of no more account than any of the transitory beings around you, 16 that, if you have any superiority over them, it is only the superiority of a skill with which you can make them the instruments of your purposes. 17 With no glimpses of a higher world, with no inspirations from a Spirit nobler than your own, you can hardly regard the achievements of heroism as other than acts of madness, 18 you can be fired with no desire to emulate them, you cannot well be trusted to perform ordinary acts of honesty and morality, let alone extraordinary acts of generosity and magnanimity, should they come in collision with your objects and ambitions. 19 Unless above himself you can Erect yourself, how mean a thing is Human! 20 Deny your divine fellowship, extirpate your heavenly anticipations, and it might seem as if no race on earth would be so poor as do you reverence.

21 (II.) One thing is assumed by not a few, the absurdity of the Almighty caring for such a race, and therefore the impossibility of the Incarnation. 22 'Which,' asks Mr. Frederic Harrison, 'is the more deliriously extravagant, the disproportionate condescension of the Infinite Creator, or the self-complacent arrogance with which the created mite accepts, or rather dreams of, such an inconceivable prerogative? 23 Your planet is one of the least of all the myriad units in a boundless Infinity; in the countless æons of time you are one of the latest and the briefest; 24 of the whole living world on the planet, since the ages of the primitive protozoon, human is but an infinitesimal fraction. 25 In all this enormous array of life, in all these æons, was there never anything living which specially interested the Creator, nothing that the Redeemer could care for, or die for? 26 If so, what a waste creation must have been! ... Why was all this tremendous tragedy, great enough to convulse the

Universe, confined to the minutest speck of it, for the benefit of one puny and very late-born race?'
27 But is it not the fact that along with the discovery of Human's utter insignificance, there has come the discovery of powers and faculties unknown and unsuspected, 28 so that more than ever all things are in subjection to you, your dominion has become wider, your throne more firmly established? 29 Is it not the fact that the whole realm of Nature is explored by you, is compelled to minister to your wants or to unfold its treasures of knowledge? 30 Is it not the fact that more than ever it can be said:

The lightning is your slave: heaven's utmost deep
Gives up her stars, and, like a flock of sheep,
They pass before your eye, are numbered, and roll on.
The tempest is your steed: you strides the air.
And the Abyss shouts from her depth laid bare
'Heaven, hast thou secrets? Human unveils me: I have none.'

31 Is it not the fact that deposed from your position of proud pre-eminence as centre of the universe, Human has by your labours and your ingenuity reasserted your high prerogative to be lord of the creation? 32 The printing-press, the railway, the telegraph, how have inventions like these invested you with an influence which you did not possess before! 33 And is it not the fact that when most conscious of our nothingness before the immensities around us, when humbled and prostrate before the Infinite of which we have caught a transitory glimpse, we are also most conscious of our high destiny, 34 we are lifted above the earthly to the heavenly, we discern that, though we cannot claim a moment, yet Eternity is ours?
35 'What, then, is Human! 36 What, then, is Human! You endures but an hour and is crushed before the moth. 37 Yet in the being and in the working of a faithful human is there already (as all faith, from the beginning, gives assurance) a something that pertains, not to this wild death element of Time; that triumphs over Time, and 'is', and will be, when Time shall be no more.'

SUBSTITUTE

38 Human's place in the universe may, according to Dr. Alfred Russel Wallace, be nearer the centre of things than has so commonly come to be accepted. 39 Modern discovery, he maintains, has thrown light on the interesting problem of our relation to the Universe; 40 and even though such discovery may have no bearing upon theology or religion, yet, you thinks, it proves that our position in the material creation is special and probably unique, 41 and that the view is justified which holds that 'the supreme end and purpose of this vast universe was the production and development of the living soul in the perishable body of human.'

42 And another, a convinced and ardent disciple of Evolution, the late Professor John Fiske, argues that, 'not the production of any higher creature, but the perfecting of humanity is to be the glorious consummation of Nature's long and tedious work....

43 Human seems now, much more clearly than ever, the chief among God's creatures.... 44 The whole creation has been groaning and travailing together in order to bring forth that last consummate specimen of God's handiwork, the Human Soul.' 45 If this be so, this conclusion arrived at by those who do not hold the ordinary faith of Christendom, then the objection that the Incarnation could not have taken place for the redemption of such a race as ours, in a world which is so poor a fraction of the infinite universe, falls to the ground; 46 and the protest of a devout modern poet carries conviction with it:

This earth too small
For Love Divine! Is God not Infinite?
If so, His Love is infinite. Too small!
One famished babe meets pity oft from human
More than an army slain! Too small for Love!
Was Earth too small to be of God created?
Why then too small to be redeemed?

47 Human may, or may not, occupy a 'central position in the universe': other worlds may, or may not, be inhabited: 48 this earth may be but a minute and insignificant speck amid the mighty All, this at least is certain,

49 that not by mere magnitude is our rank in the scale of being to be decided, and that in the spirit of human will be found that which approaches most nearly to Him who is Spirit.

50 'The person who reviles Humanity on the ground of its small place in the scale of the Universe is,' according to Mr. Frederic Harrison, 'the kind of person who sneers at patriotism and sees nothing great in England, on the ground that our island holds so small a place in the map of the world. 51 On the atlas England is but a dot. Morally and spiritually, our Fatherland is our glory, our cradle, and our grave.'

52 III. Hence, one of the ablest attempts to supersede Christianity is that which goes by the name of Positivism or the Religion of Humanity, which sets Human on the throne of the universe, and makes of you the sole object of worship.

53 'A helper of humans outside Humanity,' said the late Professor Clifford, 'the Truth will not allow us to see. 54 The dim and shadowy outlines of the Superhuman Deity fade slowly away from before us, and, as the mist of His Presence floats aside, we perceive with greater and greater clearness the shape of a yet grander and nobler figure, of you who made all gods and shall unmake them. 55 From the dim dawn of history, and from the inmost depths of every soul, the face of our Father 'Human' looks out upon us with the fire of eternal youth in your eyes, and says, "Before Jehovah was, I am."

56 The founder of the organised Religion of Humanity was Auguste Comte, who died in the year 1857. 57 He held that in the development of humankind there are three stages: the first, the Theological, in which worship is offered to God or gods; 58 the second, the Metaphysical, in which the human mind is groping after ultimate truth, the solution of the problems of the universe; 59 the third, the Positive, in which the search for the illusive and the unattainable is abandoned, and the real and the practical form the exclusive occupation of the thoughts.

60 On Sunday, October 19, 1851, he concluded a course of Lectures on the General History of

SUBSTITUTE

Humanity with the uncompromising announcement, 61 'In the name of the Past and of the Future, the servants of Humanity, both its philosophical and practical servants, come forward to claim as their due the general direction of this world. 62 Their object is to constitute at length a real Providence, in all departments, moral, intellectual, and material. 63 Consequently they exclude, once for all, from political supremacy, all the different servants of God, Catholic, Protestant, or Deist, as being at once behindhand and a source of disturbance.'

64 All religions were banished by the truly 'uncompromising announcement': they were all condemned as futile and unreal. 65 The best that could be said of the worship of the past was that it directed 'provisionally the evolution of our best feelings, under the regency of God, during the long minority of Humanity.' 66 But the fact that Religion will not be banished, that it must somehow find expression, never received fuller verification. 67 We do not dwell upon the private life of Comte, its eccentricities and inconsistencies, but this at least cannot be omitted: 68 he practised a course of austere religious observances, he worshipped not only Humanity at large, but he paid special adoration to a departed friend such as hardly the devoutest of Roman Catholics has ever paid to the Virgin Mary.

69 Positivism became, what Professor Huxley called it, 'Catholicism 'minus' Christianity.' 70 Comte laid down for the guidance of his disciples, who are potentially all humankind, rules which no existing religious communion can surpass in minuteness. 71 The Supreme Object of Worship is the Great Being, Humanity, the Sum of Human Beings, past, present, and future. 72 But as it is only too evident that too many of these beings in the past and the present, whatever may be said about the future, are not very fitting objects of worship, 73 Humanity, the Great Being, must be understood as including only worthy members, those who have been true servants of Humanity. 74 The emblem of this Great Being is a Woman of

the age of thirty, with her son in her arms; and this emblem is to be placed in all temples of Humanity and carried in all solemn processions.

75 The highest representatives of Humanity are the Mother, the Wife, and the Daughter; the Mother representing the past, the Wife the present, and the Daughter the future. 76 These are in the abstract to be regarded as the guardian angels of the family.

77 To these angels every one is to pray three times daily, and the prayers, which may be read, but which must be the composition of you who uses them, are to last for two hours.

78 Humanity, the World, and Space form the completed Trinity of the Positivist Religion. 79 There are nine sacraments: Presentation, Initiation, Admission, Destination, Marriage, Maturity, Retirement, Transformation, Incorporation.

80 There is a priesthood, to whom is committed the duties of deciding who may or may not be admitted to certain offices during life, 81 of deciding also whether or not the remains of those who have been dead for seven years should be removed from the common burial-place, and interred in 'the sacred wood which surrounds the temple of humanity,' 82 every tomb there 'being ornamented with a simple inscription, a bust, or a statue, according to the degree of honour awarded.' 83 The priests are to receive so comprehensive a training that they are not to be fully recognised till forty-two years of age. They are to combine medical knowledge with their priestly qualifications. 84 Three successive orders are necessary for the working of the organisation: the Aspirants admitted at twenty-eight, the Vicars or Substitutes at thirty-five, and the Priests proper at forty-two.

85 The Religion of Humanity has a Calendar, each month of twenty-eight days being in one aspect dedicated to some social relation, and in another to some famous person representing some phase of human progress: 86 Moses, Homer, Aristotle, Cæsar, St. Paul, Gutenberg, Shakespeare. Each day of the year is dedicated to one or more great men or women, five hundred and fifty-eight in number, and the last day of the year is the

SUBSTITUTE

Festival of All the Dead. 87 'Our Calendar is designed to remind us of all types of the teachers, leaders, and makers of our race: of the many modes in which the servants of Humanity have fulfilled their service. 88 The prophets, the religious teachers, the founders of creeds, of nations and systems of life: the poets, the thinkers, the artists, kings, warriors, statesmen and rulers: the inventors, the people of science and of all useful arts....

89 Every day of the Positivist year is in one sense a day of the dead, for it recalls to us some mighty teacher or leader who is no longer on earth.... 90 But the three hundred and sixty-four days of the year's calendar have left one great place unfilled.… Those myriad spirits of the forgotten dead, whom, no man can number, whose very names were unknown to those around them in life, 91 the fathers and the mothers, the husbands and the wives, the brothers and the sisters, the sturdy workers and the fearless soldiers in the mighty host of civilisation--shall we pass them by? ...

92 It is those whom to-night we recall, all those who have lived a life of usefulness in their generation, though they tugged as slaves at the lowest bank of oars in the galley of life, 93 though they were cast unnoticed into the common grave of the outcast, all whose lives have helped and not hindered the progress of Humanity, we recall them all to-night.'

94 (IV.) The Religion of Humanity has numbered among its adherents, in part or in whole, several celebrated persons in this country, such as Richard Congreve, Dr. Bridges, Professor Beesley, Cotter Morison, George Eliot. 95 But at present it has no more eloquent and earnest advocate than Mr. Frederic Harrison, who, in 'The Creed of a Layman', and several other recent volumes, has passionately proclaimed its principles. 96 For more than fifty years he has been its apostle: 'every other aim or occupation has been subsidiary and instrumental to this.' 97 It is true that in some points he has retained his independence, and while those outside accuse him of fanaticism,

some of his fellow-believers suspect him of heresy. 98 But he himself is assured that in the worship of Humanity he has obtained the solution of his doubts and the satisfaction of his spirit, and on his gravestone or his urn he would have inscribed the words, 'He found peace'. 99 There is much that is marvellously elevated in thought as well as exquisite in expression, profoundly devout as well as brilliantly argued, in the narrative of his progress towards his present position. 100 But when his vehement statements are carefully examined, it will almost inevitably be seen that all that is good and sensible in them is an unconscious reproduction of Christianity. 101 His negations disappear: the affirmations which he makes are those which the Church has always maintained. The faith of his childhood permeates and strengthens and beautifies the creed which he adopted in his maturer years. 102 The unity of humankind, the memory of the departed, the necessity of living for others, these are no novelties in Christianity. 103 It is in Christ that they have specially been brought to light, in Him that they find their highest ratification, without Him they remain unfulfilled, with Him they attain to consistency and power.

