34 But those LINES and ANGLES, by means whereof some MATHEMATICIANS pretend to explain the perception of distance, are themselves not at all perceived, nor are they in truth ever thought of by those unskillful in optics. 35 I appeal to anyone's experience whether upon sight of an OBJECT you computes its distance by the bigness of the ANGLE made by the meeting of the two OPTIC AXES? 36 Or whether you ever thinks of the greater or lesser divergency of the rays, which arrive from any point to your PUPIL? 37 Everyone is ownself the best judge of what you perceives, and what not. 38 In vain shall all the MATHEMATICIANS in the world tell me, that I perceive certain LINES and ANGLES which introduce into my mind the various IDEAS of DISTANCE, so long as I myself am conscious of no such thing.

39 Since, therefore, those ANGLES and LINES are not themselves perceived by sight, it follows from verses:30 and 31 that the mind doth not by them judge of the distance of OBJECTS.

40 Secondly, the truth of this assertion will be yet farther

evident to anyone that considers those LINES and ANGLES have no real existence in Nature, being only an HYPOTHESIS framed by the MATHEMATICIANS, 41 and by them introduced into OPTICS, that they might treat of that science in a GEOMETRICAL way.

42 The third and last reason I shall give for rejecting that doctrine is, that though we should grant the real existence of those OPTIC ANGLES, etc., and that it was possible for the mind to perceive them, 43 yet these principles would not be found sufficient to explain the PHENOMENA of DISTANCE, as shall be shown hereafter.

44 Now, it being already shown that distance is suggested to the mind by the mediation of some other IDEA which is itself perceived in the act of seeing, 45 it remains that we inquire what IDEAS or SENSATIONS there be that attend VISION, unto which we may suppose the IDEAS of distance are connected, and by which they are introduced into the mind. 46 And FIRST, it is certain by experience that when we look at a near OBJECT with both eyes, according as it approaches or recedes from us, we alter the disposition of our eyes, by lessening or widening the interval between the PUPILS. 47 This disposition or turn of the eyes is attended with a sensation, which seems to me to be that which in this case brings the IDEA of greater or lesser distance into the mind.

48 Not that there is any natural or necessary connection between the sensation we perceive by the turn of the eyes and greater or lesser distance, 49 but because the mind has by constant EXPERIENCE found the different sensations corresponding to the different dispositions of the eyes to be attended each with a different degree of distance in the OBJECT: 50 there has grown an habitual or customary connection between those two sorts of IDEAS, so that the mind no sooner perceives the sensation arising from the different turn it gives the eyes, 51 In order to bring the PUPILS nearer or farther asunder, but it withal perceives the different IDEA of distance which was wont to be connected with that sensation; 52 just as upon hearing a certain sound, the IDEA is immediately suggested to the

understanding which custom had united with it.

53 Nor do I see how I can easily be mistaken in this matter. I know evidently that distance is not perceived of itself. 54 That by consequence it must be perceived by means of some other IDEA which is immediately perceived, and varies with the different degrees of distance. 55 I know also that the sensation arising from the turn of the eyes is of itself immediately perceived, and various degrees thereof are connected with different distances, 56 which never fail to accompany them into my mind, when I view an OBJECT distinctly with both eyes, whose distance is so small that in respect of it the interval between the eyes has any considerable magnitude.

57 I know it is a received opinion that by altering the disposition of the eyes the mind perceives whether the angle of the OPTIC AXES is made greater or lesser. 58 And that accordingly by a kind of NATURAL GEOMETRY it judges the point of their intersection to be nearer or farther off. 59 But that this is not true I am convinced by my own experience, since I am not conscious that I make any such use of the perception I have by the turn of my eyes. 60 And for me to make those judgments, and draw those conclusions from it, without knowing that I do so, seems altogether incomprehensible.

61 From all which it follows that the judgment we make of the distance of an OBJECT, viewed with both eyes, is entirely the RESULT OF EXPERIENCE. 62 If we had not constantly found certain sensations arising from the various disposition of the eyes, attended with certain degrees of distance, we should never make those sudden judgments from them concerning the distance of OBJECTS; 63 no more than we would pretend to judge other people's thoughts by them pronouncing words we had never heard before.

64 Secondly, an OBJECT placed at a certain distance from the eye, to which the breadth of the PUPIL bears a considerable proportion, being made to approach, is seen more confusedly: and the nearer it is brought the more confused appearance it makes. 65 And this

being found constantly to be so, there ariseth in the mind an habitual CONNECTION between the several degrees of confusion and distance; 66 the greater confusion still implying the lesser distance, and the lesser confusion the greater distance of the OBJECT.

67 This confused appearance of the OBJECT doth therefore seem to be the MEDIUM whereby the mind judgeth of distance in those cases 68 wherein the most approved writers of optics will have it judge by the different divergency with which the rays flowing from the radiating point fall on the PUPIL. 69 No person, I believe, will pretend to see or feel those imaginary angles that the rays are supposed to form according to their various inclinations on own eye. 70 But you cannot choose seeing whether the OBJECT appear more or less confused. It is therefore a manifest consequence from what hath been demonstrated, 71 that instead of the greater or lesser divergency of the rays, the mind makes use of the greater or lesser confusedness of the appearance, thereby to determine the apparent place of an OBJECT.

72 Nor doth it avail to say there is not any necessary connection between confused VISION and distance, great or small. 73 For I ask any person what necessary connection you sees between the redness of a blush and shame? 74 And yet no sooner shall you behold that colour to arise in the face of another, but it brings into you and the IDEA of that passion which hath been observed to accompany it.

75 What seems to have misled the writers of optics in this matter is that they imagine humans judge of distance as they do of a conclusion in mathematics, 76 betwixt which and the premises it is indeed absolutely requisite there be an apparent, necessary connection: but it is far otherwise in the sudden judgments humans make of distance. 77 We are not to think that brutes and children, or even grown reasonable people, whenever they perceive an OBJECT to approach, or depart from them, do it by virtue of GEOMETRY and DEMONSTRATION.

78 That one IDEA may suggest another to the mind it will suffice that they have been observed to go

together, 79 without any demonstration of the necessity of their coexistence, or without so much as knowing what it is that makes them so to coexist. 80 Of this there are innumerable instances of which no one can be ignorant.

81 Thus, greater confusion having been constantly attended with nearer distance, no sooner is the former IDEA perceived, but it suggests the latter to our thoughts. 82 And if it had been the ordinary course of Nature that the farther off an OBJECT were placed, the more confused it should appear, 83 it is certain the very same perception that now makes us think an OBJECT approaches would then have made us to imagine it went farther off. 84 That perception, abstracting from CUSTOM and EXPERIENCE, being equally fitted to produce the IDEA of great distance, or small distance, or no distance at all.

85 Thirdly, an OBJECT being placed at the distance above specified, and brought nearer to the eye, we may nevertheless prevent, at least for some time, the appearances growing more confused, by straining the eye. 86 In which case that sensation supplies the place of confused VISION in aiding the mind to judge of the distance of the OBJECT; 87 it being esteemed so much the nearer by how much the effort or straining of the eye in order to distinct VISION is greater.

88 I have here set down those sensations or IDEAS that seem to be the constant and general occasions of introducing into the mind the different IDEAS of near distance. 89 It is true in most cases that diverse other circumstances contribute to frame our IDEA of distance, to wit, the particular number, size, kind, etc., of the things seen. 90 Concerning which, as well as all other the forementioned occasions which suggest distance, I shall only observe they have none of them, in their own nature, any relation or connection with it: 91 nor is it possible they should ever signify the various degrees thereof, otherwise than as by EXPERIENCE they have been found to be connected with them.

92 I shall proceed upon these principles to account for a

phenomenon which has hitherto strangely puzzled the writers of optics, 93 and is so far from being accounted for by any of their THEORIES OF VISION that it is, by their own confession, plainly repugnant to them; and of consequence, if nothing else could be objected, were alone sufficient to bring their credit in question. 94 The whole difficulty I shall lay before you in the words of the learned Dr. Barrow, with which he concludes his optic lectures:--

95 'I have here delivered what my thoughts have suggested to me concerning that part of optics which is more properly mathematical. 96 As for the other parts of that science (which being rather physical, do consequently abound with plausible conjectures instead of certain principles), 97 there has in them scarce anything occurred to my observation different from what has been already said by Kepler, Scheinerus, Descartes, and others. 98 And methinks, I had better say nothing at all, than repeat that which has been so often said by others. I think it therefore high time to take my leave of this subject: 99 but before I quit it for good and all, the fair and ingenuous dealing that I owe both to you and to truth obligeth me to acquaint you with a certain untoward difficulty, 100 which seems directly opposite to the doctrine I have been hitherto inculcating, at least, admits of no solution from it. 101 In short it is this. Before the double convex glass or concave speculum EBF, let the point A be placed at such a distance that the rays proceeding from A, after refraction or reflection, be brought to unite somewhere in the AxAB. 102 And suppose the point of union (i.e. the image of the point A, as hath been already set forth) to be Z; between which and B, the vertex of the glass or speculum, conceive the eye to be anywhere placed. 103 The question now is, where the point A ought to appear? Experience shows that it does not appear behind at the point Z, and it were contrary to Nature that it should, since all the impression which affects the sense comes from towards A. 104 But from our tenets it should seem to follow that it would appear before the eye at a

vast distance off, so great as should in some sort surpass all sensible distance. 105 For since if we exclude all anticipations and prejudices, every OBJECT appears by so much the farther off, by how much the rays it sends to the eye are less diverging. 106 And that OBJECT is thought to be most remote from which parallel rays proceed unto the eye. 107 Reason would make one think that OBJECT should appear at yet a greater distance which is seen by converging rays. 108 Moreover it may in general be asked concerning this case what it is that determines the apparent place of the point A, and maketh it to appear after a constant manner sometimes nearer, at other times farther off? 109 To which doubt I see nothing that can be answered agreeable to the principles we have laid down except only that the point A ought always to appear extremely remote. 110 But on the contrary we are assured by experience that the point A appears variously distant, according to the different situations of the eye between the points B and Z. 111 And that it doth never (if at all) seem farther off, than it would if it were beheld by the naked eye, but on the contrary it doth sometimes appear much nearer. 112 Nay, it is even certain that by how much the rays falling on the eye do more converge by so much the nearer doth the OBJECT seem to approach. 113 For the eye being placed close to the point B, the OBJECT A appears nearly in its own natural place, if the point B is taken in the glass, or at the same distance, if in the speculum. 114 The eye being brought back to O, the OBJECT seems to draw near: and being come to P it beholds it still nearer. 115 And so on little and little, till at length the eye being placed somewhere, suppose at Q, the OBJECT appearing extremely near, begins to vanish into mere confusion. 116 All which doth seem repugnant to our principles, at least not rightly to agree with them. 117 Nor is our tenet alone struck at by this experiment, but likewise all others that ever came to my knowledge are, every whit as much, endangered by it. 118 The ancient one especially (which is most commonly received, and

comes nearest to mine) seems to be so effectually overthrown 119 thereby that the most learned Tacquet has been forced to reject that principle, as false and uncertain, on which alone he had built almost his whole CATOPTRICS; 120 and consequently by taking away the foundation, hath himself pulled down the superstructure he had raised on it. 121 Which, nevertheless, I do not believe he would have done had he but considered the whole matter more thoroughly, and examined the difficulty to the bottom. 122 But as for me, neither this nor any other difficulty shall have so great an influence on me as to make me renounce that which I know to be manifestly agreeable to reason: 123 especially when, as it here falls out, the difficulty is founded in the peculiar nature of a certain odd and particular case. 124 For in the present case something peculiar lies hid, which being involved in the subtilty of Nature will, perhaps, hardly be discovered till such time as the manner of vision is more perfectly made known. 125 Concerning which, I must own, I have hitherto been able to find out nothing that has the least show of PROBABILITY, not to mention CERTAINTY. 126 I shall, therefore, leave this knot to be untied by you, wishing you may have better success in it than I have had.'

127 The ancient and received principle, which Dr. Barrow here mentions as the main foundation of Tacquet's CATOPTRICS, is that: 'every visible point seen by reflection from a speculum shall appear placed at the intersection of the reflected ray, and the perpendicular of incidence:' 128 which intersection in the present case, happening to be behind the eye, it greatly shakes the authority of that principle, 129 whereon the aforementioned author proceeds throughout his whole CATOPTRICS in determining the apparent place of OBJECTS seen by reflection from any kind of speculum.

130 Let us now see how this phenomenon agrees with our tenets. The eye the nearer it is placed to the point B in the foregoing figures, the more distinct is the appearance of the OBJECT; 131 but as it recedes to O the appearance grows more confused; and at P it sees the

OBJECT yet more confused; and so on till the eye being brought back to Z sees the OBJECT in the greatest confusion of all. 132 Wherefore by verses:64-66 the OBJECT should seem to approach the eye gradually as it recedes from the point B, 133 that is, at O it should (in consequence of the principle I have laid down in the aforesaid section) seem nearer than it did at B, and at P nearer than at O, and at Q nearer than at P; and so on, till it quite vanishes at Z. 134 Which is the very matter of fact, as anyone that pleases may easily satisfy yourself by experiment.

135 This case is much the same as if we should suppose an Englishman to meet a foreigner who used the same words with the English, but in a direct contrary signification. 136 The Englishman would not fail to make a wrong judgment of the IDEAS annexed to those sounds in the mind of one that used them. 137 Just so, in the present case the OBJECT speaks (if I may so say) with words that the eye is well acquainted with, that is, confusions of appearance; 138 but whereas heretofore the greater confusions were always wont to signify nearer distances, they have in this case a direct, contrary signification, being connected with the greater distances. 139 Whence it follows that the eye must unavoidably be mistaken, since it will take the confusions in the sense it has been used to, which is directly opposed to the true.

140 This phenomenon as it entirely subverts the opinion of those who will have us judge of distance by lines and angles, on which supposition it is altogether inexplicable, so it seems to me no small confirmation of the truth of that principle whereby it is explained. 141 But in order to develop a more full explication of this point, and to show how far the hypothesis of the mind's judging by the various divergency of rays may be of use in determining the apparent place of an OBJECT, 142 it will be necessary to premise some few things, which are already well known to those who have any skill in dioptrics.

143 FIRST, any radiating point is then distinctly seen when the rays proceeding from it are, by the refractive power of the crystalline,

accurately reunited in the retina or fund of the eye: 144 but if they are reunited, either before they arrive at the retina, or after they have passed it, then there is confused vision.

145 SECONDLY, suppose in the adjacent figures NP represent an eye duly framed and retaining its natural figure. In Fig. 1 the rays falling nearly parallel on the eye, are by the crystalline AB refracted, 146 so as their focus or point of union F falls exactly on the retina: but if the rays fall sensibly diverging on the eye, as in Fig. 2, then their focus falls beyond the retina: 147 or if the rays are made to converge by the lens QS before they come at the eye, as in Fig. 3, their focus F will fall before the retina.

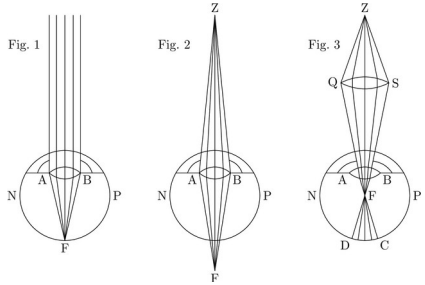

Fig-1,2,3

148 In which two last cases it is evident from the foregoing section that the appearance of the point Z is confused. 149 And by how much the greater is the convergency, or divergency, of the rays falling on the pupil, by so much the farther will the point of their reunion be from the retina, either before or behind it, 150 and consequently the point Z will appear by so much the more confused. And this, by the eye, may show us the difference between confused and faint vision. 151 Confused vision is when the rays proceedings from each distinct point of the OBJECT are not accurately recollected in one corresponding point on the retina, 152 but take up some space thereon, so that rays from different points become mixed and confused together. This is opposed to a distinct vision, and attends near objects. 153 Faint vision is when by reason of the distance of the object or grossness of the interjacent medium few rays arrive from the object to the eye. 154 This is opposed to vigorous or clear vision, and attends remote objects. But to return.

155 The eye, or (to speak truly) the mind, perceiving only the confusion itself, without ever considering the cause from which it proceeds, doth constantly annex

the same degree of distance to the same degree of confusion. 156 Whether that confusion be occasioned by converging or by diverging rays, it matters not. 157 Whence it follows that the eye viewing the object Z through the glass QS (which by refraction causeth the rays ZQ, ZS, etc., to converge) 158 should judge it to be at such a nearness at which if it were placed it would radiate on the eye with rays diverging to that degree as would produce the same confusion which is now produced by converging rays, i.e. 159 would cover a portion of the retina equal to DC (in Fig. 3 supra). But then this must be understood (to use Dr. Barrow's phrase) SECLUSIS PRAENOTIONIBUS ET PRAEJUDICIIS, 160 in case we abstract from all other circumstances of vision, such as the figure, size, faintness, etc. of the visible objects; 161 all which do ordinarily concur to form our idea of distance, the mind having by frequent experience observed their several sorts or degrees to be connected with various distances.

162 It plainly follows from what hath been said that a person perfectly purblind (i.e. that could not see an object distinctly but when placed close to your eye) would not make the same wrong judgment that others do in the forementioned case. 163 For to you greater confusions constantly suggesting greater distances, 164 you must, as you recedes from the glass and the object grows more confused, judge it to be at a farther distance, contrary to what they do who have had the perception of the objects growing more confused connected with the idea of approach.

165 Hence also it doth appear there may be good use of computation by lines and angles in optics; 166 not that the mind judgeth of distance immediately by them, but because it judgeth by somewhat which is connected with them, and to the determination whereof they may be subservient. 167 Thus the mind judging of the distance of an object by the confusedness of its appearance, and this confusedness being greater or lesser to the naked eye, 168 according as the object is seen by rays more or less diverging, it follows that a person may make use of the divergency of

the rays in computing the apparent distance, though not for its own sake, yet on account of the confusion with which it is connected. 169 But, so it is, the confusion itself is entirely neglected by mathematicians as having no necessary relation with distance, such as the greater or lesser angles of divergency are conceived to have. 170 And these (especially for that they fall under mathematical computation) are alone regarded in determining the apparent places of objects, as though they were the sole and immediate cause of the judgments the mind makes of distance. 171 Whereas, in truth, they should not at all be regarded in themselves, or any otherwise, than as they are supposed to be the cause of confused vision.

172 The not considering of this has been a fundamental and perplexing oversight. For proof whereof we need go no farther than the case before us. 173 It having been observed that the most diverging rays brought into the mind the idea of nearest distance, and that still, as the divergency decreased, the distance increased: 174 and it being thought the connexion between the various degrees of divergency and distance was immediate; this naturally leads one to conclude, from an ill-grounded analogy, that converging rays shall make an object appear at an immense distance: 175 and that, as the convergency increases, the distance (if it were possible) should do so likewise. 176 That this was the cause of Dr. Barrow's mistake is evident from his own words which we have quoted. 177 Whereas had the learned doctor observed that diverging and converging rays, how opposite soever they may seem, do nevertheless agree in producing the same effect, 178 to wit, confusedness of vision, greater degrees whereof are produced indifferently, either as the divergency or convergency and the rays increaseth. 179 And that it is by this effect, which is the same in both, that either the divergency or convergency is perceived by the eye; 180 I say, had he but considered this, it is certain he would have made a quite contrary judgment, and rightly concluded that those rays which fall on the

eye with greater degrees of convergency should make the object from whence they proceed appear by so much the nearer. 181 But it is plain it was impossible for any person to attain to a right notion of this matter so long as you had regard only to lines and angles, and did not apprehend the true nature of vision, and how far it was of mathematical consideration.

182 Before we dismiss this subject, it is fit we take notice of a query relating thereto, proposed by the ingenious Mr. Molyneux, in his *TREATISE OF DIOPTRICS*, [Par. I. Prop. 31, Sect. 9.] 183 where speaking of this difficulty, he has these words: 'And so he (i.e. Dr. Barrow) leaves this difficulty to the solution of others, which I (after so great an example) shall do likewise; 184 but with the resolution of the same admirable author of not quitting the evident doarine which we have before laid down, for determining the LOCUS OBJECTI, 185 on account of being pressed by one difficulty which seems inexplicable till a more intimate knowledge of the visive faculty be obtained by mortals. 186 In the meantime, I propose it to the consideration of the ingenious, whether the LOCUS APPARENS of an object be not as much before the eye as the distinct base is behind the eye!' 187 To which query we may venture to answer in the negative. For in the present case the rule for determining the distance of the distinct base, or respective focus from the glass, is this: 188 as the difference between the distance of the object and focus is to the focus or focal length, so the distance of the object from the glass is to the distance of the respective focus or distinct base from the glass. [Molyneux Dioptr., Par. I. Prop. 5.] 189 Let us now suppose the object to be placed at the distance of the focal length, and one half of the focal length from the glass, and the eye close to the glass, 190 hence it will follow by the rule that the distance of the distinct base behind the eye is double the true distance of the object before the eye. 191 If therefore Mr. Molyneux's conjecture held good, it would follow that the eye should see the object twice as far off as it really is; and in other cases at three or four times its due distance, or

more. 192 But this manifestly contradicts experience, the object never appearing, at farthest, beyond its due distance. 193 Whatever, therefore, is built on this supposition comes to the ground along with it. (in VID. COROL. I. PROP. 57, IBID.)

190 From what hath been premised it is a manifest consequence that a person born blind, being made to see, would, at first, have no idea of distance by sight; 191 the sun and stars, the remotest objects as well as the nearer, would all seem to be in own eye, or rather in own mind. 192 The objects intromitted by sight would seem to you (as in truth they are) no other than a new set of thoughts or sensations, each whereof is as near to you as the perceptions of pain or pleasure, or the most inward passions of your soul. 193 For our judging objects provided by sight to be at any distance, or without the mind, is entirely the effect of experience, which one in those circumstances could not yet have attained to.

194 It is indeed otherwise upon the common supposition that humans judge of distance by the angle of the optic axes, 195 just as one in the dark, or a blind-person by the angle comprehended by two sticks, one whereof you held in each hand. 196 For if this were true, it would follow that one blind from own birth being made to see, should stand in need of no new experience in order to perceive distance by sight. But that this is false has, I think, been sufficiently demonstrated.

197 And perhaps upon a strict inquiry we shall not find that even those who from their birth have grown up in a continued habit of seeing are irrecoverably prejudiced on the other side, to wit, in thinking what they see to be at a distance from them. 198 For at this time it seems agreed on all hands, by those who have had any thoughts of that matter, that colours, which are the proper and immediate object of sight, are not without the mind. 199 But then it will be said, by sight we have also the ideas of extension, and figure, and motion; all which may well be thought without, and at some distance from the mind, though colour should not. 200 In answer to this I appeal to any human's experience, whether the visible

extension of any object doth not appear as near to you as the colour of that object; nay, whether they do not both seem to be in the very same place. 201 Is not the extension we see coloured, and is it possible for us, so much as in thought, to separate and abstract colour from extension? 202 Now, where the extension is there surely is the figure, and there the motion too. I speak of those which are perceived by sight.

203 But for a fuller explication of this point, and to show that the immediate objects of sight are not so much as the ideas or resemblances of things placed at a distance, 204 it is requisite that we look nearer into the matter and carefully observe what is meant in common discourse, when one says that which he sees is at a distance from the self. 205 Suppose, for example, that looking at the moon I should say it were fifty or sixty semi-diameters of the earth distant from me. Let us see what moon this is spoken of: 206 it is plain it cannot be the visible moon, or anything like the visible moon, or that which I see, which is only a round, luminous plane of about thirty visible points in diameter. 207 For in case I am carried from the place where I stand directly towards the moon, it is manifest the object varies, still as I go on; 208 and by the time that I am advanced fifty or sixty semi-diameters of the earth, I shall be so far from being near a small, round, luminous flat that I shall perceive nothing like it; 209 this object having long since disappeared, and if I would recover it, it must be by going back to the earth from whence I set out. 210 Again, suppose I perceive by sight the faint and obscure idea of something which I doubt whether it be a human, or a tree, or a tower, but judge it to be at the distance of about a mile. 211 It is plain I cannot mean that what I see is a mile off, or that it is the image or likeness of anything which is a mile off, since that every step I take towards it the appearance alters, and from being obscure, small, and faint, grows clear, large, and vigorous. 212 And when I come to the mile's end, that which I saw first is quite lost, neither do I find anything in the likeness of it.

213 In these and the like instances the truth of the matter stands thus: having of a long time experienced certain ideas, perceivable by touch, as distance, tangible figure, and solidity, to have been connected with certain ideas of sight, 214 I do upon perceiving these ideas of sight forthwith conclude what tangible ideas are, by the wonted ordinary course of Nature like to follow. 215 Looking at an object I perceive a certain visible figure and colour, with some degree of faintness and other circumstances, which from what I have formerly observed, determine me to think that if I advance forward so many paces or miles, I shall be affected with such and such ideas of touch: 216 so that in truth and strictness of speech I neither see distance itself, nor anything that I take to be at a distance. 217 I say, neither distance nor things placed at a distance are themselves, or their ideas, truly perceived by sight. 218 This I am persuaded of, as to what concerns myself: and I believe whoever will look narrowly into own thoughts and examine what you means by saying you sees this or that thing at a distance, 219 will agree with me that what you sees only suggests to your understanding that after having passed a certain distance, to be measured by the motion of your body, which is perceivable by touch, 220 you shall come to perceive such and such tangible ideas which have been usually connected with such and such visible ideas. 221 But that one might be deceived by these suggestions of sense, and that there is no necessary connexion between visible and tangible ideas suggested by them, we need go no farther than the next looking-glass or pictures to be convinced. 222 Note that when I speak of tangible ideas, I take the word idea for any the immediate object of sense or understanding, in which large signification it is commonly used by the moderns.

223 From what we have shown it is a manifest consequence that the ideas of space, outness, and things placed at a distance are not, strictly speaking, the object of sight; they are not otherwise perceived by the eye than by the ear. 224 Sitting in my study I hear a coach drive along the street; I look through the

casement and see it; I walk out and enter into it; thus, common speech would incline one to think I heard, saw, and touched the same thing, to wit, the coach. 225 It is nevertheless certain, the ideas intromitted by each sense are widely different and distinct from each other; but having been observed constantly to go together, they are spoken of as one and the same thing. 226 By the variation of the noise I perceive the different distances of the coach, and know that it approaches before I look out. 227 Thus by the ear I perceive distance, just after the same manner as I do by the eye.

228 I do not nevertheless say I hear distance in like manner as I say that I see it, the ideas perceived by hearing not being so apt to be confounded with the ideas of touch as those of sight are. 229 So likewise a person is easily convinced that bodies and external things are not properly the object of hearing; 230 but only sounds, by the mediation whereof the idea of this or that body or distance is suggested to your thoughts. 231 But then one is with more difficulty brought to discern the difference there is betwixt the ideas of sight and touch: 232 though it be certain a person no more sees and feels the same thing than you hears and feels the same thing.

233 One reason of which seems to be this. It is thought a great absurdity to imagine that one and the same thing should have any more than one extension, and one figure. 234 But the extension and figure of a body, being let into the mind two ways, and that indifferently either by sight or touch, it seems to follow that we see the same extension and the same figure which we feel.

235 But if we take a close and accurate view of things, it must be acknowledged that we never see and feel one and the same object. 236 That which is seen is one thing, and that which is felt is another. 237 If the visible figure and extension be not the same with the tangible figure and extension, we are not to infer that one and the same thing has diverse extensions. 238 The true consequence is that the objects of sight and touch are two distinct things. It may perhaps require some thought rightly to

conceive this distinction. 239 And the difficulty seems not a little increased, because the combination of visible ideas hath constantly the same name as the combination of tangible ideas wherewith it is connected: which doth of necessity arise from the use and end of language.

240 In order therefore to treat accurately and unconfusedly of vision, we must bear in mind that there are two sorts of objects apprehended by the eye, the one primarily and immediately, the other secondarily and by intervention of the former. 241 Those of the first sort neither are, nor appear to be, without the mind, or at any distance off; 242 they may indeed grow greater or smaller, more confused, or more clear, or more faint, but they do not, cannot approach or recede from us. 243 Whenever we say an object is at a distance, whenever we say it draws near, or goes farther off, we must always mean it of the latter sort, 244 which properly belong to the touch, and are not so truly perceived as suggested by the eye in like manner as thoughts by the ear.

245 No sooner do we hear the words of a familiar language pronounced in our ears, but the ideas corresponding thereto present themselves to our minds: 246 in the very same instant the sound and the meaning enter the understanding: so closely are they united that it is not in our power to keep out the one, except we exclude the other also. 247 We even act in all respects as if we heard the very thoughts themselves. 248 So likewise the secondary objects, or those which are only suggested by sight, do often more strongly affect us, and are more regarded than the proper objects of that sense; 249 along with which they enter into the mind, and with which they have a far more strict connexion, than ideas have with words. 250 Hence it is, we find it so difficult to discriminate between the immediate and mediate objects of sight, and are so prone to attribute to the former what belongs only to the latter. 251 They are, as it were, most closely twisted, blended, and incorporated together. 252 And the prejudice is confirmed and riveted in our thoughts by a long tract of

time, by the use of language, and want of reflexion. 253 However, I believe anyone that shall attentively consider what we have already said, and shall say, upon this subject before we have done (especially if you pursue it in your own thoughts) may be able to deliver yourself from that prejudice. 254 Sure I am, it is worth some attention, to whoever would understand the true nature of vision.

THE SIZE OF OBJECTS OF SIGHT

George Berkeley

2 I have now done with distance, and proceed to show how it is that we perceive by sight the magnitude of objects. 2 It is the opinion of some that we do it by angles, or by angles in conjunction with distance: but neither angles nor distance being perceivable by sight, and the things we see being in truth at no distance from us, 3 it follows that as we have shown lines and angles not to be the medium the mind makes use of in apprehending the apparent place, so neither are they the medium whereby it apprehends the apparent magnitude of objects.

4 It is well known that the same extension at a near distance shall subtend a greater angle, and at a farther distance a lesser angle. 5 And by this principle (we are told) the mind estimates the magnitude of an object, comparing the angle under which it is seen with its distance, and thence inferring the magnitude thereof. 6 What inclines people to this mistake (beside the humour of making one see by geometry) is that the same perceptions or ideas which suggest distance do also suggest magnitude. 7 But if we examine it we shall find they suggest the latter as immediately as the former. 8 I say, they do not first suggest distance, and then leave it to the judgment to us that as a medium whereby to collect the magnitude; 9 but they have as close and immediate a connexion with the magnitude as with the distance; and suggest magnitude as independently of distance as they do distance independently of magnitude. 10 All which will be evident to whoever considers what

hath been already said, and what follows.

11 It hath been shown there are two sorts of objects apprehended by sight; each whereof hath its distinct magnitude, or extension. 12 The one, properly tangible, i.e. to be perceived and measured by touch, and not immediately falling under the sense of seeing: the other, properly and immediately visible, by mediation of which the former is brought in view. 13 Each of these magnitudes are greater or lesser, according as they contain in them more or fewer points, they being made up of points or minimums. 14 For, whatever may be said of extension in abstract, it is certain sensible extension is not infinitely divisible. 15 There is a MINIMUM TANGIBILE and a MINIMUM VISIBILE, beyond which sense cannot perceive. This everyone's experience will inform you.

16 The magnitude of the object which exists without the mind, and is at a distance, continues always invariably the same: 17 but the visible object still changing as you approach to, or recede from, the tangible object, it hath no fixed and determinate greatness. 18 Whenever, therefore, we speak of the magnitude of anything, for instance a tree or a house, we must mean the tangible magnitude, otherwise there can be nothing steady and free from ambiguity spoken of it. 19 But though the tangible and visible magnitude in truth belong to two distinct objects: 20 I shall nevertheless (especially since those objects are called by the same name, and are observed to coexist), to avoid tediousness and singularity of speech, sometimes speak of them as belonging to one and the same thing.

21 Now in order to discover by what means the magnitude of tangible objects is perceived by sight. I need only reflect on what passes in my own mind, 22 and observe what those things be which introduce the ideas of greater or lesser into my thoughts, when I look on any object. 23 And these I find to be, FIRST, the magnitude or extension of the visible object, which being immediately perceived by sight, is connected with that other which is tangible and placed at a distance.

24 SECONDLY, the confusion or distinctness. And thirdly, the vigorousness or faintness of the aforesaid visible appearance. 25 CETERIS PARIBUS, by how much the greater or lesser the visible object is, by so much the greater or lesser do I conclude the tangible object to be. 26 But, be the idea immediately perceived by sight never so large, yet if it be withal confused, I judge the magnitude of the thing to be but small. If it be distinct and clear, I judge it greater. 27 And if it be faint, I apprehend it to be yet greater. What is here meant by confusion and faintness hath been explained in verses:145-154.

28 Moreover the judgments we make of greatness do, in like manner as those of distance, depend on the disposition of the eye, also on the figure, number, and situation of objects and other circumstances that have been observed to attend great or small tangible magnitudes. 29 Thus, for instance, the very same quantity of visible extension, which in the figure of a tower doth suggest the idea of great magnitude, shall in the figure of a human suggest the idea of much smaller magnitude. 30 That this is owing to the experience we have had of the usual bigness of a tower and a human no one, I suppose, need be told.

31 It is also evident that confusion or faintness have no more a necessary connexion with little or great magnitude than they have with little or great distance. As they suggest the latter, so they suggest the former to our minds. 32 And by consequence, if it were not for experience, we should no more judge a faint or confused appearance to be connected with great or little magnitude, than we should that it was connected with great or little distance.

33 Nor will it be found that great or small visible magnitude hath any necessary relation to great or small tangible magnitude: so that the one may certainly be inferred from the other. 34 But before we come to the proof of this, it is fit we consider the difference there is betwixt the extension and figure which is the proper object of touch, and that other which is termed visible; 35 and how the former is principally, though not

immediately taken notice of, when we look at any object. 36 This has been before mentioned, but we shall here inquire into the cause thereof. 37 We regard the objects that environ us in proportion as they are adapted to benefit or injure our own bodies, and thereby produce in our minds the sensation of pleasure or pain. 38 Now bodies operating on our organs, by an immediate application, and the hurt or advantage arising therefrom, depending altogether on the tangible, and not at all on the visible, qualities of any object: 39 this is a plain reason why those should be regarded by us much more than these: and for this end the visive sense seems to have been bestowed on animals, 40 to wit, that by the perception of visible ideas (which in themselves are not capable of affecting or any wise altering the frame of their bodies) they may be able to foresee (from the experience they have had what tangible ideas are connected with such and such visible ideas) 41 and damage or benefit which is like to ensue, upon the application of their own bodies to this or that body which is at a distance. 42 Which foresight, how necessary it is to the preservation of an animal, everyone's experience can inform you. 43 Hence it is that when we look at an object, the tangible figure and extension thereof are principally attended to; 44 whilst there is small heed taken of the visible figure and magnitude, which, though more immediately perceived, do less concern us, and are not fitted to produce any alteration in our bodies.

45 That the matter of fact is true will be evident to anyone who considers that a human placed at ten foot distance is thought as great as if you were placed at a distance only of five foot: 46 which is true not with relation to the visible, but tangible greatness of the object: the visible magnitude being far greater at one station: than it is at the other.

47 Inches, feet, etc., are settled stated lengths whereby we measure objects and estimate their magnitude: we say, for example, an object appears to be six inches or six foot long. 48 Now, that this cannot be meant of visible inches, etc., is evident, because a visible

inch is itself no constant, determinate magnitude, and cannot therefore serve to mark out and determine the magnitude of any other thing. 49 Take an inch marked upon a ruler: view it, successively, at the distance of half a foot, a foot, a foot and a half, etc., from the eye: 50 at each of which, and at all the intermediate distances, the inch shall have a different visible extension, i.e. there shall be more or fewer points discerned in it. 51 Now I ask which of all these various extensions is that stated, determinate one that is agreed on for a common measure of other magnitudes? No reason can be assigned why we should pitch on one more than another: 52 and except there be some invariable, determinate extension fixed on to be marked to the word inch, it is plain it can be used to little purpose; 53 and to say a thing contains this or that number of inches shall imply no more than that it is extended, without bringing any particular idea of that extension into the mind. 54 Farther, an inch and a foot, from different distances, shall both exhibit the same visible magnitude, and yet at the same time you shall say that one seems several times greater than the other. 55 From all which it is manifest that the judgments we make of the magnitude of objects by sight are altogether in reference to their tangible extension. 56 Whenever we say an object is great, or small, of this or that determinate measure, I say it must be meant of the tangible, and not the visible extension, which, though immediately perceived, is nevertheless little taken notice of.

57 Now, that there is no necessary connexion between these two distinct extensions is evident from hence: because our eyes might have been framed in such a manner as to be able to see nothing but what were less than the MINIMUM TANGIBILE. 58 In which case it is not impossible we might have perceived all the immediate objects of sight, the very same that we do now: but unto those visible appearances there would not be connected those different tangible magnitudes that are now. 59 Which shows the judgments we make of the magnitude of things placed at a

distance from the various greatness of the immediate objects of sight do not arise from any essential or necessary but only a customary tie, which has been observed between them.

60 Moreover, it is not only certain that any idea of sight might not have been connected with this or that idea of touch, which we now observe to accompany it: 61 but also that the greater visible magnitudes might have been connected with, and introduced into our minds lesser tangible magnitudes and the lesser visible magnitudes greater tangible magnitudes. 62 Nay, that it actually is so we have daily experience; that object which makes a strong and large appearance, not seeming near so great as another, the visible magnitude whereof is much less, but more faint, 63 and the appearance upper, or which is the same thing painted lower on the RETINA, which faintness and situation suggest both greater magnitude and greater distance.

64 From which, and from verses:28-32, it is manifest that as we do not perceive the magnitudes of objects immediately by sight, so neither do we perceive them by the mediation of anything which has a necessary connexion with them. 65 Those ideas that now suggest unto us the various magnitudes of external objects before we touch them, might possibly have suggested no such thing: 66 or they might have signified them in a direct contrary manner: so that the very same ideas, on the perception whereof we judge an object to be small, might as well have served to make us conclude it great. 67 Those ideas being in their own nature equally fitted to bring into our minds the idea of small or great, or no size at all of outward objects; 68 just as the words of any language are in their own nature indifferent to signify this or that thing or nothing at all.

69 As we see distance, so we see magnitude. And we see both in the same way that we see shame or anger in the looks of a person. 70 Those passions are themselves invisible, they are nevertheless let in by the eye along with colours and alterations of countenance, which are the immediate object of vision: 71 and which signify them for no other reason than barely

because they have been observed to accompany them. 72 Without which experience we should no more have taken blushing for a sign of shame than of gladness.

73 We are nevertheless exceeding prone to imagine those things which are perceived only by the mediation of others to be themselves the immediate objects of sight; 74 or, at least, to have in their own nature a fitness to be suggested by them, before ever they had been experienced to coexist with them. 75 From which prejudice everyone, perhaps, will not find it easy to emancipate yourself, by any [but] the clearest convictions of reason. 76 And there are some grounds to think that if there was one only invariable and universal languages in the world, and that humans were born with the faculty of speaking it, 77 it would be the opinion of many that the ideas of other humans' minds were properly perceived by the ear, or had at least a necessary and inseparable tie with the sounds that were affixed to them. 78 All which seems to arise from want of a due application of our discerning faculty, thereby to discriminate between the ideas that are in our understandings, and consider them apart from each other; 79 which would preserve us from confounding those that are different, and make us see what ideas do, and what do not include or imply this or that other idea.

80 There is a celebrated phenomenon, the solution whereof I shall attempt to give by the principles that have been laid down, in reference to the manner wherein we apprehend by sight the magnitude of objects. 81 The apparent magnitude of the moon when placed in the horizon is much greater than when it is in the meridian, though the angle under which the diameter of the moon is seen be not observed greater in the former case than in the latter: 82 and the horizontal moon doth not constantly appear of the same bigness, but at some times seemeth far greater than at others.

83 Now in order to explain the reason of the moon's appearing greater than ordinary in the horizon, it must be observed that the particles which compose our atmosphere intercept the rays of

light proceeding from any object to the eye; 84 and by how much the greater is the portion of atmosphere interjacent between the object and the eye, by so much the more are the rays intercepted; 85 and by consequence the appearance of the object rendered more faint, every object appearing more vigorous or more faint in proportion as it sendeth more or fewer rays into the eye. 86 Now between the eye and the moon, when situated in the horizon, there lies a far greater quantity of atmosphere than there does when the moon is in the meridian. 87 Whence it comes to pass that the appearance of the horizontal moon is fainter, and therefore by verses:21-27 it should be thought bigger in that situation than in the meridian, or in any other elevation above the horizon.

88 Farther, the air being variously impregnated, sometimes more and sometimes less, with vapours and exhalations fitted to retund and intercept the rays of light, 89 it follows that the appearance of the horizontal moon hath not always an equal faintness, and by consequence that luminary, though in the very same situation, is at one time judged greater than at another.

90 That we have here given the true account of the phenomena of the horizontal moon will, I suppose, be farther evident to anyone from the following considerations. 91 FIRST, it is plain that which in this case suggests the idea of greater magnitude must be something which is itself perceived; for that which is unperceived cannot suggest to our perception any other thing. 92 SECONDLY, it must be something that does not constantly remain the same, but is subject to some change or variation, since the appearance of the horizontal moon varies, being at one time greater than at another. 93 And yet, THIRDLY, it cannot be the visible figure or magnitude, since that remains the same, or is rather lesser, by how much the moon is nearer to the horizon. 94 It remains therefore that the true cause is that affection or alteration of the visible appearance which proceeds from the greater paucity of rays arriving at the eye, and which I term FAINTNESS: 95 since this

answers all the forementioned conditions, and I am not conscious of any other perception that doth.

96 Add to this that in misty weather it is a common observation that the appearance of the horizontal moon is far larger than usual, which greatly conspires with and strengthens our opinion. 97 Neither would it prove in the least irreconcilable with what we have said, if the horizontal moon should chance sometimes to seem enlarged beyond its usual extent, even in more serene weather. 98 For we must not only have regard to the mist which happens to be in the place where we stand; we ought also to take into our thoughts the whole sum of vapours and exhalations which lie betwixt the eye and the moon: 99 all which cooperating to render the appearance of the moon more faint, and thereby increase its magnitude, it may chance to appear greater than it usually does, even in the horizontal position, 100 at a time when, though there be no extraordinary fog or haziness, just in the place where we stand, yet the air between the eye and the moon, taken all together, may be loaded with a greater quantity of interspersed vapours and exhalations than at other times.

101 It may be objected that in consequence of our principles the interposition of a body in some degree opaque, which may intercept a great part of the rays of light, should render the appearance of the moon in the meridian as large as when it is viewed in the horizon. 102 To which I answer, it is not faintness anyhow applied that suggests greater magnitude, there being no necessary but only an experimental connexion between those two things. 103 It follows that the faintness which enlarges the appearance must be applied in such sort, and with such circumstances, as have been observed to attend the vision of great magnitudes. 104 When from a distance we behold great objects, the particles of the intermediate air and vapours, which are themselves unperceivable, do interrupt the rays of light, and thereby render the appearance less strong and vivid: 105 now, faintness of appearance caused in this sort hath been experienced to coexist with great magnitude. But when it is

caused by the interposition of an opaque sensible body, this circumstance alters the case, 106 so that a faint appearance this way caused doth not suggest greater magnitude, because it hath not been experienced to coexist with it.

107 Faintness, as well as all other ideas or perceptions which suggest magnitude or distance, doth it in the same way that words suggest the notions to which they are annexed. 108 Now, it is known a word pronounced with certain circumstances, or in a certain context with other words, hath not always the same import and signification that it hath when pronounced in some other circumstances or different context of words. 109 The very same visible appearance as to faintness and all other respects, if placed on high, shall not suggest the same magnitude that it would if it were seen at an equal distance on a level with the eye. 110 The reason whereof is that we are rarely accustomed to view objects at a great height; our concerns lie among things situated rather before than above us, 111 and accordingly our eyes are not placed on the top of our heads, but in such a position as is most convenient for us to see distant objects standing in our way. 112 And this situation of them being a circumstance which usually attends the vision of distant objects, we may from hence account for (what is commonly observed) an object's appearing of different magnitude, even with respect to its horizontal extension, on the top of a steeple, 113 for example, an hundred feet high to one standing below, from what it would if placed at an hundred feet distance on a level with your eye. 114 For it hath been shown that the judgment we make on the magnitude of a thing depends not on the visible appearance alone, but also on diverse other circumstances, 115 any one of which being omitted or varied may suffice to make some alteration in our judgment. 116 Hence, the circumstances of viewing a distant object in such a situation as is usual, and suits with the ordinary posture of the head and eyes being omitted, 117 and instead thereof a different situation

of the object, which requires a different posture of the head taking place, it is not to be wondered at if the magnitude be judged different: 118 but it will be demanded why an high object should constantly appear less than an equidistant low object of the same dimensions, for so it is observed to be: 119 it may indeed be granted that the variation of some circumstances may vary the judgment made on the magnitude of high objects, which we are less used to look at: but it does not hence appear why they should be judged less rather than greater? 120 I answer that in case the magnitude of distant objects was suggested by the extent of their visible appearance alone, and thought proportional thereto, it is certain they would then be judged much less than now they seem to be (See verses:174-182). 121 But several circumstances concurring to form the judgment we make on the magnitude of distant objects, by means of which they appear far larger than others, whose visible appearance hath an equal or even greater extension; 122 it follows that upon the change or omission of any of those circumstances which are wont to attend the vision of distant objects, and so come to influence the judgments made on their magnitude, they shall proportionably appear less than otherwise they would. 123 For any of those things that caused an object to be thought greater than in proportion to its visible extension being either omitted or applied without the usual circumstances, 124 the judgment depends more entirely on the visible extension, and consequently the object must be judged less. 125 Thus in the present case the situation of the thing seen being different from what it usually is in those objects we have occasion to view, and whose magnitude we observe, 126 it follows that the very same object, being an hundred feet high, should seem less than if it was an hundred feet off on (or nearly on) a level with the eye. 127 What has been here set forth seems to me to have no small share in contributing to magnify the appearance of the horizontal moon, and deserves not to be passed over in the explication of it.

VISION

128 If we attentively consider the phenomenon before us, we shall find the not discerning between the mediate and immediate objects of sight to be the chief cause of the difficulty that occurs in the explication of it. 129 The magnitude of the visible moon, or that which is the proper and immediate object of vision, is not greater when the moon is in the horizon than when it is in the meridian. 130 How comes it, therefore, to seem greater in one situation than the other? What is it can put this cheat on the understanding? 131 It has no other perception of the moon than what it gets by sight: and that which is seen is of the same extent, 132 I say, the visible appearance hath the same, or rather a less, magnitude when the moon is viewed in the horizontal than when in the meridional position: and yet it is esteemed greater in the former than in the latter. 133 Herein consists the difficulty, which doth vanish and admit of a most easy solution, if we consider that as the visible moon is not greater in the horizon than in the meridian, so neither is it thought to be so. 134 It hath been already shown that in any act of vision the visible object absolutely, or in itself, is little taken notice of, the mind still carrying its view from that to some tangible ideas which have been observed to be connected with it, and by that means come to be suggested by it. 135 So that when a thing is said to appear great or small, or whatever estimate be made of the magnitude of any thing, this is meant not of the visible but of the tangible object. 136 This duly considered, it will be no hard matter to reconcile the seeming contradiction there is, that the moon should appear of a different bigness, the visible magnitude thereof remaining still the same. 137 For by verses:21-27 the very same visible extension, with a different faintness, shall suggest a different tangible extension. 138 When therefore the horizontal moon is said to appear greater than the meridional moon, this must be understood not of a greater visible extension, but a of greater tangible or real extension, 139 which by reason of the more than ordinary faintness of the

visible appearance, is suggested to the mind along with it.

140 Many attempts have been made by learned people to account for this appearance. Gassendus, Descartes, Hobbes, and several others have employed their thoughts on that subject; 141 but how fruitless and unsatisfactory their endeavours have been is sufficiently shown in THE TRANSACTIONS, [Phil. Trans. Num. 187. p. 314] where you may see their several opinions at large set forth and confuted, 142 not without some surprise at the gross blunders that ingenious people have been forced into by endeavouring to reconcile this appearance with the ordinary Principles of optics. 143 Since the writing of which there hath been published in the TRANSACTIONS [Numb. 187. P. 323] another paper relating to the same affair by the celebrated Dr. Wallis, 144 wherein he attempts to account for that phenomenon which, though it seems not to contain anything new or different from what had been said before by others, I shall nevertheless consider in this place.

145 His opinion, in short, is this; we judge not of the magnitude of an object by the visual angle alone, but by the visual angle in conjunction with the distance. 146 Hence, though the angle remain the same, or even become less, yet if withal the distance seem to have been increased, the object shall appear greater. 147 Now, one way whereby we estimate the distance of anything is by the number and extent of the intermediate objects: 148 when therefore the moon is seen in the horizon, the variety of fields, houses, etc., together with the large prospect of the wide extended land or sea that lies between the eye and the utmost limb of the horizon, suggest unto the mind the idea of greater distance, and consequently magnify the appearance. 149 And this, according to Dr. Wallis, is the true account of the extraordinary largeness attributed by the mind to the horizontal moon at a time when the angle subtended by its diameter is not one jot greater than it used to be.

150 With reference to this opinion, not to repeat what hath been already said concerning distance, I

shall only observe, FIRST, that if the prospect of interjacent objects be that which suggests the idea of farther distance, 151 and this idea of farther distance be the cause that brings into the mind the idea of greater magnitude, 152 it should hence follow that if one looked at the horizontal moon from behind a wall, it would appear no bigger than ordinary. 153 For in that case the wall interposing cuts off all that prospect of sea and land, etc. which might otherwise increase the apparent distance, and thereby the apparent magnitude of the moon. 154 Nor will it suffice to say the memory doth even then suggest all that extent of land, etc., which lies within the horizon; which suggestion occasions a sudden judgment of sense that the moon is farther off and larger than usual. 155 For ask any person who, from such a station beholding the horizontal moon, shall think her greater than usual, whether you hath at that time in your mind any idea of the intermediate objects, or long tract of land that lies between your eye and the extreme edge of the horizon? 156 And whether it be that idea which is the cause of your making the aforementioned judgment? You will, I suppose, reply in the negative, 157 and declare the horizontal moon shall appear greater than the meridional, though you never thinks of all or any of those things that lie between you and it. 158 SECONDLY, it seems impossible by this hypothesis to account for the moon's appearing in the very same situation at one time greater than at another; 159 which nevertheless has been shown to be very agreeable to the principles we have laid down, and receives a most easy and natural explication from them. 160 For the further clearing' up of this point it is to be observed that what we immediately and properly see are only lights and colours in sundry situations and shades and degrees of faintness and clearness, confusion and distinctness. 161 All which visible objects are only in the mind, nor do they suggest ought external, whether distance or magnitude, otherwise than by habitual connexion as words do things. 162 We are also to remark that, beside the straining of the eyes, and beside the vivid and faint, the

distinct and confused appearances (which, bearing some proportion to lines and angles, have been substituted instead of them in the foregoing part of this treatise), 163 there are other means which suggest both distance and magnitude; particularly the situation of visible points of objects, as upper or lower; 164 the one suggesting a farther distance and greater magnitude, the other a nearer distance and lesser magnitude: all which is an effect only of custom and experience; 165 there being really nothing intermediate in the line of distance between the uppermost and lowermost, which are both equidistant, or rather at no distance from the eye, 166 as there is also nothing in upper or lower, which by necessary connexion should suggest greater or lesser magnitude. 167 Now, as these customary, experimental means of suggesting distance do likewise suggest magnitude, so they suggest the one as immediately as the other. 168 I say they do not (See-verses:4-10) first suggest distance, and then leave the mind from thence to infer or compute magnitude, jut suggest magnitude as immediately and directly as they suggest distance.

169 This phenomenon of the horizontal moon is a clear instance of the insufficiency of lines and angles for explaining the way wherein the mind perceives and estimates the magnitude of outward objects. 170 There is nevertheless a use of computation by them in order to determine the apparent magnitude of things, 171 so far as they have a connexion with, and are proportional to, those other ideas or perceptions which are the true and immediate occasions that suggest to the mind the apparent magnitude of things. 172 But this in general may, I think, be observed concerning mathematical computation in optics: 173 that it can never be very precise and exact since the judgments we make of the magnitude of external things do often depend on several circumstances, which are not proportionable to, or capable of being defined by, lines and angles.

174 From what has been said we may safely deduce this consequence; to wit, that a human

born blind and made to see would, at first opening of your eyes, make a very different judgment of the magnitude of objects intromitted by them from what others do. 175 You would not consider the ideas of sight with reference to, or as having any connexion with, the ideas of touch: 176 your view of them being entirely terminated within themselves, you can no otherwise judge them great or small than as they contain a greater or lesser number of visible points. 177 Now, it being certain that any visible point can cover or exclude from view only one other visible point, it follows that whatever object intercepts the view of another hath an equal number of visible points with it; 178 and consequently they shall both be thought by you to have the same magnitude. 179 Hence it is evident one in those circumstances would judge your thumb, with which you might hide a tower or hinder its being seen, equal to that tower, 180 or your hand, the interposition whereof might conceal experimental means the firmament from your view, equal to the firmament: 181 how great an inequality soever there may in our apprehensions seem to be betwixt those two things, because of the customary and close connexion that has grown up in our minds between the objects of sight and touch; 182 whereby the very different and distinct ideas of those two senses are so blended and confounded together as to be mistaken for one and the same thing; out of which prejudice we cannot easily extricate ourselves.

183 For the better explaining the nature of vision, and setting the manner wherein we perceive magnitudes in a due light, I shall proceed to make some observations concerning matters relating thereto, 184 whereof the want of reflexion, and duly separating between tangible and visible ideas, is apt to create in us mistaken and confused notions. 185 And FIRST, I shall observe that the MINIMUM VISIBILE is exactly equal in all beings whatsoever that are endowed with the visive faculty. 186 No exquisite formation of the eye, no peculiar sharpness of sight, can make it less in one creature than in another; for it not being distinguishable into parts,

nor in any wise a consisting of them, it must necessarily be the same to all. 187 For suppose it otherwise, and that the MINIMUM VISIBILE of a mite, for instance, be less than the MINIMUM VISIBILE of a human: the latter therefore may by detraction of some part be made equal to the former: 188 it doth therefore consist of parts, which is inconsistent with the notion of a MINIMUM VISIBILE or point.

189 It will perhaps be objected that the MINIMUM VISIBILE of a human doth really and in itself contain parts whereby it surpasses that of a mite, though they are not perceivable by the person. 190 To which I answer, the MINIMUM VISIBILE having (in like manner as all other the proper and immediate objects of sight) been shown not to have any existence without the mind of you who sees it, 191 it follows there cannot be any part of it that is not actually perceived, and therefore visible. 192 Now for any object to contain distinct visible parts, and at the same time to be a MINIMUM VISIBILE, is a manifest contradiction.

193 Of these visible points we see at all times an equal number. It is every whit as great when our view is contracted and bounded by near objects as when it is extended to larger and remoter. 194 For it being impossible that one MINIMUM VISIBILE should obscure or keep out of sight mote than one other, it is a plain consequence that when my view is on all sides bounded by the walls of my study see just as many visible points as I could, 195 in case that by the removal of the study-walls and all other obstructions, I had a full prospect of the circumjacent fields, mountains, sea, and open firmament: 196 for so long as I am shut up within the walls, by their interposition every point of the external objects is covered from my view: 197 but each point that is seen being able to cover or exclude from sight one only other corresponding point, 198 it follows that whilst my sight is confined to those narrow walls I see as many points, or MINIMA VISIBILIA, as I should were those walls away, by looking on all the external objects whose prospect is intercepted by them. 199 Whenever therefore we

are said to have a greater prospect at one time than another, this must be understood with relation, not to the proper and immediate, but the secondary and mediate objects of vision, which, as hath been shown, properly belong to the touch.

200 The visive faculty considered with reference to its immediate objects may be found to labour of two defects. 201 FIRST, in respect of the extent or number of visible points that are at once perceivable by it, which is narrow and limited to a certain degree. 202 It can take in at one view but a certain determinate number of MINIMA VISIBILIA, beyond which it cannot extend its prospect. 203 Secondly, our sight is defective in that its view is not only narrow, but also for the most part confused: of those things that we take in at one prospect we can see but a few at once clearly and unconfusedly: 204 and the more we fix our sight on any one object, by so much the darker and more indistinct shall the rest appear.

205 Corresponding to these two defects of sight, we may imagine as many perfections, to wit, Firstly, that of comprehending in one view a greater number of visible points. Secondly, of being able to view them all equally and at once with the utmost clearness and distinction. 206 That those perfections are not actually in some intelligences of a different order and capacity from ours it is impossible for us to know.

207 In neither of those two ways do microscopes contribute to the improvement of sight; 208 for when we look through a microscope we neither see more visible points, nor are the collateral points more distinct than when we look with the naked eye at objects placed in a due distance. 209 A microscope brings us, as it were, into a new world: it presents us with a new scene of visible objects quite different from what we behold with the naked eye. 210 But herein consists the most remarkable difference, to wit, that whereas the objects perceived by the eye alone have a certain connexion with tangible objects, 211 whereby we are taught to foresee what will ensue upon the approach or application of distant objects to the parts of our own body, which much conduceth to its

preservation, 212 there is not the like connexion between things tangible and those visible objects that are perceived by help of a fine microscope.

213 Hence it is evident that were our eyes turned into the nature of microscopes, we should not be much benefited by the change; 214 we should be deprived of the forementioned advantage we at present receive by the visive faculty, and have left us only the empty amusement of seeing, without any other benefit arising from it. 215 But in that case, it will perhaps be said, our sight would be endued with a far greater sharpness and penetration than it now hath. 216 But it is certain from what we have already shown that the MINIMUM VISIBILE is never greater or lesser, but in all cases constantly the same: 217 and in the case of microscopical eyes I see only this difference, to wit, that upon the ceasing of a certain observable connexion betwixt the diverse perceptions of sight and touch, which before enabled us to regulate our actions by the eye, it would now be rendered utterly unserviceable to that purpose.

218 Upon the whole it seems that if we consider the use and end of sight, together with the present state and circumstances of our being, we shall not find any great cause to complain of any defect or imperfection in it, or easily conceive how it could be mended. 219 With such admirable wisdom is that faculty contrived, both for the pleasure and convenience of life.

THE ORIENTATION OF THE OBJECTS OF SIGHT

George Berkeley

3 Having finished what I intended to say concerning the distance and magnitude of objects, I come now to treat of the manner wherein the mind perceives by sight their situation. 2 Among the discoveries of the last age, it is reputed none of the least that the manner of vision hath been more clearly explained than ever it had been before. 3 There is at this day no one ignorant that the pictures of external objects are painted on the RETINA, or fund of the eye: that we can see nothing which is not so painted: 4 and that, according as

the picture is more distinct or confused, so also is the perception we have of the object: but then in this explication of vision there occurs one mighty difficulty. 5 The objects are painted in an inverted order on the bottom of the eye: the upper part of any object being painted on the lower part of the eye, and the lower part of the object on the upper part of the eye: and so also as to right and left. 6 Since therefore the pictures are thus inverted, it is demanded how it comes to pass that we see the objects erect and in their natural posture?

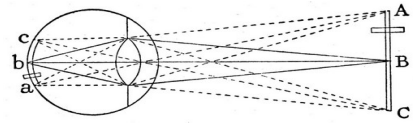

Fig-4

7 In answer to this difficulty we are told that the mind, perceiving an impulse of a ray of light on the upper part of the eye, considers this ray as coming in a direct line from the lower part of the object; 8 and in like manner tracing the ray that strikes on the lower part of the eye, it is directed to the upper part of the object. 9 Thus in the adjacent figure, C, the lower point of the object ABC, is projected on C the upper part of the eye. 10 So likewise the highest point A is projected on A the lowest part of the eye, which makes the representation CBA inverted: 11 but the mind considering the stroke that is made on C as coming in the straight line CC from the lower end of the object; 12 and the stroke or impulse on a as coming in the line AA from the upper end of the object, is directed to make a right judgment of the situation of the object ABC, notwithstanding the picture of it is inverted. 13 This is illustrated by conceiving a blind person who, holding in own hands two sticks that cross each other, doth with them touch the extremities of an object, placed in a perpendicular situation. 14 It is certain this person will judge that to be the upper part of the object which one touches with the stick held in the undermost hand, and that to be the lower part of the object which one touches with the stick in own uppermost hand. 15 This is the common explication of the erect appearance of objects, which is generally received and acquiesced in, being 'allowed by all humans as satisfactory' (as Mr.

Molyneux tells us [Diopt. par. 2. c. 7. P. 289.]).

16 But this account to me does not seem in any degree true. Did I perceive those impulses, decussations, and directions of the rays of light in like manner as hath been set forth, then indeed it would not be altogether void of probability. 17 And there might be some pretence for the comparison of the blind person and own cross sticks. 18 But the case is far otherwise. I know very well that I perceive no such thing. And of consequence I cannot thereby make an estimate of the situation of objects. 19 I appeal to anyone's experience, whether you be conscious to yourself that you thinks on the intersection made by the radious [SIC] pencils, or pursues the impulses they give in right lines, whenever you perceives by sight the position of any object? 20 To me it seems evident that crossing and tracing of the rays is never thought on by children, idiots, or in truth by any other, save only those who have applied themselves to the study of optics. 21 And for the mind to judge of the situation of objects by those things without perceiving them, or to perceive them without knowing it, is equally beyond my comprehension. 22 Add to this that the explaining the manner of vision by the example of cross sticks and hunting for the object along the axes of the radious pencils, 23 doth suppose the proper objects of sight to be perceived at a distance from us, contrary to what hath been demonstrated.

24 It remains, therefore, that we look for some other explication of this difficulty: and I believe it not impossible to find one, provided we examine it to the bottom, and carefully distinguish between the ideas of sight and touch; 25 which cannot be too oft inculcated in treating of vision: but more especially throughout the consideration of this affair we ought to carry that distinction in our thoughts: 26 for that from want of a right understanding thereof the difficulty of explaining erect vision seems chiefly to arise.

27 In order to disentangle our minds from whatever prejudices we may entertain with relation to the subject in hand, nothing seems more apposite than the taking into

our thoughts the case of one born blind, and afterwards, when grown up, made to see. 28 And though, perhaps, it may not be an easy task to divest ourselves entirely of the experience received from sight, so as to be able to put our thoughts exactly in the posture of such a one's, 29 we must, nevertheless, as far as possible, endeavour to frame true conceptions of what might reasonably be supposed to pass in one's own mind.

30 It is certain that a person actually blind, and who had continued so from birth, would by the sense of feeling attain to have ideas of upper and lower. 31 By the motion of own hand one might discern the situation of any tangible object placed within own FI reach. 32 That part on which you felt yourself supported, or towards which you perceived your body to gravitate, you would term lower, and the contrary to this upper; and accordingly denominate whatsoever objects you touched.

33 But then, whatever judgments you makes concerning the situation of objects are confined to those only that are perceivable by touch. 34 All those things that are intangible and of a spiritual nature, your thoughts and desires, your passions, and in general all the modifications of the soul, to these you would never apply the terms UPPER and LOWER, except only in a metaphorical sense. 35 You may, perhaps, by way of allusion, speak of high or low thoughts: but those terms in their proper signification would never be applied to anything that was not conceived to exist without the mind. 36 For a person born blind, and remaining in the same state, could mean nothing else by the words HIGHER and LOWER than a greater or lesser distance from the earth; 37 which distance you would measure by the motion or application of your hand or some other part of your body. 38 It is therefore evident that all those things which, in respect of each other, would by you be thought higher or lower, must be such as were conceived to exist without your mind, in the ambient space.

39 Whence it plainly follows that such a one, if we suppose you made to see, would not at first sight think anything you saw was high or low, erect or inverted;

40 for it hath been already demonstrated in chapter-1, verses: 190-193 that you would not think the things you perceived by sight to be at any distance from you, or without your mind. 41 The objects to which you had hitherto been used to apply the terms UP and DOWN, HIGH and LOW, were such only as affected or were some way perceived by your couch: 42 but the proper objects of vision make a new set of ideas, perfectly distinct and different from the former, and which can in no sort make themselves perceived by touch. 43 There is, therefore, nothing at all that could induce you to think those terms applicable to them: nor would you ever think it till such time as you had observed their connexion with tangible objects, 44 and the same prejudice began to insinuate itself into your understanding, which from their infancy had grown up in the understandings of other humans.

45 To set this matter in a clearer light I shall make use of an example. Suppose the above-mentioned blind person by own touch perceives a human to stand erect. Let us inquire into the manner of this. 46 By the application of own hand to the several parts of a human body one had perceived different tangible ideas, which being collected into sundry complex ones, have distinct names annexed to them. 47 Thus one combination of a certain tangible figure, bulk, and consistency of parts is called the head, another the hand, a third the foot, and so of the rest: 48 all which complex ideas could, in your understanding, be made up only of ideas perceivable by touch. 49 You had also by your touch obtained an idea of earth or ground, towards which you perceives the parts of your body to have a natural tendency. 50 Now, by ERECT nothing more being meant than that perpendicular position of a human wherein your feet are nearest to the earth, 51 if the blind person by moving own hand over the parts of the human who stands before own self perceives the tangible ideas that compose the head to be farthest from, and those that compose the feet to be nearest to, 52 that other combination of tangible ideas which you calls earth, you will

denominate that human erect. 53 But if we suppose you on a sudden to receive your sight, and that you behold a human standing before you, it is evident in that case you would neither judge the person you sees to be erect nor inverted; 54 for you never having known those terms applied to any other save tangible things, or which existed in the space without you, 55 and what you sees neither being tangible nor perceived as existing without, you could not know that in propriety of language they were applicable to it.

56 Afterwards, when upon turning your head or eyes up and down to the right and left you shall observe the visible objects to change, and shall also attain to know that they are called by the same names, and connected with the objects perceived by touch; 57 then indeed you will come to speak of them and their situation, in the same terms that you have been used to apply to tangible things; 58 and those that you perceives by turning up your eyes you will call upper, and those that by turning down your eyes you will call lower.

59 And this seems to me the true reason why you should think those objects uppermost that are painted on the lower part of your eye: for by turning the eye up they shall be distinctly seen; 60 as likewise those that are painted on the highest part of the eye shall be distinctly seen by turning the eye down, and are for that reason esteemed lowest; 61 for we have shown that to the immediate objects of sight considered in themselves, you would not attribute the terms HIGH and LOW. 62 It must therefore be on account of some circumstances which are observed to attend them: and these, it is plain, are the actions of turning the eye up and down, which suggest a very obvious reason why the mind should denominate the objects of sight accordingly high or low. 63 And without this motion of the eye, this turning it up and down in order to discern different objects, doubtless ERECT, INVERSE, and other the like terms relating to the position of tangible objects, would never have been transferred, 64 or in any degree apprehended to belong to the ideas of sight: the mere act of

seeing including nothing in it to that purpose; 65 whereas the different situations of the eye naturally direct the mind to make a suitable judgment of the situation of objects intromitted by it.

66 Farther, when you have by experience learned the connexion there is between the several ideas of sight and touch, 67 you will be able, by the perception you have of the situation of visible things in respect of one another, to make a sudden and true estimate of the situation of outward, tangible things corresponding to them. 68 And thus it is you shall perceive by sight the situation of external objects which do not properly fall under that sense.

69 I know we are very prone to think that, if just made to see, we should judge of the situation of visible things as we do now: 70 but we are also as prone to think that, at first sight, we should in the same way apprehend the distance and magnitude of objects as we do now: 71 which hath been shown to be a false and groundless persuasion. 72 And for the like reasons the same censure may be passed on the positive assurance that most people, before they have thought sufficiently of the matter, might have of their being able to determine by the eye at first view, whether objects were erect or inverse.

73 It will, perhaps, be objected to our opinion that a human, for instance, being thought erect when your feet are next the earth, and inverted when your head is next the earth, 74 it doth hence follow that by the mere act of vision, without any experience or altering the situation of the eye, we should have determined whether you were erect or inverted: 75 for both the earth itself, and the limbs of the person who stands thereon, being equally perceived by sight, one cannot choose seeing what part of the person is nearest the earth, and what part farthest from it, i.e. whether you be erect or inverted.

76 To which I answer, the ideas which constitute the tangible earth and human are entirely different from those which constitute the visible earth and human. 77 Nor was it possible, by virtue of the visive faculty alone, without superadding any experience of touch, or altering the position of

the eye, ever to have known, or so much as suspected, there had been any relation or connexion between them. 78 Hence a human at first view would not denominate anything you saw earth, or head, or foot; and consequently you could not tell by the mere act of vision whether the head or feet were nearest the earth: 79 nor, indeed, would we have thereby any thought of earth or human, erect or inverse, at all: which will be made yet more evident if we nicely observe, and make a particular comparison between, the ideas of both senses.

80 That which I see is only variety of light and colours. That which I feel is hard or soft, hot or cold, rough or smooth. 81 What similitude, what connexion have those ideas with these? 82 Or how is it possible that anyone should see reason to give one and the same name to combinations of ideas so very different before you had experienced their coexistence? 83 We do not find there is any necessary connexion betwixt this or that tangible quality and any colour whatsoever. And we may sometimes perceive colours where there is nothing to be felt. 84 All which doth make it manifest that no human, at first receiving of your sight, would know there was any agreement between this or that particular object of your sight and any object of touch you had been already acquainted with: 85 the colours, therefore, of the head would to you no more suggest the idea of head than they would the idea of foot.

86 Farther, we have at large shown (In Chapter-2, verses:60-68) there is no discoverable necessary connexion between any given visible magnitude and any one particular tangible magnitude; 87 but that it is entirely the result of custom and experience, and depends on foreign and accidental circumstances that we can by the perception of visible extension inform ourselves what may be the extension of any tangible object connected with it. 88 Hence it is certain that neither the visible magnitude of head or foot would bring along with them into the mind, at first opening of the eyes, the respective tangible magnitudes of those parts.

89 By the foregoing section it is plain the visible figure of any part of the body hath no necessary connexion with the tangible figure thereof, so as at first sight to suggest it to the mind. 90 For figure is the termination of magnitude; whence it follows that no visible magnitude having in its own nature an aptness to suggest any one particular tangible magnitude, 91 so neither can any visible figure be inseparably connected with its corresponding tangible figure: so as of itself and in a way prior to experience, it might suggest it to the understanding. 92 This will be farther evident if we consider that what seems smooth and round to the touch may to sight, if viewed through a microscope, seem quite otherwise.

93 From all which laid together and duly considered, we may clearly deduce this inference. 94 In the first act of vision no idea entering by the eye would have a perceivable connexion with the ideas to which the names EARTH, HUMAN, HEAD, FOOT, etc., were annexed in the understanding of a person blind from own birth; 95 so as in any sort to introduce them into own mind, or make themselves be called by the same names, and reputed the same things with them, as afterwards they come to be.

96 There doth, nevertheless, remain one difficulty, which perhaps may seem to press hard on our opinion, and deserve not to be passed over: 97 for though it be granted that neither the colour, size, nor figure of the visible feet have any necessary connexion with the ideas that compose the tangible feet, 98 so as to bring them at first sight into my mind, or make me in danger of confounding them before I had been used to, and for some time experienced their connexion: 99 yet thus much seems undeniable, namely, that the number of the visible feet being the same with that of the tangible feet, I may from hence without any experience of sight reasonably conclude that they represent or are connected with the feet rather than the head. 100 I say, it seems the idea of two visible feet will sooner suggest to the mind the idea of two tangible feet than of one head; 101 so that the blind person upon first

reception of the visive faculty might know which were the feet or two, and which the head or one.

102 In order to get clear of this seeming difficulty we need only observe that diversity of visible objects doth not necessarily infer diversity of tangible objects corresponding to them. 103 A picture painted with great variety of colours affects the touch in one uniform manner; 104 it is therefore evident that I do not by any necessary consecution, independent of experience, judge of the number of things tangible from the number of things visible. 105 I should not, therefore, at first opening my eyes conclude that because I see two I shall feel two. 106 How, therefore, can I, before experience teaches me, know that the visible legs, because two, are connected with the tangible legs, or the visible head, because one, is connected with the tangible head? 107 The truth is, the things I see are so very different and heterogeneous from the things I feel, 108 that the perception of the one would never have suggested the other to my thoughts, or enabled me to pass the least judgment thereon, until I had experienced their connexion.

109 But for a fuller illustration of this matter it ought to be considered that number (however some may reckon it amongst the primary qualities) is nothing fixed and settled, really existing in things themselves. 110 It is entirely the creature of the mind, considering either an idea by itself, or any combination of ideas to which it gives one name, and so makes it pass for an unit. 111 According as the mind variously combines its ideas the unit varies: and as the unit, so the number, which is only a collection of units, doth also vary. 112 We call a window one, a chimney one, and yet a house in which there are many windows and many chimneys hath an equal right to be called one, and many houses go to the making of the city. 113 In these and the like, instances it is evident the unit constantly relates to the particular draughts the mind makes of its ideas, to which it affixes names, and wherein it includes more or less as best suits its own ends and purposes. 114 Whatever, therefore, the mind

considers as one, that is an unit. Every combination of ideas is considered as one thing by the mind, and in token thereof is marked by one name. 115 Now, this naming and combining together of ideas is perfectly arbitrary, and done by the mind in such sort as experience shows it to be most convenient: without which our ideas had never been collected into such sundry distinct combinations as they now are.

116 Hence it follows that a person born blind and afterwards, when grown up, made to see, would not in the first act of vision parcel out the ideas of sight into the same distinct collections that others do, 117 who have experienced which do regularly coexist and are proper to be bundled up together under one name. 118 You would not, for example, make into one complex idea, and thereby esteem an unit, all those particular ideas which constitute the visible head or foot. 119 For there can be no reason assigned why you should do so, barely upon your seeing a human stand upright before you. 120 There crowd into your mind the ideas which compose the visible human, in company with all the other ideas of sight perceived at the same time: 121 but all these ideas offered at once to your view, you would not distribute into sundry distinct combinations till such time as by observing the motion of the parts of the human and other experiences you comes to know which are to be separated and which to be collected together.

122 From what hath been premised it is plain the objects of sight and touch make, if I may so say, two sets of ideas which are widely different from each other. 123 To objects of either kind we indifferently attribute the terms high and low, right and left, and suchlike, denoting the position or situation of things: 124 but then we must well observe that the position of any object is determined with respect only to objects of the same sense. 125 We say any object of touch is high or low, according as it is more or less distant from the tangible earth: 126 and in like manner we denominate any object of sight high or low in proportion as it is more or less distant from the visible earth: 127 but to define the situation of visible things with

relation to the distance they bear from any tangible thing, or VICE VERSA, this were absurd and perfectly unintelligible. 128 For all visible things are equally in the mind, and take up no part of the external space: and consequently are equidistant from any tangible thing which exists without the mind.

129 Or rather, to speak truly, the proper objects of sight are at no distance, neither near nor far, from any tangible thing. 130 For if we inquire narrowly into the matter we shall find that those things only are compared together in respect of distance which exist after the same manner, or appertain unto the same sense. 131 For by the distance between any two points nothing more is meant than the number of intermediate points: 132 if the given points are visible the distance between them is marked out by the number of the interjacent visible points: 133 if they are tangible, the distance between them is a line consisting of tangible points; 134 but if they are one tangible and the other visible, the distance between them doth neither consist of points perceivable by sight nor by touch, i.e. it is utterly inconceivable. 135 This, perhaps, will not find an easy admission into all humans' understanding: however, I should gladly be informed whether it be not true by anyone who will be at the pains to reflect a little and apply it home to your thoughts.

136 The not observing what has been delivered in the two last sections seems to have occasioned no small part of the difficulty that occurs in the business of erect appearances. 137 The head, which is painted nearest the earth, seems to be farthest from it: and on the other hand the feet, which are painted farthest from the earth, are thought nearest to it. 138 Herein lies the difficulty, which vanishes if we express the thing more clearly and free from ambiguity, thus: 139 how comes it that to the eye the visible head which is nearest the tangible earth seems farthest from the earth, and the visible feet, which are farthest from the tangible earth seem nearest the earth? 140 The question being thus proposed, who sees not the difficulty is founded on a supposition that the eye, or visive

faculty, or rather the soul by means thereof, should judge of the situation of visible objects with reference to their distance from the tangible earth? 141 Whereas it is evident the tangible earth is not perceived by sight: and it hath been shown in the two last preceding sections that the location of visible objects is determined only by the distance they bear from one another; 142 and that it is nonsense to talk of distance, far or near, between a visible and tangible thing.

143 If we confine our thoughts to the proper objects of sight, the whole is plain and easy. The head is painted farthest from, and the feet nearest to, the visible earth; and so they appear to be. 144 What is there strange or unaccountable in this? Let us suppose the pictures in the fund of the eye to be the immediate objects of the sight. The consequence is that things should appear in the same posture they are painted in; and is it not so? 145 The head which is seen seems farthest from the earth which is seen; and the feet which are seen seem nearest to the earth, which is seen; and just so they are painted.

146 But, say you, the picture of the human is inverted, and yet the appearance is erect: I ask, what mean you by the picture of the human, or, which is the same thing, the visible human's being inverted? 147 You tell me it is inverted, because the heels are uppermost and the head undermost? Explain me this. 148 You say that by the head's being undermost you mean that it is nearest to the earth; and by the heels being uppermost that they are farthest from the earth. I ask again what earth you mean? 149 You cannot mean the earth that is painted on the eye, or the visible earth: for the picture of the head is farthest from the picture of the earth, and the picture of the feet nearest to the picture of the earth; and accordingly the visible head is farthest from the visible earth, and the visible feet nearest to it. 150 It remains, therefore, that you mean the tangible earth, and so determine the situation of visible things with respect to tangible things; contrary to what hath been demonstrated in verses:122-135.

151 The two distinct provinces of sight and touch should be considered apart, and as if their objects had no intercourse, no manner of relation one to another, in point of distance or position.

152 Farther, what greatly contributes to make us mistake in this matter is that when we think of the pictures in the fund of the eye, we imagine ourselves looking on the fund of another's eye, 153 or another looking on the fund of our own eye, and beholding the pictures painted thereon. 154 Suppose two eyes A and B: A from some distance looking on the pictures in B sees them inverted, and for that reason concludes they are inverted in B: but this is wrong. 155 There are projected in little on the bottom of A the images of the pictures of, suppose, human, earth, etc., which are painted on B. 156 And besides these the eye B itself, and the objects which environ it, together with another earth, are projected in a larger size on A.

157 Now, by the eye A these larger images are deemed the true objects, and the lesser only pictures in miniature. And it is with respect to those greater images that it determines the situation of the smaller images: 158 so that comparing the little human with the great earth, A judges you inverted, or that the feet are farthest from and the head nearest to the great earth. 159 Whereas, if A compare the little human with the little earth, then you will appear erect, i.e. your head shall seem farthest from, and your feet nearest to, the little earth. 160 But we must consider that B does not see two earths as A does: it sees only what is represented by the little pictures in A, and consequently shall judge the human erect. 161 For, in truth, the human in B is not inverted, for there the feet are next the earth; 162 but it is the representation of it in A which is inverted, for there the head of the representation of the picture of the human in B is next the earth, and the feet farthest from the earth, meaning the earth which is without the representation of the pictures in B. 163 For if you take the little images of the pictures in B, and consider them by themselves, and with respect

only to one another, they are all erect and in their natural posture.

164 Farther, there lies a mistake in our imagining that the pictures of external objects are painted on the bottom of the eye. 165 It hath been shown there is no resemblance BETWEEN the ideas of sight and things tangible. 166 It hath likewise been demonstrated that the proper objects of sight do not exist without the mind. 167 Whence it clearly follows that the pictures painted on the bottom of the eye are not the pictures of external objects. 168 Let anyone consult own thoughts, and then say what affinity, what likeness there is between that certain variety and disposition of colours which constitute the visible human, or picture of a human, 169 and that other combination of far different ideas, sensible by touch, which compose the tangible human. 170 But if this be the case, how come they to be accounted pictures or images, since that supposes them to copy or represent some originals or other?

171 To which I answer: in the forementioned instance the eye A takes the little images, included within the representation of the other eye B, to be pictures or copies, 172 whereof the archetypes are not things existing without, but the larger pictures projected on its own fund: and which by A are not thought pictures, but the originals, or true things themselves. 173 Though if we suppose a third eye C from a due distance to behold the fund of A, then indeed the things projected thereon shall, to C, seem pictures or images in the same sense that those projected on B do to A.

174 Rightly to conceive this point we must carefully distinguish between the ideas of sight and touch, between the visible and tangible eye; for certainly on the tangible eye nothing either is or seems to be painted. 175 Again, the visible eye, as well as all other visible objects, hath been shown to exist only in the mind, which perceiving its own ideas, and comparing them together, calls some PICTURES in respect of others. 176 What hath been said, being rightly comprehended and laid together, doth, I think, afford a full and genuine explication of the erect appearance of objects;

177 which phenomenon, I must confess, I do not see how it can be explained by any theories of vision hitherto made public.

178 In treating of these things the use of language is apt to occasion some obscurity and confusion, and create in us wrong ideas; 179 for language being accommodated to the common notions and prejudices of humans, it is scarce possible to deliver the naked and precise truth without great circumlocution, impropriety, and (to an unwary reader) seeming contradictions; 180 I do therefore once for all desire whoever shall think it worth your while to understand what I have written concerning vision, 181 that you would not stick in this or that phrase, or manner of expression, but candidly collect my meaning from the whole sum and tenour of my discourse, 182 and laying aside the words as much as possible, consider the bare notions themselves, and then judge whether they are agreeable to truth and your own experience, or no.

IDEAS OF SIGHT AND OF TOUCH

George Berkeley

4 We have shown the way wherein the mind by mediation of visible ideas doth perceive or apprehend the distance, magnitude and situation of tangible objects. 2 We come now to inquire more particularly concerning the difference between the ideas of sight and touch, which are called by the same names, and see whether there be any idea common to both senses. 3 From what we have at large set forth and demonstrated in the foregoing parts of this treatise, it is plain there is no one selfsame numerical extension perceived both by sight and touch; 4 but that the particular figures and extensions perceived by sight, however they may be called by the same names and reputed the same things with those perceived by touch, are nevertheless different, and have an existence distinct and separate from them: 5 so that the question is not now concerning the same numerical ideas, but whether there be any one and the same sort of species of ideas equally

perceivable to both senses; 6 or, in other words, whether extension, figure, and motion perceived by sight are not specifically distinct from extension, figure, and motion perceived by touch.