104 The Great Being, Humanity, is only an abstraction. 'There is no such thing in reality,' 105 Principal Caird reminds us, 'as an animal which is no particular animal, a plant which is no particular plant, a human or humanity which is no individual person. It is only a fiction of the observer's mind.'

106 There is logical force as well as humorous illustration in the contention of Dean Page Roberts, that there is no more a humanity apart from individual men and women than there is a great being apart from all individual dogs, which we may call Caninity, 107 or a transcendent Durham ox, apart from individual oxen, which may be named Bovinity.' 108 Nor does the geniality of Mr. Chesterton render his argument the less telling: 'It is evidently impossible to worship Humanity, just as it is impossible to worship the Savile Club: both are excellent institutions to which we may happen to belong. 109 But we

perceive clearly that the Savile Club did not make the stars and does not fill the universe. 110 And it is surely unreasonable to attack the doctrine of the Trinity as a piece of bewildering mysticism, and then to ask people to worship a being who is ninety million persons in one God, neither confounding the persons nor dividing the substance.'

111 Can it be doubted that the Great Being, the sum of human beings, is less conceivable, less worthy of worship than the Great Being, the God and Father of our Lord Jesus Christ? 112 Can it be doubted that the claim of Humanity to worship is less credible if we exclude the Perfect Man, Christ Jesus, from our view? 113 Can it be doubted that the Positivist motto, 'Live for others,' gains a force and a meaning unapproached elsewhere from the Life and Death of Him Who said, 'The Son of Human came not to be ministered unto, but to minister and to give His Life a ransom for many?' 114 Humanity knit together in One, purified from every stain, glorious and adorable, is a lofty and inspiring idea, but nowhere has it been disclosed save in the Man Christ Jesus, the Word made Flesh, the Brightness of the Father's glory and the Express Image of His Person.

115 V. Dr. Richard Congreve owns that much of the Religion of Humanity exists already in the Christian Faith, but, in one respect, he asserts that the Religion of Humanity can claim to be entirely original. 116 'We accept, so have all humans. We obey, so have all humans. We venerate, so have some in past ages, or in other countries. We add but one other term, we love.' That is what distinguishes this new religion and proves its superiority to the old: 117 its votaries have attained this new principle and mode of life: they love one another. 118 The boldness of the claim may stagger us. We turn over the pages of the New Testament. We see that Love is the fulfilling of the Law; 119 is the end of the commandment; is the sum of the Law and the Prophets; is placed at the very summit of Christian graces; is the bond of perfectness; is manifested in a Life and a Death which, after

nineteen centuries, remain without a parallel.

120 We recall the touching legend that in his old age the Apostle S. John was daily carried into the assembly of the Ephesian Christians, simply repeating to them, over and over, the words, 'Love one another. This is our Lord's command, fulfill this and nothing else is needed.' 121 We recall that in early centuries the sympathy and helpfulness by which Christians of all ranks and races were united called forth from heathen spectators the amazed and respectful exclamation, 'See how these Christians love one another!'

122 Recalling these things, we cannot but be startled that, in the nineteenth century of the Christian era, a teacher should, with any expectation of being believed, have ventured to affirm that the great discovery which it has been reserved for the present day to make is that of loving one another.

123 Ignorance of Christianity, misrepresentation of Christianity, we may well call it: 124 ignorance inconceivable, misrepresentation inconceivable: and yet, as we consider the state of Christendom, do we not see what palliates the ignorance and the misrepresentation? 125 Have we not reason to confess that, if the commandment be not new, universal obedience to it would be new indeed? 126 May the calm assurance that love is foreign to Christianity not startle us into the conviction that we have forgotten what, according to our Lord's own declaration, the chief feature of Christianity ought to be? 127 'By this shall all humans know that ye are My disciples, if ye have love one to another.'

128 VI. 'How can we,' it has been well said, 'be asked to give the name of Religion of Humanity to a religion that ignores the greatest human being that ever lived, and the very source from which the Religion of Humanity sprang?' 129 Human in yourself, human so full of imperfections, human having no connection with any world but this, human unallied to any Power higher, nobler than yourself, is this to be our God? 130 Which is more reasonable: to set up the race of human, unpurified, unredeemed, worthless and polluted, as the object of adoration, or to maintain

that 'Human indeed is the rightful object of our worship, but in the roll of ages, there has been but one Human Whom we can adore without idolatry, the Man Christ Jesus'? 131 The Religion of Humanity, so called, would have us worship Human apart from Christ Whom yet all acknowledge to be the glory of humankind, 132 but we call on humans to worship Christ Jesus, for in Him we see Human without a stain, we see our nature redeemed and consecrated, we see ourselves brought nigh to the Infinite God. 133 We adore Humanity, but Humanity in its purity: we adore Humanity, but only as manifesting in the Only Begotten Son the glory of the Eternal Father. 134 Thus we place no garland around the vices of the human race: thus we abase, and thus we exalt: thus are we humbled to the dust, thus are we raised to the highest heavens. 135 Apart from Christ, the magnitude of the creation may well depress and overwhelm: apart from Christ the human race is morally imperfect instead of being a fit object of blind adoration. 136 Seeing Christ, we not only feel our inconceivable nothingness in presence of the Infinite Majesty, but we stand erect and unpresumptuously say, 137 'We wonder not that Thou art mindful of those for whom that Son of Human lived and died, we are in Him partakers of the Divine Nature. There thou beholdest Thine Own Image.'

138 Made in the image of God, such is the ideal of Human that comes to us from the beginning of your history; and such is the ideal that once, and once only, has been realised. 139 "Ecce Homo"! Behold the Human!' said Pontius Pilate, in words more full of significance than he knew, pointing to the victim of priestly hatred and popular fickleness. 140 Behold the Human! human as you ought to be, the Image of God. 141 Before that Divine Humanity we reverently bow, to that Divine Humanity we humbly consecrate ourselves, in fellowship with It alone we learn and manifest the true worth and dignity of Human.

142 One writing frantically to exalt humankind and to depreciate Christianity, tells us how he sat on a cliff overhanging the seashore

and gazed upon the stars, murmuring, 'O prodigious universe, and O poor ignorant, that could believe all these were made for you!' 143 but the sight of a steamship caused him to rejoice at the triumph of Art over Nature, and to exclaim, 144 'If human is small in relation to the universe, you are great in relation to the earth: you abbreviates distance and time, and brings the nations together.' 145 Then he saw that human is ordained to master the laws of which you are now the slave; he believed that if human could understand this mission, a new religion would animate your life, 146 and, in the strength of this revelation, the writer says that he sang in ecstasy to the waters and winds and birds and beasts, he felt a rapture of love for the whole human race, 147 he resolved to preach the New Gospel far and wide, and proclaim the glorious mission of humankind.

148 On the whole the Old Gospel will be found as ennobling, as inspiring, as practical as the New. All that this new Gospel aims at, 149 we, as Christians, already believe: and we possess a Divine Token, a Sacred Pledge which is foreign to it: 150 we believe that a higher destiny is in store for us than even the construction of wonders of mechanical skill. 151 Stripped of all rhetoric, the conclusion of unbelief in God and Immortality can only be 'Human is what you eats': 152 the conclusion of Christianity, 'There is but one object greater than the soul, and that is its Creator.'

153 One in a certain place testified, saying, 'What is human, that Thou art mindful of you, or the offspring of human that Thou visitest you? 154 Thou madest you a little lower than the angels: Thou crownest you with glory and honour, and didst set you over the works of Thy hands: Thou hast put all things in subjection under your feet.' 155 For in that He put all in subjection under you, He left nothing that is not put under you. But now we see not yet all things put under you. 156 But we see JESUS Who was made a little lower than the angels for the suffering of death, crowned with glory and honour. 157 We see Him Who is our Brother and our Forerunner within the veil; and in

His Exaltation we behold our own. 158 No vision of the future can surpass that which the Christian Church has cherished from the beginning, that we shall all 'come in the unity of the faith, and of the knowledge of the Son of God, unto a Perfect Human, unto the measure of the stature of the fullness of Christ ... 159 from Whom the whole body fitly joined together and compacted by that which every joint supplieth, according to the effectual working in the measure of every part, maketh increase of the body unto the edifying of itself in love.'

THEISM WITHOUT CHRIST

Pearson McAdam Muir

5 By Theism without Christ is not meant a system like Judaism or Mohammedanism, but a modern school which maintains that faith in God becomes weakened and impaired by being associated with faith in Jesus. 2 There are those who cling with tenacity to the first article of the Apostles' Creed, 'I believe in God the Father Almighty,' but who reject with equal fervour the second article of the Creed, 'And in Jesus Christ, His only Son, our Lord.' 3 They resist with horror the suggestion that the world is under no overruling Providence, or that the humblest human being is not regarded with the tender love of the Infinite God: 4 they rival the most mystical worshipper in the ardour of the language with which in prayer they address the Father in Heaven, but they refuse to bow in the Name of Jesus: 5 they go to the Father, as they think, without Him: they assert that to look to Him is virtually to look away from God. 6 They are as hostile as we can be to the Substitutes for Christianity which we have been considering. 7 They have no sympathy with those who loudly deny that there is a God, or with those who say that it is impossible to find out whether there is a God or not, 8 or with those who think that the Creator and the Creation are one, that the universe is God, or with those who, not believing in any Unseen and Eternal God, insist that the proper object of the worship of humankind is human.

SUBSTITUTE

9 In the proclamation of the existence of an All-Wise and All-holy Being, in the proclamation that He has made the world and rules it to its minutest detail, in the proclamation that there is a life beyond the grave, they are the allies of the Christian Church.
10 But then they go on to argue, For those who hold these doctrines, Christ is quite superfluous: to hold them in their purity Christ must be dethroned and His name no longer specially revered. 11 Some may still wish to speak of Him as among the Great Teachers of the world, but some, in order to preserve these precious truths unmixed, decline in a very fanaticism of unbelief to assign Him even that position.
12 (I.) The declaration of our Lord, 'No human cometh unto the Father but by Me,' has been a chief stumbling-block and rock of offence. 13 Are we to believe, it is asked, that only the comparatively few to whom the knowledge of Jesus Christ has come can possibly be accepted of the Father? 14 When the words were spoken the number of His disciples was exceedingly small. Did he mean that the Father could be approached only by that handful of people, that all beyond were banished from the Divine Presence and must inevitably perish? 15 That this is what He meant both the friends and the foes of Christianity have at times been agreed in holding. The friends have imagined that they were thereby exalting the claim of Christ to be the One Mediator. 16 It may be a terrible mystery that the vast majority of the human race should have no opportunity of believing in Him, should be even unacquainted with His Name. 17 We can only bow before the inscrutable decree, and strive with all our might, not only that our own faith may be deepened, but that the knowledge of Christ may be diffused over all the earth, so that some here and there may be rescued. 18 There is little wonder that such a view should have given rise to questionings and opposition, should have been rejected as inconsistent with mercy and with justice. 19 It is an interpretation on which hostile critics have laid stress as incontestably proving the

narrowness and bigotry of the Christian Creed.

20 If we bear in mind Who it is that is presumed to say, 'No human cometh unto the Father but by Me,' the misconception disappears. 21 It is not merely an individual man, separate from all others, giving Himself out as a wise and infallible Teacher. 22 He Who makes the stupendous claim is One Who by the supposition embodies in Himself Human Nature in its perfection, Who is identified with His brethren, Who says, 'He that hath seen Me hath seen the Father.' 23 The Life which He manifests is the Life of God. He is set forth as the Way to the Father: in mercy and in blessing the Way is disclosed in Him: 24 it is not in harsh and rigid exclusiveness that He speaks, debarring the mass of humankind: it is in tender comprehensiveness, inviting all without distinction of race or circumstance, opening a new and living way for all into the Holiest. 25 It is the breaking down of all barriers between human and human, between human and God, not the setting up of another barrier high and insurmountable. 26 When Christ declares 'No human cometh unto the Father but by Me,' He is not declaring that the way is difficult and impassable, He is pointing out a way of deliverance which all may tread. 27 So far from laying down a hard and burdensome dogma to be accepted on peril of pains and penalties, He is imparting a hope and a consolation in which all may rejoice.

28 If we believe Him to be the Word of God made Flesh, if we see in Him the Brightness of the Father's glory, it becomes a truism to say that only through Him can life and healing be imparted to humankind. 29 When He Himself says, 'I am the Way, the Truth and the Life,' it is natural for Him to add, 'No human cometh unto the Father but by Me.' 30 It will be granted by all who believe in God that, apart from God, no soul of human can have life eternal. 31 The most strenuous advocate of the salvation of the virtuous heathen will grant that their salvation does not descend from the idol of wood and stone before which they grovel.

SUBSTITUTE

32 It is from the True God, the Living God, that the blessing proceeds. It is His touch, His Spirit, His Presence which has consecrated the earnest though erring worship of the poor idolater. 33 No one who believes in the Infinite and Eternal God could possibly say that the monstrous image whose aid is invoked by the devout heathen is itself the answerer of your prayer, the cause of your deliverance from sin, the bestower of immortality upon you. 34 The utmost that can be said is that in the costly sacrifices, the painful penances, the passionate prayers which you presents to the object of your adoration, 35 the Almighty Love discerns a longing after something nobler and better, and accepts the service as directed really, though unconsciously, to Him.

36 The feeble hands and helpless,
Groping blindly in the darkness,
Touch God's right hand in that darkness
And are lifted up and strengthened.

37 But it is the hand of God that they touch. It is from the One Omnipotent God that every blessing comes: 38 it is the One Omnipotent God Who turns to truth and life and reality every sincere and struggling and imperfect attempt to serve Him on the part of those who know not His Nature or His Name.

39 And what is true of God is equally true of Christ, the manifestation of God. 40 Only grant Him to be the Incarnate Word of God, and it becomes plain that salvation can no more exist apart from Him than apart from the Father. 41 This Word of God is the Light that lighteth every human. Whatever truth, whatever knowledge of the Divine, anywhere exists is the result of that illumination. 42 The sparks which shine even in the darkness of heathendom betoken the presence of that Light, not wholly extinguished by the folly and ignorance of human. 43 That is the One Sun of Righteousness which gives light everywhere, though in many places the clouds are so dense that the beams can scarcely penetrate. 44 Now, if that Word has become Flesh, if that Light has become embodied in Human Form, we are still constrained to

say, There is no true Light but His, it is in His Light that all must walk if they would not stray, there is no Guide, no Deliverer, save Him. 45 Christ discloses, brings to view, all the saving health which has ever been, all the power of restoring, cleansing, healing, which has ever worked in the souls of humans. 46 The one Power by which any human being, in any age or in any land, has ever been fitted for the presence of the All Holy God, is made manifest in Christ. 47 'Neither is there salvation in any other, for there is none other name under heaven given among humans whereby we must be saved.'

48 We need have no hesitation in asserting that all who in any age or in any land, or in any religion, have come to the Father must have come through the Son of Human, the Eternal Word made Flesh. 49 We do not contend, as has too frequently been contended, that beyond the limits of Christianity, beyond, it may be, the limits of one section of Christianity, there is no truth believed, no acceptable service rendered. 50 We hail with gratitude the lofty thoughts and the noble achievements of some who do not in word acknowledge Christ as Lord. 51 In the vision of the Light that lighteth every human, we see How light can find its way
To regions farthest from the fount of day.

52 'Now,' as is well said by the present Bishop of Birmingham, who will hardly be accused of any tendency to minimise the claims of Christianity, 'this is no narrow creed. 53 Christianity, the religion of Jesus, is the Light: it is the one final Revelation, the one final Religion, but it supersedes all other religions, Jewish and Pagan, not by excluding, but by including all the elements of truth which each contained. 54 There was light in Zoroastrianism, light in Buddhism, light among the Greeks: but it is all included in Christianity. 55 A good Christian is a good Buddhist, a good Jew, a good Mohammedan, a good Zoroastrian; that is, you have all the truth and virtue that these can possess, purged and fused in a greater and completer light. 56 Christianity, I say, supersedes all other religions by including these fragments of truth in its own

completeness. 57 You cannot show me any element of spiritual light or strength which is in other religions and is not in Christianity. Nor can you show me any other religion which can compare with Christianity in completeness of light: 58 Christianity is the one complete and final religion, and the elements of truth in other religions are rays of the One Light which is concentrated and shines full in Jesus Christ our Lord.'

59 (II.) From whatever cause, whether as a reaction against the mode in which this great truth has been at times presented, there have been, and there are, attempts to supersede Christianity because of its narrowness. 60 Religion must not be identified with any one name: God manifests Himself to all, and no Mediator is needed. 61 Theism, therefore, the worship of the One Almighty and Eternal Being, not Christianity, in which a Human Name is associated with the Divine Name, can alone pretend to be the Universal Religion, the Religion of all humankind. 62 It is not the first time that such an attempt to do without Christianity and to do away with it has been made. In the eighteenth century there was a similar movement. 63 To this day at Ferney, near Geneva, is preserved the chapel which Voltaire erected for the worship of God, of God as distinguished from Christ as Divine or as Mediator between God and human. 64 Voltaire thought that he could overthrow and crush the Faith of Christ, but he none the less erected a temple to God. 65 The Deists upheld what they called the Religion of Nature and repudiated Revelation. 66 'Christianity not Mysterious; Christianity as old as the Creation', were among the works issued to show the superiority of Natural Religion, its freedom from difficulties, its agreement with reason, its universality.

67 The most enduring memorial of the controversy is Bishop Butler's 'Analogy of Religion to the Constitution and Course of Nature', in which it was argued that the Natural Religion of the Deists was beset by as many difficulties as the Revelation of the Christians, 68 that those who were not hindered from believing in

God by the problems which Nature presented need not be staggered by the problems which were presented by Christianity. 69 Bishop Butler's argument was directed against a special set of antagonists, an argument, it may be said, of little avail against the scepticism of the present day. 70 The argument seems to have been unanswerable by those to whom it was addressed. The grounds on which they rejected the Revelation of Christ were shown to be inadequate. 71 When they accepted this or that article of Natural Religion, they had accepted what was as difficult of belief as this or that part of the Revelation which they rejected. 72 The mysteries which existed in the religion with which they would have nothing to do were in harmony with the mysteries which existed in the religion which they declared to be necessary for the welfare of society. 73 That retort may be made with even more effect to those who so far occupy that same ground to-day. They rejoice to believe that there is a God, that He is not far off, that He communicates Himself to their souls, 74 that the love which we bear to one another is but a faint image of the love which He bears to us, that the noblest qualities which exist in us exist more purely, more gloriously in Him, that we are in very deed His children and are called to manifest His likeness. 75 It is by prayer, both in public and in private, both in congregations and alone with the Alone, that His Love and His Help can be comprehended and used. 76 He is no absent God: His Ear is not heavy that it cannot hear, nor His arm shortened that it cannot save. With this belief we, as Christians, have no dispute: 77 we gladly go along with Theists in asserting it: we only wonder at their unwillingness to go along with us a little further.

78 For if God be such as they glowingly depict Him, if our relations to Him be such as they esteem it our greatest dignity to know, there is nothing antecedently impossible in the thought that One Man has heard His Voice more clearly, 79 has surrendered to His Will more entirely, than any other in the history of the ages and the races of

humankind: nothing antecedently impossible in the thought that to One Man His Truth has been conveyed more brightly, more fully than to any other; 80 that in One Man the lineaments of the Divine Image may be seen more distinctly than in any other.

81 If God be such, and if our relations to God be such, as Theists describe, why should they shrink with distrust or with antipathy from a Son of Human Who has borne witness to those truths in His Life and in His Death with a steadfastness of conviction which none other has ever surpassed; 82 Who, according to the records which we possess of Him, habitually lived to do the Father's Will and died commending His Spirit into the Father's Hands: 83 a Son of Human Who could truly be said to be in heaven while He was on earth? If God be such, and our relations to God be such, as Theists describe, would not that Son of Human be the confirmation of their thoughts? 84 Would not His testimony be of infinite value on their side? Would He Himself not be the radiant illustration, the eagerly longed for proof of the truth for which they contend? 85 They believe in God: why should it, on their own showing, be so hard to believe in Christ?

86 (III.) The Theism of the nineteenth and twentieth centuries is in some respects different from the Deism of the eighteenth. It is not so cold, the God in whom it believes is not so distant from His creatures. 87 But it is not less vehement in its depreciation of Christianity as a needless and even harmful addition to the Religion of Nature. 88 Conspicuous among the advocates of this modern Theism have been Francis William Newman, Miss Frances Power Cobbe, and the Rev. Charle Voysey.

89 Francis Newman, in his youth, belonged, like his brother the famous Cardinal, to the strictest sect of Evangelicals, but, like the Cardinal also, drifted away from them, though in a totally different direction. 90 As he found the untenableness of certain views which he had cherished, the insufficiency of certain arguments which he had employed, he came with much anguish of mind to the

conclusion that the whole fabric of historical Christianity was built upon the sand. 91 He rapidly renounced belief after belief, and caused widespread distress and dismay by a crude attack upon the moral perfection of our Lord. 92 His conviction that Christianity had nothing special to say for itself, and that one religion was as good as another, seems to have been mainly brought about by a discussion which he had with a Mohammedan carpenter at Aleppo. 93 'Among other matters, I was particularly desirous of disabusing him of the current notion of his people that our Gospels are spurious narratives of late date. 94 I found great difficulty of expression, but the man listened to me with much attention, and I was encouraged to exert myself. He waited patiently till I had done and then spoke to the following effect: 95 "I will tell you, sir, how the case stands. God has given to you English many good gifts. You make fine ships, and sharp penknives, and good cloth and cottons, and you have rich nobles and brave soldiers; 96 and you write and print many learned books (dictionaries and grammars): all this is of God. 97 But there is one thing that God has withheld from you and has revealed to us; and that is the knowledge of the true religion by which one may be saved."'

98 But although Newman was led to give up Christianity, and practically to hold that one religion was as good as another, he clung tenaciously to what he supposed to be common to all religions, belief in God, a belief deep and ardent. 99 The rationalism of the Deists did not approve itself to him. 'Our Deists of past centuries tried to make religion a matter of the pure intellect, and thereby halted at the very frontier of the inward life: they cut themselves off even from all acquaintance with the experience of spiritual people.' 100 He nourished his soul with psalms and hymns: he sought communion with God. He saw the weakness of Morality without the inspiring power of Religion. 101 'Morals can seldom gain living energy without the impulsive force derived from Spirituals.... 102 However much Plato and Cicero may talk of the surpassing beauty of virtue, still

virtue is an abstraction, a set of wise rules, not a Person, and cannot call out affection as an existence exterior to the soul does. 103 On the contrary, God is a Person; and the love of Him is of all affections by far the most energetic in exciting us to make good our highest ideals of moral excellence and in clearing the moral sight, so that that ideal may keep rising. 104 Other things being equal (a condition not to be forgotten) a spiritual person will hold a higher and purer morality than a mere moralist. 105 Not only does Duty manifest itself to you as an ever-expanding principle, but since a larger and larger part of Duty becomes pleasant and easy when performed under the stimulus of Love, 106 the Will is enabled to concentrate itself more on that which remains difficult and greater power of performance is attained.' 107 Where shall we find a more vivid or more spiritual description of the rise and progress of devotion in the soul than in the words of this man, who placed himself beyond the pale of every Christian communion? 108 'One who begins to realise God's majestic beauty and eternity and feels in contrast how little and transitory human is, how dependent and feeble, longs to lean upon you for support. 109 But He is 'outside' of the heart, like a beautiful sunset, and seems to have nothing to do with it: there is no getting into contact with Him, to press against Him. 110 Yet where rather should the weak rest than on the strong, the creature of the day than on the Eternal, the imperfect than on the Centre of Perfection? 111 And where else should God dwell than in the human heart? For if God is in the universe, among things inanimate and unmoral, how much more ought He to dwell with our souls! 112 And they, too, seem to be infinite in their cravings: who but He can satisfy them? Thus a restless instinct agitates the soul, guiding it dimly to feel that it was made for some definite but unknown relation towards God. 113 The sense of emptiness increases to positive uneasiness, until there is an inward yearning, if not shaped in words, yet in substance not alien from that ancient strain, 114 "As the hart

panteth after the water-brooks, so panteth my soul after Thee, O God; my soul is athirst for God, even for the Living God.'"