7 But before I come more particularly to discuss this matter, I find it proper to consider extension in abstract: for of this there is much talk, 8 and I am apt to think that when people speak of extension as being an idea common to two senses, it is with a secret supposition that we can single out extension from all other tangible and visible qualities, and form thereof an abstract idea, which idea they will have common both to sight and touch. 9 We are therefore to understand by extension in abstract an idea of extension, 10 for instance, a line or surface entirely stripped of all other sensible qualities and circumstances that might determine it to any particular existence; 11 it is neither black nor white, nor red, nor hath it any colour at all, or any tangible quality whatsoever and consequently it is of no finite determinate magnitude: 12 for that which bounds or distinguishes one extension from another is some quality or circumstance wherein they disagree.

13 Now I do not find that I can perceive, imagine, or any wise frame in my mind such an abstract idea as is here spoken of. 14 A line or surface which is neither black, nor white, nor blue, nor yellow, etc., nor long, nor short, nor rough, nor smooth, nor square, nor round, etc., is perfectly incomprehensible. 15 This I am sure of as to myself: how far the faculties of other people may reach they best can tell.

16 It is commonly said that the object of geometry is abstract extension: but geometry contemplates figures: now, figure is the termination of magnitude: but we have shown that extension in abstract hath no finite determinate magnitude. 17 Whence it clearly follows that it can have no figure, and consequently is not the object of geometry. 18 It is indeed a tenet as well of the modern as of the ancient philosophers that all general truths are concerning universal abstract ideas; 19 without which, we are

told, there could be no science, no demonstration of any general proposition in geometry. 20 But it were no hard matter, did I think it necessary to my present purpose, to show that propositions and demonstrations in geometry might be universal, though they who make them never think of abstract general ideas of triangles or circles.

21 After reiterated endeavours to apprehend the general idea a triangle, I have found it altogether incomprehensible. 22 And surely if anyone were able to introduce that idea into my mind, it must be the author of the *ESSAY CONCERNING HUMAN UNDERSTANDING*; 23 he who has so far distinguished himself from the generality of writers by the clearness and significancy of what he says. 24 Let us therefore see how this celebrated author describes the general or abstract idea of a triangle. 'It must be (says he) neither oblique nor rectangular, neither equilateral, equicrural, nor scalenum; but all and none of these at once. 25 In effect, it is somewhat imperfect that cannot exist; an idea, wherein some parts of several different and inconsistent ideas are put together' ESSAY ON HUMAN UNDERSTAND. 26 This is the idea which he thinks needful for the enlargement of knowledge, which is the subject of mathematical demonstration, and without which we could never come to know any general proposition concerning triangles. 27 That author acknowledges it doth 'require some pains and skill to form this general idea of a triangle'. 28 But had he called to mind what he says in another place, to wit, 'That ideas of mixed modes wherein any inconsistent ideas are put together cannot so much as exist in the mind, i.e. be conceived'. 29 I say, had this occurred to his thoughts, it is not improbable he would have owned it above all the pains and skill he was master of to form the above-mentioned idea of a triangle, which is made up of manifest, staring contradictions. 30 That a person who laid so great a stress on clear and determinate ideas should nevertheless talk at this rate seems very surprising. 31 But the wonder will lessen if it be considered that the source whence

this opinion flows is the prolific womb which has brought forth innumerable errors and difficulties in all parts of philosophy and in all the sciences: 32 but this matter, taken in its full extent, were a subject too comprehensive to be insisted on in this place. And so much for extension in abstract.

33 Some, perhaps, may think pure space, VACUUM, or trine dimension to be equally the object of sight and touch: 34 but though we have a very great propension to think the ideas of outness and space to be the immediate object of sight, yet, if I mistake not, in the foregoing parts of this essay that hath been clearly demonstrated to be a mere delusion, 35 arising from the quick and sudden suggestion of fancy, which so closely connects the idea of distance with those of sight, that we are apt to think it is itself a proper and immediate object of that sense till reason corrects the mistake.

36 It having been shown that there are no abstract ideas of figure, and that it is impossible for us by any precision of thought to frame an idea of extension separate from all other visible and tangible qualities which shall be common both to sight and touch: 37 the question now remaining is, whether the particular extensions, figures, and motions perceived by sight be of the same kind with the particular extensions, figures, and motions perceived by touch? 38 In answer to which I shall venture to lay down the following proposition: THE EXTENSION, FIGURES, AND MOTIONS PERCEIVED BY SIGHT ARE SPECIFICALLY DISTINCT FROM THE IDEAS OF TOUCH CALLED BY THE SAME NAMES, NOR IS THERE ANY SUCH THING AS ONE IDEA OR KIND OF IDEA COMMON TO BOTH SENSES.

39 This proposition may without much difficulty be collected from what hath been said in several places of this essay. 40 But because it seems so remote from, and contrary to, the received notions and settled opinion of humankind, I shall attempt to demonstrate it more particularly and at large by the following arguments.

41 When upon perception of an idea I range it under this or that sort, it is because it is perceived after the same manner, or because it has a likeness or conformity with, or affects me in the same way as, the ideas of the sort I rank

it under. 42 In short, it must not be entirely new, but have something in it old and already perceived by me. 43 It must, I say, have so much at least in common with the ideas I have before known and named as to make me give it the same name with them. 44 But it has been, if I mistake not, clearly made out that a human born blind would not at first reception of own sight think the things one saw were of the same nature with the objects of touch, or had anything in common with them; 45 but that they were a new set of ideas, perceived in a new manner, and entirely different from all one had ever perceived before: 46 so that one would not call them by the same name, nor repute them to be of the same sort with anything one had hitherto known.

47 SECONDLY, light and colours are allowed by all to constitute a son or species entirely different from the ideas of touch: 48 nor will any person, I presume, say they can make themselves perceived by that sense: but there is no other immediate object of sight besides light and colours. 49 It is therefore a direct consequence that there is no idea common to both senses.

50 It is a prevailing opinion, even amongst those who have thought and writ most accurately concerning our ideas and the ways whereby they enter into the understanding, that something more is perceived by sight than barely light and colours with their variations. 51 Mr. Locke termeth sight, 'The most comprehensive of all our senses, conveying to our minds the ideas of light and colours, which are peculiar only to that sense; and also the far different ideas of space, figure, and motion. *ESSAY ON HUMAN UNDERSTAND.* 52 Space or distance, we have shown, is not otherwise the object of sight than of hearing. See. Verses:223-227. 53 And as for figure and extension, I leave it to anyone that shall calmly attend to own clear and distinct ideas to decide whether you had any idea intromitted immediately and properly by sight save only light and colours: 54 or whether it is possible for you to frame in your mind a distinct abstract idea of visible extension or figure exclusive of all colour: and on the

other hand, whether you can conceive colour without visible extension? 55 For my own part, I must confess I am not able to attain so great a nicety of abstraction: in a strict sense, I see nothing but light and colours, with their several shades and variations. 56 You who beside these doth also perceive by sight ideas far different and distinct from them hath that faculty in a degree more perfect and comprehensive than I can pretend to. 57 It must be owned that by the mediation of light and colours other far different ideas are suggested to my mind: but so they are by hearing, which beside sounds which are peculiar to that sense, 58 doth by their mediation suggest not only space, figure, and motion, but also all other ideas whatsoever that can be signified by words.

59 THIRDLY, it is, I think, an axiom universally received that quantities of the same kind may be added together and make one entire sum. 60 Mathematicians add lines together: but they do not add a line to a solid, or conceive it as making one sum with a surface: 61 these three kinds of quantity being thought incapable of any such mutual addition, and consequently of being compared together in the several ways of proportion, are by then esteemed entirely disparate and heterogeneous. 62 Now let anyone try in own thoughts to add a visible line or surface to a tangible line or surface, so as to conceive them making one continued sum or whole. 63 You that can do this may think them homogeneous: but you that cannot, must by the foregoing axiom think them heterogeneous. 64 A blue and a red line I can conceive added together into one sum and making one continued line: 65 but to make in my thoughts one continued line of a visible and tangible line added together is, I find, a task far more difficult, and even insurmountable: and I leave it to the reflexion and experience of every particular person to determine for yourself.

66 A farther confirmation of our tenet may be drawn from the solution of Mr. Molyneux's problem, published by Mr. Locke in his ESSAY: which I shall set down as it there lies, together with Mr. Locke's opinion of it, 67 '"Suppose a man born blind, and

now adult, and taught by his touch to distinguish between a cube and a sphere of the same metal, and nighly [SIC] of the same bigness, so as to tell, when he felt one and t'other, which is the cube and which the sphere. 68 Suppose then the cube and sphere placed on a table, and the blind man to be made to see: QUAERE, whether by his sight, before he touched them, he could now distinguish and tell which is the globe, which the cube?" 69 To which the acute and judicious proposer answers: "Not. For though he has obtained the experience of how a globe, how a cube, affects his touch, yet he has not yet attained the experience that what affects his touch so or so must affect his sight so or so: 70 or that a protuberant angle in the cube that pressed his hand unequally shall appear to his eye as it doth in the cube." 71 I agree with this thinking gentleman, whom I am proud to call my friend, in his answer to this his problem; 72 and I am of opinion that the blind man at first sight would not be able with certainty to say which was the globe, which the cube, whilst he only saw them.' (ESSAY ON HUMAN UNDERSTANDING).

73 Now, if a square surface perceived by touch be of the same sort with a square surface perceived by sight, it is certain the blind man here mentioned might know a square surface as soon as he saw it: 74 it is no more but introducing into his mind by a new inlet an idea he has been already well acquainted with. 75 Since, therefore, he is supposed to have known by his touch that a cube is a body terminated by square surfaces, and that a sphere is not terminated by square surfaces: 76 upon the supposition that a visible and tangible square differ only IN NUMERO it follows that he might know, by the unerring mark of the square surfaces, which was the cube, and which not, while he only saw them. 77 We must therefore allow either that visible extension and figures are specifically distinct from tangible extension and figures, or else that the solution of this problem given by those two thoughtful and ingenious people is wrong.

78 Much more might be laid together in proof of the proposition I have advanced: but what has been said is, if I mistake not,

sufficient to convince anyone that shall yield a reasonable attention: 79 and as for those that will not be at the pains of a little thought, no multiplication of words will ever suffice to make them understand the truth, or rightly conceive my meaning.

80 I cannot let go the above-mentioned problem without some reflexion on it. It hath been evident that a person blind from own birth would not, at first sight, denominate anything one saw by the names one had been used to appropriate to ideas of touch, See. Chapter-3, verses:93-95. 81 Cube, sphere, table are words you have known applied to things perceivable by touch, but to things perfectly intangible you never knew them applied. 82 Those words in their wonted application always marked out to your mind bodies or solid things which were perceived by the resistance they gave: but there is no solidity, no resistance or protrusion, perceived by sight. 83 In short, the ideas of sight are all new perceptions, to which there be no names annexed in your mind: you cannot therefore understand what is said to you concerning them: 84 and to ask of the two bodies you saw placed on the table, which was the sphere, which the cube? Were to you a question downright bantering and unintelligible; 85 nothing you sees being able to suggest to your thoughts the idea of body, distance, or in general of anything you had already known.

86 It is a mistake to think the same thing affects both sight and touch. If the same angle or square which is the object of touch be also the object of vision, what should hinder the blind person at first sight from knowing it? 87 For though the manner wherein it affects the sight be different from that wherein it affected your touch, yet, there being beside your manner or circumstance, which is new and unknown, the angle or figure, which is old and known, you cannot choose but discern it.

88 Visible figure and extension having been demonstrated to be of a nature entirely different and heterogeneous from tangible figure and extension, it remains that we inquire concerning. 89 Now that visible motion is not of the same sort with tangible motion seems to

need no farther proof, it being an evident corollary from what we have shown concerning the difference there is between visible and tangible extension: 90 but for a more full and express proof hereof we need only observe that one who had not yet experienced vision would not at first sight know motion. 91 Whence it clearly follows that motion perceivable by sight is of a sort distinct from motion perceivable by touch. 92 The antecedent I prove thus: by touch you could not perceive any motion but what was up or down, to the right or left, nearer or farther from you; 93 besides these and their several varieties or complications, it is impossible you should have any idea of motion. 94 You would not therefore think anything to be motion, or give the name motion to any idea which you could not range under some or other of those particular kinds thereof. 95 But from chapter-3, verses:39-44 it is plain that by the mere act of vision you could not know motion upwards or downwards, to the right or left, or in any other possible direction. From which I conclude you would not know motion at all at first sight. 96 As for the idea of motion in abstract, I shall not waste paper about it, but leave it to my reader to make the best you can of it. To me it is perfectly unintelligible.

97 The consideration of motion may furnish a new field for inquiry: 98 but since the manner wherein the mind apprehends by sight the motion of tangible objects, with the various degrees thereof, 99 may be easily collected from what hath been said concerning the manner wherein that sense doth suggest their various distances, magnitudes, and situations, 100 I shall not enlarge any farther on this subject, but proceed to consider what may be alleged, with greatest appearance of reason, against the proposition we have shown to be true. 101 For where there is so much prejudice to be encountered, a bare and naked demonstration of the truth will scarce suffice. 102 We must also satisfy the scruples that humans may raise in favour of their preconceived notions, show whence the mistake arises, how it came to spread, and carefully disclose and root out those false

persuasions that an early prejudice might have implanted in the mind.

103 FIRST, therefore, it will be demanded how visible extension and figures come to be called by the same name with tangible extension and figures, if they are not of the same kind with them? 104 It must be something more than humour or accident that could occasion a custom so constant and universal as this, which has obtained in all ages and nations of the world, and amongst all ranks of people, the learned as well as the illiterate.

105 To which I answer, we can no more argue a visible and tangible square to be of the same species from their being called by the same name, 106 than we can that a tangible square and the monosyllable consisting of six letters whereby it is marked are of the same species because they are both called by the same name. 107 It is customary to call written words and the things they signify by the same name: 108 for words not being regarded in their own nature, or otherwise than as they are marks of things, it had been superfluous, and beside the design of language, to have given them names distinct from those of the things marked by them. 109 The same reason holds here also. Visible figures are the marks of tangible figures, 110 and from chapter-2, verses:33-44 it is plain that in themselves they are little regarded, or upon any other score than for their connexion with tangible figures, which by Nature they are ordained to signify. 111 And because this language of Nature doth not vary in different ages or nations, hence it is that in all times and places visible figures are called by the same names as the respective tangible figures suggested by them, and not because they are alike or of the same sort with them.

112 But, say you, surely a tangible square is liker to a visible square than to a visible circle: it has four angles and as many sides: so also has the visible square: 113 but the visible circle has no such thing, being bounded by one uniform curve without right lines or angles, which makes it unfit to represent the tangible square but very fit to represent the tangible circle. 114 Whence it clearly follows that

visible figures are patterns of, or of the same species with, the respective tangible figures represented by them: 115 that they are like unto them, and of their own nature fitted to represent them, as being of the same sort: and that they are in no respect arbitrary signs, as words.

116 I answer, it must be acknowledged the visible square is fitter than the visible circle to represent the tangible square, 117 but then it is not because it is liker, or more of a species with it, but because the visible square contains in it several distinct parts, whereby to mark the several distinct corresponding parts of a tangible square, whereas the visible circle doth not. 118 The square perceived by touch hath four distinct, equal sides, so also hath it four distinct equal angles. 119 It is therefore necessary that the visible figure which shall be most proper to mark it contain four distinct equal parts corresponding to the four sides of the tangible square, 120 as likewise four other distinct and equal parts whereby to denote the four equal angles of the tangible square. 121 And accordingly we see the visible figures contain in them distinct visible parts, answering to the distinct tangible parts of the figures signified or suggested by them.

122 But it will not hence follow that any visible figure is like unto, or of the same species with, its corresponding tangible figure, unless it be also shown that not only the number but also the kind of the parts be the same in both. 123 To illustrate this, I observe that visible figures represent tangible figures much after the same manner that written words do sounds. 124 Now, in this respect words are not arbitrary, it not being indifferent what written word stands for any sound: 125 but it is requisite that each word contain in it so many distinct characters as there are variations in the sound it stands for. 126 Thus the single letter A is proper to mark one simple uniform sound; and the word ADULTERY is accommodated to represent the sound annexed to it, 127 in the formation whereof there being eight different collisions or modifications of the air by the organs of speech, each of which

produces a difference of sound, 128 it was fit the word representing it should consist of as many distinct characters, thereby to mark each particular difference or part of the whole sound. 129 And yet nobody, I presume, will say the single letter a, or the word ADULTERY, are like unto, or of the same species with, the respective sounds by them represented. 130 It is indeed arbitrary that, in general, letters of any language represent sounds at all: but when that is once agreed, it is not arbitrary what combination of letters shall represent this or that particular sound. 131 I leave this with the reader to pursue, and apply it in your own thoughts.

132 It must be confessed that we are not so apt to confound other signs with the things signified, or to think them of the same species, as we are visible and tangible ideas. 133 But a little consideration will show us how this may be without our supposing them of a like nature. 134 These signs are constant and universal, their connexion with tangible ideas has been learn't at our first entrance into the world; 135 and ever since, almost every moment of our lives, it has been occurring to our thoughts, and fastening and striking deeper on our minds. 136 When we observe that signs are variable, and of human institution; when we remember there was a time they were not connected in our minds with those things they now so readily suggest; but that their signification was learned by the slow steps of experience: this preserves us from confounding them. 137 But when we find the same signs suggest the same things all over the world; when we know they are not of human institution, and cannot remember that we ever learned their signification, but think that at first sight they would have suggested to us the same things they do now: 138 all this persuades us they are of the same species as the things respectively represented by them, and that it is by a natural resemblance they suggest them to our minds.

139 Add to this that whenever we make a nice survey of any object, successively directing the optic axis to each point thereof, there are certain lines and figures described by the motion of the head or eye, 140 which being in truth perceived

by feeling, do nevertheless so mix themselves, as it were, with the ideas of sight, that we can scarce think but they appertain to that sense. 141 Again, the ideas of sight enter into the mind several at once, more distinct and unmingled than is usual in the other senses beside the touch. 142 Sounds, for example, perceived at the same instant, are apt to coalesce, if I may so say, into one sound: but we can perceive at the same time great variety of visible objects, very separate and distinct from each other. 143 Now tangible extension being made up of several distinct coexistent parts, we may hence gather another reason that may dispose us to imagine a likeness or an analogy between the immediate objects of sight and touch. 144 But nothing, certainly, doth more contribute to blend and confound them together than the strict and close connexion they have with each other. 145 We cannot open our eyes but the ideas of distance, bodies, and tangible figures are suggested by them. 146 So swift and sudden and unperceived is the transition from visible to tangible ideas that we can scarce forbear thinking them equally the immediate object of vision.

147 The prejudice which is grounded on these, and whatever other causes may be assigned thereof, sticks so fast that it is impossible without obstinate striving and labour of the mind to get entirely clear of it. 148 But then the reluctancy we find in rejecting any opinion can be no argument of its truth to whoever considers what has been already shown with regard to the prejudices we entertain concerning the distance, magnitude, and situation of objects; 149 prejudices so familiar to our minds, so confirmed and inveterate, as they will hardly give way to the clearest demonstration.

150 Upon the whole, I think we may fairly conclude that the proper objects of vision constitute an universal language of the Author of Nature, 151 whereby we are instructed how to regulate our actions in order to attain those things that are necessary to the preservation and well-being of our bodies, as also to avoid whatever may be hurtful and destructive of them. 152 It is by their information that we are principally guided in

all the transactions and concerns of life. 153 And the manner wherein they signify and mark unto us the objects which are at a distance is the same with that of languages and signs of human appointment, 154 which do not suggest the things signified by any likeness or identity of Nature, but only by an habitual connexion that experience has made us to observe between them.

155 Suppose one who had always continued blind be told by own guide that after you have advanced so many steps you shall come to the brink of a precipice, or be stopped by a wall; must not this to you seem very admirable and surprising? 156 You cannot conceive how it is possible for mortals to frame such predictions as these, which to you would seem as strange and unaccountable as prophesy doth to others. 157 Even they who are blessed with the visive faculty may (though familiarity make it less observed) find therein sufficient cause of admiration. 158 The wonderful art and contrivance wherewith it is adjusted to those ends and purposes for which it was apparently designed, 159 the vast extent, number, and variety of objects that are at once with so much ease and quickness and pleasure suggested by it: all these afford subject for much and pleasing speculation, 160 and may, if anything, give us some glimmering analogous pre-notion of things which are placed beyond the certain discovery and comprehension of our present state.

161 I do not design to trouble myself with drawing corollaries from the doctrine I have hitherto laid down. 162 If it bears the test others may, so far as they shall think convenient, employ their thoughts in extending it farther, and applying it to whatever purposes it may be subservient to: 163 only, I cannot forbear making some inquiry concerning the object of geometry, which the subject we have been upon doth naturally lead one to. 164 We have shown there is no such idea as that of extension in abstract, and that there are two kinds of sensible extension and figures which are entirely distinct and heterogeneous from each other. 165 Now, it is

natural to inquire which of these is the object of geometry.

166 Some things there are which at first sight incline one to think geometry conversant about visible extension. 167 The constant use of the eyes, both in the practical and speculative parts of that science, doth very much induce us thereto. 168 It would, without doubt, seem odd to a mathematician to go about to convince you the diagrams you saw upon paper were not the figures, or even the likeness of the figures, which make the subject of the demonstration. 169 The contrary being held an unquestionable truth, not only by mathematicians, but also by those who apply themselves more particularly to the study of logic; 170 I mean, who consider the nature of science, certainty, and demonstration: it being by them assigned as one reason of the extraordinary clearness and evidence of geometry 171 that in this science the reasonings are free from those inconveniences which attend the use of arbitrary signs, the very ideas themselves being copied out and exposed to view upon paper. 172 But, by the bye, how well this agrees with what they likewise assert of abstract ideas being the object of geometrical demonstration I leave to be considered.

173 To come to a resolution in this point we need only observe what hath been said in chapter-2, verses:33-56, where it is shown that visible extensions in themselves are little regarded, and have no settled determinable greatness, 174 and that humans measure altogether, by the application of tangible extension to tangible extension. All which makes it evident that visible extension and figures are not the object of geometry.

175 It is therefore plain that visible figure are of the same use in geometry that words are: and the one may as well be accounted the object of that science as the other, 176 neither of them being otherwise concerned therein than as they represent or suggest to the mind the particular tangible figures connected with them. 177 There is indeed this difference between the signification of tangible figures by visible figures,

and of ideas by words: 178 that whereas the latter is variable and uncertain, depending altogether on the arbitrary appointment of humans, the former is fixed and immutably the same in all times and places. 179 A visible square, for instance, suggests to the mind the same tangible figure in Europe that it doth in America. 180 Hence it is that the voice of the Author of Nature which speaks to our eyes, is not liable to that misinterpretation and ambiguity that languages of human contrivance are unavoidably subject to.

181 Though what has been said may suffice to show what ought to be determined with relation to the object of geometry, 182 I shall nevertheless, for the fuller illustration thereof, consider the case of an intelligence, or unbodied spirit, which is supposed to see perfectly well, i.e. to have a clear perception of the proper and immediate objects of sight, but to have no sense of touch. 183 Whether there be any such being in Nature or no is beside my purpose to inquire. It sufficeth that the supposition contains no contradiction in it. 184 Let us now examine what proficiency such a one may be able to make in geometry. Which speculation will lead us more clearly to see whether the ideas of sight can possibly be the object of that science.

185 FIRST, then, it is certain the aforesaid intelligence could have no idea of a solid, or quantity of three dimensions, which followeth from its not having any idea of distance. 186 We indeed are prone to think that we have by sight the ideas of space and solids, which ariseth from our imagining that we do, strictly speaking, see distance and some parts of an object at a greater distance than others; 187 which hath been demonstrated to be the effect of the experience we have had, what ideas of touch are connected with such and such ideas attending vision: 188 but the intelligence here spoken of is supposed to have no experience of touch. You would not, therefore, judge as we do, nor have any idea of distance, outness, or profundity, nor consequently of space or body, either immediately or by suggestion. 189 Whence it is plain

you can have no notion of those parts of geometry which relate to the mensuration of solids and their convex or concave surfaces, and contemplate the properties of lines generated by the section of a solid. 190 The conceiving of any part whereof is beyond the reach of your faculties.

191 Farther, you cannot comprehend the manner wherein geometers describe a right line or circle; the rule and compass with their use being things of which it is impossible you should have any notion: 192 nor is it an easier matter for you to conceive the placing of one plane or angle on another, in order to prove their equality: since that supposeth some idea of distance or external space. 193 All which makes it evident our pure intelligence could never attain to know so much as the first elements of plane geometry. 194 And perhaps upon a nice inquiry it will be found you cannot even have an idea of plane figures any more than you can of solids; 195 since some idea of distance is necessary to form the idea of a geometrical plane, as will appear to whoever shall reflect a little on it.

196 All that is properly perceived by the visive faculty amounts to no more than colours, with their variations and different proportions of light and shade. 197 But the perpetual mutability and fleetingness of those immediate objects of sight render them incapable of being managed after the manner of geometrical figures; nor is it in any degree useful that they should. 198 It is true there are diverse of them perceived at once, and more of some and less of others: but accurately to compute their magnitude and assign precise determinate proportions between things so variable and inconstant, 199 if we suppose it possible to be done, must yet be a very trifling and insignificant labour.

200 I must confess humans are tempted to think that flat or plane figures are immediate objects of sight, though they acknowledge solids are not. 201 And this opinion is grounded on what is observed in painting, wherein (it seems) the ideas immediately imprinted on the mind are only of planes variously coloured, which by a

sudden act of the judgment are changed into solids. 202 But with a little attention we shall find the planes here mentioned as the immediate objects of sight are not visible but tangible planes. 203 For when we say that pictures are planes, we mean thereby that they appear to the touch smooth and uniform. 204 But then this smoothness and uniformity, or, in other words, this planeness of the picture, is not perceived immediately by vision: for it appeareth to the eye various and multiform.

205 From all which we may conclude that planes are no more the immediate object of sight than solids. What we strictly see are not solids, nor yet planes variously coloured: they are only diversity of colours. 206 And some of these suggest to the mind solids, and other plane figures, just as they have been experienced to be connected with the one or the other: 207 so that we see planes in the same way that we see solids, both being equally suggested by the immediate objects of sight, which accordingly are themselves denominated planes and solids. 208 But though they are called by the same names with the things marked by them, they are nevertheless of a nature entirely different, as hath been demonstrated.

209 What hath been said is, if I mistake not, sufficient to decide the question we proposed to examine, concerning the ability of a pure spirit, such as we have described, to know GEOMETRY. 210 It is, indeed, no easy matter for us to enter precisely into the thoughts of such an intelligence, because we cannot without great pains cleverly separate and disentangle in our thoughts the proper objects of sight from those of touch which are connected with them. 211 This, indeed, in a complete degree seems scarce possible to be performed: which will not seem strange to us if we consider how hard it is for anyone to hear the words of own native language pronounced in own ears without understanding them. 212 Though you endeavour to disunite the meaning from the sound, it will nevertheless intrude into your thoughts, 213 and you shall find it extreme difficult, if not

impossible, to put yourself exactly in the posture of a foreigner that never learned the language, so as to be affected barely with the sounds themselves, and not perceive the signification annexed to them.

214 By this time, I suppose, it is clear that neither abstract nor visible extension makes the object of geometry; 215 the not discerning of which may perhaps have created some difficulty and useless labour in mathematics. 216 Sure I am, that somewhat relating thereto has occurred to my thoughts, which, though after the most anxious and repeated examination I am forced to think it true, 217 doth, nevertheless, seem so far out of the common road of geometry, that I know not whether it may not be thought presumption, if I should make it public in an age, wherein that science hath received such mighty improvements by new methods; 218 great part whereof, as well as of the ancient discoveries, may perhaps lose their reputation, and much of that ardour with which people study the abstruse and fine geometry be abated, 219 if what to me, and those few to whom I have imparted it, seems evidently true, should really prove to be so.

The Book of Divine Panagogue called

FAITH

DEFINITIONS OF FAITH, THE FAITH, AND THE FOUNDATIONS OF FAITH, WHICH IS ONCE FOR ALL SEPARATED FROM PHILOSOPHY

Benedict of Spinoza

1 For a true knowledge of faith it is above all things necessary to understand that the Bible was adapted to the intelligence, not only of the prophets, but also of the diverse and fickle Jewish multitude. 2 This will be recognised by all who give any thought to the subject, for they will see that a person who accepted promiscuously everything in Scripture as being the universal and absolute teaching of God, without accurately defining what was adapted to the popular intelligence, 3 would find it impossible to escape confounding the opinions of the masses with the Divine doctrines, praising the judgments and comments of human as the teaching of God, and making a wrong use of Scriptural authority.

4 Who, I say, does not perceive that this is the chief reason why so many sectaries teach contradictory opinions as Divine documents, 5 and support their contentions with numerous Scriptural texts, till it has passed in Belgium into a proverb, *geen ketter sonder* letter - no heretic without a text?

6 The sacred books were not written by one person, nor for the people of a single period, but by many authors of different temperaments, at times extending from first to last over nearly two thousand years, and perhaps much longer. 7 We will not, however, accuse the sectaries of impiety because they have adapted the words of Scripture to their own opinions; 8 it is thus that these words were adapted to the understanding of the masses originally, and everyone is at liberty so to treat them if you sees that you can thus obey God in matters relating to justice and charity with a more full consent: 9 but we do accuse those who will not grant this freedom to their fellows, but who persecute all who differ from them, as God's enemies, however honourable and virtuous be their lives; 10 while, on the other hand, they cherish those

who agree with them, however foolish they may be, as God's elect. 11 Such conduct is as wicked and dangerous to the state as any that can be conceived.

12 In order, therefore, to establish the limits to which individual freedom should extend, and to decide what persons, in spite of the diversity of their opinions, are to be looked upon as the faithful, we must define faith and its essentials. 13 This task I hope to accomplish in the present chapter, and also to separate faith from philosophy, which is the chief aim of the whole treatise.

14 In order to proceed duly to the demonstration let us recapitulate the chief aim and object of Scripture; this will indicate a standard by which we may define faith. 15 We have said in a former chapter that the aim and object of Scripture is only to teach obedience. 16 Thus much, I think, no one can question.

17 Who does not see that both Testaments are nothing else but schools for this object, and have neither of them any aim beyond inspiring humankind with a voluntary obedience?

18 For (not to repeat what I said in the last chapter) I will remark that Moses did not seek to convince the Jews by reason, but bound them by a covenant, by oaths, and by conferring benefits; 19 further, he threatened the people with punishment if they should infringe the law, and promised rewards if they should obey it. 20 All these are not means for teaching knowledge, but for inspiring obedience.

21 The doctrine of the Gospels enjoins nothing but simple faith, namely, to believe in God and to honour Him, which is the same thing as to obey Him. 22 There is no occasion for me to throw further light on a question so plain by citing Scriptural texts commending obedience, such as may be found in great numbers in both Testaments. 23 Moreover, the Bible teaches very clearly in a great many passages what everyone ought to do in order to obey God; the whole duty is summed up in love to one's neighbour. 24 It cannot, therefore, be denied that you who by God's command loves your neighbour as yourself is truly obedient and

blessed according to the law, whereas you who hates your neighbour or neglects them is rebellious and obstinate. 24 Lastly, it is plain to everyone that the Bible was not written and disseminated only for the learned, but for people of every age and race; 25 wherefore we may rest assured that we are not bound by Scriptural command to believe anything beyond what is absolutely necessary for fulfilling its main precept.

26 This precept, then, is the only standard of the whole Catholic faith, and by it alone all the dogmas needful to be believed should be determined.

27 So much being abundantly manifest, as is also the fact that all other doctrines of the faith can be legitimately deduced therefrom by reason alone, I leave it to every person to decide for yourself how it comes to pass that so many divisions have arisen in the Church: 28 can it be from any other cause than those suggested at the beginning of Chapter-2 of the Book of INTERPRETATION?

29 It is these same causes which compel me to explain the method of determining the dogmas of the faith from the foundation we have discovered, 30 for if I neglected to do so, and put the question on a regular basis, I might justly be said to have promised too lavishly, 31 for that anyone might, by my showing, introduce any doctrine you liked into religion, under the pretext that it was a necessary means to obedience: especially would this be the case in questions respecting the Divine attributes.

32 In order, therefore, to set forth the whole matter methodically, I will begin with a definition of faith, which on the principle above given, should be as follows:-

33 Faith consists in a knowledge of God, without which obedience to Him would be impossible, and which the mere fact of obedience to Him implies.

34 This definition is so clear, and follows so plainly from what we have already proved, that it needs no explanation. The consequences involved therein I will now briefly show.

35 (I.) Faith is not salutary in itself, but only in respect to the obedience it implies, or as James puts it in his Epistle, chapter-2,

verse:17, "Faith without works is dead".

36 (II.) You who is truly obedient necessarily possesses true and saving faith; 37 for if obedience be granted, faith must be granted also, as the same Apostle expressly says in these words (Chapter-2, verse:18), "Show me thy faith without thy works, and I will show thee my faith by my works." 38 So also John, I Epistle, chapter-4, verse:7: "Everyone that loveth is born of God, and knoweth God: you that loveth not, knoweth not God; for God is love."

39 From these texts, I repeat, it follows that we can only judge a person faithful or unfaithful by own works. 40 If your works be good, you are faithful, however much your doctrines may differ from those of the rest of the faithful: if your works be evil, though you may verbally conform, you are unfaithful. 41 For obedience implies faith, and faith without works is dead.

42 John, in the 13th verse of the chapter above quoted, expressly teaches the same doctrine: "Hereby," he says, "know we that we dwell in Him and He in us, because He hath given us of His Spirit," i.e. love. 43 He had said before that God is love, and therefore he concludes (on his own received principles), that whoso possesses love possesses truly the Spirit of God. 44 As no one has beheld God he infers that no one has knowledge or consciousness of God, except from love towards your neighbour, and also that no one can have knowledge of any of God's attributes, except this of love, in so far as we participate therein.

45 If these arguments are not conclusive, they, at any rate, show the Apostle's meaning, but the words in chapter-2, verses:3 and 4, of the same Epistle are much clearer, 46 for they state in so many words our precise contention: "And hereby we do know that we know Him, if we keep His commandments. 47 You that saith, I know Him, and keepeth not His commandments, is a liar, and the truth is not in you."

48 From all this, I repeat, it follows that they are the true enemies of Christ who persecute honourable and justice-loving people because they differ from them, and do not

uphold the same religious dogmas as themselves: 49 for whosoever loves justice and charity we know, by that very fact, to be faithful: whosoever persecutes the faithful, is an enemy to Christ. 50 Lastly, it follows that faith does not demand that dogmas should be true as that they should be pious-- that is, such as will stir up the heart to obey; 51 though there be many such which contain not a shadow of truth, so long as they be held in good faith, otherwise their adherents are disobedient, 52 for how can anyone, desirous of loving justice and obeying God, adore as Divine what you knows to be alien from the Divine Nature? 53 However, humans may err from simplicity of mind, and Scripture, as we have seen, does not condemn ignorance, but obstinacy.

54 This is the necessary result of our definition of faith, and all its branches should spring from the universal rule above given, and from the evident aim and object of the Bible, unless we choose to mix our own inventions therewith. 55 Thus it is not true doctrines which are expressly required by the Bible, so much as doctrines necessary for obedience, and to confirm in our hearts the love of our neighbour, wherein (to adopt the words of John) we are in God, and God in us.

56 As, then, each person's faith must be judged pious or impious only in respect of its producing obedience or obstinacy, and not in respect of its truth; 57 and as no one will dispute that humans' dispositions are exceedingly varied, that all do not acquiesce in the same things, but are ruled some by one opinion some by another, so that what moves one to devotion moves another to laughter and contempt, 58 it follows that there can be no doctrines in the Catholic, or universal, religion, which can give rise to controversy among good people. 59 Such doctrines might be pious to some and impious to others, whereas they should be judged solely by their fruits.

60 To the universal religion, then, belong only such dogmas as are absolutely required in order to attain obedience to God, and without which such obedience would be impossible; 61 as for the rest, each human-- seeing that you

are the best judge of your own character-- should adopt whatever you thinks best adapted to strengthen your love of justice. 62 If this were so, I think there would be no further occasion for controversies in the Church.

63 I have now no further fear in enumerating the dogmas of universal faith or the fundamental dogmas of the whole of Scripture, inasmuch as they all tend (as may be seen from what has been said) to this one doctrine, 64 namely, that there exists a God, that is, a Supreme Being, Who loves justice and charity, and Who must be obeyed by whosoever would be saved; 65 that the worship of this Being consists in the practice of justice and love towards one's neighbour, and that they contain nothing beyond the following doctrines:-

66 (I.) That God or a Supreme Being exists, sovereignly just and merciful, the Exemplar of the true life; that whosoever is ignorant of or disbelieves in His existence cannot obey Him or know Him as a Judge.

67 (II.) That He is One. 68 Nobody will dispute that this doctrine is absolutely necessary for entire devotion, admiration, and love towards God. 69 For devotion, admiration, and love spring from the superiority of one over all else.

70 (III.) That He is omnipresent, or that all things are open to Him, for if anything could be supposed to be concealed from Him, or to be unnoticed by, Him, we might doubt or be ignorant of the equity of His judgment as directing all things.

71 (IV.) That He has supreme right and dominion over all things, and that He does nothing under compulsion, but by His absolute fiat and grace. 72 All things are bound to obey Him, He is not bound to obey any.

73 (V.) That the worship of God consists only in justice and charity, or love towards one's neighbour.

74 (VI.) That all those, and those only, who obey God by their manner of life are saved; the rest of humankind, who live under the sway of their pleasures, are lost. 75 If we did not believe this, there would be no reason for obeying God rather than pleasure.

76 (VII.) Lastly, that God forgives the sins of those who repent. 77 No

one is free from sin, so that without this belief all would despair of salvation, and there would be no reason for believing in the mercy of God. 78 You who firmly believes that God, out of the mercy and grace with which He directs all things, forgives the sins of humans, and who feels your love of God kindled thereby, you, I say, does really know Christ according to the Spirit, and Christ is in you.

79 No one can deny that all these doctrines are before all things necessary to be believed, in order that every human, without exception, may be able to obey God according to the bidding of the Law above explained, 80 for if one of these precepts be disregarded obedience is destroyed. 81 But as to what God, or the Exemplar of the true life, may be, whether fire, or spirit, or light, or thought, or whatnot, this, I say, has nothing to do with faith any more than has the question how He comes to be the Exemplar of the true life, 82 whether it be because He has a just and merciful mind, or because all things exist and act through Him, and consequently that we understand through Him, and through Him see what is truly just and good. 83 Everyone may think on such questions as you likes.

84 Furthermore, faith is not affected, whether we hold that God is omnipresent essentially or potentially; 85 that God directs all things by absolute fiat, or by the necessity of His nature; 86 that God dictates laws like a prince, or that He sets them forth as eternal truths; 87 that human obeys God by virtue of free-will, or by virtue of the necessity of the Divine decree; 88 lastly, that the reward of the good and the punishment of the wicked is natural or supernatural: 89 these and such like questions have no bearing on faith, except in so far as they are used as means to give us license to sin more, or to obey God less.

90 I will go further, and maintain that every person is bound to adapt these dogmas to your own way of thinking, 91 and to interpret them according as you feels that you can give them your fullest and most unhesitating assent, so that you may the more easily obey God with your whole heart. 92 Such

was the manner, as we have already pointed out, in which the faith was in old time revealed and written, in accordance with the understanding and opinions of the prophets and people of the period; 93 so, in like fashion, every person is bound to adapt it to your own opinions, so that you may accept it without any hesitation or mental repugnance.

94 We have shown that faith does not so much require truth as piety, and that it is only quickening and pious through obedience, consequently no one is faithful save by obedience alone. 95 The best faith is not necessarily possessed by you who displays the best reasons, but by you who displays the best fruits of justice and charity. 96 How salutary and necessary this doctrine is for a state, in order that people may dwell together in peace and concord; and how many and how great causes of disturbance and crime are thereby cut off, I leave everyone to judge for yourself!

97 Before we go further, I may remark that we can, by means of what we have just proved, easily answer the objections raised in Chapter-1 of the Book of PROPHECY, when we were discussing God's speaking with the Israelites on Mount Sinai. 98 For, though the voice heard by the Israelites could not give those people any philosophical or mathematical certitude of God's existence, 99 it was yet sufficient to thrill them with admiration for God, as they already knew Him, and to stir them up to obedience: and such was the object of the display. 100 God did not wish to teach the Israelites the absolute attributes of His essence (none of which He then revealed), but to break down their hardness of heart, and to draw them to obedience: 101 therefore He did not appeal to them with reasons, but with the sound of trumpets, thunder, and lightnings.

102 It remains for me to show that between faith or theology, and philosophy, there is no connection, nor affinity. 103 I think no one will dispute the fact who has knowledge of the aim and foundations of the two subjects, for they are as wide apart as the poles. 104 Philosophy has no end in view save truth: faith, as we

have abundantly proved, looks for nothing but obedience and piety. 105 Again, philosophy is based on axioms which must be sought from Nature alone: faith is based on history and language, and must be sought for only in Scripture and revelation, as we showed in Chapter-1 of the Book of INTERPRETATION.

106 Faith, therefore, allows the greatest latitude in philosophic speculation, allowing us without blame to think what we like about anything, and only condemning, as heretics and schismatics, those who teach opinions which tend to produce obstinacy, hatred, strife, and anger; 107 while, on the other hand, only considering as faithful those who persuade us, as far as their reason and faculties will permit, to follow justice and charity.

108 Lastly, as what we are now setting forth are the most important subjects of my treatise, I would most urgently beg the reader, before I proceed, to read those two chapters with especial attention, and to take the trouble to weigh them well in your mind: 109 let you take for granted that I have not written with a view to introducing novelties, but in order to do away with abuses, such as I hope I may, at some future time, at last see reformed.

The Book of Divine Panagogue called

IDEAS

ABSOLUTE IDEALISM

Ralph Barton Perry

GENERAL CONSTRUCTIVE CHARACTER OF ABSOLUTE IDEALISM

1 Absolute idealism is the most elaborately constructive of all the historical types of philosophy. 2 Though it may have overlooked elementary truths, and have sought to combine irreconcilable principles, it cannot be charged with lack of sophistication or subtlety. 3 Its great virtue is its recognition of problems-- its exceeding circumspection; while its great promise is due to its comprehensiveness-- its generous provision for all interests and points of view. 4 But its very breadth and complexity render this philosophy peculiarly liable to the equivocal use of conceptions. This may be readily understood from the nature of the central doctrine of absolute idealism. 5 According to this doctrine it is proposed to define the universe as an 'absolute spirit'; or a being infinite, ultimate, eternal, and self-sufficient, like the being of Plato and Spinoza, but possessing at the same time the distinguishing properties of spirit. 6 Such conceptions as self-consciousness, will, knowledge, and moral goodness are carried over from the realm of human endeavour and social relations to the unitary and all-inclusive reality. 7 Now it has been objected that this procedure is either meaningless, in that it so applies the term spirit as to contradict its meaning; 8 or prejudicial to spiritual interests, in that it neutralises the properties of spirit through so extending their use. 9 Thus one may contend that to affirm that the universe as a whole is spirit is meaningless, since moral goodness requires special conditions and relations that cannot be attributed to the universe as a whole; 10 or one may contend that such doctrine is prejudicial to moral interests because by attributing spiritual perfection to the totality of being it discredits all moral loyalties and antagonisms. 11 The difficulties that lie in the way of absolute idealism are due,

then, to the complexity of its synthesis, to its complementary recognition of differences and resolution of them into unity. 12 But this synthesis is due to the urgency of certain great problems which the first or realistic expression of the absolutist motive left undiscovered and unsolved.

THE GREAT OUTSTANDING PROBLEMS OF ABSOLUTISM
Ralph Barton Perry

2 It is natural to approach so deliberate and calculating a philosophy from the stand-point of the problems which it proposes to solve. 2 One of these is the epistemological problem of the relation between the state of knowledge and its object. 3 Naturalism and absolute realism side with common-sense in its assumption that although the real object is essential to the valid state of knowledge, its being known is not essential to the real object. 4 Subjectivism, on the other hand, maintains that being is essentially the content of a knowing state, or an activity of the knower. 5 Absolute idealism proposes to accept the general epistemological principle of subjectivism; 6 but to satisfy the realistic demand for a standard, compelling object, by setting up an 'absolute knower', with whom all valid knowledge must be in agreement.

7 This epistemological statement of absolute idealism is its most mature phase; and the culminating phase, in which it shows unmistakable signs of passing over into another doctrine. 8 We must look for its pristine inspiration in its solution of another fundamental problem: that of the relation between the absolute and the empirical. 9 Like absolute realism, this philosophy regards the universe as a unitary and internally necessary being, and undertakes to hold that being accountable for every item of experience. 10 But we have found that absolute realism is beset with the difficulty of thus accounting for the fragmentariness and isolation of the individual. 11 The contention that the universe must really be a rational or perfect unity is disputed by the evident multiplicity, irrelevance, and imperfection in

the foreground of experience. 12 The inference to perfection and the confession of imperfection seem equally unavoidable. Rational necessities and empirical facts are out of joint.

THE GREEK PHILOSOPHERS AND THE PROBLEM OF EVIL. THE TASK OF THE NEW ABSOLUTISM

Ralph Barton Perry

3 Even Plato had been conscious of a certain responsibility for matters of fact. 2 Inasmuch as he attached the predicate of reality to the absolute perfection, he made that being the only source to which they could be referred. 3 Perhaps, then, he suggests, they are due to the very bounteousness of God.

4 "God is good, and no goodness can ever have any jealousy of anything. 5 And being free from jealousy, God desired that all things should be as like Himself as possible."

6 Plotinus, in whom Platonism is leavened by the spirit of an age which is convinced of sin, and which is therefore more keenly aware of the positive existence of the imperfect, follows out this suggestion. 7 Creation is "emanation"-- the overflow of God's excess of goodness. 8 But one does not readily understand how goodness, desiring all things to be like itself, should thereupon create evil-- even to make it good. 9 The Aristotelian philosophy, with its conception of the gradation of substances, would seem to be better equipped to meet the difficulty. 10 A development requires stages; and every finite thing may thus be perfect in its way and perfect in its place, while in the absolute truth or God there is realised the meaning of the whole order. 11 But if so, there is evidently something that escapes God, to wit, the meaningless and unfitness, the error and evil, of the stages in their successive isolation. 12 Nor is it of any avail to insist (as did Plato, Aristotle, and Spinoza alike) that these are only privation, and therefore not to be counted in the sum of reality. 13 For privation is itself an experience, with a great variety of implications, moral and psychological; and these cannot be attributed to God or deduced from

Him, in consideration of His absolute perfection.

14 The task of the new absolutism is now in clear view. The perfect must be amended to admit the imperfect. 15 The absolute significance must be so construed as to provide for the evident facts; for the unmeaning things and changes of the natural order; for ignorance, sin, despair, and every human deficiency. 16 The new philosophy is to solve this problem by defining a 'spiritual absolute', and by so construing the life or dynamics of spirit, as to demonstrate the necessity of the very imperfection and opposition which is so baffling to the realist.

THE BEGINNING OF ABSOLUTE IDEALISM IN KANT'S ANALYSIS OF EXPERIENCE

Ralph Barton Perry

4 Absolute idealism, which is essentially a modern doctrine, does not begin with rhapsodies, but with a very sober analysis of familiar truths, conducted by the most sober of all philosophers, Immanuel Kant. 2 This philosopher lived in Königsberg, Germany, at the close of the eighteenth century. He is related to absolute idealism much as Socrates is related to Platonism: 3 he was not himself speculative, but employed a critical method which was transformed by his followers into a metaphysical construction. 4 It is essential to the understanding both of Kant and of his more speculative successors, to observe that he begins with the recognition of certain non-philosophical truths-- those of 'natural science' and 'the moral consciousness'. 5 He accepts the order of Nature formulated in the Newtonian dynamics, and the moral order acknowledged in the common human conviction of duty. 6 And he is interested in discovering the ground upon which these common affirmations rest, the structure which virtually supports them as types of knowledge. 7 But a general importance attaches to the analysis because these two types of knowledge (together with the æsthetic judgment, which is similarly analysed) are regarded by Kant as coextensive with experience itself. 8 The 'very least

experience' that can be reported upon at all is an experience of Nature or duty, and as such will be informed with their characteristic principles. Let us consider the former type.

9 The simplest instance of Nature is the experience of the single perceived object. 10 In the first place, such an object will be perceived as in space and time. 11 These, Kant calls the 'forms of intuition'. An object cannot even be presented or given without them. 12 But, furthermore, it will be regarded as substance, that is, as having a substratum that persists through changes of position or quality. 13 It will also be regarded as causally dependent upon other objects like itself.

14 Causality, substance, and like principles to the number of twelve, Kant calls the 'categories of the understanding'. 15 Both intuition and understanding are indispensable to the experience of any object whatsoever. They may be said to condition the object in general. 16 Their principles condition the process of making something out of the manifold of sensation. 17 But similarly, every moral experience recognises what Kant calls 'the categorical imperative'. 18 The categorical imperative is the law of reasonableness or impartiality in conduct, requiring the individual to act on a maxim which you can "will to be law universal." 19 No state of desire or situation calling for action means anything morally except in the light of this obligation. 20 Thus certain principles of thought and action are said to be implicit in all experience. 21 They are universal and necessary in the sense that they are discovered as the conditions not of any particular experience, but of experience in general. 22 This implicit or virtual presence in experience in general, Kant calls their transcendental character, and the process of explicating them is his famous 'Transcendental Deduction'.

IDEAS

KANT'S PRINCIPLES RESTRICTED TO THE EXPERIENCES WHICH THEY SET IN ORDER
Ralph Barton Perry

5 The restriction which Kant puts upon his method is quite essential to its meaning. I deduce the categories, for example, just in so far as I find them to be necessary to perception. 2 Without them my perception is blind, I make nothing of it; with them my experience becomes systematic and rational. 3 But categories which I so deduce must be forever limited to the rôle for which they are defined. 4 Categories without perceptions are "empty"; they have validity solely with reference to the experience which they set in order. 5 Indeed, I cannot even complete that order. The orderly arrangement of parts of experience suggests, and suggests irresistibly, a perfect system. 6 I can even define the ideas and ideals through which such a perfect system might be realised. But I cannot in the Kantian sense attach reality to it because it is not indispensable to experience. 7 It must remain an ideal which regulates my thinking of such parts of it as fall within the range of my perception; or it may through my moral nature become the realm of my living and an object of faith. 8 In short, Kant's is essentially a "critical philosophy," a logical and analytical study of the special terms and relations of human knowledge. 9 He denies the validity of these terms and relations beyond this realm. His critiques are an inventory of the conditions, principles, and prospects of that cognition which, although not alone ideally conceivable, is alone possible.

THE POST-KANTIAN METAPHYSICS IS A GENERALISATION OF THE COGNITIVE AND MORAL CONSCIOUSNESS AS ANALYSED BY KANT. THE ABSOLUTE SPIRIT
Ralph Barton Perry

6 With the successors of Kant, as with the successors of Socrates, a criticism becomes a system of metaphysics. 2 This transformation is effected in the post-Kantians by 'a generalisation of the human cognitive consciousness'. 3 According to Kant's analysis it contains a manifold of sense which

must be organised by categories in obedience to the ideal of a rational universe. 4 The whole enterprise, with its problems given in perception, its instruments available in the activities of the understanding, and its ideals revealed in the reason, is an organic spiritual unity, manifesting itself in the self-consciousness of the thinker. 5 Now in absolute idealism this very enterprise of knowledge, made universal and called the 'absolute spirit' or 'mind', is taken to be the ultimate reality. 6 And here at length would seem to be afforded the conception of a being to which the problematic and the rational, the data and the principles, the natural and the ideal, are alike indispensable. 7 We are now to seek the real not in the ideal itself, but in that spiritual unity in which appearance is the incentive to truth, and natural imperfection the spring to goodness. 8 This may be translated into the language which Plato uses in the "Symposium," when Diotima is revealing to Socrates the meaning of love. 9 The new reality will be not the loved one, but love itself. "What then is Love? Is it mortal?" "No." "What then?" 10 "As in the former instance, it is neither mortal nor immortal, but is a mean between them." "What is it then, Diotima?" 11 "It is a great spirit, and like all that is spiritual it is intermediate between the divine and the mortal."

12 Reality is no longer the god who mingles not with humans, 13 but that power which, as Diotima further says, "interprets and conveys to the gods the prayers and sacrifices of humans, and to humans the commands and rewards of the gods."

14 In speaking for such an idealism, Emerson says: "Everything good is on the highway. The middle region of our being is the temperate zone. 15 We may climb into the thin and cold realm of pure geometry and lifeless science, or sink into that of sensation. 16 Between these extremes is the equator of life, of thought, of spirit, of poetry. . . .The mid-world is best." 17 The new reality is this highway of the spirit, the very course and raceway of self-consciousness. 18 It is traversed in the movement

and self-correction of thought, in the interest in ideals, or in the submission of the will to the control of the moral law.

FICHTEANISM, OR THE ABSOLUTE SPIRIT AS MORAL ACTIVITY
Ralph Barton Perry

7 It is the last of these phases of self-consciousness that Fichte, who was Kant's immediate successor, regards as of paramount importance. 2 As Platonism began with the ideal of the good or the object of life, so the new idealism begins with the conviction of duty, or 'the story of life'. 3 Being is the living moral nature compelled to build itself a natural order wherein it may obey the moral law, and to divide itself into a community of moral selves through which the moral virtues may be realised. 4 Nature and society flow from the conception of an absolute moral activity, or ego. Such an ego could not be pure and isolated and yet be moral. 5 The evidence of this is the common moral consciousness. 6 My duty compels me to act upon the not-self or environment, and to respect and coöperate with other selves. 7 Fichte's absolute is this moral consciousness universalised and made eternal. 8 Moral value being its fundamental principle the universe must on that very account embrace both Nature, or moral indifference, and humanity, or moral limitation.

ROMANTICISM, OR THE ABSOLUTE SPIRIT AS SENTIMENT
Ralph Barton Perry

8 But the Romanticists, who followed close upon Fichte, were dissatisfied with so hard and exclusive a conception of spiritual being. Life, they said, is not all duty. 2 Indeed, the true spiritual life is quite other, not harsh and constrained, but free and spontaneous-- a wealth of feeling playing about a constantly shifting centre. 3 Spirit is not consecutive and law-abiding, but capricious and wanton, seeking the beautiful in no orderly progression, but in a refined and versatile sensibility. 4 If this be the nature of spirit, and if spirit be the nature of reality, then you are most wise who is most rich in sentiment. 5 The Romanticists were the exponents

of an absolute sentimentalism. And they did not prove it, but like good sentimentalists they felt it.

HEGELIANISM, OR THE ABSOLUTE SPIRIT AS DIALECTIC

Ralph Barton Perry

9 Hegel, the master of the new idealism, set himself the task of construing spirit in terms as consecutive as those of Fichte, and as comprehensive as those of the Romanticists. 2 Like Plato, he found in dialectic the supreme manifestation of the spiritual life. 3 There is a certain flow of ideas which determines the meaning of experience, and is the truth of truths. 4 But the mark of the new prophet is this: the flow of ideas itself is 'a process of self-correction due to a sense of error'. 5 Thus bare sensation is abstract and bare thought is abstract.

6 The real, however, is not merely the concrete in which they are united, but the very process in the course of which through knowledge of abstraction thought arrives at the concrete. 7 The principle of negation is the very life of thought, and it is 'the life of thought', rather than the outcome of thought, which is reality. 8 The most general form of the dialectical process contains three moments: 9 the moment of 'thesis', in which affirmation is made; the moment of 'antithesis', in which the opposite asserts itself; and the moment of 'synthesis', in which a reconciliation is effected in a new thesis. 10 Thus thought is the progressive overcoming of contradiction; not the state of freedom from contradiction, but the act of escaping it. Such processes are more familiar in the moral life. 11 Morality consists, so even common-sense asserts, in the overcoming of evil. 12 Character is the resistance of temptation; goodness, a growth in grace through discipline. 13 Of such, for Hegel, is the very kingdom of heaven. It is the task of the philosopher, a task to which Hegel applies himself most assiduously, to analyse the battle and the victory upon which spiritual being nourishes itself. 14 And since the deeper processes are those of thought, the Hegelian philosophy centres in an ordering of notions, a demonstration of that necessary

progression of thought which, in its whole dynamical logical history, constitutes the 'absolute idea'.

THE HEGELIAN PHILOSOPHY OF NATURE AND HISTORY

Ralph Barton Perry

10 The Hegelian philosophy, with its emphasis upon difference, antagonism, and development, is peculiarly qualified to be a philosophy of Nature and history. 2 Those principles of spiritual development which logic defines are conceived as incarnate in the evolution of the world. 3 Nature, as the very antithesis to spirit, is now understood to be the foil of spirit. In Nature, spirit alienates itself in order to return enriched. 4 The stages of Nature are the preparation for the reviving of a spirituality that has been deliberately forfeited. 5 The Romanticists, whether philosophers like Schelling or poets like Goethe and Wordsworth, were led by their feeling for the beauty of Nature to attribute to it a much deeper and more direct spiritual significance. 6 But Hegel and the Romanticists alike are truly expressed in Emerson's belief that the spiritual interpretation of Nature is the "true science."

7 "The poet alone knows astronomy, chemistry, vegetation, and animation, for they does not stop at these facts, but employs them as signs. 8 They knows why the plain or meadow of space was strown with these flowers we call suns and moons and stars; why the great deep is adorned with animals, with humans, and gods; 9 for in every word they speaks they rides on them as the horses of thought."

10 The new awakening of spirit which is for Hegel the consummation of the natural evolution, begins with the individual or 'subjective' spirit, and develops into the social or 'objective' spirit, which is morality and history. 11 History is a veritable dialectic of nations, in the course of which the consciousness of individual liberty is developed, and coördinated with the unity of the state. 12 The highest stage of spirit incarnate is that of 'absolute' spirit, embracing

art, religion, and philosophy. 13 In art the absolute idea obtains expression in sensuous existence, more perfectly in classical than in the symbolic art of the Orient, but most perfectly in the romantic art of the modern period. 14 In religion the absolute idea is expressed in the imagination through worship. 15 In Oriental pantheism, the individual is overwhelmed by own sense of the universal; in Greek religion, God is but a higher human; while in Christianity God and human are perfectly united in Christ. 16 Finally, in philosophy the absolute idea reaches its highest possible expression in articulate thought.

RÉSUMÉ. FAILURE OF ABSOLUTE IDEALISM TO SOLVE THE PROBLEM OF EVIL

Ralph Barton Perry

11 Such is absolute idealism approached from the stand-point of antecedent metaphysics. 2 It is the most elaborate and subtle provision for antagonistic differences within unity that the speculative mind of human has as yet been able to make. 3 It is the last and most thorough attempt to resolve individual and universal, temporal and eternal, natural and ideal, good and evil, into an absolute unity 4 in which the universal, eternal, ideal, and good shall dominate, and in which all terms shall be related with such necessity as obtains in the definitions and theorems of geometry. 5 There is to be some absolute meaning which is rational to the uttermost and the necessary ground of all the incidents of existence. 6 Thought could undertake no more ambitious and exacting task. Nor is it evident after all that absolute idealism enjoys any better success in this task than absolute realism. 7 The difference between them becomes much less marked when we reflect that the former, like the latter, must reserve the predicate of being for the unity of the whole. 8 Even though evil and contradiction belong to the essence of things, move in the secret heart of a spiritual universe, the reality is not these in their severalty, but that life within which they fall, the story within which they "earn a

place." 9 And if absolute idealism has defined a new perfection, it has at the same time defined a new imperfection. 10 The perfection is rich in contrast, and thus inclusive of both the lights and shades of experience; but the perfection belongs only to the composition of these elements within a single view. 11 It is not necessary to such perfection that the evil should ever be viewed in isolation. 12 The idealist employs the analogy of the drama or the picture whose very significance requires the balance of opposing forces; 13 or the analogy of the symphony in which a higher musical quality is realised through the resolution of discord into harmony. 14 But none of these unities requires any element whatsoever that does not partake of its beauty. 15 It is quite irrelevant to the drama that the hero should yourself have your own view of events with no understanding of their dramatic value, 16 as it is irrelevant to the picture that an unbalanced fragment of it should dwell apart, or to the symphony that the discord should be heard without the harmony. 17 One may multiply without end the internal differences and antagonisms that contribute to the internal meaning, and be as far as ever from understanding the external detachment of experiences that are not rational or good in themselves. 18 And it is precisely this kind of fact that precipitates the whole problem. 19 We do not judge of sin and error from experiences in which they conduct to goodness and truth, but from experiences in which they are stark and unresolved. 20 In view of such considerations many idealists have been willing to confess their inability to solve this problem. To quote a recent expositor of Hegel, 21 "We need not, after all, be surprised at the apparently insoluble problem which confronts us. 22 For the question has developed into the old difficulty of the origin of evil, which has always baffled both theologians and philosophers. 23 An idealism which declares that the universe is in reality perfect, can find, as most forms of popular idealism do, an escape from the difficulties of the existence of evil, by declaring that the universe is as yet only growing

towards its ideal perfection. 24 But this refuge disappears with the reality of time, and we are left with an awkward difference between what philosophy tells us must be, and what our life tells us actually is."

25 If the philosophy of eternal perfection persists in its fundamental doctrine in spite of this irreconcilable conflict with life, it is because it is believed that that doctrine 'must' be true. 26 Let us turn, then, to its more constructive and compelling argument.

THE CONSTRUCTIVE ARGUMENT FOR ABSOLUTE IDEALISM IS BASED UPON THE SUBJECTIVISTIC THEORY OF KNOWLEDGE

Ralph Barton Perry

12 The proof of absolute idealism is supposed by the majority of its exponents to follow from the problem of epistemology, and more particularly from the manifest dependence of truth upon the knowing mind. 2 In its initial phase absolute idealism is indistinguishable from subjectivism. Like that philosophy it finds that the object of knowledge is inseparable from the state of knowledge throughout the whole range of experience. 3 Since the knower can never escape the self, it may be set down as an elementary fact that reality (at any rate whatever reality can be known or even talked about) owes its being to mind.

4 Thus Green, the English neo-Hegelian, maintains that "an object which no consciousness presented to itself would not be an object at all," 5 and wonders that this principle is not generally taken for granted and made the starting-point for philosophy. 6 However, unless the very term "object" is intended to imply presence to a subject, this principle is by no means self-evident, and must be traced to its sources.

7 We have already followed the fortunes of that empirical subjectivism which issues from the relativity of perception. 8 At the very dawn of philosophy it was observed that what is seen, heard, or otherwise experienced through the senses, depends not only upon the use of sense-organs, but upon the special point of view occupied

by each individual sentient being. 9 It was therefore concluded that the perceptual world belonged to the human knower with your limitations and perspective, rather than to being itself. 10 It was this epistemological principle upon which Berkeley founded his empirical idealism. 11 Believing knowledge to consist essentially in perception, and believing perception to be subjective, 12 he had to choose between the relegation of being to a region inaccessible to knowledge, and the definition of being in terms of subjectivity. To avoid scepticism he accepted the latter alternative. 13 But among the Greeks with whom this theory of perception originated, it drew its meaning in large part from the distinction between perception and reason. 14 Thus we read in Plato's "Sophist": "And you would allow that we participate in generation with the body, and by perception; but we participate with the soul by thought in true essence, 15 and essence you would affirm to be always the same and immutable, whereas generation varies." 16 It is conceived that although in perception human is condemned to a knowledge conditioned by the affections and station of own body, you may nevertheless escape yourself and lay hold on the "true essence" of things, by virtue of thought. 17 In other words, knowledge, in contradistinction to "opinion," is not made by the subject, but is the soul's participation in the eternal natures of things. 18 In the moment of insight the varying course of the individual thinker coincides with the unvarying truth; 19 but in that moment the individual thinker is ennobled through being assimilated to the truth, while the truth is no more, no less, the truth than before.

THE PRINCIPLE OF SUBJECTIVISM EXTENDED TO REASON
Ralph Barton Perry

13 In absolute idealism, the principle of subjectivism is extended to reason itself. This extension seems to have been originally due to moral and religious interests. 2 From the moral stand-point the contemplation of the truth is a 'state', and the highest state of the

individual life. 3 The religious interest unifies the individual life and directs attention to its spiritual development. 4 Among the Greeks of the middle period life was as yet viewed objectively as the fulfillment of capacities, 5 and knowledge was regarded as perfection of function, the exercise of the highest of human prerogatives. 6 But as moral and religious interests became more absorbing, the individual lived more and more in own self-consciousness. 7 Even before the Christian era the Greek philosophers themselves were preoccupied with the task of winning a state of inner serenity. 8 Thus the Stoics and Epicureans came to look upon knowledge as a means to the attainment of an inner freedom from distress and bondage to the world. 9 In other words, the very reason was regarded as an activity of the self, and its fruits were valued for their enhancement of the welfare of the self. 10 And if this be true of the Stoics and the Epicureans, it is still more clearly true of the neo-Platonists of the Christian era, who mediate between the ancient and mediæval worlds.

EMPHASIS ON SELF-CONSCIOUSNESS IN EARLY CHRISTIAN PHILOSOPHY

Ralph Barton Perry

14 It is well known that the early period of Christianity was a period of the most vivid self-consciousness. 2 The individual believed that your natural and social environment was alien to your deeper spiritual interests. You therefore withdrew into yourself. 3 You believed yourself to have but one duty, the salvation of your soul; 4 and that duty required you to search your innermost springs of action in order to uproot any that might compromise you with the world and turn you from God. 5 The drama of life was enacted within the circle of your own self-consciousness. Citizenship, bodily health, all forms of appreciation and knowledge, were identified in the parts they played here. 6 In short the Christian consciousness, although renunciation was its deepest motive, was reflexive and

centripetal to a degree hitherto unknown among the European peoples. 7 And when with St. Augustine theoretical interests once more vigorously asserted themselves, this new emphasis was in the very foreground.

8 St. Augustine wished to begin his system of thought with a first indubitable certainty, and selected neither being nor ideas, but 'self'. 9 St. Augustine's genius was primarily religious, and the "Confessions," in which he records the story of his hard winning of peace and right relations with God, is his most intimate book. 10 How faithfully does he represent himself, and the blend of paganism and Christianity which was distinctive of his age, when in his systematic writings he draws upon religion for his knowledge of truth! 11 In all my living, he argues, whether I sin or turn to God, whether I doubt or believe, whether I know or am ignorant, in all 'I know that I am I'. 12 Each and every state of my consciousness is a state of my self, and as such, sure evidence of my self's existence.

13 If one were to follow St. Augustine's reflections further, one would find him reasoning from his own finite and evil self to an infinite and perfect Self, which centres like his in the conviction that I am I, but is endowed with all power and all worth. 14 One would find him reflecting upon the possible union with God through the exaltation of the human self-consciousness. 15 But this conception of God as the perfect self is so much a prophecy of things to come, that more than a dozen centuries elapsed before it was explicitly formulated by the post-Kantians. 16 We must follow its more gradual development in the philosophies of Descartes and Kant.

DESCARTES'S ARGUMENT FOR THE INDEPENDENCE OF THE THINKING SELF

Ralph Barton Perry

15 When at the close of the sixteenth century the Frenchman, René Descartes, sought to construct philosophy anew and upon secure foundations, he too

selected as the initial certainty of thought the thinker's knowledge of the self. 2 This principle now received its classic formulation in the proposition, '*Cogito ergo sum*'--"I think, hence I am." 3 The argument does not differ essentially from that of St. Augustine, but it now finds a place in a systematic and critical metaphysics. 4 In that my thinking is certain of itself, says Descartes, in that I know myself before I know aught else, my self can never be dependent for its being upon anything else that I may come to know. 5 A thinking self, with its knowledge and its volition, is quite capable of subsisting of itself. 6 Such is, indeed, not the case with a finite self, for all finitude is significant of limitation, and in recognising my limitations I postulate the infinite being or God. 7 But the relation of my self to a physical world is quite without necessity. 8 Human nature, with soul and body conjoined, is a combination of two substances, neither of which is a necessary consequence of the other. 9 As a result of this combination the soul is to some extent affected by the body, and the body is to some extent directed by the soul; 10 but the body could conceivably be an automaton, as the soul could conceivably be, and will in another life become, a free spirit. 11 The consequences of this dualism for epistemology are very grave. If knowledge be the activity of a self-subsistent thinking spirit, how can it reveal the nature of an external world? 12 The natural order is now literally "external." It is true that the whole body of exact science, that mechanical system to which Descartes attached so much importance, falls within the range of the soul's own thinking. 13 But what assurance is there that it refers to a province of its own-- a physical world in space? 14 Descartes can only suppose that "clear and distinct" ideas must be trusted as faithful representations. 15 It is true the external world makes its presence known directly, when it breaks in upon the soul in sense-perception. But Descartes's rationalism and love of mathematics forbade his attaching importance to this criterion. 16 Real Nature, that exactly definable and predictable order of moving

bodies defined in physics, is not known through sense-perception, but through thought. Its necessities are the necessities of reason. 17 Descartes finds himself, then, in the perplexing position of seeking an internal criterion for an external world. 18 The problem of knowledge so stated sets going the whole epistemological movement of the eighteenth century, from Locke through Berkeley and Hume to Kant. 19 And the issue of this development is the absolute idealism of Kant's successors.

EMPIRICAL REACTION OF THE ENGLISH PHILOSOPHERS

Ralph Barton Perry

16 Of the English philosophers who prepare the way for the epistemology of Kant, Hume is the most radical and momentous. 2 It was he who roused Kant from his "dogmatic slumbers" to the task of the "Critical Philosophy." Hume is one of the two possible consequences of Descartes. 3 One who attaches greater importance to the rational necessities of science than to its external reference, is not unwilling that Nature should be swallowed up in mind. 4 With Malebranche, Descartes's immediate successor in France, Nature is thus provided for within the archetypal mind of God. 5 With the English philosophers, on the other hand, externality is made the very mark of Nature, and as a consequence sense-perception becomes the criterion of scientific truth.

6 This empirical theory of knowledge, inaugurated and developed by Locke and Berkeley, culminates in Hume's designation of the 'impression' as the distinguishing element of Nature, at once making up its content and certifying to its externality. 7 The processes of Nature are successions of impressions; 8 and the laws of Nature are their uniformities, or the expectations of uniformity which their repetitions engender. 9 Hume does not hesitate to draw the logical conclusion. If the final mark of truth is the presence to sense of the individual element, then science can consist only of items of information and probable generalisations concerning their

sequences. 10 The effect is observed to follow upon the cause in fact, but there is no understanding of its necessity; therefore no absolute certainty attaches to the future effects of any cause.

TO SAVE EXACT SCIENCE KANT MAKES IT DEPENDENT ON MIND

Ralph Barton Perry

17 But what has become of the dream of the mathematical physicist? Is the whole system of Newton, that brilliant triumph of the mechanical method, unfounded and dogmatic? 2 It is the logical instability of this body of knowledge, made manifest in the well-founded scepticism of Hume, that rouses Kant to a reëxamination of the whole foundation of natural science. 3 The general outline of his analysis has been developed above. It is of importance here to understand its relations to the problem of Descartes. 4 Contrary to the view of the English philosophers, natural science is, says Kant, the work of the mind. The certainty of the causal relation is due to the human inability to think otherwise. 5 Hume is mistaken in supposing that mere sensation gives us any knowledge of Nature. The very least experience of objects involves the employment of principles which are furnished by the mind. 6 Without the employment of such principles, or in bare sensation, there is no intelligible meaning whatsoever. 7 But once admit the employment of such principles and formulate them systematically, and the whole Newtonian order of nature is seen to follow from them. 8 Furthermore, since these principles or categories are the conditions of human experience, are the very instruments of knowledge, they are valid wherever there is any experience or knowledge. 9 There is but one way to make anything at all out of Nature, and that is to conceive it as an order of necessary events in space and time. 10 Newtonian science is part of such a general conception, and is therefore necessary if knowledge is to be possible at all, even the least. 11 Thus Kant turns upon Hume, and shuts him up to

the choice between the utter abnegation of all knowledge, including the knowledge of his own scepticism, and the acceptance of the whole body of exact science.

12 But with Nature thus conditioned by the necessities of thought, what has become of its externality? 13 That, Kant admits, has indeed vanished. Kant does not attempt, as did Descartes, to hold that the Nature which mind constructs and controls, exists also outside of mind. 14 The Nature that is known is on that very account phenomenal, anthropocentric-- created by its cognitive conditions. 15 Descartes was right in maintaining that sense-perception certifies to the existence of a world outside the mind, but mistaken in calling it Nature and identifying it with the realm of science. 16 In short, Kant acknowledges the external world, and names it the 'thing-in-itself'; but insists that because it is outside of mind it is outside of knowledge. 17 Thus is the certainty of science saved at the cost of its metaphysical validity. It is necessarily true, but only of a conditioned or dependent world. 18 And in saving science, Kant has at the same time prejudiced metaphysics in general. For the human or naturalistic way of knowing is left in sole possession of the field, with the higher interest of reasons in the ultimate nature of being, degraded to the rank of practical faith.

THE POST-KANTIANS TRANSFORM KANT'S MIND-IN-GENERAL INTO AN ABSOLUTE MIND

Ralph Barton Perry

18 The transformation of this critical and agnostic doctrine into absolute idealism is inevitable. 2 The metaphysical interest was bound to avail itself of the speculative suggestiveness with which the Kantian philosophy abounds. 3 The transformation turns upon Kant's assumption that whatever is constructed by the mind is on that account phenomenon or appearance. 4 Kant has carried along the presumption that whatever is act or content of mind is on that account not 'real' object or 'thing-in-itself'.

5 We have seen that this is generally accepted as true of the relativities of sense-perception. But is it true of thought? The post-Kantian idealist maintains that 'that depends upon the thought'.

6 The content of private individual thinking is in so far not real object; but it does not follow that this is true of such thinking as is universally valid. 7 Now Kant has deduced his categories for thought in general. There are no empirical cases of thinking except the human thinkers; 8 but the categories are not the property of any one human individual or any group of such individuals. They are the conditions of 'experience in general', and of every possibility of experience. 9 The transition to absolute idealism is now readily made. 'Thought in general' becomes the 'absolute mind', and experience in general its content. 10 The thing-in-itself drops out as having no meaning. The objectivity to which it testified is provided for in the completeness and self-sufficiency which is attributed to the absolute experience.

11 Indeed, an altogether new definition of subjective and objective replaces the old. 12 The subjective is that which is only insufficiently thought, as in the case of relativity and error; the objective is that which is completely thought. 13 Thus the natural order is indeed phenomenal; but only because the principles of science are not the highest principles of thought, and not because Nature is the fruit of thought. 14 Thus Hegel expresses his relation to Kant as follows:

"According to Kant, the things that we know about are 'to us' appearances only, and we can never know their essential nature, which belongs to another world, which we cannot approach. . . . 15 The true statement of the case is as follows. The things of which we have direct consciousness are mere phenomena, not for us only, but in their own nature; 16 and the true and proper case of these things, finite as they are, is to have their existence founded not in themselves, but in the universal divine idea. 17 This view of things, it is true, is as idealist as Kant's, but in contradistinction to the

subjective idealism of the Critical Philosophy should be termed Absolute Idealism."

THE DIRECT ARGUMENT. THE INFERENCE FROM THE FINITE MIND TO THE INFINITE MIND

Ralph Barton Perry

19 Absolute idealism is thus reached after a long and devious course of development. 2 But the argument may be stated much more briefly. Plato, it will be remembered, found that experience tends ever to transcend itself. 3 The thinker finds the self compelled to pursue the ideal of immutable and universal truth, and must identify the ultimate being with that ideal.

4 Similarly Hegel says: "That upward spring of the mind signifies that the being which the world has is only a semblance, no real being, no absolute truth; 5 it signifies that beyond and above that appearance, truth abides in God, so that true being is another name for God."

6 The further argument of absolute idealism differs from that of Plato in that the dependence of truth upon the mind is accepted as a first principle. 7 The ideal with which experience is informed is now 'the state of perfect knowledge', rather than the system of absolute truth. 8 The content of the state of perfect knowledge will indeed be the system of absolute truth, but none the less 'content', precisely as finite knowledge is the content of a finite mind. 9 In pursuing the truth, I who pursue, aim to realise in myself a certain highest state of knowledge. 10 Were I to know all truth I should indeed have ceased to be the finite individual who began the quest, but the evolution would be continuous and the character of self-consciousness would never have been lost. 11 I may say, in short, that God or being, is my perfect cognitive self.

12 The argument for absolute idealism is a constructive interpretation of the subjectivistic contention that knowledge can never escape the circle of its own activity and states. 13 To meet the demand for a final and standard truth, a demand which realism meets with its doctrine of a being independent of any mind, this

philosophy defines a 'standard mind'. 14 The impossibility of defining objects in terms of relativity to a finite self, conducts dialectically to the conception of the 'absolute self'. 15 The sequel to my error or exclusiveness, is truth or inclusiveness. 16 The outcome of the dialectic is determined by the symmetry of the antithesis. 17 Thus, corrected experience implies a last correcting experience; partial cognition, complete cognition; empirical subject, transcendental subject; finite mind, an absolute mind.

18 The following statement is taken from a contemporary exponent of the philosophy: 19 "What you and I lack, when we lament our human ignorance, is simply a certain desirable and logically possible state of mind, or type of experience; 20 to wit, a state of mind in which we should wisely be able to say that we had fulfilled in experience what we now have merely in idea, namely, the knowledge, the immediate and felt presence, of what we now call the Absolute Reality. . . . 21 There is an Absolute Experience for which the conception of an absolute reality, 'i. e.', the conception of a system of ideal truth, is fulfilled by the very contents that get presented to this experience. 22 This Absolute Experience is related to our experience as an organic whole to its own fragments. 23 It is an experience which finds fulfilled all that the completest thought can conceive as genuinely possible. 24 Herein lies its definition as an Absolute. For the Absolute Experience, as for ours, there are data, contents, facts. 25 But these data, these contents, express, for the Absolute Experience, its own meaning, its thought, its ideas. 26 Contents beyond these that it possesses, the Absolute Experience knows to be, in genuine truth, impossible. Hence its contents are indeed particular,-- 27 a selection from the world of bare or merely conceptual possibilities,-- but they form a self-determined whole, than which nothing completer, more organic, more fulfilled, more transparent, or more complete in meaning, is concretely or genuinely possible. 28 On the other hand, these contents are not foreign to those of

our finite experience, but are inclusive of them in the unity of one life."

THE REALISTIC TENDENCY IN ABSOLUTE IDEALISM
Ralph Barton Perry

20 As has been already intimated, at the opening, the inclusion of the whole of reality within a single self is clearly a questionable proceeding. 2 The need of avoiding the relativism of empirical idealism is evident. 3 But if the very meaning of the self-consciousness be due to a certain selection and exclusion within the general field of experience, it is equally evident that the relativity of self-consciousness can never be overcome through appealing to a higher self. 4 One must appeal 'from' the self to the realm of things as they are. 5 Indeed, although the exponents of this philosophy use the language of spiritualism, and accept the idealistic epistemology, their absolute being tends ever to escape the special characters of the self. 6 And inasmuch as the absolute self is commonly set over against the finite or empirical self, as the standard and test of truth, it is the less distinguishable from the realist's order of independent beings.

THE CONCEPTION OF SELF-CONSCIOUSNESS CENTRAL IN THE ETHICS OF ABSOLUTE IDEALISM. KANT
Ralph Barton Perry

21 But however much absolute idealism may tend to abandon its idealism for the sake of its absolutism within the field of metaphysics, such is not the case within the field of ethics and religion. 2 The conception of the self here receives a new emphasis. The same self-consciousness which admits to the highest truth is the evidence of human's practical dignity. 3 In virtue of your immediate apprehension of the principles of selfhood, and your direct participation in the life of spirit, human may be said to possess the innermost secret of the universe.

4 In order to achieve goodness you must therefore recognise and

express 'yourself'. 5 The Kantian philosophy is here again the starting-point. It was Kant who first gave adequate expression to the Christian idea of the moral self-consciousness.

6 "'Duty!' Thou sublime and mighty name that dost embrace nothing charming or insinuating, but requirest submission, 7 and yet seekest not to move the will by threatening aught that would arouse natural aversion or terror, but merely holdest forth a law which of itself finds entrance into the mind, . . . 8 a law before which all inclinations are dumb, even though they secretly counterwork it; 9 what origin is there worthy of thee, and where is to be found the root of thy noble descent which proudly rejects all kindred with the inclinations . . . ? 10 It can be nothing less than a power which elevates human above the self, . . . a power which connects you with an order of things that only the understanding can conceive, 11 with a world which at the same time commands the whole sensible world, and with it the empirically determinable existence of human in time, as well as the sum total of all ends."

12 With Kant there can be no morality except conduct be attended by the consciousness of this duty imposed by the higher nature upon the lower. 13 It is this very recognition of a deeper self, of a personality that belongs to the sources and not to the consequences of Nature, that constitutes human as a moral being, and only such action as is inspired with a reverence for it can be morally good. 14 Kant does little more than to establish the uncompromising dignity of the moral will. 15 In moral action human submits to a law that issues from yourself in virtue of your rational nature. 16 Here you yields nothing, as you owes nothing, to that appetency which binds you to the natural world. 17 As a rational being you yourself affirms the very principles which determine the organisation of Nature. 18 This is your 'freedom', at once the ground and the implication of your duty. Human is free from Nature to serve the higher law of your personality.

IDEAS

KANTIAN ETHICS SUPPLEMENTED THROUGH THE CONCEPTIONS OF UNIVERSAL AND OBJECTIVE SPIRIT

Ralph Barton Perry

22 There are two respects in which Kant's ethics has been regarded as inadequate by those who draw from it their fundamental principles. 2 It is said that Kant is too rigouristic, that he makes too stern a business of morality, in speaking so much of law and so little of love and spontaneity. There are good reasons for this. 3 Kant seeks to isolate the moral consciousness, and dwell upon it in its purity, in order that he may demonstrate its incommensurability with the values of inclination and sensibility. 4 Furthermore, Kant may speak of the principle of the absolute, and recognise the deeper eternal order as a law, but he may not, if he is to be consistent with his own critical principles, affirm the metaphysical being of such an order. 5 With his idealistic followers it is possible to define the spiritual setting of the moral life, but with Kant it is only possible to define the antagonism of principles. Hence the greater optimism of the post-Kantians. 6 They know that the higher law is the reality, and that you who obeys it thus unites yourself with the absolute self. 7 That which for Kant is only a resolute obedience to more valid principles, to rationally superior rules for action, is for idealism human's appropriation of own spiritual birthright. 8 Since the law is the deeper nature, human may respect and obey it as valid, and at the same time act upon it gladly in the sure knowledge that it will enhance own eternal welfare. 9 Indeed, the knowledge that the very universe is founded upon this law will make you less suspicious of Nature and less exclusive in your adherence to any single law. 10 You will be more confident of the essential goodness of all manifestations of a universe which you knows to be fundamentally spiritual.