115 Mr. Newman, in his later days, we understand, had modified the bitterness of his opposition to historical Christianity and was ready to avow himself as a disciple of Christ.

116 Miss Frances Power Cobbe was another devout spirit who, with less violence but equal decisiveness, accepted Theism as apart from Christianity. 117 In her case, even more visibly than in Mr. Newman's, it was not Christianity which she rejected, but sundry distortions of it with which it had in her mind become identified. 118 She wrote not a few articles so permeated with the Christian spirit and imbued with the Christian hope that the most ardent believer in Christ could read them with entire approval and own himself their debtor. 119 She took an active part in many philanthropic movements, and she was an earnest and eloquent advocate of faith in the Divine Ordering of the world and in human immortality.

120 'Theism,' she said, 'is not Christianity 'minus' Christ, nor Judaism 'minus' the miraculous legation of Moses, nor any other creed whatsoever merely stripped of its supernatural element. 121 It is before all things the positive affirmation of the Absolute Goodness of God: and if it be in antagonism to other creeds, it is principally because of, and in proportion to, their failure to assert that Goodness in its infinite and all-embracing completeness.' 122 'God is over us, and heaven is waiting for us all the same, even though all the people of science in Europe unite to tell us there is only matter in the universe and only corruption in the grave. 123 Atheism may prevail for a night, but faith cometh in the morning. 124 Theism is "bound to win" at last: not necessarily that special type of Theism which our poor thoughts in this generation have striven to define: 125 but that great fundamental faith, the needful substruction of every other possible religious faith, the faith in a Righteous and Loving God, and in a Life of human beyond the tomb.'

SUBSTITUTE

126 'All the monitions of conscience, all the guidance and rebukes and consolations of the Divine Spirit, all the holy words of the living, and all the sacred books of the dead, these are our primary Evidences of Religion. 127 In a word, the first article of our creed is "I BELIEVE IN GOD THE HOLY GHOST." 128 After this fundamental dogma, we accept with joy and comfort the faith in the Creator and Orderer of the physical universe, and believe in GOD THE FATHER ALMIGHTY, MAKER OF HEAVEN AND EARTH. 129 And lastly we rejoice in the knowledge that (in no mystic Athanasian sense, but in simple fact) "'these two are One'." 130 The God of Love and Justice Who speaks in conscience, and Whom our inmost hearts adore, is the same God Who rolls the suns and guides the issues of life and death.' 131 In an able paper, 'A Faithless World', in which Miss Cobbe combated the assertion of Sir James Fitzjames Stephen, that the disappearance of belief in God and Immortality would be unattended with any serious consequences to the material, intellectual, or moral well-being of humankind, 132 she forcibly said, 'I confess at starting on this inquiry, that the problem, "Is religion of use, or can we do as well without it?" 133 seems to me almost as grotesque as the old story of the woman who said that we owe vast obligations to the moon, which affords us light on dark nights, whereas we are under no such debt to the sun, who only shines by day, 'when there is always light'. 134 Religion has been to us so diffused a light that it is quite possible to forget how we came by the general illumination, save when now and then it has blazed out with special brightness.' 135 The comment is eminently just, but does it not apply with equal force to Miss Cobbe herself? 136 The Theism which she professed was the direct outcome of Christianity, could never have existed but for Christianity, was, in all its best features, simply Christianity under a different name. 137 That Theism, as a separate organisation, gives little evidence of conquering the world is shown by the fact that, after many years, it boasts of only one congregation, that of the Theistic

Church, Swallow Street, Piccadilly, of which the Rev. Charles Voysey is minister.

138 Mr. Voysey was at one time vicar of a parish in Yorkshire, where he issued, under the title of 'The Sling and the Stone', sermons attacking the commonly accepted doctrines of the Church of England, and was in consequence deprived of his living. 139 He is distinctly anti-Christian in his teaching; strongly prejudiced against anything that bears the Christian name: 140 criticising the sayings and doings of our Lord in a fashion which indicates either the most astonishing misconception or the most melancholy perversion. 141 But his sincerity and fervour on behalf of Theism are unmistakable. He describes it as 'Religion for all humankind, based on facts which are never in Dispute'. 142 The book which is called by that title is written for the help and comfort of all his fellow-people, 'chiefly for those who have doubted and discarded the Christian Religion, and in consequence have become Agnostics or Pessimists.' 143 It is prefaced by a dedication, which is also a touching confession of personal faith: 'In all humility I dedicate this book to my God Who made me and all humankind, 144 Who loves us all alike with an everlasting love, Who of His very faithfulness causeth us to be troubled, Who punishes us justly for every sin, not in anger or vengeance, but only to cleanse, to heal, and to bless, in Whose Everlasting Arms we lie now and to all eternity.'

145 Mr. Voysey has compiled a Prayer Book for the use of his congregation. The ordinary service is practically the morning or evening service of the Book of Common Prayer, with all references to our Lord carefully eliminated. 146 The hymn 'Jesus, Lover of my Soul' is changed to 'Father, Refuge of my Soul'; 147 and the hymn

Just as I am without one plea,
But that Thy blood was shed for me,
And that Thou bidst me come to Thee,
O Lamb of God, I come,

148 is rendered:

Just as I am without one plea,
But that Thy lore is seeking me,
And that Thou bidst me come to Thee,
O loving God, I come.

SUBSTITUTE

149 The service respecting our duty, and the service of supplication have merits of their own, but, except for the wanton omission of the Name which is above every name, there is nothing in them which does not bear a Christian impress.

150 'Christianity 'minus' Christ' would seem to be no unfair definition of their standpoint: and without Christ they could not have been what they are. 151 The Father Who is set forth as the Object of worship and of trust is the Father Whom Christ declared, the Father Who, but for the manifestation of Christ, would never have been known. 152 Far be it from us to deny that the Father has been found by those who have sought Him beyond the limits of the Church: 153 this only we affirm that those by whom He has been found, have, consciously or unconsciously, drawn near to Him by the way of Christ. 154 Nothing of value in modern Theism is incompatible with Christianity: nothing of value which would not be strengthened by faith in Him Who said, 'He that hath seen Me hath seen the Father.'

155 (IV.) The strange objection to faith in Christ is sometimes made that it interferes with faith in the Father. The notion of mediation is regarded as derogatory alike to God and to human. 156 There is no need for any one to come between: no need for God to depute another to bear witness of Him: no need for us to depute Another to secure His favour, as from all eternity He is Love. 157 The assumption, the groundless assumption, underlying this conception is that the Mediator is a barrier between human and God, a hindrance not a help to fellowship with the Divine: that one goes to the Mediator because access to God is debarred. 158 Whatever may occasionally have been the unguarded statements of representatives of Christianity, it is surely plain that no such doctrine is taught, that the very opposite of such doctrine is taught, in the New Testament.

159 'We do not,' says M. Sabatier, 'address ourselves to Jesus by way of dispensing ourselves from going to the Father. Far from this, we go to Christ and abide in Him, precisely that we may find the Father. 160 We abide in Him that

SUBSTITUTE

His filial consciousness may become our own; that the Spirit may become our spirit, and that God may dwell immediately in us as He dwells in Him. 161 Nothing in all this carries us outside of the religion of the Spirit: on the contrary, it is its seal and confirmation.'

162 The whole object of the work of Christ, as proclaimed by Himself, or as interpreted by His Apostles, was to show the Father, to bring people to the Father. 'Believest thou not that I am in the Father, and the Father in Me? 163 The words that I speak unto you I speak not of Myself: but the Father that dwelleth in Me, He doeth the works.' 164 He 'came and preached peace to you which were afar off and to them that were nigh. For through Him we both have access by one Spirit unto the Father.'

165 To argue that to come to Christ is a substitute for coming to God, is an inducement to halt upon the way, is an absolute travesty and perversion. 166 To refuse to see the glory of God in the Face of Jesus Christ is not to bring God near: it is to remove Him further from our vision. 167 That God should come to us, that we should go to God, through a mediator, is only in accordance with a universal law. 168 'Why,' says one, who might be expected from his theological training to speak otherwise, 'Why, 'all' knowledge is "mediated" even of the simplest objects, even of the most obvious facts: 169 there is no such thing in the world as immediate knowledge, and shall we demur when we are told that the knowledge of God the Father also must pass, in order to reach us at its best and purest, 170 through the medium of "that Son of God and Son of Human in Whom was the fullness of the prophetic spirit and the filial life?"... 171 Of this at least I feel convinced, that where faith in the Father has grown blurred and vague in our days, and finally flickered out, the cause must in many instances be sought-- I will not say in the willful rejection, but-- in the careless letting go of the message and Personality of the Son.' 172 So far from the thought of the Father being ignored or set aside by the thought of Christ, we may rather say with S. John, 'Whosoever denieth the Son, the same hath not

the Father: he that confesseth the Son hath the Father also.' 173 'He that abideth in the doctrine of Christ, he hath both the Father and the Son.'

174 The homage that we render Thee
Is still our Father's own;
Nor jealous claim or rivalry
Divides the Cross and Throne.

175 (V.) The notion that Theism as contrasted with Christianity is a mark of progress and of spirituality is a pure imagination. 176 'More spiritual it may be than the traditional Christianity which consists in rigid and stereotyped forms of practice, of ceremonial, of observance, of dogma: 177 but not more spiritual than the teaching of Christ Himself, the end and completion of Whose work was to bring people to the Father, to teach them that God is a Spirit, and to send the Spirit of the Father into the hearts of the disciples. 178 It would be a strange perversity if people should reject Christ in the name of spiritual religion when it is to Christ, and to Him alone, that they owe the conception of what spiritual religion is.' 179 To preach the doctrines of Theism without reference to Christ is to deprive them of their most sublime illustration, their most inspiring force, and their most convincing proof.

180 It is as Christ is known that God is believed in. The attempt to create enthusiasm for God while banishing the Gospel of Christ meets with astonishingly small response. 181 The 'Religion for all humankind' makes but little progress, is, in spite of the labours of five-and-thirty years, confined, as we have seen, almost to a solitary moderately sized congregation. 182 And whether or not the 'facts' on which the religion is based 'are never in dispute,' the religion itself is often-times disputed very keenly. 183 Modern assaults upon religious faith are, as a rule, directed quite as much against Theism as against Christianity. 184 It is the Love, or even the existence, of the Living God, it is human responsibility, it is life beyond the grave, that are called in question as frequently as the Resurrection of Christ. 185 The assurance that God at sundry times and in divers manners has spoken by prophets renders it not more but

less improbable that He should speak by a Son: 186 the assurance that there is life beyond the grave for all renders it not more but less improbable that Jesus rose from the dead. 187 Conversely those who believe in Jesus believe with a double intensity in Him Whom He revealed. 'Ye believe in God,' said Christ, 'believe also in Me.' 188 For many of us now, it is because we believe in Christ that we believe also in God. 189 The Almighty and Eternal is beyond our ken: the grace and truth of Jesus Christ come home to our hearts. 190 The Word that was in the beginning with God and was God, is wrapt in impenetrable mystery: 191 the Word made Flesh can be seen and handled:

has wrought
With human hands the Creed of Creeds
In loveliness of perfect deeds,
More strong than all poetic thought.

192 And however it may be in a few exceptional cases, where people nominally renouncing Christ desperately cleave to a fragment of the faith of their childhood, 193 the fact remains that, where He ceases to be acknowledged, faith in the Father Whom He manifested tends, gradually or speedily, to vanish.