11 But it has been urged, secondly, that the Kantian ethics is too formal, too little pertinent to the issues of life. 12 Kant's moral law imposes only obedience to the law, or conduct conceived as suitable to

a universal moral community. But what is the nature of such conduct in particular? 13 It may be answered that to maintain the moral self-consciousness, to act dutifully and dutifully only, to be self-reliant and unswerving in the doing of what one ought to do, is to obtain a very specific character. 14 But does this not leave the individual's conduct to your own interpretation of your duty? 15 It was just this element of individualism which Hegel sought to eliminate through the application of his larger philosophical conception. 16 If that which expresses itself within the individual consciousness as the moral law be indeed the law of that self in which the universe is grounded, it will appear as 'objective spirit' in the evolution of society. 17 For Hegel, then, the most valid standard of goodness is to be found in that customary morality which bespeaks the moral leadings of the general humanity, 18 and in those institutions, such as the family and the state, which are the moral acts of the absolute idea itself. 19 Finally, in the realm of 'absolute spirit', in art, in revealed religion, and in philosophy, the individual may approach to the self-consciousness which is the perfect truth and goodness in and for itself.

THE PECULIAR PANTHEISM AND MYSTICISM OF ABSOLUTE IDEALISM

Ralph Barton Perry

23 Where the law of life is the implication in the finite self-consciousness of the eternal and divine self-consciousness, there can be no division between morality and religion, as there can be none between thought and will. 2 Whatever human seeks is in the end God. 3 As the perfect fulfillment of the thinking self, God is the truth; as the perfect fulfillment of the willing self, God is the good. 4 The finite self-consciousness finds facts that are not understood, and so seeks to resolve itself into the perfect self wherein all that is given has meaning. 5 On the other hand, the finite self-consciousness finds ideals that are not realised, and so seeks to resolve itself into that

perfect self wherein all that is significant is given. 6 All interests thus converge toward "some state of conscious spirit in which the opposition of cognition and volition is overcome-- 7 in which we neither judge our ideas by the world, nor the world by our ideas, but are aware that inner and outer are in such close and necessary harmony that even the thought of possible discord has become impossible. 8 In its unity not only cognition and volition, but feeling also, must be blended and united. 9 In some way or another it must have overcome the rift in discursive knowledge, and the immediate must for it be no longer the alien. It must be as direct as art, as certain and universal as philosophy."

10 The religious consciousness proper to absolute idealism is both pantheistic and mystical, but with distinction. 11 Platonism is pantheistic in that Nature is resolved into God. 12 All that is not perfect is esteemed only for its promise of perfection. 13 And Platonism is mystical in that the purification and universalisation of the affections brings one in the end to a perfection that exceeds all modes of thought and speech.

14 With Spinoza, on the other hand, God may be said to be resolved into Nature. 15 Nature is made divine, but is none the less Nature, for its divinity consists in its absolute necessity. 16 Spinoza's pantheism passes over into mysticism because the absolute necessity exceeds in both unity and richness the laws known to the human understanding. 17 In absolute idealism, finally, both God and Nature are resolved into the self. 18 For that which is divine in experience is self-consciousness, and this is at the same time the ground of Nature. 19 Thus in the highest knowledge the self is expanded and enriched without being left behind. 20 The mystical experience proper to this philosophy is the consciousness of identity, together with the sense of universal immanence. 21 The individual self may be directly sensible of the absolute self, for these are one spiritual life.

22 Thus Emerson says: "It is a secret which every intellectual person quickly learns, that beyond the energy of your possessed and

conscious intellect you are capable of a new energy (as of an intellect doubled on itself), by abandonment to the nature of things; 23 that beside your privacy of power as an individual human, there is a great public power upon which you can draw, by unlocking, at all risks, your human doors, and suffering the ethereal tides to roll and circulate through you; 24 then you are caught up into the life of the Universe, your speech is thunder, your thought is law, and your words are universally intelligible as the plants and animals. 25 The poet knows that you speaks adequately then only when you speaks somewhat wildly, or 'with the flower of the mind'; 26 not with the intellect used as an organ, but with the intellect released from all service and suffered to take its direction from its celestial life."

THE RELIGION OF EXUBERANT SPIRITUALITY

Ralph Barton Perry

24 But the distinguishing flavour and quality of this religion arises from its spiritual hospitality. 2 It is not, like Platonism, a contemplation of the best; nor, like pluralistic idealisms, a moral knight-errantry. 3 It is neither a religion of exclusion, nor a religion of reconstruction, but a profound willingness that things should be as they really are. 4 For this reason its devotees have recognised in Spinoza their true forerunner. But idealism is not Spinozism, though it may contain this as one of its strains. For it is not the worship of necessity, 5 Emerson's "beautiful necessity, which makes human brave in believing that you cannot shun a danger that is appointed, nor incur one that is not"; but the worship of 'that which is' necessary.

6 Not only must one understand that every effort, however despairing, is an element of sense in the universal significance; 7 "that the whole would not be what it is were not precisely this finite

purpose left in its own uniqueness to speak precisely its own word-- a word which no other purpose can speak in the language of the divine-will"; 8 but one must have a zest for such participation, and a heart for the divine-will which it profits. 9 Indeed, so much is this religion a love of life, that it may, as in the case of the Romanticists, be a love of caprice. 10 Battle and death, pain and joy, error and truth-- all that belongs to the story of this mortal world, are to be felt as the thrill of health, and relished as the essences of God. 11 Religion is an exuberant spirituality, a fearless sensibility, a knowledge of both good and evil, and a will to serve the good, while exulting that the evil will not yield without a battle.

The Book of Divine Panagogue Called
INTELLIGENCE

CREATIVE INTELLIGENCE
John Dewey

THE NEED FOR A RECOVERY OF PHILOSOPHY

1 Intellectual advance occurs in two ways. 2 At times increase of knowledge is organised about old conceptions, while these are expanded, elaborated and refined, but not seriously revised, much less abandoned. 3 At other times, the increase of knowledge demands qualitative rather than quantitative change; alteration, not addition. 4 Humans' minds grow cold to their former intellectual concerns; ideas that were burning fade; interests that were urgent seem remote. 5 Humans face in another direction; their older perplexities are unreal; considerations passed over as negligible loom up. Former problems may not have been solved, but they no longer press for solutions.

6 Philosophy is no exception to the rule. But it is unusually conservative-- not, necessarily, in proffering solutions, but in clinging to problems. 7 It has been so allied with theology and theological morals as representatives of humans' chief interests, that radical alteration has been shocking. 8 Humans' activities took a decidedly new turn, for example, in the seventeenth century, and it seems as if philosophy, under the lead of thinkers like Bacon and Descartes, was to execute an about-face. 9 But, in spite of the ferment, it turned out that many of the older problems were but translated from Latin into the vernacular or into the new terminology furnished by science.

10 The association of philosophy with academic teaching has reinforced this intrinsic conservatism. 11 Scholastic philosophy persisted in universities after people's thoughts outside of the walls of colleges had moved in other directions. 12 In the last hundred years intellectual advances of science and politics have in like fashion been crystallised into material of instruction and now resist further

change. 13 I would not say that the spirit of teaching is hostile to that of liberal inquiry, but a philosophy which exists largely as something to be taught rather than wholly as something to be reflected upon is conducive to discussion of views held by others rather than to immediate response. 14 Philosophy when taught inevitably magnifies the history of past thought, and leads professional philosophers to approach their subject-matter through its formulation in received systems. 15 It tends, also, to emphasise points upon which people have divided into schools, for these lend themselves to retrospective definition and elabouration. 16 Consequently, philosophical discussion is likely to be a dressing out of antithetical traditions, where criticism of one view is thought to afford proof of the truth of its opposite (as if formulation of views guaranteed logical exclusives). 17 Direct preoccupation with contemporary difficulties is left to literature and politics.

18 If changing conduct and expanding knowledge ever required a willingness to surrender not merely old solutions but old problems it is now. 19 I do not mean that we can turn abruptly away from all traditional issues. This is impossible; it would be the undoing of the one who attempted it. 20 Irrespective of the professionalising of philosophy, the ideas philosophers discuss are still those in which Western civilisation has been bred. They are in the backs of the heads of educated people. 21 But what serious-minded people not engaged in the professional business of philosophy most want to know is what modifications and abandonments of intellectual inheritance are required by the newer industrial, political, and scientific movements. 22 They want to know what these newer movements mean when translated into general ideas. 23 Unless professional philosophy can mobilise itself sufficiently to assist in this clarification and redirection of humans' thoughts, it is likely to get more and more sidetracked from the main currents of contemporary life.

24 This essay may, then, be looked upon as an attempt to forward the

emancipation of philosophy from too intimate and exclusive attachment to traditional problems. 25 It is not in intent a criticism of various solutions that have been offered, but raises a question 'as to the genuineness, under the present conditions of science and social life, of the problems'. 26 The limited object of my discussion will, doubtless, give an exaggerated impression of my conviction as to the artificiality of much recent philosophising. 27 Not that I have willfully exaggerated in what I have said, but that the limitations of my purpose have led me not to say many things pertinent to a broader purpose. 28 A discussion less restricted would strive to enforce the genuineness, in their own context, of questions now discussed mainly because they have been discussed rather than because contemporary conditions of life suggest them. 29 It would also be a grateful task to dwell upon the precious contributions made by philosophic systems which as a whole are impossible. 30 In the course of the development of unreal premises and the discussion of artificial problems, points of view have emerged which are indispensable possessions of culture. 31 The horizon has been widened; ideas of great fecundity struck out; imagination quickened; a sense of the meaning of things created. 32 It may even be asked whether these accompaniments of classic systems have not often been treated as a kind of guarantee of the systems themselves. 33 But while it is a sign of an illiberal mind to throw away the fertile and ample ideas of a Spinoza, a Kant, or a Hegel, because their setting is not logically adequate, 34 is surely a sign of an undisciplined one to treat their contributions to culture as confirmations of premises with which they have no necessary connection.

I

35 A criticism of current philosophising from the standpoint of the traditional quality of its problems must begin somewhere, and the choice of a beginning is arbitrary. 36 It has appeared to me that the notion of experience implied in the questions most

actively discussed gives a natural point of departure. 37 For, if I mistake not, it is just the inherited view of experience common to the empirical school and its opponents which keeps alive many discussions even of matters that on their face are quite remote from it, 38 while it is also this view which is most untenable in the light of existing science and social practice. 39 Accordingly I set out with a brief statement of some of the chief contrasts between the orthodox description of experience and that congenial to present conditions.

40 (i) In the orthodox view, experience is regarded primarily as a knowledge-affair. 41 But to eyes not looking through ancient spectacles, it assuredly appears as an affair of the intercourse of a living being with its physical and social environment.

42 (ii) According to tradition, experience is (at least primarily) a psychical thing, infected throughout by "subjectivity." 43 What experience suggests about itself is a genuinely objective world which enters into the actions and sufferings of humans and undergoes modifications through their responses.

44 (iii) So far as anything beyond a bare present is recognised by the established doctrine, the past exclusively counts. 45 Registration of what has taken place, reference to precedent, is believed to be the essence of experience. 46 Empiricism is conceived of as tied up to what has been, or is, "given." 47 But experience in its vital form is experimental, an effort to change the given; it is characterised by projection, by reaching forward into the unknown; connexion with a future is its salient trait.

48 (iv) The empirical tradition is committed to particularism. Connexions and continuities are supposed to be foreign to experience, to be by-products of dubious validity. 49 An experience that is an undergoing of an environment and a striving for its control in new directions is pregnant with connexions.

50 (v) In the traditional notion, experience and thought are antithetical terms. 51 Inference, so far as it is other than a revival of what has been given in the past,

goes beyond experience; hence it is either invalid, 52 or else a measure of desperation by which, using experience as a springboard, we jump out to a world of stable things and other selves. 53 But experience, taken free of the restrictions imposed by the older concept, is full of inference. There is, apparently, no conscious experience without inference; reflection is native and constant. 54 These contrasts, with a consideration of the effect of substituting the account of experience relevant to modern life for the inherited account, afford the subject-matter of the following discussion.

55 Suppose we take seriously the contribution made to our idea of experience by biology,-- 56 not that recent biological science discovered the facts, but that it has so emphasised them that there is no longer an excuse for ignoring them or treating them as negligible. 57 Any account of experience must now fit into the consideration that experiencing means living; and that living goes on in and because of an environing medium, not in a vacuum. 58 Where there is experience, there is a living being. Where there is life, there is a double connexion maintained with the environment. 59 In part, environmental energies constitute organic functions; they enter into them. Life is not possible without such direct support by the environment. 60 But while all organic changes depend upon the natural energies of the environment for their origination and occurrence, 61 the natural energies sometimes carry the organic functions prosperously forward, and sometimes act counter to their continuance. 62 Growth and decay, health and disease, are alike continuous with activities of the natural surroundings. 63 The difference lies in the bearing of what happens upon future life-activity. From the standpoint of this future reference environmental incidents fall into groups: those favourable to life-activities, and those hostile.

64 The successful activities of the organism, those within which environmental assistance is incorporated, react upon the environment to bring about modifications favourable to their

own future. 65 The human being has upon your hands the problem of responding to what is going on around you so that these changes will take one turn rather than another, namely, that required by its own further functioning. 66 While backed in part by the environment, its life is anything but a peaceful exhalation of environment. 67 It is obliged to struggle-- that is to say, to employ the direct support given by the environment in order indirectly to effect changes that would not otherwise occur. 68 In this sense, life goes on by means of controlling the environment. Its activities must change the changes going on around it; 69 they must neutralise hostile occurrences; they must transform neutral events into coöperative factors or into an efflorescence of new features.

70 Dialectic developments of the notion of self-preservation, of the '*conatus essendi*', often ignore all the important facts of the actual process. 71 They argue as if self-control, self-development, went on directly as a sort of unrolling push from within. 72 But life endures only in virtue of the support of the environment. 73 And since the environment is only incompletely enlisted in our behalf, self-preservation-- or self-realisation or whatever-- is always indirect-- 74 always an affair of the way in which our present activities affect the direction taken by independent changes in the surroundings. 75 Hindrances must be turned into means.

76 We are also given to playing loose with the conception of adjustment, as if that meant something fixed-- a kind of accommodation once for all (ideally at least) of the organism 'to' an environment. 77 But as life requires the fitness of the environment to the organic functions, adjustment to the environment means not passive acceptance of the latter, but acting so that the environing changes take a certain turn. 78 The "higher" the type of life, the more adjustment takes the form of an adjusting of the factors of the environment to one another in the interest of life; 79 the less the significance of living, the more it becomes an adjustment to a given environment till at the lower end of the scale the

differences between living and the non-living disappear.

80 These statements are of an external kind. They are about the conditions of experience, rather than about experiencing itself. 81 But assuredly experience as it concretely takes place bears out the statements. 82 Experience is primarily a process of undergoing: a process of standing something; of suffering and passion, of affection, in the literal sense of these words. 83 The organism has to endure, to undergo, the consequences of its own actions. 84 Experience is no slipping along in a path fixed by inner consciousness. 85 Private consciousness is an incidental outcome of experience of a vital objective sort; it is not its source. 86 Undergoing, however, is never mere passivity. The most patient patient is more than a receptor. You are also an agent-- 87 a reactor, one trying experiments, one concerned with undergoing in a way which may influence what is still to happen. 88 Sheer endurance, side-stepping evasions, are, after all, ways of treating the environment with a view to what such treatment will accomplish. 89 Even if we shut ourselves up in the most clam-like fashion, we are doing something; our passivity is an active attitude, not an extinction of response. 90 Just as there is no assertive action, no aggressive attack upon things as they are, which is all action, so there is no undergoing which is not on our part also a going on and a going through.

91 Experience, in other words, is a matter of 'simultaneous' doings and sufferings. 92 Our undergoings are experiments in varying the course of events; our active tryings are trials and tests of ourselves. This duplicity of experience shows itself in our happiness and misery, our successes and failures. 93 Triumphs are dangerous when dwelt upon or lived off from; successes use themselves up. 94 Any achieved equilibrium of adjustment with the environment is precarious because we cannot evenly keep pace with changes in the environment. 95 These are so opposed in direction that we must choose. We must take the risk of casting in our lot with one movement or the other. 96 Nothing

can eliminate all risk, all adventure; the one thing doomed to failure is to try to keep even with the whole environment at once--that is to say, to maintain the happy moment when all things go our way.

97 The obstacles which confront us are stimuli to variation, to novel response, and hence are occasions of progress. 98 If a favour done us by the environment conceals a threat, so its disfavour is a potential means of hitherto unexperienced modes of success. 99 To treat misery as anything but misery, as for example a blessing in disguise or a necessary factor in good, is disingenuous apologetics. 100 But to say that the progress of the race has been stimulated by ills undergone, and that humans have been moved by what they suffer to search out new and better courses of action is to speak veraciously.

101 The preoccupation of experience with things which are coming (are now coming, not just to come) is obvious to any one whose interest in experience is empirical. 102 Since we live forward; since we live in a world where changes are going on whose issue means our weal or woe; since every act of ours modifies these changes and hence is fraught with promise, or charged with hostile energies-- what should experience be but a future implicated in a present! 103 Adjustment is no timeless state; it is a continuing process. To say that a change takes time may be to say something about the event which is external and uninstructive. 104 But adjustment of organism to environment takes time in the pregnant sense; every step in the process is conditioned by reference to further changes which it effects. 105 What is going on in the environment is the concern of the organism; not what is already "there" in accomplished and finished form. 106 In so far as the issue of what is going on may be affected by intervention of the organism, the moving event is a challenge which stretches the agent-patient to meet what is coming. 107 Experiencing exhibits things in their unterminated aspect moving toward determinate conclusions. The finished and done with is of import as affecting the future, not on its own account:

in short, because it is not, really, done with.

108 Anticipation is therefore more primary than recollection; projection than summoning of the past; the prospective than the retrospective. 109 Given a world like that in which we live, a world in which environing changes are partly favourable and partly callously indifferent, and experience is bound to be prospective in import; 110 for any control attainable by the living creature depends upon what is done to alter the state of things. 111 Success and failure are the primary "categories" of life; achieving of good and averting of ill are its supreme interests; 112 hope and anxiety (which are not self-enclosed states of feeling, but active attitudes of welcome and wariness) are dominant qualities of experience. 113 Imaginative forecast of the future is this forerunning quality of behaviour rendered available for guidance in the present. 114 Day-dreaming and castle-building and esthetic realisation of what is not practically achieved are offshoots of this practical trait, or else practical intelligence is a chastened fantasy. 115 It makes little difference. Imaginative recovery of the bygone is indispensable to successful invasion of the future, but its status is that of an instrument. 116 To ignore its import is the sign of an undisciplined agent; but to isolate the past, dwelling upon it for its own sake and giving it the eulogistic name of knowledge, is to substitute the reminiscence of old-age for effective intelligence. 117 The movement of the agent-patient to meet the future is partial and passionate; yet detached and impartial study of the past is the only alternative to luck in assuring success to passion.

II

118 This description of experience would be but a rhapsodic celebration of the commonplace were it not in marked contrast to orthodox philosophical accounts. 119 The contrast indicates that traditional accounts have not been empirical, but have been deductions, from unnamed premises, of what experience 'must' be. 120 Historic empiricism

has been empirical in a technical and controversial sense. It has said, Lord, Lord, Experience, Experience; but in practice it has served ideas 'forced into' experience, not 'gathered from' it. 121 The confusion and artificiality thereby introduced into philosophical thought is nowhere more evident than in the empirical treatment of relations or dynamic continuities. 122 The experience of a living being struggling to hold its own and make its way in an environment, physical and social, partly facilitating and partly obstructing its actions, is of necessity a matter of ties and connexions, of bearings and uses. 123 The very point of experience, so to say, is that it doesn't occur in a vacuum; 124 its agent-patient instead of being insulated and disconnected is bound up with the movement of things by most intimate and pervasive bonds. 125 Only because the organism is in and of the world, and its activities correlated with those of other things in multiple ways, is it susceptible to undergoing things and capable of trying to reduce objects to means of securing its good fortune. 126 That these connexions are of diverse kinds is irresistibly proved by the fluctuations which occur in its career. 127 Help and hindrance, stimulation and inhibition, success and failure mean specifically different modes of correlation. 128 Although the actions of things in the world are taking place in one continuous stretch of existence, there are all kinds of specific affinities, repulsions, and relative indifferencies.

129 Dynamic connexions are qualitatively diverse, just as are the centers of action. 'In this sense', pluralism, not monism, is an established empirical fact. 130 The attempt to establish monism from consideration of the very nature of a relation is a mere piece of dialectics. 131 Equally dialectical is the effort to establish by a consideration of the nature of relations an ontological Pluralism of Ultimates: 'simple and independent beings.' 132 To attempt to get results from a consideration of the "external" nature of relations is of a piece with the attempt to deduce results from their "internal" character.

133 Some things are relatively insulated from the influence of other things; some things are easily invaded by others; some things are fiercely attracted to conjoin their activities with those of others. 134 Experience exhibits every kind of connexion from the most intimate to mere external juxtaposition.

135 Empirically, then, active bonds or continuities of all kinds, together with static discontinuities, characterise existence. 136 To deny this qualitative heterogeneity is to reduce the struggles and difficulties of life, its comedies and tragedies to illusion: to the non-being of the Greeks or to its modern counterpart, the "subjective." 137 Experience is an affair of facilitations and checks, of being sustained and disrupted, being let alone, being helped and troubled, of good fortune and defeat in all the countless qualitative modes which these words pallidly suggest. 138 The existence of genuine connexions of all manner of heterogeneity cannot be doubted. Such words as conjoining, disjoining, resisting, modifying, saltatory, and ambulatory (to use James' picturesque term) only hint at their actual heterogeneity.

139 Among the revisions and surrenders of historic problems demanded by this feature of empirical situations, those centering in the rationalistic-empirical controversy may be selected for attention. 140 The implications of this controversy are twofold: First, that connexions are as homogeneous in fact as in name; and, secondly, if genuine, are all due to thought, or, if empirical, are arbitrary by-products of past particulars. 141 The stubborn particularism of orthodox empiricism is its outstanding trait; consequently the opposed rationalism found no justification of bearings, continuities, and ties save to refer them in gross to the work of a hyper-empirical Reason.

142 Of course, not all empiricism prior to Hume and Kant was sensationalistic, pulverising "experience" into isolated sensory qualities or simple ideas. 143 It did not all follow Locke's lead in regarding the entire content of generalisation as the

"workmanship of the understanding." 144 On the Continent, prior to Kant, philosophers were content to draw a line between empirical generalisations regarding matters of fact and necessary universals applying to truths of reason. 145 But logical atomism was implicit even in this theory. Statements referring to empirical fact were mere quantitative summaries of particular instances. 146 In the sensationalism which sprang from Hume (and which was left unquestioned by Kant as far as any strictly empirical element was concerned) the implicit particularism was made explicit. 147 But the doctrine that sensations and ideas are so many separate existences was not derived from observation nor from experiment. It was a logical deduction from a prior unexamined concept of the nature of experience. 148 From the same concept it followed that the appearance of stable objects and of general principles of connexion was but an appearance.

149 Kantianism, then, naturally invoked universal bonds to restore objectivity. But, in so doing, it accepted the particularism of experience and proceeded to supplement it from non-empirical sources. 150 A sensory manifold being all which is really empirical in experience, a reason which transcends experience must provide synthesis. The net outcome might have suggested a correct account of experience. 151 For we have only to forget the apparatus by which the net outcome is arrived at, to have before us the experience of the plain person-- a diversity of ceaseless changes connected in all kinds of ways, static and dynamic. 152 This conclusion would deal a deathblow to both empiricism and rationalism. For, making clear the non-empirical character of the alleged manifold of unconnected particulars, it would render unnecessary the appeal to functions of the understanding in order to connect them. 153 With the downfall of the traditional notion of experience, the appeal to reason to supplement its defects becomes superfluous.

154 The tradition was, however, too strongly entrenched; especially as it furnished the subject-matter

of an alleged science of states of mind which were directly known in their very presence. 155 The historic outcome was a new crop of artificial puzzles about relations; it fastened upon philosophy for a long time the quarrel about the 'a priori' and the 'a posteriori' as its chief issue. 156 The controversy is to-day quiescent. Yet it is not at all uncommon to find thinkers modern in tone and intent who regard any philosophy of experience as necessarily committed to denial of the existence of genuinely general propositions, 157 and who take empiricism to be inherently averse to the recognition of the importance of an organising and constructive intelligence.

158 The quiescence alluded to is in part due, I think, to sheer weariness. But it is also due to a change of standpoint introduced by biological conceptions; and particularly the discovery of biological continuity from the lower organisms to human. 159 For a short period, Spencerians might connect the doctrine of evolution with the old problem, and use the long temporal accumulation of "experiences" to generate something which, for human experience, is 'a priori'. 160 But the tendency of the biological way of thinking is neither to confirm or negate the Spencerian doctrine, but to shift the issue. 161 In the orthodox position 'a posteriori' and 'a priori' were affairs of knowledge. But it soon becomes obvious that while there is assuredly something 'a priori'--that is to say, native, unlearned, original-- 162 in human experience, that something is 'not' knowledge, but is activities made possible by means of established connexions of neurones. 163 This empirical fact does not solve the orthodox problem; it dissolves it. It shows that the problem was misconceived, and solution sought by both parties in the wrong direction.

164 Organic instincts and organic retention, or habit-forming, are undeniable factors in actual experience. They are factors which effect organisation and secure continuity. 165 They are among the specific facts which a description of experience cognisant of the

correlation of organic action with the action of other natural objects will include. 166 But while fortunately the contribution of biological science to a truly empirical description of experiencing has outlawed the discussion of the 'a priori' and 'a posteriori', 167 the transforming effect of the same contributions upon other issues has gone unnoticed, save as pragmatism has made an effort to bring them to recognition.

III

168 The point seriously at issue in the notion of experience common to both sides in the older controversy thus turns out to be the place of thought or intelligence in experience. 169 Does reason have a distinctive office? Is there a characteristic order of relations contributed by it?

170 Experience, to return to our positive conception, is primarily what is undergone in connexion with activities whose import lies in their objective consequences--their bearing upon future experiences. 171 Organic functions deal with things as things in course, in operation, in a state of affairs not yet given or completed. 172 What is done with, what is just "there," is of concern only in the potentialities which it may indicate. As ended, as wholly given, it is of no account. 173 But as a sign of what may come, it becomes an indispensable factor in behaviour dealing with changes, the outcome of which is not yet determined.

174 The only power the organism possesses to control its own future depends upon the way its present responses modify changes which are taking place in its medium. 175 A living being may be comparatively impotent, or comparatively free. It is all a matter of the way in which its present reactions to things influence the future reactions of things upon it. 176 Without regard to its wish or intent every act it performs makes some difference in the environment. The change may be trivial as respects its own career and fortune. 177 But it may also be of incalculable importance; it may import harm, destruction, or it may procure well-being.

INTELLIGENCE

178 Is it possible for a living being to increase its control of welfare and success? Can it manage, in any degree, to assure its future? 179 Or does the amount of security depend wholly upon the accidents of the situation? Can it learn? Can it gain ability to assure its future in the present? 180 These questions center attention upon the significance of reflective intelligence in the process of experience. 181 The extent of an agent's capacity for inference, its power to use a given fact as a sign of something not yet given, measures the extent of its ability systematically to enlarge its control of the future.

182 A being which can use given and finished facts as signs of things to come; which can take given things as evidences of absent things, can, in that degree, forecast the future; it can form reasonable expectations. 183 It is capable of achieving ideas; it is possessed of intelligence. For use of the given or finished to anticipate the consequence of processes going on is precisely what is meant by "ideas," by "intelligence."

184 As we have already noted, the environment is rarely all of a kind in its bearing upon organic welfare; its most whole-hearted support of life-activities is precarious and temporary. 185 Some environmental changes are auspicious; others are menacing. 186 The secret of success-- that is, of the greatest attainable success-- is for the organic response to cast in its lot with present auspicious changes to strengthen them and thus to avert the consequences flowing from occurrences of ill-omen. 187 Any reaction is a venture; it involves risk. We always build better or worse than we can foretell. 188 But the organism's fateful intervention in the course of events is blind, its choice is random, except as it can employ what happens to it as a basis of inferring what is likely to happen later. 189 In the degree in which it can read future results in present on-goings, its responsive choice, its partiality to this condition or that, become intelligent. 190 Its bias grows reasonable. It can deliberately, intentionally, participate in the direction of the course of affairs.

191 Its foresight of different futures which result according as this or that present factor predominates in the shaping of affairs permits it to partake intelligently instead of blindly and fatally in the consequences its reactions give rise to. 192 Participate it must, and to its own weal or woe. 193 Inference, the use of what happens, to anticipate what will-- or at least may-- happen, makes the difference between directed and undirected participation. 194 And this capacity for inferring is precisely the same as that use of natural occurrences for the discovery and determination of consequences-- the formation of new dynamic connexions-- which constitutes knowledge.

195 The fact that thought is an intrinsic feature of experience is fatal to the traditional empiricism which makes it an artificial by-product. 196 But for that same reason it is fatal to the historic rationalisms whose justification was the secondary and retrospective position assigned to thought by empirical philosophy. 197 According to the particularism of the latter, thought was inevitably only a bunching together of hard-and-fast separate items; 198 thinking was but the gathering together and tying of items already completely given, or else an equally artificial untying-- a mechanical adding and subtracting of the given. 199 It was but a cumulative registration, a consolidated merger; generality was a matter of bulk, not of quality. 200 Thinking was therefore treated as lacking constructive power; even its organising capacity was but simulated, being in truth but arbitrary pigeon-holing. 201 Genuine projection of the novel, deliberate variation and invention, are idle fictions in such a version of experience. 202 If there ever was creation, it all took place at a remote period. Since then the world has only recited lessons.

203 The value of inventive construction is too precious to be disposed of in this cavalier way. 204 Its unceremonious denial afforded an opportunity to assert that in addition to experience the subject has a ready-made faculty of thought or reason which

transcends experience. 205 Rationalism thus accepted the account of experience given by traditional empiricism, and introduced reason as extra-empirical. 206 There are still thinkers who regard any empiricism as necessarily committed to a belief in a cut-and-dried reliance upon disconnected precedents, 207 and who hold that all systematic organisation of past experiences for new and constructive purposes is alien to strict empiricism.

208 Rationalism never explained, however, how a reason extraneous to experience could enter into helpful relation with concrete experiences. 209 By definition, reason and experience were antithetical, so that the concern of reason was not the fruitful expansion and guidance of the course of experience, but a realm of considerations too sublime to touch, or be touched by, experience. 210 Discreet rationalists confined themselves to theology and allied branches of abtruse science, and to mathematics. 211 Rationalism would have been a doctrine reserved for academic specialists and abstract formalists had it not assumed the task of providing an apologetics for traditional morals and theology, thereby getting into touch with actual human beliefs and concerns. 212 It is notorious that historic empiricism was strong in criticism and in demolition of outworn beliefs, but weak for purposes of constructive social direction. 213 But we frequently overlook the fact that whenever rationalism cut free from conservative apologetics, it was also simply an instrumentality for pointing out inconsistencies and absurdities in existing beliefs-- a sphere in which it was immensely useful, as the Enlightenment shows. 214 Leibniz and Voltaire were contemporary rationalists in more senses than one.

215 The recognition that reflection is a genuine factor within experience and an indispensable factor in that control of the world which secures a prosperous and significant expansion of experience 216 undermines historic rationalism as assuredly as it abolishes the foundations of historic empiricism. 217 The

bearing of a correct idea of the place and office of reflection upon modern idealisms is less obvious, but no less certain.

218 One of the curiosities of orthodox empiricism is that its outstanding speculative problem is the existence of an "external world." 219 For in accordance with the notion that experience is attached to a private subject as its exclusive possession, a world like the one in which we appear to live must be "external" to experience instead of being its subject-matter. 220 I call it a curiosity, for if anything seems adequately grounded empirically it is the existence of a world which resists the characteristic functions of the subject of experience; 221 which goes its way, in some respects, independently of these functions, and which frustrates our hopes and intentions. 222 Ignorance which is fatal; disappointment; the need of adjusting means and ends to the course of Nature, would seem to be facts sufficiently characterising empirical situations as to render the existence of an external world indubitable.

223 That the description of experience was arrived at by forcing actual empirical facts into conformity with dialectic developments from a concept of a knower outside of the real world of Nature is testified to by the historic alliance of empiricism and idealism. 224 According to the most logically consistent editions of orthodox empiricism, all that can be experienced is the fleeting, the momentary, mental state. 225 That alone is absolutely and indubitably present; therefore, it alone is cognitively certain. It alone is 'knowledge'. 226 The existence of the past (and of the future), of a decently stable world and of other selves-- indeed, of one's own self-- falls outside this datum of experience. 227 These can be arrived at only by inference which is "ejective"-- a name given to an alleged type of inference that jumps from experience, as from a springboard, to something beyond experience.

228 I should not anticipate difficulty in showing that this doctrine is, dialectically, a mass of inconsistencies. 229 Avowedly it is a doctrine of desperation, and as

such it is cited here to show the desperate straits to which ignoring empirical facts has reduced a doctrine of experience. 230 More positively instructive are the objective idealisms which have been the offspring of the marriage between the "reason" of historic rationalism and the alleged immediate psychical stuff of historic empiricism. 231 These idealisms have recognised the genuineness of connexions and the impotency of "feeling." 232 They have then identified connexions with logical or rational connexions, and thus treated "the real World" as a synthesis of sentient consciousness by means of a rational self-consciousness introducing objectivity: stability and universality of reference.

233 Here again, for present purposes, criticism is unnecessary. It suffices to point out that the value of this theory is bound up with the genuineness of the problem of which it purports to be a solution. 234 If the basic concept is a fiction, there is no call for the solution. 235 The more important point is to perceive how far the "thought" which figures in objective idealism comes from meeting the empirical demands made upon actual thought. 236 Idealism is much less formal than historic rationalism. It treats thought, or reason, as constitutive of experience by means of uniting and constructive functions, not as just concerned with a realm of eternal truths apart from experience. 237 On such a view thought certainly loses its abstractness and remoteness. But, unfortunately, in thus gaining the whole world it loses its own self. 238 A world already, in its intrinsic structure, dominated by thought is not a world in which, save by contradiction of premises, thinking has anything to do.

239 That the doctrine logically results in making change unreal and error unaccountable are consequences of importance in the technique of professional philosophy; 240 in the denial of empirical fact which they imply they seem to many a '*reductio ad absurdum*' of the premises from which they proceed. But, after all, such consequences are of only professional import. 241 What is serious, even sinister, is the

implied sophistication regarding the place and office of reflection in the scheme of things. 242 A doctrine which exalts thought in name while ignoring its efficacy in fact (that is, its use in bettering life) is a doctrine which cannot be entertained and taught without serious peril.

243 Those who are not concerned with professional philosophy but who are solicitous for intelligence as a factor in the amelioration of actual conditions 244 can but look askance at any doctrine which holds that the entire scheme of things is already, if we but acquire the knack of looking at it aright, fixedly and completely rational. 245 It is a striking manifestation of the extent in which philosophies have been compensatory in quality. 246 But the matter cannot be passed over as if it were simply a question of not grudging a certain amount of consolation to one amid the irretrievable evils of life. 247 For as to these evils no one knows how many are retrievable; 248 and a philosophy which proclaims the ability of a dialectic theory of knowledge to reveal the world as already and eternally a self-luminous rational whole, contaminates the scope and use of thought at its very spring. 249 To substitute the otiose insight gained by manipulation of a formula for the slow coöperative work of a humanity guided by reflective intelligence is more than a technical blunder of speculative philosophers.

250 A practical crisis may throw the relationship of ideas to life into an exaggerated Brocken-like spectral relief, where exaggeration renders perceptible features not ordinarily noted. 251 The use of force to secure narrow because exclusive aims is no novelty in human affairs. 252 The deploying of all the intelligence at command in order to increase the effectiveness of the force used is not so common, yet presents nothing intrinsically remarkable. 253 The identification of force--military, economic, and administrative-- with moral necessity and moral culture is, however, a phenomenon not likely to exhibit itself on a wide scale 254 except where intelligence has already been suborned by an idealism which identifies "the

actual with the rational," and thus finds the measure of reason in the brute event determined by superior force. 255 If we are to have a philosophy which will intervene between attachment to rule of thumb muddling and devotion to a systematised subordination of intelligence to preëxistent ends, 256 it can be found only in a philosophy which finds the ultimate measure of intelligence in consideration of a desirable future and in search for the means of bringing it progressively into existence. 257 When professed idealism turns out to be a narrow pragmatism-- narrow because taking for granted the finality of ends determined by historic conditions-- 258 the time has arrived for a pragmatism which shall be empirically idealistic, proclaiming the essential connexion of intelligence with the unachieved future-- with possibilities involving a transfiguration.

IV

259 Why has the description of experience been so remote from the facts of empirical situations? 260 To answer this question throws light upon the submergence of recent philosophising in epistemology-- 261 that is, in discussions of the nature, possibility, and limits of knowledge in general, and in the attempt to reach conclusions regarding the ultimate nature of reality from the answers given to such questions.

262 The reply to the query regarding the currency of a non-empirical doctrine of experience (even among professed empiricists) is that the traditional account is derived from a conception once universally entertained regarding the subject or bearer or center of experience. 263 The description of experience has been forced into conformity with this prior conception; it has been primarily a deduction from it, actual empirical facts being poured into the moulds of the deductions. 264 The characteristic feature of this prior notion is the assumption that experience centers in, or gathers about, or proceeds from a center or subject which is outside the course of natural existence, and set over against it:-- 265 it

being of no importance, for present purposes, whether this antithetical subject is termed soul, or spirit, or mind, or ego, or consciousness, or just knower or knowing subject.

266 There are plausible grounds for thinking that the currency of the idea in question lies in the form which humans' religious preoccupations took for many centuries. 267 These were deliberately and systematically other-worldly. They centered about a Fall which was not an event in Nature, but an aboriginal catastrophe that corrupted Nature; 268 about a redemption made possible by supernatural means; about a life in another world--essentially, not merely spatially, Other. 269 The supreme drama of destiny took place in a soul or spirit which, under the circumstances, could not be conceived other than as non-natural-- extra-natural, if not, strictly speaking, supernatural. 270 When Descartes and others broke away from medieval interests, they retained as commonplaces its intellectual apparatus: 271 Such as, knowledge is exercised by a power that is extra-natural and set over against the world to be known. 272 Even if they had wished to make a complete break, they had nothing to put as knower in the place of the soul. 273 It may be doubted whether there was any available empirical substitute until science worked out the fact that physical changes are functional correlations of energies, and that human is continuous with other forms of life, 274 and until social life had developed an intellectually free and responsible individual as its agent.

275 But my main point is not dependent upon any particular theory as to the historic origin of the notion about the bearer of experience. 276 The point is there on its own account. The essential thing is that the bearer was conceived as outside of the world; 277 so that experience consisted in the bearer's being affected through a type of operations not found anywhere in the world, 278 while knowledge consists in surveying the world, looking at it, getting the view of a spectator.

279 The theological problem of attaining knowledge of God as

ultimate reality was transformed in effect into the philosophical problem of the possibility of attaining knowledge of reality. 280 For how is one to get beyond the limits of the subject and subjective occurrences? Familiarity breeds credulity oftener than contempt. 281 How can a problem be artificial when humans have been busy discussing it almost for three hundred years?

282 But if the assumption that experience is something set over against the world is contrary to fact, then the problem of how self or mind or subjective experience or consciousness can reach knowledge of an external world is assuredly a meaningless problem. 283 Whatever questions there may be about knowledge, they will not be the kind of problems which have formed epistemology.

284 The problem of knowledge as conceived in the industry of epistemology is the problem of knowledge 'in general'-- of the possibility, extent, and validity of knowledge in general. 285 What does this "in general" mean? In ordinary life there are problems a-plenty of knowledge in particular; every conclusion we try to reach, theoretical or practical, affords such a problem. 286 But there is no problem of knowledge in general. I do not mean, of course, that general statements cannot be made about knowledge, or that the problem of attaining these general statements is not a genuine one. 287 On the contrary, specific instances of success and failure in inquiry exist, and are of such a character that one can discover the conditions conducing to success and failure. 288 Statement of these conditions constitutes logic, and is capable of being an important aid in proper guidance of further attempts at knowing. 289 But this logical problem of knowledge is at the opposite pole from the epistemological. 290 Specific problems are about right conclusions to be reached-- which means, in effect, right ways of going about the business of inquiry. 291 They imply a difference between knowledge and error consequent upon right and wrong methods of inquiry and testing; not a difference between experience and the world. 292 The problem of knowledge 'überhaupt'

exists because it is assumed that there is a knower in general, who is outside of the world to be known, and who is defined in terms antithetical to the traits of the world. 293 With analogous assumptions, we could invent and discuss a problem of digestion in general. All that would be required would be to conceive the stomach and food-material as inhabiting different worlds. 294 Such an assumption would leave on our hands the question of the possibility, extent, nature, and genuineness of any transaction between stomach and food.

295 But because the stomach and food inhabit a continuous stretch of existence, because digestion is but a correlation of diverse activities in one world, the problems of digestion are specific and plural: 296 What are the particular correlations which constitute it? How does it proceed in different situations? What is favourable and what unfavourable to its best performance?-- and so on. 297 Can one deny that if we were to take our clue from the present empirical situation, including the scientific notion of evolution (biological continuity) and the existing arts of control of Nature, 298 subject and object would be treated as occupying the same natural world as unhesitatingly as we assume the natural conjunction of an animal and its food? 299 Would it not follow that knowledge is one way in which natural energies coöperate? 300 Would there be any problem save discovery of the peculiar structure of this coöperation, the conditions under which it occurs to best effect, and the consequences which issue from its occurrence?

301 It is a common-place that the chief divisions of modern philosophy, idealism in its different kinds, realisms of various brands, so-called common-sense dualism, agnosticism, relativism, phenomenalism, have grown up around the epistemological problem of the general relation of subject and object. 302 Problems not openly epistemological, such as whether the relation of changes in consciousness to physical changes is one of interaction, parallelism, or automatism have the same origin. 303 What becomes

of philosophy, consisting largely as it does of different answers to these questions, in case the assumptions which generate the questions have no empirical standing? 304 Is it not time that philosophers turned from the attempt to determine the comparative merits of various replies to the questions to a consideration of the claims of the questions?

305 When dominating religious ideas were built up about the idea that the self is a stranger and pilgrim in this world; 306 when morals, falling in line, found true good only in inner states of a self inaccessible to anything but its own private introspection; 307 when political theory assumed the finality of disconnected and mutually exclusive personalities, the notion that the bearer of experience is antithetical to the world instead of being in and of it was congenial. 308 It at least had the warrant of other beliefs and aspirations. But the doctrine of biological continuity or organic evolution has destroyed the scientific basis of the conception. 309 Morally, humans are now concerned with the amelioration of the conditions of the common lot in this world. 310 Social sciences recognise that associated life is not a matter of physical juxtaposition, but of genuine intercourse-- of community of experience in a non-metaphorical sense of community. 311 Why should we longer try to patch up and refine and stretch the old solutions till they seem to cover the change of thought and practice? Why not recognise that the trouble is with the problem?

312 A belief in organic evolution which does not extend unreservedly to the way in which the subject of experience is thought of, 313 and which does not strive to bring the entire theory of experience and knowing into line with biological and social facts, is hardly more than Pickwickian. 314 There are many, for example, who hold that dreams, hallucinations, and errors cannot be accounted for at all except on the theory that a self (or "consciousness") exercises a modifying influence upon the "real object." 315 The logical assumption is that consciousness is outside of the real object; 316 that it is something

different in kind, and therefore has the power of changing "reality" into appearance, of introducing "relativities" into things as they are in themselves-- in short, of infecting real things with subjectivity. 317 Such writers seem unaware of the fact that this assumption makes consciousness supernatural in the literal sense of the word; 318 and that, to say the least, the conception can be accepted by one who accepts the doctrine of biological continuity only after every other way of dealing with the facts has been exhausted.

319 Realists, of course (at least some of the Neo-realists), deny any such miraculous intervention of consciousness. But they admit the reality of the problem; 320 denying only this particular solution, they try to find some other way out, which will still preserve intact the notion of knowledge as a relationship of a general sort between subject and object. 321 Now dreams and hallucinations, errors, pleasures, and pains, possibly "secondary" qualities, do not occur save where there are organic centers of experience. They cluster about a subject. 322 But to treat them as things which inhere exclusively in the subject; or as posing the problem of a distortion of 'the' real object by a knower set over against the world, 323 or as presenting facts to be explained primarily as cases of contemplative knowledge, is to testify that one has still to learn the lesson of evolution in its application to the affairs in hand.

324 If biological development be accepted, the subject of experience is at least an animal, continuous with other organic forms in a process of more complex organisation. 325 An animal in turn is at least continuous with chemico-physical processes which, in living things, are so organised as really to constitute the activities of life with all their defining traits. 326 And experience is not identical with brain action; it is the entire organic agent-patient in all its interaction with the environment, natural and social. 327 The brain is primarily an organ of a certain kind of behaviour, not of knowing the world. 328 And to repeat what has already been said,

experiencing is just certain modes of interaction, of correlation, of natural objects among which the organism happens, so to say, to be one. 329 It follows with equal force that experience means primarily not knowledge, but ways of doing and suffering. 330 Knowing must be described by discovering what particular mode-- qualitatively unique-- of doing and suffering it is. 331 As it is, we find experience assimilated to a non-empirical concept of knowledge, derived from an antecedent notion of a spectator outside of the world.

332 In short, the epistemological fashion of conceiving dreams, errors, "relativities," etc., depends upon the isolation of mind from intimate participation with other changes in the same continuous nexus. 333 Thus it is like contending that when a bottle bursts, the bottle is, in some self-contained miraculous way, exclusively responsible. 334 Since it is the nature of a bottle to be whole so as to retain fluids, bursting is an abnormal event-- comparable to an hallucination. Hence it cannot belong to the "real" bottle; the "subjectivity" of glass is the cause. 335 It is obvious that since the breaking of glass is a case of specific correlation of natural energies, its accidental and abnormal character has to do with 'consequences', not with causation. 336 Accident is interference with the consequences for which the bottle is intended. The bursting considered apart from its bearing on these consequences is on a plane with any other occurrence in the wide world. 337 But from the standpoint of a desired future, bursting is an anomaly, an interruption of the course of events.

338 The analogy with the occurrence of dreams, hallucinations, etc., seems to me exact. 339 Dreams are not something outside of the regular course of events; they are in and of it. They are not cognitive distortions of real things; they are 'more' real things. 340 There is nothing abnormal in their existence, any more than there is in the bursting of a bottle. 341 But they may be abnormal, from the standpoint of their influence, of their operation as stimuli in calling out responses to modify the future.

342 Dreams have often been taken as prognostics of what is to happen; they have modified conduct. 343 A hallucination may lead a person to consult a doctor; such a consequence is right and proper. But the consultation indicates that the subject regarded it as an indication of consequences which one feared: as a symptom of a disturbed life. 344 Or the hallucination may lead one to anticipate consequences which in fact flow only from the possession of great wealth. 345 Then the hallucination is a disturbance of the normal course of events; the occurrence is wrongly 'used' with reference to eventualities.

346 To regard reference to use and to desired and intended consequences as involving a "subjective" factor is to miss the point, for this has regard to the future. 347 The uses to which a bottle are put are not mental; they do not consist of physical states; they are further correlations of natural existences. 348 Consequences in use are genuine natural events; but they do not occur without the intervention of behaviour involving anticipation of a future. 349 The case is not otherwise with an hallucination. The differences it makes are in any case differences in the course of the one continuous world. The important point is whether they are good or bad differences. 350 To use the hallucination as a sign of organic lesions that menace health means the beneficial result of seeing a physician; 351 to respond to it as a sign of consequences such as actually follow only from being persecuted is to fall into error-- to be abnormal. 352 The persecutors are "unreal"; that is, there are no things which act as persecutors act; but the hallucination exists. 353 Given its conditions it is as natural as any other event, and poses only the same kind of problem as is put by the occurrence of, say, a thunderstorm. 354 The "unreality" of persecution is not, however, a subjective matter; it means that conditions do not exist for producing the 'future' consequences which are now anticipated and reacted to. 355 Ability to anticipate future consequences and to respond to them as stimuli to present

behaviour may well 'define' what is meant by a mind or by "consciousness." 356 But this is only a way of saying just what kind of a real or natural existence the subject is; it is not to fall back on a preconception about an unnatural subject in order to characterise the occurrence of error.

357 Although the discussion may be already laboured, let us take another example-- the occurrence of disease. By definition it is pathological, abnormal. 358 At one time in human history this abnormality was taken to be something dwelling in the intrinsic nature of the event-- in its existence irrespective of future consequences. 359 Disease was literally extra-natural and to be referred to demons, or to magic. No one to-day questions its naturalness-- its place in the order of natural events. 360 Yet it is abnormal-- for it operates to effect results different from those which follow from health. The difference is a genuine empirical difference, not a mere mental distinction. 361 From the standpoint of bearing on a subsequent course of events disease is unnatural, in spite of the naturalness of its occurrence and origin.

362 The habit of ignoring reference to the future is responsible for the assumption that to admit human participation in any form is to admit the "subjective" in a sense which alters the objective into the phenomenal. 363 There have been those who, like Spinoza, regarded health and disease, good and ill, as equally real and equally unreal. 364 However, only a few consistent materialists have included truth along with error as merely phenomenal and subjective. 365 But if one does not regard movement toward possible consequences as genuine, wholesale denial of existential validity to all these distinctions is the only logical course. 366 To select truth as objective and error as "subjective" is, on this basis, an unjustifiably partial procedure. 367 Take everything as fixedly given, and both truth and error are arbitrary insertions into fact. 368 Admit the genuineness of changes going on, and capacity for its direction through organic action based on foresight, and both truth

and falsity are alike existential. 369 It is human to regard the course of events which is in line with our own efforts as the 'regular' course of events, and interruptions as abnormal, but this partiality of human desire is itself a part of what actually takes place.

370 It is now proposed to take a particular case of the alleged epistemological predicament for discussion, since the entire ground cannot be covered. 371 I think, however, the instance chosen is typical, so that the conclusion reached may be generalised. The instance is that of so-called relativity in perception. 372 There are almost endless instances; the stick bent in water; the whistle changing pitch with change of distance from the ear; objects doubled when the eye is pushed; the destroyed star still visible, etc., etc. 373 For our consideration we may take the case of a spherical object that presents itself to one observer as a flat circle, to another as a somewhat distorted elliptical surface. 374 This situation gives empirical proof, so it is argued, of the difference between a real object and mere appearance. Since there is but one object, the existence of two 'subjects' is the sole differentiating factor. 375 Hence the two appearances of the one real object is proof of the intervening distorting action of the subject. 376 And many of the Neo-realists who deny the difference in question, admit the case to be one of knowledge and accordingly to constitute an epistemological problem. 377 They have in consequence developed wonderfully elabourate schemes of sundry kinds to maintain "epistemological monism" intact.

378 Let us try to keep close to empirical facts. In the first place the two unlike appearances of the one sphere are physically necessary because of the laws of reaction of light. 379 If the one sphere did 'not' assume these two appearances under given conditions, we should be confronted with a hopelessly irreconcilable discrepancy in the behaviour of natural energy. 380 That the result is natural is evidenced by the fact that two cameras-- or other arrangements of apparatus for reflecting light-- yield precisely the same results.

381 Photographs are as genuinely physical existences as the original sphere; and they exhibit the two geometrical forms.

382 The statement of these facts makes no impression upon the confirmed epistemologist; he merely retorts that as long as it is admitted that the organism is the cause of a sphere being seen, 383 from different points, as a circular and as an elliptical surface, the essence of his contention-- the modification of the real object by the subject-- is admitted. 384 To the question why the same logic does not apply to photographic records he makes, as far as I know, no reply at all.

385 The source of the difficulty is not hard to see. The objection assumes that the alleged modifications of 'the' real object are cases of 'knowing' and hence attributable to the influence of a 'knower'. 386 Statements which set forth the doctrine will always be found to refer to the organic factor, to the eye, as an observer or a percipient. 387 Even when reference is made to a lens or a mirror, language is sometimes used which suggests that the writer's naïveté is sufficiently gross to treat these physical factors as if they were engaged in perceiving the sphere. 388 But as it is evident that the lens operates as a physical factor in correlation with other physical factors-- notably light-- so it ought to be evident that the intervention of the optical apparatus of the eye is a purely non-cognitive matter. 389 The relation in question is not one between a sphere and a would-be knower of it, unfortunately condemned by the nature of the knowing apparatus to alter the thing one would know; 390 it is an affair of the dynamic interaction of two physical agents in producing a third thing, an effect;-- 391 an affair of precisely the same kind as in any physical conjoint action, say the operation of hydrogen and oxygen in producing water. 392 To regard the eye as primarily a knower, an observer, of things, is as crass as to assign that function to a camera. 393 But unless the eye (or optical apparatus, or brain, or organism) be so regarded, there is absolutely no problem of observation or of knowledge in the case of the occurrence of elliptical

and circular surfaces. 394 Knowledge does not enter into the affair at all till 'after' these forms of refracted light have been produced. About them there is nothing unreal. 395 Light is really, physically, existentially, refracted into these forms. 396 If the same spherical form upon refracting light to physical objects in two quite different positions produced the same geometric forms, there would, indeed, be something to marvel at-- 397 as there would be if wax produced the same results in contact simultaneously with a cold body and with a warm one. 398 Why talk about 'the real' object in relation to 'a knower' when what is given is one real thing in dynamic connection with another real thing?

399 The way of dealing with the case will probably meet with a retort; at least, it has done so before. 400 It has been said that the account given above and the account of traditional subjectivism differ only verbally. 401 The essential thing in both, so it is said, is the admission that an activity of a self or subject or organism makes a difference in the real object. 402 Whether the subject makes this difference in the very process of knowing or makes it prior to the act of knowing is a minor matter; what is important is that the known thing has, by the time it is known, been "subjectified."

403 The objection gives a convenient occasion for summarising the main points of the argument. On the one hand, the retort of the objector depends upon talking about 'the' real object. 404 Employ the term "'a' real object," and the change produced by the activity characteristic of the optical apparatus is of just the same kind as that of the camera lens or that of any other physical agency. 405 Every event in the world marks a difference made to one existence in active conjunction with some other existence. 406 And, as for the alleged subjectivity, if subjective is used merely as an adjective to designate the specific activity of a particular existence, comparable, say, to the term feral, applied to tiger, or metallic, applied to iron, then of course reference to subjective is legitimate. 407 But it is also

tautological. It is like saying that flesh eaters are carnivorous. 408 But the term "subjective" is so consecrated to other uses, usually implying invidious contrast with objectivity (while subjective in the sense just suggested means specific mode 'of' objectivity), that it is difficult to maintain this innocent sense. 409 Its use in any disparaging way in the situation before us-- any sense implicating contrast with a real object-- assumes that the organism 'ought' not to make any difference when it operates in conjunction with other things. 410 Thus we run to earth that assumption that the subject is heterogeneous from every other natural existence; it is to be the one otiose, inoperative thing in a moving world-- our old assumption of the self as outside of things.

411 What and where is knowledge in the case we have been considering? Not, as we have already seen, in the production of forms of light having a circular and elliptical surface. 412 These forms are natural happenings. They may enter into knowledge or they may not, according to circumstances. 413 Countless such refractive changes take place without being noted. When they become subject-matter for knowledge, the inquiry they set on foot may take on an indefinite variety of forms. 414 One may be interested in ascertaining more about the structural peculiarities of the forms themselves; one may be interested in the mechanism of their production; one may find problems in projective geometry, or in drawing and painting-- all depending upon the specific matter-of-fact context. 415 The forms may be 'objectives' of knowledge-- of reflective examination-- or they may be means of knowing something else. 416 It may happen-- under some circumstances it does happen-- that the objective of inquiry is the nature of the geometric form which, when refracting light, gives rise to these other forms. 417 In this case the sphere is the thing known, and in this case, the forms of light are signs or evidence of the conclusion to be drawn. 418 There is no more reason for supposing that they 'are' (mis)knowledges of the sphere--

that the sphere is necessarily and from the start what one is trying to know-- 419 than for supposing that the position of the mercury in the thermometer tube is a cognitive distortion of atmospheric pressure. 420 In each case (that of the mercury and that of, say, a circular surface) the primary datum is a physical happening. 421 In each case it may be used, upon occasion, as a sign or evidence of the nature of the causes which brought it about. 422 Given the position in question, the circular form would be an intrinsically 'unreliable' evidence of the nature and position of the spherical body only in case it, as the direct datum of perception, were 'not' what it is-- a circular form.

423 I confess that all this seems so obvious that the reader is entitled to inquire into the motive for reciting such plain facts. 424 Were it not for the persistence of the epistemological problem it would be an affront to the reader's intelligence to dwell upon them. 425 But as long as such facts as we have been discussing furnish the subject-matter with which philosophising is peculiarly concerned, these commonplaces must be urged and reiterated. 426 They bear out two contentions which are important at the juncture, although they will lose special significance as soon as these are habitually recognised: 427 Negatively, a prior and non-empirical notion of the self is the source of the prevailing belief that experience as such is primarily cognitional-- a knowledge affair; 428 positively, 'knowledge is always a matter of the use that is made of experienced natural events', a use in which given things are treated as indications of what will be experienced under different conditions.

429 Let us make one effort more to clear up these points. Suppose it is a question of knowledge of water. The thing to be known does not present itself primarily as a matter of knowledge-and-ignorance at all. 430 It occurs as a stimulus to action and as the source of certain undergoings. It is something to react to:-- 431 to drink, to wash with, to put out fire with, and also something that reacts unexpectedly to our reactions, that makes us undergo disease, suffocation,

drowning. 432 In this twofold way, water or anything else enters into experience. Such presence in experience has of itself nothing to do with knowledge or consciousness; 433 nothing that is in the sense of depending upon them, though it has everything to do with knowledge and consciousness in the sense that the latter depends upon prior experience of this non-cognitive sort. 434 Human's experience is what it is because your response to things (even successful response) and the reactions of things to your life, are so radically different from knowledge. 435 The difficulties and tragedies of life, the stimuli to acquiring knowledge, lie in the radical disparity of presence-in-experience and presence-in-knowing. 436 Yet the immense importance of knowledge experience, the fact that turning presence-in-experience over into presence-in-a-knowledge-

experience is the sole mode of control of Nature, 437 has systematically hypnotised European philosophy since the time of Socrates into thinking that all experiencing is a mode of knowing, if not good knowledge, then a low-grade or confused or implicit knowledge.

438 When water is an adequate stimulus to action or when its reactions oppress and overwhelm us, it remains outside the scope of knowledge. 439 When, however, the bare presence of the thing (say, as optical stimulus) ceases to operate directly as stimulus to response 440 and begins to operate in connection with a forecast of the consequences it will effect when responded to, 441 it begins to acquire meaning-- to be known, to be an object. 442 It is noted as something which is wet, fluid, satisfies thirst, allays uneasiness, etc. 443 The conception that we begin with a known visual quality which is thereafter enlarged by adding on qualities apprehended by the other senses does not rest upon experience; 444 it rests upon making experience conform to the notion that every experience 'must' be a cognitive noting. 445 As long as the visual stimulus operates as a stimulus on its own account, there is no apprehension, no noting, of colour or light at all. 446 To much the greater portion of sensory

stimuli we react in precisely this wholly non-cognitive way. 447 In the attitude of suspended response in which consequences are anticipated, the direct stimulus becomes a sign or index of something else-- 448 and thus matter of noting or apprehension or acquaintance, or whatever term may be employed. 449 This difference (together, of course, with the consequences which go with it) is the difference which the natural event of knowing makes to the natural event of direct organic stimulation. 450 It is no change of a reality into an unreality, of an object into something subjective; it is no secret, illicit, or epistemological transformation; 451 it is a genuine acquisition of new and distinctive features through entering into relations with things with which it was not formerly connected-- namely, possible and future things.

452 But, replies some one so obsessed with the epistemological point of view that you assumes that the prior account is a rival epistemology in disguise, all this involves no change in Reality, no difference made to Reality. 453 Water was all the time all the things it is ever found out to be. Its real nature has not been altered by knowing it; any such alteration means a mis-knowing. 454 In reply let it be said,-- once more and finally,-- there is no assertion or implication about 'the' real object or 'the' real world or 'the' reality. 455 Such an assumption goes with that epistemological universe of discourse which has to be abandoned in an empirical universe of discourse. 456 The change is of 'a' real object. An incident of the world operating as a physiologically direct stimulus is assuredly a reality. 457 Responded to, it produces specific consequences in virtue of the response. 458 Water is not drunk unless somebody drinks it; it does not quench thirst unless a thirsty person drinks it-- and so on. 459 Consequences occur whether one is aware of them or not; they are integral facts in experience. 460 But let one of these consequences be anticipated and let it, as anticipated, become an indispensable element in the stimulus, and then there is a known object. 461 It is not that

knowing 'produces' a change, but that it 'is' a change of the specific kind described. 462 A serial process, the successive portions of which are as such incapable of simultaneous occurrence, is telescoped and condensed into an object, 463 a unified inter-reference of contemporaneous properties, most of which express potentialities rather than completed data.

464 Because of this change, an 'object' possesses truth or error (which the physical occurrence as such never has); 465 it is classifiable as fact or fantasy; it is of a sort or kind, expresses an essence or nature, possesses implications, etc., etc. 466 That is to say, it is marked by specifiable 'logical' traits not found in physical occurrences as such. 467 Because objective idealisms have seized upon these traits as constituting the very essence of Reality is no reason for proclaiming that they are ready-made features of physical happenings, 468 and hence for maintaining that knowing is nothing but an appearance of things on a stage for which "consciousness" supplies the footlights. 469 For only the epistemological predicament leads to "presentations" being regarded as cognitions of things which were previously unpresented. 470 In any empirical situation of everyday life or of science, knowledge signifies something stated or inferred of another thing. 471 Visible water is not a more less erroneous presentation of H_2O, but H_2O is a knowledge about the thing we see, drink, wash with, sail on, and use for power.

472 A further point and the present phase of discussion terminates. 473 Treating knowledge as a presentative relation between the knower and object makes it necessary to regard the mechanism of 'presentation' as constituting the act of knowing. 474 Since things may be presented in sense-perception, in recollection, in imagination and in conception, and since the mechanism in every one of these four styles of presentation is sensory-cerebral, the problem of knowing becomes a mind-body problem. 475 The psychological, or physiological, mechanism of presentation involved in seeing a chair, remembering what I ate

yesterday for luncheon, imagining the moon the size of a cart wheel, 476 conceiving a mathematical continuum is identified with the operation of knowing. 477 The evil consequences are twofold. The problem of the relation of mind and body has become a part of the problem of the possibility of knowledge in general, to the further complication of a matter already hopelessly constrained. 478 Meantime the actual process of knowing, namely, operations of controlled observation, inference, reasoning, and testing, the only process with 'intellectual' import, is dismissed as irrelevant to the theory of knowing. 479 The methods of knowing practised in daily life and science are excluded from consideration in the philosophical theory of knowing. 480 Hence the constructions of the latter become more and more elabourately artificial because there is no definite check upon them. 481 It would be easy to quote from epistemological writers statements to the effect that these processes (which supply the only empirically verifiable facts of knowing) are 'merely' inductive in character, or even that they are of purely psychological significance. 482 It would be difficult to find a more complete inversion of the facts than in the latter statement, since presentation constitutes in fact the psychological affair. 483 A confusion of logic with physiological physiology has bred hybrid epistemology, 484 with the amazing result that the technique of effective inquiry is rendered irrelevant to the theory of knowing, 485 and those physical events involved in the occurrence of data for knowing are treated as if they constituted the act of knowing.

V

486 What are the bearings of our discussion upon the conception of the present scope and office of philosophy? What do our conclusions indicate and demand with reference to philosophy itself? 487 For the philosophy which reaches such conclusions regarding knowledge and mind must apply them, sincerely and whole-heartedly, to its idea of its own nature. For philosophy claims to be one form or mode of

knowing. 488 If, then, the conclusion is reached that knowing is a way of employing empirical occurrences with respect to increasing power to direct the consequences which flow from things, the application of the conclusion must be made to philosophy itself. 489 It, too, becomes not a contemplative survey of existence nor an analysis of what is past and done with, but an outlook upon future possibilities with reference to attaining the better and averting the worse. 490 Philosophy must take, with good grace, its own medicine.

491 It is easier to state the negative results of the changed idea of philosophy than the positive ones. 492 The point that occurs to mind most readily is that philosophy will have to surrender all pretension to be peculiarly concerned with ultimate reality, or with reality as a complete (i.e., completed) whole: with 'the' real object. The surrender is not easy of achievement. 493 The philosophic tradition that comes to us from classic Greek thought and that was reinforced by Christian philosophy in the Middle Ages discriminates philosophical knowing from other modes of knowing by means of an alleged peculiarly intimate concern with supreme, ultimate, true reality. 494 To deny this trait to philosophy seems to many to be the suicide of philosophy; to be a systematic adoption of scepticism or agnostic positivism.

495 The pervasiveness of the tradition is shown in the fact that so vitally a contemporary thinker as Bergson, who finds a philosophic revolution involved in abandonment of the traditional identification of the truly real with the fixed (an identification inherited from Greek thought), 496 does not find it in his heart to abandon the counterpart identification of philosophy with search for the truly Real; 497 and hence finds it necessary to substitute an ultimate and absolute flux for an ultimate and absolute permanence. 498 Thus his great empirical services in calling attention to the fundamental importance of considerations of time for problems of life and mind get compromised with a mystic, non-empirical "Intuition"; 499 and

we find him preoccupied with solving, by means of his new idea of ultimate reality, the traditional problems of realities-in-themselves and phenomena, matter and mind, free-will and determinism, God and the world. 500 Is not that another evidence of the influence of the classic idea about philosophy?

501 Even the new realists are not content to take their realism as a plea for approaching subject-matter directly instead of through the intervention of epistemological apparatus; 502 they find it necessary first to determine the status of 'the' real object. Thus they too become entangled in the problem of the possibility of error, dreams, hallucinations, etc., in short, the problem of evil. 503 For I take it that an uncorrupted realism would accept such things as real events, and find in them no other problems than those attending the consideration of any real occurrence-- namely, problems of structure, origin, and operation.

504 It is often said that pragmatism, unless it is content to be a contribution to mere methodology, must develop a theory of Reality. 505 But the chief characteristic trait of the pragmatic notion of reality is precisely that no theory of Reality in general, 'überhaupt', is possible or needed. 506 It occupies the position of an emancipated empiricism or a thoroughgoing naïve realism. 507 It finds that "reality" is a 'denotative' term, a word used to designate indifferently everything that happens. 508 Lies, dreams, insanities, deceptions, myths, theories are all of them just the events which they specifically are. 509 Pragmatism is content to take its stand with science; for science finds all such events to be subject-matter of description and inquiry-- just like stars and fossils, mosquitoes and malaria, circulation and vision. 510 It also takes its stand with daily life, which finds that such things really have to be reckoned with as they occur interwoven in the texture of events.

511 The only way in which the term reality can ever become more than a blanket denotative term is through recourse to specific events in all their diversity and thatness.

512 Speaking summarily, I find that the retention by philosophy of the notion of a Reality feudally superior to the events of everyday occurrence is the chief source of the increasing isolation of philosophy from common sense and science. For the latter do not operate in any such region. 513 As with them of old, philosophy in dealing with real difficulties finds itself still hampered by reference to realities more real, more ultimate, than those which directly happen.

514 I have said that identifying the cause of philosophy with the notion of superior reality is the cause of an 'increasing' isolation from science and practical life. 515 The phrase reminds us that there was a time when the enterprise of science and the moral interests of humans both moved in a universe invidiously distinguished from that of ordinary occurrence. 516 While all that happens is equally real--since it really happens--happenings are not of equal worth. Their respective consequences, their import, varies tremendously. 517 Counterfeit money, although real (or rather 'because' real), is really different from valid circulatory medium, just as disease is really different from health; different in specific structure and so different in consequences. 518 In occidental thought, the Greeks were the first to draw the distinction between the genuine and the spurious in a generalised fashion and to formulate and enforce its tremendous significance for the conduct of life. 519 But since they had at command no technique of experimental analysis and no adequate technique of mathematical analysis, 520 they were compelled to treat the difference of the true and the false, the dependable and the deceptive, as signifying two kinds of existence, the truly real and the apparently real.

521 Two points can hardly be asserted with too much emphasis. 522 The Greeks were wholly right in the feeling that questions of good and ill, as far as they fall within human control, are bound up with discrimination of the genuine from the spurious, of "being" from what only pretends to be. 523 But because they lacked adequate instrumentalities for

coping with this difference in specific situations, they were forced to treat the difference as a wholesale and rigid one. 524 Science was concerned with vision of ultimate and true reality; opinion was concerned with getting along with apparent realities. 525 Each had its appropriate region permanently marked off. Matters of opinion could never become matters of science; their intrinsic nature forbade. 526 When the practice of science went on under such conditions, science and philosophy were one and the same thing. Both had to do with ultimate reality in its rigid and insuperable difference from ordinary occurrences.

527 We have only to refer to the way in which medieval life wrought the philosophy of an ultimate and supreme reality into the context of practical life 528 to realise that for centuries political and moral interests were bound up with the distinction between the absolutely real and the relatively real. 529 The difference was no matter of a remote technical philosophy, but one which controlled life from the cradle to the grave, from the grave to the endless life after death. 530 By means of a vast institution, which in effect was state as well as church, the claims of ultimate reality were enforced; means of access to it were provided. 531 Acknowledgment of The Reality brought security in this world and salvation in the next. 532 It is not necessary to report the story of the change which has since taken place. It is enough for our purposes to note that none of the modern philosophies of a superior reality, or 'the' real object, idealistic or realistic, 533 holds that its insight makes a difference like that between sin and holiness, eternal condemnation and eternal bliss. While in its own context the philosophy of ultimate reality entered into the vital concerns of humans, 534 it now tends to be an ingenious dialectic exercised in professorial corners by a few who have retained ancient premises while rejecting their application to the conduct of life.

535 The increased isolation from science of any philosophy identified with the problem of 'the' real is equally marked. 536 For the

growth of science has consisted precisely in the invention of an equipment, a technique of appliances and procedures, 537 which, accepting all occurrences as homogeneously real, proceeds to distinguish the authenticated from the spurious, the true from the false, by specific modes of treatment in specific situations. 538 The procedures of the trained engineer, of the competent physician, of the labouratory expert, have turned out to be the only ways of discriminating the counterfeit from the valid. 539 And they have revealed that the difference is not one of antecedent fixity of existence, but one of mode of treatment and of the consequences thereon attendant. 540 After humankind has learned to put its trust in specific procedures in order to make its discriminations between the false and the true, philosophy arrogates to itself the enforcement of the distinction at its own cost.

541 More than once, this essay has intimated that the counterpart of the idea of invidiously real reality is the spectator notion of knowledge. 542 If the knower, however defined, is set over against the world to be known, knowing consists in possessing a transcript, more or less accurate but otiose, of real things. 543 Whether this transcript is presentative in character (as realists say) or whether it is by means of states of consciousness which represent things (as subjectivists say), is a matter of great importance in its own context. 544 But, in another regard, this difference is negligible in comparison with the point in which both agree. Knowing is viewing from outside. 545 But if it be true that the self or subject of experience is part and parcel of the course of events, it follows that the self 'becomes' a knower. It becomes a mind in virtue of a distinctive way of partaking in the course of events. 546 The significant distinction is no longer between the knower 'and' the world; it is between different ways of being in and of the movement of things; between a brute physical way and a purposive, intelligent way.

547 There is no call to repeat in detail the statements which have

been advanced. Their net purport is that the directive presence of future possibilities in dealing with existent conditions is what is meant by knowing; 548 that the self becomes a knower or mind when anticipation of future consequences operates as its stimulus. 549 What we are now concerned with is the effect of this conception upon the nature of philosophic knowing.

550 As far as I can judge, popular response to pragmatic philosophy was moved by two quite different considerations. 551 By some it was thought to provide a new species of sanctions, a new mode of apologetics, for certain religious ideas whose standing had been threatened. 552 By others, it was welcomed because it was taken as a sign that philosophy was about to surrender its otiose and speculative remoteness; 553 that philosophers were beginning to recognise that philosophy is of account only if, like everyday knowing and like science, it affords guidance to action and thereby makes a difference in the event. 554 It was welcomed as a sign that philosophers were willing to have the worth of their philosophising measured by responsible tests.

555 I have not seen this point of view emphasised, or hardly recognised, by professional critics. The difference of attitude can probably be easily explained. 556 The epistemological universe of discourse is so highly technical that only those who have been trained in the history of thought think in terms of it. 557 It did not occur, accordingly, to non-technical readers to interpret the doctrine that the meaning and validity of thought are fixed by differences made in consequences and in satisfactoriness, to mean consequences in personal feelings. 558 Those who were professionally trained, however, took the statement to mean that consciousness or mind in the mere act of looking at things modifies them. 559 It understood the doctrine of test of validity by consequences to mean that apprehensions and conceptions are true if the modifications affected by them were of an emotionally desirable tone.

560 Prior discussion should have made it reasonably clear that the source of this misunderstanding lies in the neglect of temporal considerations. 561 The change made in things by the self in knowing is not immediate and, so to say, cross-sectional. It is longitudinal-- in the redirection given to changes already going on. 562 Its analogue is found in the changes which take place in the development of, say, iron ore into a watch-spring, not in those of the miracle of transubstantiation. 563 For the static, cross-sectional, non-temporal relation of subject and object, the pragmatic hypothesis substitutes apprehension of a thing in terms of the results in other things which it is tending to effect. 564 For the unique epistemological relation, it substitutes a practical relation of a familiar type:-- responsive behaviour which changes in time the subject-matter to which it applies. 565 The unique thing about the responsive behaviour which constitutes knowing is the specific difference which marks it off from other modes of response, namely, the part played in it by anticipation and prediction. 566 Knowing is the act, stimulated by this foresight, of securing and averting consequences. 567 The success of the achievement measures the standing of the foresight by which response is directed. 568 The popular impression that pragmatic philosophy means that philosophy shall develop ideas relevant to the actual crises of life, ideas influential in dealing with them and tested by the assistance they afford, is correct.

569 Reference to practical response suggests, however, another misapprehension. Many critics have jumped at the obvious association of the word pragmatic with practical. 570 They have assumed that the intent is to limit all knowledge, philosophic included, to promoting "action," 571 understanding by action either just any bodily movement, or those bodily movements which conduce to the preservation and grosser well-being of the body. 572 James' statement, that general conceptions must "cash in" has been taken (especially by European critics) to mean that the end and measure of intelligence

lies in the narrow and coarse utilities which it produces. 573 Even an acute American thinker, after first criticising pragmatism as a kind of idealistic epistemology, goes on to treat it as a doctrine which regards intelligence as a lubricating oil facilitating the workings of the body.

574 One source of the misunderstanding is suggested by the fact that "cashing in" to James meant that a general idea must always be capable of verification in specific existential cases. 575 The notion of "cashing in" says nothing about the breadth or depth of the specific consequences. 576 As an empirical doctrine, it could not say anything about them in general; the specific cases must speak for themselves. 577 If one conception is verified in terms of eating beefsteak, and another in terms of a favourable credit balance in the bank, that is not because of anything in the theory, but because of the specific nature of the conceptions in question, and because there exist particular events like hunger and trade. 578 If there are also existences in which the most liberal esthetic ideas and the most generous moral conceptions can be verified by specific embodiment, assuredly so much the better. 579 The fact that a strictly empirical philosophy was taken by so many critics to imply an 'a priori' dogma about the kind of consequences capable of existence is evidence, 580 I think, of the inability of many philosophers to think in concretely empirical terms. 581 Since the critics were themselves accustomed to get results by manipulating the concepts of "consequences" and of "practice," they assumed that even a would-be empiricist must be doing the same sort of thing. 582 It will, I suppose, remain for a long time incredible to some that a philosopher should really intend to go to specific experiences to determine of what scope and depth practice admits, and what sort of consequences the world permits to come into being. 583 Concepts are so clear; it takes so little time to develop their implications; experiences are so confused, and it requires so much time and energy to lay hold of them. 584 And yet these same critics charge pragmatism with

adopting subjective and emotional standards!

585 As a matter of fact, the pragmatic theory of intelligence means that the function of mind is to project new and more complex ends-- to free experience from routine and from caprice. 586 Not the use of thought to accomplish purposes already given either in the mechanism of the body or in that of the existent state of society, but the use of intelligence to liberate and liberalise action, is the pragmatic lesson. 587 Action restricted to given and fixed ends may attain great technical efficiency; but efficiency is the only quality to which it can lay claim. 588 Such action is mechanical (or becomes so), no matter what the scope of the preformed end, be it the Will of God or 'Kultur'. 589 But the doctrine that intelligence develops within the sphere of action for the sake of possibilities not yet given is the opposite of a doctrine of mechanical efficiency. 590 Intelligence 'as' intelligence is inherently forward-looking; only by ignoring its primary function does it become a mere means for an end already given. 591 The latter 'is' servile, even when the end is labeled moral, religious, or esthetic. 592 But action directed to ends to which the agent has not previously been attached inevitably carries with it a quickened and enlarged spirit. 593 A pragmatic intelligence is a creative intelligence, not a routine mechanic.

594 All this may read like a defense of pragmatism by one concerned to make out for it the best case possible. Such is not, however, the intention. 595 The purpose is to indicate the extent to which intelligence frees action from a mechanically instrumental character. 596 Intelligence is, indeed, instrumental 'through' action to the determination of the qualities of future experience. 597 But the very fact that the concern of intelligence is with the future, with the as-yet-unrealised (and with the given and the established only as conditions of the realisation of possibilities), makes the action in which it takes effect generous and liberal; free of spirit. 598 Just that action which extends and approves intelligence has an

intrinsic value of its own in being instrumental:-- the intrinsic value of being informed with intelligence in behalf of the enrichment of life. 599 By the same stroke, intelligence becomes truly liberal: 600 knowing is a human undertaking, not an esthetic appreciation carried on by a refined class or a capitalistic possession of a few learned specialists, whether people of science or of philosophy.

601 More emphasis has been put upon what philosophy is not than upon what it may become. But it is not necessary, it is not even desirable, to set forth philosophy as a scheduled program. 602 There are human difficulties of an urgent, deep-seated kind which may be clarified by trained reflection, and whose solution may be forwarded by the careful development of hypotheses. 603 When it is understood that philosophic thinking is caught up in the actual course of events, having the office of guiding them towards a prosperous issue, problems will abundantly present themselves. 604 Philosophy will not solve these problems; philosophy is vision, imagination, reflection-- and these functions, apart from action, modify nothing and hence resolve nothing. 605 But in a complicated and perverse world, action which is not informed with vision, imagination, and reflection, is more likely to increase confusion and conflict than to straighten things out. 606 It is not easy for generous and sustained reflection to become a guiding and illuminating method in action. 607 Until it frees itself from identification with problems which are supposed to depend upon Reality as such, or its distinction from a world of Appearance, or its relation to a Knower as such, the hands of philosophy are tied. 608 Having no chance to link its fortunes with a responsible career by suggesting things to be tried, it cannot identify itself with questions which actually arise in the vicissitudes of life. 609 Philosophy recovers itself when it ceases to be a device for dealing with the problems of philosophers and becomes a method, cultivated by philosophers, for dealing with the problems of humans.

INTELLIGENCE

610 Emphasis must vary with the stress and special impact of the troubles which perplex humans. Each age knows its own ills, and seeks its own remedies. 611 One does not have to forecast a particular program to note that the central need of any program at the present day is an adequate conception of the nature of intelligence and its place in action. 612 Philosophy cannot disavow responsibility for many misconceptions of the nature of intelligence which now hamper its efficacious operation. It has at least a negative task imposed upon it. 613 It must take away the burdens which it has laid upon the intelligence of the common person in struggling with own individual difficulties. 614 It must deny and eject that intelligence which is naught but a distant eye, registering in a remote and alien medium the spectacle of Nature and life. 615 To enforce the fact that the emergence of imagination and thought is relative to the connexion of the sufferings of humans with their doings is of itself to illuminate those sufferings and to instruct those doings. 616 To catch mind in its connexion with the entrance of the novel into the course of the world is to be on the road to see that intelligence is itself the most promising of all novelties, 617 the revelation of the meaning of that transformation of past into future which is the reality of every present. 618 To reveal intelligence as the organ for the guidance of this transformation, the sole director of its quality, is to make a declaration of present untold significance for action. 619 To elabourate these convictions of the connexion of intelligence with what humans undergo because of their doings and with the emergence and direction of the creative, the novel, in the world is of itself a program which will keep philosophers busy until something more worth while is forced upon them. 620 For the elabouration has to be made through application to all the disciplines which have an intimate connexion with human conduct:-- to logic, ethics, esthetics, economics, and the procedure of the sciences formal and natural.

621 I also believe that there is a genuine sense in which the

enforcement of the pivotal position of intelligence in the world and thereby in control of human fortunes (so far as they are manageable) is the peculiar problem in the problems of life which come home most closely to ourselves. 622 It is easy to be foolish about the connexion of thought with national life. But I do not see how any one can question the distinctively national colour of English, or French, or German philosophies. 623 And if of late the history of thought has come under the domination of the German dogma of an inner evolution of ideas, 624 it requires but a little inquiry to convince oneself that that dogma itself testifies to a particularly nationalistic need and origin. 625 I believe that philosophy in America will be lost between chewing a historic cud long since reduced to woody fiber, 626 or an apologetics for lost causes (lost to natural science), or a scholastic, schematic formalism, 627 unless it can somehow bring to consciousness America's own needs and its own implicit principle of successful action.

628 This need and principle, I am convinced, is the necessity of a deliberate control of policies by the method of intelligence, 629 an intelligence which is not the faculty of intellect honoured in text-books and neglected elsewhere, 630 but which is the sum-total of impulses, habits, emotions, records, and discoveries which forecast what is desirable and undesirable in future possibilities, and which contrive ingeniously in behalf of imagined good. 631 Our life has no background of sanctified categories upon which we may fall back; we rely upon precedent as authority only to our own undoing-- 632 for with us there is such a continuously novel situation that final reliance upon precedent entails some class interest guiding us by the nose whither it will. 633 British empiricism, with its appeal to what has been in the past, is, after all, only a kind of 'a priorism'. 634 For it lays down a fixed rule for future intelligence to follow; and only the immersion of philosophy in technical learning prevents our

seeing that this is the essence of 'a priorism'.