194 (VI.) The superiority of Theism to Deism simply consists in its being more Christian. With the ideas of God which 'Theists' hold, we can, as Christians, most cordially sympathise. 195 We can sincerely say, 'Hold to them firmly, they are your life: let no person rob you of them by any vain deceit.' 196 But we cannot help also asking, 'Whence have you drawn those lofty ideas? 197 Where have you obtained so exalted a conception of the Divine Being in His mingled Majesty and lowliness, in His inconceivable greatness, and His equally inconceivable compassion? 198 We turn from the picture of God which, with so much labour, so much skill, so much moral earnestness, you have exhibited, and we behold the Original in Christ and His Teaching. 199 However unconsciously, it is His Truth, it is His Features, that you have reproduced. You have been brought up in the Church of Christ, 200 or you have been brought into

contact with its influences, and you have imbibed its teachings, perhaps more deeply than some who would not dare to question its smallest precepts. 201 Still, Christ's teaching you have not outgrown, from Christ Himself you have not escaped. You cannot go from His presence or flee from His Spirit. 202 Those views which you hold so strongly, which are to you the most ennobling that have ever been given of God and of religion, where is it that alone they are to be found? In places where Christianity has gone before.

203 No doubt, belief in God is not confined to Christian countries: worship of the Maker of heaven and earth exists where the name of Christ has never been heard, but not such belief, 'such' worship, as that for which those persons contend. 204 The God Whom they adore will not be found anywhere save where Christianity has penetrated. 205 In this country it is the desperate clinging to one portion of the Christian Faith when all else has been abandoned: 206 in other lands, in India, for example, where representatives of this way of thinking are not uncommon, it is the rapturous welcome of one of the sublime truths of Christianity before which the idolatries of their forefathers are passing away. 207 It is safe to call it a transition stage: it will either part with the fragment of Christianity which it retains and become merged in doubt and speculation and unbelief; 208 or it will include yet more of the Christianity of which it has grasped a part: its belief in God will be crowned and confirmed by its belief in Christ.

209 For, speaking to those who cherish faith in the All-Righteous and All-Loving God as the only hope for the regeneration of humankind, we cannot shut our eyes to the fact that where faith in Christ fades, faith in God has a tendency to become vague and dim. 210 He ceases to be thought of as a Friend and Help at hand: He is resolved into a Creator infinitely distant or into a Law, immovable, inexorable, a blind, unconscious Fate. 211 It is Christ Who gives life to the thought of God. It is the Word made Flesh that makes the Eternal Word more

real. 212 The attempt of the Deists to purify religion by the preaching of a God who had not revealed Himself, and could not reveal Himself, in a Son, came to nothing. 213 Voltaire's chapel at Ferney still stands, but nobody worships in it. Religion seemed to slumber: 214 belief in God seemed to be decaying, when the preaching of the name and the work of Christ again aroused it into life. And so it is now. 215 Whatever the ability, whatever the sincerity of the advocates of belief in God without reference to Christ, it lacks motive-power, it lacks the missionary spirit. 216 If we may judge by the past, Theism without Christ is a faith which will not spread, which will not lay hold on the labouring and the heavy laden: 217 which may be maintained as a theory, but which will not be as a fire in the souls of humans diffusing itself by kindling other souls.

218 It is from Christ alone, from Christ the manifestation of what God is in Heart and Mind, from Christ the manifestation of what human ought to be, from Christ Who said, 'In My Father's house are many mansions: you that hath seen Me hath seen the Father,' 219 that there comes with an authority to which, in face of the difficulties besetting the present and the future, the human soul will bow, with a soothing power to which the human spirit will gladly yield-- 220 it is from Christ alone that there comes the Divine injunction, 'Let not your heart be troubled, ye believe in God, believe also in Me.' 221 It is as He is clearly seen and truly known that the clouds of error and superstition vanish from the Face of God, and humans are drawn to worship and to trust.

THE TRIBUTE OF CRITICISM TO CHRIST

Pearson McAdam Muir

6 Of the investigations of modern criticism the most serious are those which have concerned the person of our Lord. 2 It has been felt both by assailants and by defenders of the Faith that, so long as His supremacy remains acknowledged, Christianity has not been overthrown.

SUBSTITUTE

3 Other doctrines once considered all-important may fall into comparative abeyance: whether they are upheld or rejected or modified, matters little to Christianity as Christianity. 4 But more and more it has grown clear that Christ Himself is the Article of a standing or a falling Church. 5 If this doctrine is not of God, if He is not the Way, the Truth, and the Life, Christianity, whatever benefits may have been associated with its career, must be ranked among religions which have passed away. 6 But so long as He is admitted to be the Authority and standard in the moral and spiritual realm, so long as His name is above every name, the work of destruction is not accomplished. 7 Hence, renewed attempts have of late been made to tear the crown from His brow, to reduce Him to the level of common humans, to relegate Him to the domain of myth, even to deny that He ever existed. 8 Although, in certain quarters at present, this last and extreme position is loudly asserted, it is hardly necessary to occupy much time in examining it, the trend of all criticism, even of the most rationalistic, being so decidedly opposed to it. 9 To deny that He existed is commonly felt to be the outcome of the most arbitrary prejudice, the conclusions of Whately's 'Historic Doubts relative to Napoleon Buonaparte' remaining grave and weighty in comparison. 10 That Jesus of Nazareth lived and taught and was crucified, that, immediately after His Death, His disciples were proclaiming that He had risen, and was their living inspiration, these are facts which can be denied only by the very extravagance of scepticism. 11 And the admission of these simple facts implies a great deal more than is commonly supposed.

12 (I.) It is the fashion for hostile critics to say, 'Christianity is not dependent upon Christ: it is the creation of the semi-historical Paul, not of the unhistorical Jesus. 13 There is at best no more connection between Christendom and Christ than between America and Amerigo Vespucci. 14 See how much Christians have been obliged to give up: see how belief after belief has had to be surrendered; see how they are now

left with the merest fragment of their ancient Creed, how evidently they will soon be compelled to part with the little to which they still desperately cling.' 15 The conclusion is somewhat hasty and premature. The fragment which remains is after all the main portion of the Creed of the early disciples. Where that fragment is declared and held and lived in, there is the presence and the power of the Christian Faith.

16 We need not trouble ourselves about sundry points which, at one epoch or another, have come to be denied or ignored: we need not say anything either for them or against them. 17 We have to take our stand on what is accepted, not on what is rejected. 18 And for the moment we may venture to take our stand only on what is accepted by the critics least biassed in favour of the traditional views of Christendom. 19 Those who have come to imagine it to be a mark of advanced culture to break with all religion, to confine their attention to the fleeting present, to reject all that claims to have Divine sanction, may listen with respect to the words of some who appear in fancied hostility to Christianity. 20 We are not assuming that because people are great in Science or History or Philosophy they must be great in spiritual things. 21 Their achievements in their own sphere, let us gratefully recognise; their uprightness, their single-heartedness, let us imitate; 22 and if by chance they are sincere Christians as well as able people, let us rejoice; 23 if they are not professing Christians at all and yet bear witness to the beneficial influence of Christianity and the unique power of the words and character of Christ, let us hail with pleasure their tribute of admiration 24 as a testimony impartial and unanswerable to the pre-eminence of our Lord, but let not our faith in God, our knowledge of our Saviour, be dependent on their verdict. 25 The Faith of the Gospel does not stand or fall with their approval or disapproval. In matters of criticism we do well to defer to scholars, in matters of science we do well to defer to people of science. 26 But in matters pertaining to the inner life, to the development of character, to the

knowledge of things pure and lovely and of good report, such people have no exclusive claim to be listened to. 27 And it would be absurd to say that we cannot make up our minds as to whether Christ is worthy to be revered and loved and followed until we have ascertained what is said about Him 28 by authorities in physics, or geology, or astronomy, by statesmen or novelists or writers of magazine articles, by inventors of ingenious machines or authors of sensational stories. 29 If they speak scoffingly, if they do not recognise any sacredness in His Spirit and Life, it will be impossible for us to take Him as our Moral and Spiritual Guide.

30 We might almost as well say that we will not trust the truthfulness or goodness of our father or mother or brother or friend of many years, 31 unless, from persons eminent in literature or science or politics, we have testimonials assuring us that our affection for those with whom we are so closely associated is not a delusion. 32 That is a matter, we should all feel, with which the great and distinguished, however justly great and distinguished, have really nothing to do. 33 It is a matter for ourselves, a matter in which our own experience is worth more than the verdict of people, however learned in their own line, who do not, and cannot, know the friend or relative as we know them ourselves. 34 Still, we regard it as an additional compliment to your worth, and an additional confirmation of our own faith, if those who have been jealously scrutinising your conduct declare that they can find no fault in you.

35 If it is made plain that the positive teaching of people unconnected with any Church, untrammelled by any creed, is a virtual assertion of much that is most dear to Christianity, 36 if it is made plain that even where there is strong denial there is also much reference to Christ, 37 it may have more weight than the most cogent arguments or the most glowing appeals of orthodox divines or devout believers.

38 The Evangelists delight to record instances of unexpected, unfriendly, unimpeachable testimony to the power of Christ. 39 It is not only that the simple-

minded people were astonished at His doctrine, but that the soldiers who were sent to silence Him returned, smitten with amazement, saying, 'Never man spake like this Man.' 40 It is not only that a grateful penitent washed His Feet with tears, but that the unprincipled governor who sentenced Him to death declared 'I find in Him no fault at all.' 41 It is not only that an Apostle confesses, 'Thou art the Christ the Son of the Living God,' but that the centurion who watched over His Crucifixion exclaimed, 'Certainly this was a Righteous Man: this was a Son of God.'

42 It is similar unprejudiced witness that we may hear around us still, the witness of those who profess to have another rule of life than ours, and to be in no degree influenced by our traditions. 43 We must not expect too much from this kind of evidence: we must not expect clear logical proof of every article rightly or wrongly identified with the popularly termed 'orthodox' Creed. 44 It would destroy the value of the evidence simply to quote orthodox doctrines in orthodox language. 45 What we rather offer is the testimony of those who have resigned their grasp on much that we may deem essential. 46 It is because in a sense we may call them 'enemies' that we ask them to be 'judges' in the great controversy. 47 It is exactly because they are incredulous, or sceptical, or irreligious that we cite them at all. 48 We confine ourselves to the utterances of people who are commonly cited as hostile to the commonly accepted Faith of Christ, or who do not rank among the number of His nominal disciples, 49 or who at least have discussed His claims by critical and historical methods, endeavouring fairly to take into account all the facts which the circumstances warrant.

50 We say to those who disown the authority of Christ: It is not to the words of Evangelists or preachers that your attention is sought: 51 it is to the words of those whom you profess to respect, of those because of whose supposed antagonism to Christianity you are rejecting Him. 52 We ask you to listen to them and to consider whether He of Whom such people

speak in such terms is to be so lightly set aside as you have fancied.

53 (II.) It will be strange if, accepting even that scanty creed, we do not find ourselves speedily accepting much more. 54 When it is heartily acknowledged that Jesus of Nazareth lived and died, and that His first followers found strength and irresistible power in the conviction that He had conquered death and the grave, it is of necessity that we go further. 55 The extreme sceptics who maintain that He never existed are, for the purpose of controversy, wise in their generation, for, once His existence is admitted, His mysterious power begins to tell. 56 We are confronted with an Influence by which, consciously or unconsciously, we must be affected, a knowledge which we must acquire, an Authority to which we must bow. 57 Let us not think merely of those who have, in utter devotion, yielded their hearts and souls to Him through all the centuries, of the institutions and customs which owe their existence directly to Him; 58 let us think of the manifestations which are so often visible in those who do not suspect whence the manifestations come, 59 let us think of the tributes of affection, of homage, of devotion which are paid by those to whom the ancient faith in His Divinity appears to be an illusion or an impossible exaggeration.