635 We pride ourselves upon being realistic, desiring a hardheaded cognisance of facts, and devoted to mastering the means of life. 636 We pride ourselves upon a practical idealism, a lively and easily moved faith in possibilities as yet unrealised, in willingness to make sacrifice for their realisation. 637 Idealism easily becomes a sanction of waste and carefulness, and realism a sanction of legal formalism in behalf of things as they are-- the rights of the possessor. 638 We thus tend to combine a loose and ineffective optimism with assent to the doctrine of take who take can: a deification of power. 639 All peoples at all times have been narrowly realistic in practice and have then employed idealisation to cover up in sentiment and theory their brutalities. 640 But never, perhaps, has the tendency been so dangerous and so tempting as with ourselves. 641 Faith in the power of intelligence to imagine a future which is the projection of the desirable in the present, and to invent the instrumentalities of its realisation, is our salvation. 642 And it is a faith which must be nurtured and made articulate: surely a sufficiently large task for our philosophy.

REFORMATION OF LOGIC

Addison W. Moore

I

2 In a general survey of the development of logical theory one is struck by the similarity, not to say identity, of the indictments which reformers, since the days of Aristotle, have brought against it. 2 The most fundamental of these charges are: first, that the theory of logic has left it formal and with little significance for the advancement of science and the conduct of society; 3 second, that it has great difficulty in avoiding the predicament of logical operations that are merely laboured reproductions of non-logical activities and therefore tautologous and trifling, 4 or of logical operations that are so far removed from immediate, non-logical experience that they are irrelevant; 5 third, that logical

theory has had trouble in finding room in its own household for both truth and error; each crowds out the other.

6 The identity of these indictments regardless of the general philosophical faith, empiricism, or rationalism, realism, or idealism to which the reformer or the logic to be reformed has belonged, 7 suggests that whatever the differences in the doctrines of these various philosophic traditions, they possess a common ground from which these common difficulties spring.

8 It is the conviction of a number who are at present attempting to rid logic of these ancient disabilities that their common source is to be found in a lack of continuity 9 between the acts of intelligence (or to avoid the dangers of hypostasis, intelligent acts) and other acts; between logical conduct and other conduct. 10 So wide, indeed, is this breach, that often little remains of the act of knowing but the name. 11 It may still be called an act, but it has no describable instruments nor technique of operation. It is an indefinable and often mystical performance of which only the results can be stated. 12 In recent logical discussion this techniqueless act of knowing has been properly enough transformed into an indefinable "external relation" in which an entity called a knower stands to another entity called the known.

13 For many centuries this breach between the operations of intelligence and other operations has been closed by various metaphysical devices 14 with the result that logic has been a hybrid science,-- half logic, half metaphysics and epistemology. 15 So great has been the momentum of the metaphysical tradition that long after we have begun to discover the connection between logical and non-logical operations its methods remain to plague us. 16 Efforts to heal the breach without a direct appeal to metaphysical agencies have been made by attempting a complete logicising of all operations. 17 But besides requiring additional metaphysics to effect it, the procedure is as fatal to continuity as is an impassable disjunction. 18 Continuity demands distinction as

well as connection. It requires the development, the 'growth' of old material and functions into new forms.

19 Driven by the difficulties of this complete logicisation, which are as serious as those of isolation, logical theory was obliged to reinstate some sort of distinction. 20 This it did by resorting to the categories of "explicit" and "implicit." 21 All so-called non-logical operations were regarded as "implicitly" logical. And, paradoxically, logical operations had for their task the transformation of the implicit into the explicit.

22 An adequate account of the origin and continuance of this isolation of the conduct of intelligence from other conduct is too long a story to be told here. 23 Suffice it to recall that in the society in which the distinction between immediate and reflective experience, between opinion and science, between percepts and universals was first made, 24 intelligence was largely the possession of a special and privileged class removed in great measure from hand-to-hand contact with Nature and with much of society. 25 Because it did not fully participate in the operations of Nature and society, intelligence could not become fully domesticated, i.e., fully naturalised and socialised in its world. It was a charmed spectator of the cosmic and social drama. 26 Doubtless when Greek intelligence discovered the distinction between immediate and reflective experience-- possibly the most momentous discovery in history-- "the world," as Kant says of the speculations of Thales, "must suddenly have appeared in a new light." 27 But not recognising the full significance of this discovery, ideas, universals, became but a wondrous spectacle for the eye of reason. 28 They brought, to be sure, blessed relief from the bewildering and baffling flux of perception. But it was the relief of sanctuary, not of victory.

29 That the brilliant speculations of Greek intelligence were barren because there was no technique for testing and applying them in detail is an old story. 30 But it is merely a restatement, not a solution, of the pertinent question. This is: why

did not Greek intelligence develop such a technique? 31 The answer lies in the fact that the technique of intelligence is to be found precisely in the details of the operations of Nature and of human conduct from which an aristocratic intelligence is always in large measure shut off. 32 Intelligence cannot operate fruitfully in a vacuum. It must be incarnate. It must, as Hegel said, have "hands and feet." 33 When we turn to the history of modern science the one thing that stands out is that it was not until the point was reached where intelligence was ready (continuing the Hegelian figure) to thrust its hands into the vitals of Nature and society that it began to acquire a real control over its operations.

34 In default of such controlling technique there was nothing to be done with this newly found instrument of intelligence-- the universal-- but to retain it as an object of contemplation and of worshipful adoration. 35 This involved, of course, its hypostasis as the metaphysical reality of supreme importance. With this, the only difference between "opinion" and "science" became one of the kind of objects known. 36 That universals were known by reason and particulars by sense was of little more logical significance than that sounds are known by the ear and smells by the nose. 37 Particulars and universals were equally given. If the latter required some abstraction this was regarded as merely auxiliary to the immediate vision, as sniffing is to the perception of odour. 38 That universals should or could be conceived as experimental, as hypotheses, was, when translated into later theology, the sin against the Holy Ghost.

39 However, the fact that the particulars in the world of opinion were the stimuli to the "recollection" of universals and that the latter in turn were the patterns, 40 the forms, for the particulars, opened the way in actual practice for the exercise of a great deal of the controlling function of the universals. 41 But the failure to recognise this control value of the universal as fundamental, made it necessary for the universal to exercise its function surreptitiously, in the

disguise of a pattern and in the clumsy garb of imitation and participation.

42 With perceptions, desires, and impulses relegated to the world of opinion and shadows, and with the newly discovered instrument of knowledge turned into an object, 43 the knower was stripped of all your knowing apparatus and was left an empty, scuttled entity definable and describable only as "a knower." 44 The knower must know, even if you had nothing to know with. Hence the mystical almost indefinable character of the knowing act or relation. 45 I say "almost indefinable"; for as an act it had, of course, to have some sort of conceptualised form. And this form vision naturally furnished. 46 "Naturally," because intelligence was so largely contemplative, and vision so largely immediate, unanalysed, and diaphanous. 47 There was, to be sure, the concept of effluxes. But this was a statement of the fact of vision in terms of its results, not of the process itself. 48 Thus it was that the whole terminology of knowing which we still use was moulded and fixed upon a very crude conception of one of the constituents of its process. 49 There can be no doubt that this terminology has added much to the inertia against which the advance of logical theory has worked. 50 It would be interesting to see what would be the effect upon logical theory of the substitution of an auditory or olfactory terminology for visual; 51 or of a visual terminology revised to agree with modern scientific analysis of the 'act' of vision as determined by its connections with other functions.

52 With the act of knowing stripped of its technique and left a bare, unique, indescribable act or relation, the foundations for epistemological and metaphysical logic were laid. 53 That Greek logic escaped the ravages of epistemology was due to the saving materialism in its metaphysical conception of mind and to the steadfastness of the aristocratic régime. 54 But when medieval theology and Cartesian metaphysics had destroyed the last remnant of metaphysical connection between the knowing mind and Nature, 55 and when revolutions had torn the individual

from your social moorings, the stage for epistemological logic was fully set. 56 I do not mean to identify the epistemological situation with the Cartesian disjunction. That disjunction was but the metaphysical expression of the one which constitutes the real foundation of epistemology-- 57 the disjunction, namely, between the act of knowing and other acts.

58 From this point logic has followed one of two general courses. It has sought continuity by attempting to reduce non-logical things and operations to terms of logical operations, i.e., to sensations or universals or both; 59 or it has attempted to exclude entirely the act of knowing from logic and to transfer logical distinctions and operations, and even the attributes of truth and error to objects 60 which, significantly enough, are still composed of these same hypostatised logical processes. 61 The first course results in an epistemological logic of some form of the idealistic tradition, rationalism, sensationalism, or transcendentalism, depending upon whether universals, or sensations, or a combination of both, is made fundamental in the constitution of the object. 62 The second course yields an epistemological logic of the realistic type,-- again, sensational or rationalistic (mathematical), or a combination of the two-- a sort of realistic transcendentalism. 63 Each type has essentially the same difficulties with the processes of inference, with the problem of change, with truth and error, and, on the ethical side, with good and evil.

64 With the processes of knowing converted into objects, and with the act of knowing reduced to a unique and external relation between the despoiled knower and the objects made from its own hypostatised processes, all knowing becomes in the end immediate. 65 All attempts at an inference that is anything more than an elabourated and often confused restatement of non-logical operations break down. 66 The associational inference of empiricism, the subsumptive inference of rationalism, the transcendental inference of objective idealism, the analytical

inference of neo-realism-- all alike face the dilemma of an inference that is trifling or miraculous, tautologous or false. 67 Where the knower and its object are so constituted that the only relation in which the latter can stand to the former is that of presence or absence, 68 and if to be present is to be known, how, as Plato asked, can there be any false knowing?

69 For those who accept the foregoing general diagnosis the prescription is obvious. 70 The present task of logical theory is the restoration of the continuity of the act and agent of knowing with other acts and agents. 71 But this is not to be done by merely furnishing the act of knowing with a body and a nervous system. If the nervous system be regarded as only an onlooking, beholding nervous system, 72 if no connection be made between the logical operations of a nervous system and its other operations, a nervous system has no logical advantage over a purely psychical mind.

73 It was to be expected that this movement toward restoration of continuity made in the name of "instrumental" or "experimental" logic would be regarded, alike, 74 by the logics of rationalism and empiricism, of idealism and of realism, as an attempt to rob intelligence of its own unique and proper character; 75 to reduce it to a merely "psychological" and "existential" affair; to leave no place for genuine intellectual interest and activity; and to make science a series of more or less respectable adventures. 76 The counter thesis is, that this restoration is truly a restoration-- not a despoliation of the character and rights of intelligence; 77 that only such a restoration can preserve the unique function of intelligence, can prevent it from becoming merely "existential," and can provide a distinct place for intellectual and scientific interest and activity. 78 It does not, however, promise to remove the stigma of "adventure" from science. Every experiment is an adventure; 79 and it is precisely the experimental character of scientific logic that distinguishes it from scholasticism, medieval or modern.

II

80 First it is clear that a reform of logic based upon the restoration of knowing to its connections with other acts will begin with a chapter containing an account of these other operations and the general character of this connection. 81 Logical theory has been truncated. It has tried to begin and end in the middle, with the result that it has ended in the air. 82 Logic presents the curious anachronism of a science which attempts to deal with its subject-matter apart from what it comes from and what comes from it.

83 The objection that such a chapter on the conditions and genesis of the operations of knowing belongs to psychology, only shows how firmly fixed is the discontinuity we are trying to escape. 84 As we have seen, the original motive for leaving this account of the Bible book of Genesis to psychology was that the act of knowing was supposed to originate in a purely psychical mind. 85 Such an origin was of course embarrassing to logic, which aimed to be scientific. 86 The old opposition between origin and validity was due to the kind of origin assumed and the kind of validity necessitated by the origin. 87 One may well be excused for evading the question of how ideas, originated in a purely psychical mind, can, in Kant's phrase, "have objective validity," by throwing out the question of origin altogether. 88 Whatever difficulties remain for validity after this expulsion could not be greater than those of the task of combining the objective validity of ideas with their subjective origin.

89 The whole of this chapter on the connection between logical and non-logical operations cannot be written here. But its central point would be that these other acts with which the act of knowing must have continuity are just the operations of our unreflective conduct. 90 Note that it is "unreflective," not "unconscious," nor yet merely "instinctive" conduct. It is our perceptive, remembering, imagining, desiring, loving, hating conduct. 91 Note also that we do not say "psychical" or "physical," nor "psycho-physical" conduct. These terms stand for certain distinctions in

logical conduct, 92 and we are here concerned with the character of non-logical conduct which is to be distinguished from, and yet kept in closest continuity with, logical conduct.

93 If, here, the metaphysical logician should ask: "Are you not in this assumption of a world of reflective and unreflective conduct and affection, and of a world of beings in interaction, begging a whole system of metaphysics?" 94 the reply is that if it is a metaphysics bad for logic, it will keep turning up in the course of logical theory as a constant source of trouble. 95 On the other hand, if logic encounters grave difficulties when it attempts to get on without it, its assumption, for the purposes of logic, has all the justification possible.

96 Again it will be urged that this alleged non-logical conduct, in so far as it involves perception, memory, and anticipation, is already cognitive and logical; 97 or if the act of knowing is to be entirely excluded from logic, then, in so far as what is left involves objective "terms and relations," it, also, is already logical. 98 And it may be thought strange that a logic based upon the restoration of continuity between the act of knowing and other acts should here be insisting on distinction and separation. 99 The point is fundamental; and must be disposed of before we go on. First, we must observe that the unity secured by making all conscious conduct logical turns out, on examination, to be more nominal than real. 100 As we have already seen, this attempt at a complete logicising of all conduct is forced at once to introduce the distinction of "explicit" and "implicit," of "conscious and unconscious" or "subconscious" logic. 101 Some cynics have found that this suggests dividing triangles into explicit and implicit triangles, or into triangles and sub-triangles.

102 Doubtless the attempt to make all perceptions, memories, and anticipations, and even instincts and habits, into implicit or subconscious inference is an awkward effort to restore the continuity of logical and non-logical conduct. 103 Its awkwardness consists in attempting to secure this

continuity by the method of subsumptive identity, instead of finding it in a transitive continuity of function;-- 104 instead of seeing that perception, memory, and anticipation 'become' logical processes when they are employed in a process of inquiry, 105 whose purpose is to relieve the difficulties into which these operations in their function as direct stimuli have fallen. 106 Logical conduct is constituted by the coöperation of these processes for the improvement of their further operation. 107 To regard perception, memory, and imagination as implicit forms or as sub-species of logical operation is much like conceiving the movements of our fingers and arms as implicit or imperfect species of painting, or swimming.

108 Moreover, this doctrine of universal logicism teaches that when that which is perfect is come, imperfection shall be done away. 109 This should mean that when painting becomes completely "explicit" and perfect, fingers and hands shall disappear. Perfect painting will be the pure essence of painting. 110 And this interpretation is not strained; for this logic expressly teaches that in the perfected real system all temporal elements are unessential to logical operations. 111 They are, of course, 'psychologically' necessary for finite beings, who can never have perfectly logical experiences. 112 But, from the standpoint of a completely logicised experience, all finite, temporal processes are accidents, not essentials, of logical operations.

113 The fact that the processes of perception, memory, and anticipation are transformed in their logical operation into sensations and universals, terms, and relations, and, as such, become the subject-matter of logical theory, 114 does not mean that they have lost their mediating character, and have become merely objects of logical contemplation at large. 115 Sensations or sense-data, and ideas, terms and relations, are the subject-matter of logical theory for the reason that they sometimes succeed and sometimes fail in their logical operations. 116 And it is the business of logical theory to

diagnose the conditions of this success and failure. 117 If, in writing, my pen becomes defective and is made an object of inquiry, it does not therefore lose all its character as a pen and become merely an object at large. It is 'as' an instrument of writing that it is investigated. 118 So, sense-data, universals, terms, and relations as subject-matter of logic are investigated in their character 'as' mediators of the ambiguities and conflicts, of non-logical experience.

119 If the operations of habit, instinct, perceptions, memory, and anticipation 'become' logical, when, instead of operating as direct stimuli, they are employed in a process of inquiry, we must next ask: 120 (1) under what conditions do they pass over into this process of inquiry? (2) what modifications of operation do they undergo, what new forms do they take, and what new results do they produce in their logical operations?

121 If the act of inquiry be not superimposed, it must arise out of some specific condition in the course of non-logical conduct. 122 Once more, if the alarm be sounded at this proposal to find the origin of logical in non-logical operations it must be summarily answered by asking if the one who raises the cry finds it impossible to imagine that one who is not hungry, or angry, or patriotic, or wise may become so. 123 Non-logical conduct is not the abstract formal contradictory of logical conduct any more than present satiety or foolishness is the contradictory of later hunger or wisdom, 124 or than anger at one person contradicts cordiality to another, or to the same person, later. 125 The old bogie of the logical irrelevance of origin was due to the inability to conceive continuity except in the form of identity in which there was no place for the notion of 'growth'.

126 The conditions under which non-logical conduct 'becomes' logical are familiar to those who have followed the doctrines of experimental logic as expounded in the discussions of the past few years. 127 The transformation begins at the point where non-logical processes instead of operating as direct unambiguous

stimuli and response become ambiguous with consequent inhibition of conduct. 128 But again this does not mean that at this juncture the non-logical processes quit the field and give place to a totally new faculty and process called reason. They stay on the job. 129 But there is a change in the job, which now is to get rid of this ambiguity. This modification of the task requires, of course, corresponding modification and adaptation of these operations. 130 They take on the form of sensations and universals, terms and relations, data and hypotheses. This modification of function and form constitutes "reason" or, better, reasoning.

131 Here some one will ask, "Whence comes this ambiguity? How can a mere perception or memory as such be ambiguous? Must it not be ambiguous to, or for, something, or some one?" 132 The point is well taken. But it should not be taken to imply that the ambiguity is for a merely onlooking, beholding psychical mind-- especially when the perception is itself regarded as an act of beholding. 133 Nor are we any better off if we suppose the beholding mind to be equipped with a faculty of reason in the form of the principle of "contradiction." For this throws no light on the origin and meaning of ambiguity. 134 And if we seek to make all perceptions as such ambiguous and contradictory, in order to make room for, and justify, the operations of reason, other difficulties at once beset us. 135 When we attempt to remove this specific ambiguity of perceptive conduct we shall be forced, before we are through, to appeal back to perception, which we have condemned as inherently contradictory, both for data and for verification.

136 However, the insistence that perception must be ambiguous to, or for, something beyond itself is well grounded. And this was recognised in the statement that it is equivocal as a stimulus in conduct. 137 There need be no mystery as to how such equivocation arises. That there is such a thing as a conduct at all means that there are certain beings who have acquired definite ways

of responding to one another. 138 It is important to observe that these forms of interaction-- instinct and habit, perception, memory, etc.-- are not to be located in either of the interacting beings but are functions of both. 139 The conception of these operations as the private functions of an organism is the forerunner of the epistemological predicament. 140 It results in a conception of knowing as wholly the act of a knower apart from the known. This is the beginning of epistemology.

141 But to whatever extent interacting beings have acquired definite and specific ways of behaviour toward one another it is equally plain-- 142 the theory of external relations notwithstanding-- that in this process of interaction these ways of behaviour, of stimulus and response, undergo modification. 143 If the world consisted of two interacting beings, it is conceivable that the modifications of behaviour might occur in such close continuity of relation to each of the interacting beings that the adjustment would be very continuous, and there might be little or no ambiguity and conflict. 144 But in a world where any two interacting beings have innumerable interactions with innumerable other beings and in all these interactions modifications are effected, 145 it is to be expected that changes in the behaviour of each or both will occur, so marked that they are bound to result in breaks in the continuity of stimulus and response-- even to the point of tragedy. 146 However, the tragedy is seldom so great that the ambiguity extends to the whole field of conduct. Except in extreme pathological cases (and in epistemology), complete scepticism and aboulia do not occur. 147 Ambiguity always falls within a field or direction of conduct, and though it may extend much further, and must extend some further than the point at which equivocation occurs, yet it is never ubiquitous. 148 An ambiguity concerning the action of gravitation is no less specific than one regarding colour or sound; indeed, the one may be found to involve the other.

149 Logical conduct is, then, conduct which aims to remove ambiguity and inhibition in unreflective conduct. 150 The instruments of its operation are forged from the processes of unreflective conduct by such modification and adaptation as is required to enable them to accomplish this end. 151 Since these logical operations sometimes fail and sometimes succeed they become the subject-matter of logical theory. 152 But the technique of this second involution of reflection is not supplied by some new and unique entity. It also is derived from modifications of previous operations of both reflective and non-reflective conduct.

153 While emphasising the continuity between non-logical and logical operations, we must keep in mind that their distinction is of equal importance. 154 Confusion at this point is fatal. A case in point is the confusion between non-logical and logical observation. 155 The results of non-logical observation, e.g., looking and listening, are direct stimuli to further conduct. 156 But the purpose and result of 'logical' observation are to secure data, not as direct stimuli to immediate conduct 157 but as stimuli to the construction or verification of hypotheses which are the responses of the 'logical' operation of imagination to the data. Hypotheses are anticipatory. 158 But they differ from non-logical anticipation in that they are tentatively, experimentally, i.e., logically anticipatory. 159 The non-logical operations of memory and anticipation lack just this tentative, experimental character. 160 When we confuse the logical and non-logical operations of these processes the result is either that logical processes will merely repeat non-logical operations in which case we have inference that is tautologous and trifling; 161 or the non-logical will attempt to perform logical operations, and our inference is miraculous. 162 If we seek to escape by an appeal to habit, as in empiricism, or to an objective universal, as in idealism and neo-realism, we are merely disguising, not removing the miracle.

163 It may be thought that this confusion would be most likely to occur in a theory which teaches that non-logical processes are carried over into logical operations. 164 But this overlooks the fact that the theory recognises at the same time that these non-logical operations undergo modification and adaptation to the demands of the logical enterprise. 165 On the other hand, those who make all perceptions, memory, and anticipation, not to speak of habit and instinct, logical, have no basis for the distinction between logical and non-logical results; 166 while those who refuse to give the operations of perception, memory, etc., any place in logic can make no connections between logical and non-logical conduct. Nor are they able to distinguish in a specific case truth from error.

167 In all logics that fail to make this connection and distinction between logical and non-logical operations there is no criterion for data. 168 If ultimate simplicity is demanded of the data, there is no standard for simplicity except the 'minimum sensibile' or the 'minimum intelligibile' which have recently been resurrected. 169 On the other hand, where simplicity is waived, as in the logic of objective idealism, there is still no criterion of logical adequacy. 170 But if we understand by 'logical' data not anything that happens to be given, but something 'sought' as material for an hypothesis, i.e., a proposed solution (proposition) of an ambiguous object of conduct and affection, then whatever results of observation meet this requirement are logical data. 171 And whenever data are found from which an hypothesis is constructed that succeeds in abolishing the ambiguity, they are simple, adequate, and true data.

172 No scientist, not even the mathematician, in the specific investigations of own field, seeks for ultimate and irreducible data at large. 173 And if you found them you could not use them. It is only in your metaphysical personality that you longs for such data. 174 The data which the scientist in any specific inquiry seeks are the data which suggest a solution of the question in which the investigation starts. 175 When these data are found they are the "irreducibles"

of that problem. But they are relative to the question and answer of the investigation. 176 Their simplicity consists in the fact that they are the data from which a conclusion can be made. 177 The term "simple data" is tautologous. That one is in need of data more "simple" means that one is in need of new data from which an hypothesis can be formed.

178 It is true that the actual working elements with which the scientist operates are always complex in the sense that they are always something more than elements in any specific investigation. 179 They have other connections and alliances. And this complexity is at once the despair and the hope of the scientist; 180 your despair, because you cannot be sure when these other connections will interfere with the allegiance of your elements to your particular undertaking; 181 your hope, because when these alliances are revealed they often make the elements more efficient or exhibit capacities which will make them elements in some other undertaking for which elements have not been found. 182 A general resolves your army into so many marching, eating, shooting units; but these elements are something more than marching, shooting units. 183 They are husbands and fathers, brothers and lovers, protestants and catholics, artists and artisans, etc. 184 And the militarist can never be sure at what point these other activities-- I do not say merely external relationships-- may upset your calculations. 185 If you could find units whose whole and sole nature is to march and shoot, your problem would be, in some respects, simpler, though in others more complex. 186 As it is, you are constantly required to ask how far these other functions will support and at what point they will rebel at the marching and shooting.

187 Such, in principle, is the situation in every scientific inquiry. When the failure of the old elements occurs it is common to say that "simpler" elements are needed. 188 And doubtless in your perplexity the scientist may long for elements which have no entangling alliances, whose sole nature and character is to be

elements. 189 But what in fact you actually seeks in every specific investigation are elements whose nature and functions 'will not interfere' with their serving as units in the enterprise in hand. 190 But from some other standpoint these new elements may be vastly more complex than the old, as is the case with the modern as compared with the ancient atom. 191 When the elements are secured which operate successfully, the non-interfering connections can be ignored and the elements can be treated as if they did not have them,-- as if they were metaphysically simple. 192 But there is no criterion for metaphysical simplicity except operative simplicity. To be simple is to serve as an element, and to serve as an element is to be simple.

193 It is scarcely necessary in view of the foregoing to add that the data of science are not "sense-data," if by sense-data be meant data which are the result of the operations of sense organs alone. 194 Data are as much or more the result of operations, first, of the motor system of the scientist's own organism, and second, of all of the machinery of your labouratory which you calls to your aid. 195 Whether named after the way they are obtained, or after the way they are used, data are quite as much "motor" as "sense." 196 Nor, on the other hand, are there any purely intellectual data-- not even for the mathematician. 197 Some mathematicians may insist that their symbols and diagrams are merely stimuli to the platonic operation of pure and given universals. 198 But until mathematics can get on without these symbols or any substitutes the intuitionist in mathematics will continue to have own say.

199 Wherever the discontinuity between logical operations and their acts persists, all the difficulties with data have their correlative difficulties with hypotheses. 200 In Mill's logic the account of the origin of hypotheses oscillates between the view that they are happy guesses of a mind composed of states of consciousness, and the view that they are "found in the facts" or are "impressed on the mind by the facts." 201 The miracle of

relevancy required in the first position drives the theory to the second. And the tautologous, useless nature of the hypothesis in the second forces the theory back to the first view. 202 In this predicament, little wonder Mill finds that the easiest way out is to make hypotheses "auxiliary" and not indigenous to inference. 203 But this exclusion of hypotheses as essential leaves own account of inference to oscillate between the association of particulars of nominalism and scholastic formalism, 204 from both of which Mill, with the dignified zeal of a prophet, set out to rescue logic.

205 Mill's rejection of hypotheses formed by a mind whose operations have no discoverable continuity with the operations of things, or by things whose actions are independent of the operations of ideas, is forever sound. 206 But his acceptance of the discontinuity between the acts of knowing and the operation of things, and the conclusion that these two conceptions of the origin and nature of hypotheses are the only alternatives, were the source of most of his difficulties.

III

207 The efforts of classic empiricism at the reform of logic have long been an easy mark for idealistic reformers. 208 But it is interesting to observe that the idealistic logic from the beginning finds itself in precisely the same predicament regarding hypotheses;-- 209 they are trifling or false. And in the end they are made, as in Mill, "accidents" of inference.

210 The part played by Kant's sense-material and the categories is almost the reverse of those of data and hypothesis in science. 211 Sense material and the categories are the given elements from which objects are somehow made; 212 in scientific procedure data and hypothesis are derived through logical observation and imagination from the content and operations of immediate experience. 213 In Kant's account of the process by which objects are constructed we are nowhere in sight of any experimental procedure. 214 Indeed, the real act of knowing, the selection and application of the category to the sense matter, is, as Kant in the end

had to confess, "hidden away in the depths of the soul." 215 Made in the presence of the elabourate machinery of knowing which Kant had constructed, this confession is almost tragic; 216 and the tragic aspect grows when we find that the result of the "hidden" operation is merely a phenomenal object. 217 That this should be the case, however, is not strange. A phenomenal object is the inevitable correlate of the "hidden" act of knowing whether in a "transcendental" or in an "empirical" logic. 218 In vain do we call the act of knowing "constructive" and "synthetic" if its method of synthesis is hidden. 219 A transcendental unity whose method is indefinable has no advantage over empirical association.

220 It was the dream of Kant as of Mill to replace the logics of sensationalism and rationalism with a "logic of things" and of "truth." 221 But as Mill's things turned to states of consciousness, so Kant's are phenomenal. Their common fate proclaims their common failure-- 222 the failure to reëstablish continuity between the conduct of intelligence and other conduct.

223 One of the chief counts in Hegel's indictment of Kant's logic is that "it had no influence on the methods of science." 224 Hegel's explanation is that Kant's categories have no genesis; they are not constructed in and as part of logical operations. As given, ready-made, their relevance is a miracle. 225 But if categories be "generated" in the process of knowing, says Hegel, they are indigenous, and their fitness is inevitable. 226 In such statements Hegel raises expectations that we are at last to have a logic which squares with the procedure of science. 227 But when we discover that instead of being "generated" out of all the material involved in the scientific problem, Hegel's categories are derived from each other, misgivings arise. 228 And when we further learn that this "genesis" is timeless, which means that, after all, the categories stand related to each other in a closed, eternal system of implication, we abandon hope of a scientific-- i.e., experimental-- logic.

229 Hegel also says it is the business of philosophy "to substitute categories or in more precise language adequate notions for the several modes of feeling, perception, desire, and will." 230 The word "substitute" reveals the point at issue. If "to substitute" means that philosophy is a complete exchange of the modes of feeling, perception, desire, and will for a world of categories or notions, 231 then, saying nothing of the range of values in such a world, the problem of the meaning of "adequate" is on our hands. What is the notion to be adequate to? 232 But if "to substitute" means that the modes of feeling, perception, desire, and will, when in a specific situation of ambiguity and inhibition, go over into, take on, the modes of data and hypothesis in the effort to get rid of inhibiting conflict that is quite another matter. 233 Here the "notion," as the scientific hypothesis, has a criterion for its adequacy. 234 But if the notion usurps the place of feeling, perception, desire, and will, as many find, in the end, it does in Hegel's logic, it thereby loses all tests for the adequacy of its function and character as a notion.

235 In the development of the logical doctrines of Kant and Hegel by Lotze, Green, Sigwart, Bradley, Bosanquet, Royce, and others, there are indeed differences. 236 But these differences only throw their common ground into bolder relief. This common ground is that, procedure by hypotheses, by induction, is, in the language of Professor Bosanquet, "a transient and external characteristic of inference." 237 And the ground of this verdict is essentially the same as Mill's, when he rejects hypotheses "made by the mind," 238 namely, that such hypotheses are too subjective in their origin and nature to have objective validity. 239 "Objective" idealism is trying, like Mill, to escape the subjectivism of the purely individual and "psychical" knower. 240 But, being unable to reconstruct the finite knower, and being too sophisticated to make what it regards as Mill's naïve appeal to "hypotheses found in things," it transfers the real process of inference to the "objective

universal," 241 and the process of all thought, including inference, is now defined as "'the reproduction, by a universal presented in a content, of contents distinguished from the presented content which also are differences of the same universal'."

242 It need scarcely be said that in inference thus defined there is scant room for hypotheses. 243 There is nothing "hypothetical," "experimental," or "tentative" in this process of reproduction by the objective universal as such. 244 As little is there any possibility of error. If there is anything hypothetical, or any possibility of error, in inference, it is due to the temporal, finite human being in which, paradoxically enough, this process of "reproduction" goes on 245 and to whom, at times, is given an "infinitesimal" part in the operation, while at other times you are said merely to "witness" it. 246 But the real inference does not "proceed by hypotheses"; it is only the finite mind in witnessing the real logical spectacle or in its "infinitesimal" contribution to it that lamely proceeds in this manner.

247 Here, again, we have the same break in continuity between the finite, human act of knowing and the operations that constitute the real world. 248 When the logic of the objective universal rejects imputations of harbouring a despoiled psychical knower it has in mind, of course, the objective universal as knower, not the finite, human act. 249 But, if the participations of the latter are all accidents of inference, as they are said to be, its advantage over a purely psychical knower, or "states of consciousness," is difficult to see. 250 The rejection of metaphysical dualism is of no consequence if the logical operations of the finite, human being are only "accidents" of the real logical process. 251 As already remarked, the metaphysical disjunction is merely a schematism of the more fundamental, logical disjunction.

252 As for tautology and miracle, the follower of Mill might well ask: how an association of particulars, whether mental states or things, could be more tautologous than a universal reproducing its own differences?

253 And if the transition from particular to particular is a miracle in which the grace of God is disguised as "habit," why is not habit as good a disguise for Providence as universals? 254 Moreover, by what miracle does the one all-inclusive universal become 'a' universal? And since perception always presents a number of universals, what determines which one shall perform the reproduction? 255 Finally, since there are infinite differences of the universal that might be reproduced, what determines just which differences shall be reproduced? 256 In this wise the controversy has gone on ever since the challenge of the old rationalistic logic by the nominalists launched the issue of empiricism and rationalism. 257 All the charges which each makes against the other are easily retorted upon itself. Each side is resistless in attack, but helpless in defence.

258 In a conception of inference in which both data and hypothesis are regarded as the tentative, experimental results of the processes of perception, memory, and constructive imagination engaged in the special task of removing conflict, ambiguity, and inhibition, 259 and in which these processes are not conceived as the functions of a private mind nor of an equally private brain and nervous system, but as functions of interacting beings,-- 260 in such a conception there is no ground for anxiety concerning the simplicity of data, nor the objectivity of hypotheses. 261 Simplicity and objectivity do not have to be secured through elabourate and laboured metaphysical construction. 262 The data are simple and the hypothesis objective in so far as they accomplish the work where unto they are called-- the removal of conflict, ambiguity, and inhibition in conduct and affection.

263 In the experimental conception of inference it is clear that the principles of formal logic must play their rôle wholly inside the course of logical operations. 264 They do not apply to relations 'between' these operations and "reality"; nor to "reality" itself. 265 Formal identity and non-contradiction signify, in experimental logic, the complete

correlativity of data and hypothesis. 266 They mean that 'in' the logical procedure data must not be shifted without a corresponding change in the hypothesis and conversely. 267 The doctrine that "theoretically" there may be any number of hypotheses for "the same facts" is, when these multiple hypotheses are anything more than different names or symbols, nothing less than the very essence of formal contradiction. 268 It doubtless makes little difference whether a disease be attributed to big or little, black or red, demons or whether the cause be represented by a, b, or c, etc. 269 But where data and hypotheses are such as are capable of verification, i.e., of mutually checking up each other, a change in one without a corresponding modification of the other is the principle of all formal fallacies.

270 With this conception of the origin, nature, and functions of logical operations little remains to be said of their truth and falsity. 271 If the whole enterprise of logical operation, of the construction and verification of hypothesis, is in the interest of the removal of ambiguity, and inhibition in conduct, 272 the only relevant truth or falsity they can possess must be determined by their success or failure in that undertaking. 273 The acceptance of this view of truth and error, be it said again, depends on holding steadfastly to the conception of the operations of knowing as 'real acts', 274 which, though having a distinct character and function, are yet in closest continuity with other acts of which indeed they are but modifications and adaptations in order to meet the logical demand.

275 Here, perhaps, is the place for a word on truth and satisfaction. The satisfaction which marks the truth of logical operations-- 276 "intellectual satisfaction"-- is the satisfaction which attends the accomplishment of their task, viz., the removal of ambiguity in conduct, i.e., in our interaction with other beings. 277 It does not mean that this satisfaction is bound to be followed by wholly blissful consequences. All our troubles are not over when the distress of ambiguity is removed. 278 It may be indeed that the verdict of the logical operation is that we must

face certain death. Very well, we must have felt it to be "good to know the worst," or no inquiry would have been started. 279 We should have deemed ignorance bliss and sat with closed eyes waiting for fate to overtake us instead of going forward to meet it and in some measure determine it. 280 Death anticipated and accepted is 'realiter' very different from death that falls upon us unawares, however we may estimate that difference. 281 If this distinction in the 'foci' of satisfaction is kept clear it must do away with a large amount of the hedonistic interpretations of satisfaction in which many critics have indulged. 282 But hereupon some one may exclaim, as did a colleague recently: "Welcome to the ranks of the intellectualists!" 283 If so, the experimentalist is bound to reply that you are as willing, and as unwilling, to be welcomed to the ranks of intellectualism as to those of anti-intellectualism. 284 You wonders, however, how long the welcome would last in either. Among the intellectualists the welcome would begin to cool as soon as it should be discovered that the ambiguity to which logical operations are the response is not regarded by the experimentalist as a purely intellectual affair. 285 It is an ambiguity in conduct with all the attendant affectional values that may be at stake. 286 It is, to be sure, the fact of ambiguity, and the effort to resolve it, that adds the intellectual, logical character to conduct and to affectional values. 287 But if the logical interest attempts entirely to detach itself it will soon be without either subject-matter or criterion. 288 And if it sets itself up as supreme, we shall be forced to say that our quandaries of affection, our problems of life and death are merely to furnish occasions and material for logical operations.

289 On the other hand, the welcome of the anti-intellectualists is equally sure to wane when the experimentalist asserts that the doctrine that logical operations mutilate the wholeness of immediate experience overlooks the palpable fact 290 that it is precisely these immediate experiences-- the experiences of intuition and instinct-- that get into conflict and inhibit and mutilate

one another, 291 and as a consequence are obliged to go into logical session to patch up the mutilation and provide new and better methods of coöperation.

292 At this point the weakness in Bergson's view of logical operations appears. Bergson, too, is impressed by the break in continuity between logical operations and the rest of experience. 293 But with Mr. Bradley he believes this breach to be essentially incurable, because the mutilations and disjunctions are due to and introduced by logical operations. 294 Just why the latter are introduced remains in the end a mystery. Both, to be sure, believe that logical operations are valuable for "practical" purposes,-- for action. 295 But, aside from the question of 'how' operations essentially mutilative can be valuable for action, immediate intuitional experience being already in unity with Reality, 296 why should there be any practical need for logical operations-- least of all such as introduce disjunction and mutilation?

297 The admission of a demand for logical operations, whether charged to matter, the devil, or any other metaphysical adversary, 298 is, of course, a confession that conflict and ambiguity are as fundamental in experience as unity and immediacy and that logical operations are therefore no less indigenous. 299 The failure to see this implication is responsible for the paradox that in the logic of Creative Evolution the operations of intelligence are neither creative nor evolutional. 300 They not only have no constructive part but are positively destructive and devolutional.

301 Since, moreover, these logical operations, like those of the objective universal, and like Mill's association of particulars, can only reproduce in fragmentary form what has already been done, it is difficult to see how they can meet the demands of action. 302 For here no more than in Mill, or in the logic of idealism, is there any place for constructive hypotheses or any technique by which they can become effective. 303 Whatever "Creative Evolution"

may be, there is no place in its logic for "Creative Intelligence."

IV

304 The prominence in current discussion of the logical reforms proposed by the "analytic logic" of the neo-realistic movement 305 and the enthusiastic optimism of its representatives over the prospective results of these reforms for logic, science, and practical life are the warrant for devoting a special section to their discussion.

306 There are indeed some marked differences of opinion among the expounders of the "new logic" concerning the results which it is expected to achieve. 307 Some find that it clears away incredible accumulations of metaphysical lumber; others rejoice that it is to restore metaphysics, "once the queen of the sciences, to her ancient throne." 308 But whatever the difference among the representatives of analytical logic all seem agreed at the outset on two fundamental reforms which the "new logic" makes. 309 These are: first, that analytic logic gets rid entirely of the 'act' of knowing, the retention of which has been the bane of all other logics; 310 second, in its discovery of "terms and relations," "sense-data and universals" as the simple elements not only of logic but of the world, 311 it furnishes science at last with the simple neutral elements at large which it is supposed science so long has sought, and "mourned because it found them not."

312 Taking these in order, we are told that "realism frees logic as a study of objective fact from all accounts of the states and operations of mind." ... 313 "Logic and mathematics are sciences which can be pursued quite independently of the study of knowing." 314 "The new logic believes that it deals with no such entities as thoughts, ideas, or minds, but with entities that merely are."

315 The motive for the banishment of the act of knowing from logic is that as an 'act' knowing is "mental," "psychological," and "subjective." 316 All other logics have indeed realised this subjective character of the 'act' of knowing, but have neither dared

completely to discard it 317 nor been able sufficiently to counteract its effects even with such agencies as the objective universal to prevent it from infecting logic with its subjectivity. 318 Because logic has tolerated and attempted to compromise with this subjective act of knowing, say these reformers, it has been forced constantly into epistemology and has become a hybrid science. 319 Had logic possessed the courage long ago to throw overboard this subjective Jonah it would have been spared the storms of epistemology and the reefs of metaphysics.

320 Analytic logic is the first attempt in the history of modern logical theory at a deliberate, sophisticated exclusion of the act of knowing from logic. 321 Other logics, to be sure, have tried to neutralise the effects of its presence, but none has had the temerity to cast it bodily overboard. The experiment, therefore, is highly interesting.

322 We should note at the outset that in regarding the act of knowing as incurably "psychical" and "subjective" analytic logic accepts a fundamental premise of the logics of rationalism, empiricism, and idealism which it seeks to reform. 323 It is true that it is the bold proposal of analytic logic to keep logic out of the pit of epistemology by excluding the act of knowing from logic. 324 Nevertheless analytic logic still accepts the subjective character of this act; and if it excludes it from its logic it welcomes it in its psychology. This is a dangerous situation. 325 Can the analytic logician prevent all osmosis between own logic and own psychology? If not, and if the psychological act is subjective, woe then to your logic. 326 Had the new logic begun with a bold challenge of the psychical character of the act of knowing, the prospect of a logic free from epistemology would have been much brighter.

327 With the desire to rid logic of the epistemological taint the "experimental logic" of the pragmatic movement has the strongest sympathy. 328 But the proposal to effect this by the excision of the act of knowing appears to experimental logic to be

a case of heroic but fatal surgery. 329 'Prima facie' a logic with no act of knowing presents an uncanny appearance. What sort of logical operations are possible in such a logic and of what kind of truth and falsity are they capable?

330 Before taking up these questions in detail it is worthwhile to note the character of the entities that "merely are" with which analytic logic proposes exclusively to deal. 331 In their general form they are "terms" and "propositions," "sense-data" and universals. We are struck at once by the fact that these entities bear the names of logical operations. 332 They are, to be sure, disguised as entities and have been baptised in a highly dilute solution of objectivity called "subsistence." 333 But this does not conceal their origin, nor does it obscure the fact that if it is possible for any entities that "merely are" to have logical character those made from hypostatised processes of logical operations should be the most promising. 334 They might be expected to retain some vestiges of logical character even after they have been torn from the process of inquiry and converted into "entities that merely are." 335 Also it is not surprising that having stripped the act of knowing of its constituent operations analytic logic should feel that it can well dispense with the empty shell called "mind" and, as Professor Dewey says, "wish it on psychology." 336 But if the analytic logician be also a philosopher and perchance a lover of own fellow-human, it is hard to see how you can have a good conscience over this disposition of the case.

337 Turning now to the character of inference and of truth and falsity which are possible in a logic which excludes the operation of knowing and deals only with "entities that are," 338 all the expounders seem to agree that in such a logic inference must be purely deductive. All alleged induction is either disguised deduction or a lucky guess. 339 This raises apprehension at the start concerning the value of analytic logic for other sciences. But let us observe what deduction in analytic logic is.

INTELLIGENCE

340 We begin at once with a distinction which involves the whole issue. We are asked to carefully distinguish "logical" deduction from "psychological" deduction. 341 The latter is the vulgar meaning of the term, and is "the thinker's name for your own act of conforming your thought" to the objective and independent processes that constitute the real logical process. 342 This act of conforming the mind is a purely "psychological" affair. It has no logical function whatever. 343 In what the "conforming" consists is not clear. It seems to be merely the act of turning the "psychological" eye on the objective logical process. 344 "One beholds it (the logical process) as one beholds a star, a river, a character in a play.... 345 The novelist and the dramatist, like the mathematician and logician, are onlookers at the logical spectacle." 346 On the other hand, the term "conforming" suggests a task, with the possibilities of success and failure. 347 Have we, then, two wholly independent possibilities of error--one merely "psychological," the other "logical"? The same point may be made even more obviously with reference to the term "beholding." 348 The term is used as if beholding were a perfectly simple act, having no problems and no possibilities of mistakes--as if there could be no mis-beholding.

349 But fixing our psychological eye on the "logical spectacle," what does it behold? 350 A universal generating an infinite series of identical instances of itself-- i.e., instances which differ only in "logical position." 351 If in a world of entities that "merely are" the term "generation" causes perplexity, the tension is soon relieved; 352 for this turns out to be a merely subsistential non-temporal generation which, like Hegel's generation of the categories, in no way compromises a world of entities that "merely are."

353 Steering clear of the thicket of metaphysical problems that we here encounter, let us keep to the logical trail. 354 First it is clear that logical operations are of the same reproductive repetitive type that we have found in the associational logic of empiricism, and in the

logic of the objective universal. 355 Indeed, after objective idealism has conceded that the finite mind merely "witnesses" or at most contributes only in an "infinitesimal" degree to the logical activity of the objective universal, 356 what remains of the supposed gulf between absolute idealism and analytic realism?

357 It follows, of course, that there can be no place in analytic logic for "procedure by hypotheses." 358 However, it is to the credit of some analytic logicians that they see this and frankly accept the situation instead of attempting to retain hypotheses by making them "accidents" or mere "auxiliaries" of inference. 359 On the other hand, others find that the chief glory of analytic logic is precisely that it "gives thought wings" for the free construction of hypotheses.

360 In his lectures on "Scientific Methods in Philosophy" Mr. Russell calls some of the most elemental and sacred entities of analytic logic "convenient fictions." 361 This retention of hypotheses at the cost of cogency is of course in order to avoid a break with science. 362 Those who see that there is no place in analytic logic for hypotheses are equally anxious to preserve their connections with science. Hence they boldly challenge the "superstition" that science has anything to do with hypotheses. 363 Newton's "'Hypotheses non fingo'" should be the motto of every conscientious scientist who dares "trust own perceptions and disregard the ukase of idealism." 364 "The theory of mental construction is the child of idealism, now put out to service for the support of its parents." 365 "Theory is no longer regarded in science as an hypothesis added to the observed facts," but a law which is "found in the facts." 366 The identity of this with Mill's doctrine of hypotheses as "found in things" is obvious.

367 As against the conception of hypotheses as "free," "winged," constructions of a psychical, beholding, gossiping mind we may well take our stand with those who would exclude such hypotheses from science. 368 And this doubtless was the sort of mind and sort of hypotheses Newton meant

when he said "'Hypotheses non fingo'." 369 But had Newton's mind really been of the character which he, as a physicist, had learned from philosophers to suppose it to be, and had he really waited to find his hypotheses ready-made in the facts, 370 there never would have been any dispute about who discovered the calculus, and we should never have been interested in what Newton said about hypotheses or anything else. 371 What Newton did is a much better source of information on the part hypotheses play in scientific method than what he said about them. 372 The former speaks for itself; the latter is the pious repetition of a metaphysical creed made necessary by the very separation of mind from things expressed in the statement quoted.

373 Logically there is little to choose between hypotheses found ready-made in the facts and those which are the "winged" constructions of a purely psychical mind. 374 Both are equally useless in logic and in science. One makes logic and science "trifling," the other makes them "miraculous." 375 But if hypotheses be conceived not as the output of a cloistered psychical entity but as the joint product of all the beings and operations involved in the specific situation in which logical inquiry originates, 376 and more particularly in all those involved in the operations of the inquiry itself (including all the experimental material and apparatus which the inquiry may require), 377 we shall have sufficient continuity between hypotheses and things to do away with miracle, and sufficient reconstruction to avoid inference that is trifling.

378 It is, however, the second contribution of analytic logic that is the basis of the enthusiasm over its prospective value for other sciences. 379 This is the discovery that terms and propositions, sense-data, and universals, are not only elements of logical operation but are the simple, neutral elements at large which science is supposed to have been seeking. 380 "As the botanist analyses the structures of the vegetable organism and finds chemical compounds of which they are built so the ordinary chemist analyses these compounds into their elements, but does not

analyse these. 381 The physical chemist analyses these elemental atoms, as now appears, into minuter components 'which you in turn must leave to the mathematicians and logicians further to analyse'."

382 Again it is worth noting that this mutation of logical into ontological elements seems to differ only "in position" from the universal logicism of absolute idealism. 383 What are these simple elements into which the mathematician and logician are to analyse the crude elements of the labouratory? And how are these elements to be put into operation in the labouratory? 384 Let us picture an analytic logician meeting a physical scientist at a moment when the latter is distressed over the unmanageable complexity of own elements. 385 Will the logician say to the scientist: "Your difficulty is that you are trusting too much to your mundane apparatus. The kingdom of truth cometh not with such things. 386 Forsake your microscopes, test tubes, refractors and resonators, and follow me, and you shall behold the truly simple elements of which you have dreamed."? 387 And when the moment of revelation arrives and the expectant scientist is solemnly told that the "simple elements" which you has sought so long are "terms and propositions," sense-data and universals, 388 is it surprising that you does not seem impressed? Will you not ask: "What am I to do with these in the specific difficulties of my labouratory? 389 Shall I say to the crude and complex elements of my labouratory operations: 'Be ye resolved into terms and propositions, sense-data and universals'; 390 and will they forthwith obey this incantation and fall apart so that I may locate and remove the hidden source of my difficulty? 391 Are you not mocking me and deceiving yourself with the old ontological argument? Your 'simple' elements-- are they anything but the hyostatised process by which elements may be found?"

392 The expounders as well as the critics of analytic logic have agreed that it reaches its most critical junction when it faces the problem of truth and error.

393 There is no doubt that the logic of objective idealism, in other respects so similar to analytic logic, has at this point an advantage; 394 for it retains just enough of the finite operation of knowing-- an "infinitesimal" part will answer-- to furnish the culture germs of error. 395 But analytic logic having completely sterilised itself against this source of infection is in serious difficulty.

396 Here again it is Professor Holt who has the courage to follow-- or shall we say "behold"?-- his theory as it "generates" the doctrine that error is a given objective opposition of forces entirely independent of any such thing as a process of inquiry and all that such a process presupposes. 397 "All collisions between bodies, all inference between energies, all process of warming and cooling, of starting and stopping, of combining and separating, all counterbalancings, as in cantilevers and gothic vaultings, are contradictory forces which can be stated only in propositions that manifestly contradict each other." 398 But the argument proves too much. For in the world of forces to which we have here appealed there is no force which is not opposed by others and no particle which is not the center of opposing forces. 399 Hence error is ubiquitous. In making error objective we have made all objectivity erroneous. 400 We find ourselves obliged to say that the choir of Westminster Abbey, the Brooklyn bridge, the heads on our shoulders are all supported by logical errors!

401 Following these illustrations of ontological contradictions there is indeed this interesting statement: 402 "Nature is so full of these mutually negative processes that we are moved to admiration when a few forces coöperate long enough to form what we call an organism." 403 The implication is, apparently, that as an "opposition" of forces is error, "coöperation" of forces is truth. But what is to distinguish "opposition" from "coöperation"? 404 In the illustration it is clear that opposing forces-- error-- do not interfere with coöperative forces-- truth. 405 Where should we find more counterbalancing, more starting and stopping, warming and cooling, combining and separating

than in an organism? 406 And if these processes can be stated only in propositions that are "manifestly contradictory," are we to understand that truth has errors for its constituent elements? 407 Such paradoxes have always delighted the soul of absolute idealism. 408 But, as we have seen, only the veil of an infinitesimal finitude intervenes between the logic of the objective universal of absolute idealism and the objective logic of analytic realism.

409 It is, of course, this predicament regarding objective truth and error that has driven most analytic logicians to recall the exiled psychological, "mental" act of knowing. 410 It had to be recalled to provide some basis of distinction between truth and error, 411 but, this act having already been conceived as incurably "subjective," the result is only an exchange of dilemmas. 412 For the reinstatement of this act 'ipso facto' reinstates the epistemological predicament to get rid of which it was first banished from logic.

413 Earnest efforts to escape this outcome have been made by attaching the act of knowing to the nervous system, and this is a move in the right direction. 414 But so far the effort has been fruitless because no connection has been made between the knowing function of the nervous system and its other functions. 415 The result is that the cognitive operation of the nervous system, as of the "psychical" mind, is that of a mere spectator; and the epistemological problem abides. 416 An onlooking nervous system has no advantage over an "onlooking" mind. 417 Onlooking, beholding may indeed be a part of a genuine act of knowing. But in that act it is always a stimulus or response to other acts. It is one of them;--never a mere spectator of them. 418 It is when the act of knowing is cut off from its connection with other acts and finds itself adrift that it seeks metaphysical lodgings. 419 And this it may find either in an empty psychical mind or in an equally empty body.

420 If, in reinstating the act of knowing as a function of the nervous system, neo-realism had recognised the logical significance of the fact 421 that the nervous

system of which knowing is a function is the same nervous system of which loving and hating, desiring and striving are functions 422 and that the transition from these to the operations of inquiry and knowing is not a capricious jump but a transition motived by the loving and hating, desiring and striving-- 423 if this had been recognised the logic of neo-realism would have been spared its embarrassments over the distinction of truth and error. 424 It would have seen that the passage from loving and hating, desiring and striving to inquiry and knowing is made in order to renew and reform specific desires and strivings which, through conflict and consequent equivocation, have become fruitless and vain; 425 and it must have seen that the results of the inquiry are true or false as they succeed or fail in this reformation and renewal.

426 But once more, it must steadily be kept in view that while the loving and hating, desiring and striving, which the logical operations are reforming and renewing, are functions of the nervous system, 427 they are not functions of the nervous system alone, else the door of subjectivism again closes upon us. 428 Loving and hating, desiring and striving have their "objects." Hence any reformation of these functions involves no less a reformation of their objects. 429 When therefore we say that truth and error are relevant to desires and strivings, this means relevant to them as including their objects, not as entitised processes (such are the pitfalls of language) enclosed in a nervous system or mind. 430 With this before us the relevance of truth and error to desires and strivings can never be made the basis for the charge of subjectivism. 431 The conception of desires as peculiarly individual and subjective is a survival of the very isolation which is the source of the difficulty with truth and error. 432 Hence the appeal to this isolation, made alike by idealism and realism, in charging instrumental logic with subjectivism is an elementary 'petitio'.

433 Doubtless it will be urged again that the act of knowing is motived by an independent desire

and striving of its own. 434 This is of course consonant with the neo-realistic atomism, however inconsonant it may be with the conception of implication which it employs. 435 If we take a small enough, isolated segment of experience we can find meaning for this notion, as we may for the idea that the earth is flat and that the sun moves around the earth. 436 But as consequences accrue we find as great difficulties with the one as with the other. 437 If the course of events did not bring us to book, if we could get off with a mere definition of truth and error we might go on piling up subsistential definitional logics world without end. 438 But sublime adventurers, logically unregenerate and uninitiated, will go on sailing westward to the confusion and confounding of all definitional systems that leave them out of account.

439 The conclusion is plain. If logic is to have room in its household for both truth and error, if it is to avoid the old predicament of knowledge that is trifling or miraculous, tautologous or false, if it is to have no fear of the challenge of other sciences or of practical life, 440 it must be content to take for its subject-matter the operations of intelligence conceived as real acts on the same metaphysical plane and in strictest continuity with other acts. 441 Such a logic will not fear the challenge of science, for it is precisely this continuity that makes possible experimentation, which is the fundamental characteristic of scientific procedure. 442 Science without experiment is indeed a strange apparition. It is a [Greek: logos] with no [Greek: legein], a science with no 'scire'; and this spells dogmatism. 443 How necessary such continuity is to experimentation is apparent when we recall that there is no limit to the range of operations of every sort which scientific experiment calls into play; 444 and that unless there be thoroughgoing continuity between the logical demand of the experiment and all the materials and devices employed in the process of the experiment, the operations of the latter in the experiment will be either miraculous or ruinous.

445 Finally, if this continuity of the operations of intelligence with other operations be essential to science, its relation to "practical" life is 'ipso facto' established. 446 For science is "practical" life aware of its problems and aware of the part that experimental-- i.e., creative-- intelligence plays in the solution of those problems.

INTELLIGENCE AND MATHEMATICS

Harold Chapman Brown

3 Herbart is said to have given the deathblow to faculty psychology. Human no longer appears endowed with volition, passion, desire, and reason; 2 and logic, deprived of its hereditary right to elucidate the operations of inherent intelligence, has the new problem of investigating forms of intelligence in the making. 3 This is no inconsequential task. "If human originally possesses only capacities which after a given amount of education will produce ideas and judgments", 4 and if these ideas and judgments are to be substituted for a mythical intelligence, it follows that tracing their development and observing their functioning renders clearer our conception of their nature and value 5 and brings us nearer that exact knowledge of what we are talking about in which the philosopher at least aspires to equal the scientist, however much you may fall below your ideal.

6 For contemporary thought concerning the mathematical sciences this altered point of view generates peculiarly pressing problems. 7 Mathematicians have weighed the old logic and found it wanting. They have builded themselves a new logic more adequate to their ends. 8 But they have not whole-heartedly recognised the change that has come about in psychology; hence they have retained the faculty of intelligence knit into certain indefinables such as implication, relation, class, term, and the like, 9 and have transported the faculty from the human soul to a mysterious realm of subsistence whence it radiates its ghostly light upon the realm of existence below. 10 But while they reproach the old logic, often bitterly, their new logic merely furnishes a more

adequate show-case 11 in which already attained knowledge may be arranged to set off its charms for the observer in the same way that specimens in a museum are displayed before an admiring world. 12 This statement is not a sweeping condemnation, however, for such a setting forth is not useless. 13 It resembles the classificatory stage of science which, although not itself in the highest sense creative, often leads to higher stages by bringing under observation relations and facts that might otherwise have escaped notice. 14 And in the realm of pure mathematics, the new logic has undoubtedly contributed in this manner to such discoveries. 15 Danger appears when the logician attains Cartesian intoxication with the beauty of logico-mathematical form and tries to infer from the form itself the real nature of the formed material. 16 The realm of subsistence too often has armed Indefinables with metaphysical myths whose attack is valiant when the doors of reflection are opened. 17 It may be possible, however, to arrive at an understanding of mathematics without entering the kingdom of these warriors.

18 It is the essence of science to make prediction possible. 19 The value of prediction lies in the fact that through this function human can control own environment, or, at worst, fortify yourself to meet its vagaries. 20 To attain such predictions, however, the world need not be grasped in its full concreteness. Hence arise processes of abstraction. 21 While all other symptoms remain unnoticed, the temperature and pulse may mark a disease, or a barometer-reading the weather. 22 The physicist may work only in terms of quantity in a world which is equally truly qualitative. All that is necessary is to select the elements which are most effective for prediction and control. 23 Such selection gives the principle that dominates all abstractions. 24 Progress is movement from the less abstract to the more abstract, but it is progress only because the more abstract is as genuinely an aspect of the concrete starting-point as anything is. 25 Moreover, the outcome of progress of this sort cannot be definitely foreseen

at the beginnings. 26 The simple activities of primitive people have to be spontaneously performed before their value becomes evident. 27 Only afterwards can they be cultivated for the sake of their value, and then only can the self-conscious cultivation of a science begin. The process remains full not only of perplexities, but of surprises; 28 humans' activities lead to goals far other than those which appear at the start. These goals, however, never deny the method by which the start is made. 29 Developed intelligence is nothing but skill in using a set of concepts generated in this manner. In this sense the histories of all human endeavours run parallel.

30 Where the empirical bases of a science are continually in the foreground, as in physics or chemistry, the foregoing formulation of procedure is intelligible and acceptable to most people. 31 Mathematics seem, however, to stand peculiarly apart. Many, with Descartes, have delighted in them "on account of the certitude and evidence of their reasonings" and recognised their contribution to the advancement of mechanical arts. 32 But since the days of Kant even this value has become a problem, and many a young philosophic student has the question laid before them 33 as to why it is that mathematics, "a purely conceptual science," can tell us anything about the character of a world which is, apparently at least, free from the idiosyncrasies of individual mind. 34 It may be that mathematics began in empirical practice, such philosophers admit, but they add that, somehow, in its later career, it has escaped its lowly origin. 35 Now it moves in the higher circles of postulated relations and arbitrarily defined entities to which its humble progenitors and relatives are denied the entrée. 36 Parvenus, however, usually bear with them the mark of history, and in the case of this one, at least, we may hope that the history will be sufficient to drag it from the affectations of its newly acquired set and reinstate it in its proper place in the workaday world. 37 For the sake of this hope, we shall take the risk of being tedious by citing certain striking moments of

mathematical progress; and then we shall try to interpret its genuine status in the world of working truths.

BEGINNINGS OF ARITHMETIC AND GEOMETRY

38 The most primitive mathematical activity of human is counting, but here your first efforts are lost in the obscurity of the past. 39 The lower races, however, yield us evidence that is not without value. Although the savage mind is not identical with the mind of primitive human, 40 there is much in the activities of undeveloped races that can throw light upon the behaviour of peoples more advanced. 41 We must be careful in our inferences, however. Among the Australians and South Americans there are peoples whose numerical systems go little, or not at all, beyond the first two or three numbers. 42 "It has been inferred from this," writes Professor Boas, "that the people speaking these languages are not capable of forming the concept of higher numbers.... 43 People like the South American Indians, ... or like the Esquimo ... are presumably not in need of higher numerical expressions, because there are not many objects that they have to count. 44 On the other hand, just as soon as these same people find themselves in contact with civilisation, and when they acquire standards of value that have to be counted, they adopt with perfect ease higher numerals from other languages, and develop a more or less perfect system of counting.... 45 It must be borne in mind that counting does not become necessary until objects are considered in such generalised form that their individualities are entirely lost sight of. 46 For this reason it is possible that even a person who owns a herd of domesticated animals may know them by name and by their characteristics, without even desiring to count them."

47 And there is one other false interpretation to be avoided. Human does not feel the need of counting and then develop a system of numerals to meet the need. 48 Such an assumption is as ridiculous as to assume prehistoric human thinking to the self: "I must

speak," and then inventing voice culture and grammar to make speaking pleasant and possible. 49 Rather, when powers of communication are once attained, presumably in their beginnings also without forethought, human being still more animal than human, there were gradually dissociated communications of a kind approaching what numbers mean to us. 50 But the number is not yet a symbol apart from that of the things numbered. Picture writing, re-representing the things meant, preceded developmentally any kind of symbolisation representing the number by mere one-one correspondence with non-particularised symbols. 51 It is plausible, although I have no anthropological authority for the statement, that the prevalence of finger words as number symbols (cf. infra) is originally a consequence of the fact that our organisation makes the hand the natural instrument of pointing.

52 The difficulty of passing from concrete representations to abstract symbols has been keenly stated by Conant, 53 although his terminology is that of an old psychology and the limitations implied for the primitive mind are limitations of practice rather than of capacity as Mr. Conant seems to believe. 54 "An abstract conception is something quite foreign to the essentially primitive mind, as missionaries and explorers have found to their chagrin. 55 The savage can form no mental concept of what civilised human means by such a word as 'soul'; nor would the idea of the abstract number 5 be much clearer. 56 When you says 'five', you uses, in many cases at least, the same word that serves you when you wishes to say 'hand'; and your mental concept when you says 'five' is a hand. 57 The concrete idea of a closed fist, of an open hand with outstretched fingers, is what is uppermost in your mind. 58 You knows no more and cares no more about the pure number 5 than you does about the law of conservation of energy. 59 You sees in your mental picture only the real, material image, and your only comprehension of the number is, "these objects are as many as the fingers on my hand." 60 Then, in the lapse of the long interval of

centuries which intervene between lowest barbarism and highest civilisation, the abstract and concrete become slowly dissociated, the one from the other. 61 First the actual hand picture fades away, and the number is recognised without the original assistance furnished by the derivation of the word. 62 But the number is still for a long time a certain number 'of objects', and not an independent concept."

63 An excellent fur trader's story, reported to me by Mr. Dewey, suggests a further impulse to count besides that given by the need of keeping a tally, namely, the need of making one thing correspond to another in a business transaction. 64 The Indian laid down one skin and the trader two dollars; if he proposed to count several skins at once and pay for all together, the former replied "too much cheatem." 65 The result, however, demanded a tally either by the fingers, a pebble, or a mark made in the sand, and as the magnitude of such transactions grows the need of a specific number symbol becomes ever more acute.

66 The first obstacle, then, to overcome-- and it has already been successfully passed by many primitive peoples-- is the need of fortuitous attainment of a numerical symbol, which is not the mere repeated symbol of the things numbered. 67 Significantly, this symbol is usually derived from the hand, suggesting gestures of tallying, and not from the words of already developed language. 68 Consequently, number words relate themselves for the most part to the hand, and written number symbols, which are among the earliest writings of most peoples, 69 tend to depict it as soon as they have passed beyond the stage mentioned above of merely repeating the symbol of the things numbered. 70 W. C. Eells, in writing of the Number Systems of the North American Indians, finds clear linguistic evidence for a digital origin in about 40% of the languages examined. 71 Of the non-digital instances, 1 was sometimes connected with the first personal pronoun, 2 with roots meaning separation, 3, rarely, meaning more, or plural as distinguished from the dual, 72 just

as the Greek uses a plural as well as a dual in nouns and verbs, 4 is often the perfect, complete right. 73 It is often a sacred number and the base of a quarternary system. Conant also gives a classification of the meanings of simple number words for more advanced languages; 74 and even in them the hand is constantly in evidence, as in 5, the hand; 10, two hands, half a person, when fingers and toes are both considered, or a person, when the hands alone are considered; 20, one person, two feet. 75 The other meanings hang upon the ideas of existence, piece, group, beginning, for 1; and repetition, division, and collection for higher numerals.

76 A peculiar difficulty lies in the fact that when once numbering has become a self-conscious effort, the collection of things to be numbered frequently tends to exceed the number of names that have become available. 77 Sometimes the difficulty is met by using a second person when the fingers and toes of the first are used up, 78 sometimes by a method of repetition with the record of the number of the repetition itself added to the numerical significance of the whole process. 79 Hence arise the various systems of bases that occur in developed mathematics. 80 But the inertia to be overcome in the recognition of the base idea is nowhere more obvious than in the retention by the comparatively developed Babylonian system of a second base of 60 to supplement the decimal one for smaller numbers. 81 Among the American Indians the system of bases used, varies from the cumbersome binary scale, that exercised such a fascination over Leibniz, 82 through the rare ternary, and the more common quarternary to the "natural" quinary, decimal, and vigesimal systems derived from the use of the fingers and toes in counting. 83 The achievement of a number base and number words, however, does not always open the way to further mathematical development. 84 Only too often a complexity of expression is involved that almost immediately cuts off further progress. 85 Thus the Youcos of the Amazon cannot get beyond the number three, for the simplest expression for the idea in their language is

"pzettarrarorincoaroac". 86 Such names as "99, tongo solo manani nun solo manani" (i.e., 10, understood, 5 plus 4 times, and 5 plus 4) of the Soussous of Sierra Leone; 87 "399, caxtolli onnauh poalli ipan caxtolli onnaui" (15 plus 4 times 20 plus 15 plus 4) of the Aztec; 88 "29, wick a chimen ne nompah sam pah nep e chu wink a" (Sioux), make it easy to understand the proverb of the Yorubas of Abeokuta, "You may be very clever, but you can't tell 9 times 9."

89 Almost contemporaneously with the beginnings of counting various auxiliary devices were introduced to help out the difficult task. 90 In place of many people, notched sticks, knotted strings, pebbles, or finger pantomime were used. In the best form, these devices resulted in the abacus; 91 indeed, it was not until after the introduction of arabic numerals and well into the Renaissance period that instrumental arithmetic gave way to graphical in Europe. 92 "In eastern Europe," say Smith and Mikami, "it"-- the abacus-- "has never been replaced, for the tschotü is used everywhere in Russia to-day, and when one passes over into Persia the same type of abacus is common in all the bazaars. 93 In China the swan-pan is universally used for the purposes of computation, and in Japan the soroban is as strongly entrenched as it was before the invasion of western ideas."

94 Given, then, the idea of counting, and a mechanical device to aid computation, it still remains necessary to obtain some notation in which to record results. 95 At the early dawn of history the Egyptians seem to have been already possessed of number signs 96 and the Phoenicians either wrote out their number words or used a few simple signs, vertical, horizontal, and oblique lines, a process which the Arabians perpetuated up to the beginning of the eleventh century; 97 the Greeks, as early as 600 B. C., used the initial letters of words for numbers. 98 But speaking generally, historical beginnings of European number signs are too obscure to furnish us good material.

99 Our Indians have few number symbols other than words, but

when they occur they usually take the form of pictorial presentation of some counting device such as strokes, lines dotted to suggest a knotted cord, etc. 100 Indeed, the smaller Roman numerals were probably but a pictorial representation of finger symbols. 101 However, a beautiful concrete instance is furnished us in the Japanese mathematics. 102 The earliest instrument of reckoning in Japan seems to have been the rod, Ch'eou, adapted from the Chinese under the name of Chikusaku (bamboo rods) about 600 A. D. 103 At first relatively large (measuring rods?), they became reduced to about 12-cm., but from their tendency to roll were quickly replaced by the sangi (square prisms, about 7-mm. thick and 5-cm. long) 104 and the number symbols were evidently derived from the use of these rods:

Fig-1

105 For the sake of clearness, tens, hundreds, etc., were expressed in the even place by horizontal instead of vertical lines and vice versa; thus 1267 would be formed

Fig-2

106 The rods were arranged on a sort of chessboard called the swan-pan. Much later the lines were transferred to paper, and a circle used to denote the vacant square. 107 The use of squares, however, rendered it unnecessary to arrange the even places differently from the odd, so numbers like 38057 came to be written

Fig-3

108 instead of

Fig-4

as in the earlier notation.

109 Somewhere in the course of these early mathematical activities the process has changed from the more or less spontaneous operating that led primitive human to the first enunciation of arithmetical ideas, and has become a self-conscious striving for the solution of problems. 110 This change had already taken place before the historical origins of arithmetic are met. 111 Thus, the

treatise of Ahmes (2000 B. C.) contains the curious problem: 7 persons each have 7 cats; each cat eats 7 mice; each mouse eats 7 ears of barley; from each ear 7 measures of corn may grow; how much grain has been saved? 112 Such problems are, however, half play, as appears in a Leonardo of Pisa version some 3000 years later: 113 7 old women go to Rome; each woman has 7 mules; each mule, 7 sacks; each sack contains 7 loaves; with each loaf are 7 knives; each knife is in 7 sheaths. 114 Similarly in Diophantus' epitaph (330 A. D.): "Diophantus passed 1/6 of his life in childhood, 1/12 in youth, and 1/7 more as a bachelor; 115 5 years after his marriage, was born a son who died 4 years before his father at 1/2 his age." 116 Often among peoples such puzzles were a favourite social amusement. 117 Thus Braymagupta (628 A. D.) reads, "These problems are proposed simply for pleasure; the wise person can invent a thousand others, or you can solve the problems of others by the rules given here. 118 As the sun eclipses the stars by its brilliancy, so the person of knowledge will eclipse the fame of others in assemblies of the people if you proposes algebraic problems, and still more if you solves them".

119 The limitation of these early methods is that the notation merely records and does not aid computation. And this is true even of such a highly developed system as was in use among the Romans. 120 If the reader is unconvinced, let you attempt some such problem as the multiplication of CCCXVI by CCCCLXVIII, expressing it and carrying it through in Roman numerals, and you will long for the abacus to assist your labours. 121 It was the positional arithmetic of the Arabians, of which the origins are obscure, that made possible the development of modern technique. 122 Of this discovery, or rediscovery from the Hindoos, together with the zero symbol, Cajori has said "of all mathematical discoveries, no one has contributed more to the general progress of intelligence than this." 123 The notation no longer merely records results, but now assists in performing operations.

124 The origins of geometry are even more obscure than those of arithmetic. 125 Not only is geometry as highly developed as arithmetic when it first appears in occidental civilisation, 126 but, in addition, the problems of primitive peoples seem to have been such that they have developed no geometrical formulæ striking enough to be recorded by investigators, so far as I have been able to discover. 127 But just as the commercial life of the Phoenicians early forced them self-consciously to develop arithmetical calculation, so environmental conditions seem to have forced upon the Egyptians a need for geometrical considerations.

128 It is almost platitudinous to quote Herodotus' remark that the invention of geometry was necessary because of the floods of the Nile, which washed away the boundaries and changed the contours of the fields. 129 And as Proclus Diadochus adds ('Procli Diadochi, in primum Euclidis elementorum librum commentarii'-- quoted Cantor): 130 "It is not surprising that the discovery of this as well as other sciences has sprung from need, because everything in the process of beginning proceeds from the incomplete to the complete. 131 There takes place a suitable transition from sensible perception to thoughtful consideration and rational knowledge. 132 Just as with the Phoenicians, for the sake of business and commerce, an exact knowledge of numbers had its beginning, so with the Egyptians, for the above-mentioned reasons, was geometry contrived."

133 The earliest Egyptian mathematical writing that we know is that of Ahmes (2000 B. C.), 134 but long before this the mural decorations of the temple wall involved many figures, the construction of which involved a certain amount of working knowledge of such operations as may be performed with the aid of a ruler and compass. 135 The fact that these operations did not earlier lead to geometry, as ruler and compass work seems to have done in Japan in the nineteenth century, 136 is probably due to the stage at which the development of Egyptian intelligence had arrived,

feebly advanced on the road to higher abstract thinking. 137 It is everywhere characteristic of Egyptian genius that little purely intellectual curiosity is shown. 138 Even astronomical knowledge was limited to those determinations which had religious or magically practical significance, 139 and its arithmetic and geometry never escaped these bounds as with the more imaginative Pythagoreans, where mystical interpretation seems to have been a consequence of rather than a stimulus to investigation. 140 An old Egyptian treatise reads: "I hold the wooden pin (Nebi) and the handle of the mallet (semes), I hold the line in concurrence with the Goddess Safech. 141 My glance follows the course of the stars. When my eye comes to the constellation of the great bear and the time of the number of the hour determined by me is fulfilled, I place the corner of the temple." 142 This incantation method could hardly advance intelligence; but the methods of practical measuring were more effective. 143 Here the rather happy device of using knotted cords, carried about by the Harpedonapts, or cord stretchers, was of some moment. 144 Especially, the fact that the lengths 3, 4, and 5, brought into triangular form, served for an interesting connection between arithmetic and the right triangle, was not a little gain, 145 later making possible the discovery of the Pythagorean theorem, although in Egypt the theoretical properties of the triangle were never developed. 146 The triangle obviously must have been practically considered by the decorators of the temple and its builders, but the cord stretchers rendered clear its arithmetical significance. 147 However, Ahmes' "Rules for attaining the knowledge of all dark things ... all secrets that are contained in objects" contains merely a mixture of all sorts of mathematical information of a practical nature,-- 148 "rules for making a round fruit house," "rules for measuring fields," "rules for making an ornament," etc., 149 but hardly a word of arithmetical and geometrical processes in themselves, unless it be certain devices for writing fractions and the like.

INTELLIGENCE

THE PROGRESS OF SELF-CONSCIOUS THEORY

150 A characteristic of Greek social life is responsible both for the next phase of the development of mathematical thought and for the misapprehension of its nature by so many moderns. 151 "When Archytas and Menaechmus employed mechanical instruments for solving certain geometrical problems, 'Plato,' says Plutarch, 'inveighed against them with great indignation and persistence as destroying and perverting all the good that there is in geometry; 152 for the method absconds from incorporeal and intellectual or sensible things, and besides employs again such bodies as require much vulgar handicraft: 153 in this way mechanics was dissimilated and expelled from geometry, and being for a long time looked down upon by philosophy, became one of the arts of war.' 154 In fact, manual labour was looked down upon by the Greeks, and a sharp distinction was drawn between the slaves who performed bodily work and really observed Nature, and the leisured upper classes who speculated, and often only knew Nature by hearsay. 155 This explains much of the naïve dreamy and hazy character of ancient natural science. 156 Only seldom did the impulse to make experiments for oneself break through; but when it did, a great progress resulted, as was the case of Archytas and Archimedes. 157 Archimedes, like Plato, held that it was undesirable for a philosopher to seek to apply the results of science to any practical use; 158 but, whatever might have been his view of what ought to be in the case, he did actually introduce a large number of new inventions". 159 Following the Greek lead, certain empirically minded modern thinkers construe geometry wholly from an intellectual point of view. 160 History is read by them as establishing indubitably the proposition that mathematics is a matter of purely intellectual operations. 161 But by so construing it, they have, in geometry, remembered solely the measuring and forgotten the land, and, in arithmetic, remembered the counting and forgotten the things counted.

162 Arithmetic experienced little immediate gain from its new association with geometry, which was destined to be of momentous import in its latter history, beyond the discovery of irrationals (which, however, were for centuries not accepted as numbers), 163 and the establishment of the problem of root-taking by its association with the square, and interest in negative numbers.

164 The Greeks had only subtracted smaller numbers from larger, but the Arabs began to generalise the process and had some acquaintance with negative results, 165 but it was difficult for them to see that these results might really have significance. 166 N. Chuquet, in the fifteenth century, seems to have been the first to interpret the negative numbers, but he remained a long time without imitators. 167 Michael Stifel, in the sixteenth century, still calls them "Numeri absurdi" as over against the "Numeri veri." 168 However, their geometrical interpretation was not difficult, and they soon won their way into good standing. 169 But the case of the imaginary is more striking. The need for it was first felt when it was seen that negative numbers have no square roots. 170 Chuquet had dealt with second-degree equations involving the roots of negative numbers in 1484, but says these numbers are "impossible," and Descartes ('Geom.', 1637) first uses the word "imaginary" to denote them. 171 Their introduction is due to the Italian algebrists of the sixteenth century. They knew that the real roots of certain algebraic equations of the third degree are represented as results of operations effected upon "impossible" numbers of the form $a + b\sqrt{-1}$ 172 (where 'a' and 'b' are real numbers) without it being possible in general to find an algebraic expression for the roots containing only real numbers. 173 Cardan calculated with these "impossibles," using them to get real results $[(5 + \sqrt{-15})(5 - \sqrt{-15}) = 25 - (-15) = 40]$, 174 but adds that it is a "quantitas quae vere est sophistica" and that the calculus itself "adeo est subtilis ut est inutilis." 175 In 1629, Girard announced the theorem that every complete algebraic equation admits of as many roots, real or imaginary, as there are units in its

degree, but Gauss first proved this in 1799, and finally, in his '*Theory of Complex Quantity*', in 1831.

176 Geometry, however, among the Greeks passed into a stage of abstraction in which lines, planes, etc., in the sense in which they are understood in our elementary texts, took the place of actually measured surfaces, 177 and also took on the deductive form of presentation that has served as a model for all mathematical presentation since Euclid. 178 Mensuration smacked too much of the exchange, and before the time of Archimedes is practically wholly absent. 179 Even such theorems as "that the area of a triangle equals half the product of its base and its altitude" is foreign to Euclid. 180 Lines were merely directions, and points limitations from which one worked. But there was still dependence upon the things that one measures. 181 Euclid's elements, "when examined in the light of strict mathematical logic, ... has been pronounced by C. S. Peirce to be 'Riddled with fallacies'". 182 Not logic, but observation of the figures drawn, that is, concrete symbolisation of the processes indicated, saves Euclid from error.

183 Roman practical geometry seems to have come from the Etruscans, but the Roman here is as little inventive as in own arithmetical ventures, although the latter were stimulated somewhat by problems of inheritance and interest reckoning. 184 Indeed, before the entrance of Arabic learning into Europe and the translation of Euclid from the Arabic in 1120, there is little or no advance over the Egyptian geometry of 600 B. C. Even the universities neglected mathematics. 185 At Paris "in 1336 a rule was introduced that no student should take a degree without attending lectures on mathematics, 186 and from a commentary on the first six books of Euclid, dated 1536, it appears that candidates for the degree of A. M. had to give an oath that they had attended lectures on these books. 187 Examinations, when held at all, probably did not extend beyond the first book, as is shown by the nickname 'magister matheseos' applied to the 'Theorem of Pythagoras', the last in the first

book.... 188 At Oxford, in the middle of the fifteenth century, the first two books of Euclid were read". But later geometry dropped out and not till 1619 was a professorship of geometry instituted at Oxford. 189 Roger Bacon speaks of Euclid's fifth proposition as "elefuga," and it also gets the name of "pons asinorum" from its point of transition to higher learning. 190 As late as the fourteenth century an English manuscript begins "Nowe sues here a Tretis of Geometri whereby you may knowe the hegte, depnes, and the brede of most what erthely thynges."

191 The first significant turning-point lies in the geometry of Descartes. 192 Viete (1540-1603) and others had already applied algebra to geometry, but Descartes, by means of coördinate representation, established the idea of motion in geometry in a fashion destined to react most fruitfully on algebra, and through this, on arithmetic, as well as enormously to increase the scope of geometry. 193 These discoveries are not, however, of first moment for our problem, for the ideas of mathematical entities remain throughout them the generalised processes that had appeared in Greece. 194 It is worth noting, however, that in England mechanics has always been taught as an experimental science, while on the Continent it has been expanded deductively, as a development of 'a priori' principles.

CONTEMPORARY THOUGHT IN ARITHMETIC AND GEOMETRY

195 To develop the complete history of arithmetic and geometry would be a task quite beyond the limits of this paper, and of the writer's knowledge. 196 In arithmetic we were able to observe a stage in which spontaneous behaviour led to the invention of number names and methods of counting. 197 Then, by certain speculative and "play" impulses, there arose elementary arithmetical problems which began to be of interest in themselves. 198 Geometry here also comes into consideration, and, in connection with positional number symbols, begin those interactions between

arithmetic and geometry that result in the forms of our contemporary mathematics. 199 The complex quantities represented by number symbols are no longer merely the necessary results of analysing commercial relations or practical measurements, and geometry is no longer directly based upon the intuitively given line, point, and plane. 200 If number relations are to be expressed in terms of empirical spatial positions, it is necessary to construct many imaginary surfaces, as is done by Riemann in his theory of functions, 201 a construction representing the type of imagination which Poincaré has called the intuitional in contradistinction to the logical. 202 And geometry has not only been led to the construction of many non-Euclidian spaces, but has even, with Peano and his school, been freed from the bonds of any necessary spatial interpretation whatsoever.

203 To trace in concrete detail the attainment of modern refinements of number theory would likewise exhibit nothing new in the building up of mathematical intelligence. 204 We should find, here, a process carried out without thought of the consequences, there, an analogy suggesting an operation that might lead us beyond a difficulty that had blocked progress; 205 here, a play interest leading to a combination of symbols out of which a new idea has sprung; there, a painstaking and methodical effort to overcome a difficulty recognised from the start. 206 It is rather for us now to ask what it is that has been attained by these means, to inquire finally what are those things called "number" and "line" in the broad sense in which the terms are now used.

207 In so far as the cardinal number at least is concerned, the answer generally accepted by Dedekind, Peano, Russell, and such writers is this: the number is a "class of similar classes". 208 To the interpretation of this answer, Mr. Russell, the most self-consciously philosophical of these mathematicians, has devoted his full dialectic skill. 209 The definition has at least the merit of being free from certain arbitrary psychologising that has vitiated

many earlier attempts at the problem. 210 Mr. Russell claims for it "(1) that the formal properties which we expect cardinal numbers to have result from it; 211 (2) that unless we adopt this definition or some more complicated and practically equivalent definition, it is necessary to regard the cardinal number of a class as indefinable". 212 That the definition's terms, however, are not without obscurity appears in Mr. Russell's struggles with the zigzag theory, the no-class theory, etc., and finally in his taking refuge in the theory of "logical types", 213 whereby the contradiction that subverted Frege and drove Mr. Russell from the standpoint of the 'Principles of Mathematics' is finally overcome.

214 The second of Mr. Russell's claims for his definition adds nothing to the first, for it merely asserts that unless we adopt some definition of the cardinal number from which its formal properties result, number is undefined. 215 Any such definition would be, 'ipso facto', a practical equivalent of the first. 216 We need only consider whether or not the formal properties of numbers clearly follow from this definition.

217 Mr. Russell's own experience makes us hesitate. When he first adopted this definition from Frege, he was led to make the inference that the class of all possible classes might furnish a type for a greatest cardinal number. 218 But this led to nothing but paradox and contradiction. 219 The obvious conclusion was that something was wrong with the concept of class, and the obvious way out was to deny the possibility of any such all-inclusive class. 220 Just why there should be such limitation, except that it enables one to escape the contradiction, is not clear from Mr. Russell's analysis. 221 Furthermore, to pass to the theory of types on this ground is to give up the value of the first claim for the definition (quoted above), 222 since the formal properties of numbers now merely follow from the definition because the terms of the definition are reinterpreted from the properties of number, so that these properties will follow from it. The definition has become circular.

223 The real difficulty lies in the concept of the class. 224 Dogmatic realism is prone to find here an entity for which, as it is obviously not a physical thing, a home must be provided in some region of "being." 225 Hence arises the realm of subsistence, as for Plato the world of facts duplicated itself in a world of ideas. 226 But the subsistent realm of the mathematician is even more astounding than the ideal realm of Plato, for the latter world is a prototype of the world of things, 227 while the world of the mathematician is peopled by all sorts of entities that never were on land or sea. 228 The transfinite numbers of Cantor have, without doubt, a definite mathematical meaning, but they have no known representatives in the world of things, nor in the imagination of human, 229 and in spite of the efforts of philosophers it may even be doubted whether an entity correlative to the mathematical infinite has ever been or can ever be specified.

230 Mr. Russell now teaches that "classes are merely symbolic", but this expression still needs elucidation. 231 It does, to be sure, avoid the earlier difficulty of admitting "new and mysterious metaphysical entities", but the "feeling of oddity" that accompanies it seems not without significance. 232 What can be meant by a merely symbolic class of similar classes themselves merely symbolical? I do not know, 233 unless it is that we are to throw overboard the effort aimed at arbitrary and creative definition and proceed in simple inductive and interpretative fashion. 234 With classes as entities abandoned, we are left, until we have passed to a new point of view as to arithmetical entities, in the position of the intelligent ignoramus 235 who defined a stock market operation as buying what you can't get with money you never had, and selling what you never owned for more than it was ever worth.

236 The situation seems to be that we are now face to face with new generalisations. 237 Just as number symbols arose to denote operations gone through in counting things when attention is diverted from the particular characteristics of the

things counted, 238 and remained a symbol for those operations with things, so now we are becoming self-conscious of the character of the operations we have been performing 239 and are developing new symbols to express possible operations with operations. 240 The infinity of the number series expresses the fact that it is possible to continue the enumerating process indefinitely, 241 and when we are asked by certain mathematicians to practise ourselves in such thoughts as that for infinite series a proper part can be the equal of the whole, where equality is defined through the establishment of one-one correspondence, 242 we are really merely informed that among the group of symbols used to denote the concrete steps of an ever open counting process are groups of symbols 243 that can be used to indicate operations that are of the same type as the given one in so far as the characteristic of being an open series is concerned. 244 If there were anywhere an infinity of things to count, an unintelligible supposition, it would by no means be true that any selection of things from that series would be the equivalent of all things in the series, 245 except in so far as equivalence meant that they could be arranged in the same type of series as that from which they were drawn.

246 Similarly the mathematical conception of the continuum is nothing but a formulation of the manner in which the cuts of a line or the numbers of a continuous series must be chosen so that there shall remain no possible cut or number of which the choice is not indicated. 247 Correspondence is reached between elements of such series when the corresponding elements can be reached by an identical process. 248 It seems to me, however, a mistake to 'identify' the number continuum with the linear continuum, for the latter must include the irrational numbers, whereas the irrational number can never represent a spatial position in a series. 249 For example, the $\sqrt{2}$ is by nature a decimal involving an infinite, i.e., an ever increasing, number of digits to express it and, by virtue of the infinity of these digits, they can never be looked upon as all

given. 250 It is then truly a number, for it expresses a genuine numerical operation, 251 but it is not a position, for it cannot be a determinate magnitude but merely a quantity approaching a determinate magnitude as closely as one may please. 252 That is, without its complete expression, which would be analogous to the self-contradictory task of finding a greatest cardinal number, there can be no cut in the line which is symbolised by it. 253 But the operations of translating algebraic expressions into geometrical ones and vice versa (operations which are so important in physical investigations) are facilitated by the notion of a one to one correspondence between number and space.

254 When we pass to the transfinite numbers, we have nothing in the Alephs but the symbols of certain groupings of operations expressible in ordinary number series. 255 And the many forms of numbers are all simply the result of recognising value in naming definite groups of operations of a lower level, which may itself be a complication of processes indicated by the simple numerical signs. 256 To create such symbols is by no means illegitimate and no paradox results in any forms 257 as long as we remember that our numbers are not things but are signs of operations that may be performed directly upon things or upon other operations.

258 For example, let us consider such a symbol as $\sqrt{-5}$. -5 signifies the totality of a counting process carried on in an opposite sense from that denoted by +5. 259 To take the square root is to symbolise a number, the totality of an operation, such that when the operation denoted by multiplying it by itself is performed the result is 5. 260 Consequently the $\sqrt{-5}$ is merely the symbol of these processes combined in such a way that the whole operation is to be considered as opposite in some sense to that denoted by $\sqrt{5}$. 261 Hence, an easy method for the representation of such imaginaries is based on the principle of analytic geometry and a system of co-ordinates.

262 The nature of this last generalisation of mathematics is well shown by Mr. Whitehead in

his monumental 'Universal Algebra'. 263 The work begins with the definition of a calculus as "The art of manipulating substitutive signs according to fixed rules, and the deduction therefrom of true propositions". 264 The deduction itself is really a manipulation according to rules, and the truth consists essentially in the results being actually derived from the premises according to rule. 265 Following Stout, substitutive signs are characterised thus: "a word is an instrument for thinking about the meaning which it expresses; a substitutive sign is a means of not thinking about the meaning which it symbolises." 266 Mathematical symbols have, then, become substitutive signs. But this is only possible because they were at an early stage of their history expressive signs, 267 and the laws which connected them were derived from the relations of the things for which they stood. 268 First it became possible to forget the things in their concreteness, and now they have become mere terms for the relations that had been generalised between them. 269 Consequently, the things forgotten and the terms treated as mere elements of a relational complex, it is possible to state such relational complexes with the utmost freedom. 270 But this does not mean that mathematics can be created in a purely arbitrary fashion. The mark of its origin is upon it in the need of exhibiting some existing situation through which the non-contradictory character of its postulates can be verified. 271 The real advantage of the generalisation is that of all generalisations in science, 272 namely, that by looking away from practical applications (as appears in a historical survey) results are frequently obtained that would never have been attained if our labour had been consciously limited merely to those problems where the advantages of a solution were obvious. 273 So the most fantastic forms of mathematics, which themselves seem to bear no relation to actual phenomena, just because the relations involved in them are the relations that have been derived from dealing with an actual world, 274 may contribute to the solutions of problems in other forms of calculus, or even to the

creation of new forms of mathematics. 275 And these new forms may stand in a more intimate connection with aspects of the real world than the original mathematics.

276 In 1836-39 there appeared in the 'Gelehrte Schriften der Universität Kasan', Lobatchewsky's epoch-making "New Elements of Geometry, with a Complete Theory of Parallels." 277 After proving that "if a straight line falling on two other straight lines make the alternate angles equal to one another, the two straight lines shall be parallel to one another," 278 Euclid, finding himself unable to prove that in every other case they were not parallel, assumed it in an axiom. 279 But it had never seemed obvious. Lobatchewsky's system amounted merely to developing a geometry on the basis of the contradictory axiom, 280 that through a point outside a line an indefinite number of lines can be drawn, no one of which shall cut a given line in that plane. 281 In 1832-33, similar results were attained by Johann Bolyai in an appendix to his father's "'*Tentamen juventutem studiosam in elementa matheseosos puræ ... introducendi*'" entitled "The Science of Absolute Space." 282 In 1824 the dissertation of Riemann, under Gauss, introduced the idea of an 'n'-ply extended magnitude, or a study of 'n'-dimensional manifolds and a new road was opened for mathematical intelligence.

283 At first this new knowledge suggested all sorts of metaphysical hypotheses. 284 If it is possible to build geometries of 'n'-dimensions or geometries in which the axiom of parallels is no longer true, why may it not be that the space in which we make our measurements and on which we base our mechanics is some one of these "non-Euclidian" spaces? 285 And indeed many experiments were conducted in search of some clue that this might be the case. Such experiments in relation to "curved spaces" seemed particularly alluring, but all have turned out to be fruitless in results. 286 Failure leads to investigation of the causes of failure. 287 If our space had been some one of these spaces how would it have been possible

for us to know this fact? 288 The traditional definition of a straight line has never been satisfactory from a physical point of view. To define it as the shortest distance between two points is to introduce the idea of distance, 289 and the idea of distance itself has no meaning without the idea of straight line, and so the definition moves in a vicious circle. 290 On the metaphysical side, Lotze and others criticised these attempts, on the whole justly, but the best interpretation of the situation has been given by Poincaré.

291 Two lines of thought now lead to a recasting of our conceptions of the fundamental notions of geometry. 292 On the one hand, that very investigation of postulates that had led to the discovery of the apparently strange non-Euclidian geometries was easily continued to an investigation of the simplest basis on which a geometry could be founded. 293 Then by reaction it was continued with similar methods in dealing with algebra, and other forms of analysis, 294 with the result that conceptions of mathematical entities have gradually emerged that represent a new stage of abstraction in the evolution of mathematics, soon to be discussed as the dominating conceptions in contemporary thought. 295 On the other hand, there also developed the problem of the relations of these geometrical worlds to one another, 296 which has been primarily significant in helping to clear up the relations of mathematics in its "pure" and "applied" forms.

297 Geometry passed through a stage of abstraction like that examined in connection with arithmetic. 298 Beginning with the discovery of non Euclidian geometry, it has been becoming more and more evident that a line need not be a name for an aspect of a physical object such as the ridge-pole line of a house and the like, 299 nor even for the more abstract mechanical characteristic of direction of movement;-- 300 although the persistency with which intuitionally minded geometers have sought to adapt such illustrations to their needs has somewhat obscured this fact. 301 However, even a cursory examination of a modern treatise

on geometry makes clear what has taken place. 302 For example, Professor Hilbert begins his 'Grundlagen der Geometrie', not with definition of points, lines, and planes, but with the assumption of three different systems of things (Dinge) 303 of which the first, called points, are denoted A, B, C, etc., second, called straight lines (Gerade), are denoted a, b, c, etc., and the third, called planes, are denoted by [Greek: alpha], [Greek: beta], [Greek: gamma], etc. 304 The relations between these things then receive "genaue und vollständige Beschreibung" through the axioms of the geometry. 305 And the fact that these "things" are called points, lines, and planes is not to give to them any of the connotations ordinarily associated with these words further than are determined by the axiom groups that follow. 306 Indeed, other geometers are even more explicit on this point. Thus for Peano ('I Principii di Geometria', 1889) the line is a mere class of entities, the relations amongst which are no longer concrete relations but types of relations. The plane is a class of classes of entities, etc. 307 And an almost unlimited number of examples, about which the theorems of the geometry will express truths, can be exhibited, not one of which has any close resemblance to spatial facts in the ordinary sense.

308 Philosophers, it seems to me, have been slow to recognise the significance of the step involved in this last phase of mathematical thought. 309 We have been so schooled in an arbitrary distinction between relations and concepts, that while long familiar with general ideas of concepts, we are not familiar with generalised ideas of relations. 310 Yet this is exactly what mathematics is everywhere presenting. 311 A transition has been made from relations to types of relations, so that instead of speaking in terms of quantitative, spatial and temporal relations, mathematicians can now talk in terms of symmetrical, asymmetrical, transitive, intransitive relational types and the like. 312 These present, however, nothing but the empirical character that is common to such relations as that of father and son; debtor and

creditor; master and servant; 313 a is to the left of b, b of c; c of d; a is older than b, b than c, c than d, etc. 314 Hence this is not abandonment of experience but a generalisation of it, which results in a calculus potentially applicable not only to it but also to other subject-matter of thought. 315 Indeed, if it were not for the possibility of this generalisation, the almost unlimited applicability of diagrams, so useful in the classroom, 316 to illustrate everything from the nature of reality to the categorical imperative, as well as to the more technical usages of the psychological and social sciences, would not be understandable.

317 It would be a paradox, however, if starting out from processes of counting and measuring, generalisations had been attained that no longer had significance for counting or measuring, and the non-Euclidian hyper-dimensional geometries seem at first to present this paradox. 318 But, as the outcome of our second line of thought proves, this is not the case. 319 The investigation of the relations of different geometrical systems to each other has shown that these different systems have a correspondence with one another 320 so that for any theorem stated in one of them there is a corresponding theorem that can be stated in another. 321 In other words, given any factual situation that can be stated in Euclidian geometry, the aspect treated as a straight line in the Euclidian exposition will be treated as a curve in the non-Euclidian, 322 and a situation treated as three-dimensional by Euclid's methods can be treated as of any number of dimensions when the proper fundamental element is chosen, and vice versa, 323 although of course the element will not be the line or plane in our empirical usage of the term. This is what Poincaré means by saying that our geometry is a free choice, but not arbitrary, 324 for there are many limitations imposed by fact upon the choice, and usually there is some clear indication of convenience as to the system chosen, based on the fundamental ideal of simplicity.

325 It is evident, then, that geometry and arithmetic have been drawing closer together, and that to-day the distinction between them is somewhat hard to maintain. 326 The older arithmetic had limited itself largely to the study of the relations involved in serial orders as suggested by counting, 327 whereas geometry had concerned itself primarily with the relations of groups of such series to each other when the series, or groups of series, are represented as lines or planes. 328 But partly by interaction in analytic geometry, and partly in the generalisation of their own methods, both have come to recognise the fundamental character of the relations involved in their thought, 329 and arithmetic, through the complex number and the algebraic unknown quantities, has come to consider more complex serial types, 330 while geometry has approached the analysis of its series through interaction with number theory. 331 For both, the content of their entities and the relations involved have been brought to a minimum. 332 And this is true even of such apparently essentially intuitional fields as projective geometry, where entities can be substituted for directional lines and the axioms be turned into relational postulates governing their configurations.

333 Nevertheless, geometry like arithmetic, has remained true to the need that gave it initial impulse. As in the beginning it was only a method of dealing with a concrete situation, so in the end it is nothing but such a method, 334 although, as in the case of arithmetic, from ever closer contact with the situation in question, it has been led, by refinements that thoughtful and continual contact bring, to dissect that situation and give heed to aspects of it which were undreamed of at the initial moment. 335 In a sense, then, there are no such things as mathematical entities, as scholastic realism would conceive them. 336 And yet, mathematics is not dealing with unrealities, for it is everywhere concerned with real rational types and systems where such types may be exemplified. 337 Or we can say in a purely practical way that

mathematical entities are constituted by their relations, 338 but this phrase cannot here be interpreted in the Hegelian ontological sense in which it has played so great and so pernicious a part in contemporary philosophy. 339 Such metaphysical interpretation and its consequences are the basis of paradoxical absolutisms, such as that arrived at by Professor Royce. 340 The peculiar character of abstract or pure mathematics seems to be that its own operations on a lower level constitute material which serves for the subject-matter with which its later investigations deal. 341 But mathematics is, after all, not fundamentally different from the other sciences. 342 The concepts of all sciences alike constitute a special language peculiarly adapted for dealing with certain experience adjustments, 343 and the differences in the development of the different sciences merely express different degrees of success with which such languages have been formulated with respect to making it possible to predict concerning not yet realised situations. 344 Some sciences are still seeking their terms and fundamental concepts, others are formulating their first "grammar," and mathematics, still inadequate, yearly gains both in vocabulary and flexibility.

345 But if we are to conceive mathematical entities as mere terminal points in a relational system, it is necessary that we should become clear as to just what is meant by relation, and what is the connection between relations and quantities. 346 Modern thought has shown a strong tendency to insist, somewhat arbitrarily, on the "internal" or "external" character of relations. 347 The former emphasis has been primarily associated with idealistic ontology, and has often brought with it complex dialectic questions as to the identity of an individual thing in passing from one relational situation to another. 348 The latter insistence has meant primarily that things do not change with changing relations to other things. 349 It has, however, often implied the independent existence, in some curiously metaphysical state, of relations that are not relating

anything, and is hardly less paradoxical than the older view. 350 In the field of physical phenomena, it seems to triumph, while the facts of social life, on the other hand, lend some countenance to the view of the "internalists." 351 Like many such discussions, the best way around them is to forget their arguments, and turn to a fresh and independent investigation of the facts in question.

THINGS, RELATIONS, AND QUANTITIES

352 As I write, the way is paved for me by Professor Cohen, who outlines a theory of relations closely allied to that which I have in mind. 353 Professor Cohen writes: "Like the distinction between primary and secondary qualities, the distinction between qualities and relations seems to me a shifting one 354 because the 'nature' of a thing changes as the thing shifts from one context to another.... 355 To Professors Montague and Lovejoy the 'thing' is like an old-fashioned landowner and the qualities are its immemorial private possessions. 356 A thing may enter into commercial relations with others, but these relations are extrinsic. It never parts with its patrimony. 357 To me, the 'nature' of a thing seems not to be so private or fixed. 358 It may consist entirely of bonds, stocks, franchises, and other ways in which public credit or the right to certain transactions is represented.... 359 At any rate, relations or transactions may be regarded as wider or more primary than qualities or possessions. The latter may be defined as internal relations, that is, relations 'within' the system that constitutes the 'thing.' 360 The nature of a thing contains an essence, i.e., a group of characteristics which, in any given system or context, remain invariant, so that if these are changed the things drop out of our system... 361 but the same thing may present different essences in different contexts. 362 As a thing shifts from one context to another, it acquires new relations and drops old ones, 363 and in all transformations there is a change or readjustment of the line between the internal relations

which constitute the essence and the external relations which are outside the inner circle...."

364 Before continuing, however, I wish to make certain interpretations of these statements for which, of course, Professor Cohen is not responsible, and with which he would not be wholly in agreement. 365 My general attitude will be shown by the first comment. Concepts are only means of denoting fragments of experience directly or indirectly given. 366 If we then try to speak of a "nature of a thing" two interpretations of this expression are possible. 367 The "thing" as such is only a bit of reality which some motive, that without undue extension of the term can be called practical, has led us to treat as more or less isolable from the rest of reality. 368 Its nature, then, may consist of either its relations to other practically isolated realities or things, 369 its actual effective value in its environment (and hence shift with the environment as Professor Cohen points out), 370 or may consist of its essence, the "relations within the system," considered from the point of view of the potentialities implied by these for various environments. 371 In the first sense the nature may easily change with change in environment, but if it changes in the second sense, as Professor Cohen remarks, it "drops out of our system." 372 This I should interpret as meaning that we no longer have that thing, but some other thing selected from reality by a different purpose and point of view. 373 I should not say with Professor Cohen that "the same thing may present different essences in different contexts." Every reality is more than one thing-- 374 human is an aggregate of atoms, a living being, an animal, and a thinker, and all of these are different things in essence, although having certain common characteristics. 375 All attribution of "thingship" is abstraction, and all particular things may be said to participate in higher, i.e., more abstract, levels of thingship. 376 Hence the effort to retain a thingship through a changing of essence seems to me but the echo of the motive 377 that has so long deduced ontological monism from the logical fact that

to conceive any two things is at least to throw them into a common universe of discourse. 378 Consequently I should part company from Professor Cohen on this one point (which is perhaps largely a matter of definition, though here not unimportant) and distinguish merely the nature of a thing as 'actual' and as 'potential'. 379 Of these the former alone changes with the environment, while the latter changes only as the thing ceases to be by passing into some other thing. 380 In other words, if the example does not do violence to Professor Cohen's thought, I can quite understand this paper as a stimulator of criticism, or as a means of kindling a fire. 381 Professor Cohen would, I suspect, take this to mean that the same thing-- this paper-- must be looked upon as having two different essences in two different contexts, 382 for "the same thing may possess two different essences in different contexts," 383 whereas I should prefer to interpret the situation as meaning that there are before me three (and as many more as may be) different things having three different essences: 384 first, the paper as a physical object having a considerable number of definite properties; 385 second, written words, which are undoubtedly in one sense mere structural modifications of the physical object paper (i.e., colouring on it by ink, etc.), 386 but whose reality for my purpose lies in the power of evoking ideas acquired by things as symbols (things, indeed, but things whose essence lies in the effects they produce upon a reader rather than in their physical character); 387 and third, the chemical and combustion producing properties of the paper. 388 Now it is simpler for me to consider the situation as one in which three things have a common point in thingship, i.e., an abstract element in common, than to think of "'a' thing" shifting contexts and thereby changing its essence.

389 But now my divergence from Professor Cohen becomes more marked. 390 He continues with the following example: "Our neighbour M. is tall, modest, cheerful, and we understand he is a banker. His tallness, modesty, cheerfulness, and the fact that he is

a banker we usually regard as his qualities; the fact that he is our neighbour is a relation which he seems to bear to us. 391 He may move his residence, cease to be our neighbour, and yet remain the same person with the same qualities. 392 If, however, I become his tailor, his tallness becomes translated into certain relations of measurement; 393 if I become his social companion, his modesty means that he will stand in certain social relations with me, etc." 394 In other words, we are illustrating the doctrine that "qualities are reducible to relations". 395 This doctrine I cannot quite accept without modification, for I cannot tell what it means. 396 Without any presuppositions as to subjectivity or consciousness there are in the world as I know it certain coloured objects-- 397 let the expression be taken naïvely to avoid idealistico-realistic discussion which is here irrelevant. 398 Now it is as unintelligible to me that the red flowers and green leaves of the geraniums before my windows should be reducible to mere relations in any existential sense, as it would be to ask for the square root of their odour, 399 though of course it is quite intelligible that the physical theory and predictions concerning green and red surfaces (or odours) should be stated in terms of atomic distances and ether vibrations of specific lengths. 400 The scientific conception is, after all, nothing more than an indication of how to take hold of things and manipulate them to get foreseen results, 401 and its entities are real things only in the sense that they are the practically effective keynotes of the complex reality. 402 Accordingly, instead of reducing qualities to relations, it seems to me a much more intelligible view to consider relations as abstract ways of taking qualities in general, 403 as qualities thought of in their function of bridging a gap or making a transition between two bits of reality that have previously been taken as separate things. 404 Indeed, it is just because things are not ontologically independent beings (but rather selections from genuinely concatenated existence) 405 that relations become important as indications of the

practical significance of qualitative continuities which have been neglected in the prior isolation of the thing. 406 Thus, instead of an existential world that is "a network of relations whose intersections are called terms", I find more intelligible a qualitatively heterogeneous reality that can be variously partitioned into things, 407 and that can be abstractly replaced by systems of terms and relations that are adequate to symbolise their effective nature in particular respects. 408 There is a tendency for certain attributes to maintain their concreteness (qualitativeness) in things, and for others to suggest the connection of things with other things, and so to emphasise a more abstract aspect of experience. 409 Thus then arises a temporary and practical distinction that tends to be taken as opposition between qualities and relations. 410 As spatial and temporal characteristics possess their chief practical value in the connection of things, so they, like Professor Cohen's neighbour-character, are ordinarily assumed abstractly as mere relations, 411 while shapes, colours, etc., and Professor Cohen's "modesty, tallness, cheerfulness," may be thought of more easily without emphasis on other things and so tend to be accepted in their concreteness as qualities, 412 but how slender is the dividing-line Professor Cohen's easy translation of these things into relations makes clear.

413 Taken purely intellectualistically, there would be first a fiction of separation in what is really already continuous and then another fiction to bridge the gap thus made. 414 This would, of course, be the falsification against which Bergson inveighs. But this interpretation is to misunderstand the nature of abstraction. 415 Abstraction does not substitute an unreal for a real, but selects from reality a genuine characteristic of it which is adequate for a particular purpose. 416 Thus to conceive time as a succession of moments is not to falsify time, 417 but to select from processes going on in time a characteristic of them through which predictions can be made, which may be verified and turned into an instrument for the control of life or environment.

418 A similar misunderstanding of abstraction, coupled with a fuller appreciation than Bergson evinces of the value of its results, has led to the neo-realistic insistence on turning abstractions into existent entities of which the real world is taken to be an organised composite aggregate.

419 The practice of turning qualities into merely conscious entities has done much to obscure the status of scientific knowing, for it has left mere quantity as the only real character of the actual world. 420 But once take a realistic standpoint, and quantity is no more real than quality. 421 For primitive human, the qualitative aspect of reality is probably the first to which they gives heed, 422 and it is only through efforts to get along with the world in its qualitative character that its quantitative side is forced upon the attention. 423 Then so-called "exact" science is born, but it does not follow that qualities henceforth become insignificant. 424 They are still the basis of all relations, even of those that are most directly construed as quantitative. 425 Quality and quantity are only different aspects of the world which the status of our practical life leads us to take separately or abstractly. 426 "Thing" is no less an abstraction, in which we disregard certain continuities with the rest of the world because we are so constituted that the demands of living make it expedient to do so. 427 Things once given, further abstractions become possible, among which are those leading to mathematical thinking, in which higher abstractions are made, guided always by the "generating problem".

THE FUNCTION OF THEORY IN SCIENCE

428 The controlling factors for the progress of scientific thought are inventions that lead the scientist into closer contact with own data, and direct attention to complexities which would otherwise have escaped observation. 429 This end is best fulfilled by conceiving entities that under some point of view are practically isolable from the context in which they occur. 430 Only too often philosophic thought

has confused this practical segregation with ontological separation, 431 and so been obliged to introduce metaphysical and external relations to bring these entities together again in a real world, when in reality they have never been separated from one another and hence not from the real world. 432 Furthermore, the conceptual model, built on the lines of a calculus of mathematics, is often considered the truth 'par excellence' after the analogy of a camera's portrait. 433 Progress in science, however, shows that these models have to be continually rebuilt. 434 Each seems to lead to further knowledge that necessitates its reconstruction, so that truth takes on an ideal value as an ultimate but unattained, if not unattainable, goal, while existing science becomes reduced to working hypotheses. 435 From a positivistic point of view, however, the goal is not only practically unattainable, but it is irrational, for there seems to be every evidence that it expresses something contrary to the nature of the real. 436 Yet scientific theory is not wholly arbitrary. We cannot construe Nature as constituted of any sorts of entities that may suit our whim. 437 And this is because science itself recognises that its entities are not really isolated, but are endowed with all sorts of properties that serve to connect them with other entities. 438 They are only symbols of critical points of reality which, conceived in a certain way, make the behaviour of the whole intelligible. 439 Indeed, the only significant sense in which they are true for the scientist is that they indicate real connections that might otherwise have been overlooked, 440 and this is only possible from the fact that reality has the characteristics that they present and that, with their relations, they give an approximate presentation of what is actually presented 441 just as a successful portrait painter considers the individuality of the eyes, nose, mouth, etc., although you does not imply that a face is compounded of these separate features as a house is built of boards.

442 The atomic theory, for example, has undoubtedly been of the greatest service to chemistry, and atoms undoubtedly denote a

significant resting-place in the analysis of the physical world. 443 Yet in the light of electron theories, it is becoming more and more evident that atoms are not ultimate particles, and are not even all alike when they represent a single substance. 444 Again, while there is as yet no evidence to suggest that the electron must itself be considered as divisible (unless it be the distinction between the positive and negative electron), there are suggestions that electrons may themselves arise and pass away. 445 "A wisely positivistic mind," writes Enriques, "can see in the atomic hypothesis only a subjective representation," 446 and, we might add, "in any other hypothesis." He continues: "robbing the atom of the concrete attributes inherent in its image, we find ourselves regarding it as a mere symbol. 447 The logical value of the atomic theory depends, then, upon the establishment of a proper correspondence between the symbols which it contains and the reality which we are trying to represent.

448 "Now, if we go back to the time when the atomic theory was accepted by modern chemistry, we see that the plain atomic formulæ contain only the representation of the invariable relations in the combination of simple bodies, in weight and volume; 449 these last being taken in relation to a well-defined gaseous state.

450 "But, once introduced into science, the atomic phraseology suggested the extension of the meaning of the symbols, and the search in reality for facts in correspondence with its more extended conception.

451 "The theory advances, urged on, as it were, by its metaphysical nature, or, if you wish, by the association of ideas which the concrete image of the atom carries with it.

452 "Thus for the plain formulæ we have substituted, in the chemistry of carbon compounds, structural formulæ, which come to represent, thanks to the disposition or grouping of atoms in a molecule, structural relations of the second degree, 453 that is to say, relations inherent in certain chemical transformations with respect to

which some groups of elements have in some way an invariant character. 454 And here, because the image of a simple molecule upon a plane does not suffice to explain, for example, the facts of isomerism, we must resort to the stereo-chemical representation of Van't Hoff.

455 "Must we further recall the kinetic theory of gases, the facts explained by the breaking up of molecules into ions, 456 the hypothesis suggested, for example, by Van der Waals by the view that an atom has an actual bulk? 457 Must we point to a physical phenomenon of quite a different class, for example, to the colouring of the thin film forming the soap-bubbles which W. Thomson has taken as the measure of the size of a molecule?

458 "Such a résumé of results shows plainly that we cannot help the progress of science by blocking the path of theory and looking only at its positive aspects, that is to say, at the collection of facts that it explains. 459 The value of a theory lies rather in the hypothesis which it can suggest, by means of the psychological representation of the symbols.

460 "We shall not draw from all this the conclusion that the atomic hypothesis ought to correspond to the extremely subtle sensations of a being resembling a perfected human. 461 We shall not even reason about the possibility of those imaginary sensations, in so far as they are conceived simply as an extension of our own. 462 But we shall repeat, in regard to the atomic theory, what an illustrious master is said to have remarked as to the unity of matter: 463 if on first examination a fact seems possible which contradicts the atomic view of things, there is a strong probability that such a fact will be disproved by experience.

464 "Does not such a capacity for adaptation to facts, thus furnishing a model for them, perhaps denote the 'positive' reality of a theory?"

465 And the above principles are as true of mathematical concepts as of chemical. 466 Everywhere it is "capacity of adaptation to facts" that is the criterion of a branch of mathematics, except, of course, that in mathematics the facts are not always physical facts.

467 Mathematics has successfully accomplished a generalisation whereby its own methods furnish the material for higher generalisations. 468 The imaginary number and the hyper-dimensional or non-Euclidian geometries may be absurd if measured by the standard of physical reality, 469 but they nevertheless have something real about them in relation to certain mathematical processes on a lower level. 470 There is no philosophic paradox about modern arithmetic or geometry, 471 once it is recognised that they are merely abstractions of genuine features of simpler and more obviously practical manipulations that are clearly derived from the dealing of a human being with genuine realities.

472 In the light of these considerations, I cannot help feeling that the frequent attempts of mathematicians with a philosophical turn of mind, 473 and philosophers who are dipping into mathematics, to derive geometrical entities from psychological considerations are quite mistaken, 474 and are but another example of those traditional presuppositions of psychology which, Professor Dewey has pointed out, were "bequeathed by seventeenth-century philosophy to psychology, 475 instead of originating within psychology" … that "were wished upon it by philosophy when it was as yet too immature to defend itself."

476 Henri Poincaré and Enriques furnish two of the most familiar examples of this sort of philosophising. 477 Each isolates special senses, sight, touch, or motion, and tries to show how a being merely equipped with one or the other of these senses might arrive at geometrical conceptions which differ, of course, from space as represented by our familiar Euclidian geometry. 478 Then comes the question of fusing these different sorts of experience into a single experience of which geometry may be an intelligible transcription. 479 Enriques finds a parallel between the historical development and the psycho-genetic development of the postulates of geometry. 480 "The three groups of ideas that are connected with the concepts that

serve as the basis for the theory of continuum ('Analysis situs'), of metrical, and of projective geometry, may be connected, as to their psychological origin, with three groups of sensations: 481 with the general tactile-muscular sensations, with those of special touch, and of sight, respectively." 482 Poincaré even evokes ancestral experience to make good his case. "It has often been said that if individual experience could not create geometry, the same is not true of ancestral experience. But what does that mean? 483 Is it meant that we could not experimentally demonstrate Euclid's postulate, but that our ancestors have been able to do it? Not in the least. 484 It is meant that by natural selection our mind has 'adapted' itself to the conditions of the external world, that it has adopted the geometry 'most advantageous' to the species: or in other words, the 'most convenient'."

485 Now undoubtedly there may be a certain modicum of truth in these statements. As implied by the last quotation from Poincaré, 486 the modern scientist can hardly doubt that the fact of the adaptation of our thinking to the world we live in is due to the fact that it is in that world that we evolved. 487 As is implied by both writers, if one could limit human contact with the world to a particular form of sense response, thought about that world would take place in different terms from what it now does and would presumably be less efficient. 488 But these admissions do not imply that any light is thrown upon the nature of mathematical entities by such abstractions. 489 Russell (*'Scientific Method in Philosophy'*) is in the curious position of raising arithmetic to a purely logical status, but playing with geometry and sensation after the manner of Poincaré, to whom he gives somewhat grudging praise on this account.

490 The psychological methods upon which all such investigations are based are open to all sorts of criticisms. Chiefly, the conceptions on which they are based, even if correct, are only abstractions. 491 There is not the least evidence for the existence of organisms with a single differentiated sense organ, nor the

least evidence that there ever was such an organism. 492 Indeed, according to modern accounts of the evolution of the nervous system different senses have arisen through a gradual differentiation of a more general form of stimulus receptor, 493 and consequently, the possibility of the detachment of special senses is the latter end of the series and not the first. 494 But, however this may be, the mathematical concepts that we are studying have only been grasped by a highly developed organism, human, 495 but they had already begun to be grasped by you in an early stage of your career before you had analysed your experience and connected it with specific sense organs. 496 It may of course be a pleasant exercise, if one likes that sort of thing, to assume with most psychologists certain elementary sensations, and then examine the amount of information each can give in the light of possible mathematical interpretations, 497 but to do so is not to show that a being so scantily endowed would ever have acquired a geometry of the type in question, or any geometry at all. 498 Inferences of the sort are in the same category with those from hypothetical children, that used to justify all theories of the pedagogue and psychologist, or from the economic person, that still, I fear, play too great a part in the world of social science.

MATHEMATICAL INTELLIGENCE

499 The real nature of intelligence as it appears in the development of mathematics is something quite other than that of sensory analysis. 500 Intelligence is fundamentally skill, 501 and although skill may be acquired in connection with some sort of sensory contact of an organism and environment, it is only determined by that contact 502 in the sense that if the sensory conditions were different the needs of the organism might be different, and the kind and degree of skill it could attain would be other than under the conditions at first assumed. 503 Whenever the beginnings of mathematics appear with primitive people, we find a stage of development that calls for the exercise of skill in dealing with

certain practical situations. 504 Hence we found early in our investigations that it was impossible to affirm a weak intelligence from limited achievements in counting, 505 just as it would be absurd to assume the feeble intelligence of a philosopher from own inability to manipulate a boomerang. 506 The instance merely suggests a kind of skill that one has never been led to acquire.

507 Yet it is possible to distinguish intellectual skill, or better skills, from physical or athletic prowess. 508 Primarily, it is directed at the formation and use of concepts, and the concept is only a symbol that can be substituted for experiences. 509 A well-built concept is a part of a system of concepts where relations have taken the place of real connections in such a fashion 510 that, forgetting the actuality, it is possible to present situations that have never occurred or at least are not immediately given at the time and place of the presentation, 511 and to substitute them for actual situations in such a fashion that these may be expediently met, if or when such situations present themselves. 512 An isolated concept, that is, one not a part of any system, is as mythical an entity as any savage ever dreamed. 513 Indeed, it would add much to the clearness of our thinking if we could limit the use of "intelligence" to skill in constructing and using different systems of concepts, 514 and speak concretely of mathematical intelligence, philosophical intelligence, economic intelligence, historic intelligence, and the like. 515 The problem of creative intelligence is, after all, the problem of the acquisition of certain forms of skill, 516 and while the general lines are the same for all knowledge (because the instruments are everywhere symbolic presentations, or concepts), in each field the situation studied makes different types of difficulties to be overcome and suggest different methods of attaining the object.

517 In mathematics, the formal impulse to reduce the content of fundamental concepts to a minimum, and to stress merely relations has been most successful. 518 We saw its results in such

geometries as Hilbert's and Peano's, where the empty name "entity" supplants the more concrete "point," and the "1" of arithmetic has the same character. 519 In the social sciences, however, such examples as the "political" and the "economic" person are signal failures, while, perhaps, the "atom" and the "electron" approach the ideal in physics and chemistry. 520 In mathematics, all further concepts can be defined by collections of these fundamental entities constituted in certain specified ways. 521 And it is worth noting that both factually and logically a collection of entities so defined is not a mere aggregate, 522 but possesses a differentiated character of its own which, although the resultant of its constitution, is not a property of any of its elements. 523 A whole number is thus a collection of 1s, but the properties of the whole number are something quite different from that of the elements through which it is constituted, 524 just as an atom may be composed of electrons and yet, in valency, possess a property that is not the direct analogue of any property possessed by electrons not so organised.

525 Natural science, however, considers such building up of its fundamental entities into new entities 526 as a process taking place in time rather than as consequent upon change of form of the whole rendering new analytic forms expedient. 527 Hence it points to the occurrence of genuine novelties in the realm of objective reality. 528 Mathematics, on the other hand, has generalised its concepts beyond the facts implied in spatial and temporal observations, 529 so that while significant in both fields by virtue of the nature of its abstractions, its novelties are the novelties of new conceptual formations, a distinguishing of previously unnoted generalisations of relations existent in the realm of facts. 530 But the fact that time has thus passed beyond its empirical meaning in the mathematical realm is no ground for giving mathematics an elevated position as a science of eternal realities, of subsistent beings, or the like. 531 The generalisation of concepts to cover both spatial and temporal

facts does not create new entities for which a home must be provided in the partition of realities. 532 Metaphysicians should not be the "needy knife grinders" of M. Anatole France. Nevertheless, the success of abstraction for mathematical intelligence has been immense.

533 No significant thinking is wholly the work of an individual human. 534 Ideas are a product of social coöperation in which some have wrested crude concepts from Nature, others have refined them through usage, and still others have built them into an effective system. 535 The first steps were undoubtedly taken in an effort to communicate, and progress has been in part the progress of language. 536 The original nature of human may have as a part those reactions which we call curiosity, 537 but, as Auguste Comte long ago pointed out, these reactions are among the feeblest of our nature and without the pressure of practical affairs could hardly have advanced the race beyond barbarism. 538 Science was the plaything of the Greek, the consolation of the Middle Ages, and only for the modern has it become an instrument in such fashion as to mark an epoch in the still dawning discovery of mind.

539 Human is, after all, rational only because through your nervous system you can hold your immediate responses in check and finally react as a being that has had experiences and profited by them. 540 Concepts are the medium through which these experiences are in effect preserved; they express not merely a fact recorded but also the significance of a fact, not merely a contact with the world but also an attitude toward the future. 541 It may be that the mere judgment of fact, a citation of resemblances and differences, is the basis of scientific knowledge, 542 but before knowledge is worthy of the name, these facts have undergone an ideal transformation controlled by the needs of successful prediction 543 and motivated by that self-conscious realisation of the value of control which has raised human above the beasts of the field.

544 The realm of mathematics, which we have been examining, is but one aspect of the growth of

intelligence. 545 But in theory, at least, it is among the most interesting, since in it are reached the highest abstractions of science, while its empirical beginnings are not lost. 546 But its processes and their significance are in no way different in essence from those of the other sciences. 547 It marks one road of specialisation in the discovery of mind. And in these terms we may read all history. 548 To quote Professor Woodbridge: "We may see human rising from the ground, startled by the first dim intimation that the things and forces about you are convertible and controllable. 549 Curiosity excites you, but you are subdued by an untrained imagination. The things that frighten you, you tries to frighten in return. The things that bless you, you blesses. 550 You would scare the earth's shadow from the moon and sacrifice your dearest to a propitious sky. It avails not. But the little things teach you and discipline your imagination. 551 You have kicked the stone that bruised you only to be bruised again. So you converts the stone into a weapon and begins the subjugation of the world, singing a song of triumph by the way. 552 Such is your history in epitome-- a blunder, a conversion, a conquest, and a song. 553 That sequence you will repeat in greater things. You will repeat it yet and rejoice where you now despairs, converting the chaos of your social, political, industrial, and emotional life into wholesome force. 554 You will sing again. But the discovery of mind comes first, and then, the song."

SCIENTIFIC METHOD AND INDIVIDUAL THINKER

George H. Mead

4 The scientist in the ancient world found own test of reality in the evidence of the presence of the essence of the object. 2 This evidence came by way of observation, even to the Platonist. Plato could treat this evidence as the awaking of memories of the ideal essence of the object seen in a world beyond the heavens during a former stage of the existence of the soul. 3 In the language of Theatetus it was the agreement of

fluctuating sensual content with the thought-content imprinted in or viewed by the soul. 4 In Aristotle it is again the agreement of the organised sensuous experience with the vision which the mind gets of the essence of the object through the perceptual experience of a number of instances. 5 That which gives the stamp of reality is the coincidence of the percept with a rational content which must in some sense be in the mind to insure knowledge, as it must be in the cosmos to insure existence, of the object. 6 The relation of this test of reality to an analytical method is evident. Our perceptual world is always more crowded and confused than the ideal contents by which the reality of its meaning is to be tested. 7 The aim of the analysis varies with the character of the science. 8 In the case of Aristotle's theoretical sciences, such as mathematics and metaphysics, where one proceeds by demonstration from the given existences, analysis isolates such elements as numbers, points, lines, surfaces, and solids, essences and essential accidents. 9 Aristotle approaches Nature, however, as he approaches the works of human art. Indeed, he speaks of Nature as the artificer par excellence. 10 In the study of Nature, then, as in the study of the practical and productive arts, it is of the first importance that the observer should have the idea-- the final cause-- as the means of deciphering the nature of living forms. 11 Here analysis proceeds to isolate characters which are already present in forms whose functions are assumed to be known. 12 By analogy such identities as that of fish fins with limbs of other vertebrates are assumed, and some very striking anticipations of modern biological conceptions and discoveries are reached. 13 Aristotle recognises that the theory of the nature of the form or essence must be supported by observation of the actual individual. 14 What is lacking is any body of observation which has value apart from some theory. 15 He tests his theory by the observed individual which is already an embodied theory, rather than by what we are wont to call the facts. 16 He refers to other observers to disagree with them. He does not

present their observations apart from their theories as material which has existential value, independent for the time being of any hypothesis. 17 And it is consistent with this attitude that he never presents the observations of others in support of his own doctrine. 18 His analysis within this field of biological observation does not bring him back to what, in modern science, are the data, but to general characters which make up the definition of the form. 19 His induction involves a gathering of individuals rather than of data. Thus analysis in the theoretical, the natural, the practical, and the productive sciences, leads back to universals. 20 This is quite consistent with Aristotle's metaphysical position that since the matter of natural objects has reality through its realisation in the form, whatever appears without such meaning can be accounted for only as the expression of the resistance which matter offers to this realisation. 21 This is the field of a blind necessity, not that of a constructive science.

22 Continuous advance in science has been possible only when analysis of the object of knowledge has supplied not elements of meanings as the objects have been conceived but elements abstracted from those meanings. 23 That is, scientific advance implies a willingness to remain on terms of tolerant acceptance of the reality of what cannot be stated in the accepted doctrine of the time, but what must be stated in the form of contradiction with these accepted doctrines. 24 The domain of what is usually connoted by the term facts or data belongs to the field lying between the old doctrine and the new. 25 This field is not inhabited by the Aristotelian individual, for the individual is but the realisation of the form or universal essence. 26 When the new theory has displaced the old, the new individual appears in the place of its predecessor, 27 but during the period within which the old theory is being dislodged and the new is arising, a consciously growing science finds itself occupied with what is on the one hand the débris of the old and on

the other the building material of the new. 28 Obviously, this must find its immediate 'raison d'être' in something other than the meaning that is gone or the meaning that is not yet here. 29 It is true that the barest facts do not lack meaning, though a meaning which has been theirs in the past is lost. 30 The meaning, however, that is still theirs is confessedly inadequate, otherwise there would be no scientific problem to be solved. 31 Thus, when older theories of the spread of infectious diseases lost their validity because of instances where these explanations could not be applied, 32 the diagnoses and accounts which could still be given of the cases of the sickness themselves were no explanation of the spread of the infection. 33 The facts of the spread of the infection could be brought neither under a doctrine of contagion which was shattered by actual events nor under a doctrine of the germ theory of disease, which was as yet unborn. 34 The logical import of the dependence of these facts upon observation, and hence upon the individual experience of the scientist, I shall have occasion to discuss later; 35 what I am referring to here is that the conscious growth of science is accompanied by the appearance of this sort of material.

36 There were two fields of ancient science, those of mathematics and of astronomy, within which very considerable advance was achieved, a fact which would seem therefore to offer exception to the statement just made. 37 The theory of the growth of mathematics is a disputed territory, 38 but whether mathematical discovery and invention take place by steps which can be identified with those which mark the advance in the experimental sciences or not, 39 the individual processes in which the discoveries and inventions have arisen are almost uniformly lost to view in the demonstration which presents the results. 40 It would be improper to state that no new data have arisen in the development of mathematics, 41 in the face of such innovations as the minus quantity, the irrational, the imaginary, the infinitesimal, or the transfinite number, and yet the innovations appear as the recasting of the mathematical theories rather

than as new facts. 42 It is of course true that these advances have depended upon problems such as those which in the researches of Kepler and Galileo led to the early concepts of the infinitesimal procedure, 43 and upon such undertakings as bringing the combined theories of geometry and algebra to bear upon the experiences of continuous change. 44 For a century after the formulation of the infinitesimal method people were occupied in carrying the new tool of analysis into every field where its use promised advance. 45 The conceptions of the method were uncritical. Its applications were the center of attention. 46 The next century undertook to bring order into the concepts, consistency into the doctrine, and rigour into the reasoning. 47 The dominating trend of this movement was logical rather than methodological. 48 The development was in the interest of the foundations of mathematics rather than in the use of mathematics as a method for solving scientific problems. 49 Of course this has in no way interfered with the freedom of application of mathematical technique to the problems of physical science. 50 On the contrary, it was on account of the richness and variety of the contents which the use of mathematical methods in the physical sciences imported into the doctrine that this logical housecleaning became necessary in mathematics. 51 The movement has been not only logical as distinguished from methodological but logical as distinguished from metaphysical as well. 52 It has abandoned a Euclidean space with its axioms as a metaphysical presupposition, and it has abandoned an Aristotelian subsumptive logic for which definition is a necessary presupposition. 53 It recognises that everything cannot be proved, but it does not undertake to state what the axiomata shall be; 54 and it also recognises that not everything can be defined, and does not undertake to determine what shall be defined implicitly and what explicitly. 55 Its constants are logical constants, as the proposition, the class and the relation. 56 With these and their

like and with relatively few primitive ideas, which are represented by symbols, and used according to certain given postulates, it becomes possible to bring the whole body of mathematics within a single treatment. 57 The development of this pure mathematics, which comes to be a logic of the mathematical sciences, has been made possible by such a generalisation of number theory and theories of the elements of space and time 58 that the rigour of mathematical reasoning is secured, while the physical scientist is left the widest freedom in the choice and construction of concepts and imagery for own hypotheses. 59 The only compulsion is a logical compulsion. The metaphysical compulsion has disappeared from mathematics and the sciences whose techniques it provides.
60 It was just this compulsion which confined ancient science. Euclidian geometry defined the limits of mathematics. Even mechanics was cultivated largely as a geometrical field. 61 The metaphysical doctrine according to which physical objects had their own places and their own motions determined the limits within which astronomical speculations could be carried on. 62 Within these limits Greek mathematical genius achieved marvelous results. 63 The achievements of any period will be limited by two variables: the type of problem against which science formulates its methods, and the materials which analysis puts at the scientist's disposal in attacking the problems. 64 The technical problems of the trisection of an angle and the duplication of a cube are illustrations of the problems which characterise a geometrical doctrine that was finding its technique. 65 There appears also the method of analysis of the problem into simpler problems, the assumption of the truth of the conclusion to be proved and the process of arguing from this to a known truth. 66 The more fundamental problem which appears first as the squaring of the circle, which becomes that of the determination of the relation of the circle to its diameter 67 and development of the method of exhaustion, leads up to the sphere, the regular polyhedra, to conic

sections and the beginnings of trigonometry. 68 Number was not freed from the relations of geometrical magnitudes, though Archimedes could conceive of a number greater or smaller than any assignable magnitude. 69 With the method of exhaustion, with the conceptions of number found in writings of Archimedes and others, with the beginnings of spherical geometry and trigonometry, and with the slow growth of algebra finding its highest expression in that last flaring up of Greek mathematical creation, the work of Diophantes; 70 there were present all the conceptions which were necessary for attack upon the problems of velocities and changing velocities, 71 and the development of the method of analysis which has been the revolutionary tool of Europe since the Renaissance. 72 But the problems of a relation between the time and space of a motion that should change just as a motion, without reference to the essence of the object in motion, were problems which did not, perhaps could not, arise to confront the Greek mind. 73 In any case its mathematics was firmly embedded in a Euclidian space. Though there are indications of some distrust, even in Greek times, of the parallel axiom, 74 the suggestion that mathematical reasoning could be made rigourous and comprehensive independently of the specific content of axiom and definition was an impossible one for the Greek, 75 because such a suggestion could be made only on the presupposition of a number theory 76 and an algebra capable of stating a continuum in terms which are independent of the sensuous intuition of space and time and of the motion that takes place within space and time. 77 In the same fashion mechanics came back to fundamental generalisations of experience with reference to motions which served as axioms of mechanics, both celestial and terrestrial: 78 the assumptions of the natural motion of earthly substances to their own places in straight lines, and of celestial bodies in circles and uniform velocities, of an equilibrium where equal weights operate at equal distances from the fulcrum.

79 The incommensurable of Pythagoras and the paradoxes of Zeno present the "no thoroughfares" of ancient mathematical thought. 80 Neither the continuum of space nor of motion could be broken up into ultimate units, when incommensurable ratios existed which could not be expressed, 81 and when motion refused to be divided into positions of space or time since these are functions of motion. 82 It was not until an algebraic theory of number led mathematicians to the use of expressions for the irrational, the minus, and the imaginary numbers through the logical development of generalised expressions, that problems could be formulated in which these irrational ratios and quantities were involved, 83 though it is also true that the effort to deal with problems of this character was in no small degree responsible for the development of the algebra. 84 Fixed metaphysical assumptions in regard to number, space, time, motion, and the nature of physical objects determined the limits within which scientific investigation could take place. 85 Thus though the hypothesis of Copernicus and in all probability of Tycho Brahe were formulated by Greek astronomers, 86 their physical doctrine was unable to use them because they were in flagrant contradiction with the definitions the ancient world gave to earthly and celestial bodies and their natural motions. 87 The atomic doctrine with Democritus' thoroughgoing undertaking to substitute a quantitative for a qualitative conception of matter 88 with the location of the qualitative aspects of the world in the experience of the soul appealed only to the Epicurean who used the theory as an exorcism to drive out of the universe the spirits which disturbed the calm of the philosopher.

89 There was only one field in which ancient science seemed to break away from the fixed assumptions of its metaphysics and from the definitions of natural objects which were the bases for their scientific inferences, 90 this was the field of astronomy in the period after Eudoxus. Up to and including the theories of Eudoxus, physical and mathematical

astronomy went hand in hand. [91] Eudoxus' nests of spheres within spheres hung on different axes revolving in different uniform periods was the last attempt of the mathematician philosopher to state the anomalies of the heavens, [92] and to account for the stations, the retrogressions, and varying velocities of planetary bodies by a theory resolving all phenomena of these bodies into motions of uniform velocities in perfect circles, [93] and also placing these phenomena within a physical theory consistent with the prevailing conceptions of the science and philosophy of the time. [94] As a physicist Aristotle felt the necessity of introducing further spheres between the nests of spheres assigned by Eudoxus to the planetary bodies, [95] spheres whose peculiar motions should correct the tendency of the different groups of spheres to pass their motions on to each other. [96] Since the form of the orbits of heavenly bodies and their velocities could not be considered to be the results of their masses and of their relative positions with reference to one another; [97] since it was not possible to calculate the velocities and orbits from the physical characters of the bodies, [98] since in a word these physical characters did not enter into the problem of calculating the positions of the bodies nor offer explanations for the anomalies which the mathematical astronomer had to explain, [99] it was not strange that he disinterested himself from the metaphysical celestial mechanics of his time and concentrated his attention upon the geometrical hypotheses [100] by means of which he could hope to resolve into uniform revolutions in circular orbits the anomalous motions of the planetary bodies. [101] The introduction of the epicycle with the deferent and the eccentric as working hypotheses to solve the anomalies of the heavens is to be comprehended largely in view of the isolation of the mathematical as distinguished from the physical problem of astronomy. [102] In no sense were these conceptions working hypotheses of a celestial mechanics. [103] They were the only means of an age whose mathematics was almost entirely

geometrical for accomplishing what a later generation could accomplish by an algebraic theory of functions. 104 As has been pointed out, the undertaking of the ancient mathematical astronomer to resolve the motions of planetary bodies into circular, uniform, continuous, symmetrical movements 105 is comparable to the theorem of Fourier which allows the mathematician to replace any one periodic function by a sum of circular functions. 106 In other words, the astronomy of the Alexandrian period is a somewhat cumbrous development of the mathematical technique of the time 107 to enable the astronomer to bring the anomalies of the planetary bodies, as they increased under observation, within the axioms of a metaphysical physics. 108 The genius exhibited in the development of the mathematical technique places the names of Apollonius of Perga, Hipparchus of Nicaea, and Ptolemy among the great mathematicians of the world, 109 but they never felt themselves free to attack by their hypotheses the fundamental assumptions of the ancient metaphysical doctrine of the universe. 110 Thus it was said of Hipparchus by Adrastus, a philosopher of the first century A. D., in explaining his preference for the epicycle to the eccentric as a means of analysing the motions of the planetary bodies: 111 "He preferred and adopted the principle of the epicycle as more probable to his mind, 112 because it ordered the system of the heavens with more symmetry and with a more intimate dependence with reference to the center of the universe. 113 Although he guarded himself from assuming the rôle of the physicist in devoting himself to the investigations of the real movements of the stars, 114 and in undertaking to distinguish between the motions which Nature has adopted from those which the appearances present to our eyes, 115 he assumed that every planet revolved along an epicycle, the center of which describes a circumference concentric with the earth." 116 Even mathematical astronomy does not offer an exception to the scientific method of the ancient world, 117 that of bringing to consciousness the

concepts involved in their world of experience, organising these concepts with reference to each, 118 analysing and restating them within the limits of their essential accidents, and assimilating the concrete objects of experience to these typical forms as more or less complete realisations.

119 At the beginning of the process of Greek self-conscious reflection and analysis, the mind ran riot among the concepts and their characters 120 until the contradictions which arose from these unsystematised speculations brought the Greek mind up to the problems of criticism and scientific method. 121 Criticism led to the separation of the many from the one, the imperfect copy from the perfect type, the sensuous and passionate from the rational and the intrinsically good, the impermanent particular from the incorruptible universal. 122 The line of demarcation ran between the lasting reality that answered to critical objective thought and the realm of perishing imperfect instances, 123 of partially realised forms full of unmeaning differences due to distortion and imperfection, the realm answering to a sensuous passionate unreflective experience. 124 It would be a quite inexcusable mistake to put all that falls on the wrong side of the line into a subjective experience, 125 for these characters belonged not alone to the experience, but also to the passing show, to the world of imperfectly developed matter which belonged to the perceptual passionate experience. 126 While it may not then be classed as subjective, the Greeks of the Sophistic period felt that this phase of existence was an experience which belongs to the person in own individual life, 127 that life in which you revolts from the conventions of society, in which you questions accepted doctrine, in which you differentiates yourself from your fellows. 128 Protagoras seems even to have undertaken to make this experience of the individual, the stuff of the known world. 129 It is difficult adequately to assess Protagoras' undertaking. He seems to be insisting both that the human's experience as your own must be the measure of reality as known 130 and on the other

hand that these experiences present norms which offer a choice in conduct. 131 If this is true Protagoras conceived of the individual's experience in its atypical and revolutionary form as not only real but the possible source of fuller realities than the world of convention. 132 The undertaking failed both in philosophic doctrine and in practical politics. 133 It failed in both fields because the subjectivist, both in theory and practice, did not succeed in finding a place for the universal character of the object, its meaning, in the mind of the individual 134 and thus in finding in this experience the hypothesis for the reconstruction of the real world. 135 In the ancient world the atypical individual, the revolutionist, the non-conformist was a self-seeking adventurer or an anarchist, not an innovator or reformer, 136 and subjectivism in ancient philosophy remained a sceptical attitude which could destroy but could not build up.

137 Hippocrates and his school came nearer consciously using the experience of the individual as the actual material of the object of knowledge. 138 In the sceptical period in which they flourished they rejected on the one hand the magic of traditional medicine and on the other the empty theorising that had been called out among the physicians by the philosophers. 139 Their practical tasks held them to immediate experience. 140 Their functions in the gymnasia gave their medicine an interest in health as well as in disease, and directed their attention largely toward diet, exercise, and climate in the treatment even of disease. 141 In its study they have left the most admirable sets of observations, including even accounts of acknowledged errors and the results of different treatments of cases, which ancient science can present. 142 It was the misfortune of their science that it dealt with a complicated subject-matter dependent for its successful treatment upon the whole body of physical, chemical, and biological disciplines as well as the discovery and invention of complicated techniques. 143 They were forced after all to adopt a hopelessly inadequate physiological theory-- that of the four humors-- with the

corresponding doctrine of health and disease as the proper and improper mixture of these fluids. 144 Their marvelously fine observation of symptoms led only to the definition of types and a medical practice which was capable of no consistent progress outside of certain fields of surgery. 145 Thus even Greek medicine was unable to develop a different type of scientific method except in so far as it kept alive an empiricism which played a not unimportant part in post-Aristotelian philosophy. 146 Within the field of astronomy in explaining the anomalies of the heavens involved in their metaphysical assumptions, they built up a marvelously perfect Euclidian geometry, for here refined and exhaustive definition of all the elements was possible. 147 The problems involved in propositions to be proved appeared in the individual experience of the geometrician, but this experience in space was uniform with that of every one else and took on a universal not an individual form. 148 The test of the solution was given in a demonstration which holds for every one living in the same Euclidian space. 149 When the mathematician found the self carried by own mathematical technique beyond the assumptions of a metaphysical physics, abandoned the field of physical astronomy and confined the self to the development of own mathematical expressions.

150 In other fields Greek science analysed with varying success and critical skill only the conceptions found in the experience of their time and world. 151 Nor did Greek thought succeed in formulating any adequate method by which the ultimate concepts in any field of science were to be determined. 152 It is in Aristotle's statement of induction and the process of definition that we appreciate most clearly the inadequacy of their method. 153 This inadequacy lies fundamentally in Aristotle's conception of observation which, as I have already noted, implies the recognition of an individual, that is, an object which is an embodied form or idea. 154 The function of knowledge is to bring out this essence. The mind sees through the individuals the universal nature. 155 The value of

the observation lies, then, not in the controlled perception of certain data as observed facts, but in the insight with which one recognises the nature of the object. 156 When this nature has been seen it is to be analysed into essential characters and thus formulated into the definition. 157 In Aristotle's methodology there is no procedure by which the mind can deliberately question the experience of the community and by a controlled method reconstruct its received world. 158 Thus the natural sciences were as really fixed by the conceptions of the community as were the exact sciences by the conceptions of a Euclidian geometry and the mathematics which the Greeks formulated within it. 159 The individual within whose peculiar experience arises a contradiction to the prevailing conceptions of the community 160 and in whose creative intelligence appears the new hypothesis which makes possible a new heaven and a new earth could utilise own individual experience only in destructive scepticism. 161 Subjectivism served in ancient thought to invalidate knowledge not to enlarge it.

162 Zeller has sketched a parallelism between the ideal state of Plato and the social structure of the medieval world. 163 The philosopher-king is represented by the Pope, below him answering to the warrior class in the Platonic state stands the warrior class of the Holy Roman Empire, who in theory enforce the dictates of the Roman curia, 164 while at the bottom in both communities stand the mass of the people bound to obedience to the powers above. 165 There is, however, one profound difference between the two, and that is to be found in the relative positions of the ideal worlds that dominate each. 166 Plato's ideal world beyond the heavens gives what reality it has to this through the participation by the world of becoming in the ideas. 167 Opinion dimly sensed the ideas in the evanescent objects about it, and though Plato's memory theory of knowledge assumed that the ideas had been seen in former existence 168 and people could thus recognise the copies here, the ideal world was not within the mind but

without. 169 In a real sense the Kingdom of Heaven was within humans in the medieval world, as was the Holy Roman Empire. 170 They were ideal communities that ought to exist on earth, and it was due to the depravity of humans that they did not exist. 171 From time to time people undertook in various upheavals to realise in some part these spiritual and political ideals which they carried within them. 172 And people not only carried within them the ideas of a New Jerusalem in which the interest of one was the interest of all and of an earthly state ordered by a divine decree to fulfill this Christian ideal, 173 but the determining causes of the present condition and the future realisation depended also upon the inner attitudes and experiences of the individuals themselves.

174 Without carrying the analogy here too far, this relation between the experience of the individual and the world which may arise through the realisation of your ideas is the basis of the most profound distinction between the ancient world and the modern. 175 Before the logic of this attitude could appear in science a long period of intellectual and social growth was necessary. 176 The most essential part of this growth was the slow but steady development of psychological doctrine which placed the objective world in the experience of the individual. 177 It is not of interest here to bring out the modern epistemological problem that grew out of this, or to present this in the world of Leibnitzian monads that had no windows or in the Berkeleyan subjective idealism. 178 What is of interest is to point out that this attitude established a functional relationship between even the subjective experience of the individual and the object of knowledge. 179 A scepticism based upon subjectivism might thereafter question the justification of the reference of experience beyond itself; it could not question knowledge and its immediate object.

180 Kant formalises the relation of what was subjective and what was objective by identifying the former with the sensuous content of experience and the latter with the

application of the forms of sensibility and understanding to this content. 181 The relationship was formal and dead. Kant recognised no functional relationship between the nature of the 'Mannigfaltigkeit' of sensuous experience and the forms into which it was poured. 182 The forms remained external to the content, but the relationship was one which existed within experience, not without it, 183 and within this experience could be found the necessity and universality which had been located in the world independent of experience. 184 The melting of these fixed Kantian categories came with the spring floods of the romantic idealism that followed Kant.

185 The starting-point of this idealism was Kantian. Within experience lay the object of knowledge. 186 The Idealist's principal undertaking was to overcome the scepticism that attached to the object of knowledge because of its reference to what lies outside itself. 187 If, as Kant had undertaken to prove, the reality which knowledge implies must reach beyond experience, then, on the Kantian doctrine that knowledge lies within experience, knowledge itself is infected with scepticism. 188 Kant's practical bridge from the world of experience to the world of things-in-themselves, which he walked by faith and not by sight, was found in the postulates of the conduct of the self as a moral being, as a personality. 189 The romantic idealists advance by the same road, though as romanticists not critical philosophers, they fashioned the world of reality, that transcends experience, out of experience itself, 190 by centering the self in the absolute self and conceiving the whole infinite universe as the experience of the absolute self. 191 The interesting phase of this development is that the form which experience takes in becoming objective is found in the nature and thought of the individual, 192 and that this process of epistemological experience becomes thus a process of Nature, if the objective is the natural. 193 In Kant's terms our minds give laws to Nature. 194 But this Nature constantly exhibits its

dependence upon underlying noumena that must therefore transcend the laws given by the understanding. 195 The Romanticist insists that this other reality must be the same stuff as that of experience, that in experience arise forms which transcend those which bound the experience in its earlier phase. 196 If in experience the forms of the objective world are themselves involved, the process of knowledge sets no limits to itself, which it may not, does not, by implication transcend. 197 As further indication of the shift by which thought had passed into possession of the world of things in themselves stands the antinomy which in Kantian experience marks the limit of our knowledge 198 while in post-Kantian idealism it becomes the antithesis that leads to the synthesis upon the higher plane. 199 Contradiction marks the phase at which the spirit becomes creative, not simply giving an empty formal law to Nature, but creating the concrete universe in which content and form merge in true actuality. 200 The relation of the sensuous content to the conceptual form is not dead, as in Kant's doctrine. 201 It is fused as perception into concept and carries its immediacy and concreteness of detail into the concrete universal as the complete organisation of stimulation and response pass into the flexible habit. 202 And yet in the Hegelian logic, the movement is always away from the perceptual experience toward the higher realm of the 'Idee'. 203 Thought is creative in the movement, but in its ultimate reality it transcends spatial and temporal experience, the experience with which the natural and mathematical sciences deal. 204 Thought is not a means of solving the problems of this world as they arise, but a great process of realisation in which this world is forever transcended. 205 Its abstract particularities of sensuous detail belong only to the finite experience of the partial self. 206 This world is, therefore, always incomplete in its reality and, in so far, always untrue. Truth and full reality belong not to the field of scientific investigation.

INTELLIGENCE

207 In its metaphysics Romantic Idealism, though it finds a place for scientific discovery and reconstruction, 208 leaves these disdainfully behind, as incomplete phases of the ultimate process of reality, as infected with untruth and deceptive unwarranted claims. 209 The world is still too much with us. We recognise here three striking results of the development of reflective consciousness in the modern world:-- 210 first, it is assumed that the objective world of knowledge can be placed within the experience of the individual without losing thereby its nature as an object, 211 that all characters of that object can be presented as belonging to that experience, whether adequately or not is another question; 212 and second, it is assumed that the contradictions in its nature which are associated with its inclusion in individual experience, 213 its references beyond itself when so included, may themselves be the starting-point of a reconstruction which at least carries that object beyond the experience within which these contradictions arose; 214 and third, it is assumed that this growth takes place in a world of reality within which the incomplete experience of the individual is an essential part of the process, 215 in which it is not a mere fiction, destroying reality by its representation, but is a growing-point in that reality itself.

216 These characters of philosophic interpretation, the inclusion of the object of knowledge in the individual experience 217 and the turning of the conflicts in that experience into the occasion for the creation of new objects transcending these contradictions, 218 are the characters in the conscious method, of modern science, which most profoundly distinguish it from the method of ancient science. 219 This, of course, is tantamount to saying that they are those which mark the experimental method in science.

220 That phase of the method upon which I have touched already has been its occupation with the so-called data or facts as distinguished from Aristotelian individuals.

221 Whenever we reduce the objects of scientific investigation

to facts and undertake to record them as such, they become events, happenings, 222 whose hard factual character lies in the circumstance that they have taken place, and this quite independently of any explanation of their taking place. 223 When they are explained they have ceased to be facts and have become instances of a law, 224 that is, Aristotelian individuals, embodied theories, and their actuality as events is lost in the necessity of their occurrence as expressions of the law; with this change their particularity as events or happenings disappears. 225 They are but the specific values of the equation when constants are substituted for variables. 226 Before the equation is known or the law discovered they have no such ground of existence. 227 Up to this point they find their ground for existence in their mere occurrence, to which the law which is to explain them must accommodate itself.

228 There are here suggested two points of view from which these facts may be regarded. 229 Considered with reference to a uniformity or law by which they will be ordered and explained they are the phenomena with which the positivist deals; 230 as existencies to be identified and localised before they are placed within such a uniformity they fall within the domain of the psychological philosopher 231 who can at least place them in their relation to the other events in the experience of the individual who observes them. 232 Considered as having a residual meaning apart from the law to which they have become exceptions, they can become the subject-matter of the rationalist. 233 It is important that we recognise that neither the positivist nor the rationalist is able to identify the nature of the fact or datum to which they refer. 234 I refer to such stubborn facts as those of the sporadic appearance of infectious diseases before the germ theory of the disease was discovered. Here was a fact which contradicted the doctrine of the spread of the infection by contact. 235 It appeared not as an instance of a law, but as an exception to a law. As such, its nature is found in its having happened at a given place and time. 236 If the case had

appeared in the midst of an epidemic, its nature as a case of the infectious disease would have been cared for in the accepted doctrine, 237 and for its acceptance as an object of knowledge its location in space and time as an event would not have been required. 238 Its geographical and historical traits would have followed from the theory of the infection, as we identify by our calculations the happy fulfillment of Thales' prophecy. 239 The happening of an instance of a law is accounted for by the law. 240 Its happening may and in most instances does escape observation, while as an exception to an accepted law it captures attention. 241 Its nature as an event is, then, found in its appearance in the experience of some individual, whose observation is controlled and recorded as own experience. 242 Without its reference to this individual's experience it could not appear as a fact for further scientific consideration.

243 Now the attitude of the positivist toward this fact is that induced by its relation to the law which is 'subsequently' discovered. 244 It has then fallen into place in a series, and your doctrine is that all laws are but uniformities of such events. 245 You treats the fact when it is an exception to law as an instance of the new law and assumes that the exception to the old law and the instance of the new are identical. 246 And this is a great mistake,-- the mistake made also by the neo-realist when you assumes that the object of knowledge is the same within and without the mind, 247 that nothing happens to what is to be known when it by chance strays into the realm of conscious cognition. 248 Any as yet unexplained exception to an old theory can happen only in the experience of an individual, 249 and that which has its existence as an event in some one's biography is a different thing from the future instance which is not beholden to any one for its existence. 250 Yet there are, as I indicated earlier, meanings in this exceptional event which, at least for the time, are unaffected by the exceptional character of the occurrence. 251 For example, certain clinical symptoms by which an infectious disease is

identified have remained unchanged in diagnosis since the days of Hippocrates. 252 These characters remain as characters of the instance of the law of germ-origin when this law has been discovered. 253 This may lead us to say that the exception which appears for the time being as a unique incident in a biography is identical with the instance of a germ-induced disease.

254 Indeed, we are likely to go further and, in the assurance of the new doctrine, state that former exceptions can (or with adequate acquaintance with the facts could) be proved to be necessarily an instance of a disease carried by a germ. 255 The positivist is therefore confident that the field of scientific knowledge is made up of events which are instances of uniform series, 256 although under conditions of inadequate information some of them appear as exceptions to the statements of uniformities, in truth the latter being no uniformities at all.

257 That this is not a true statement of the nature of the exception and of the instance, it is not difficult to show if we are willing to accept the accounts which the scientists themselves give of their own observation, 258 the changing forms which the hypothesis assumes during the effort to reach a solution and the ultimate reconstruction which attends the final tested solution. 259 Wherever we are fortunate enough, as in the biographies of people such as Darwin and Pasteur, to follow a number of the steps by which they recognised problems and worked out tenable hypotheses for their solution, 260 we find that the direction which is given to attention in the early stage of scientific investigation is toward conflicts between current theories and observed phenomena, 261 and that since the form which these observations take is determined by the opposition, it is determined by a statement which itself is later abandoned. 262 We find that the scope and character of the observations change at once when the investigator sets about gathering as much of the material as one can secure, 263 and changes constantly as one formulates tentative hypotheses for the solution of the problem, which,

moreover, generally changes its form during the investigation. 264 I am aware that this change in the form of the data will be brushed aside by many as belonging only to the attitude of mind of the investigator, 265 while it is assumed that the "facts" themselves, however selected and organised in your observation and thought, remain identical in their nature throughout. 266 Indeed, the scientist carries with the self in the whole procedure the confidence that the fact-structure of reality is unchanged, however varied are the forms of the observations which refer to the same entities.

267 The analysis of the fact-structure of reality shows in the first place that the scientist undertakes to form such an hypothesis that all the data of observation will find their place in the objective world, 268 and in the second place to bring them into such a structure that future experience will lead to anticipated results. 269 You does not undertake to preserve facts in the form in which they existed in experience before the problem arose 270 nor to construct a world independent of experience or that will not be subject itself to future reconstructions in experience. 271 You merely insists that future reconstructions will take into account the old in re-adjusting it to the new. 272 In such a process it is evident that the change of the form in the data is not due to a subjective attitude of the investigator which can be abstracted from the facts. 273 When Darwin, for instance, found that the marl dressings which farmers spread over their soil did not sink through the soil by the force of gravity as was supposed, 274 but that the earthworm castings were thrown up above these dressings at nearly the same rate at which they disappeared, 275 he did not correct a subjective attitude of mind. He created in experience a humus which took the place of a former soil, and justified itself by fitting it into the whole process of disintegration of the earth's surface. 276 It would be impossible to separate in the earlier experiences certain facts and certain attitudes of mind entertained by people with reference to these facts.

277 Certain objects have replaced other objects. It is only after the process of analysis, which arose out of the conflicting observations, has broken up the old object that what was a part of the object, 278 heavier-things-pushing-their way-through-soil-of-lighter-texture, can become a mere idea. Earlier it was an object. 279 Until it could be tested the earthworm as the cause of the disappearance of the dressings was also Darwin's idea. It became fact. 280 For science at least it is quite impossible to distinguish between what in an object must be fact and what may be idea. 281 The distinction when it is made is dependent upon the form of the problem and is functional to its solution, not metaphysical. 282 So little can a consistent line of cleavage between facts and ideas be indicated, that we can never tell where in our world of observation the problem of science will arise, or what will be regarded as structure of reality or what erroneous idea.

283 There is a strong temptation to lodge these supposititious fact-structures in a world of conceptual objects, molecules, atoms, electrons, and the like. 284 For these at least lie beyond the range of perception by their very definition. They seem to be in a realm of things-in-themselves. Yet they also are found now in the field of fact and now in that of ideas. 285 Furthermore, a study of their structure as they exist in the world of constructive science shows that their infra-sensible character is due simply to the nature of our sense-processes, not to a different metaphysical nature. 286 They occupy space, have measurable dimensions, mass, and are subject to the same laws of motion as are sensible objects. 287 We even bring them indirectly into the field of vision and photograph their paths of motion.

290 The ultimate elements referred to above provide a consistent symbolism for the finding and formulating of applied mathematical sciences, within which lies the whole field of physics, including Euclidian geometry as well. 291 However, they have succeeded in providing nothing more than a language and logic pruned of the obstinate

contradictions, inaccuracies, and unanalysed sensuous stuff of earlier mathematical science. 292 Such a rationalistic doctrine can never present in an unchanged form the objects with which natural science deals in any of the stages of its investigation. 293 It can deal only with ultimate elements and forms of propositions. It is compelled to fall back on a theory of analysis which reaches ultimate elements and an assumption of inference as an indefinable. 294 Such an analysis is actually impossible either in the field of the conceptual objects into which physical science reduces physical objects, or in the field of sensuous experience. 295 Atoms can be reduced into positive and negative electrical elements and these may, perhaps do, imply a structure of ether that again invites further analysis and so on ad infinitum. 296 None of the hypothetical constructs carry with themselves the character of being ultimate elements unless they are purely metaphysical. 297 If they are fashioned to meet the actual problems of scientific research they will admit of possible further analysis, because they must be located and defined in the continuity of space and time. 298 They cannot 'be' the points and instants of modern mathematical theory. Nor can we reach ultimate elements in sensuous experience, for this lies also within a continuum. 299 Furthermore, our scientific analyses are dependent upon the form that our objects assume. 300 There is no general analysis which research in science has ever used. 301 The assumption that psychology provides us with an analysis of experience which can be carried to ultimate elements or facts, and which thereby provides the elements out of which the objects of our physical world must be constructed, 302 denies to psychology its rights as a natural science of which it is so jealous, turning it into a Berkeleyan metaphysics.

303 This most modern form of rationalism being unable to find ultimate elements in the field of actual science is compelled to take what it can find there. 304 Now the results of the analysis of the classical English psychological school give the impression of

being what Mr. Russell calls "hard facts," i.e., 305 facts which cannot be broken up into others. They seem to be the data of experience. 306 Moreover, the term hard is not so uncompromising as is the term element. A fact can be more or less hard, while an ultimate element cannot be more or less ultimate. 307 Furthermore, the entirely formal character of the logic enables it to deal with equal facility with any content. 308 One can operate with the more or less hard sense-data, putting them in to satisfy the seeming variables of the propositions, and reach conclusions which are formally correct. 309 There is no necessity for scrutinising the data under these circumstances, if one can only assume that the data are those which science is actually using. 310 The difficulty is that no scientist ever analysed own objects into such sense-data. They exist only in philosophical text-books. 311 Even the psychologists recognise that these sensations are abstractions which are not the elements out of which objects of sense are constructed. 312 They are abstractions made from those objects whose ground for isolation is found in the peculiar problems of experimental psychology, such as those of colour or tone perception. 313 It would be impossible to make anything in terms of Berkeleyan sense-data and of symbolic logic out of any scientific discovery. 314 Research defines its problem by isolating certain facts which appear for the time being not as the sense-data of a solipsistic mind, but as experiences of an individual in a highly organised society, 315 facts which, because they are in conflict with accepted doctrines, must be described so that they can be experienced by others under like conditions. 316 The ground for the analysis which leads to such facts is found in the conflict between the accepted theory and the experience of the individual scientist. The analysis is strictly 'ad hoc'. 317 As far as possible the exception is stated in terms of accepted meanings. Only where the meaning is in contradiction with the experience does the fact appear as the happening to an individual and become a paragraph out of own biography. 318 But as

such an event, whose existence for science depends upon the acceptance of the description of you to whom it has happened, it must have all the setting of circumstantial evidence. 319 Part of this circumstantial evidence is found in so-called scientific control, that is, the evidence that conditions were such that similar experiences could happen to others and could be described as they are described in the account given. 320 Other parts of this evidence which we call corroborative are found in the statements of others which bear out details of this peculiar event, though it is important to note that these details have to be wrenched from their settings to give this corroborative value. 321 To be most conclusive they must have no intentional connection with the experience of the scientist. 322 In other words, those individuals who corroborate the facts are made, in spite of themselves, experiencers of the same facts. 323 The perfection of this evidence is attained when the fact can happen to others and the observer simply details the conditions under which one made the observation, which can be then so perfectly reproduced that others may repeat the exceptional experience.

324 This process is not an analysis of a known world into ultimate elements and their relations. Such an analysis never isolates this particular exception which constitutes the scientific problems as an individual experience. 325 The extent to which the analysis is carried depends upon the exigencies of the problem. 326 It is the indefinite variety of the problems which accounts for the indefinite variety of the facts. 327 What constitutes them facts in the sense in which we are using the term is their 'exceptional' nature; 328 formally they appear as particular judgments, being denials of universal judgments, whether positive or negative. 329 This exceptional nature robs the events of a reality which would have belonged to them as instances of a universal law. It leaves them, however, with the rest of their meaning. 330 But the value which they have lost is just that which was essential to give them their place in the world as it has existed

for thought. 331 Banished from that universally valid structure, their ground for existence is found in the experience of the puzzled observer. 332 Such an observation was that of the moons of Jupiter made possible by the primitive telescope of Galileo. 333 For those who lived in a Ptolemaic cosmos, these could have existence only as observations of individuals. As moons they had distinct meaning, circling Jupiter as our moon circles the earth, 334 but being in contradiction with the Ptolemaic order they could depend for their existence only on the evidence of the senses, until a Copernican order could give them a local habitation and a name. 335 Then they were observed not as the experiences of individuals but as instances of planetary order in a heliocentric system3. 336 It would be palpably absurd to refer to them as mere sense-data, mere sensations. They are for the time being inexplicable experiences of certain individuals. 337 They are inexplicable because they have a meaning which is at variance with the structure of the whole world to which they belong. 338 They are the phenomena termed accidental by Aristotle and rejected as full realities by him, but which have become, in the habitat of individual experience, the headstone of the structure of modern research of science.

339 A rationalism which relegates implication to the indefinables cannot present the process of modern science. 340 Implication is exactly that process by which these events pass from their individual existence into that of universal reality, and the scientist is at pains to define it as the experimental method. 341 It is true that a proposition implies implication. But the proposition is the statement of the result of the process by which an object has arisen for knowledge and merely indicates the structure of the object. 342 In discovery, invention, and research the escape from the exceptional, from the data of early stages of observation, is by way of an hypothesis; 343 and every hypothesis so far as it is tenable and workable in its form is universal. 344 No one would waste own time with a hypothesis which confessedly was not applicable to

all instances of the problem. 345 An hypothesis may be again and again abandoned, it may prove to be faulty and contradictory, but in so far as it is an instrument of research it is assumed to be universal and to perfect a system which has broken down at the point indicated by the problem. 346 Implication and more elabourated instances flow from the structure of this hypothesis. 347 The classical illustration which stands at the door of modern experimental science is the hypothesis which Galileo formed of the rate of the velocity of a falling body. 348 He conceived that this was in proportion to the time elapsed during the fall and then elabourated the consequences of this hypothesis by working it into the accepted mathematical doctrines of the physical world, 349 until it led to an anticipated result which would be actually secured and which would be so characteristic an instance of a falling body that it would answer to every other instance as he had defined them. 350 In this fashion he defined his inference as the anticipation of a result because this result was a part of the world as he presented it amended by his hypothesis. 351 It is true that back of the specific implication of this result lay a mass of other implications, 352 many not even presented specifically in thought and many others presented by symbols which generalised innumerable instances. 353 These implications are for the scientist more or less implicit meanings, but they are meanings each of which may be brought into question and tested in the same fashion if it should become an actual problem. 354 Many of them which would not have occurred to Galileo as possible problems have been questioned since his day. 355 What has remained after this period of determined questioning of the foundations of mathematics and the structure of the world of physical science is a method of agreement with oneself and others, 356 in (a) the identification of the object of thought, in (b) the accepted values of assent and denial called truth and falsehood, and in (c) referring to meaning, in its relation to what is meant. 357 In any case the achievement of

symbolic logic, with its indefinables and axioms has been to reduce this logic to a statement of the most generalised form of possible consistent thought intercourse, with entire abstraction from the content of the object to which it refers. 358 If, however, we abstract from its value in giving a consistent theory of number, continuity, and infinity, this complete abstraction from the content has carried the conditions of thinking in agreement with self and others 359 so far away from the actual problem of science that symbolic logic has never been used as a research method. 360 It has indeed emphasised the fact that thinking deals with problems which have reference to uses to which it can be put, not to a metaphysical world lying beyond experience. 361 Symbolic logic has to do with the world of discourse, not with the world of things.