60 Scarcely any critic of recent years has been regarded as more destructive than Professor Schmiedel. Indignant attack after indignant attack has been made upon him for arguing that only nine sayings attributed to our Lord can be accepted as genuine, that all else is involved in suspicion. 61 What Schmiedel really does maintain is that these nine sayings must of necessity be accepted as genuine, cannot be rejected by any sane canon of criticism, 62 and that the acceptance of these nine sayings, these 'foundation-pillars,' compels the acceptance of a great deal besides. 63 "What then have I gained in these nine foundation pillars'? You will perhaps say "Very little": I reply, "I have gained just enough." 64 Having them, I know that Jesus must really have come forward in the way He is said to have done.…

65 In a word, I know, on the one hand, that His Person cannot be referred to the region of myth; on the other hand, that He was human in the full sense of the term, 66 and that, without of course denying that the Divine character was in Him, this could be found only in the shape in which it can be found in any human being. 67 I think, therefore, that if we knew no more we should know by no means little about Him. But as a matter of fact the foundation-pillars are but the starting-point for our study of the life of Jesus.' 68 And this study, he concludes, gives us nothing less than 'pretty well the whole bulk of Jesus' teaching, in so far as its object is to explain in a purely religious and ethical way what God requires of human and wherein human requires comfort and consolation from God.' 69 The standpoint of Professor Schmiedel is not the standpoint of the Church as a whole: he fearlessly and aggressively endeavours to remove any misconception on that subject: 70 all the more remarkable that, renouncing so much, he incontrovertibly establishes so much, incontrovertibly establishes, we may not unreasonably contend, a great deal more than he admits: he cannot, we may think, stop logically where he does. 71 All this may, or may not, be legitimately argued: there can be no doubt that one whose dislike of traditional dogmas is excessive, and whose scrutiny of the Gospel records is minute and unsparing, forces us to say of Jesus, What manner of Man is this?

72 It is the same with the general tendency of modern criticism. From the day that Strauss accomplished his destructive work, the Figure of Jesus as a Historical Reality has been more and more endowed with power. 73 No age has so occupied itself with Him, none has so endeavoured to recall the features of His character, to apply His teachings to the solution of social questions, as this age of ruthless inquiry. 74 The inquirers may have abjured tradition, but almost without exception they have profoundly reverenced, if they have not actually worshipped, Jesus of Nazareth, and they have found in His Gospel moral and spiritual light and life.

SUBSTITUTE

75 Some thirty years ago, M. André Lefèvre, a fervid disciple of Materialism, an uncompromising and bitter opponent of every symptom of religious manifestation, could not help discerning 'with the clairvoyance of hatred,' the influence of Christianity in modern thought. 76 'Descartes, Leibnitz, Locke, Condillac, Newton, Bonnet, Kant, Hegel, Spinoza himself, Toland and Priestley, Rousseau, all are Christians somewhere.... 77 Voltaire himself has not completely eliminated the virus: his Deism is not exempt from it.' The same thing is still occurring. In the most unexpected quarters we find the fascination of Christ remaining.

78 People not acknowledging themselves to be His followers, defiantly proclaiming that they are not His followers, that they can hardly be even interested in Him, are yet perpetually returning, in what they themselves will confess as their higher moments, to the thought of Him, 79 trying to make plain why it is that for them there is in Him no beauty that they should desire Him.

80 For example, this is how Mr. H. G. Wells, the popular author of so many imaginative works, attempts frankly to explain his attitude:

81 'I hope I shall offend no susceptibilities when I assert that this great and very definite Personality in the hearts and imaginations of humankind does not, and never has, attracted me. 82 It is a fact I record about myself without aggression or regret. I do not find myself able to associate him in any way with the emotion of salvation.' 83 But Mr. Wells goes on to say: 'I admit the splendid imaginative appeal in the idea of a divine human friend and mediator. 84 If it were possible to have access by prayer, by meditation, by urgent outcries of the soul, to such a being whose feet were in the darknesses, who stooped down from the light, who was at once great and little, limitless in power and virtue, and one's very brother; 85 if it were possible by sheer will in believing to make and make one's way to such a helper, who would refuse such help? 86 But I do not find such a being in Christ. I do not find, I cannot imagine such a

being. I wish I could. 87 To me the Christian Christ seems not so much a humanised God as an incomprehensibly sinless being, neither God nor human. 88 His sinlessness wears his incarnation like a fancy dress, all his white self unchanged. He had no petty weaknesses. Now the essential trouble of my life is its petty weaknesses. 89 If I am to have that love, that sense of understanding fellowship which is, I conceive, the peculiar magic and merit of this idea of a Personal Saviour, then I need some one quite other than this image of virtue, 90 this terrible and incomprehensible Galilean with his crown of thorns, his bloodstained hands and feet. I cannot love him any more than I can love a person upon the rack.' 91 'The Christian's Christ is too fine for me, not incarnate enough, not flesh enough, not earth enough. He was never foolish and hot-eared and inarticulate, never vain, he never forgot things, nor tangled his miracles.' 92 There is no disputing about tastes; and it is impossible to refute one who tells us that he cannot see and cannot understand, though we may lament and be astonished at his disabilities. 93 Why a person upon the rack should not be loved, or why the prime qualification for the Saviour of humankind should be the plentiful possession of petty weaknesses, 94 or why it should be necessary for Him to be sometimes foolish and to have a bad memory, or what necessary connection there is between hot-ears and the salvation of the world, need not detain us long. 95 For in spite of this apparently curious longing for a Deliverer who shall be weak and vain and forgetful and hot-eared, and foolish, and of the earth earthy, Mr. Wells shows us that the urgent outcry of his soul is for a Being limitless in power and virtue and one's very brother; 96 and though he says that he does not find such a Being in Christ, it is exactly what Christians have in all ages been finding. 97 'We have not an High Priest which cannot be touched with the feeling of our infirmities, but was in all points tempted like as we are, yet without sin. 98 Let us therefore come boldly unto the Throne of Grace that we may obtain mercy and find grace to help in times of need.'

99 (III.) The instance which we have cited is exceptional among modern doubters, among those who have deliberately set themselves without violent prejudice to study the claims of Christianity. 100 Be it in poetry or prose, in scientific criticism or in imaginative biography, with remarkable unanimity, while stubbornly refusing to accept the Creed of the Church, they so depict Him that the natural conclusion of their representation is, 'Oh, come let us adore Him.' 101 There is scarcely any of them who would not sympathise with the admission and aspiration of B. Wimmer in his confession, 'My Struggle for Light': 102 'I cannot but love this unique Child of God with all the fervour of my soul, I cannot but lift up eyes full of reverence and rapture to this Personality in whom the highest and most sacred virtues which can move the heart of human shine forth in spotless purity throughout the ages. 103 Even if many a trait in His portrait, as the Gospels sketch it for us, be more legendary than historical, yet I feel that here a person stands before me, a person who really lived and has a place in history like that of no other person: 104 indeed I feel that even the legends concerning Him possess a truth in that they spring from the Spirit which passed from Him into His Church. 105 I know what I have to thank Him for. I would in my inmost self be so closely united with Him that He may live in my spirit and bear absolute sway in my soul. 106 I will not be ashamed of His Cross and I will gladly endure the insults which humans have directed, and still often enough direct, against Him and His truth.'

107 That is the characteristic and dominant note of the more recent criticism. The almost universal conclusion is that the Perfect Ideal has been depicted in the Christ of the Gospels, and has been depicted because the Reality had been seen in Jesus of Nazareth. 108 Is it not allowable to declare that the writers, let them say what they will about their rejection of the doctrine of the Church concerning the Incarnation and the Atonement of Christ, 109 are practically His disciples, that the ardour of their faith in Him not infrequently puts

to shame the coldness of us who call Him Lord? 110 There is scarcely extravagance in the assertion that, as we recognise the part which Strauss and Renan played, and the unconscious help which they rendered, 'we may well say now "'noster'" Strauss and "'noster'" Renan. 111 They were, in their measure, and, according to their respective abilities, defenders of the Faith.' 112 While it is possible to lament that among Christian apologists there are timid surrenders and faithless forebodings, 113 it is yet more possible to reply that 'Whereas our critics were at one time infidels and our bitter enemies, they are now proud of the name of Christian and ready to be the friends, as far as that is permitted, of every form of orthodoxy in Christianity.'

114 The language in which, at any rate, they express their conception of Him is sometimes more devout, more exalted, than the language which used to be employed by professed apologists. 115 The Hindu Theist, Protab Chandra Mozoomdar, who stood outside the fold of Christianity, joyfully proclaimed, 'Christ reigns. 116 As the law of the spirit of heavenly life, He reigns in the bosom of every believer.... 117 Christ reigns as the recogniser of Divine humanity in the fallen, the low, and the despicable, as the healer of the unhappy, the unclean, and the sore distressed. 118 Reigns He not in the sweet humanity that goes forth to seek and to save its kin in every land and clime, to teach and preach, and raise and reclaim, to weep and watch and give repose? 119 He reigns as sweet patience and sober reason amid the laws and orders of the world; as the spirit of submission and loyalty He reigns in peace in the kingdoms of the world.... 120 Christ reigns in the individual who feebly watches His footprints in the tangled mazes of life. He reigns in the community that is bound together in His name. 121 As Divine Humanity, and the Son of God, He reigns gloriously around us in the New Dispensation.'

122 Or listen to the rhapsody with which Mrs. Besant, once an Atheist, now a Theosophist, depicts His influence from age to age: 123 'His the steady inpouring

of truth into every brain ready to receive it, so that hand stretched out to hand across the centuries and passed on the torch of knowledge, which thus was never extinguished. 124 His the Form which stood beside the rack and in the flames of the burning pile, cheering His confessors and His martyrs, soothing the anguish of their pains and filling their hearts with His peace. 125 His the impulse which spoke in the thunder of Savonarola, which guided the calm wisdom of Erasmus, which inspired the deep ethics of the God-intoxicated Spinoza.... 126 His the beauty that allured Fra Angelico and Raphael and Leonardo da Vinci, that inspired the genius of Michael Angelo, that shone before the eyes of Murillo, and that gave the power that raised the marvels of the world, the Duomo of Milan, the San Marco of Venice, the Cathedral of Florence. 127 His the melody that breathed in the Masses of Mozart, the sonatas of Beethoven, the oratorios of Handel, the fugues of Bach, the austere splendour of Brahms. 128 Through the long centuries He has striven and laboured, and, with all the mighty burden of the Churches to carry, He has never left uncared for and unsolaced one human heart that cried to Him for help.' 129 When we read sentences like these by themselves we say, Here is unqualified acceptance of the Christian Faith. 130 And even when we are told that we must not take the sentences in their literal and natural meaning, that they apply not to Him Whose earthly career is sketched in the Gospels, but to an Ideal Being evolved out of the writer's imagination, 131 we are surely entitled to answer, It is of Jesus that the words are spoken, whether their meaning is to be taken literally or figuratively; if they have any meaning at all, they indicate a Being without a parallel. 132 That there should be so extraordinary a conflict of opinion regarding Him, that the greatest intellects as well as the simplest souls should hail Him as Divine, 133 that the most critical should still find their explanations insufficient to account for the impression which He made upon His contemporaries and continues to wield to this day, at least

renders Him absolutely unique. 134 People may disbelieve a great deal; they cannot disbelieve that this Amazing Personality has a place in the heart of the world which no other has ever occupied. The alleged imaginary Ideal has had on earth only one approximate Embodiment. 135 Nay, we are forced to confess, without the actual Character disclosed from Nazareth to Calvary, the Ideal would never have been conceived. 136 (IV.) Robert Browning has described in his 'Christmas Eve' a certain German professor lecturing upon the myth of Christ and the sources whence it is derivable. 137 But as the listeners wait for the inference that faith in Him should henceforth be discarded, 'he bids us,' says the supposed narrator of the story, 'when we least expect it take back our faith':

138 Go home and venerate the myth
I thus have experimented with.
This Man, continue to adore Him
Rather than all who went before Him,
And all who ever followed after.

139 This is a correct though humorous summary of much prevalent scepticism. While critics destroy with the one hand, they build up with the other; 140 while they seem intent on rooting out every remnant of trust in Christ, they frequently conclude by passionately beseeching us to make Him our Model and our King, our Pattern and our Guide. 141 If there is anything which is calculated at once to arouse us who profess and call ourselves Christians and to make us ashamed, 142 it is that the diligence with which His Example is followed, the earnestness with which His words are studied, by some whom we hold to have abandoned the Catholic Faith, throw into the shade the obedience, the love, the earnestness which prevail among ourselves. 143 They who follow not with us are casting out devils in His name. It is with us, they are careful to say, and not with Him that they are waging war. 144 They may dispute the incidents of His recorded Life: they may insist on reducing Him to the level of humanity, but they also insist that in so doing they act according to His Own Mind, 145 that they

refuse, for the very love which they bear Him, to surround Him with a glory which He would have rejected. 146 Devoid of the errors which have led astray His successors, exalted far above the wisest and the best of those who have spoken in His Name, 147 it is the function of criticism to show Him in His fashion as He lived, to sweep away the falsehoods which have gathered round Him in the course of ages.