362 What Russell pushes to one side as a happy guess is the actual process of implication by which, for example, the minute form in the diseased human system is identified with unicellular life and the history of the disease with the life history of this form. 363 This identification implies reclassification of these forms and a treatment of the disease that answers to their life history. 365 Having made this identification we anticipate the result of this treatment, calling it an inference.

366 Implication belongs to the reconstruction of the object. As long as no question has arisen, the object is what it means or means what it is. 367 It does not imply any feature of itself. When through conflict with the experience of the individual some feature of the object is divorced from some, meaning the relationship between these becomes a false implication. 368 When a hypothetically reconstructed object finds us anticipating a result which accords with the nature of such objects we assert an implication of this meaning. 369 To carry this relation of implication back into objects which are subject to no criticism or question would of course resolve the world into elements connected by external relations, 370 with the added consequence that these elements can have no content, since every content in the

face of such an analysis must be subject to further analysis. 371 We reach inevitably symbols such as X, Y, and Z, which can symbolise nothing. 372 Theoretically we can assume an implication between any elements of an object, 373 but in this abstract assumption the symbolic logician overlooks the fact that one is also assuming some content which is not analysed and which is the ground of the implication. 374 In other words this logician confuses the scientific attitude of being ready to question anything with an attitude of being willing to question everything at once. 375 It is only in an unquestioned objective world that the exceptional instance appears and it is only in such a world that an experimental science tests the implications of the hypothetically reconstructed object.

376 The guess is happy because it carries with it the consequences which follow from its fitting into the world, 377 and the guess, in other words the hypothesis, takes on this happy form solely because of the material reconstruction 378 which by its nature removes the unhappy contradiction and promises the successful carrying out of the conflicting attitudes in the new objective world. 379 There is no such thing as formal implication.

380 Where no reconstruction of the world is involved in our identification of objects that belong to it and where, therefore, no readjustment of conduct is demanded, such a logic symbolises what takes place in our direct recognition of objects and our response to them. 381 Then "X is a person implies X is mortal for all values of X" exactly symbolises the attitude toward a person subject to a disease supposedly mortal. 382 But it fails to symbolise the biological research which starting with inexplicable sporadic cases of an infectious disease carries over from the study of the life history of infusoria, a hypothetical reconstruction of the history of disease and then acts upon the result of this assumption. 383 Research-science presents a world whose form is always universal, but this universal form is neither a metaphysical assumption nor a fixed form of the

understanding. 384 While the scientist may as a metaphysician assume the existence of realities which lie beyond a possible experience, or be a Kantian or Neo-Kantian, neither of these attitudes is necessary for own research. 385 You may be a positivist-- a disciple of Hume or of John Stuart Mill. You may be a pluralist who conceives, with William James, 386 that the order which we detect in parts of the universe is possibly one that is rising out of the chaos and which may never be as universal as our hypothesis demands. 387 None of these attitudes has any bearing upon your scientific method. This simplifies your thinking, enables you to identify the object in which you are interested wherever you finds it, 388 and to abstract in the world as you conceives it those features which carry with them the occurrence you are endeavouring to place. 389 Especially it enables you to make your thought a part of the socially accepted and socially organised science to which your thought belongs. 390 You are far too modest to demand that the world be as your inference demands.

391 You asks that your view of the world be cogent and convincing to all those whose thinking has made your own possible, and be an acceptable premise for the conduct of that society to which you belongs. 392 The hypothesis has no universal and necessary characters except those that belong to the thought which preserves the same meanings to the same objects, 393 the same relations between the same relata, the same attributes of assent and dissent under the same conditions, the same results of the same combinations of the same things. 394 For scientific research the meanings, the relations with the relata, the assent and dissent, the combinations and the things combined are all in the world of experience. 395 Thinking in its abstractions and identifications and reconstructions undertakes to preserve the values that it finds, 396 and the necessity of its thinking lies in its ability to so identify, preserve, and combine what it has isolated 397 that the thought structure will have an identical import under like

conditions for the thinker with all other thinkers to whom these instruments of research conduct are addressed. 398 Whatever conclusions the scientist draws as necessary and universal results from own hypothesis for a world independent of own thought are due, not to the cogency of own logic, but to other considerations. 399 For you knows if you reflects that another problem may arise which will in its solution change the face of the world built upon the present hypothesis. 400 You will defend the inexorableness of your reasoning, but the premises may change. 401 Even the contents of tri-dimensional space and sensuous time are not essential to the cogency of that reasoning nor can the unbroken web of the argument assure the content of the world as invariable. 402 Your universals, when applied to Nature, are all hypothetical universals; hence the import of experiment as the test of an hypothesis. 403 Experience does not rule out the possible cropping up of a new problem which may shift the values attained. 404 Experience simply reveals that the new hypothesis fits into the meanings of the world which are not shaken; 405 it shows that, with the reconstruction which the hypothesis offers, it is possible for scientific conduct to proceed.

406 But if the universal character of the hypothesis and the tested theory belong to the instrumental character of thought in so reconstructing a world that has proved to be imperfect, and inadequate to conduct, 407 the stuff of the world and of the new hypothesis are the same. 408 At least this is true for the scientist who has no interest in an epistemological problem that does not affect own scientific undertakings in one way nor another. 409 I have already pointed out that from the standpoint of logical and psychological analysis the things with which science deals can be neither ultimate elements nor sense-data; 410 but that they must be phases and characters and parts of things in some whole, parts which can only be isolated because of the conflict between an accepted meaning and some experience. 411 I have pointed out that an analysis is

guided by the practical demands of a solution of this conflict; 412 that even that which is individual in its most unique sense in the conflict and in attempts at its solution does not enter into the field of psychology-- which has its own problems peculiar to its science. 413 Certain psychological problems belong to the problems of other sciences, as, for example, that of the personal equation belongs to astronomy or that of colour vision to the theory of light. But they bulk small in these sciences. 414 It cannot be successfully maintained that a scientific observation of the most unique sort, one which is accepted for the time being simply as a happening in this or that scientist's experience, is as such a psychological datum, 415 for the data in psychological text-books have reference to 'psychological' problems. 416 Psychology deals with the consciousness of the individual in its dependence upon the physiological organism 417 and upon those contents which detach themselves from the objects outside the individual and which are identified with one’s inner experience. 418 It deals with the laws and processes and structures of this consciousness in all its experiences, not with 'exceptional' experiences. 419 It is necessary to emphasise again that for science these particular experiences arise within a world which is in its logical structure organised and universal. 420 They arise only through the conflict of the individual's experience with such an accepted structure. 421 For science individual experience 'presupposes' the organised structure; hence it cannot provide the material out of which the structure is built up. 422 This is the error of both the positivist and of the psychological philosopher, if scientific procedure gives us in any sense a picture of the situation. 423 A sharp contrast appears between the accepted hypothesis with its universal form and the experiences which invalidate the earlier theory. 424 The reality of these experiences lies in their happening. They were unpredictable. They are not instances of a law. 425 The later theory, the one which explains these occurrences, changes their

character and status, making them necessary results of the world as that is conceived under this new doctrine. 426 This new standpoint carries with it a backward view, which explains the erroneous doctrine, and accounts for the observations which invalidated it. 427 Every new theory must take up into itself earlier doctrines and rationalise the earlier exceptions. 428 A generalisation of this attitude places the scientist in the position of anticipating later reconstructions. You then must conceive of your world as subject to continuous reconstructions. 429 A familiar interpretation of your attitude is that the hypothesis is thus approaching nearer and nearer toward a reality which would never change if it could be attained, or, from the standpoint of the Hegelian toward a goal at infinity. 430 The Hegelian also undertakes to make this continuous process of reconstruction an organic phase in reality and to identify with Nature the process of finding exceptions and of correcting them. 431 The fundamental difference between this position and that of the scientist who looks before and after is that the Hegelian undertakes to make the exception in its exceptional character a part of the reality which transcends it, 432 while the scientist usually relegates the exception to the experience of individuals who were simply caught in an error which later investigation removes. 433 The error remains as an historical incident explicable perhaps as a result of the conditions under which it occurred, but in so far as it was an error, not a part of reality. 434 It is customary to speak of it as subjective, though this implies that we are putting the person who was unwittingly in error into the position of the one who has corrected it. 435 To entertain that error in the face of its correction would be subjective. A result of this interpretation is that the theories are abstracted from the world and regarded as something outside it. 436 It is assumed that the theories are mental or subjective and change while the facts remain unchanged. 437 Even when it is assumed that theories and facts agree, humans speak of a

correspondence or parallelism between idea and the reality to which it refers. 438 While this attitude seems to be that of science toward the disproved theories which lie behind it, it is not its attitude to the theories which it accepts. 439 These are not regarded as merely parallel to realities, as abstracted from the structure of things. These meanings go into the makeup of the world. 440 It is true that the scientist who looks before and after realises that any specific meaning which is now accepted may be questioned and discarded. 441 If you carries your reflection far enough you sees that a complete elimination of all the meanings which might conceivably be so discredited would leave nothing but logical constants, a world with no facts in any sense. 442 In this position you may of course take an agnostic attitude and besatisfied with the attitude of Hume or Mill or Russell. 443 But if you does so, you will pass into the camp of the psychological philosophers and will have left the position of the scientist. 444 The scientist always deals with an 'actual' problem, and even when you looks before and after you does so in so far as you are facing in inquiry some actual problem. 445 No actual problem could conceivably take on the form of a conflict involving the whole world of meaning. 446 The conflict always arises between an individual experience and certain laws, certain meanings while others are unaffected. 447 These others form the necessary field without which no conflict can arise. 448 They give the person of research own [Greek: pou stô] upon which one can formulate own problem and undertake its solution. 449 The possible calling in question of any content, whatever it may be, means always that there is left a field of unquestioned reality. 450 The attitude of the scientist never contemplates or could contemplate the possibility of a world in which there would be no reality by which to test your hypothetical solution of the problem that arises. 451 Nor does this attitude when applied to past discarded theories necessarily carry with it the implication that these older theories were subjective ideas in humans' minds,

while the reality lay beside and beyond them unmingled with ideas. 452 It always finds a standpoint from which these ideas in the earlier situation are still recognised as reliable, for there are no scientific data without meanings. 453 There could be no history of science on any other basis. No history of science goes back to ultimate elements or sense-data, or to any combination of bare data on one hand and logical elements on the other. 454 The world of the scientist is always there as one in which reconstruction is taking place with continual shifting of problems, but as a real world within which the problems arise. 455 The errors of the past and present appear as untenable hypotheses which could not bear the test of experiment if the experience were sufficiently enlarged and interpreted. 456 But they are not mere errors to be thrown into the scrap heap. They become a part of a different phase of reality which a fuller history of the past records or a fuller account of the present interprets, giving them thereby their proper place in a real world.

457 The completion of this program, however, awaits the solution of the scientific problem of the relation of the psychical and the physical with the attendant problem of the meaning of the so-called origin of consciousness in the history of the world. 458 My own feeling is that these problems must be attacked from the standpoint of the social nature of so-called consciousness. 459 The clear indications of this I find in the reference of our logical constants to the structure of thought as a means of communication, in the explanation of errors in the history of science by their social determination, 460 and in the interpretation of the inner field of experience as the importation of social intercourse into the conscious conduct of the individual. 461 But whatever may be the solution of these problems, it must carry with it such a treatment of the experience of the individual 462 that the latter will never be regarded merely as a subjective state, however inadequate it may have proved itself as a scientific hypothesis. 463 This seems to me to be involved in

the conception of psychology as a natural science and in any legitimate carrying out of the Hegelian program of giving reality and creative import to individual experience. 464 The experience of the individual in its exceptional character is the growing-point of science, first of all in the recognition of data upon which the older theories break, 465 and second in the hypothesis which arises in the individual and is tested by the experiment which reconstructs the world. 466 A scientific history and a scientific psychology from which epistemology has been banished must place these observations and hypotheses together with erroneous conceptions and mistaken observations 'within' the real world 467 in such a fashion that their reference to the experience of the individual and to the world to which one belongs will be comprehensible. 468 As I have indicated, the scientific theory of the physical and conscious individual in the world implied in this problem has still to be adequately developed. 469 But there is implied in the conception of such a theory such a location of the process of thought in the process of reality as will give it an import both in the meaning of things and in the individual's thinking. 470 We have the beginning of such a doctrine in the conception of a functional value of consciousness in the conduct of living forms, 471 and the development of reflective thought out of such a consciousness which puts it within the act and gives it the function of preparation where adjustment is necessary. 472 Such a process creates the situation with reference to which the form acts. 473 In all adjustment or adaptation the result is that the form which is adjusted finds that by its adjustment it has created an environment. 474 The ancients by their formulation of the Ptolemaic theory committed themselves to the world in which the fixed values of the heavenly over against the earthly obtained. 475 Such a world was the interpretation of the experience involved in their physical and social attitudes. 476 They could not accept the hypothesis of Aristarchus because it conflicted with the world which

they had created, with the values which were determining values for them. 477 The same was true of the hypothesis of Democritus. They could not, as they conceived the physical world, accept its purely quantitative character. 478 The conception of a disinterested truth which we have cherished since the Middle Ages is itself a value that has a social basis as really as had the dogma of the church. 479 The earliest statement of it was perhaps that of Francis Bacon. Freeing investigation from the church dogma and its attendant logic meant to him the freedom to find in Nature what humans needed and could use for the amelioration of their social and physical condition. 480 The full implication of the doctrine has been recognised as that of freedom, freedom to effect not only values already recognised, but freedom to attain as well such complete acquaintance with Nature 481 that new and unrecognised uses would be at our disposal; that is, that progress should be one toward any possible use to which increased knowledge might lead. 482 The cult of increasing knowledge, of continually reconstructing the world, took the place both of the ancient conception of adequately organising the world as presented in thought, 483 and of the medieval conception of a systematic formulation on the basis of the statement in church dogma of social values. 484 This modern conception proceeds from the standpoint not of formulating values, but giving society at the moment the largest possible number of alternatives of conduct, i.e., 485 undertaking to fix from moment to moment the widest possible field of conduct. 486 The purposes of conduct are to be determined in the presence of a field of alternative possibilities of action. 487 The ends of conduct are not to be determined in advance, but in view of the interests that fuller knowledge of conditions awaken. 488 So there appears a conception of determining the field that shall be quite independent of given values. A real world which consists not of an unchanged universe, 489 but of a universe which may be continually readjusted according to the problems arising in the

consciousness of the individuals within society. 490 The seemingly fixed character of such a world is found in the generally fixed conditions which underlie the type of problems which we find. 491 We determine the important conditions incident to the working out of the great problems which face us. 492 Our conception of a given universe is formed in the effort to mobilise all the material about us in relation to these problems-- 493 the structure of the self, the structure of matter, the physical process of life, the laws of change and the interrelation of changes. 494 With reference to these problems certain conditions appear fixed and become the statement of the world by which we must determine by experimental test the viability of our hypotheses. 495 There arises then the conception of a world which is unquestioned over against any particular problem. 496 While our science continually changes that world, at least it must be always realised as there. 497 On the other hand, these conceptions are after all relative to the ends of social conduct which may be formulated in the presence of any freedom of action.

498 We postulate freedom of action as the condition of formulating the ends toward which our conduct shall be directed. 499 Ancient thought assured itself of its ends of conduct and allowed these to determine the world which tested its hypothesis. 500 We insist such ends may not be formulated until we know the field of possible action. 501 The formulation of the ends is essentially a social undertaking and seems to follow the statement of the field of possible conduct, 502 while in fact the statement of the possible field of conduct is actually dependent on the push toward action. 503 A moving end which is continually reconstructing itself follows upon the continually enlarging field of opportunities of conduct.

504 The conception of a world of existence, then, is the result of the determination at the moment of the conditions of the solution of the given problems. 505 These problems constitute the conditions of conduct, and the ends of conduct can only be determined as we realise the possibilities which

changing conditions carry with them. 506 Our world of reality thus becomes independent of any special ends or purposes and we reach an entirely disinterested knowledge. 507 And yet the value and import of this knowledge is found in our conduct and in our continually changing conditions. 508 Knowledge for its own sake is the slogan of freedom, for it alone makes possible the continual reconstruction and enlargement of the ends of conduct.

509 The individual in your experiences is continually creating a world which becomes real through your discovery. 510 In so far as new conduct arises under the conditions made possible by your experience and your hypothesis the world, which may be made the test of reality, has been modified and enlarged.

511 I have endeavoured to present the world which is an implication of the scientific method of discovery with entire abstraction from any epistemological or metaphysical presuppositions or complications. 512 Scientific method is indifferent to a world of things-in-themselves, or to the previous condition of philosophic servitude of those to whom its teachings are addressed. 513 It is a method not of knowing the unchangeable but of determining the form of the world within which we live as it changes from moment to moment. 514 It undertakes to tell us what we may expect to happen when we act in such or such a fashion. 515 It has become a matter of serious consideration for a philosophy which is interested in a world of things-in-themselves, and the epistemological problem. 516 For the cherished structures of the metaphysical world, having ceased to house the values of humankind, provide good working materials in the hypothetical structures of science, on condition of surrendering their metaphysical reality; 517 and the epistemological problem, having seemingly died of inanition, has been found to be at bottom a problem of method or logic. 518 My attempt has been to present what seems to me to be two capital instances of these transformations. 519 Science always has a world of reality by which to test its hypotheses, but this world is not a world

independent of scientific experience, but the immediate world surrounding us within which we must act. 520 Our next action may find these conditions seriously changed, and then science will formulate this world so that in view of this problem we may logically construct our next plan of action. 521 The plan of action should be made self-consistent and universal in its form, 522 not that we may thus approach nearer to a self-consistent and universal reality which is independent of our conduct, but because our plan of action needs to be intelligent and generally applicable. 523 Again science advances by the experiences of individuals, experiences which are different from the world in which they have arisen and which refer to a world which is not yet in existence, so far as scientific experience is concerned. 524 But this relation to the old and new is not that of a subjective world to an objective universe, but is a process of logical reconstruction by which out of exceptions the new law arises to replace a structure that has become inadequate.

525 In both of these processes, that of determining the structure of experience which will test by experiment the legitimacy of the new hypothesis, and that of formulating the problem and the hypothesis for its solution, 526 the individual functions in own full particularity, and yet in organic relationship with the society that is responsible for you. 527 It is the import for scientific method of this relationship that promises most for the interpretation of the philosophic problems involved.

CONSCIOUSNESS AND PSYCHOLOGY

Boyd H. Bode

5 If it is true that misery loves company, those persons who feel despondent over the present situation in philosophy may console themselves with the reflection that things are not so bad as they might be. 2 Our friends, the psychologists, are afflicted even as we are. 3 The disagreements of experts as to both

the subject-matter and the method of psychology are as fundamental as anything that philosophy can show. 4 A spirit of revolt is abroad in the land, and psychology is once more on trial. 5 The compact which provided that psychology should be admitted to the rank of a natural science, on condition that it surrender its pretension to be the science of the soul and confine itself to the study of consciousness, is no longer considered binding. 6 The suspicion is growing that consciousness is nothing more nor less than an attenuated form of the soul that it pretends to displace. 7 Consequently the psychology without a soul to which we have just become accustomed is now attacked on behalf of a psychology without a consciousness, 8 on the ground that this latter standpoint alone can give assurance against entangling alliances between psychology and metaphysics.

9 From the side of philosophy this situation is interesting, not only to such as may crave the comfort that springs from the spectacle of distress, but also to those who take a more hopeful view of present-day tendencies. 10 The question that is at issue is fundamentally the question of the nature of consciousness, which is quite as important to philosophy as to psychology. 11 On the one hand it is maintained that psychology has to do with consciousness and that its distinctive method is the method of introspection. 12 On the other hand it is urged that psychology is nothing more nor less than a study of behaviour, that it is not a science at all, 13 unless the existence of consciousness is denied or at least ignored, and that the method of introspection is a delusion and a snare. 14 The two standpoints are not always clearly formulated, nor can we say that every system of psychology is true to type. 15 It is, in fact, the lack of clearness in the fundamental concepts that makes the status of psychology a matter of so much uncertainty.

16 The situation presents an apparent anomaly. Both parties profess to deal with facts of observation, yet the claim of the introspectionist that they observes facts of consciousness is met by the assertion of their rival that

there is no consciousness to be observed. 17 How can this be, unless we assume that introspection presupposes an esoteric principle, like the principle of grace in religion? 18 It seems evident that we have to do here with some deep-seated misconception regarding the facts that are supposed to constitute the subject-matter for observation and description.

19 A common procedure on the part of introspectionism is to assert the existence of consciousness as something which is indeed indefinable, but which admits of observation and description. But this procedure is no longer justified. 20 In the first place, the assertion that consciousness exists is not the statement of a fact but the designation of a problem. What is the nature of the fact that we call consciousness? 21 If the common-sense individual, who assents so readily to the proposition that we all know consciousness, be asked to differentiate between consciousness and the objects of consciousness, you are dazed and helpless. 22 And, secondly, the assertion of indefinability involves us in a difficulty. The indefinability of consciousness has sometimes been likened to that of space, but in this latter case we find no such confusion between space and the objects in space. 23 It is clear, however, that if consciousness is not something distinguishable from objects, there is no need to discuss consciousness, 24 and if it is distinguishable, it must be distinguished before we are entitled to proceed with observation and description. 25 Definition is indispensable, at least to the extent of circumscribing the facts that are to be investigated.

26 Moreover, if consciousness cannot be defined, neither can it be described. What is definition, after all, but a form of description? 27 To assert, in effect, that consciousness is indefinable because it is indescribable, and that for this reason we must be content with description, is both a flagrant disregard of consistency and an unwarranted abuse of our good nature.

28 This difficulty leads on to another, for doubts, like lies, have

a singular propensity to breed more of their kind. 29 If consciousness is something that everybody knows, why should it be necessary to look to the psychologist for a description of it? 30 If the study of consciousness brings to light any new fact, that fact by definition is not a conscious fact at all, and consequently is not the kind of thing that we set out to describe. 31 Consciousness, in short, cannot be analysed; it cannot be resolved into elements or constituents. It is precisely what it is and not some product of our after-thought that we are pleased to substitute for it.

32 These familiar considerations do not, indeed, decide the issue between the rival theories of psychology, but they serve to suggest that our introspective psychology has been too easily satisfied in the conception of its specific problem or subject-matter. 33 As a matter of fact, the work that has been done in the name of psychology has been peculiarly barren of results, so far as a consciousness 'an sich' is concerned, 34 although it has led to a wealth of material pertaining to adaptive behaviour. Its solid achievements lie in the domain, not of consciousness, but of instinctive, habitual, and intelligent adaptation. 35 It teaches us little that has to do unequivocally with consciousness as distinct from things, but it teaches us much concerning stimulus and response, attention and habit, conflict and adjustment. 36 The doctrine that psychology is a science of behaviour is justified at least to the extent that it emphasises a factor, the importance of which introspectionism has consistently refused to recognise. 37 Whatever conclusion we may ultimately reach regarding the nature of consciousness, the whole drift of psychological and biological investigation seems to indicate that an adequate conception of consciousness and of the distinctive problem of psychology can be attained only on the basis of a painstaking reflection on the facts of behaviour.

I

38 It is evident that the attempt to ascertain the nature of

consciousness and of psychology from the standpoint of behaviour is committed to the assumption that the behaviour in question is of a distinctive kind. 39 The justification of this assumption will enable us to formulate the definitions which we seek. 40 Discussions of conscious behaviour ordinarily emphasise the similarity between conscious and reflex behaviour rather than the difference. 41 An attitude of expectancy, for example, is usually conceived as a sort of temporary reflex. 42 Certain nervous connections are organised for the occasion, so that, when a given stimulus arrives, it will induce its appropriate response. 43 This situation is best exemplified, perhaps, in simple reaction-experiments, in which the subject makes a certain predetermined response upon presentation of the stimulus. 44 The process is supposed to be of the reflex type throughout, the only difference being that ordinary reflexes are relatively permanent and unvarying, 45 whereas a prearranged response to a stimulus has to do with a reflex that is made to order so as to meet the exigencies of the moment.

46 For certain purposes such a description of conscious behaviour is no doubt sufficiently accurate. Our present concern, however, is with the differences between these temporary organisations and ordinary reflexes. 47 In order to bring out these differences, let us introduce a slight complication into our reaction-experiment and suppose that the subject is to make one of two alternative responses, according to the nature of the stimulus. 48 Your state of expectancy is accompanied by a certain bodily "set" or preparedness for the coming event, although the precise nature of the event is a matter of uncertainty. 49 Your nervous system is in readiness to respond this way or that, or rather, it has already started to act in both of the alternative ways. 50 If the subject is to respond with the right hand to one stimulus and with the left hand to the other, both hands are in a state of activity before the stimulus appears. 51 The organisation of the temporary reflex through the agency of the cerebral cortex could

not be achieved were it not for the fact that all the movements entering into the organisation are nascently aroused before the spring is touched which permits the act to unroll itself in orderly sequence.

52 The various successive movements, then, which make up our temporary reflex achieve their relationship to one another from the fact that they are started simultaneously, and this peculiarity constitutes a distinctive feature. 53 Apparently this feature is absent from true reflexes. An act of swallowing, performed unconsciously, may start the complicated processes of digestion, but it is merely the first act of a series. 54 There is no evidence that the movements of the stomach and of the other organs concerned in digestion must be presupposed before the act of swallowing can take place. 55 The swallowing may start the other processes, but we cannot say that these other processes react back upon the first act and make it one of swallowing rather than something else. 56 Yet this "back stroke" is precisely what is necessary in our reaction-experiment, for it is by virtue of this fact that the organisation of the temporary reflex becomes a possibility. 57 The first response cannot take place until the last is provided for. Thus the immediate act of looking has embodied in it the activity that is to follow later. 58 The looking is not simply with the eye, but with the hands that are to complete the response. 59 The optical response is a response which, in the language of Bergson, prefigures or sketches out the act of a later moment. 60 The nervous system is enabled to act as a unit, because the movements that are to occur at a later time are represented in the first stage of the complete act. 61 The first stage, accordingly, does not occur independently, but 'as' a preliminary to the second. 62 With an imperfect organisation of the entire response, it may happen that the subsequent movements are not suppressed until their proper moment arrives, but appear in advance of their scheduled time. 63 In writing, for example, we frequently omit words or add to a word the final letter of some word

that belongs to a subsequent part of the sentence. 64 An error of this sort could hardly occur so readily in the course of an act that belongs to the type of the true reflex.

65 Lest the reader suspect that this is 'a priori' physiology, I may quote the following from a prominent neurologist: 66 "No simple sensory impulse can, under ordinary circumstances, reach the cerebral cortex without first being influenced by subcortical association centers, 67 within which complex reflex combinations may be effected and various automatisms set off in accordance with their preformed structure. 68 These subcortical systems are to some extent modifiable by racial and individual experience, 69 but their reactions are chiefly of the determinate or stereotyped character, with a relatively limited range of possible reaction types for any given stimulus complex.

70 "It is shown by the lower vertebrates, which lack the cerebral cortex, that these subcortical mechanisms are adequate for all of the ordinary simple processes of life, including some degree of associative memory. 71 But here, when emergencies arise which involve situations too complex to be resolved by these mechanisms, the animal will pay the inevitable penalty of failure-- perhaps the loss of own dinner, or even of own life.

72 "In the higher mammals with well-developed cortex the automatisms and simple associations are likewise performed mainly by the subcortical apparatus, 73 but the inadequacy of this apparatus in any particular situation presents not the certainty of failure, but rather a dilemma. 74 The rapid preformed automatisms fail to give relief, or perhaps the situation presents so many complex sensory excitations as to cause mutual interference and inhibition of all reaction. There is a stasis in the subcortical centers. 75 Meanwhile the higher neural resistance of the cortical pathways has been overcome by summation of stimuli and the cortex is excited to function. 76 Here is a mechanism adapted, not for a limited number of predetermined and immediate

responses, but for a much greater range of combination of the afferent impressions with each other 77 and with memory vestiges of previous reactions and a much larger range of possible modes of response to any given set of afferent impressions. 78 By a process of trial and error, perhaps, the elements necessary to effect the adaptive response may be assembled and the problem solved. 79 "It is evident here that the physiological factors in the dilemma or problem as this is presented to the cortex are by no means simple sensory impressions, 80 but definitely organised systems of neural discharge, each of which is a physiological resultant of the reflexes, automatisms, impulses, and inhibitions characteristic of its appropriate subcortical centers. 81 The precise form which these subcortical combinations will assume in response to any particular excitation is in large measure determined by the structural connections 'inter se'....

82 "From the standpoint of the cerebral cortex considered as an essential part of the mechanism of higher conscious acts, 83 every afferent stimulus, as we have seen, is to some extent affected by its passage through various subcortical association centers (i.e., it carries a quale of central origin). 84 But this same afferent impulse in its passage through the spinal cord and brain stem may, before reaching the cortex, discharge collateral impulses into the lower centers of reflex coördination, from which incipient (or even actually consummated) motor responses are discharged previous to the cortical reaction. 85 These motor discharges may, through the 'back stroke' action, in turn exert an influence upon the slower cortical reaction. 86 Thus the lower reflex response may in a literal physiological sense act 'into' the cortical stimulus complex and become an integral part of it."

87 It seems clear, then, that conscious behaviour involves a certain 'process' of organisation which constitutes a differential. 88 The units entering into this process are "definitely organised systems of neural discharge," the antecedent organisation of these several systems being due either to the inherited or to the acquired

structure of the nervous system. 89 Given a certain amount of plasticity, the nervous system builds up specific forms of response for certain objects or situations, 90 and these forms of response subsequently become the material from which new organisations or new modes of response are constructed. 91 The achievements of the past, accordingly, become stepping-stones to new achievement. 92 The new organisation, moreover, is not determined by a mechanism antecedently provided, but has a peculiar flexibility, so as to meet the demands of a new situation. That is, a new mode of procedure is adopted. 93 Instead of being a purely mechanical reaction, the response that results from the situation is tentative or experimental in character, 94 and "by a process of trial and error, perhaps, the elements necessary to effect the adaptive response may be assembled and the problem solved."

95 We may add at once that the re-organisation which is required to constitute conscious behaviour varies a great deal in extent. 96 In an act that is more or less habitual, a comparatively slight modification of the corresponding organised system of neural discharge will suffice to harmonise the conflicting elements, whereas on other occasions a more extensive modification is required. 97 But in any case it appears that there is a certain impropriety in describing conscious behaviour in terms of a temporary reflex, 98 since the study of this behaviour is concerned with the organisation of the discordant elements, not as a result, but primarily as a process. 99 In a reflex act we may suppose that the stimulus which evokes the first stage in the response is like the first in a row of upstanding bricks, which in falling knocks down another. 100 That is, the reflex arc is built up by agencies that are quite independent of the subsequent act. The arc is all set up and ready for use by the time the reflex act appears upon the scene. 101 In the case of conscious activity, on the other hand, we find a very different state of affairs. The arc is not first constructed and then used, but is constructed as the act proceeds; 102 and this

progressive organisation is, in the end, what is meant by conscious behaviour. 103 If the course of a reflex act may be compared with traveling in a railroad train, the progress of a conscious act is more like that of a band of explorers, who hew their path and build their bridges as they go along. 104 The direction of the act is not determined from without but from within; the end is internal to the process.

105 This process of organisation and purposive direction is exemplified in every act of attention. Is that noise, for example, a horse in the street, or is it the rain on the roof? 106 What we find in such a situation is not a paralysis of activity, but a redirection. The incompatibility of responses is purely relative. 107 There is indeed a mutual inhibition of the responses for hoof-beats and rain respectively, in the sense that neither has undisputed possession of the field; 108 but this very inhibition sets free the process of attention, in which the various responses participate and coöperate. 109 There is no static balancing of forces, but rather a process in which the conflict is simply a condition for an activity of a different kind. 110 If I am near a window facing the street, my eye turns thither for a clue; if the appeal to vision be eliminated, the eye becomes unseeing and coöperates with the ear by excluding all that is irrelevant to the matter in hand. 111 In this process the nervous system functions as a unit, with reference to the task of determining the source and character of the sound. 112 This task or problem dominates the situation. A voice in an adjoining room may break in, but only as something to be ignored and shut out; 113 whereas a voice in the street may become all-absorbing as possibly indicating the driver of the hypothetical horse. 114 That is, the reason why the conflict of responses does not end in a deadlock, but in a redirection, is that a certain selectiveness of response comes into play. 115 Out of the mass of more or less inchoate activities a certain response is selected as a rallying-point for the rest, and this selection is of a purposive character. 116 The

selection is determined by reference to the task in hand, which is to restore a certain harmony of response. 117 Accordingly, that response is selected which gives promise of forwarding the business of the moment. 118 By virtue of this selective character, one of the constituents of the total activity becomes exalted among its fellows and is entrusted with the function of determining further behaviour.

119 The purpose of the discussion, up to this point, is to put forward this selective or teleological character as the fundamental and differentiating trait of conscious behaviour; 120 and our task, accordingly, is to give an account of the nature and 'modus operandi' of this purposive control. 121 This control, it is evident, consists in giving direction to behaviour with reference to results that are still in the future. 122 The basis for this anticipation of the future is furnished by the nascent responses which foreshadow further activity, even while they are still under the thraldom of the inhibitions which hold them back. 123 These suppressed activities furnish a sort of diagram or sketch of further possible behaviour, 124 and the problem of consciousness is the problem of making the result or outcome of these incipient responses effective in the control of behaviour. 125 Future results or consequences must be converted into present stimuli; and the accomplishment of this conversion is the miracle of consciousness. 126 To be conscious is to have a future possible result of present behaviour embodied as a present existence functioning as a stimulus to further behaviour. 127 Thus the qualities of a perceptual experience may be interpreted, without exception, as anticipations of the results of activities which are as yet in an embryonic stage. 128 The results of the activity that is as yet partly suppressed are already expressed or anticipated in the perception. 129 The present experience may, as James says, "shoot its perspective far before it, irradiating in advance the regions in which lie the thoughts as yet unborn." 130 A baseball player, for example, who is all "set" to field a ball as a preliminary to a further play, sees the ball, not simply as

an approaching object, but as ball-to-be-caught-and-then-thrown-to-first-base. 131 Moreover, the ball, while still on the way, is a ball-that-may-bound-to-the-right-or-to-the-left. 132 The corresponding movements of the player to the right or left, and the act of throwing, although present only as inhibited or incipient acts, are nevertheless embodied in the visual experience. 133 Similarly my couch looks soft and inviting, because the optical stimulation suggests or prompts, not only the act of lying down, but also the kind of relaxation that is made possible by a comfortable bed. 134 So likewise the tiger's jaws and claws look cruel and horrible, because in that perception are reflected the incipient movements of defense and recoil which are going on in the body of the observer. 135 Perception, like our air-castles, or like dreams in the Freudian theory, presents what is at best but a suggestion or program in the guise of accomplished fact. 136 This projection, however, of our submerged activities into our perceptions requires a more precise statement. 137 According to the foregoing contention, the appearance, for example, of a razor's edge as sharp is the sensory correlate of an incipient response which, if it were to attain full-blown perfection, would be the reaction to a cut. 138 By hypothesis, however, the response is inhibited, and it is this inhibition which calls forth the perception of the object. If the response encountered no obstruction, adaptation would be complete and perception would not occur. 139 Since there is a blocking of the response, Nature resorts to a special device in order to overcome the difficulty, and this device consists in furnishing the organism with a new type of stimulus. 140 The razor as perceived does not actually cut just now, but it bodies forth the quality 'will cut,' i.e., the perceived attribute derives its character from what the object will, or may, do at a future time. 141 That is, a perceived object is a stimulus which controls or directs the organism by results which have not yet occurred, but which will, or may, occur in the future. 142 The uniqueness of such a stimulus

lies in the fact that a contingent result somehow becomes operative as a present fact; the future is transferred into the present so as to become effective in the guidance of behaviour.

143 This control by a future that is made present is what constitutes consciousness. 144 A living body may respond to an actual cut by a knife on purely mechanical or reflex principles; 145 but to respond to a cut by anticipation, i.e., to behave with reference to a merely possible or future injury, is manifestly an exhibition of intelligence. 146 Not that there need be any conscious reference to the future as future in the act. Merely to see the object as "sharp" is sufficient to give direction to conduct. But "sharp" is equivalent to "will cut"; 147 the quality of sharpness is a translation of future possibility into terms of present fact, and as thus translated the future possibility becomes a factor in the control of behaviour. 148 Perception, therefore, is a point where present and future coincide. 149 What the object 'will' do is, in itself, just a contingency, an abstract possibility, 150 but in perception this possibility clothes itself in the garments of present, concrete fact and thus provides the organism with a different environment. 151 The environment provides a new stimulus by undergoing a certain kind of change, i.e., by exercising a peculiar function of control. 152 This control is seeing, and the whole mystery of consciousness is just this rendering of future stimulations or results into terms of present existence. 153 Consciousness, accordingly, is a name for a certain change that takes place in the stimulus; or, more specifically, it is a name for the control of conduct by future results or consequences.

154 To acquire such a stimulus and to become conscious are one and the same thing. 155 As was indicated previously, the conscious stimulus is correlated with the various inherited and acquired motor tendencies which have been set off and which are struggling for expression, 156 and the uniqueness of the stimulus lies in the fact that the adaptive value of these nascent motor tendencies becomes operative as the

determining principle in the organisation of the response. 157 The response, for example, to "sharp" or "will cut" is reminiscent of an earlier reaction in which the organism engaged in certain defensive movements as the result of an actual injury. 158 That is, the response to "sharp" is a nascent or incipient form of a response which at the time of its first occurrence was the expression of a maladaptation. 159 The response that is induced when an object is seen as sharp would be biologically bad, if it were completed, 160 and the fact that the object is seen as sharp means that this result is foreshadowed and operates as a stimulus to prevent such maladaptation. 161 Similarly the couch which meets my weary eye becomes a stimulus to repose because the nascent activity which is aroused would be biologically good if completed. 162 In any case the character of the stimulus is determined by the adaptive value which the incipient activity would have if it were carried out. 163 Consciousness, accordingly, is just a future adaptation that has been set to work so as to bring about its own realisation. The future thus becomes operative in the present, 164 in much the same way as the prospects for next year's crop may be converted by the farmer into ready money with which to secure the tools for its production.

165 To justify this conclusion by a detailed and extensive application of this interpretation to every form of quality and relation would carry us beyond the limits of the present undertaking. 166 It is a view, however, which offers possibilities that have not as yet been properly recognised. Certain considerations, besides those already discussed, may be mentioned as giving it an antecedent plausibility. 167 As regards simple sense-qualities, there is abundant reason for believing that Locke's doctrine of "simple ideas" is a violent perversion of the facts. 168 To assume that the last results of analysis are the first things in experience is to give a fatal twist to psychology and to commit us to the fruitless agonies of epistemology. 169 The original "blooming, buzzing confusion" with which experience starts becomes differentiated into

specific qualities only to the extent that certain typical and organised forms of response are built up within the body. 170 Sense-qualities, in other words, are functionally not simple but extremely complex; they owe their distinctiveness or individuality to the fact that each of them embodies a specific set of cues or anticipations, with reference to further experiences. 171 The difference between a quality like "sharpness" and a quality like "red" lies in the fact that the former is a translation of a relatively simple possibility, viz., "will cut," whereas the latter embodies a greater variety of anticipations. 172 The perception of red, being the outcome of many comparisons and associations, presupposes a complex physical response which contains multitudinous tendencies to reinstate former responses; 173 and the combined effect of these suppressed tendencies is the perception of a colour which offers possibilities of control over behaviour in such directions as reminiscences, idle associations, or perhaps scrutiny and investigation. 174 A similar explanation evidently applies to abstract ideas, which neither admit of reduction to "revived sensations" nor compel the adoption of a peculiarly "spiritual" or "psychic" existence in the form of unanalysable meanings. 175 Here again a complex mode of response must be assumed, having as its correlate an experience describable only in terms of its functioning, 176 which is such as to enable the organism to act intelligently, i.e., with reference to future results, which are sufficiently embodied in the experience to secure appropriate behaviour. 177 Again, this point of view offers a satisfactory solution for the time-worn puzzle of relativity. 178 If perception is just the translation of future possible stimulations into present fact, there is assuredly no justification for the notion that perception distorts the facts or that discrepancies among different perceptions prove their "subjectivity." 179 There remains but one test by which the correctness or validity of perception may be judged, 180 viz., whether the perceived object proves to be the kind of stimulus

which is reported or anticipated in the present experience.

181 So far our discussion has emphasised the anticipatory character of the conscious stimulus. Future consequences come into the present as 'conditions' for further behaviour. 182 These anticipations are based, indeed, upon previous happenings, but they enter into the present situation as conditions that must be taken into account. 183 But to take them into account means that the conscious situation is essentially incomplete and in process of transformation or reconstruction. 184 This peculiar incompleteness or contingency stands out prominently when the situation rises to the level of uncertainty and perplexity. 185 To borrow the classical illustration of the child and the candle, the child is in a state of uncertainty because the neural activity of the moment comprises two incompatible systems of discharge, 186 the one being a grasping and holding, the other a withdrawal and such further movements as may be induced by contact with fire. 187 Hence the candle has the seductiveness of a prize, but at the same time carries the suggestion of burning the fingers. 188 That is, the perceived object has a unique character of uncertainty, which inheres in it as a present positive quality. 189 We are here confronted with genuine contingency, such as is encountered nowhere else. 190 Other modes of behaviour may be uncertain in the sense that the incoming stimulation finds no fixed line of discharge laid down for itself within the organism. 191 In seeking to convert itself into response it may either sweep away the obstructions in its path or work itself out along lines of less resistance, in ways that no human can foretell. 192 There may be moments of equilibrium, moments when it remains to be seen where the dam will break and the current rush through. 193 Such uncertainty, however, is the uncertainty of the bystander who attempts to forecast what will happen next. It is not the uncertainty that figures as an integral part of conscious behaviour.

194 This inherent uncertainty means that conscious behaviour, as

contrasted with the mechanical character of the reflexes, is essentially experimental. 195 The uncertainty exists precisely because an effort is under way to clear up the uncertainty. 196 The resort to eye or ear or to reflective thinking is suggested by the corresponding nascent responses and is an endeavour to secure something which is still to seek, but which, when found, will meet the requirements of the situation. 197 Translating this process into terms of stimulus and response, we may say that the conscious stimulus of the moment induces the investigation or scrutiny which presently results in the arrival of a stimulus that is adequate to the situation. 198 The stimulus, in other words, provides for its own successor; or we may say that the process as a whole is a self-directing, self-determining activity. 199 Stimulus and response are not successive stages or moments, but rather simultaneous functions or phases of the total process. 200 Within this process the given situation is the stimulus because it is that aspect or function which guides the subsequent course of the activity, 201 while the bodily movements are the response because they already embody the activity that is to follow. 202 The significant circumstance here is that stimulus and response resist the temporal separation that we find in a purely reflex act; 203 stimulus and response are bound together as correlated functions in a unitary, self-directing process, so that these twain are one flesh.

204 Situations of uncertainty and expectancy, as exemplified by the familiar child-candle incident, are of interest, because they emphasise both the anticipatory character of experience and the peculiar reconstruction of the stimulus. 205 These situations, however, differ merely in degree, not in kind, from other experiences; their merit is that in them the distinctive character of conscious life is writ large. 206 To say that they are conscious situations is to say that they are so constituted that the possibilities of a subsequent moment are embodied in them as a positive quality. 207 In them the present moment embodies a future that is contingent. 208 And

similarly the response has neither the predetermined organisation of the reflex nor the aimless character of a response that issues in a set of random movements. 209 It is, so to speak, of a generalised character, like the paleontological specimens that foreshadow in their structure the advent of both fish and reptile. 210 This form of organisation, however, while exemplified most strikingly in situations of uncertainty, pertains to all conscious behaviour. 211 In uttering a sentence, for example, we know in advance what we are going to say, yet the sentence shapes itself into definite form only as we proceed; 212 or perhaps we get "stuck," and by hemming and hawing bear witness that a struggle for a certain kind of organisation is going on. 213 The same word in different contexts is a different word in each instance, by virtue of the colouring that it takes on from what is to follow after. And this is equally true of our most casual experiences. 214 The auditory or visual object that we happen to notice and immediately afterwards ignore is apprehended with reference to the possibility of warranting further attention, 215 or else it presents itself as an intruder that is to be excluded in order that we may go on with the concern of the moment. 216 All experience is a kind of intelligence, a control of present behaviour with reference to future adjustment. 217 To be in experience at all is to have the future operate in the present.

218 This reference to the future may be in the nature of an end or goal that controls a series of activities or it may be of a momentary and casual kind. 219 In any case the character of the stimulus changes with the progress of the act. 220 The book on the table must become successively book-to-be-reached-for, book-to-be-picked-up, and book-to-be-opened, unless the process is to drop back to the type of reflex. 221 This development of the stimulus gives genuine continuity, since every moment in the process comes as a fulfillment of its predecessor and as a transition-point to its successor. 222 In a purely mechanical act response follows stimulus like the successive strokes of a clock. It is

a touch-and-go affair; 223 the stimulus presses the button and then subsides, while the neural organisation does the rest. 224 In conscious behaviour, on the other hand, stimulus and response keep step with each other. 225 A mere succession of stimuli would reduce conscious behaviour to a series of explosive jerks, on the principle of the gasoline engine. 226 To be conscious at all is to duplicate in principle the agility of the tight-rope performer, 227 who continuously establishes new co-ordinations according to the exigencies of the moment and with constant reference to the controlling consideration of keeping right side up. 228 The sensory stimulus provides continuously for its own rehabilitation or appropriate transformation, 229 and in a similar way the neural organisation is never a finished thing, but is in constant process of readjustment to meet the demands of an adaptation that still lies in the future.

230 It is this relationship of present response to the response of the next moment that constitutes the distinctive trait of conscious behaviour. 231 The relatively unorganised responses of the present moment, in becoming reflected in the experienced object, reveal their outcome or meaning before they have become overt, and thus provide the conditions of intelligent action. 232 In other words, future consequences become transformed into a stimulus for further behaviour. 233 We are confronted here with a distinctive mode of operation, which must be properly recognised, if we are to give a consistent and intelligent account of conscious behaviour. 234 On the other hand, if we refuse to recognise the advent here of a new category, intelligence becomes an anomaly and mystery deepens into contradiction. 235 Since intelligence or consciousness must be provided for somehow, we are forced back upon either interactionism or else epiphenomenalism, more or less disguised under a euphonious name, such as psycho-physical parallelism or the double-aspect theory. 236 That is, the relation of stimulus and response is either

reduced to plain cause and effect or else is rejected altogether and supplanted by a bare concomitance of the physical and mental series. 237 In either case conscious behaviour is reduced to the type of reflex action, the only issue between the two doctrines being the question whether or not it is necessary or permissible to interpolate mental links in the causal chain.

238 According to the doctrine of parallelism, conscious behaviour is nothing more than a complicated form of reflex, which goes on without any interference on the part of mind or intelligence. 239 Intelligence adds nothing to the situation except itself; it carries no implications or new significance with regard to conduct. 240 The psychic correlate is permitted to tag along, but the explanations of response remain the same in kind as they were before they reached the level of consciousness. 241 "Mere complexity should not becloud the issue. Every brain process, like every reflex activity, is presumably the result of physico-chemical processes. 242 The assumption of a mysterious intuition or 'psychic force' adds nothing to the mechanistic explanation, even when the latter is most fragmentary. 243 The interactionists go out of their way unnecessarily in assuming a special activity of consciousness to account for the dislocation of reactions from sensations. 244 The nervous organisation suffices to explain it. Distant-stimuli and central stimuli co-operate to bring about anticipatory reactions; foresight is but the conscious side of this process. The phenomenon is 'both' physical and mental."

245 The passage just quoted is fairly typical. Since the mental is an aspect or concomitant of the physical it is clearly entitled to an occasional honourable mention, 246 but the fact remains that the explanation of behaviour is to be given wholly in terms of neural organisation. 247 The mental is quite literally an "also ran." To say that a physico-chemical process is also mental is of no particular significance as long as it is implied that the end or goal of the process plays no part in shaping the course of events. 248 The mental simply gives dignity to the occasion, like

the sedan chair with no bottom, in which the Irishman's admirers, according to James's story, ran him along to the place of banquet 249 and which prompted the hero to remark: "Faith, if it wasn't for the honour of the thing, I might as well have come on foot."

250 It is this empty show of respect which the interactionists seek to avoid when they make the mental a distinct link in the causal sequence. 251 The physical first causes the mental, and the mental in turn brings about a change in the physical. 252 In this way a certain importance is indeed secured to mental facts, but it appears that, so far as purposive action is concerned, we are no better off than we were before. 253 The mental is simply another kind of cause; it has as little option regarding its physical effect as the physical cause has with regard to its mental effect. 254 Non-mechanical behaviour is again ruled out, or else a vain attempt is made to secure a place for it through the introduction of an independent psychic agency.

255 It is true, indeed, that we are under no antecedent obligation to maintain the existence of an activity that is not entirely reducible to the type of everyday cause and effect. 256 But neither does scientific zeal and incorruptibility require us to do violence to the facts in order to secure this uniformity of type. 257 Not to speak at all of the difficulties inherent in this dualism, it seems undeniable that some facts persistently refuse to conform to the type of mechanism, unless they are previously clubbed into submission. 258 Foresight and the sense of obligation, for example, must learn to regard themselves as nothing more than an interesting indication of the way in which the neural machinery is operating before they will fit into the scheme. 259 And similarly the progress of an argument is no way controlled or directed by the end in view, or by considerations of logical coherence, but by the impact of causation. 260 Ideas lose their power to guide conduct by prevision of the future, and truth and error consequently lose their significance, save perhaps as manifestations of cerebral operations. 261 Since reasoning

involves association, it must be reducible to bare association; the sequence of the process is just sequence and nothing more. 262 A description of this kind is on a par with the celebrated opinion that violin music is just a case of scraping horse-hair on catgut. 263 Everything that is distinctive in the facts is left out of account, and we are forced to the conclusion that no conclusion has any logical significance or value.

264 In the end these difficulties, and in fact most of our philosophic ills, may be traced back to the prejudice that experience or knowing is a process in which the objects concerned do not participate and have no share. 265 This assumption commits us at once to various corollaries and thus breeds a set of abstractions that pass themselves off as entities and add themselves to the world of our experience as demonstrable facts. 266 In philosophy, as in the financial world, there is a constant temptation to do business on a basis of fictitious capitalisation. 267 Our abstract physico-chemical processes, with their correlates, such as passive, independent objects, souls, minds, or absolutes, do not represent actual working capital, but watered stock, 268 and their inevitable tendency is to convert the legitimate business of philosophy into a campaign of exploitation, 269 which is nonetheless exploitation because it is frequently done in the interests of what are supposed to be the spiritual values of human. 270 A careful inventory of our assets brings to light no such entities as those which have been placed to our credit. 271 We do not find body and object 'and' consciousness, but only body and object. 272 We do not find objects that remain indifferent to the experiential process, but rather objects that exhibit a flexibility and mobility which defy all description. 273 We do not find a self-sufficient environment or absolute 'to' which intelligence must needs adjust itself, but an environment that is at odds with itself and struggling in the throes of a reconstruction. 274 The process of intelligence is something that goes on, not in our minds, but in things; it is not photographic, but creative.

275 From the simplest perception to the most ideal aspiration or the wildest hallucination, our human experience is reality engaged in the guidance or control of behaviour. 276 Things undergo a change in becoming experienced, but the change consists in a doing, in the assumption of a certain task or duty. 277 The experiential object hence varies with the response; the situation and the motor activity fit together like the sections of a broken bowl.

278 The bearing of this standpoint on the interpretation of psychology is readily apparent. 279 If it be granted that consciousness is just a name for behaviour that is guided by the results of acts not yet performed but reflected beforehand in the objects of experience, it follows that this behaviour is the peculiar subject-matter of psychology. 280 It is only by reference to behaviour that a distinctive field can be marked off for psychological enterprise. 281 When we say that the flame is hot, the stone hard, and the ice cold and slippery, we are describing objects and nothing more. 282 These qualities are, indeed, anticipations of future possibilities, but this means simply that the objects are described in terms of their properties or capacities as stimuli of the organism. 283 Such an account leaves out of consideration certain changes which things undergo when they exercise the function of controlling or directing changes in the adjustment of the body. 284 A quality, such as "sharp" or "hot," is not mental or constituted by consciousness, but the function of the quality in giving direction to behaviour through certain changes which it undergoes is consciousness. 285 The changes that take place in things as a result of association, attention, or memory, are changes that have no significance, save with regard to their function as stimuli to new adjustments. 286 Psychology, therefore, is properly a study of the conditions which determine the change or development of stimuli; 287 more specifically it is a study of the conditions which govern such processes as those by which problems are solved, lessons are memorised, habits and attitudes are built up, and decisions are

reached. 288 To call such study "applied" psychology is to misunderstand the proper scope and purpose of the subject. 289 Psychology frequently has occasion to draw extensively upon physics and physiology, but it has its own problem and its own method of procedure.

290 That this view of conscious behaviour should involve an extensive reinterpretation of familiar facts is altogether natural and inevitable. 291 If consciousness is a form of control, the question, for example, what is "in" consciousness and what is not must be interpreted with reference to this function of control. 292 In a sense we perceive many things to which we are not paying attention, such as the light in the room or the familiar chairs and bookcases. 293 These are perceived "marginally," as we say, in the sense that the presence of these objects affects the total adjustment of the moment in such a way that the experience 'would' become a clue to these objects if they were withdrawn. 294 And similarly we may speak of marginal sensations of strain or movement, to indicate possible clues to certain bodily activities which are factors in the process. 295 These marginal perceptions or images are not actual existences, but are symbols and nothing more. 296 The significance of these symbols is that they point to certain conditions by which the experiences in question are determined. 297 Thus the question whether a given experience involves certain "sensations" is just a question whether certain bodily or extra-bodily conditions are involved in the experience. 298 If this reference to conditions is ignored and experience is explained in terms of sensory material that blends and fuses and otherwise disposes itself, the explanation is no longer science but sleight-of-hand. 299 Psychology has no proper concern with such mythical constituents of consciousness; its business is with things as related to conduct, which is to say that psychology is a science of behaviour.

II

300 According to the standpoint set forth in the preceding discussion, the key to a consistent and fruitful

interpretation of consciousness and psychology lies in behaviour. 301 If we turn now to the psychology of introspection, which has been dominant so many years, we find a standpoint and mode of procedure which, on the surface at least, is of a radically different kind. 302 It behooves us, therefore, to consider this standpoint in some detail in order to justify the attempt to reinterpret and "evaluate" it in the light of our own doctrine.

303 The point of departure for introspective psychology is to be found, so it seems, not in the facts of behaviour, but in the distinction between focal and marginal experience. 304 It is on this distinction that the introspective psychologist bases the attempt to give a psychological analysis and description of the contents of experience. 305 To analyse and describe the facts of consciousness is to bring the marginal constituents of experience into the white light of attention. 306 Analysis and description are possible just because experience is so largely a welter of elements that disguise their identity and character. 307 In some way these unrecognised and unidentified elements are constituents of the total experience. 308 To borrow the language of a writer quoted by James, "However deeply we may suppose the attention to be engaged by any thought, any considerable alteration of the surrounding phenomena would still be perceived; 309 the most abstruse demonstration in this room would not prevent a listener, however absorbed, from noticing the sudden extinction of the lights." 310 Or, as James remarks: "It is just like the overtones in music. Different instruments give the 'same note,' namely, various upper harmonics of it which differ from one instrument to another. 311 They are not separately heard by the ear; they blend with the fundamental note and suffuse it, and alter it." 312 Let the attention be directed to these overtones, however, and they at once detach themselves from their surroundings and step forth into the light of day. 313 Even so the ticking of the clock may pass unnoticed in the sense that it is an undiscriminated element in the background of our consciousness; 314 but if the ticking comes to a

sudden stop, the feeling of a void in our consciousness proclaims the fact that something has gone out from it.

315 The observation and description of the facts of consciousness, then, is based directly on the fact that experience, as the psychologist deals with it, possesses a focus and margin. 316 Nature as conceived by the physical sciences presents no such distinction. The facts are what they are, and their character as focal or marginal, as clear or obscure, depends altogether upon their relation to an intelligence. 317 Or we may say that if the facts of experience were always focal and never marginal, it would never occur to us to speak of consciousness as we do at present. 318 As long as we confine ourselves to a given colour, shape or temperature, as experienced focally, we are not dealing with consciousness, but with objects. 319 An analysis of such facts that does not bring in the marginal is not an analysis of consciousness, but an analysis of physical reality. 320 Even if we consider non-physical objects, such as mathematical or economic concepts, we find that our analysis is not psychological as long as the marginal is left out. 321 The consideration of the margin, however, brings us into the presence of facts which are of a distinctive kind and which warrant a new science. 322 Let the margin be eliminated and psychology disappears at the same time.

323 The psychological doctrine of focus and margin, then, is a matter of fundamental importance. On the interpretation of this doctrine depend our systems of psychology and of philosophy. 324 What, then, is meant by focus and margin? If we turn to our psychologies, we seem to be confronted once more with something that everybody knows and nobody can define. 325 But since we have to do with a distinction, the obligation to differentiate cannot be wholly ignored. 326 Consciousness is sometimes likened to a visual field and sometimes to the waves of the sea. 327 Like the visual field it has a foreground and a background, a near and a remote, a center and a margin or periphery. 328 The contents of consciousness are

vivid or clear in the center of this field and fade away into vagueness or obscureness in proportion to their approach to the periphery. 329 Or, to take the other comparison, the focus may be represented by the crest of a wave and the margin by what we may call its base. 330 This illustration has the advantage that it indicates the difference between higher and lower degrees of concentration. 331 As concentration increases, the crest of the wave rises higher and its width decreases, while the reverse is true where the concentration of attention is less intense. 332 All consciousness possesses the distinction of focus and margin in some degree; 333 however much we may be absorbed in an object or topic, there is always an indirect mental vision that informs us of other facts, which for the time being are in the background of our consciousness.

334 For purposes of description a metaphor is at best a clumsy device. It has a tendency to substitute itself for the thing to be described and thus to conceal its limitations and inaccuracies. 335 The present case is no exception. I am forced to think that the visual field in particular is a thoroughly vicious metaphor when employed to body forth the distinction of focus and margin. 336 Whatever this distinction may in the end turn out to be, it is not such as this comparison would lead one to suppose. 337 Objects seen in indirect vision appear obscure and blurred precisely because they are in the focus of consciousness. 338 We get pretty much the same sort of obscureness or blur on a printed page when we look at it in indirect vision as we do when we look at it from a distance that is just too great to make out the words or characters. 339 What the illustration shows is that things look different according as the circumstances under which we see them are different, 340 but what bearing this has on marginal consciousness is not at all obvious to an unsophisticated intelligence.

341 When we speak of a focus and margin in consciousness, we are presumably dealing with conscious fact. Now this illustration of the visual field does not represent conscious fact. 342 Ordinary perception carries with it no sense

of obscureness at all, and when it does we have exactly the same kind of situation as when an object is too distant or in some other way inaccessible to satisfactory perception. 343 That is, the object perceived is in the 'focus' and not in the margin. 344 The obscureness of objects when seen with the margin of the retina has no more to do with the margin of consciousness than the obscureness caused by an attack of dizziness or by a morning fog.

345 It will be said, perhaps, that consciousness may be unclear even though there be no sense of unclearness, that there is such a thing as intrinsic clearness, quite apart from obstacles and problems. 346 In other words, the same sensation is capable of realising various degrees of clearness. 347 It is not at all obvious, however, why the different experiences that are concerned in such a comparison should be called the same sensation. 348 As long as we abstract from objective reference, each sensation is just what it is and there is no opportunity to make comparisons on the basis of clearness. 349 A sensation as such-- if we are bound to speak of sensations-- can by no possibility be an obscure sensation, for the trait that we call obscureness or vagueness constitutes the intrinsic being of that sensation. 350 If we permit ourselves to speak of clearness at all, we should rather say that it possesses a maximum of clearness, since it has managed to express or present its whole nature with not one trait or feature lacking. 351 What more could be demanded, in the way of clearness, of any conscious fact than that it should body forth every detail that it possesses?

352 If sensations or states of consciousness possess degrees of clearness, it seems to follow that we may scrutinise them for the purpose of discovering characteristics that were present 353 though scarcely perceived, in much the same way that the polishing of old furniture brings out the grain in the wood. But such a parallel, I submit, is plain nonsense. 354 The supposition that consciousness is something that in due time and with good fortune may attain consciousness is too absurd for discussion, even though

it is a supposition that plays a considerable rôle in present-day psychology.

355 The purpose of the discussion, up to this point, has not been to deny the validity of the distinction between focus and margin, 356 but to insist upon the necessity of reconsidering the meaning of this distinction, if we are to attain to a workable definition of consciousness and a fruitful or even intelligible conception of the problem of psychology. 357 I have endeavoured to show, in the first place, that the doctrine of focus and margin involves the 'raison d'être' of psychology. 358 Apart from this doctrine we have no task or problem that psychology can claim as its distinctive possession. 359 The analysis of what is in the focus of consciousness is adequately provided for in the other sciences; it is only with the introduction of what is called the margin that an enterprise of a different kind becomes necessary. 360 But, secondly, this distinction of focus and margin cannot be drawn on the basis of the experienced contrast between clearness and obscureness. 361 The very fact that anything is experienced as obscure means that it is an object of attention, or, in other words, that it is in the focus of consciousness and not in the margin. 362 The comparison of focus and margin with direct and indirect vision is misleading, because it suggests that experiences are marginal in proportion as they are felt as obscure. 363 And, thirdly, if we undertake to distinguish between focus and margin on the basis of a difference in clearness or vividness of which no note is taken at the time, 364 we encounter the difficulty that experience or consciousness, taken abstractly, does not admit of such variations in degree, and so this criterion likewise goes by the board.

365 The situation is indeed peculiar. That there is a realm of psychological fact is universally conceded. 366 As a consequence of this conviction a great body of fact and of doctrine has been built up. It would be folly to deny either the distinctiveness or the significance of this achievement. 367 And yet James's description of psychology as "a string of raw facts; a little

gossip and wrangle about opinions; a little classification and generalisation on the mere descriptive level; a strong prejudice that we 'have' states of mind and that our brain conditions them," is not wholly untrue even today. 368 It is even possible for a present-day critic to outdo James and maintain that the legitimacy of psychology as a separate inquiry is a matter of faith rather than of sight. 369 The 'raw facts' of which James speaks resolve themselves into physical and physiological material on the one hand and metaphysical dogmas on the other; 370 the gossip and wrangle are largely over fictitious problems; the classifications and generalisations as a rule involve trespassing on other fields; the prejudice that we have states of mind has less standing-ground today than it had twenty years ago. 371 In other words, there is still plausible ground for James's pessimistic comment: "This is no science, it is only the hope of a science." 372 A situation such as this carries with it the insistent suggestion that the trouble lies, not primarily in the nature of the subject-matter, but in our conception of the problem. 373 "The matter of a science," as James says, "is with us." 374 And if the distinction of focus and margin constitutes the starting-point and justification for a science of psychology, a better understanding of this distinction will mean a more adequate appreciation of the problem with which psychology has to deal.

375 As a starting-point for a reconsideration of focus and margin, we may take those experiences in which the distinction of clearness and obscureness is presented as an experienced fact. 376 Let us then turn once more to the familiar illustration of the visual field. "When we look at a printed page, there is always some one portion of it, perhaps a word, which we see more clearly than we do the rest; 377 and out beyond the margin of the page we are still conscious of objects which we see only in a very imperfect way." 378 That is, we appreciate the distinction between what lies in the center of our visual field and what is more remote, 379 just

because in this experiment we are trying to see what lies beyond the center without turning our eyes in that direction. 380 We set ourselves the task of seeing what is on the page, and at the same time we interpose an artificial obstacle. Hence the sense of effort, and the contrast between what is clear and what is obscure. 381 The present experience is obscure, not inherently, but only with reference to a certain problem or question. It is inadequate as an anticipation of further experience. 382 The contrast between clear and obscure is created by our attempt to overcome the difficulty, and is therefore absent from ordinary, unobstructed visual perception.

383 The situation described in the following familiar quotation from James is an illustration of the same thing: 384 "Suppose we try to recall a forgotten name. The state of our consciousness is peculiar. There is a gap therein; but no mere gap. 385 It is a gap that is intensely active. A sort of wraith of the name is in it, beckoning us in a given direction, making us at moments tingle with the sense of our closeness, and then letting us sink back without the longed-for term."

386 'I met this man on the train, and later at the reception; but what is his name?' The struggle rends our consciousness in twain. 387 The occasions of our meeting, his appearance, his conversation, are solid fact, yet all suffused with the pervasive, evanscent "wraith" that tantalises us with glimpses which half reveal and half conceal the name we seek to grasp.

388 To account for such experiences simply in terms of half-submerged "sensations" and "images" is to do violence to all the requirements for clear thinking. 389 If we rule out explanations of this kind, we are evidently forced to the conclusion that these experiences are obscure, 390 not in themselves or in the abstract, but with reference to the function of putting us in possession of the name to which they are inadequate clues. 391 It is the subsequent, satisfactory experience of the name which furnishes our standard for clearness; in other words, the implications of obscureness are of a functional, and not of a static or

structural, kind. 392 The marginal character of an experience is simply a reference to its function as a clue or cue to some further experience, i.e., a reference to its character as a changing stimulus. 393 Or we may say that the distinction between focus and margin is just another aspect of the distinction between the conditions for further activity and the incompleteness which leads to further adjustment. 394 The transfer of the future into the present gives us a fact, here and now, 395 and in this respect the experience is entirely focal in character, and as such it is subject-matter for the various sciences. 396 Whatever the nature of the experience, it is just what it is, and not something else. 397 With respect to the further experience, however, which it conditions or for which it prepares the way, the present experience is entirely marginal, i.e., in its character as a changing stimulus it is subject-matter for psychology. 398 The distinction of focus and margin, then, is based ultimately upon the function of experience in the control of behaviour. 399 The given situation is a present fact and is in functional change; or, in terms of our present discussion, it has both a focus and a margin. 400 As present fact it is a reality which requires recognition in the form of adjustment; as in functional change it provides opportunity for bringing the adjustment to fruition. 401 That is, the experience both sets a task or makes a demand and it points the way. 402 The distinction is a distinction of function, not of static existence, and it is this distinction which is represented by the contrast of focus and margin.

403 If we compare this interpretation of focus and margin with that of traditional psychology, we find that the latter construes the relation of the present to the future experience wholly in static terms, the functional relation being left out of account. 404 The later experience is read back into its predecessor in the form of dim or marginal images, which need but show themselves more completely to make the two identical. 405 If these sensations were intended only as symbols of a functional relationship, it would perhaps be

scarcely worthwhile to enter a protest against them. 406 But when the functional relationship is quite overlooked, the explanation that is given becomes exceedingly dubious. 407 The ticking of the clock, for example, that is present, though unnoticed, the overtones of the note that suffuse the whole without diverting attention to their individual qualities,-- 408 in what precise way are facts of this kind concerned in the description of the experience which they modify? 409 A study of the clock or of the overtones can hardly pass as an analysis of consciousness; it is too obviously an affair of physics. 410 Such a study becomes merely an excuse for repeating the analyses of physics and reading them off in terms of sensations and images. 411 Moreover, the transfer of all this material to consciousness looks suspiciously like a transaction in mental chemistry. Where, then, is psychology to gain a foothold? 412 What is the meaning of these uncanny sensations and images, which nobody experiences, unless it be their character as symbols of adjustment? 413 They have no legitimate status, and psychology, by consequence, has no legitimate problem, except in so far as they represent those possible acts of adaptation which are the sole and proper concern of psychology.

414 It remains to point out briefly the bearing of these results on what is called "the method of introspection." 415 We are sometimes assured that introspection has discarded the belief in a separate mental stuff or subject-matter, 416 but there is ground for the suspicion that such protestations are made in the same spirit that we affirm our belief in the Ten Commandments or the Golden Rule, with no thought of being taken seriously. 417 At all events, without a literal "looking within" it seems to become exceedingly difficult to differentiate introspection from ordinary observation as practised in the other sciences. 418 The reason for this difficulty is that there is nothing left in introspection by which it can be differentiated. 419 The term introspection properly designates, not a method but a problem; the problem, namely, of interpreting

given facts with reference to their function in the control of behaviour. 420 If psychology is to justify its claim to the status of a science, it is in duty bound to secure for itself both an objective criterion for the adjudication of disputes which otherwise are of necessity interminable, 421 and a subject-matter that is not simply a heritage of metaphysical prejudice, but a realm of fact that is attested by everyday observation and experience.

III

422 Within recent years the doctrine that psychology is a science of behaviour has acquired a certain prominence. 423 It is presupposed, of course, that the behaviour with which psychology is concerned is of a distinctive sort; but the differentia is unfortunately the very thing that the "behaviourist" has hitherto left out of account. 424 In their revolt against introspectionism, which has been accustomed to give to its subject-matter a subjectivistic and "psychic" interpretation, they goes to the other extreme and relies on behaviour pure and simple. 425 Being without a serviceable differentia, they are unable to mark off the field of psychology from contiguous territory. 426 The selection of certain problems within the general range of behaviour, with no recognition of any distinctive trait to guide and justify the selection, is hardly enough to warrant a new science. 427 Even an arbitrary principle of selection is better than none, and it would, therefore, be quite as reasonable to subdivide the field of botany in the interests of a new science, 428 and group together for separate botanical study those flowers which have enabled poets to give symbolic expression to the beauty of women.

429 That the principle of selection is, in the end, the ability to modify behaviour through the anticipation of possible consequences, appears from the fact that the category of stimulus and response is otherwise found to be unworkable. 430 It is true that in the simpler forms of behaviour stimulus and response may be correlated without practical difficulty. 431 But when we deal with what has been called "delayed overt response," the

matter becomes more complicated and the theoretical difficulty becomes more prominent. 432 The behaviourist would not seriously undertake to record everything that happens between stimulus and response. They proceeds selectively, taking the relation of stimulus and response as their clue. 433 They are properly interested in the movements which result from the application of the stimulus only in so far as they constitute response. Otherwise their study is not a study of behaviour, but a study of movements. 434 But when does a movement constitute a response? Do we label as stimulus the spoken word which results in overt action a week later, 435 or the visual perception which sets a complicated and long-drawn-out problem, for no other reason than that it appears somewhere as an antecedent in the causal chain of events? 436 If so, there is no obvious reason why the event which occurred just before or immediately after the 'soi-disant' stimulus should not be regarded as the true stimulus. 437 Unless a satisfactory reason is forthcoming, it would seem better to substitute cause and effect for stimulus and response and to drop the term behaviour from our vocabulary. 438 Psychology then becomes a study of certain causal relationships, but is still without a principle for the selection of those causal events which are supposed to constitute its peculiar subject-matter.

439 Even if we manage to become reconciled to this situation, however, our troubles are not yet at an end. 440 There still remains the difficulty in certain cases of showing that the event which is selected as stimulus or cause bears any significant relationship to the event which figures in our scheme as the response. 441 The stimulus is supposed to have a causal connection with the response, but how are we to know that this is the fact? 442 How are we to know that the engineer who solves a problem for me at my request might not have done so anyway? 443 No behaviourist can possibly show that the air waves set in motion by my vocalisation were an indispensable stimulus. 444 We doubtless believe that the spoken

word was in fact the spark which lit the fuse and finally exploded the mine, but this belief involves a complication of causes which it is wholly beyond our power to control or to verify.

445 It is true, of course, that we are able, as a matter of fact, to correlate stimulus and response. 446 I know that it was the spoken word which caused the commission to be executed, for the expert reminds me of the fact and presents a bill. 447 But neither of us makes any pretense that your belief is derived from a scrutiny of the causal sequence. 448 Memory furnishes us with a shortcut to the result. While our present acts are doubtless connected with the past through causation, 449 we do not regard them as simply the effects of antecedent causes. They are rather responses to present stimuli. 450 The expert presents own bill, being moved thereto by a stimulus which may be indicated by saying that it is the spoken-word-constituting-a-commission-now-completed-and-entitling-me-to-compensation. 451 That is, the stimulus cannot be pushed back and anchored at a fixed point in the past, but is a present factor at the moment of response and is operative by virtue of its anticipation of future events.

452 If, then, psychology is to be regarded as a study of behaviour, it is plainly necessary to reinterpret the category of behaviour. 453 For example, a purely mechanical response to a light-stimulus may properly be viewed as response to the ether-vibration or wave-length upon which it follows in temporal sequence. 454 But if this stimulation results in what is commonly called consciousness, a different kind of response ensues. 455 The light-stimulus becomes a cause or occasion for the act of looking. But why look, unless it be to secure a new stimulus for further response? 456 We stop to look, precisely because the first stimulus does not run smoothly off the reel. The response will not go forward, but is halted and expends itself in the effort to secure a further stimulus. 457 This is the moment of attention, in which the stimulus undergoes a process of transformation, concomitantly with the process of re-organisation in the motor responses, and in the

direction of ends or results that are foreshadowed in it. 458 This change in the stimulus takes place under certain specifiable conditions, 459 and the study of these conditions is a study of such processes as perceiving, attending, remembering, and deliberating, which are distinctively psychological in their nature. 460 Processes of this kind, if taken as changes in stimuli, find an objective criterion in the adaptive behaviour for the sake of which they occur, and they provide psychology with a distinctive task and subject-matter.

461 As against the introspectionist, then, the behaviourist is justified in own contention that psychological procedure must be objective and experimental in character. 462 The danger to which it has exposed itself is the failure to differentiate its problem from that of physiology and physics. 463 It is only by a proper recognition of both the objective and the distinctive character of conscious behaviour that psychology can free itself of the reproach which is heaped upon it by members of its own household and take the place that rightfully belongs to it in the community of the sciences.

IV

464 According to the preceding exposition, the current psychological doctrine of focus and margin is an attempt to reduce the changes in the stimulus to terms of static entities denominated sensations and images. 465 By abstracting from change we convert the new stimulus that is already on the way into inert sensory material, which lends itself to purely analytic treatment. 466 In this way the suggested hardness of the rock becomes a "centrally aroused sensation" of a stubbed toe, the heat of the candle becomes an image of a burn, etc. 467 As was said before, the sensations are not existences, but representatives or symbols of our nascent activities; they are the static equivalents of this foreshadowing or reference to the future. 468 The explanation of experience that we find in James and Bergson approximates this view so closely in one respect and departs from it so widely in

another as to warrant a brief discussion.

469 A prominent characteristic of the doctrine advocated by James and Bergson is the emphasis given to the foreshadowings or anticipations of the future. 470 Experiences of conflict, such as the struggle to recall a name, take on their peculiar colouring, 471 so these writers contend, from their relationship to a beyond, to something which is yet to be. 472 If we are to understand experience as it really is, we must guard against the besetting temptation to translate everything into spatial equivalents. 473 This forward reference is usually read off as a distinction and contrast between simultaneously existing components. 474 Some constituent is first set apart as the nucleus or focus and is then enveloped with an elusive, intangible wraith of meaning, which is called the margin. 475 We have been taught to think of the focus as made up of sensory material of some sort and silhouetted against a background lit up by the fitful, inconsequential heat-lightning of meaning. But this is a perversion of the facts. 476 When we are engaged in a problem it is precisely these unformed meanings that are of interest and importance. 477 They are in the focus of consciousness, in so far as we can speak of a focus at all. They absorb our attention and direct our energies. 478 They inform us of a margin, not by refusing to compete for our attention with more important or more interesting facts, but by bodying forth the 'unfinished' character of the situation. 479 Hence this beckoning, this tingling with the sense of closeness, this sinking back when our efforts meet with defeat. 480 Focus and margin, in short, have to do with movement, with transition, and not with a static field. These situations are felt as inherently unstable and in process of reconstruction. 481 There is a peculiar sense of activity, of "something doing," of a future knocking on the door of the present. 482 What is thus on its way to the present we can designate only in terms of the object as it is after it has arrived. 483 To call it marginal is to immerse the object in this temporal flux, which embodies

perfectly the characteristics of Bergsonian duration.

484 But this is only a first step. If we turn now to those experiences from which this inner diremption of fact and meaning is absent, we find a process that is essentially the same in kind. 485 They likewise constitute a temporal flow, even though there be no sense of duration or of change as such. 486 The different moments of these experiences are not mechanically juxtaposed, but blend together in much the same way as when the process is experienced as a process. 487 In principle we have the same transition, the same becoming, the same growth from less to more, the same activity of continuous reconstruction. 488 Conscious life, we find, is a continuous adjustment; each of its moments is a "transitive state." 489 The more evenly flowing experiences are likewise endowed with a focus and margin, not in the form of static elements, but as a dynamic relationship of what is with what is to be.

490 Such an interpretation of experience, moreover, opens the way for a proper valuation of the psychologist's procedure. The concept of sensation is methodology pure and simple. 491 Granted that focus and margin are such as was indicated a moment ago, how are they to be described, unless we resort to some 'Hilfsbegriff' such as sensations? 492 James's description of the effort to recall a forgotten name is not description at all in a scientific sense, 493 since the "wraith of the name" that we are trying to recover is of too unearthly a fabric to be weighed and measured by accepted scientific standards. 494 It makes us "tingle," it lets us "sink back," but such portrayal is literature rather than science. 495 Our first step must be to resolve our material into components. These components we identify with genuine elements if we can, with pious fictions if we must; but until this is done there can be no exact description. 496 There can be no precision in our statement of the facts and no formulation of the laws that govern their changes.

497 This view undeniably has a certain plausibility. As long as the results are attained which the

psychologist sets out to reach, we need not be hypersensitive on the score of methods. 498 In the field of natural science, at all events, this Jesuitical principle is not incompatible with respectability. 499 If it be true, however, that sensation is but a tool or artifact, a means to an end, what is the end that is to be attained by this device? 500 It is at this point that we come to the parting of the ways. 501 According to the view previously elabourated, the anticipations of the future have to do with the results of our possible acts, and sensations are simply symbols for the various elements in our complex motor responses. 502 In the case of Bergson and James, however, the clue that is furnished by response is discarded. 503 The reference to the future, being dissociated from behaviour, is taken as evidence of an abstract or metaphysical duration, so that experience is somehow other than it seems; and sensation is regarded as the translation of duration into the language of space. 504 Associationism is justified in its belief that reality is different from its appearance in our experience, but is criticised for attempting to interpret the real in terms of space rather than time. 505 In both cases the lead of the subject-matter is abandoned in favour of an explanation that is derived from a fourth-dimensional plane of existence.

506 The suspicion that these two positions have a deep-seated affinity is strengthened if we call to mind that the concept of sensation was originated, not in the interests of methodology, but as the expression of a historic preconception that mistook fiction for fact. 507 The fundamental error back of it was the preposterous notion that consciousness consists of subconscious or unconscious constituents, which by their mechanical or chemical combinations make our experience what it is. 508 The question which it raises and which has afflicted us even to the present day is not primarily the question of fact, but the question of intelligibility, as the controversy over mind stuff abundantly attests. 509 Whether we regard experience as made up of sensory material, however, or as constituted in a Bergsonian

fashion, is a matter of detail; 510 the primary question is whether a distinction between consciousness as it appears and as it "really" is has any meaning. 511 In so far as this distinction is maintained, we are beating the thin air of mythology, despite our reinterpretations and justifications. 512 True conversion does not consist in a renaming of old gods, but demands a humble and a contrite heart. 513 To call sensation an artifact, a methodological device, without a surrender of the metaphysical assumption that lies back of Associationism is not to correct the evil, but is more likely to be treated as an indulgence for sins that are yet to be committed.

514 This fundamental identity is presumably the reason for certain other similarities, which would perhaps not be readily anticipated. 515 Both doctrines undertake to tell us what is going on behind the scenes, what consciousness or experience "really" is. 516 The descriptions present an astonishing difference of vocabulary, but if we take care not to be misled by superficial differences, we find an equally astonishing agreement as to content. 517 From the one side consciousness is explained as a juxtaposition of elements; from the other as an interpenetration of elements so complete that the parts can be neither isolated nor distinguished from the whole. 518 On the one hand we find a multiplicity without unity, on the other a unity without multiplicity. 519 In the one account the temporal unit is a sensation devoid of internal temporal diversity; in the other duration as such is a unity in which past, present, and future blend into an undifferentiated whole. 520 The one position gathers its facts by a mystifying process called introspection; the other obtains its results from a mystical faculty of intuition. 521 The difference in language remains, but both accounts lead us away into a twilight region where words substitute themselves for facts.

522 As was suggested a moment ago, the contrast between ordinary experience and something else of which it is the appearance is the result of the failure to give proper recognition to the facts of behaviour. 523 If we connect the

forward reference of experience with the operations of our nascent activities, we have no need of a pure duration or of bridging the gulf between reality and its appearances. 524 In the same way, if we construe sensations as just symbols of our responses, we rid ourselves of problems that are insoluble because they are unintelligible. 525 Such problems constitute metaphysics in the bad sense of the word, whether they show themselves in the domain of science or of philosophy. 526 To describe experience by reference to such a real is to explain what we know in terms of what we do not know. 527 The question what is real is absolutely sterile. Our descriptions and explanations must remain on the same plane as the experiences with which they deal, and not seek after a real of a different order. 528 If we are to have an explanation of consciousness at all, the explanation must not take us back to hypothetical sensations that are almost but not quite experienced, 529 nor to a duration in which all distinctions are swallowed up, but must be rendered in terms of other facts that dwell in the light of common day.

530 By way of conclusion I venture to urge once more that a proper consideration of the facts of behaviour will furnish us with a key that will unlock many a door. 531 The conception of stimulus and response gives us a differentia for experience and also enables us to distinguish within experience between consciousness and object. 532 If, however, we disregard behaviour, we are bound to lose our way. 533 The distinction between the experienced and the unexperienced is either wiped out or else is permitted to convert itself into a distinction between appearance and reality that leads nowhere and explains nothing. 534 The significance of truth as the successful guidance of behaviour, in accordance with the program laid down in the organisation of stimulus and response, is lost to sight 535 and recourse is had to a fourth-dimensional truth or reality for the miracle of breathing life into the dead bones of our philosophic abstractions. 536 The study of behaviour constitutes a mode of approach that holds out

the hope of deliverance from questions that should never have been asked. 537 We are on a different and, let us hope, a higher level when we cease to ask how consciousness can lay hold of passive objects, or how knowledge 'überhaupt' is possible, 538 and concern ourselves rather with the wondrous activity whereby this plastic dance of circumstance that we call the universe transcends the domain of mechanism and embodies itself in the values of conscious life.