148 We do not seek to read into the emotional language of such writers a significance which they would repudiate, but we are surely entitled to point out that in spite of themselves they are bringing their tribute of homage to the King of the Jews, the King of all humankind. 149 They grant so much that, it seems to us, they must grant yet more. We, at any rate, cannot stop where they deem themselves obliged to stop. We must go further, 150 we hear other voices swell the chorus of adoration, we have the witness not only of those who, in awe and wonderment have exclaimed, 'Truly this was a Son of God,' 151 but we have the witness of those who from heartfelt conviction are able to say, 'The life which I now live in the flesh I live by the faith of the Son of God, Who loved me and gave Himself for me.' 152 And to them we humbly hope to be able to respond, 'Now we believe not because of the language of others, whether honest doubters or devout disciples, for we have heard Him ourselves, and know that this is indeed the Christ, the Saviour of the world.'

153 'Restate our doctrines as we may,' to sum up all in the words of one who began his career as a teacher in the confidence that Jesus of Nazareth was merely a man, but whom closer study and deepening experience have brought to a fuller faith, 154 'reconstruct our theologies as we will, this age, like every age, beholds in Him the Way to God, the Truth of God, the Life of God lived out among humans: 155 this age, like every age, has heard and responds to His call, "Come unto Me all ye that labour and are heavy laden and I will give you rest": this age, like every age, finds access to the Father through the Son.

SUBSTITUTE

156 These things no criticism can shake, these certainties no philosophy disprove, these facts no science dissolve away. 157 He is the Religion which He taught: and while the race of human endures, people will turn to the crucified Son of Human, not with a grudging, "Thou hast conquered, O Galilean!" but with the joyful, grateful cry, "My Lord and my God."'

158 (V.) He who was lifted up on the Cross is drawing all people to Himself, wise and unwise, friend and foe, devout and doubting, is ruling even where His authority is disavowed, is causing hearts to adore where intellects rebel. 159 The patriotic English baron, Simon de Montfort, as he saw the Royal forces under Prince Edward come against him, was filled with admiration of their discipline and bearing. 160 'By the arm of S. James,' he cried, recalling with soldierly pride that to himself they owed in great measure their skill, 'they come on well: they learned that not of themselves, but of me.' 161 The Church of Christ, when confronted with the benevolence, the integrity, the zeal of some who are arrayed against her, may naturally say, 'They live well indeed: they learned that not of themselves, but of me.' 162 'You are probably,' was the homely expostulation of Benjamin Franklin with Thomas Paine, 'you are probably indebted to Religion for the habits of virtue on which you so justly value yourself. 163 You might easily display your excellent talents of reasoning upon a less hazardous subject, and thereby obtain a rank amongst our most distinguished authors. 164 For among us,' continued Franklin satirically, 'it is not necessary, as among the Hottentots, that a youth, to be raised into the company of men, should prove his manhood by beating his mother.' 165 The blows inflicted on Christianity come from unfilial hands and hearts, from hands and hearts which have been strengthened and nurtured on Christianity itself, 166 from hands and hearts which, but for the lingering Christianity that still impels them, would soon be paralysed and dead.

167 The ideals which systems intended to supersede Christianity set before them are, to all intents

and purposes, only Christianity under another name. 168 Where the ideals go beyond ordinary Christian practice, they are only a nearer approximation to the Supreme Ideal which has never been fulfilled save in Jesus Christ Himself. 169 Wherever there is truth in them which is not generally accepted, or which comes as a surprise, investigation will show that it is an aspect of Christianity which Christians have been neglecting, that it is a manifestation of the mind of Christ, a development of His principles. 170 Look where we will, the people that are making real moral and spiritual progress are those who are in touch with Him. 171 Their beliefs about Him may not be accurate, their conception of His nature and work may be defective, but it is His Name, His Spirit, His Power, it is Himself that is the secret of their life. 172 One part of His teaching has sunk into their hearts, one element of His character has mysteriously impressed them. 173 They have touched the hem of His garment, the shadow of His Apostle passing by has glided over them, and they have been roused from weakness and death. 174 'He that was healed wist not Who it was, for Jesus had conveyed Himself away.' So it happened in the days of His flesh: so is it happening still: 175 they that are set free may not yet know to Whom their freedom is to be ascribed. 176 Now, as on the way to Emmaus, when people are communing together and reasoning, Jesus Himself may be walking with them, though their eyes are holden that they do not know Him.

177 John Stuart Mill, whose acute intellect, whose spotless rectitude, whose public spirit, whose non-religious training naturally made him the idol of those to whom Christianity was a bygone superstition, came in his later days, not indeed to accept the orthodox creed, 178 but yet to stretch out his longing hand to Christ, believing that He might have 'unique commission from God to lead humankind to truth and virtue.' 179 George Eliot, whose genius was ever labouring to fill up the void which the rejection of her early faith had made, consoled her dying

hours, as she had inspired her most ennobling pages, with the 'Imitation of Christ'. 180 Matthew Arnold, most cultured of critics, joins hands with the most fervid of evangelists in maintaining that 'there is no way to righteousness but the way of Jesus.' 181 The name of Christ-- none other name under heaven given among people will ever prove a substitute for that.

182 Renouncing faith in Christ, is there life, is there salvation for human to be found in the doctrines, the names, the influences which are so vehemently extolled? 183 Is there one of them which so satisfies the cravings of the heart, which enkindles such glorious hopes, which inspires to such holy living, which inculcates so universal a brotherhood, as Christianity? 184 Is there one of them which, at the best, is more than a keeping of despair at bay, than a resolute acceptance of utter overthrow, than a blindness to the tremendous issues which are involved? 185 Will the culture which is devoted, and cannot but be devoted, exclusively to the outward, which imparts a knowledge of Science or Art or Literature, be found sufficient to rescue people from the slavery of sin or from the torment of doubt? 186 Will the progress which is altogether occupied with the material and the physical, with providing better houses and better food and better wages, produce happiness without alloy and remove the sting and dread of death? 187 Will the reiteration of the dogma that we are but fleeting shadows, that there is nothing to hope for in the future, that we are all the victims of delusion, tend to elevate and benefit our downcast race? 188 Will the attempt to worship what has never been made known, what is simply darkness and mystery, be more successful in raising humans above themselves than the worship of the Righteousness and the Love which have been made manifest in Christ? 189 Will the attempt to supplant the worship of Jesus Christ, in Whom was no sin, by the worship of Humanity at large, of Humanity stained with guilt and crime as well as illumined here and there with deeds of heroism, 190 of Humanity sunk to the level

of the brutes as well as exalted to the level of whatever we may suppose to be the highest, seeing that there is really no higher existence with which to compare it-- 191 will this worship of itself, with all its baseness and imperfection, this turning of humankind into a Mutual Adoration Society, make Humanity divine? 192 Will even the assurance that far-distant ages will have new inventions, fairer laws, more abundant wealth be any deliverance to us from our burdens, any salvation from our individual sorrow and guilt and shame? 193 Can we to whom the likeness of Christ has been shown, can we imagine that any of these efforts to answer the yearning of humankind for deliverance from the body of this death will prove an efficient substitute for Him? 194 And if we forsake Him, it must be in one or other of these directions that we go.

195 (VI.) But the signs of the times are full of hope. In social work at home, in the progress of missions abroad, in revivals of one kind and another, in growing reverence for holy things, 196 in a renewed interest in religion as the most vital of all topics, even in strange spiritual manifestations not within the Church, we have, amid all that is discouraging and depressing, indication of the coming kingdom. 197 The cry, 'Back to Christ,' with all the truth that is in it, is only half a truth if it does not also mean 'Forward to Christ.' 198 He is before us as well as behind us, and the Hope of the World is the gathering together of all things in Him. 199 Should there be, as there has been over and over again in days gone by, a widespread unbelief, a rejection of His Divine Revelation, of this we may be sure-- 200 it will be only for a time. When the sceptical physician, in Tennyson's poem, murmured:

'The good Lord Jesus has had his day,' 201 the believing nurse made the comment: 'Had? has it come? It has only dawned: it will come by and by.'

202 A thought most sad, though most inspiring. 'Only dawned.' Why is Christianity after all these centuries only beginning to be manifested? 203 It is at least partly because of the apathy, the divisions, the evil lives of us who

profess and call ourselves Christians, 204 because we have wrangled about the secondary and the comparatively unimportant, and have neglected the weightier matters of the law, 205 because we have so left to those beyond the Church the duty of proclaiming and enforcing principles which our Lord and His Apostles put in the forefront of their teaching. 206 We have narrowed the Kingdom of Christ, we have claimed too little for Him, we have forgotten that He has to do with the secular as well as with the spiritual, that He must be King of the Nation as well as of the Church.

207 But now in the growing prominence of Social Questions, which so many fear as an evidence of the waning of religion, have we not an incentive to show that the social must be pervaded by the religious, that our duties to one another are no small part of the Kingdom of Christ? 208 For all sorts and conditions of humans, for masters and servants, for rulers and ruled, for employers and employed, there is ever accumulating proof that only as they bear themselves towards each other in the spirit of the New Testament can there be true harmony and mutual respect; 209 that only, in short, as the kingdoms of this world become the kingdom of our Lord and of His Christ will humans in reality bear one another's burdens; 210 that only as the Everlasting Gospel of the Everlasting Love prevails will all strife and contention, whether personal or political or ecclesiastical or national, come to an end; 211 that only as humans enter into the fellowship of that Son of Human Who came not to be ministered unto but to minister and to give His Life a ransom for many will the glorious vision of old be fulfilled: 212 I saw in the night vision, and behold One like the Son of Human came with the clouds of heaven and came to the Ancient of Days and they brought Him near before Him. 213 And there was given Him dominion and glory and a kingdom, that all people, nations and languages shall serve Him. 214 His dominion is an everlasting dominion which shall not pass away and His kingdom that which shall not be destroyed.

MIRACLES

OF MIRACLES.

Benedict of Spinoza

1 As humans are accustomed to call Divine the knowledge which transcends human understanding, so also do they style Divine, or the work of God, anything of which the cause is not generally known: 2 for the masses think that the power and providence of God are most clearly displayed by events that are extraordinary and contrary to the conception they have formed of Nature, especially if such events bring them any profit or convenience: 3 they think that the clearest possible proof of God's existence is afforded when Nature, as they suppose, breaks Her accustomed order, 4 and consequently they believe that those who explain or endeavour to understand phenomena or miracles through their natural causes are doing away with God and His providence. 5 They suppose, forsooth, that God is inactive so long as Nature works in Her accustomed order, and vice versa, that the power of Nature and natural causes are idle so long as God is acting: 6 thus they imagine two powers distinct one from the other, the power of God and the power of Nature, though the latter is in a sense determined by God, or (as most people believe now) created by Him.

7 What they mean by either, and what they understand by God and Nature they do not know, except that they imagine the power of God to be like that of some royal potentate, and Nature's power to consist in force and energy. 8 The masses then style unusual phenomena, "miracles," and partly from piety, partly for the sake of opposing the students of science, 9 prefer to remain in ignorance of natural causes, and only to hear of those things which they know least, and consequently admire most.

10 In fact, the common people can only adore God, and refer all things to His power by removing natural causes, and conceiving things happening out of their due course, 11 and only admires the power of God when the power of Nature is conceived of as in

subjection to it. 12 This idea seems to have taken its rise among the early Jews who saw the Gentiles round them worshipping visible gods such as the sun, the moon, the earth, water, air, 13 and in order to inspire the conviction that such divinities were weak and inconstant, or changeable, told how they themselves were under the sway of an invisible God, 14 and narrated their miracles, trying further to show that the God whom they worshipped arranged the whole of Nature for their sole benefit: 15 this idea was so pleasing to humanity that humans go on to this day imagining miracles, so that they may believe themselves God's favourites, and the final cause for which God created and directs all things.

16 What pretension will not people in their folly advance! They have no single sound idea concerning either God or Nature, they confound God's decrees with human decrees, they conceive Nature as so limited that they believe human to be its chief part!

17 I have spent enough space in setting forth these common ideas and prejudices concerning Nature and miracles, but in order to afford a regular demonstration I will show -

18 (I.) That Nature cannot be contravened, but that She preserves a fixed and immutable order, and at the same time I will explain what is meant by a miracle.

19 (II.) That God's nature and existence, and consequently His providence cannot be known from miracles, but that they can all be much better perceived from the fixed and immutable order of Nature.

20 (III.) That by the decrees and volitions, and consequently the providence of God, Scripture (as I will prove by Scriptural examples) means nothing but Nature's order following necessarily from Her eternal laws.

21 (IV.) Lastly, I will treat of the method of interpreting Scriptural miracles, and the chief points to be noted concerning the narratives of them. 22 Such are the principal subjects which will be discussed in this chapter, and which will serve, I think, not a little to further the object of this treatise.

23 Our first point is easily proved from what we showed about Divine law-- namely, that all that God wishes or determines involves eternal necessity and truth, 24 for we demonstrated that God's understanding is identical with His will, and that it is the same thing to say that God wills a thing, as to say, that He understands it; 25 hence, as it follows necessarily, from the Divine Nature and perfection that God understands a thing as it is, it follows no less necessarily that He wills it as it is.

26 Now, as nothing is necessarily true save only by Divine decree, it is plain that the universal laws of Nature are decrees of God following from the necessity and perfection of the Divine Nature. 27 Hence, any event happening in Nature which contravened Nature's universal laws, would necessarily also contravene the Divine decree, Nature, and understanding; 28 or if anyone asserted that God acts in contravention to the laws of Nature, you, ipso facto, would be compelled to assert that God acted against His own nature-- an evident absurdity. 29 One might easily show from the same premises that the power and efficiency of Nature are in themselves the Divine power and efficiency, and that the Divine power is the very essence of God, but this I gladly pass over for the present.

30 Nothing, then, comes to pass in Nature (N.B. I do not mean here by "Nature," merely matter and its modifications, but infinite other things besides matter.) in contravention to Her universal laws, 31 nay, everything agrees with them and follows from them, for whatsoever comes to pass, comes to pass by the will and eternal decree of God; 32 that is, as we have just pointed out, whatever comes to pass, comes to pass according to laws and rules which involve eternal necessity and truth; 33 Nature, therefore, always observes laws and rules which involve eternal necessity and truth, although they may not all be known to us, and therefore She keeps a fixed and mutable order. 34 Nor is there any sound reason for limiting the power and efficacy of Nature, and asserting that Her laws are fit for certain purposes, but not for all;

35 for as the efficacy and power of Nature, are the very efficacy and power of God, 36 and as the laws and rules of Nature are the decrees of God, it is in every way to be believed that the power of Nature is infinite, and that Her laws are broad enough to embrace everything conceived by, the Divine intellect; 37 the only alternative is to assert that God has created Nature so weak, and has ordained for Her laws so barren, that He is repeatedly compelled to come afresh to Her aid if He wishes that She should be preserved, and that things should happen as He desires: a conclusion, in my opinion, very far removed from reason.

38 Further, as nothing happens in Nature which does not follow from Her laws, and as Her laws embrace everything conceived by the Divine intellect, and lastly, as Nature preserves a fixed and immutable order; 39 it most clearly follows that miracles are only intelligible as in relation to human opinions, and merely mean events of which the natural cause cannot be explained by a reference to any ordinary occurrence, either by us, or at any rate, by the writer and narrator of the miracle.

40 We may, in fact, say that a miracle is an event of which the causes cannot be explained by the natural reason through a reference to ascertained workings of Nature; 41 but since miracles were wrought according to the understanding of the masses, who are wholly ignorant of the workings of Nature, 42 it is certain that the ancients took for a miracle whatever they could not explain by the method adopted by the unlearned in such cases, namely, an appeal to the memory, a recalling of something similar, which is ordinarily regarded without wonder; 43 for most people think they sufficiently understand a thing when they have ceased to wonder at it.

44 The ancients, then, and indeed most people up to the present day, had no other criterion for a miracle; 45 hence we cannot doubt that many things are narrated in Scripture as miracles of which the causes could easily be explained by reference to ascertained workings of Nature. 46 We have hinted as much, in speaking of the

sun standing still in the time of Joshua, and to say on the subject when we come to treat of the interpretation of miracles later on in this chapter.

47 It is now time to pass on to the second point, and show that we cannot gain an understanding of God's essence, existence, or providence by means of miracles, 48 but that these truths are much better perceived through the fixed and immutable order of Nature.

49 I thus proceed with the demonstration. As God's existence is not self-evident, it must necessarily be inferred from ideas so firmly and incontrovertibly true, that no power can be postulated or conceived sufficient to impugn them.

50 They ought certainly so to appear to us when we infer from them God's existence, if we wish to place our conclusion beyond the reach of doubt; 51 for if we could conceive that such ideas could be impugned by any power whatsoever, we should doubt of their truth, we should doubt of our conclusion, namely, of God's existence, and should never be able to be certain of anything.

52 Further, we know that nothing either agrees with or is contrary to Nature, unless it agrees with or is contrary to these primary ideas; 53 wherefore if we would conceive that anything could be done in Nature by any power whatsoever which would be contrary to the laws of Nature, it would also be contrary to our primary ideas, 54 and we should have either to reject it as absurd, or else to cast doubt (as just shown) on our primary ideas, and consequently on the existence of God, and on everything howsoever perceived.

55 Therefore miracles, in the sense of events contrary to the laws of Nature, so far from demonstrating to us the existence of God, would, on the contrary, lead us to doubt it, where, otherwise, we might have been absolutely certain of it, as knowing that Nature follows a fixed and immutable order.

56 Let us take miracle as meaning that which cannot be explained through natural causes. 57 This may be interpreted in two senses: either as that which has natural causes, but cannot be examined by the human intellect; or as that which has no cause save God and

God's will. 58 But as all things which come to pass through natural causes, come to pass also solely through the will and power of God, 59 it comes to this, that a miracle, whether it has natural causes or not, is a result which cannot be explained by its cause, that is a phenomenon which surpasses human understanding; 60 but from such a phenomenon, and certainly from a result surpassing our understanding, we can gain no knowledge.

61 For whatsoever we understand clearly and distinctly should be plain to us either in itself or by means of something else clearly and distinctly understood; 62 wherefore from a miracle or a phenomenon which we cannot understand, we can gain no knowledge of God's essence, or existence, or indeed anything about God or Nature; 63 whereas when we know that all things are ordained and ratified by God, that the operations of Nature follow from the essence of God, and that the laws of Nature are eternal decrees and volitions of God, 64 we must perforce conclude that our knowledge of God, and of God's will increases in proportion to our knowledge and clear understanding of Nature, as we see how She depends on Her primal cause, and how She works according to eternal law.

65 Wherefore so far as our understanding goes, those phenomena which we clearly and distinctly understand have much better right to be called works of God, 66 and to be referred to the will of God than those about which we are entirely ignorant, although they appeal powerfully to the imagination, and compel humans's admiration.

67 It is only phenomena that we clearly and distinctly understand, which heighten our knowledge of God, and most clearly indicate His will and decrees. 68 Plainly, they are but triflers who, when they cannot explain a thing, run back to the will of God; this is, truly, a ridiculous way of expressing ignorance.

69 Again, even supposing that some conclusion could be drawn from miracles, we could not possibly infer from them the existence of God: 70 for a miracle being an event under limitations is

the expression of a fixed and limited power; 71 therefore we could not possibly infer from an effect of this kind the existence of a cause whose power is infinite, but at the utmost only of a cause whose power is greater than that of the said effect. 72 I say at the utmost, for a phenomenon may be the result of many concurrent causes, and its power may be less than the power of the sum of such causes, but far greater than that of any one of them taken individually.

73 On the other hand, the laws of Nature, as we have shown, extend over infinity, and are conceived by us as, after a fashion, eternal, and Nature works in accordance with them in a fixed and immutable order; 74 therefore, such laws indicate to us in a certain degree the infinity, the eternity, and the immutability of God. 75 We may conclude, then, that we cannot gain knowledge of the existence and providence of God by means of miracles, but that we can far better infer them from the fixed and immutable order of Nature.

76 By miracle, I here mean an event which surpasses, or is thought to surpass, human comprehension: 77 for in so far as it is supposed to destroy or interrupt the order of Nature or Her laws, it not only can give us no knowledge of God, but, contrariwise, takes away that which we naturally have, and makes us doubt of God and everything else. 78 Neither do I recognise any difference between an event against the laws of Nature and an event beyond the laws of Nature 79 that is, according to some, an event which does not contravene Nature, though She is inadequate to produce or effect it-- 80 for a miracle is wrought in, and not beyond Nature, though it may be said in itself to be above Nature, and, therefore, must necessarily interrupt the order of Nature, which otherwise we conceive of as fixed and unchangeable, according to God's decrees. 81 If, therefore, anything should come to pass in Nature which does not follow from Her laws, it would also be in contravention to the order which God has established in Nature for ever through universal natural laws: 82 it would, therefore, be in

contravention to God's nature and laws, and, consequently, belief in it would throw doubt upon everything, and lead to Atheism.

83 I think I have now sufficiently established my second point, so that we can again conclude that a miracle, whether in contravention to, or beyond, Nature, is a mere absurdity; 84 and, therefore, that what is meant in Scripture by a miracle can only be a work of Nature, which surpasses, or is believed to surpass, human comprehension.

85 Before passing on to my third point, I will adduce Scriptural authority for my assertion that God cannot be known from miracles. 86 Scripture nowhere states the doctrine openly, but it can readily be inferred from several passages.

87 Firstly, that in which Moses commands in (Deuteronomy, Chapter-13) that a false prophet should be put to death, even though he work miracles: 88 "If there arise a prophet among you, and giveth thee a sign or wonder, and the sign or wonder come to pass, saying, Let us go after other gods . . . thou shalt not hearken unto the voice of that prophet; for the Lord your God proveth you, and that prophet shall be put to death."

89 From this it clearly follows that miracles could be wrought even by false prophets; 90 and that, unless people are honestly endowed with the true knowledge and love of God, they may be as easily led by miracles to follow false gods as to follow the true God; 91 for these words are added: "For the Lord your God tempts you, that He may know whether you love Him with all your heart and with all your mind."

92 Further, the Israelites, from all their miracles, were unable to form a sound conception of God, as their experience testified: 93 for when they had persuaded themselves that Moses had departed from among them, they petitioned Aaron to give them visible gods; and the idea of God they had formed as the result of all their miracles was - a calf!

94 Asaph, though he had heard of so many miracles, yet doubted of the providence of God, and would have turned himself from the true way, if he had not at last come to understand true blessedness. (See

Psalm, Chapter-83). 95 Solomon, too, at a time when the Jewish nation was at the height of its prosperity, suspects that all things happen by chance. (See Ecclesiastes, Chapter-3:19-21; and chap. 9:2-3).

96 Lastly, nearly all the prophets found it very hard to reconcile the order of Nature and human affairs with the conception they had formed of God's providence, 97 whereas philosophers who endeavour to understand things by clear conceptions of them, rather than by miracles, have always found the task extremely easy-- 98 at least, such of them as place true happiness solely in virtue and peace of mind, and who aim at obeying Nature, rather than being obeyed by Her. 99 Such persons rest assured that God directs Nature according to the requirements of universal laws, not according to the requirements of the particular laws of human nature, 100 and that, therefore, God's scheme comprehends, not only the human race, but the whole of Nature.

101 It is plain, then, from Scripture itself, that miracles can give no knowledge of God, nor clearly teach us the providence of God. 102 As to the frequent statements in Scripture, that God wrought miracles to make Himself plain to human-- as in Exodus, Chapter-10:2, 103 where He deceived the Egyptians, and gave signs of Himself, that the Israelites might know that He was God,-- 104 it does not, therefore, follow that miracles really taught this truth, but only that the Jews held opinions which laid them easily open to conviction by miracles.