THE PHASES OF THE ECONOMIC INTEREST

Henry Waldgrave Stuart

6 In the logic of Instrumentalism, truth has been identified with usefulness and the good with the satisfactory. 2 Classifying critics have seen in this the damaging mark of Utilitarianism, certain of them deeming "Amerikanismus" an even shrewder and more specific diagnosis. 3 The association of these terms together and the aptness of either to express what the critics have in mind are matters of small interest. 4 It is of more importance to discover, behind the reproach implied, the assumptions which may have made the reproach seem pertinent. 5 One cannot, of course, suppose it to express a sheer general aversion to the useful or an ascetic abhorrence of all satisfaction on principle. 6 Puritanism, æstheticism, and pedantry should be last resorts in any search for an interpretative clue.

7 The distrust of Utilitarianism need be ascribed to none of these. It comes instead from a conception of the true Utilitarian as a dull and dogmatic being with no interests beyond the range of own uninquiring vision, 8 no aspiration beyond the complacent survey of own perfections and no standards beyond the inventory of own 'bourgeois' tastes and prejudices. 9 The type is indeed not yet extinct in our day: but is it plausible to charge a "new" philosophy with conspiring to perpetuate it? 10 Is Instrumentalism only philistinism called by a more descriptive name? It professes at least to be a logic of hypothesis and experiment, 11 whereas for the

perfect philistine there are no ultimate problems and hence no logic but the logic of self-evidence. 12 When Instrumentalism speaks of needs and interests in its analysis of truth and goodness does it then mean the needs and interests that define the individual in what is sometimes invidiously termed a "biological" sense-- 13 interests that control you before your conduct becomes in any way a problem for yourself? 14 Quite as a matter of course, just this has been the assumption. 15 The satisfactoriness of prompt and cogent classification has had a hand in the vindication of truth's supremacy over satisfaction. 16 In the view of instrumentalism this ready interpretation of its meaning is nothing less than the thinking of the unthinkable and the bodying-forth of what is not. 17 The person who has solved a problem simply 'is' not the person one was before-- if your problem was a genuine one and it was you who solved it. 18 You cannot measure and judge the outcome by your earlier demands for the very good reason that the outcome of real deliberation empties these earlier demands of their interest and authority for you. 19 Can the conception thus suggested of personal growth through exercise of creative or constructive intelligence be in any measure verified by a general survey of the economic side of life? 20 Has it any important bearings upon any parts of economic theory? These are the questions to which this essay is addressed.

I

21 How have the real or fancied needs of the average person of today come to be what they are? 22 For all sorts and conditions of humans, the ways and means of living have, during the past century or two-- even during the past decade or two-- undergone revolutionary changes. 23 It is true that many of these changes have been relatively superficial, touching only certain externalities and entering in no important way into life's underlying and dominant motives. 24 Others, no doubt, may fairly be held to confuse and disperse the energies of people, instead of making for wholeness,

sanity and development of human interest and power. 25 And critics of industrial and social progress who have felt the need for reservations of this sort fall easily into a certain mood of historic homesickness for the supposed "simplicity" of an earlier age. 26 But our interest, in this discussion, is in the genesis, the actual process of becoming, of our present "standards of living," not their value as rated by any critical (or uncritical) standard. 27 And accordingly we shall take it for a fact that on the whole the average person of today is reasonably, perhaps unreasonably, well satisfied with own telephone, own typewriter, and own motor-car; 28 with your swift and easy journeyings over land and sea; with your increasingly scientific medical attendance and public sanitation; with your virtually free supplies of literature and information, new and old, and with your electric light or your midnight oil (triple distilled) to aid in the perusal. 29 More than this, you are so well satisfied with all these modern inventions that, historical or æsthetical or other "holidays" apart, you would never for a moment dispense with any one of them as a matter of free choice. 30 Grossly material and humbly instrumental though they are, these things and their like constitute the framework sustaining the whole system of spiritual functions that make up the life we live today, as a society and as individuals. 31 And our present problem simply is the way in which they were first received by those who were to use them, and passed into their present common acceptance. 32 To put the matter in general terms, how is it that novel means of action or enjoyment, despite their novelty, are able to command fair scrutiny and hearing and can contrive to make their way, often very speedily, into a position of importance for industry and life?

33 There is an easy and not unnatural way of thinking of this process as we see it going on about us that may keep us long unmindful of even the possibility of such a question. 34 In every field of action, we habitually look back upon accomplished changes from some present well-secured

vantage-point, 35 and as we trace the steps by which they have come to pass it is almost inevitable that we should first see the sequence as an approach, direct or devious but always sure, to the stage on which we happen to have taken our stand. 36 It seems clear to us that what we have attained is better than aught that has gone before-- if it were not distinctly satisfactory on its own merits we should not now be taking it as the standpoint for a survey. 37 But once it is so taken, our recognition of its appreciable and satisfying superiority passes over insensibly into metaphysics. 38 What we now find good we find ourselves perceiving to have been all the while predestined in the eternal scheme of things! 39 We pause in retrospect like the wayfarer who has reached the turning of a mountain road or the person of middle age who for the first time feels that own professional position is assured. 40 This, we say, justifies the effort it has cost, 'this' at last is really living! 41 And the next step in retrospective reconstruction follows easily; this was my true goal from the first, the dim and inexpressible hope of which would not let me pause and kept me until now dissatisfied. 42 The end was present in the beginning, provoking the first groping efforts and affording progressively the test and measure by which their results were found ever wanting.

43 This retrospective logic may explain the presence and perennial charm of those panoramic pages in our encyclopædias purporting to show forth the gradual perfecting of great instrumentalities upon which our modern life depends. 44 We survey the "evolution" of printing, for example, from the wooden blocks of the Chinese or of Laurens Coster down to the Hoe press, the stereotype plate, and the linotype machine. 45 Or we see the forms of written record from pictured papyrus, cuneiform brick, and manuscript scroll down to the printed book and the typewritten page; 46 the means of carriage by land from the ox-cart of the patriarchs to the stage-coach, the Cannonball Limited, the motor-truck, and the twelve-cylinder touring-car. 47 And as one contemplates these cheerfully coloured exhibits there is in each

case an almost irresistible suggestion of a constant and compelling need of "universal human" seeking in more and more marvellously ingenious ways an adequate expression and satisfaction. 48 This need seems never to have lapsed or changed its nature. All along both driving power and direction, it has been the one fixed factor in a long process in which all else has been fluctuating, contingent, and imperfect-- 49 all else except the nature of the materials and the principles of mechanics, which, too, are seen in the end to have been mutely conspiring toward the result. 50 Essential human nature, it seems clear, does not and happily cannot change. 51 Spiritual progress, in this ultimate optimism, means simply clearer vision, completer knowledge, and a less petulant and self-assertive habit of insistence upon the details of particular purposes as individual "impulse" and "idiosyncrasy" define them. 52 We fortunate beings of today have available, in the various departments of our life, certain instrumentalities, and to these our interests attach. 53 These interests of ours in their proportional strength (so the argument runs) express our native and generic constitution in so far as this constitution has been able as yet to achieve outward expression and embodiment. 54 And accordingly, in interpreting the long history of technological evolution, we take what we conceive ourselves now to be as normative and essential. 55 We project back into the lives of primitive human, of our own racial ancestors, or of our grandfathers, the habits and requirements which we acknowledge in ourselves today 56 and we conceive the people of the past to have been driven forward on the ways of progress by the identical discontent that would presumably beset ourselves if we were to be suddenly carried back to their scale and manner of existence.

57 Whatever else may be thought of it, there is at least this to be said for the cult of historic homesickness to which reference has just been made: 58 it happens to be at one with modern ethnology and history in suggesting that earlier cultures

were on the whole not less content and self-satisfied in their condition than our own. 59 It is primitive human, not the modern, who is slow to move and is satisfied, as a matter of course, with the manner of life in which one fancies own people to have lived from time immemorial. 60 Change in early social groups is tragic when it is not insensible. It comes through conquest and enslavement by outsiders or through stress of the dread of these, 61 or by gradual adaptation of custom to failing environmental resources or to increasing wealth. 62 Assent to change is in general grudging or tacit at best and is commonly veiled by some more or less transparent fiction.

63 And our suspicion of fallacy lurking somewhere in the type of retrospective Idealism we have been considering is strengthened when we come to look a little closely to details. 64 To take a commonplace example-- can it be held that the difference between using a typewriter and "writing by hand" is purely and simply a matter of degree-- 65 that the machine serves the same purpose and accomplishes the same 'kind' of result as the pen, but simply does the work more easily, rapidly, and neatly? 66 Undoubtedly some such impression may easily be gathered from an external survey of the ways that humans have used at different times for putting their ideas on record. 67 But it ignores important aspects of the case. For one thing, the modern invention effects a saving of the writer's time which can be used in further investigation or in more careful revision or in some way wholly unrelated to literary work, 68 and if the machine makes any part of the writer's task less irksome, or the task as a whole less engrossing, the whole matter of literary effort becomes less forbidding and its place and influence as a social or a personal function may for better or for worse be altered. 69 The difference brought to pass transcends mere technical facility-- it ramifies into a manifold of differences affecting the entire qualitative character and meaning of the literary function. 70 And only by an arbitrary sophistication of the facts can this complexity of new outcome be thought of as

implicit and dynamic in the earlier stage.

71 In the same way precisely, the motor-car, as every one knows, has "vanquished distance" and has "revolutionised suburban life." 72 In England it is said to have made acute the issue of plural voting. In America it is hailed by the optimistic as the solution of the vexed problem of urban concentration and the decline of agriculture. 73 Even as a means of recreation it is said by the initiated to transform the whole meaning of one's physical environment, 74 exploiting new values in sky and air and the green earth, which pass the utmost possibilities of family "carry-all" or coach and four. 75 Or consider the ocean steamship and its influence: today we travel freely over the world, for all manner of reasons, sufficient or otherwise. 76 A hundred years ago distant journeyings by sea or land were arduous and full of peril, undertaken only by the most adventurous or the most curious or for urgent need. 77 Now commodities of every sort can be transported to virtually every quarter of the globe-- 78 rails and locomotives, cement and structural steel, machinery of all kinds from the motor and the dynamo to the printing press and the cinematograph, 79 in a word whatever is necessary to recreate the waste places of the earth and to make life in these regions humanly liveable. 80 The sheer scale and magnitude of such operations lifts them above the level of the international trade of five hundred or even a hundred years ago. 81 And their far-reaching results of every sort in the lives of nations and of individuals the world over can in no intelligible sense be understood as mere homogeneous multiples of what trade meant before our age of steam, iron, and electricity. 82 Finally, we may think of modern developments in printing as compared, for example, with the state of the craft in the days when the New England Primer served to induct juvenile America into the pleasant paths of "art and literature." 83 And it is clear that the mechanical art that makes books and reading both widely inviting and easily possible of enjoyment today is not merely a more perfect substitute for the

quill and ink-horn of the mediæval scribe or even for the printing press of Caxton or of Benjamin Franklin. 84 The enormously and variously heightened "efficiency" of the mechanical instrumentalities nowadays available has for good and for evil carried forward the whole function of printing and publication into relations and effects 85 which are qualitatively new and beyond the possible conception of the earlier inventors and readers.

86 The real evolution in such cases of the coming of a new commodity or a new instrument into common and established use is an evolution of a more radical, more distinctly epigenetic type than the pictured stories of the encyclopædia-maker serve to suggest. 87 At each forward step the novelty makes possible not merely satisfactions more adequate as measured by existing requirements or more economical in terms of cost, 88 but new satisfactions also for which no demand or desire before existed or could possibly exist-- 89 satisfactions which, once become habitual, make the contentment of former times in the lack of them hard to understand or credit. 90 And indeed the story is perhaps never quite one-sided; the gain we reckon is perhaps never absolutely unmixed. There may be, perhaps must in principle be, not only gain but loss. 91 The books we read have lost something of the charm of the illuminated manuscript; our compositors and linotypers, it may be, have forgotten something of the piety and devotion of the mediæval scribe and copyist. 92 So everywhere in industry the machine depreciates and pushes out the skilled artisan and craftsman, summoning into own place the hired operative whose business is to feed and serve instead of to conceive and execute. 93 For cheapness and abundance, for convenience of repair and replacement we everywhere sacrifice something of artistic quality in the instrumentalities of life and action and something of freedom and self-expression in the processes of manufacture. 94 Thus again, to change the venue, there are those who miss in democratic government or in an ethical type of religion the poignant and exalting spiritual quality of devotion to a

personal sovereign or a personal God. 95 Whatever one's judgment may be in particular cases, there can be no reason for disputing that in epigenetic or creative evolution there is, in a sense, loss as well as gain. 96 There is no more reason for supposing that all that was wholesome or ennobling or beautiful in an earlier function 'must' somehow have its specific compensation in kind infallibly present in the new 97 than for supposing that all that is desirable in the new must surely have been present discernibly or indiscernibly in the old.

98 If we are on the whole satisfied with the new on its intrinsic merits as a present complex fact, we have therein sufficient ground for saying that it marks a stage in progress. 99 This, in fact, is what such a proposition means. And the old then appears more or less widely discontinuous with the new-- 100 not merely that it shows, in units of measure, less of the acceptable quality or qualities which the 'new' fact or situation is found to possess, but that it belongs for us to a qualitatively different level and order of existence. 101 How, we wonder, could our ancestors have found life tolerable in their undrained and imperfectly heated dwellings, without the telephone, the morning's news of the world by cable, and the phonograph? 102 How, again, could feudal homage and fealty have ever been the foundation of social order in countries where today every elector is wont to think and to act in own public relations no longer as a subject but as a citizen. 103 And how, in still a different sphere, could the father or the mother of a happy family of children ever have found the freedom and irresponsibility of bachelorhood endurable? 104 Shall we say that in changes like these we have to do simply with the quantitative increase of some quality, present in small measure in the earlier stages and in larger measure in the later? 105 Or shall we evade the issue with the general admission that 'of course', as every schoolchild knows, there are in this world many differences of degree that somehow "amount to differences of kind"? 106 As a matter of fact what has happened

in every case like these is an actual change of standard, a new construction in the growing system of one's norms of value and behaviour. 107 Provisionally, though hopefully, a step has been taken-- a real event in personal and in social history has been given place and date. 108 From some source beyond the scope and nature of the earlier function a suggestion or an impulsion has come by which the agent has endeavoured to move forward. 109 The change wrought is a transcendence of the earlier level of experience and valuation, not a widening and clarification of vision on that level. 110 And the standards which govern on the new level serve not so much to condemn the old as to seal its consignment to disuse and oblivion. 111 Least of all can a judgment or appraisal of the old from the standpoint of the new be taken for a transcript of the motives which led to the transition.

112 We must confine ourselves more closely, however, to the sphere of material goods and their uses. And in this sphere objection to the view proposed will run in some such terms as the following: 113 Take our ancestors, for example, and their household arrangements to which invidious reference has been made: 114 why should we suppose that their seeming contentment was anything more (or less) than a dignified composure in which we might well imitate them-- 115 an attitude in no way precluding a definite sense of specific discomforts and embarrassments and a distinct determination to be rid of them as soon as might be? 116 And, in fact, if they were satisfied with what they had why did they receive the new when it was offered? 117 If, on the other hand, they were not satisfied, how is the fact intelligible except upon the assumption that they had distinct and definite wants not yet supplied, and were wishing (but patiently) for conveniences and comforts of a sort not yet existent. 118 And this latter hypothesis, it will be urged, is precisely what the foregoing argument has sought to discredit as an account of the moving springs in the evolution of consumption.

119 Any adequate discussion of the central issue thus presented would fall into two parts. 120 In the first place, before a consumption good can come into general acceptance and currency it must have been in some way discovered, suggested or invented, 121 and the psychology of invention is undoubtedly a matter of very great complexity and difficulty. 122 But for the purposes of the present inquiry all this may be passed over. The other branch of a full discussion of our problem has to do with the reception of the newly invented commodity or process into wider and wider use-- and this again is a social phenomenon not less complex than the other. 123 It is this phenomenon of increasing extension and vogue, of widening propagation from person to person, that is directly of present concern for us-- 124 and in particular the individual person's attitude toward the new thing and the nature of the interest you takes in it.

125 It has recently been argued by a learned and acute investigator of economic origins that "invention is the mother of necessity," and not the child. 126 Such a complete reversal of all our ordinary thought about the matter seems at first sheer paradox. 127 What, one may ask, can ever suggest an invention and what can give it welcome and currency but an existing need-- 128 which, if it happens to be for the time being latent and unconscious, needs only the presentation of its appropriate means of satisfaction to "arouse" and "awaken" it fully into action? 129 But this paradox as to invention is at all events not more paradoxical than the view as to the reception of new commodities and the rise of new desires that has been above suggested. 130 What it appears to imply is in principle identical with what has seemed, from our consideration of the other aspect of the general situation, to be the simple empirical fact; 131 neither the existence of the new commodity nor our interest in it when it is presented admits of explanation as an effect on each particular occasion of a preëxisting unsatisfied desire for it. 132 What both sides of the problem bring to view is a certain original bent or constitutive character of human nature-- 133 a predisposition, an

'élan vital' perhaps, which we must recognise as nothing less than perfectly general and comprehensive-- 134 finding expression in inventive effort and likewise in the readiness with which the individual meets a new commodity halfway and gives it opportunity to become for you, if it can, a new necessity and the source of a new type of satisfaction.

135 From the point of view of "logic," as William James might have said, such a version of psychological fact may seem essentially self-contradictory. 136 Unless, it may be argued, a novelty when presented excites some manner of desire for itself in the beholder, 137 the beholder will make no effort towards it and thus take no step away from own existing system of life to a new system in which a new desire and a new commodity shall have a place. 138 So much would seem clear enough but the question immediately follows: How can a thing that is new arouse desire? 139 In so far as it is new it must 'ex vi termini' be unknown and wanting definition in terms of remembered past experiences; 140 and how can a thing unknown make that connection with the present character of the individual which must be deemed necessary to the arousal of desire in you? 141 A new thing would seem, then, from this point of view, to be able to arouse desire only in so far as it is able to conceal or subordinate its aspects of novelty and appear as known and well-accredited-- 142 either this or there must be in the individual some definite instinctive mechanism ready to be set in action by the thing's presentment. 143 And on neither of these suppositions can having to do with the new thing effect any fundamental or radical difference in the individual-- 144 it can serve at most only to "bring out" what was already "there" in you in a "latent" or "implicit" status. 145 Whatever new developments of power or desire may be attained and organised into the individual's character through your commerce with the novelty must be new in only a superficial sense-- 146 they will be new only as occurrences, only as the striking of the hour by the clock and the resulting

abrasion of the bell and hammer are new events. 147 But the clock was made to strike; it is the nature of metal to wear away and likewise these changes in the individual are in deeper truth not new at all but only a disclosure of the agent's character, 148 a further fulfillment along pre-ëstablished and unalterable lines which all along was making headway in the agent's earlier quests and efforts and attainments.

149 There is a sense, no doubt, in which some such version of the facts as this is unanswerable, but controversial advantage is paid for, here as elsewhere in the logic of absolute idealism, at the cost of tangible meaning and practical importance. 150 Just what does the contention come to? Let us say, for example, that one has learned to use a typewriter. What has happened is like an illiterate person's learning to read and write. 151 Correspondence with one's friends begins to take on new meaning and to acquire new value; one begins to find a new pleasure and stimulation taking the place of the ineffectual drivings of an uneasy conscience. 152 All this, let us say, has come from the moderate outlay for a superior mechanical instrument. 153 And now let it be granted that it would not have come if the fortunate individual had not been "what one was." 154 If it has come it is because the individual and the rest of the world were "of such a sort" that the revival and new growth of interest 'could' take its rise with the provision of the new instrumentality. 155 But what, precisely, does such a statement mean? What sort of verification does it admit of? 156 What fruitful insight into the concrete facts of the case does it convey? Of 'what' sort, prior to the event, does it show the individual to have been?

157 The truth is, of course, that you was of 'no' sort, then and there and with reference to the purchase--you was of no sort decisively. 158 You were neither purchaser nor rejector. 159 You were neither a convinced "typist" nor piously confirmed in your predilection for writing "by hand." 160 You were neither wholly weary of your correspondence nor fully cognisant of the importance of intercourse with your friends for your soul's

good. 161 You may have been dissatisfied and rebellious or you may have been comfortably persuaded that letter-writing, though an irksome labour, was even at that sufficiently worthwhile. 162 The most that can be said is simply that you must have been willing and desirous to try the experiment for the sake of any good, imaginable or beyond present imagination, that might come of it. 163 But being of "such a sort" as this could not prejudge the issue-- although, undoubtedly, in willingness to raise an issue there lies always the possibility of change. 164 All the plausibility of the dogma we are here considering comes from its hasty inclusion of this general attitude of constructively experimental inquiry and effort, 165 this essential character of creative intelligence, as 'one among' the concrete interests which constitute and define our particular problems in their inception. 166 To say 'ex post facto' that the individual must have been "of such a sort" as to do what you have in fact done is a purely verbal comment 167 which, whatever may be its uses, can assuredly be of no use whatever in suggesting either solution or method for the next situation to arise. 168 It may be comfortably reassuring afterwards, but it is an empty oracle beforehand.

169 If then "logic" is unable to express the nature of our forward looking interest in the unexperienced and unpredictable, perhaps the empirical fact will speak for itself. 170 We call things new; we recognise their novelty and their novelty excites our interest. 171 But just as we are sometimes told that we can only 'know' the new in terms of its resemblances to what we have known before, so it may be held that in the end we can 'desire' it only on the like condition. 172 Are we, then, to conclude that the seeming novelty of things new is an illusion, 173 or shall we hold, on the contrary, that novelty need not be explained away and that a spontaneous constructive interest stands more or less constantly ready in us to go out to meet it and possess it?

174 Unquestionably, let us say the latter. Any new commodity will, of course, resemble in part or in a

general way some old one. 175 It is said that bath-tubs are sometimes used in "model tenements" as coal-bins. 176 Old uses persist unchanged in the presence of new possibilities. 177 But in general new possibilities invite interest and effort because our experimental and constructive bent contrives on the whole to make head against habituation and routine. 178 We recognise the new as new. And if it be contended that novelty in its own right cannot be a ground of interest, that novelty must first get restatement as the old with certain "accidents" externally adhering, the answer is that the "accidents" interest us nevertheless. 179 They may prove their right to stand as the very essence of some new "kind" that one may wish to let take form and character for you. 180 Instead of the chips and shavings, they are in fact the raw material of the logical process. 181 For if we can know the new 'as new', if we can know the "accident" 'as accidental' in a commodity before us, the fact betrays an incipient interest in the quality or aspect that its novelty or contingency at least does not thwart. 182 And is this quite all? Will it be disputed that a 'relation' of a quality or feature to ourselves which we can know, name, and recognise-- like "novelty"-- must be known, as anything else is known, through an interest of which it is the appropriate terminus?

183 And there is no difficulty in pointing to instances in which the character of novelty seems fundamental. 184 Consider, for example, the interest one feels in spending a day with a friend or in making a new acquaintance or, say, in entering on the cares of parenthood. 185 Or again, take the impulse toward research, artistic creation, or artistic study and appreciation. Or again, take the interest in topography and exploration. 186 That there is in such phenomena as these a certain essentially and irreducibly forward look, a certain residual freedom of our interest and effort from dependence on the detail of prior experience down to date, probably few persons without ulterior philosophical prepossessions will dispute. 187 If we call these phenomena instinctive we are

using the term in a far more loose and general sense than it seems to have in the best usage of animal psychology. 188 If we call them attitudes or dispositions, such a term has at least the negative merit of setting them apart from the class of instinctive acts, 189 but it may carry with it a connotation of fixity and unconsciousness that after all surrenders the essential distinction. It will suffice to look at a single one of these instances. 190 In friendship, for example, there is undoubtedly strongly operative a desire for the mere recurrence, in our further friendly intercourse, of certain values that have become habitual and familiar. 191 We may have long known and become attached to a friend's tones of voice, peculiarities of manner and external appearance, turns of speech and thought and the like, which we miss in absence and which give us pleasure when we meet the friend again. 192 But if the friendship is not one of "pleasure" or "utility" simply, but of "virtue" as well, there is also present on both sides a constructive or progressive or creative interest. 193 And this interest, stated on its self-regarding and introspective side, is more than a desire for the mere grateful recurrence of the old looks and words "recoined at the old mint." 194 It is an interest looking into the "undone vast," an interest in an indefinite prolongation, an infinite series, of joint experiences the end of which cannot and need not be foreseen and the nature of which neither can nor need be forecasted. 195 And there is the same characteristic in all the other instances mentioned in this connection. 196 It is not a desire for recurrent satisfactions of a determinate type, but an interest in the active development of unexperienced and indeterminate possibilities. 197 If finally the question be pressed, how there can be an interest of this seemingly self-contradictory type in human nature, the answer can only be that we must take the facts as we find them. 198 Is such a conception inherently more difficult than the view that all ramifications and developments of human interest are concretely predetermined and implicit 'a priori'? 199 To ignore or deny palpable fact because it

eludes the reach of a current type of conceptual analysis is to part company with both science and philosophy. 200 We are in fact here dealing with the essential mark and trait of what is called self-conscious process. 201 If there are ultimates and indefinables in this world of ours, self-consciousness may as fairly claim the dignity or avow the discredit as any other of the list.

202 Does our interest in economic goods on occasion exhibit the trait of which we are here speaking? Precisely this is our present contention. 203 And yet it seems not too much to say that virtually all economic theory, whether the classical or the present dominant type that has drawn its terminology and working concepts from the ostensible psychology of the Austrian School, is founded upon the contradictory assumption. 204 The economic interest, our desire and esteem for solid and matter-of-fact things like market commodities and standardised market services, has been conceived as nothing visionary and speculative, 205 as no peering into the infinite or outreaching of an inexpressible discontent, but an intelligent, clear-eyed grasping and holding of known satisfactions for measured and acknowledged desires. 206 Art and religion, friendship and love, sport and adventure, morality and legislation, these all may be fields for the free play and constructive experimentation of human faculty, 207 but in our economic efforts and relations we are supposed to tread the solid ground of fact. Business is business. Waste not, want not. 208 First a living, then (perhaps) a "good life." And we are assured one need not recoil from the hard logic of such maxims, for they do not dispute the existence of spacious (and well-shaded) suburban regions fringing the busy areas of industry and commerce.

209 Such is the assumption. We have said that it precludes the admission of speculation as an economic factor. 210 Speculation for economic theory is a purely commercial phenomenon, a hazarding of capital on the supposition that desires will be found ready and waiting for the commodity produced-- 211 with a sufficient offering of purchasing

power to afford a profit. And the "creation of demand," where this is part of the program of speculative enterprise, means the arousal of a "dormant" or implicit desire, 212 in the sense above discussed-- there is nothing, at all events, in other parts of current theory to indicate a different conception. 213 The economist will probably contend that what the process of the creation of demand may 'be' is not theirs, but the psychologist's affair; 214 that own professional concern is only whether or not the economic demand, as an objective market fact, be actually forthcoming. 215 But what we here contend for as a fact of economic experience is a speculation that is in the nature of personal adventure and not simply an "adventuring of stock."

216 For what is the nature of the economic "experience" or situation, considered as a certain type of juncture in the life of an individual? 217 It may be shortly described as the process of determining how much of one's time, strength, or external resources of any sort shall be expended for whatever one is thinking of doing or acquiring. 218 Two general motives enter here to govern the estimate and each may show the routine or the innovative phase. 219 In any work there is possible, first, more or less of the workman's interest-- 220 an interest not merely in a conventional standard of excellence in the finished result but also in betterment of the standard and in a corresponding heightened excellence of technique and spirit in the execution. 221 These interests, without reference to the useful result and "for their own sake" (i.e., for the workman's sake, in ways not specifiable in advance), may command a share of one's available time, strength, and resources. 222 In the second place, any work or effort or offer to give in exchange has a nameable result of some kind in view-- a crop of wheat, a coat, a musical rendition, or the education of a child. 223 Why are such things "produced" or sought for? Verbally and platitudinously one may answer: For the sake of the "satisfactions" they are expected to afford. 224 But such an answer ignores the contrast of attitudes

that both workmanship and productive or acquisitive effort in the ordinary sense display. 225 As the workman may conform to own standard or may be ambitious to surpass it, so the intending consumer may be counting on known satisfactions or hoping for satisfactions of a kind that one has never known before. 226 Both sorts of effort may be of either the routine or the innovative type. 227 In neither workmanship nor acquisition can one fix upon routine as the "normal" type, hoping to derive or to explain away the inevitable residue of "outstanding cases." 228 For as a matter of fact the outstanding cases prove to be our only clue to a knowledge of how routine is made.

229 The above formula will apply, with the appropriate changes of emphasis, to buyers and sellers in an organised market, as well as to the parties to a simple transaction of barter. 230 Two main empirical characteristics of the economic situation are suggested in putting the statement in just these terms. 231 In the first place, the primary problem in such a situation is that of "exchange valuation," the fixation of a "subjective" (or better, a "personal") price ratio between what the agent wishes to acquire and whatever it is that you offers in exchange. 232 The agent thus is engaged in determining what shall be the relative importance for the self of 'two' commodities or exchangeable goods. 233 And in the second place these goods get their values determined together and in relation to each other, never singly and with a view to 'subsequent' comparison. 234 These values when they have been determined will be measured in terms of marginal utility in accordance with familiar principles, 235 but the marginal utilities that are to express the attained and accepted ratio at which exchange eventually takes place are not known quantities at all in the inception of the process of comparison. 236 If these dogmatic statements seem to issue in hopeless paradox or worse, then let us not fear to face the paradox and fix its lines with all possible distinctness. 237 Can a person decide to offer so much of one commodity for so much of

another unless you 'first' has settled what each is worth to you in some intelligible terms or other? 238 And is not this latter in point of fact the real decision-- at all events clearly more than half the battle? 239 Does not the exchange ratio to which one can agree "leap to the eyes," in fact, as soon as the absolute values in the case have been once isolated and given numerical expression?

240 In a single word we here join issue. For the comparison in such a case is 'constructive comparison', not a mechanical measuring of fixed magnitudes, as the above objection tacitly assumes. 241 And constructive comparison is essentially a transitive or inductive operation whereby the agent moves from one level to another, 242 altering own standard of living in some more or less important way, embarking upon a new interest, entering upon the formation of a new habit or upon a new accession of power or effectiveness-- 243 making or seeking to make, in short, some transformation in own environment and in own self that shall give own life as an entire system a changed tenor and perspective. 244 The term "constructive comparison" is thus intended, among other things, to suggest that the process is in the nature of adventure, not calculation, and, on the other hand, that though adventurous it is not sheer hazard uncontrolled. 245 And the motive dominant throughout the process-- the economic motive in its constructive phase-- is neither more nor less than a supposition, on the agent's part, 246 that there may be forthcoming for you in the given case in hand just such an "epigenetic" development of new significance and value as we have found actual history to disclose as a normal result of economic innovation. 247 It is the gist of hedonism, in economic theory as in its other expressions, that inevitably the agent's interests and motives are restricted in every case to the precise range and scope of own existing tendencies and desires; 248 you can be provoked to act only by the hope of just those particular future pleasures or means of pleasure which the present constitution of your nature

enables you to enjoy. 249 Idealism assumes that the emergent new interest of the present was wrapped up or "implied," in some sense, in the interests of the remote and immediate past-- 250 interests of which the agent at the time could of course be but "imperfectly" aware. 251 Such differences as one can discern between the two interpretations seem small indeed-- like many others to which idealism has been wont to point in disparagement of the hedonistic world view. 252 For in both philosophies the agent is without initiative and effect; you are in principle but the convergence of impersonal motive powers which it is, in the one view, absurdly futile, in the other misguidedly presumptuous, to try to alter or control.

253 A commodity sought or encountered may then be of interest to us for reasons of the following three general sorts. In the first place it may simply be the normal and appropriate object of some established desire of ours. 254 We may be seeking the commodity because this desire has first become active, or encountering the commodity in the market may have suddenly awakened the desire. 255 Illustration seems superfluous; tobacco for the habitual smoker, clothing of most sorts for the ordinary person, regular supplies of the household staples-- these will suffice. 256 This is the province within which a hedonistic account of the economic motive holds good with a cogency that anti-hedonistic criticism has not been able to dissolve. 257 Our outlays for such things as these may as a rule be held in their due and proper relation to each other-- 258 at all events in their established or "normal" relation-- simply by recalling at critical times our relative marginal likes and dislikes for them. 259 That these likes and dislikes are not self-explanatory, that they are concrete expectations and not abstract affective elements, 260 does not seem greatly to matter where the issue lies between maintaining or renouncing an existing schedule of consumption. 261 And in this same classification belong also industrial and commercial expenditures of a similarly routine

sort. 262 Even where the scale of operations is being enlarged, expenditures for machines, fuel, raw materials, and labour may have been so carefully planned in advance 263 with reference to the desired increase of output or pecuniary profit that no special problem of motivation attaches directly to them. 264 And these outlays are so important in industry and commerce that the impression comes easily to prevail that all business undertaking, and then all consumption of finished goods, fall under the simple hedonistic type.

265 But if we keep to the plane of final consumption, there appears a second sort of situation. 266 Our interest in the commodity before us may be due to a suggestion of some sort that prompts us to take a step beyond the limits that our present formed desires mark out. 267 The suggestion may be given by adroit advertising, by fashion, by the habits of another class to which one may aspire or by a person to whom one may look as guide, philosopher, and friend. 268 An authority of one sort or another invites or constrains us to take the merits of the article on trust. 269 Actual trial and use may show, not so much that it can minister to a latent desire as that we have been able through its use to form a habit that constitutes a settled need.

270 And, finally, in the third place, there is a more spontaneous and intrinsically personal type of interest which is very largely independent of suggestion or authority. 271 A thing of beauty, a new author, a new acquaintance, a new sport or game, a new convenience or mechanical device may challenge one's curiosity and powers of appreciation, 272 may seem to offer a new facility in action or some unimagined release from labour or restriction. 273 The adventure of marriage and parenthood, the intimate attraction of great music, the mystery of an unknown language or a forbidden country, the disdainful aloofness of a mountain peak dominating a landscape are conspicuous instances 274 inviting a more spontaneous type of constructive interest that finds abundant expression also in the more commonplace situations and emergencies of everyday life.

275 It is sheer play upon words to speak in such cases of a pleasure of adventurousness, a pleasure of discovery, a pleasure of conquest and mastery, 276 assigning this as the motive in order to bring these interests to the type that fits addiction to one's particular old coat or easy-chair. 277 The specific "pleasure" alleged could not exist were the tendency not active beforehand. 278 While the same is true in a sense for habitual concrete pleasures in relation to their corresponding habits, 279 the irreducible difference in constructive interest as a type lies in the 'transition' which this type of interest purposes and effects from one level of concrete or substantive desire and pleasure to another. 280 Here one consciously looks to a result that you cannot foresee or foretell; in the other type your interest as interest goes straight to its mark, sustained by a confident forecast.

281 But constructive interests, whether provoked by suggestion or of the more freely imaginative type, may, as has been said, be held to lie outside the scope of economic theory. 282 How a desire for a certain thing has come to get expression may seem quite immaterial-- economically speaking. 283 Economics has no concern with human folly as such or human imitativeness, or human aspiration high or low or any other of the multitude of motives that have to do with secular changes in the "standard of living" and in the ideals of life at large. 284 It has no concern with anything that lies behind the fact that I am in the market with my mind made up to buy or sell a thing at a certain price. 285 And the answer to this contention must be that it first reverses and then distorts the true perspective of our economic experience. 286 Let it be admitted freely-- indeed, let it be insisted on-- that the definition of a science must be determined by the pragmatic test. 287 If an economist elects to concern the self with the problems of what has been called the "loose mechanics of trade" there can be no question of own right to do so or of the importance of the services you may render thereby, both to theory and to practice. 288 But on the other hand economic theory cannot be

therefore, once and for all, made a matter of accounting-- to the effacement of all problems and aspects of problems of which the accountant has no professional cognisance. 289 Just this, apparently, is what it means to level down all types of interest to the hedonistic, leaving aside as "extra-economic" those that too palpably resist the operation. 290 It is acknowledged that freshly suggested modes of consumption and ends of effort require expenditure and sacrifice no less than the habitual, 291 that the exploration of Tibet or of the Polar Seas affects the market for supplies not less certainly than the scheduled voyages of oceanic liners. 292 Moreover, behind these scheduled voyages there are all the varied motives that induce people to travel and the desires that lead to the shipment of goods. 293 Shall it be said that all of these motives and desires must be traceable back to settled habits of behaviour and consumption? 294 And if this cannot be maintained is it not hazardous to assume that such general problems of economic theory as the determination of market values or of the shares in distribution require no recognition of the other empirical types of interest? 295 These types, if they are genuine, are surely important; they may well prove to be, in many ways, fundamentally important. 296 For a commodity that has become habitual must once have been new and untried.

297 The economic demands which make up the budget of a particular person at a particular time are clearly interdependent. 298 A person's income or the greater part of it is usually distributed among various channels of expenditure in a certain fairly constant way. 299 In proportion to the definiteness of this distribution and the resoluteness with which it is maintained does the impression gain strength that the person is carrying out a consistent plan of some sort. 300 Such a regular plan of expenditure may be drawn out into a schedule, setting forth the amounts required at a certain price for the unit of each kind. 301 And such a schedule is an expression in detail, in terms of ways and means, of the type of life one has elected to lead. 302 For virtually

any income above the level of bare physical subsistence, there will be an indefinite number of alternative budgets possible. 303 A little less may be spent for household conveniences and adornments and a little more for food. Some recreations may be sacrificed for an occasional book or magazine. One may build a house or purchase a motor-car instead of going abroad. 304 And whichever choice is made, related expenditures must be made in consequence for which, on the assumption of a definite amount of income, compensation must be made by curtailment of outlay at other points. 305 What seems clear in general is that one's total budget is relative to the general plan and manner of life one deems for oneself the best possible 306 and that this plan, more or less definitely formulated, more or less steadily operative, is what really determines how far expenditure shall go in this direction and in that. 307 The budget as a whole will define for the individual an equilibrium among own various recognised wants; 308 if the work of calculating it has been carefully done there will be for the time being no tendency to change in any item.

309 If, then, we choose to say in such a case that the individual carries own expenditure along each line to the precise point at which the last or marginal utility enjoyed is precisely equal to the marginal utility on every other line, it seems not difficult to grasp what such a statement means. 310 Quite harmlessly, all that it can mean is that the individual has planned precisely what own self has planned and is not sorry for it, and for the time being does not think the self can improve upon it. 311 As there is one earth drawing toward its center each billiard ball of the dozen in equilibrium in a bowl, 312 so there is behind the budget of the individual one complex personal conception of a way of life that fixes more or less certainly and clearly the kinds and intensities of your wants and assigns to each its share of purchasing power. 313 That the units or elements in equilibrium hold their positions with reference to each other for reasons capable of separate statement for each unit

seems a supposition no less impossible in the one case than in the other. 314 To think of each kind of want in the individual's nature as holding separately in fee simple and clamoring for full and separate "satisfaction" in its separate kind, is the characteristic illusion of a purely formal type of analysis. 315 The permanence of a budget and its carrying out no doubt require the due and precise realisation of each plotted marginal utility-- 316 to go further than this along any one line would inevitably mean getting not so far along certain others, and thus a distorted and disappointing total attainment in the end. 317 But to say that one actually plans and controls own expenditures along various lines by the ultimate aim of attaining equivalent terminal utilities on each is quite another story. 318 It is much like saying that the square inches of canvas assigned in a picture to sky and sea and crannied wall are arranged upon the principle of identical and equal effects for artist or beholder from the last inches painted of each kind. 319 The formula of the equality of marginal effects is no constructive principle; it is only a concise if indeed somewhat grotesque way of phrasing the essential fact that no change of the qualitative whole is going to be made, because no imperfection in it as a whole is felt.

320 We come, then, to the problem of the individual's encounter with a new commodity. In general, a purchase in such a case must amount to more or less of a departure from the scheme of life in force and a transition over to a different one. 321 And a new commodity (in the sense in which the term has been used above) is apt to be initially more tempting than an addition along some line of expenditure already represented in the budget. 322 The latter, supposing there has been no change of price and no increase of income, is usually a mere irregularity, 323 an insurgent departure from some one specification of a total plan without preliminary compensating adjustment or appropriate change at other points. 324 The erratic outlay, if considerable, will result in sheer disorder and extravagance-- indefensible and

self-condemned on the principles of the individual's own economy. 325 But with a new commodity the case stands differently. It is more interesting to consider a really new proposal than to reopen a case once closed when no evidence distinctly new is offered. 326 A sheer "temptation" or an isolated impulse toward new outlay along a line already measured in one's scheme has the force of habit and a presumption of un-wisdom to overcome. 327 If the case is one not of temptation but of "being urged" one is apt to answer, "No, I can make no use of any more of 'that'." 328 But a new commodity has the charm of its novelty, a charm consisting in the promise, in positive fashion, of new qualitative values about which a new entire schedule will have to be organised. 329 Partly its strength of appeal lies in its radicalism; it gains ready attention not only by its promise but by its boldness. 330 "Preparedness" gains a more ready acclaim than better schools or the extirpation of disease. 331 The automobile and the "moving picture" probably have a vogue today far surpassing any use of earlier "equivalents" that a mere general augmentation of incomes could have brought about. 332 Indeed, the economic danger of the middle classes in present-day society lies not in mere occasional excess at certain points but in heedless commitment to a showy and thinned-out scheme of life 333 in which the elements are ill-chosen and ill-proportioned and from which, as a whole, abiding satisfaction cannot be drawn. 334 It is where real and thoroughgoing change in the manner of life is hopeless that irregular intemperance of various sorts appears to bulk relatively largest as an economic evil.

335 Shall we not say, however, that the superior attraction of the new in competition with established lines of expenditure only indicates the greater "satiation" of the wants the latter represent and the comparative freshness of the wants the novelty will satisfy? 336 On the contrary the latter wants are in the full sense not yet existent, the new satisfactions are untried and unmeasured; 337 the older wants have the advantage of position, and if satiated today, will reassert

themselves with a predictable strength tomorrow. 338 The new wants, it is true, if they are acquired, will be part of a new system, 339 but the present fact remains that their full meaning cannot be known in advance of trial and the further outlines of the new scheme of uses and values cannot be drawn up until this meaning has been learned. 340 If, then, the new commodity is taken, it is not because the promised satisfaction and the sum of known utilities to be sacrificed are found equal, 341 nor again because the new commodity will fit neatly into a place in the existing schedule that can be vacated for it. This latter is the case of substitution. 342 Such an interpretation of the facts is retrospective only; it is a formal declaration that the exchange has been deemed on the whole worthwhile, but the reasons for this outcome such a formula is powerless to suggest.

343 In general the new commodity and the habits it engenders could not remain without effect upon a system into which they might be mechanically introduced. 344 Certain items in the schedule, associated in use with those dispensed with for the new, must be rendered obsolete by the change. 345 The new interests called into play will draw to themselves and to their further development attention which may be in large measure diverted from the interests of older standing. 346 And in the new system all interests remaining over from the old will accordingly stand in a new light and their objects will be valued, will be held important, for reasons that will need fresh statement.

347 In similar fashion it might be argued that the commodities or uses which one sacrifices for the sake of a new venture are inevitably more than a simple deduction that curtails one's schedule in a certain kind and amount. 348 Such a deduction or excision must leave the remaining lines of the original complex hanging at loose ends. 349 The catching-up of these and their coördination with the new interest must in any event amount, as has been contended, to a thoroughgoing reorganisation. 350 What must really happen then, in the event of action, is in principle

nothing less than the disappearance of the whole from which the sacrificed uses are dissevered. 351 These latter, therefore, stand in the process of decision as a symbol for the existing personal economy as a whole. 352 The old order and the new confront each other as an accepted view of fact 353 and a plausible hypothesis everywhere confront each other and the issue for the individual is the practical issue of making the transition to a new working level. 354 To declare that the salient elements of the confronting complexes are quantitatively equivalent is only to announce in symbolic terms that the transition has been effected, the die cast.

355 The statement thus given has been purposely made, for many transactions of the sort referred to, something of an over-statement. 356 If I contemplate purchasing a typewriter or a book on an unfamiliar but inviting subject it may well seem somewhat extravagant to describe the situation as an opposition between two schemes of life. 357 Is the issue so momentous; is the act so revolutionary? But the purpose of our over-statement was simply to make clear the type of situation without regard to the magnitudes involved. 358 No novelty that carries one in any respect beyond the range of existing habits can be wholly without its collateral effects nor can its proximate and proper significance be measured in advance. 359 This is in principle as true of a relatively slight innovation as of a considerable one. 360 And our present conscious exaggeration departs less widely from the truth than the alternative usual preoccupation of economic theory with the logic of routine desire and demand. 361 For the phenomena of routine and habit are thereby made a standard by which all others, if indeed recognised as real at all, must be judged "exceptional." 362 And, as we shall see, to do this introduces difficulty into certain parts of substantive economic theory.

363 Again, objection may attach to the view that equivalence of the "salient members" of the opposing systems is only another name for the comprehensive fact of the novelty's acceptance. 364 For if we

hesitate in such a case, is this not because we judge the price too high? 365 What can this signify but that the service or satisfaction we expect from the novelty falls short of sufficing to convince us? 366 And unless we are dealing with measured quantities, how can we come to this conclusion? 367 Moreover, if the novel commodity is divided into units we may take a smaller quantity when the price demanded is "high" than if the price were lower. 368 And does this not suggest predetermined value-magnitudes as data? 369 But if one takes thus a smaller amount, as the argument contends, it is because there is a presumption of being able to make some important total use of it 370 and there is no general reason apparent for supposing that this will be merely a fractional part of a larger but like significance that might be hoped for from a larger quantity. 371 And on the other hand, the prospect simply may not tempt at all; the smaller quantity may be deemed an improbable support for a really promising total program and the present program will hold its ground, not seriously shaken. 372 The total demand of a market for a given commodity is no doubt in some sort a mathematical function of the price. 373 The lower the price the greater in some ratio will be the number of persons who will buy and in general the greater the number of units taken by those who are already buyers. 374 But that such a proposition admits of statistical proof from the observation of a series of price changes in a market affords no presumption concerning the nature of the reasons that move any individual person to own action. 375 The theoretical temptation is strong, here as elsewhere, in passing from the study of markets to the personal economy of the individual forthwith 376 to find this also a trafficking in unit-quantities and marginal satisfactions to which the concepts and notation of market analysis will readily apply.

377 It remains to consider certain implications of this view of economic desire and demand.

II

378 It is evident that the issue finally at stake in any economic

problem of constructive comparison, is an ethical issue. 379 Two immediate alternatives are before one-- to expend a sum of money in some new and interesting way, or to keep it devoted to the uses of one's established plan. 380 Upon the choice, one recognises, hinge consequences of larger and more comprehensive importance than the mere present enjoyment or non-enjoyment of the new commodity. 381 And these "more important" consequences 'are' important because there appears to lie in them the possibility of a type of personal character divergent from the present type and from any present point of view incommensurable with it. 382 The ethical urgency of such a problem will impress one in the measure in which one can see that such an issue really does depend upon one’s present action and irretrievably depends. 383 And we are able now to see what that economic quality is that attaches to ethical problems at a certain stage of their development and calls for a supplementary type of treatment.

384 Let us first consider certain types of juncture in conduct that will be recognised at once as ethical and in which any economic aspect is relatively inconspicuous. 385 Temperance or intemperance, truth or falsehood, idleness or industry, honesty or fraud, social justice or class-interest-- these will serve. 386 What makes such problems as these ethical is their demand for creative intelligence. In each, alternative types of character or manners of life stand initially opposed. 387 If the concrete issue is really problematical, if there is no rule that one can follow in the case with full assurance, constructive comparison, whether covertly or openly, must come into play. 388 How long, then, will a problem of temperance or intemperance, idleness or industry, preserve its obviously ethical character without admixture? 389 Just so long, apparently, as the modes of conduct that come into view as possible solutions are considered and valued with regard to their 'directly physiological and psychological' consequences alone. 390 Any given sort of

conduct, that is to say, makes inevitably for the formation of certain habits of mind or muscle, weakening, or precluding the formation of, certain others. 391 Attention is engrossed that is thereby not available elsewhere, time and strength are expended, discriminations are dulled and sharpened, sympathies and sensitivities are narrowed and broadened, 392 every trait and bent of character is directly or indirectly affected in some way by every resolve concluded and every action embarked upon. 393 If one moves a certain way along a certain line you can never return to the starting-point and set out unchanged along any other. 394 If one does one thing one cannot do another. 395 And when the sufficient reasons for this mutual exclusion lie in the structure and organisation of the human mind and body our deliberation as between the two alternatives, our constructive comparison of them remains upon the ethical plane.

396 If one does one thing one cannot do another. If we substitute the well-worn saying "one cannot eat own cake and have it" we indicate the economic plane of constructive comparison with all needful clearness.

397 This is in fact the situation that has been already under discussion at such length above 398 and the economic quality of which we are just now in quest arises from neither more nor less than the fact of our dependence in the working out of our personal problems upon limited external resources. 399 The eventual solution sought under these circumstances remains ethical as before. But to reach it, it is necessary to bring into consideration not only such other interests and ends as the psycho-physical structure of human nature and the laws of character-development show to be involved, 400 but a still wider range of interests less intimately or "internally" related to the focal interest of the occasion but imperatively requiring to be heard. 401 If my acquisition of a phonograph turns upon the direct psychological bearing of the new interest upon my other interests, its probable effects whether good or bad upon my musical tastes 402 and the diplomatic complications

with my neighbours in which the possession of the instrument may involve me, the problem of its purchase remains clearly in the ethical phase. 403 But when I count the cost in terms of sacrifices which the purchase price makes necessary, from literature down to food and fuel, and must draw this whole range of fact also into the adjustment if I can, the economic phase is reached. 404 In principle two entire and very concrete schemes of life now stand opposed. Just 'what' concrete sacrifices I shall make I do not know-- this, in fact, is one way of stating my problem. 405 Nor, conversely, do I know just what I shall be able to make the phonograph worth to me. 406 It is my task to come to a conclusion in the case that shall be explicit and clear enough to enable me to judge in 'the event' whether my expectation has been realised and I have acted wisely or unwisely. 407 Thus a problem is economic when the fact of the limitation of my external resources must be eventually and frankly faced. 408 The characteristic quality of a problem grown economic is a certain vexatiousness and seeming irrationality in the ill-assorted array of nevertheless indisputable interests, prosaic and ideal, that have to be reduced to order.

409 It is perhaps this characteristic emotional quality of economic problems that has insensibly inclined economists to favour a simpler and more clear-cut analysis. 410 As for ethical problems-- they have been left to "conscience" or to the jurisdiction of a "greatest happiness" principle in which the ordinary individual or legislator has somehow come to take an interest. 411 That they arise and become urgent in us of course does human nature unimpeachable credit and economics must by all means wait respectfully upon their settlement. 412 So much is conceded. But economics is economics, when all is said and done. 413 What we mean by the economic interest is an interest in the direct and several satisfactions that a person can get from the several things you shrewdly finds it worth your while to pay for. 414 And shrewdness means nicety of calculation, accuracy of measurement in the determination

of tangible loss and gain. Here, then, is no field for ethics but a field of fact. 415 Thus ethics on its side must also wait until the case is fully ready for its praise or blame. Such is the 'modus vivendi'. 416 But its simplicity is oversimple and unreal. It pictures the "economic person" as bound in the chains of a perfunctory deference that you would throw off if you could. 417 For the theory of constructive comparison or creative intelligence, on the other hand, instead of a seeker and recipient of "psychic income" and a calculator of gain and loss, 418 you are a personal agent maintaining continuity of action in a life of discontinuously changing levels of interest and experience. 419 Your measure of attainment lies not in an accelerating rate of "psychic income," but in an increasing sense of personal effectiveness and an increasing readiness and confidence before new junctures.

420 The possession and use of commodities are, then, not in themselves and directly economic facts at all. As material things commodities serve certain purposes and effect certain results. 421 They are means to ends and their serving so is a matter of technology. But do I seriously want their services? This is a matter of my ethical point of view. 422 Do I want them at the price demanded or at what price and how many? This is the economic question and it obviously is a question wholly ethical in import-- 423 more broadly and inclusively ethical, in fact, than the ethical question in its earlier and more humanly inviting form. 424 And what we have now to see is the fact that no consideration that has a bearing upon the problem in its ethical phase can lose its importance and relevance in the subsequent phase.

425 There can be no restriction of the economic interest, for example, to egoism. 426 If on general principles I would really rather use goods produced in safe and cleanly factories or produced by "union labour," there is no possible reason why this should not incline me to pay the higher prices that such goods may cost and make the needful readjustment in my budget. 427 Is there reason

why my valuation of these goods should 'not' thus be the decisive act that takes me out of one relation to industrial workers and sets me in another-- can anything else, indeed, quite so distinctly do this? 428 For economic valuation is only the fixation of a purchase price, or an exchange relation in terms of price and quantity, 429 upon which two schemes of life, two differing perspectives of social contact and relationship converge-- the scheme of life from which I am departing and the one upon which I have resolved to make my hazard. 430 It is this election, this transition, that the purchase price expresses-- drawing all the strands of interest and action into a knot so that a single grasp may seize them. 431 The only essential egoism in the case lies in the "subjectivism" of the fact that inevitably the emergency and the act are mine and not another's. 432 This is the "egocentric predicament" in its ethical aspect. 433 And the egocentric predicament proves Hobbes and La Rochefoucauld as little as it proves Berkeley or Karl Pearson. 434 No social interest, no objective interest of any sort, is shown ungenuine by my remembering in season that if I cannot fill my coal-bin I shall freeze.

435 This logical and psychological continuity of the ethical and economic problems suggests certain general considerations of some practical interest. 436 In the first place as to "egoism." I am, let us say, an employer. If I am interested in procuring just "labour," in the sense of foot-pounds of energy, then undoubtedly labour performed under safe and healthful conditions is worth no more to me than other labour (provided it does not prove more efficient). 437 But is this attitude of interest in just foot-pounds of energy the attitude 'par excellence' or solely entitled to be called economic? 438 And just this may be asserted for the reason that an exclusive interest in just 'labour' is the only interest in the case that people of business, or at least many of them, can entertain without going speedily to the wall. 439 If, then, I do 'in fact' pay more than I must in wages or if I expend more than a bare minimum for conveniences and safety-guards

this is not because of the valuation I put upon 'labour', but only because I take pleasure in the contentment and well-being of others. 440 And this is not "business" but "uplift"-- or else a subtle form of emotional self-indulgence. 441 Suppose, however, that by legislation similar working conditions have been made mandatory for the entire industry and suppose that the community approves the law, even to the extent of cheerfully paying so much of the additional cost thereby imposed as may be shifted upon them.

442 Shall we say that this is an ethical intrusion into the sphere of economics or shall we say that the former economic demand for labour "as such" has given place to an economic demand for labour better circumstanced or better paid? 443 The community at all events is paying the increase of price or a part of the increase. It seems arbitrary to insist that the old price is still the 'economic' price of the commodity and the increase only the price of a quiet conscience. 444 The notion of a strictly economic demand for labour pure and simple seems in fact a concept of accounting. 445 To meet the community's demand for the commodity a number of producers were required. The least capable of these could make both ends meet at the prevailing price only by ignoring all but the severely impersonal aspects of the process. 446 Taking these costs as a base, other more capable or more fortunate producers may have been able to make additional expenditures of the sort in question, charging these perhaps to "welfare" account. 447 The law then intervenes, making labour in effect more expensive for all by requiring the superior conveniences or by compelling employers' insurance against accidents to workmen or by enforcing outright a higher minimum wage. 448 The old basic labour cost becomes thus obsolete. And without prejudging as to the expediency of such legislation in particular industrial or business situations may we not protest against 'a priori' 449 and wholesale condemnation of such legislation as merely irresponsibly "ethical" and "unscientific"? 450 Is it not,

rather, economically experimental and constructive, amounting in substance to a simple insistence that henceforth the hiring and paying of labour shall express a wider range of social interests-- 451 shall signalise a more clearly self-validating level of comprehension, on the part of employers and consumers, of the social significance of industry than the old? 452 And may we not protest also, as a matter of sheer logic, against carrying over a 'producer's' distinction of accounting between "labour" cost and "welfare" cost into the 'consumer's' valuation of the article? 453 How and to what end shall a distinction be drawn between 'your' "esteem" for the trimmed and isolated article and 'your' esteem for the people who made it-- which, taken together, dispose you to pay a certain undivided price for it?

454 For the egoism of humans is no fixed and unalterable fact. Taking it as a postulate, a mathematical theory of market phenomena may be erected upon it, 455 but such a postulate is purely formal, taking no note of the reasons which at any given time lie behind the individuals' "demand" or "supply schedules." 456 It amounts simply to an assumption that these schedules will not change during the lapse of time contemplated in the problem in hand. And it therefore cannot serve as the basis for a social science. 457 As an actual social phenomenon egoism is merely a disclosure of a certain present narrowness and inertness in the nature of the individual which may or may not be definitive for you. 458 It is precisely on a par with anemia, dyspepsia or fatigue, or any other like unhappy fact of personal biography.

459 There is another suggestion of ethical and economic continuity that may be briefly indicated. If our view of this relation is correct, a problem, by becoming economic, may lose something in dramatic interest and grandiosity but gains in precision and complexity. 460 In the economic phase an issue becomes sensibly crucial. It is in this phase that are chiefly developed those qualities of clear-headedness, temperateness of thought and action, 461 and

well-founded self-reliance that are the foundation of all genuine personal morality and social effectiveness.

462 And one may question therefore the ethical consequences of such measures as old age, sickness, and industrial accident insurance or insurance against unemployment. 463 In proportion as these measures are effective they amount to a constant virtual addition to the individual's income from year to year without corresponding effort and forethought on own part. 464 They may accordingly be condemned as systematic pauperisation-- the "endowment of the unfit." 465 There is evidently a fundamental problem here at issue, apart from all administrative difficulties. 466 Clearly this type of criticism assumes a permanent incapacity in "human nature" or in most actual beings therewith endowed, to recognise as seriously important other interests than those upon which hinge physical life and death. 467 The ordinary person, it is believed, is held back from moral Quixotism as from material extravagance by the fear of starvation alone; 468 and it is assumed that there are no other interests in the "normal" person that can or ever will be so wholesomely effective to these ends. 469 And two remarks in answer appear not without a measure of pertinence. 470 First, if what is alleged be true (and there is evidence in Malthus' 'Essay' and elsewhere to support it) it seems less a proof of original sin and "inperfectibility" than a reproach to a social order 471 whose collective tenour and institutions leave the mass untouched and unawakened above the level of animal reproduction 472 and whose inequalities of opportunity prevent awakened life from growing strong. 473 And second, the democratic society of the future, if it exempts the individual in part or wholly from the dread of premature physical extinction must leave one on higher levels of interest similarly dependent for success or failure upon own ultimate personal discretion. 474 And is it inconceivable that on higher levels there should ever genuinely be such a persisting type

of issue for the multitude of humans?

475 We have held constructive comparison in its economic phase to be a reciprocal evaluating of the "salient members" of two budgets. 476 The respective budgets in such a case express in the outcome (1) the plane of life to which one is to move and (2) the plane one is forsaking. 477 It was the salient member of the former that presented the problem at the outset. In the course of the process its associates were 'gathered about' it in their due proportions and perspective. 478 The salient member of the latter (i.e., whatever the purchase is to oblige one to do without), it was the business of constructive comparison to 'single out' from among its associates and designate for sacrifice. 479 In any case at all departing from the type of substitution pure and simple, the commodities sacrificed will come to have a certain "value in exchange" that clearly is a new fact, a new judgment, in experience. 480 This value in exchange, this "subjective" or "personal" exchange value, may fittingly be termed a "value for transition." 481 The transition once made, the exchange once concluded, I shall deem the motor-car, for example, that I have 'not' bought to replace one used-up, to be worth less than the piano I 'have' bought instead. 482 This indeed (in no disparaging sense) is a tautology. 483 But does this lesser relative value equal or exceed or fall short of the value the car would have had if no question of a piano had been raised at all and I had bought it in replacement of the old one as a matter of course? How can one say? 484 The question seems unmeaning, for the levels of value referred to are different and discontinuous and the magnitudes belong to different orders. 485 In a word, because a "value for transition" marks a resolve and succinctly describes an act, it cannot be broken in two and expressed as an equating of two magnitudes independently definable apart from the relation. 486 The motor-car 'had' its value as a member of the old system-- the piano 'has' its value as a member of the new. 487 "The piano is

worth more than the car"; "the car is worth less than the piano"-- these are the prospective and retrospective views across a gulf that separates two "specious presents," not judgments of static inequality in terms of a common measure.

488 Is value, then, absolute or relative? Is value or price the prior notion? 489 Was the classical English economics superficial in its predilection for the relative conception of value? Or is the reigning Austrian economics profound in its reliance upon marginal utility? 490 By way of answer let us ask-- What in our world can be more absolute a fact than a human's transition from one level of experience and action to another? 491 Can the flight of time be stayed or turned backward? 492 And if not, can the acts by whose intrinsic uniqueness and successiveness time becomes filled for me and by which I feel time's sensible passage as swift or slow, lose their individuality? 493 But it is not by a mere empiric temporalism alone that the sufficient absoluteness of the present act is attested. 494 My transition from phase to phase of "finitude" is a thing so absolute that Idealism itself has deemed an Absolute indispensable to assure its safe and sane achievement. 495 And with all Idealism's distrust of immediate experience for every evidential use, the Idealist does not scruple to cite the "higher obviousness" of personal effort, attainment, and fruition as the best of evidence for own most momentous truth of all. 496 And accordingly (in sharp descent) we need not hesitate to regard value in exchange as a primary fact in its own right, standing in no need of resolution into marginal pseudo-absolutes. 497 A price agreed to and paid marks a real transition to another level. 498 There are both marginal valuation and 'Werthaltung' on this level, but they are subordinate incidents to this level's mapping and the conservation of its resources. 499 On this level every marginal utility is relative, as we have seen, to every other through their common relation to the complex plan of organisation as a whole.

500 In conclusion one more question closely related to the

foregoing may be briefly touched upon. 501 We have held that the individual's attitude toward a commodity is in the first instance one of putting a price-estimate upon it and only secondarily that of holding it in a provisionally settled marginal esteem. 502 If this principle of the priority of price-estimation or exchange value is true, it seems evident that there can be no line of demarcation drawn (except for doubtfully expedient pedagogical purposes) 502 between (1) "Subjective valuations" with which individuals are conceived to come to a market and (2) a mechanical equilibration of demand and supply which it is the distinctive and sole function of market concourse to effect. 503 In such a view the market process in strict logic must be timeless as it is spaceless; 504 a superposition of the two curves is effected and they are seen to cross in a common point which their shapes geometrically predetermine. 505 Discussion, in any proper sense, can be no inherent part of a market process thus conceived. 506 Once in the market, buyers and sellers can only declare their "subjective exchange valuations" of the commodity and await the outcome with a dispassionate certainty that whoever may gain by exchanging at the price to be determined, those who cannot exchange will at all events not lose. 507 But considered as a typical likeness of people who have seen a thing they want and are seeking to possess it, this picture of mingled hope and resignation is not convincing. 508 Most actual offering of goods for sale that one observes suggests less the dispassionate manner of the physiologist or psychologist taking the measure of own subject's reactions, sensibilities, and preferences 509 than the more masterful procedure of the physician or the hypnotist who seeks to uproot or modify or reconstruct them. 510 This is the process known in economic writing since Adam Smith as "the higgling and bargaining of the market."

511 In fact, the individual's ante-market valuation, when there temporarily is one, is an exchange valuation of the constructive or experimental and therefore (in any significant sense of the word)

perfectly objective type, 512 and the market process into which this enters is only a perfectly homogeneous temporal continuation of it that carries the individual forward to decisive action. 513 There is no more reason for a separation here than for sundering the ante-experimental sketching out of an hypothesis in any branch of research from the work of putting the hypothesis to experimental test. 514 The results of experiment may serve in a marked way in both sorts of process to elucidate or reconstruct the hypothesis.

515 The "higgling and bargaining of the market" has been accorded but scant attention by economists. 516 It has apparently been regarded as a kind of irrelevance-- a comedy part, at best, in the serious drama of industry and trade, never for a moment hindering the significant movement and outcome of the major action. 517 As if to excuse the incompetence of this treatment (or as another phase of it) theory has tended to lay stress upon, and mildly to deplore, certain of the less amiable and engaging aspects of the process. 518 The very term indeed as used by Adam Smith, imported a certain æsthetic disesteem, albeit tempered with indulgent approbation on other grounds. 519 In Böhm-Bawerk's more modern account this approbation has given place to a neutral tolerance. 520 A certain buyer, he says (in his discussion of simple "isolated" exchange), will give as much as thirty pounds for a horse; the horse's owner will take as little as ten pounds-- 521 these are predetermined and fixed valuations brought to the exchange negotiations and nothing that happens in the game of wits is conceived to modify them. 522 The price will then be fixed somewhere between these limits. But how? "Here ..." we read, "is room for any amount of 'higgling.' 523 According as in the conduct of the transaction the buyer or the seller shows the greater dexterity, cunning, obstinacy, power-of-persuasion, or such like, will the price be forced either to its lower or to its upper limit." 524 But the higgling cannot touch the underlying attitudes. Even "power of persuasion" is only one part of

"skill in bargaining," with all the rest and like all the rest; 525 if it were more than this there would be for Böhm-Bawerk no theoretically grounded price limits to define the range of accidental settlement and the whole explanation, as a theory of price, would reduce to nullity.

526 With this, then, appears to fall away all ground for a one-sided, or even a sharply two-sided, conception of the process of fixation of market-values. 527 A "marginal utility" theory and a "cost of production" theory of market price alike assume that the factor chosen as the ultimate determinant is a fixed fact defined by conditions which the actual spatial and temporal meeting-together of buyers and sellers in the market cannot affect. 528 In this logical sense, the chosen determinant is in each case an ante-market or extra-market fact and the same is true of the blades of Marshall's famous pair of scissors.

529 The price of a certain article let us say is $5. According to the current type of analysis this is the price because, intending buyers' and sellers' valuations of the article being just what they are, it is at this figure that the largest number of exchanges can occur. 530 Were the price higher there would be more persons willing to sell than to buy; were it lower there would be more persons willing to buy than to sell. 531 At $5 no buyer or seller who means what one says about own valuation when you enters the market goes away disappointed or dissatisfied. 532 With this price established all sellers whose costs of production prevent their conforming to it must drop out of the market; so must all buyers whose desire for the article does not warrant their paying so much. 533 More fundamentally then, Why is $5 the price? Is it because intending buyers and the marginal buyer in particular do not desire the article more strongly? 534 Or is it because conditions of production, all things considered, do not permit a lower marginal unit cost? 535 The argument might seem hopeless. But the advantage is claimed for the principle of demand.

536 Without demand arising out of desires expressive of wants there

would simply 'be' no value, no production, and no price. 537 Demand evokes production and sanctions cost. But cost expended can give no value to a product that no one wants.

538 Does it follow, however, that the cost of a commodity in which on its general merits I have come to take a hypothetical interest can in no wise affect my actual price-offer for it? 539 Can it contribute nothing to the preciser definition of my interest which is eventually to be expressed in a price offer? If the answer is "No, for how can this external fact affect the strength of your desire for the object?"-- 540 then the reason given begs the question at issue. 'Is' my interest in the object an interest in the object alone? And 'is' the cost of the object a fact for me external and indifferent? 541 It is, at all events, not uncommon to be assured that an article "cannot be produced for less," that one or another of its elements of cost is higher than would be natural to suppose. 542 Not always scientifically accurate, such assurances express an evident confidence that they will not be without effect upon a hesitant but fair-minded purchaser. 543 And in other ways as well, the position of sellers in the market is not so defenseless as a strict utility theory of price conceives-- 544 apart from the standpoint of an abstract "normality" that can never contrive to get itself realised in empirical fact. 545 It is true that, in general, one tends to purchase an article of a given familiar kind where its price, all things considered, is lowest. 546 In consequence the less "capable" producers or sellers must go to the wall. But the fact seems mainly "regulative" and of subordinate importance. 547 Is it equally certain that as between branches of expenditure, such as clothing, food, and shelter, children, books, and "social" intercourse, the shares of income we expend upon them or the marginal prices we are content to pay express the original strength of separate and unmodified extra-market interests? 548 On the contrary we have paid in the past what we have had to pay, what we have deemed just and reasonable, what we have been willing experimentally to hazard upon the possibility of the

outlay's proving to have been worthwhile. 549 In these twilight-zones of indetermination, cost as well as other factors of supply have had their opportunity. 550 Shall we nevertheless insist that our "demands" are 'ideally' fixed, even though in fallible human fact they are more or less indistinct, yielding and modifiable? 551 On the contrary they are "in principle and for the most part" indeterminate and expectant of suggested experimental shaping from the supply side of the market. 552 It is less in theory than in fact that they have a salutary tendency (none too dependable) toward rigidity.

CONCLUSION

THE ARGUMENT MAY NOW BE SUMMARILY REVIEWED

553 How are we to understand the acquisition, by an individual, of what are called new economic needs and interests? 554 Except by a fairly obvious fallacy of retrospection we cannot regard this phenomenon as a mere arousal of so-called latent or implicit desires. 555 New products and new means of production afford "satisfactions" and bring about objective results which are unimaginable and therefore unpredictable, in any descriptive fashion, in advance. 556 In a realistic or empirical view of the matter, these constitute genuinely new developments of personality and of social function, not mere unfoldings of a preformed logical or vital system. 557 "Human nature" is modifiable and economic choice and action are factors in this indivisible process. 558 Now "logically" it would seem clear that unless a new commodity is an object of desire it will not be made or paid for. 559 On the other hand, with equal "logic," a 'new' commodity, it would seem, 'cannot' be an object of desire because all desire must be for what we already know. 560 We seem confronted with a complete 'impasse'. But the 'impasse' is conceptual only. 561 We have simply to acknowledge the patent fact of our recognition of the new as novel and our interest in the new in its outstanding character of novelty. 562 We need only express

and interpret this fact, instead of fancying ourselves bound to explain it away. It is an interest not less genuine and significant in economic experience than elsewhere. 563 Its importance lies in the fact that it obliges us to regard what is called economic choice not as a balancing of utilities, marginal or otherwise, but as a process of "constructive comparison." 564 The new commodity and its purchase price are in reality symbols for alternatively possible systems of life and action. Can the old be relinquished for the new? 565 Before this question is answered each system may be criticised and interpreted from the standpoint of the other, each may be supplemented by suggestion, by dictate of tradition and by impulsive prompting, by inference, and by conjecture. 566 Finally in experimental fashion an election must be made. The system as accepted may or may not be, in terms, identical with one of the initial alternatives; 567 it can never be identical in full meaning and perspective with either one. 568 And in the end we have not chosen the new because its value, as seen beforehand, measured more than the value of the old, but we now declare the old, seen in retrospect, to have been worth less. 569 There are apparently no valid objections to this view to be drawn from the current logical type of marginal-utility analysis.

II

570 Because so-called economic "choice" is in reality "constructive comparison" it must be regarded as essentially ethical in import. 571 Ethics and economic theory, instead of dealing with separate problems of conduct, deal with distinguishable but inseparable stages belonging to the complete analysis of most, if not all, problems. 572 This view suggests, ('a') that no reasons in experience or in logic exist for identifying the economic interest with an attitude of exclusive or particularistic egoism, 573 and ('b') that social reformers are justified in their assumption of a certain "perfectibility" in human nature--a constructive responsiveness instead of an insensate and stubborn inertia

574 Again, in the process of constructive comparison in its economic phase, Price or Exchange Value is, in apparent accord with the English classical tradition, the fundamental working conception. 575 Value as "absolute" is essentially a subordinate and "conservative" conception, belonging to a status of system and routine, and is "absolute" in a purely functional sense. 576 And finally constructive comparison, with price or exchange value as its dominant conception, is clearly nothing if not a market process. 577 In the nature of the case, then, there can be no such ante-market definiteness and rigidity of demand schedules as a strictly marginal-utility theory of market prices logically must require.

578 In at least two respects the argument falls short of what might be desired. 579 No account is given of the actual procedure of constructive comparison and nothing like a complete survey of the leading ideas and problems of economic theory is undertaken by way of verification. 580 But to have supplied the former in any satisfactory way would have required an unduly extended discussion of the more general, or ethical, phases of constructive comparison. 581 The other deficiency is less regrettable, since the task in question is one that could only be hopefully undertaken and convincingly carried through by a professional economist.

582 For the present purpose, it is perhaps enough to have found in our economic experience and behaviour the same interest in novelty that is so manifest in other departments of life, 583 and the same attainment of new self-validating levels of power and interest, through the acquisition and exploitation of the novel. 584 In our economic experience, no more than elsewhere, is satisfaction an ultimate and self-explanatory term. 585 Satisfaction carries with it always a reference to the level of power and interest that makes it possible and on which it must be measured. 586 To seek satisfaction for its own sake or to hinge one's interest in science or art upon their ability to serve the palpable needs of the present

moment-- these, together, make up the meaning of what is called Utilitarianism. 587 And Utilitarianism in this sense (which is far less what Mill meant by the term than a tradition he could never, with all his striving, quite get free of), this type of Utilitarianism spells routine. 588 It is the surrender of initiative and control, in the quest for ends in life, for a philistine pleased acceptance of the ends that Nature, assisted by the advertisement-writers, sets before us. 589 But this type of Utilitarianism is less frequent in actual occurrence than its vogue in popular literature and elsewhere may appear to indicate. 590 As a matter of fact, we more often look to satisfaction, not as an end of effort or a condition to be preserved, but as the evidence that an experimental venture has been justified in its event. 591 And this is a widely different matter, for in this there is no inherent implication of a habit-bound or egoistic narrowness of interest in the conceiving or the launching of the venture.

592 The economic interest, as a function of intelligence, finds its proper expression in a valuation set upon one thing in terms of another-- 593 a valuation that is either a step in a settled plan of spending and consumption or marks the passing of an old plan and our embarkation on a new. 594 From such a view it must follow that the economic betterment of an individual or a society can consist neither in the accumulation of material wealth alone nor in a more diversified technical knowledge and skill. 595 For the individual or for a collectivist state there must be added to these things alertness and imagination in the personal quest and discovery of values and a broad and critical intelligence in making the actual trial of them. 596 Without a commensurate gain in these qualities it will avail little to make technical training and industrial opportunity more free or even to make the rewards of effort more equitable and secure. 597 But it has been one of the purposes of this discussion to suggest that just this growth in outlook and intelligence may in the long run be counted on-- 598 not indeed as a direct and simple consequence of increasing

material abundance but as an expression of an inherent creativeness in human that responds to discipline and education and will not fail to recognise the opportunity it seeks. 599 Real economic progress is ethical in aim and outcome. 600 We cannot think of the economic interest as restricted in its exercise to a certain sphere or level of effort-- 601 such as "the ordinary business of life" or the gaining of a "livelihood" or the satisfaction of our so-called "material" wants, or the pursuit of an enlightened, or an unenlightened, self-regard. 602 Economics has no special relation to "material" or even to commonplace ends. Its materialism lies not in its aim and tendency but in its problem and method. 603 It has no bias toward a lower order of mundane values. It only takes note of the ways and degrees of dependence upon mundane resources and conditions that values of every order must acknowledge. 604 It reminds us that morality and culture, if they are genuine, must know not only what they intend but what they cost. 605 They must understand not only the direct but the indirect and accidental bearing of their purposes upon all of our interests, private and social, that they are likely to affect. 606 The detachment of the economic interest from any particular level or class of values is only the obverse aspect of the special kind of concern it has with values of every sort. 607 The very generality of the economic interest, and the abstractness of the ideas by which it maintains routine or safeguards change in our experience, are what make it unmistakably ethical. 608 Without specific ends of its own, it affords no ground for dogmatism or apologetics. And this indicates as the appropriate task of economic theory not the arrest and thwarting but the steadying and shaping of social change.

THE MORAL LIFE AND THE CONSTRUCTION OF VALUES AND STANDARDS

James Hayden Tufts

7 Writing about ethics has tended to take one of two directions. On the one hand we have description

of conduct in terms of psychology, or anthropology. On the other a study of the concepts right and wrong, good and bad, duty and freedom. 2 If we follow the first line we may attempt to explain conduct psychologically by showing the simple ideas or feelings and the causal connections or laws of habit and association out of which actions arise. 3 Or anthropologically we may show the successive stages of custom and taboo, or the family, religious, political, legal, and social institutions from which morality has emerged. 4 But we meet at once a difficulty if we ask what is the bearing of this description and analysis. Will it aid me in the practical judgment "What shall I do?" 5 In physics there is no corresponding difficulty. To analyse gravity enables us to compute an orbit, or aim a gun; to analyse electric action is to have the basis for lighting streets and carrying messages. 6 It assumes the uniformity of Nature and takes no responsibility as to whether we shall aim guns or whether our messages shall be of war or of peace. 7 Whereas in ethics it is claimed that the elements are so changed by their combination-- that the 'process' is so essential a factor-- that no prediction is certain. 8 And it is also claimed that the ends themselves are perhaps to be changed as well as the means. 9 Stated otherwise, suppose that humankind has passed through various stages, can mere observation of these tell me what next? Perhaps I don't care to repeat the past; how can I plan for a better future? 10 Or grant that I may discover instinct and emotion, habit and association in my thinking and willing, how will this guide me to direct my thinking and willing to right ends?

11 The second method has tended to examine concepts. 12 Good is an eternal, changeless pattern; it is to be discovered by a vision; 13 or right and good are but other terms for Nature's or reason's universal laws which are timeless and wholly unaffected by human desires or passions; 14 moral nature is soul, and soul is created not built up of elements,-- such were some of the older absolutisms. 15 Right and good are

unique concepts not to be resolved or explained in terms of anything else,-- this is a more modern thesis which on the face of it may appear to discourage analysis. 16 The ethical world is a world of "eternal values." 17 Philosophy "by taking part in empirical questions sinks both itself and them." 18 These doctrines bring high claims, but are they more valuable for human guidance than the empirical method?

19 "The knowledge that is superhuman only is ridiculous in human." No human can ever find own way home with the pure circle unless you have also the art of the impure. 20 It is the conviction of this paper that in ethics, as in knowledge, thoughts without contents are empty; percepts without concepts are blind. 21 Description of what has been-- empiricism-- is futile in itself to project and criticise. Intuitions and deductions a priori are empty. 22 The "thoughts" of ethics are of course the terms right, good, ought, worth, and their kin. 23 The "percepts" are the instincts and emotions, the desires and aspirations, the conditions of time and place, of Nature, and institutions.

24 Yet it is misleading to say that in studying the history of morals we are merely empiricists, and can hope to find no criterion. This would be the case if we were studying non-moral beings. 25 But moral beings have to some degree guided life by judgments and not merely followed impulse or habit. 26 Early judgments as to taboos, customs, and conduct may be crude and in need of correction; they are none the less judgments. 27 Over and over we find them reshaped to meet change from hunting to agriculture, from want to plenty, from war to peace, from small to large groupings. 28 Much more clearly when we consider civilised peoples, the interaction between reflection and impulse becomes patent. 29 To study this interaction can be regarded as futile for the future only if we discredit all past moral achievement.

30 Those writers who have based their ethics upon concepts have frequently expressed the conviction that the security of morality depends upon the

question whether good and right are absolute and eternal essences independent of human opinion or volition. 31 A different source of standards which to some offers more promise for the future is the fact of the moral life 'as' a constant process of forming and reshaping ideals and of bringing these to bear upon conditions of existence. 32 To construct a right and good is at least a process tending to responsibility, if this construction is to be for the real world in which we must live and not merely for a world of fancy or caprice. 33 It is not the aim of this paper to give a comprehensive outline of ethical method. Four factors in the moral life will be pointed out 34 and this analysis will be used to emphasise especially certain social and constructive aspects of our concepts of right and good.

I

35 The four factors which it is proposed to emphasise are these:

36 (1) Life as a biological process involving relation to Nature, with all that this signifies in the equipment of instincts, emotions, and selective activity by which life maintains itself.

37 (2) Interrelation with other human beings, including on the one hand associating, grouping, mating, communicating, coöperating, commanding, obeying, worshiping, adjudicating, 38 and on the psychological side the various instincts, emotions, susceptibilities to personal stimulation and appropriate responses in language and behaviour which underlie or are evoked by the life in common.

39 (3) Intelligence and reason, through which experience is interrelated, viewed as a whole, enlarged in imagination.

40 (4) The process of judgment and choice, in which different elements are brought together, considered in one conscious universe, evaluated or measured, thereby giving rise reciprocally to a self on the one hand and to approved or chosen objects on the other.

41 (1) Life. Life is at least the raw material of all values, even if it is not in itself entitled to be called good without qualification. 42 For in the process of nourishing and protecting itself, the plant or

animal selects and in the case of higher animals, manipulates; 43 Life adapts itself to Nature and adapts Nature to itself; it shows reciprocal relation of means to end, of whole to part. 44 It foreshadows the conscious processes in so many ways that humans have always been trying to read back some degree of consciousness. 45 And life in the animal, at least, is regarded as having experiences of pleasure and pain, and emotions of fear, anger, shame, and sex, which are an inseparable aspect of values. 46 If it is not the supreme or only good, if humans freely sacrifice it for other ends, it is none the less an inevitable factor. 47 Pessimistic theories indeed have contended that life is evil and have sought to place good in a will-less Nirvana. Yet such theories make limited appeal. 48 Their protest is ultimately not against life as life but against life as painful. 49 And their refutation is rather to be intrusted to the constructive possibilities of freer life than to an analysis of concepts.

50 Another class of theories which omit life from the good is that which holds to abstractly ontological concepts of good as an eternal essence or form. 51 It must be remembered, however, that the idea of good was not merely a fixed essence. It was also for Plato the self-moving and the cause of all motion. 52 And further, Plato evidently believed that life, the very nature of the soul, was itself in the class of supreme values along with God and the good. 53 The prize of immortality was [Greek: kalon] and the hope great. 54 And with Aristotle and his followers the good of contemplation no less truly than the good of action had elements of value derived from the vital process. 55 Such a mystic as Spinoza, who finds good in the understanding values this because in it human is "active," and would unite own self with the All because in God is Power and Freedom. 56 The Hebrew prophet found a word capable of evoking great ethical values when he urged his countrymen to "choose life," and Christian teaching found in the conception of "eternal life" an ideal of profound appeal. 57 It is not surprising that with his

biological interests Spencer should have set up life of greatest length and breadth as a goal.

58 The struggle of the present war emphasises tremendously two aspects of this factor of life. 59 National life is an ideal which gets its emotional backing largely from the imagery of our physical life. 60 For any one of the small nations involved to give up its national life-- whatever the possibilities of better organised industry or more comfortable material conditions-- seems to it a desperate alternative. 61 Self-defense is regarded by the various powers at war as a complete justification not merely for armed resistance or attack but for ruthless acts. 62 And if we are tempted to say that the war involves a prodigal waste of individual life on a scale never known before, we are at the same time compelled to recognise that never before has the bare destruction of life aroused such horror.

63 For never before has peace set its forces so determinedly to protect life. 64 The span of human life has been lengthened: the wastefulness of accident and disease has been magnified. 65 The dumb acquiescence with which former generations accepted the death of infants and children and those in the prime of life has given way to active and increasingly successful efforts to preserve. 66 The enormous increase in scientific study of biology, including eugenics, reflects not only an advance of science but a trend in morality. 67 It is scarcely conceivable that it should grow less in absolute importance, whatever crises may temporarily cause its depreciation relatively to other values.

68 One exception to the growing appreciation calls for notice-- the interest in immortality appears to be less rather than greater. 69 The strong belief in life beyond the grave which since the days of ancient Egypt has prevailed in the main stream of Western culture seems not only to be affected by the scientific temper of the day, but also to be subject to a shift in interest. 70 This may be in part a reaction from other-worldliness. In part it may be due to loss of fervour for a theological picture of

a future heaven 71 of a rather monotonous sort and may signify not so much loss of interest in life as desire for a more vital kind of continuance. 72 It is not true that all that a human hath will you give for your life, yet it is true that no valuing process is intelligible that leaves out life with its impulses, emotions, and desires as the first factor to be reckoned with.

73 (2) The second factor is the life in common, with its system of relations, and its corresponding instincts, emotions, and desires.

74 So much has been written in recent years on the social nature of human that it seems unnecessary to elabourate the obvious. 75 Protest has even been raised against the exaggeration of the social. But I believe that in certain points at least we have not yet penetrated to the heart of the social factor, and its significance for morals.

76 So far as the moral aspect is concerned I know nothing more significant than the attitude of the Common Law as set forth by Professor Pound. 77 This has sought to base its system of duties on relations. The relation which was prominent in the Middle Ages was that of landlord and tenant; other relations are those of principal and agent, of trustee, etc. 78 An older relation was that of kinship. The kin was held for the wergeld; the goël must avenge own next of kin; the father must provide for prospective parents-in-law; the child must serve the parents. 79 Duty was the legal term for the relation. In all this there is no romanticism, no exaggeration of the social; 80 there is a fair statement of the facts which people have recognised and acted upon the world over and in all times. 81 Individualistic times or peoples have modified certain phases. The Roman law sought to ground many of its duties in the contract, the will of the parties. But covenants by no means exhaust duties. 82 And according to Professor Pound the whole course of English and American law today is belying the generalisation of Sir Henry Maine, that the evolution of law is a progress from status to contract. 83 We are shaping law of insurance, of public service companies, not by contract but by the relation of

insurer and insured, of public utility and patron.

84 Psychologically, the correlate of the system of relations is the set of instincts and emotions, of capacity for stimulation and response, which presuppose society for their exercise and in turn make society possible. 85 There can be no question as to the reality and strength of these in both animals and humans. 86 The bear will fight for her young more savagely than for her life. 87 The human mother's thoughts center far more intensely upon her offspring than upon her own person. 88 The person who is cut dead by all own acquaintance suffers more than one would from hunger or physical fear. 89 The passion of sex frequently overmasters every instinct of individual prudence. 90 The majority of people face poverty and live in want; relatively few prefer physical comfort to family ties. 91 Aristotle's [Greek: philia] is the oftenest quoted recognition of the emotional basis of common life, but a statement of Kant's earlier years is particularly happy. 92 "The point to which the lines of direction of our impulses converge is thus not only in ourselves, but there are besides powers moving us in the will of others outside of ourselves. 93 Hence arise the moral impulses which often carry us away to the discomfiture of selfishness, the strong law of duty, and the weaker of benevolence. 94 Both of these wring from us many a sacrifice, and although selfish inclinations now and then preponderate over both, these still never fail to assert their reality in human nature. 95 Thus we recognise that in our most secret motives, we are dependent upon the rule of the general will."

96 The "law of duty," and I believe we may add, the conception of right, do arise objectively in the social relations as the common law assumes 97 and subjectively in the social instincts, emotions, and the more intimate social consciousness which had not been worked out in the time of Kant as it has been by recent authors. 98 This point will receive further treatment later, but I desire to point out in anticipation that if right and duty have their origin in this social factor there is at least a presumption against their being subordinate ethically to the

conception of good as we find them in certain writers. 99 If they have independent origin and are the outgrowth of a special aspect of life it is at least probable that they are not to be subordinated to the good 100 unless the very notion of good is itself reciprocally modified by right in a way that is not usually recognised in teleological systems.

101 (3) Intelligence and reason imply ('a') considering the proposed act or the actually performed act as a whole and in its relations. Especially they mean considering consequences. 102 In order to foresee consequences there is required not only empirical observation of past experience, not only deduction from already formulated concepts-- as when we say that injustice will cause hard feelings and revolt-- 103 but that rarer quality which in the presence of a situation discerns a meaning not obvious, suggests an idea, "injustice," to interpret the situation. 104 Situations are neither already labeled "unjust," nor are they obviously unjust to the ordinary mind. 105 Analysis into elements and rearrangement of the elements into a new synthesis are required. This is eminently a synthetic or "creative" activity. 106 Further it is evident that the activity of intelligence in considering consequences implies not only what we call reasoning in the narrower sense but imagination and feeling. 107 For the consequences of an act which are of importance ethically are consequences which are not merely to be described but are to be imagined so vividly as to be felt, whether they are consequences that affect ourselves or affect others.

108 ('b') But it would be a very narrow intelligence that should attempt to consider only consequences of a single proposed act without considering also other possible acts and their consequences. 109 The second important characteristic of intelligence is that it considers either other means of reaching a given end, or other ends, and by working out the consequences of these also has the basis for deliberation and choice. 110 The method of "multiple working hypotheses," urged as highly

important in scientific investigation, is no less essential in the moral field. 111 To bring several ends into the field of consideration is the characteristic of the intelligent, or as we often say, the open-minded human. 112 Such consideration as this widens the capacity of the agent and marks you off from the creature of habit, of prejudice, or of instinct.

113 ('c') Intelligence implies considering in two senses all persons involved, that is, it means taking into account not only how an act will affect others but also how others look at it. 114 It is scarcely necessary to say that this activity of intelligence cannot be cut off from its roots in social intercourse. 115 It is by the processes of give and take, of stimulus and response, in a social medium that this possibility of looking at things from a different angle is secured. 116 And once more this different angle is not gained by what in the strict sense could be called a purely intellectual operation, 117 although it has come to be so well recognised as the necessary equipment for dealing successfully with conditions 118 that we commonly characterise the person as stupid who does not take account of what others think and feel and how they will react to a projected line of conduct. 119 This social element in intelligence is to a considerable degree implied in the term "reasonable," 120 which signifies not merely that a person is logical in own processes but also that you are ready to listen to what others say and to look at things from their point of view whether you finally accepts it or not.

121 The broad grounds on which it is better to use the word intelligence than the word reason in the analysis with which we are concerned are two. 122 (1) It is not a question-begging term which tends to commit us at the outset to a specific doctrine as to the source of our judgments. 123 (2) The activity of intelligence which is now most significant for ethical progress is not suggested by the term reason, 124 for unless we arbitrarily smuggle in under the term practical reason the whole activity of the moral consciousness without inquiry as to the propriety

of the name 125 we shall be likely to omit the constructive and creative efforts to promote morality by positive supplying of enlarged education, new sources of interest, and more open fields for development, 126 by replacing haunting fears of misery with positive hopes, and by suggesting new imagery, new ambitions in the place of sodden indifference or sensuality. 127 The term reason as used by the Stoics and by Kant meant control of the passions by some "law"-- some authority cosmic or logical. 128 It prepared for the inevitable; it forbade the private point of view. But as thus presenting a negative aspect the law was long ago characterised by a profound moral genius as "weak." 129 It has its value as a schoolmaster, but it is not in itself capable of supplying the new life which dissolves the old sentiment, breaks up the settled evil habit, and supplies both larger ends and effective motives.

130 If we state human progress in objective fashion we may say that although people today are still as in earlier times engaged in getting a living, in mating, in rearing of offspring, in fighting and adventure, in play, and in art, 131 they are also engaged in science and invention, interested in the news of other human activities all over the world; 132 they are adjusting differences by judicial processes, coöperating to promote general welfare, enjoying refined and more permanent friendships and affections, and viewing life in its tragedy and comedy with enhanced emotion and broader sympathy. 133 Leaving out of consideration the work of the religious or artistic genius as not in question here, 134 the great objective agencies in bringing about these changes have been on the one hand the growth of invention, scientific method, and education, and on the other the increase in human intercourse and communication. 135 Reason plays its part in both of these in freeing the mind from wasteful superstitious methods and in analysing situations and testing hypotheses, 136 but the term is inadequate to do justice to that creative element in the formation of hypotheses which finds the new, and it tends to leave out of

account the social point of view involved in the widening of the area of human intercourse. 137 More will be said upon this point in connection with the discussion of rationalism.

138 (4) The process of judgment and choice. The elements are not the sum. The moral consciousness is not just the urge of life, plus the social relations, plus intelligence. 139 The 'process' of moral deliberation, evaluation, judgment, and choice is itself essential. In this process are born the concepts and standards good and right, and likewise the moral self which utters the judgment. 140 It is in this twofold respect synthetic, creative. It is as an interpretation of this process that the concept of freedom arises. Four aspects of the process may be noted.

141 ('a') The process involves holding possibilities of action, or objects for valuation, or ends for choice, 142 in consciousness and measuring them one against another in a simultaneous field-- or in a field of alternating objects, any of which can be continually recalled. 143 One possibility after another may be tried out in anticipation and its relations successively considered, but the comparison is essential to the complete moral consciousness.

144 ('b') The process yields a universe of valued 'objects' as distinguished from a subjective consciousness of desires and feelings. We say, "This is right," "That is good." 145 Every "is" in such judgments may be denied by an "is not" and we hold one alternative to be true, the other false. 146 As the market or the stock exchange or board of trade fixes values by a meeting of buyers and sellers and settles the price of wheat accurately enough to enable farmers to decide how much land to seed for the next season, 147 so the world of men and women who must live together and coöperate, or fight and perish, forces upon consciousness the necessity of adjustment. 148 The preliminary approaches are usually hesitant and subjective-- like the offers or bids in the market-- e.g., "I should like to go to college; I believe that is a good thing"; "My parents need my help; it does not seem right to leave them." 149 The judgments finally emerge. "A

college education is good;" "It is wrong to leave my parents"-- both seemingly objective yet conflicting, 150 and unless I can secure both I must seemingly forego actual objective good, or commit actual wrong.

151 ('c') The process may be described also as one of "universalising" the judging consciousness. 152 For it is a counterpart of the objective implication of a judgment that it is not an affirmation as to any individual's opinion. 153 This negative characterisation of the judgment is commonly converted into the positive doctrine that any one who is unprejudiced and equally well informed would make the same judgment. 154 Strictly speaking the judgment itself represents in its completed form the elimination of the private attitude rather than the express inclusion of other judges. 155 But in the making of the judgment it is probable that this elimination of the private is reached by a mental reference to other persons and their attitudes, if not by an actual conversation with another. 156 It is dubious whether an individual that had never communicated with another would get the distinction between a private subjective attitude and the "general" or objective.

157 Moreover, one form of the moral judgment: "This is right," speaks the language of law-- of the collective judgment, or of the judge who hears both sides but is neither. 158 This generalising or universalising is frequently supposed to be the characteristic activity of "reason." 159 I believe that a comparison with the kindred value judgments in economics supports the doctrine that in judgments as to the good as well as in those as to right, there is no product of any simple faculty, but rather a synthetic process in which the social factor is prominent. 160 A compelling motive toward an objective and universal judgment is found in the practical conditions of moral judgments. 161 Unless people agree on such fundamental things as killing, stealing, and sex relations they cannot get on together. 162 Not that when I say, "Killing is wrong," I mean to affirm "I agree with you in objecting to it"; 163 but that the

necessity (a) of acting as if I either do or do not approve it, and (b) of either making my attitude agree with yours, or yours agree with mine, or of fighting it out with you or with the whole force of organised society, 164 compels me to put my attitude into objective terms, to meet you and society on a common platform. 165 This is a 'synthesis', an achievement. To attribute the synthesis to any faculty of "practical reason," adds nothing to our information, but tends rather to obscure the facts.

166 ('d') The process is thus a reciprocal process of valuing objects and of constructing and reconstructing a self. 167 The object as first imaged or anticipated undergoes enlargement and change as it is put into relations to other objects and as the consequences of adoption or rejection are tried in anticipation. 168 The self by reflecting and by enlarging its scope is similarly enlarged. It is the 'resulting' self which is the final valuer. 169 The values of most objects are at first fixed for us by instinct or they are suggested by the ethos and mores of our groups-- family, society, national religions, and "reign under the appearance of habitual self-suggested tendencies." 170 The self is constituted accordingly. Collisions with other selves, conflicts between group valuations and standards 171 and individual impulses or desires, failure of old standards as applied to new situations, bring about a more conscious definition of purposes. 172 The agent identifies own self with these purposes, and values objects with reference to them. In this process of revaluing and defining, of comparing and anticipation, freedom is found if anywhere.

173 For if the process is a real one the elements do not remain unaffected by their relation to each other and to the whole. 174 The act is not determined by any single antecedent or by the sum of antecedents. It is determined by the process. 175 The self is not made wholly by heredity, or environment. 'It is itself creating for each of its elements a new environment', viz., the process of reflection and choice. 176 And if people can change the heredity of pigeons and race horses by

suitable selection, if every scientific experiment is a varying of conditions, it is at least plausible that human can guide own acts by intelligence, and revise own values by criticism.

177 The self is itself creating for each of its elements a new environment-- 178 this is a fact which if kept in mind will enable us to see the abstractness and fallacies not merely of libertarianism and determinism, but of subjectivism and objectivism. 179 Subjective or "inward" theories have sought standards in the self; 180 but in regarding the self as an entity independent of such a process as we have described they have exposed themselves to the criticism of providing only private, variable, accidental, unauthoritative sources of standards-- instincts, or emotions, or intuitions. 181 The self of the full moral consciousness, however,-- the only one which can claim acceptance or authority-- is born only in the process of considering real conditions, of weighing and choosing between alternatives of action in a real world of Nature and persons. 182 Its judgments are more than subjective. Objectivism in its absolutist and abstract forms assumes a standard-- Nature, essence, law-- independent of process. 183 Such a standard is easily shown to be free from anything individual, private, or changing. It is universal, consistent, and eternal, in fact it has many good mathematical characteristics, but unfortunately it is not moral. 184 As mathematical, logical, biological, or whatnot, it offers no standard that appeals to the moral nature as authoritative or that can help us to find our way home.

II

185 If we are dissatisfied with custom and habit and seek to take philosophy for the guide of life we have two possibilities: 186 (1) we may look for the good, and treat right and duty as subordinate concepts which indicate the way to the good, that is, consider them as good as a means, 187 or (2) we may seek first to do right irrespective of consequences, in the belief that in willing to do right we are already

in possession of the highest good. 188 In either case we may consider our standards and values either as in some sense fixed or as in the making. 189 We may suppose that good is objective and absolute, that right is discovered by a rational faculty, 190 or we may consider that in regarding good as objective we have not made it independent of the valuing process 191 and that in treating right as a standard we have not thereby made it a fixed concept to be discovered by the pure intellect. 192 The position of this paper will be (1) that good while objective is yet objective as a value and not as an essence or physical fact; 193 (2) that a social factor in value throws light upon the relation between moral and other values; 194 (3) that right is not merely a means to the good but has an independent place in the moral consciousness; 195 (4) that right while signifying order does not necessarily involve a timeless, eternal order since it refers to an order of personal relations; 196 (5) that the conception of right instead of being a matter for pure reason or even the "cognitive faculty" shows an intimate blending of the emotional and intellectual and that this appears particularly in the conception of the reasonable.

197 (1) We begin with the question of the synthetic and objective character of the good. With G. E. Moore as with the utilitarians the good is the ultimate concept. Right and duty are means to the good. 198 Moore and Rashdall also follow Sidgwick in regarding good as unique, that is, as "synthetic." 199 Sidgwick emphasised in this especially the point that moral value cannot be decided by physical existence or the course of evolution, nor can the good be regarded as meaning the pleasant. 200 Moore and Russell reinforce this. However true it may be that pleasure is one among other good things or that life is one among other good things, good does not mean either pleasure or survival. 201 Good means just "good."

202 A similar thought underlies Croce's division of the Practical into the two spheres of the Economic and the Ethical. 203 "The economic activity is that which wills and effects only what corresponds to the conditions of

fact in which a person finds own self; 204 the ethical activity is that which, although it correspond to these conditions, also refers to something that transcends them. 205 To the first correspond what are called individual ends, to the second universal ends; 206 the one gives rise to the judgment concerning the greater or less coherence of the action taken in itself, the other to that concerning its greater or less coherence in respect to the universal end, which transcends the individual.

207 Utilitarianism is according to Croce an attempt to reduce the Ethical to the Economic form, 208 although the utilitarians as people attempt in various ways to make a place for that distinction which as philosophers they would suppress. 209 "Human is not a consumer of pleasures. You are a creator of life." 210 With this claim of the distinctive, synthetic, character of the moral consciousness and of the impossibility of testing the worth of ideals by cosmic laws, or by gratification of particular wants as measured by pleasure, I have no issue. 211 The analysis of the moral judgment made above points out just how it is that good is synthetic. 212 It is synthetic in that it represents a measuring and valuing of ends-- instinctive and imagined, individual and social-- against each other and as part of a whole to which a growing self corresponds. 213 It is synthetic in that it represents not merely a process of evaluating ends which match actually defined desires, 214 but also a process in which the growing self, dissatisfied with any ends already in view, gropes for some new definition of ends that shall better respond to its living, creative capacity, its active synthetic character. 215 Good is the concept for just this valuing process as carried on by a conscious being that is not content to take its desire as ready made by its present construction, 216 but is reaching out for ends that shall respond to a growing, expanding, inclusive, social, self. It expresses value 'as' value.

217 Value 'as value!' not as being; nor as independent essence; nor as anything static and fixed. 218 For a synthetic self, a living personality, could find no supreme value in the complete absence of valuing, in

the cessation of life, in the negation of that very activity of projection, adventure, construction, and synthesis in which it has struck out the concept good. 219 A theory of ethics which upholds the synthetic character of the good may be criticised as being not synthetic enough 220 if it fails to see that on the basis of the mutual determination of percepts and concepts, of self and objects, the synthetic character of the process must be reflected in the ultimate meaning of the category which symbolises and incorporates the process.

221 (2) We may find some light upon the question how moral value gets its distinctive and unique character, and how it comes to be more "objective" than economic value if we consider some of the social factors in the moral judgment. 222 For although the concept good is rooted in the life process with its selective activity and attending emotions it involves a subtle social element, as well as the more commonly recognised factors of intelligence.

223 Within the fundamental selective process two types of behaviour tend to differentiate in response to two general sorts of stimulation. 224 One sort is simpler, more monotonous, more easily analysable. Response to such stimulation, or treatment of objects which may be described under these terms of simple, analysable, etc., is easily organised into a habit. 225 It calls for no great shifts in attention, no sudden readjustments. There is nothing mysterious about it. As satisfying various wants it has a certain kind of value. It, however, evokes no consciousness of self. 226 Toward the more variable, complex sort of stimuli, greater attention, constant adjustment and readjustment, are necessary.

227 Objects of the first sort are treated as things, in the sense that they do not call out any respect from us or have any intrinsic value. 228 We understand them through and through, manipulate them, consume them, throw them away. We regard them as valuable only with reference to our wants. 229 On the other hand, objects of the second sort take their place in a bi-focal situation. Our attention shifts alternately to their behaviour

and to our response, or, conversely, from our act to their response. 230 This back and forth movement of attention in the case of certain of these objects is reinforced by the fact that certain stimuli from them or from the organism, find peculiar responses already prepared in social instincts; gesture and language play their part. 231 Such a bi-focal situation as this, when completely developed, involves persons. 232 In its earlier stages it is the quasi-personal attitude which is found in certain savage religious attitudes, in certain æsthetic attitudes, and in the emotional attitudes which we all have toward many of the objects of daily life.

233 Economic values arise in connection with attitudes toward things. We buy things, we sell them. They have value just in that they gratify our wants, 234 but they do not compel any revision or change in wants or in the self which wants. They represent a partial interest-- or if they become the total interest we regard them as now in the moral sphere. 235 Values of personal affection arise as we find a constant rapport in thought, feeling, purpose, between the two members of our social consciousness. 236 The attitude is that of going along with another and thereby extending and enriching our experiences. 237 We enter into your ideas, range with your imagination, kindle at your enthusiasms, sympathise with your joys or sorrows. 238 We may disagree with our friends' opinions, but we do not maintain a critical attitude toward 'them', that is, toward their individual fundamental convictions and attitudes. 239 If "home is the place where, when you have to go there, they have to take you in," as Frost puts it, a friend is one who, when you go to them, has to accept you.

240 Moral values also arise in a social or personal relation-- not in relation to things. 241 This is on the surface in the form of judgment; "He is a good man," "That is a good act." If it is less obvious in the practical judgment, "This is the better course of action," 242 i.e., the course which leads to the greater good, or to the good, this is because we fail to discern that the good in these cases is a something with which I can

identify myself, not a something which I merely possess and keep separate from my personality. 243 It is something I shall be rather than have. Or if I speak of a share or participation it is a sharing in the sense of entering into a kindred life. 244 It is an ideal, and an ideal for a conscious personal being can hardly be other than conscious. 245 It may be objected that however personal the ideal, it is not on this account necessarily social. It embodies what I would be, but does not necessarily imply response to any other personality. 246 This, however, would be to overlook the analyses which recent psychology has made of the personal. 247 The ideal does not develop in a vacuum. It implies for one thing individuality which is conceivable only as other individuals are distinguished. 248 It implies the definition of purposes, and such definition is scarcely if ever attempted except as a possible world of purposes is envisaged.

249 Æsthetic valuation is in certain respects intermediate between the valuation of things on the one hand and the moral evaluation of acts of persons or conscious states on the other. 250 Æsthetic objects are in many cases seemingly things and yet even as things they are quasi-personal; they are viewed with a certain sympathy quite different from that which we feel for a purely economic object. 251 If it is a work of art the artist has embodied own thought and feeling and the observer finds it there.

252 The experience is that of 'Einfühlung'. Yet we do not expect the kind of response which we look for in friendship, 253 nor do we take the object as merely a factor for the guidance or control of our own action as in the practical judgment of morality. 254 The æsthetic becomes the object of contemplation, not of response; of embodied meaning, not of individuality. 255 It is so far personal that no one of æsthetic sensibility likes to see a thing of beauty destroyed or mistreated. 256 The situation in which we recognise in an object meaning and embodied feeling, or at least find sources of stimulation which appeal to our emotions, develops an æsthetic enhancement of

conscious experience. 257 The æsthetic value predicate is the outcome of this peculiar enhancement.

258 It seems that the social nature of the judgment plays a part also in the varying objectivity of values. 259 It is undoubtedly true that some values are treated as belonging to objects. 260 If we cannot explain this fully we may get some light upon the situation by noticing the degree to which this is true in the cases of the kinds of values already described.

261 Economic values are dubiously objective. 262 We use both forms of expression. We say on the one hand, "I want wheat," "There is a demand for wheat," or, on the other, "Wheat is worth one dollar a bushel." 263 Conversely, "There is no demand for the old-fashioned high-framed bicycle" or "It is worthless." 264 The Middle Ages regarded economic value as completely objective. A thing had a 'real value'. The retailer could not add to it. 265 The mediæval economist believed in the externality of relations; they prosecuted for the offenses of forestalling and regrating the person who would make a profit by merely changing things in place. 266 They condemned usury. We have definitely abandoned this theory. We recognise that it is the want which makes the value. 267 To make exchange possible and socialise to some degree the scale of prices we depend upon a public market or a stock exchange.

268 In values of personal affection we may begin with a purely individual attitude, "I love or esteem my friend." If I put it more objectively I may say, "My friend is an honoured and valued friend." 269 Perhaps still more objectively, we-- especially if we are feminine-- may say "Is not X dear?" We may then go on to seek a social standard. 270 We perhaps look for reinforcement in a small group of like-minded. 271 We are a little perplexed and, it may be, aggrieved if other members of the circle do not love the one whom we love. 272 In such a group judgment of a common friend there is doubtless greater objectivity than in the economic judgment. 273 The value of a friend does not depend upon own adjustment to our wants. As

Aristotle pointed out, true friendship is for its own sake. Its value is "disinterested." 274 If a person does not care for an economic good it does not reflect upon the person. 275 You may be careless of futures, neglectful of corn, indifferent to steel. It lessens the demand, lowers the values of these goods, an infinitesimal, but does not write you down an inferior person. 276 To fail to prize a possible friend is a reflection upon us. However the fact that in the very nature of the case one can scarcely be a personal friend to a large, not to say a universal group, operates to limit the objectivity.

277 In the æsthetic and moral attitudes we incorporate value in the object decisively. 278 We do not like to think that beauty can be changed with shifting fashions or to affirm that the firmament was ever anything but sublime. 279 It seems to belong to the very essence of right that it is something to which the self can commit itself in absolute loyalty and finality. 280 And, as for good, we may say with Moore in judgments of intrinsic value, at least, 281 "we judge concerning a particular state of things that it would be worthwhile-- would be a good thing-- that that state of things should exist, even if nothing else were to exist besides."

282 With regard to this problem of objectivity it is significant in the first place that the kind of situation out of which this object value is affirmed in æsthetic and moral judgments is a social situation. It contrasts in this respect with the economic situation. 283 The economic is indeed social in so far as it sets exchange values, but the object valued is not a social object. 284 The æsthetic and moral object is such an object. Not only is there no contradiction in giving to the symbolic form or the moral act intrinsic value: there is entire plausibility in doing so. 285 For in so far as the situation is really personal, 'either member is fundamentally equal to the other and may be treated as embodying all the value of the situation'. 286 The value which rises to consciousness in the situation is made more complete by eliminating from consideration the originating factors, the plural agents of admiration or approval,

and incorporating the whole product abstractly in the object. 287 In thus calling attention to the social or personal character of the æsthetic or moral object it is not intended to minimise that factor in the judgment 288 which we properly speak of as the universalising activity of thought, much less to overlook the importance of the judgmental process itself. 289 The intention is to point out some of the reasons why in one case the thinking process does universalise while in the other it does not, why in one case the judgment is completely objective while in the other it is not. 290 In both æsthetic and moral judgments, social art, social action, social judgments, through collective decisions prepare the way for the general non-personal, objective form. 291 It is probable that human would not say, "This is right," using the word as an adjective, if you had not first said, as member of a judicially acting group, "This is right," using the word as a noun. 292 And finally whatever we may claim as to the "cognitive" nature of the æsthetic and moral judgment, the only test for the beauty of an object is that persons of taste discover it. 293 The only test for the rightness of an act is that persons of good character approve it. 294 The only test for goodness is that good persons on reflection approve and choose it-- just as the test for good persons is that they choose and do the good.

295 (3) Right is not merely a means to good but has a place of its own in the moral consciousness. 296 Many of our moral choices or judgments do not take the form of choice between right and wrong, or between duty and its opposite; they appear to be choices between goods. 297 That is, we do not always consider our value as crystallised into a present standard or feel a tension between a resisting and an authoritative self. But when they do emerge they signify a distinct factor. 298 What Moore says of good may be said also of right. Right means just "right," nothing else. 299 That is, we mean that acts so characterised correspond exactly to a self in a peculiar attitude, viz., one of adequate standardising and adjustment, of equilibrium, in

view of all relations. 300 The concept signifies that in finding our way into a moral world into which we are born in the process of valuing and judging, we take along the imagery of social judgment 301 in which through language and behaviour the individual is constantly adjusting own self, not only to the social institutions, and group organisation but far more subtly and unconsciously to the social consciousness and attitudes.

302 This conception of an order to which the act must refer has usually been regarded as peculiarly a "rational" factor. 303 It is, however, rather an order of social elements, of a nature of persons, than of a "nature of things." 304 In savage life the position of father, wife, child, guest, or other members of the household, is one of the most prominent facts of the situation. 305 The relationship of various totem groups and inter-marrying groups is the very focus of moral consciousness. 306 Even in the case of such a cosmic conception of order as Dike and Themis, Rita and Tao, the "Way" is not impersonal cosmos. It is at least quasi-personal. 307 And if we say such primitive myth has no bearing on what the "nature" of right or the "true" meaning of right is, it is pertinent to repeat that concepts without percepts are empty; 308 that the term means nothing except the conceptual interpretation of a unique synthetic process in which an act placed in relation to a standard is thereby given new meaning. 309 So long as custom or law forms the only or the dominant factor in the process, we have little development of the ideal concept right as distinct from a factual standard. 310 But when reason and intelligence enter, particularly when that creative activity of intelligence enters which attempts a new construction of ends, a new ordering of possible experience, then the standardising process is set free; 311 a new self with new possibilities of relation seeks expression.

312 The concept "right" reflects the standardising, valuing process of a synthetic order and a synthetic self. 313 Duty born similarly in the world of social relations and reflecting especially the tension

between the individual and the larger whole is likewise given full moral significance when it becomes a tension within the synthetic self. 314 And as thus reflecting the immediate attitudes of the self to an ideal social order both right and duty are not to be treated merely as means to any value which does not include as integrant factors just what these signify.

315 This view is contrary to that of Moore, for whom "right does and can mean nothing but 'cause of a good result,' and is thus identical with useful." 316 The right act is that which has the best consequences. 317 Similarly duty is that action which will cause more good to exist in the Universe than any possible alternative. 318 It is evident that this makes it impossible for any finite mind to assert confidently that any act is right or a duty. 319 "Accordingly it follows that we never have any reason to suppose that an action is our duty: we can never be sure that any action will produce the greatest value possible.

320 Whatever the convenience of such a definition of right and duty for a simplified ethics it can hardly be claimed to accord with the moral consciousness, for humans have notoriously supposed certain acts to be duty. 321 To say that a parent has no reason to suppose that it is your duty to care for your child is more than paradox. 322 And a still greater contradiction to the morality of common sense inheres in the doctrine that the right act is that which has the best consequences. 323 Considering all the good to literature and free inquiry which has resulted from the condemnation of Socrates it is highly probable-- or at least it is arguable-- that the condemnation had better results than an acquittal would have yielded. 324 But it would be contrary to our ordinary use of language to maintain that this made the act right. 325 Or to take a more recent case: the present war may conceivably lead to a more permanent peace. The "severities," practised by one party, may stir the other to greater indignation and lead ultimately to triumph of the latter. 326 Will the acts in question be termed right by the second party if they actually have this effect? 327 On this

hypothesis the more outrageous an act and the greater the reaction against it, the better the consequences are likely to be and hence the more reason to call the act right and a duty.

328 The paradox results from omitting from right the elements of the immediate situation and considering only consequences. 329 The very meaning of the concept right, implies focussing attention upon the present rather than upon the future. It suggests a cross-section of life in its relations. 330 If the time process were to be arrested immediately after our act I think we might still speak of it as right or wrong. 331 In trying to judge a proposed act we doubtless try to discover what it will mean, that is, we look at consequences. 332 But these consequences are looked upon as giving us the meaning of the present act and we do not on this account subordinate the present act to these consequences. 333 Especially we do not mean to eliminate the significance of this very process of judgment. 334 It is significant that in considering what are the intrinsic goods Moore enumerates personal affection and the appreciation of beauty, and with less positiveness, true belief, but does not include any mention of the valuing or choosing or creative consciousness.

335 (4) If we regard right as the concept which reflects the judgment of standardising our acts by some ideal order, questions arise as to the objectivity of this order and the fixed or moving character of the implied standard. 336 Rashdall lays great stress upon the importance of objectivity: 337 "Assuredly there is no scientific problem upon which so much depends as upon the answer we give to the question 338 whether the distinction which we are accustomed to draw between right and wrong belongs to the region of objective truth like the laws of mathematics and of physical science, 339 or whether it is based upon an actual emotional constitution of individual human beings." 340 The appraisement of the various desires and impulses by myself and other people is "a piece of insight into the true nature of things." 341 While these statements are primarily intended

to oppose the moral sense view of the judgment, they also bear upon the question whether right is something fixed. 342 The phrase "insight into the true nature of things" suggests at once the view that the nature of things is quite independent of any attitude of human beings toward it. 343 It is something which the seeker for moral truth may discover but nothing which one can in any way modify. 344 It is urged that if we are to have any science of ethics at all what was once right must be conceived as always right in the same circumstances.

345 I hold no brief for the position-- if any one holds the position-- that in saying "this is right" I am making an assertion about my own feelings or those of any one else. 346 As already stated the function of the judging process is to determine objects, with reference to which we say "is" or "is not." 347 The emotional theory of the moral consciousness does not give adequate recognition to this. 348 But just as little as the process of the moral consciousness is satisfied by an emotional theory of the judgment does it sanction any conception of objectivity which requires that values are here or there once for all; 349 that they are fixed entities or "a nature of things" upon which the moral consciousness may look for its information but upon which it exercises no influence. 350 The process of attempting to give-- or discover-- moral values is a process of mutual determination of object and agent. 351 We have to do in morals not with a nature of things but with natures of persons. 352 The very characteristic of a person as we have understood it is that you are synthetic, is actually creating something new by organising experiences and purposes, by judging and choosing. 353 Objectivity does not necessarily imply changelessness.

354 Whether right is a term of fixed and changeless character depends upon whether the agents are fixed units, either in fact or in ideal. 355 If, as we maintain, right is the correlate of a self confronting a world of other persons conceived as all related in an order, the vital question is whether this order is a fixed or a moving order. 356 "Straight" is a

term of fixed content just because we conceive space in timeless terms; it is by its very meaning a cross-section of a static order. 357 But a world of living intelligent agents in social relations is in its very presuppositions a world of activity, of mutual understanding and adjustment. 358 Rationalistic theory, led astray by geometrical conceptions, conceived that a universal criterion must be like a straight line, a fixed and timeless-- or eternal-- entity. 359 But in such an order of fixed units there could be no selection, no adjustment to other changing agents, no adventure upon the new untested possibility which marks the advance of every great moral idea, in a word, no morality of the positive and constructive sort. 360 And if it be objected that the predicate of a judgment must be timeless whatever the subject, that the word "is" as Plato insists cannot be used if all flows, 361 we reply that if right the correlate of a moving order, of living social intelligent beings, it is quite possible to affirm "This is according to that law." 362 If our logic provides no form of judgment for the analysis of such a situation it is inadequate for the facts which it would interpret. 363 But in truth humankind's moral judgments have never committed themselves to any such implication. 364 We recognise the futility of attempting to answer simply any such questions as whether the Israelites did right to conquer Canaan or Hamlet to avenge his father.

365 (5) The category of right has usually been closely connected, if not identified, with reason or "cognitive" activity as contrasted with emotion. 366 Professor Dewey on the contrary has pointed out clearly the impossibility of separating emotion and thought. 367 "To put ourselves in the place of another ... is the surest way to attain universality and objectivity of moral knowledge." 368 "The only truly general, the reasonable as distinct from the merely shrewd or clever thought, is the 'generous' thought." 369 But in the case of certain judgments such as those approving fairness and the general good Sidgwick finds a rational intuition. 370 "The principle of impartiality is obtained by

considering the similarity of the individuals that make up a Logical Whole or Genus." 371 Rashdall challenges any but a rationalistic ethics to explain fairness as contrasted with partiality of affection.

372 There is without question a properly rational or intellectual element in the judgment of impartiality, namely, analysis of the situation and comparison of the units. 373 But what we shall set up as our units-- whether we shall treat the gentile or the barbarian or negro as a person, as end and not merely means, or not, depends on something quite other than reason. 374 And this other factor is not covered by the term "practical reason." 375 In fact no ethical principle shows better the subtle blending of the emotional and social factors with the rational. 376 For the student of the history of justice is aware that only an extraordinarily ingenious exegesis could regard justice as having ever been governed by a mathematical logic. 377 The logic of justice has been the logic of a we-group gradually expanding its area. Or it has been the logic of a Magna Charta-- 378 a document of special privileges wrested from a superior by a strong group, and gradually widening its benefits with the admission of others into the favoured class. 379 Or it has been the logic of class, in which those of the same level are treated alike but those of different levels of birth or wealth are treated proportionately. 380 Yet it would seem far-fetched to maintain that the countrymen of Euclid and Aristotle were deficient in the ability to perform so simple a reasoning process as the judgment one equals one, 381 or that people who developed the Roman Law, or built the cathedrals of the Middle Ages, were similarly lacking in elementary analysis. 382 Inequality rather than equality has been the rule in the world's justice. It has not only been the practice but the approved principle. It still is in regard to great areas of life. 383 In the United States there is no general disapproval of the great inequalities in opportunity for children, to say nothing of inequalities in distribution of wealth. 384 In England higher education is for the classes rather

than for the masses. 385 In Prussia the inequality in voting strength of different groups and the practical immunity of the military class from the constraints of civil law seem to an American unfair. 386 The western states of the Union think it unfair to restrict the suffrage to males and give women no voice in the determination of matters of such vital interest 387 to them as the law of divorce, the guardianship of children, the regulation of women's labour, the sale of alcoholic liquors, the protection of milk and food supply. 388 Are all these differences of practice and conviction due to the fact that some people use reason while others do not? 389 Of course in every case excellent reasons can be given for the inequality. 390 The gentile should not be treated as a Jew because you are not a Jew. The slave should not be treated as a free citizen because you are not a free citizen. The churl should not have the same wergeld as the thane because you are lowborn. 391 The more able should possess more goods. The woman should not vote because she is not a man. 392 The reasoning is clear and unimpeachable if you accept the premises, but what gives the premises? 393 In every case cited the premise is determined largely if not exclusively by social or emotional factors. 394 If reason can then prescribe equally well that the slave should be given rights because you are a man of similar traits or denied rights because you have different traits from your master, 395 if the Jew may either be given own place of equality because you hath eyes, hands, organs, dimensions, senses, affections, passions, or denied equality because you differs in descent, 396 if a woman is equal as regards taxpaying but unequal as regards voting, it is at least evident that reason is no unambiguous source of morality. 397 The devil can quote Scripture and it is a very poor reasoner who cannot find a reason for anything that you wishes to do. 398 A partiality that is more or less consistently partial to certain sets or classes is perhaps as near impartiality as human has yet come, whether by a rational faculty or any other.

399 Is it, then, the intent of this argument merely to reiterate that reason is and ought to be the slave of the passions? 400 On the contrary, the intent is to substitute for such blanket words as reason and passions a more adequate analysis. And what difference will this make? 401 As regards the particular point in controversy it will make this difference: 402 the rationalist having smuggled in under the cover of reason the whole moral consciousness then proceeds to assume that because two and two are always four, or the relations of a straight line are timeless, therefore ethics is similarly a matter of fixed standards and timeless goods. 403 A legal friend told me that he once spent a year trying to decide whether a corporation was or was not a person and then concluded that the question was immaterial. 404 But when the supreme court decided that a corporation was a person in the meaning of the Fourteenth Amendment it thereby made the corporation heir to the rights established primarily for the negro. 405 Can the moral consciousness by taking the name "reason" become heir to all the privileges of the absolute idea and to the timelessness of space and number?

406 Suppose I am to divide an apple between my two children-- two children, two pieces-- this is an analysis of the situation which is obvious and may well be called the analytic activity of reason. 407 But shall I give to each an equal share on the ground that both are equally my children or shall I reason that as John is older or larger or hungrier or mentally keener or more generous or is a male, he shall have a larger piece than Jane? 408 To settle this it may be said that we ought to see whether there is any connection between the size of the piece and the particular quality of John which is considered, 409 or that by a somewhat different use of reason we should look at the whole situation and see how we shall best promote family harmony and mutual affection. 410 To settle the first of these problems, that of the connection between the size of the piece and the size of the hunger or the sex of the child, is seemingly again a question of analysis, of

finding identical units, 411 but a moment's thought shows that the case is not so simple; that the larger child should have the larger piece is by no means self-evident. 412 This is in principle doubtless the logic, to one that hath shall be given. It is the logic of the survival of the strong, 413 but over against that the moral consciousness has always set another logic which says that the smaller child should have the larger piece if thereby intelligent sympathy can contribute toward evening up the lot of the smaller. 414 Now it is precisely this attitude of the moral consciousness which is not suggested by the term reason, for it is quite different from the analytic and identifying activity. 415 This analytical and identifying activity may very well rule out of court the hypothesis that I should give John the larger piece because he has already eaten too much or because he has just found a penny or because he has red hair; 416 it has undoubtedly helped in abolishing such practices as that of testing innocence by the ordeal. 417 But before the crucial question of justice which divides modern society, namely, whether we shall lay emphasis upon adjustment of rewards to previous abilities, habits, possessions, character, 418 or shall lay stress upon needs, and the possibility of bringing about a greater measure of equality, the doctrine which would find its standard in an 'a priori' reason is helpless.

419 If we look at the second test suggested, namely, that of considering the situation as a whole with a view to the harmony of the children and the mutual affection within the family, 420 there can be even less question that this is no mere logical problem of the individuals in a logical genus. 421 It is the social problem of individuals who have feelings and emotions as well as thought and will. 422 The problem of distributing the apple fairly is then a complex in which at least the following processes enter. 423 (1) Analysis of the situation to show all the relevant factors with the full bearing of each; 424 (2) putting yourself in the place of each one to be considered and experiencing to the full the claims, the difficulties and the purposes of

each person involved; 425 (3) considering all of these 'as' members of the situation so that no individual is given rights or allowed claims except in so far as one represents a point of view which is comprehensive and sympathetic. 426 This I take it is the force of President Wilson's utterance which has commanded such wide acceptance: "America asks nothing for herself except what she has a right to ask in the name of humanity." 427 Kant aimed to express a high and democratic ideal of justice in his doctrine that we should treat every rational being as end. 428 The defect in his statement is that the rational process as such has never treated and so far as can be foreseen never will treat 'human' beings as ends. 429 To treat a human being as an end it is necessary to put oneself into other’s place in other’s whole nature and not simply in other’s universalising, and legislative aspects: 430 Kant's principle is profound and noble, but his label for it is misleading and leaves a door open for appalling disregard of other people's feelings, sympathies, and moral sentiments, 431 as Professor Dewey has indicated in his recent lectures on "*German Philosophy and Politics*."

432 The term "reasonable," which is frequently used in law and common life as a criterion of right, seems to imply that reason is a standard. 433 As already stated, common life understands by the reasonable person one who not only uses own thinking powers but is willing to listen to reason as presented by some one else. You makes allowance for frailties in human nature. 434 To be reasonable means, very nearly, taking into account all factors of the case not only as I see them but as people of varying capacities and interests regard them. 435 The type of the "unreasonable" employer is the person who refuses to talk over things with the labourers; to put own self in their place; or to look at matters from the point of view of society as a whole.

436 Just as little does the term reasonable as used in law permit a purely intellectualistic view of the process or an 'a priori' standard. 437 The question as to what is

reasonable care or a reasonable price is often declared to be a matter not for the court but for the jury to decide, 438 i.e., it is not to be deduced from any settled principle but is a question of what the average thoughtful person, who considers other people as well as own self, would do under the circumstances. 439 A glance at some of the judicial definitions of such phrases as "reasonable care," "reasonable doubt," "reasonable law," as brought together in 'Words and Phrases Judicially Defined', illustrates this view. 440 We get a picture not of any definite standard but of such a process as we have described in our analysis, 441 namely, a process into which the existing social tradition, the mutual adjustments of a changing society and the intelligent consideration of all facts, enter. 442 The courts have variously defined the reasonable (1) as the customary, or ordinary, or legal, or (2) as according with the existing state of knowledge in some special field, or (3) as proceeding on due consideration of all the facts, or (4) as offering sufficient basis for action. 443 For example, (1) reasonable care means "according to the usages, habits, and ordinary risks of the business," 444 (2) "surgeons should keep up with the latest advances in medical science," 445 (3) a reasonable price "is such a price as the jury would under all the circumstances decide to be reasonable." 446 "If, after an impartial comparison and consideration the jury can say candidly they are not satisfied with the defendant's guilt they have a reasonable doubt." 447 Under (4) falls one of various definitions of "beyond reasonable doubt." 448 "The evidence must be such as to produce in the minds of prudent people such certainty that they would act without hesitation in their own most important affairs." 449 There is evidently ground for the statement of one judge that "reasonable" (he was speaking the phrase "reasonable care," but his words would seem to apply to other cases) "cannot be measured by any fixed or inflexible standard." 450 Professor Freund characterises "reasonable" as "the negation of precision." 451 In the development of judicial

interpretation as applied to the Sherman Law the tendency is to hold that the "rule of reason" will regard as forbidden by the statute ('a') such combinations as have historically been prohibited and ('b') such as seem to work some definite injury.

III

452 The above view of the function of intelligence, and of the synthetic character of the conscious process may be further defined in certain aspects by comparison with the view of Professor Fite, 453 who likewise develops the significance of consciousness and particularly of intelligence for our ethical concepts and social program.

454 Professor Fite insists that in contrast with the "functional psychology" which would make consciousness merely a means to the preservation of the organic individual in mechanical working order, 455 the whole value of life from the standpoint of the conscious agent consists in its being conscious. 456 Creative moments in which there is complete conscious control of materials and technique represent high and unique individuality. 457 Extension of range of consciousness makes the agent "a larger and more inclusive being," for you are living in the future and past as well as in the present. 458 Consciousness means that a new and original force is inserted into the economy of the social and the physical world." 459 On the basis of the importance of consciousness Professor Fite would ground his justification of rights, his conception of justice, and his social program. 460 The individual derives own rights simply from the fact that you knows what you are doing, hence as individuals differ in intelligence they differ in rights. 461 The problem of justice is that of according to each a degree of recognition proportioned to your intelligence, that is, treat others as ends so far as they are intelligent; so far as they are ignorant treat them as means. 462 "The conscious individual when dealing with other conscious individuals will take account of their aims, as of other factors in own situation. 463 This will involve 'adjustment,' but not abandonment of ends, i.e., self-

sacrifice. 464 Obligation to consider these ends of others is based on 'the same logic that binds me to get out of the way of an approaching train.'"

465 The point in which the conception of rights and justice and the implied social program advocated in this paper differs as I view it from that of Professor Fite is briefly this. 466 I regard both the individual and your rights as essentially synthetic and in constant process of reconstruction. 467 Therefore what is due to any individual at a moment is not measured by your present stage of consciousness. It is measured rather by your possibilities than your actualities. 468 This does not mean that the actual is to be ignored, but it does mean that if we take our stand upon the actual we are committed to a program with little place for imagination, 469 with an emphasis all on the side of giving people what they deserve rather than of making them capable of deserving more. 470 Professor Fite's position I regard as conceiving consciousness itself too largely in the category of the identical and the static rather than in the more "conscious" categories of constant reconstruction. 471 When by virtue of consciousness you conceive new ends in addition to your former particular ideas of present good the problem is, you says, "to secure perfect fulfillment of each of them." 472 The "usefulness" or "advantage" or "profitableness" of entering into social relations is the central category for measuring their value and their obligation.

473 Now the conception of securing perfect fulfillment of all one's aims by means of society rather than of putting one's own aims into the process for reciprocal modification and adjustment 474 with the aims of others and of the new social whole involves a view of these ends as fixed, an essentially mechanical view. 475 The same is the implication in considering society from the point of view of use and profit. 476 As previously suggested these economic terms apply appropriately to things rather than to intrinsic values. 477 To consider the uses of a fellow-being is to measure others in terms of some other end than your own intrinsic

personal worth. 478 To consider family life or society as profitable implies in ordinary language that such life is a means for securing ends already established 479 rather than that it 'proves' a good to the person who invests in it and thereby becomes own self a new individual with a new standard of values. 480 Any object to be chosen must of course have value to the chooser. 481 But it is one thing to be valued because it appeals to the actual chooser as already constituted; it is another thing to be valued because it appeals to a moving self which adventures upon this new unproved objective. 482 This second is the distinction of taking an interest instead of being interested.

483 The second point of divergence is that Professor Fite lays greater stress upon the intellectual side of intelligence, 484 whereas I should deny that the intellectual activity in itself is adequate to give either a basis for obligation or a method of dealing with the social problem. 485 The primary fact, as Professor Fite well states it, is "that humans are conscious beings and therefore know themselves and one another." 486 It involves "a mutual recognition of personal ends." "That very knowledge which shows the individual own self shows you also that you are living in a world with other persons 487 and other things whose mode of behaviour and whose interests determine for you the conditions through which your own interests are to be realised."

488 What kind of "knowledge" is it "which shows the individual own self"? 489 Professor Fite has two quite different ways of referring to this. He uses one set of terms when he would contrast his view with the sentimental, 490 or the "Oriental," or justify exploitation by those who know better what they are about than the exploited. 491 He uses another set of terms to characterise it when he wishes to commend his view as human, and fraternal, and as affording the only firm basis for social reform. 492 In the first case he speaks of "mere knowing"; of intelligence as "clear," and "far-sighted," of higher degrees of consciousness as simply "more in one." 493 "Our test of intelligence would be

breadth of vision (in a coherent view), fineness and keenness of insight."

494 In the second case it is "generous," it will show an "intelligent sympathy"; 495 it seeks "fellowship," and would not "elect to live in a social environment in which the distinction of 'inferiors' were an essential part of the idea." 496 The type of intelligence is found not in the person seeking wealth or power, nor in the legal acumen which forecasts all discoverable consequences and devises means to carry out purposes, but in literature and art.

497 The terms which cover both these meanings are the words "consider" and "considerate." "Breadth of consideration" gives the basis for rights. The selfish person is the "inconsiderate." 498 This term plays the part of the 'amor intellectualis' in the system of Spinoza, which enables him at once to discard all emotion and yet to keep it. 499 For "consideration" is used in common life, and defined in the dictionaries, as meaning both "examination," "careful thought," and "appreciative or sympathetic regard." 300 The ambiguity in the term may well have served to disguise from the author the double rôle which intelligence is made to play. 301 The broader use is the only one that does justice to the moral consciousness, but we cannot include sympathy and still maintain that "mere knowing" covers the whole. 302 The insistence at times upon the "mere knowing" is a mechanical element which needs to be removed before the ethical implications can be accepted.

303 Once more, how does one know own self and others? Is it the same process precisely as knowing a mechanical object? 304 Thoughts without percepts are empty, and what are the "percepts" in the two cases? 305 In the first case, that of knowing things, the percepts are colours, sounds, resistances; in the case of persons the percepts are impulses, feelings, desires, passions, as well as images, purposes, and the reflective process itself. 306 In the former case we construct objects dehumanised; in the latter we keep them more or less concrete. 307 But now, just as primitive human

did not so thoroughly de-personalise Nature, but left in it an element of personal aim, 308 so science may view human beings as objects whose purposes and even feelings may be predicted, and hence may, as Professor Fite well puts it, view them mechanically. 309 What he fails to note is that just this mechanical point of view is the view of "mere knowing"-- if "mere" has any significance at all, it is meant to shut out "sentiment." 310 And this mechanical view is entirely equal to the adjectives of "clear," "far-sighted," and even "broad" so far as this means "more in one." 311 For it is not essential to a mechanical point of view that we consider people in masses or study them by statistics. 312 I may calculate the purposes and actions, yes, and the emotions and values of one, or of a thousand, and be increasingly clear, and far-sighted, and broad, but if it is "mere" knowing-- scientific information-- it is still "mechanical," i.e., external. 313 On the other hand, if it is to be a knowledge that has the qualities of humaneness, or "intelligent sympathy," it must have some of the stuff of feeling, 314 even as in the realm of things an artist's forest will differ from that of the most "far-sighted," "clear," and "broad" statistician, by being rich with colour and moving line.

315 And this leads to a statement of the way in which my fellow-beings will find place in "my" self. 316 I grant that if they are there I shall take some account of them. But they may be there in all sorts of ways. 317 They may be there as "population" if I am a statistician, or as "consumers," or as rivals, or as enemies, or as fellows, or as friends. 318 They will have a "value" in each case, but it will sometimes be a positive value, and sometimes a negative value. 319 Which it will be, and how great it will be, depends not on the mere fact of these objects being "in consciousness" but on the capacity in which they are there. 320 And this capacity depends on the dominant interest and not on mere knowing. 321 The trouble with the selfish person, says Professor Fite, is that you "fails to consider," "you fails to take account of me." 322 Well, then, 'why' does you fail? 'Why' does you not take account of

me? 323 You probably does "consider" me in several of the ways that are possible and in the ways that it suits you to consider me. 324 I call you selfish because you does not consider me in the one particular way in which I wish to be considered. 325 And what will get me into your consideration from this point of view? 326 In some cases it may be that I can speak: "Sir, you are standing on my toe," and as the message encounters no obstacle in any fixed purpose or temperamental bent the idea has no difficulty in penetrating your mind. 327 In other cases it may interfere with your desire to raise yourself as high as possible, 328 but I may convince you by the same logic as that of an"approaching railway train"-- that you must regard me. 329 In still other cases-- and it is these that always test Individualism-- I am not myself aware of the injury, or I am too faint to protest. 330 How shall those who have no voice to speak get "consideration"? Only by "intelligent sympathy," and by just those emotions rooted in instinctive social tendencies which an intellectualistic Individualism excludes or distrusts.

IV

331 What practical conclusion, if any, follows from this interpretation of the moral consciousness and its categories? 332 Moral progress involves both the formation of better ideals and the adoption of such ideals as actual standards and guides of life. 333 If our view is correct we can construct better ideals neither by logical deduction nor solely by insight into the nature of things-- if by this we mean things as they are. 334 We must rather take as our starting-point the conviction that moral life is a process involving physical life, social intercourse, measuring and constructive intelligence. 335 We shall endeavour to further each of these factors with the conviction that thus we are most likely to reconstruct our standards and find a fuller good.

336 Physical life, which has often been depreciated from the moral point of view, is not indeed by itself supreme, 337 but it is certain that much evil charged to a bad

will is due to morbid or defective conditions of the physical organism. 338 One would be ashamed to write such a truism were it not that our juvenile courts and our prison investigations show how far we are from having sensed it in the past. 339 And our present labour conditions show how far our organisation of industry is from any decent provision for a healthy, sound, vigorous life of all the people. 340 This war is shocking in its destruction, but it is doubtful if it can do the harm to Great Britain that her factory system has done. 341 And if life is in one respect less than ideals, in another respect it is greater; for it provides the possibility not only of carrying out existing ideals but of the birth of new and higher ideals.

342 Social interaction likewise has been much discussed but is still very inadequately realised. 343 The great possibilities of coöperation have long been utilised in war. 344 With the factory and commercial organisation of the past century we have hints of their economic power. 345 Our schools, books, newspapers, are removing some of the barriers. But how far different social classes are from any knowledge, not to say appreciation, of each other! 346 How far different races are apart! How easy to inculcate national hatred and distrust! 347 The fourth great problem which baffles Wells's hero in the 'Research Magnificent' is yet far from solution. 348 The great danger to morality in America lies not in any theory as to the subjectivity of the moral judgment, but in the conflict of classes and races.

349 Intelligence and reason are in certain respects advancing. The social sciences are finding tools and methods. 350 We are learning to think of much of our moral inertia, our waste of life, our narrowness, our muddling and blundering in social arrangements, as stupid-- 351 we do not like to be called stupid even if we scorn the imputation of claiming to be "good." 352 But we do not organise peace as effectively as war. We shrink before the thought of expending for scientific investigation sums comparable with those used for military purposes. 353 And is scholarship entitled to shift the blame entirely

upon other interests? Perhaps if it conceived its tasks in greater terms and addressed itself to them more energetically it would find greater support.

354 And finally the process of judgment and appraisal, of examination and revaluation. To judge for the sake of judging, to analyse and evaluate for the sake of the process hardly seems worthwhile. 355 But if we supply the process with the new factors of increased life, physical, social, intelligent, we shall be compelled to new valuations. 356 Such has been the course of moral development; we may expect this to be repeated. 357 The great war and the changes that emerge ought to set new tasks for ethical students. 358 As medievalism, the century of enlightenment, and the century of industrial revolution, each had its ethics, so the century that follows ought to have its ethics, 359 roused by the problem of dealing fundamentally with economic, social, racial, and national relations, and using the resources of better scientific method than belonged to the ethical systems which served well their time.

360 Only willful misinterpretation will suppose that the method here set forth is that of taking every want or desire as itself a final justification, or of making morality a matter of arbitrary caprice. 361 But some may in all sincerity raise the question: "Is morality then after all simply the shifting mores of groups stumbling forward-- or backward, or sidewise-- with no fixed standards of right and good? 362 If this is so how can we have any confidence in our present judgments, to say nothing of calling others to an account or of reasoning with them?" 363 What we have aimed to present as a moral method is essentially this: to take into our reckoning all the factors in the situation, to take into account the other persons involved, to put ourselves into their places by sympathy as well as conceptually, 364 to face collisions and difficulties not merely in terms of fixed concepts of what is good or fair, and what the right of each party concerned may be, 365 but with the conviction that we need new

definitions of the ideal life, and of the social order, and thus reciprocally of personality. 366 Thus harmonised, free, and responsible, life may well find new meaning also in the older intrinsic goods of friendship, æsthetic appreciation and true belief. 367 And it is not likely to omit the satisfaction in actively constructing new ideals and working for their fulfillment.

368 Frankly, if we do not accept this method what remains? Can any one by pure reason discover a single forward step in the treatment of the social situation or a single new value in the moral ideal? 369 Can any analysis of the pure concept of right and good teach us anything? 370 In the last analysis the moral judgment is not analytic but synthetic. The moral life is not natural but spiritual. And spirit is creative.

VALUE AND EXISTENCE IN PHILOSOPHY, ART, AND RELIGION

Horace M. Kallen

I

8 You who assiduously compares the profound and the commonplace will find their difference to turn merely on the manner of their expression; 2 a profundity is a commonplace formulated in strange or otherwise obscure and unintelligible terms. 3 This must be my excuse for beginning with the trite remark that the world we live in is not one which was made for us, but one in which we happened and grew. 4 I am much aware that there exists a large and influential class of persons who do not think so; and I offer this remark with all deference to devotees of idealism, 5 and to other such pietists who persist in arguing that the trouble which we do encounter in this vale of tears springs from the inwardness of our own natures and not from that of the world. 6 I wish, indeed, that I could agree with them, but unhappily their very arguments prevent me, since,

if the world were actually as they think it, they could not think it as they do. 7 In fact, they could not think. Thinking-- worse luck!-- came into being as response to discomfort, to pain, to uncertainty, to problems, such as could not exist in a world truly made for us; 8 while from time immemorial 'pure' as distinct from human consciousness has been identified with absolute certainty, with self-absorption and self-sufficiency; as a god, a goal to attain, not a fact to rest in. 9 It is notable that those who believe the world actually to have been made for us devote most of their thinking to explaining away the experiences which have made all humans feel that the world was actually not made for us. 10 Their chief business, after proving the world to be all good, is solving "the problem of evil." 11 Yet, had there really been no evil, this evil consequence could not have ensued: existence would have emerged as beatitude and not as adjustment; 12 thinking might in truth have been self-absorbed contemplation, blissful intuition, not painful learning by the method of trial and error.

13 Alas that what "might have been" cannot come into being by force of discursive demonstration! 14 If it could, goodness alone would have existed and been real, and evil would have been non-existence, unreality, and appearance-- all by the force of the Word. 15 As it is, the appearance of evil is in so far forth no less an evil than its reality; in truth, it is reality and its best witnesses are the historic attempts to explain it away. 16 For even as "appearance" it has a definite and inexpugnable character of its own which cannot be destroyed by subsumption under the "standpoint of the whole," "the absolute good," the "over-individual values." 17 Nor, since only sticks and stones break bones and names never hurt, can it be abolished by the epithet "appearance." 18 To deny reality to evil is to multiply the evil. It is to make two "problems" grow where only one grew before, 19 to add to the "problem of evil" the "problem of appearance" without serving any end toward the solution of the

real problem how evil can be effectively abolished.

20 I may then, in view of these reflections, hold myself safe in assuming that the world we live in was not made for us; that, humanly speaking, it is open to improvement in a great many directions. 21 It will be comparatively innocuous to assume also, as a corollary, that in so far as the world was made for mind, it has been made so by human, that civilisation is the adaptation of Nature to human nature. 22 And as a second corollary it may be safely assumed that the world does not stay made; civilisation has brought its own problems and peculiar evils.

23 I realise that, in the light of my title, much of what I have written above must seem irrelevant, since the "problem of evil" has not, within the philosophic tradition, been considered part of a "problem of values" as such. 24 If I dwell on it, I do so to indicate that the "problem of evil" can perhaps be best understood in the light of another problem: the problem, namely, of why humans have created the "problem of evil." 25 For obviously, evil can be problematic only in an absolutely good world, and the idea that the world is absolutely good is not a generalisation 'upon' experience, but a contradiction 'of' experience. 26 If there exists a metaphysical "problem of evil," hence, it arises out of this generalisation; it is secondary, not primary; and the primary problem requires solution before the secondary one can be understood. 27 And what else, under the circumstances, can the primary one be than this: "Why do humans contradict their own experience?"

II

28 So put, the problem suggests its own solution. 29 It indicates, first of all, that Nature and human nature are not completely compatible, that consequently, conclusions are being forced by Nature on human nature which human nature resents and rejects, 30 and that traits are being assigned to Nature by human nature which Nature does not possess, but which, if possessed, would make Her congenial to human needs. 31 All this is so

platitudinous that I feel ashamed to write it; but then, how can one avoid platitudes without avoiding truth? 32 And truth here is the obvious fact that since human nature is the point of existence to which good and evil refer, what is called value has its seat necessarily in human nature, 33 and what is called existence has its seat necessarily in the nature of which human nature is a part and apart. 34 Value, in so far forth, is a content of Nature, having its roots in Her conditions and its life in Her force, while the converse is not true. 35 All nature and all existence is not spontaneously and intrinsically a content of value. Only that portion of it which is human is such. 36 Humanly speaking, non-human existences become valuable by their efficacious bearing on humanity, by their propitious or their disastrous relations to human consciousness. 37 It is these relations which delimit the substance of our goods and evils, and these, at bottom, are indistinguishable from consciousness. 38 They do not, need not, and cannot connect all existence with human life. They are inevitably implicated only with those which make human life possible at all. 39 Of the environment, they pertain only to that portion which is fit by the implicated conditions of life itself. 40 It may therefore be said that natural existence produces and sustains some values,-- at least the minimal value which is identical with the bare existence of humankind-- on its own account, but no more. 41 The residual environment remains-- irrelevant and menacing, wider than consciousness and independent of it. 42 Value, hence, is a specific kind of natural existence among other existences. To say that it is non-existent in Nature, is to say that value is not coincident and coexistent with other existences, 43 just as when it is said that a thing is not red, the meaning is that red is not copresent with other qualities. 44 Conversely, to say that value exists in Nature is to say that Nature and human nature, things and thoughts, are in some respect harmonious or identical. 45 Hence, what human nature tries to force upon Nature must be, by

implication, non-existent in Nature but actual in mind, so that then nature of value must be held inseparable from the nature of mind.

46 It follows that value is, in origin and character, completely irrational. 47 At the foundations of our existence it is relation of their conditions and objects to our major instincts, our appetites, our feelings, our desires, our ambitions-- 48 most clearly, to the self-regarding instinct and the instincts of nutrition, reproduction, and gregariousness. 49 Concerning those, as William James writes, "Science may come and consider their ways and find that most of them are useful. 50 But it is not for the sake of their utility that they are followed, but because at the moment of following them we feel that it is the only appropriate and natural thing to do. 51 Not a person in a billion when taking own dinner, ever thinks of utility. You eats because the food tastes good and makes you want more. 52 If I ask you why you should want to eat more of what tastes like that, instead of revering you as a philosopher, you will probably laugh at me for a fool. 53 The connection between the savory sensation and the act it awakens is for you absolute and 'selbstverständlich', an 'a priori' synthesis of the most perfect sort, needing no proof but its own evidence.... 54 To the metaphysician alone can such questions occur as 'Why do we smile when pleased, and not scowl? 55 Why are we unable to talk to a crowd as we talk to a single friend? Why does a particular maiden turn our wits upside down?' 56 The common person can only say "of course' we smile, 'of course' our heart palpitates at the sight of a crowd, 57 'of course' we love the maiden, that beautiful soul clad in that perfect form, so palpably and flagrantly made from all eternity to be loved.' 58 And so, probably, does each animal feel about the particular things it tends to do in the presence of particular objects.... 59 To the broody hen the notion would probably seem monstrous that there should be a creature in the world to whom a nestful of eggs was not the utterly fascinating and precious and

never-to-be-too-much-set-upon object it is to her." 60 In sum, fundamental values are relations, responses, attitudes, immediate, simple, subjectively obvious, and irrational. But everything else becomes valuable or rational only by reference to them.

61 Study them or others empirically, and they appear as types of specific behaviour, simple or complicated, 62 consisting of a given motor "set" of the organism, strong emotional tone, and aggregates of connected ideas, more or less systematised. 63 In the slang of the new medical psychology which has done so much to uncover their method and mechanism, they are called "complexes"; ethics has called them interests, and that designation will do well enough. 64 They are the primary and morally ultimate efficacious units of which human nature is compounded, 65 and it is in terms of the world's bearing upon their destiny that we evaluate Nature and judge Her significance and worth.

66 Now in interest, the important delimiting quality is emotional tone. Whatever else is shareable, that is not. 67 It is the very stuff of our attitudes, of our acceptances and rejections of the world and its contents, the very essence of the relations we bear to these. 68 That these relations shall be identical for any two human beings requires that the two shall be identical: 69 two persons cannot hold the same relation to the same or different objects any more than two objects can occupy absolutely the same space at the same time. Hence, all our differences and disagreements. 70 However socially-minded we may be, mere numerical diversity compels us to act as separate centers, to value things with reference to separate interests, to orient our worlds severally, and with ourselves as centers. 71 This orienting is the relating of the environment to our interests, the establishment of our worlds of appreciation, the creation of our orders of value. 72 However much these cross and inter-penetrate, coincide they never can.

73 Our interests, furthermore, are possibly as numerous as our reflex arcs. 74 Each may, and most do, constitute distinct and independent

valuations of their objects, to which they respond, and each, with these objects, remains an irreducible system. 75 But reflex arcs and interests do not act alone. They act like armies; 76 they compound and are integrated, and when so integrated their valuations fuse and constitute the more complex and massive feelings, pleasures and pains, the emotions of anger, of fear, of love; the sentiments of respect, of admiration, of sympathy. 77 They remain, through all degrees of complexity, appraisements of the environment, reactions upon it, behaviour toward it, as subject to empirical examination by the psychologist as the environment itself by the physicist.

78 With a difference, however, a fundamental difference. When you have an emotion you cannot yourself examine it. 79 Effectively as the mind may work in sections, it cannot with sanity be divided against itself nor long remain so. A feeling cannot be had and examined in the same time. 80 And though the investigator who studies the nature of red does not become red, the investigator who studies the actual emotion of anger does tend to become angry. 81 Emotion is infectious; anger begets anger; fear, fear; love, love; hate, hate; actions, relations, attitudes, when actual, integrate and fuse; 82 as feelings, they constitute the sense of behaviour, varying according to a changing and unstable equilibrium of factors 'within' the organism; 83 they are actually underneath the skin, and consequently, to know them alive is to have them. On the other hand, to know 'things' is simply to have a relation to them. 84 The same thing may be both loved and hated, desired or spurned, by different minds at the same time or by the same mind at different times. 85 One, for example, values whiskey positively, approaches, absorbs it, aims to increase its quantity and sale; another apprehends it negatively, turns from it, strives to oust it from the world. 86 Then, according to these direct and immediate valuations of whiskey, its place in the common world of the two minds will be determined. To save or destroy it, they may seek to destroy each other. 87 Even similar positive valuations of the

object might imply this mutual repugnance and destruction. 88 Thus, rivals in love: they enhance and glorify the same woman, but as she is not otherwise shareable, they strive to eliminate each other. 89 Throughout the world of values the numerical distinctness of the seats or centers of value, whatever their identity otherwise, keeps them ultimately inimical. 90 They may terminate in the common object, but they originate in different souls and they are related to the object like two magnets of like polarity to the same piece of iron that lies between them. 91 Most of what is orderly in society and in science is the outcome of the adjustment of just such oppositions: 92 our civilisation is an unstable equilibrium of objects, through the coöperation, antipathy, and fusion of value-relations.

93 Individuals are no better off; personality is constructed in the same way. If, indeed, the world had been made for us, we might have been spared this warfare to human upon earth. 94 Life might have been the obvious irrational flow of bliss so vividly described by William James; 95 Nature and human nature would have been one; bridging the gulf between them would never have been the task of the tender-minded among philosophers. 96 Unfortunately our mere numerical difference, the mere numerical difference of the interests which compose our egos, makes the trouble, so that we are compelled to devote most of our lives to converting the different into the same. 97 The major part of our instincts serve this function recognisably, e.g., nutrition, and the "higher powers" do so no less, if not so obviously. generalisation is nothing more, thinking nothing else. 98 It is the assimilation of many instances into one form, law, or purpose; the preservation of established contents of value, 99 just as nutrition is the preservation of life by means of the conversion of foreign matter into the form and substance of the body. 100 By bowels and by brain, what is necessary, what will feed the irrationally given interest, is preserved and consumed: the rest is cast off as waste, as irrelevance, as contradiction.

101 The relation may, of course, also reverse itself. Face to face with the immovable and inexorable, the mind may accept it with due resignation, or it may challenge its tyranny and exclude it from its world. 102 It may seek or create or discover a substitute that it is content to accept, though this will in turn alter the course and character of the interest which in such an instance defines the mind's action. 103 Thus, a way out for one of the lovers of the same girl might be to become a depressed and yearning bachelor, realising his potential sexuality in the vicarious reproduction of reverie and sentiment; 104 another might be to divert the stream of his affections to another girl, re-organising his life about a different center and acquiring a new system of practical values determined by this center; 105 a third might be a complete redirection of his sexual energies upon objects the interest in which we would call, abnormal and anti-social in one case, and in another lofty and spiritual. 106 In the latter case sexuality would have been depersonalised; it would have changed into poetic and humanitarian passion; it would have become love as Plato means us to take the word. 107 But each of these processes would have been a conversion, through the need defined by an identical instinct, of the 'same into the different'; 108 the human nature which existed at the beginning of the change would be deeply other than the human nature in which the change culminated. 109 In each case a condition thrust upon the spirit by its environment would have occasioned the creation and maintenance of an environment demanded by the spirit. 110 Yet in so far as it was not truly 'the same' as that envisaged in the primitive demand, it would still imply the tragedy of the world not made for us and the "problem of evil," 111 in which the life of the spirit is persistently a salvage of one of two always incompatible goods, a saving by surrender.

112 And this is all that a mind is--an affair of saving and rejecting, of valuing with a system of objects of which a living body and its desires and operations, its interests, are focal and the objects marginal, for its standard. 113 Mind, thus, is

neither simple, nor immutable, nor stable; it is a thing to be "changed," "confused," "cleared," "made-up," "trained." 114 One body, I have written elsewhere, "in the course of its lifetime, has many minds, only partially united. Humans are all too often "of two minds." 115 The unity of a mind depends on its consistent pursuit of 'one' interest, although we then call it narrow; or on the coöperation and harmony of its many interests. 116 Frequently, two or more minds may struggle for the possession of the same body; that is, the body may be divided by two elabourately systematised tendencies to act. 117 The beginning of such division occurs wherever there is a difficulty in deciding between alternative modes of behaviour; 118 the end is to be observed in those cases of dual or multiple personality in which the body has ordered a great collection of objects 119 and systematised so large a collection of interests in such typically distinct ways as to have set up for itself different and opposed "minds." 120 On the other hand, two or fifty or a million bodies may be "of the same mind." 121 Unhappily, difference of mind, diversity and conflict of interests is quite as fundamental, if not more so, as sameness of mind, coöperation and unity of interests. This the philosophical tradition sufficiently attests. 122 To Plato human is at once a protean beast, a lion, and an intellect; the last having for its proper task to rule the first and to regulate the second, which is always rebellious and irruptive. 123 According to the Christian tradition human is at once flesh and spirit, eternally in conflict with one another, and the former is to be mortified that the latter may have eternal life. 124 Common sense divides us into head and heart, never quite at peace with one another. 125 There is no need of piling up citations. Add to the inward disharmonies of mind its incompatibilities with the environment, and you perceive at once how completely it is, 126 from moment to moment, a theater and its life a drama of which the interests that compose it are at once protagonists and directors. 127 The catastrophe of this

unceasing drama is always that one or more of the players is driven from the stage of conscious existence. 128 It may be that the environment-- social conditions, commercial necessity, intellectual urgency, allies of other interests-- will drive it off; 129 it may be that its own intrinsic unpleasantness will banish it, will put it out of mind; whatever the cause, it is put out. 130 Putting it out does not, however, end the drama; putting it out serves to complicate the drama. 131 For the "new psychology" shows that whenever an interest or a desire or impulsion is put out of the mind, it is really, if not extirpated, put into the mind; it is driven from the conscious level of existence to the unconscious. 132 It retains its force and direction, only its work now lies underground. 133 Its life henceforward consists partly in a direct oppugnance to the inhibitions that keep it down, partly in burrowing beneath and around them and seeking out unwonted channels of escape. 134 Since life is long, repressions accumulate, the mass of existence of feeling and desire tends to become composed entirely of these repressions, 135 layer upon layer, with every interest in the aggregate striving to attain place in the daylight of consciousness.

136 Now, empirically and metaphysically, no one interest is more excellent than any other. 137 Repressed or patent, each is, whether in a completely favourable environment or in a completely indifferent universe, or before the bar of an absolute justice, or under the domination of an absolute and universal good, entitled to its free fulfillment and perfect maintenance. 138 Each is a form of the good; the essential content of each is good. 139 That any are not fulfilled, but repressed, is a fact to be recorded, not an appearance to be explained away. 140 And it may turn out that the existence of the fact may explain the effort to explain it away. 141 For where interests are in conflict with each other or with reality, and where the loser is not extirpated, its revenge may be just this self-fulfillment in unreality, in idea, which philosophies of absolute values offer it. 142 Dreams, some of the arts, religion, and

philosophy may indeed be considered as such fulfillment, 143 worlds of luxuriant self-realisation of all that part of our nature which the harsh conjunctions with the environment overthrow and suppress. 144 Sometimes abortive self-expressions of frustrated desires, sometimes ideal compensations for the shortcomings of existence, they are always equally ideal reconstructions of the surrounding evil of the world into forms of the good. 145 And because they are compensations in idea, they are substituted for existence, appraised as "true," and "good," and "beautiful," and "real," while the experiences which have suppressed the desires they realise are condemned as illusory and unreal. 146 In them humanity has its freest play and amplest expression.

III

147 This has been, and still to a very great extent remains, most specifically true of philosophy. 148 The environment with which philosophy concerns itself is nothing less than the whole universe; its content is, within the history of its dominant tradition, absolutely general and abstract; 149 it is, of all great human enterprises, even religion, least constrained by the direction and march of events or the mandate of circumstance. 150 Like music, it expresses most truly the immediate and intrinsic interests of the mind, its native bias and its inward goal. 151 It has been constituted, for this reason, of the so-called "normative" sciences, envisaging the non-existent as real, forcing upon Nature pure values, forms of the spirit incident to the total life of this world, unmixed with baser matter. 152 To formulate ultimate standards, to be completely and utterly lyrical has been the prerogative of philosophy alone. 153 Since these standards reappear in all other reconstructions of the environment and most clearly in art and in religion, it is pertinent to enumerate them, and to indicate briefly their bearing on existence.

154 The foremost outstanding is perhaps "the unity of the world." Confronted by the perplexing menace of the variation of

experience, 155 the dichotomies and oppositions of thoughts and things, the fusion and diversifications of many things into one and one into many, 156 humankind has, from the moment it became reflective, felt in the relation of the One and the Many the presence of a riddle that engendered and sustained uneasiness, a mystery that concealed a threat. 157 The mind's own preference, given the physiological processes that condition its existence, constitution, and operation, could hardly come to rest in a more fundamental normation than Unity. 158 A world which is 'one' is easier to live in and with; initial adjustment therein is final adjustment; in its substance there exists nothing sudden and in its character nothing uncontrollable. 159 It guarantees whatever vital equilibrium the organism has achieved in it, ill or good. It secures life in attainment and possession, insuring it repose, simplicity, and spaciousness. 160 A world which is many complicates existence: it demands watchful consideration of irreducible discrete individualities: 161 it necessitates the integration and humanisation in a common system of adjustment of entities which in the last analysis refuse all ordering and reject all subordination, 162 consequently keeping the mind on an everlasting jump, compelling it to pay with eternal vigilance the price of being. 163 The preference for unity, then, is almost inevitable, 164 and the history of philosophy, from the Vedas to the Brahma Somaj and from Thales to Bergson, is significantly unanimous in its attempts to prove that the world is, 165 somehow, through and through one. That the oneness requires 'proof' is 'prima facie' evidence that it is a value, a desiderate, not an existence. 166 And how valuable it is may be seen merely in the fact that it derealises the inner conflict of interests, 167 the incompatibilities between Nature and human, the uncertainties of knowledge, and the certainties of evil, and substitutes therefore the ultimate happy unison which "the identity of the different" compels.

168 Unity is the common desiderate of philosophic systems

of all metaphysical types-- neutral, materialistic, idealistic. 169 But the dominant tradition has tended to think this unity in terms of 'interest', of 'spirit', of 'mentality'. 170 It has tended, in a word, to assimilate Nature to human nature, to identify things with the 'values' of things, to envisage the world in the image of human. 171 To it, the world is all spirit, ego, or idea; and if not such through and through, then entirely subservient, in its unhumanised parts, to the purposes and interests of ego, idea, or spirit. 172 Why, is obvious. A world of which the One substance is such constitutes a totality of interest and purpose which faces no conflict and has no enemy. 173 It is fulfillment even before it is need, and need, indeed, is only illusion. 174 Even when its number is many, the world is a better world if the stuff of these many is the 'same' stuff as the spirit of human. 175 For mind is more at home with mind than with things; the pathetic fallacy is the most inevitable and most general. 176 Although the totality of spirit is conceived as good, that is, as actualising all our desiderates and ideals, 177 it would still be felt that, even if the totality were evil, and not God, but the Devil ruled the roost, the world so constituted must be better than one utterly non-spiritual. 178 We can understand and be at home with malevolence: it offers at least the benefits of similarity, of companionship, of intimateness, of consubstantiality with 'will'; 179 its behaviour may be foreseen and its intentions influenced; but no horror can be greater than that of utter aliency. 180 How much of religion turns with a persistent tropism to the consideration of the devil and his works, and how much it has fought his elimination from the cosmic scheme! 181 Yet never because it loved the devil. The deep-lying reason is the fact that the humanisation of Evil into Devil mitigates Evil and improves the world. 182 Philosophy has been least free from this corrective and spiritising bias. Though it has cared less for the devil, it has predominantly repudiated aliency, 183 has sought to prove spirit the cause and substance of the world, and in that degree, to transmute the aliency of Nature into sameness with human nature.

184 With unity and spirituality, 'eternity' makes a third. This norm is a fundamental attribute of the One God Himself, and interchangeable with His ineffable name: 185 the Lord is Eternal, and the Eternal, even more than the One, receives the eulogium of exclusive realness. 186 To the philosophical tradition it is the most real. Once more the reason should be obvious. 187 The underlying urge which pushes the mind to think the world as a unity pushes it even more inexorably to think the world as timeless. 188 For unity is asserted only against the perplexities of a manyness which may be static and unchanging, and hence comparatively simple. 189 But eternity is asserted and set against mutability: it is the negation of change, of time, of novelty, of the suddenness and slaughter of the flux of life itself, 190 which consumes what it generates, undermines what it builds and sweeps to destruction what it founds to endure. 191 Change is the arch-enemy of a life which struggles for self-'preservation', of an intellect which operates spontaneously by the logic of identity, of a will which seeks to convert others into sames. 192 It substitutes a different self for the old, it falsifies systems of thought and deteriorates systems of life. It makes unity impossible and manyness inevitable. It upsets every actual equilibrium that life attains. 193 It opens the doors and windows of every closed and comfortable cosmos to all transcosmic winds that blow, with whatever they carry of possible danger and possible ill. 194 It is the very soul of chaos in which the pleasant, ordered world is such a little helpless thing. 195 Of this change eternity is by primary intention the negation, as its philological form shows. 196 It is 'not-time', without positive intrinsic content, and in its secondary significances, i.e., in those significances which appear in metaphysical dialectic, without meaning; 197 since it is there a pure negation, intrinsically affirming nothing, of the same character as "not-human" or "not-donkey," standing for a nature altogether unspecific and indeterminable in the residual

universe. 198 By a sort of obverse implication it does, however, possess, in the philosophic tradition, a positive content which accrues to it by virtue of what it denies. 199 This content makes it a designation for the persistence and perdurability of desiderated quality-- from metaphysical unity and spirituality to the happy hunting-grounds or a woman's affection. 200 At bottom it means the assurance that the contents of value cannot and will not be altered or destroyed, that their natures and their relations to human do not undergo change. 201 There is no recorded attempt to prove that evil is eternal: eternity is 'eternity of the good alone'.

202 Unity, spirituality, and eternity, then, are the forms which contents of value receive under the shaping hands of the philosophic tradition, to which they owe their metaphysical designation 203 and of which the business has so largely and uniquely been to 'prove' them the foundations and ontological roots of universal nature. 204 But "the problem of evil" does not come to complete solution with these. Even in a single, metaphysically spiritual and unchanging world, 205 human may still be less than a metaphysical absolute and your proper individuality doomed to absorption, your wishes to obstruction and frustration. 206 Of human, therefore, the tradition posits 'immortality' and 'freedom', and even the materialistic systems have sought to keep somehow room for some form of these goods.

207 To turn first to immortality. Its source and matrix is less the love of life than the fear of death-- that fear which Lucretius, dour poet of disillusion, so nobly deplored. 208 That he had ever himself been possessed of it is not clear, but it is perfectly clear that his altogether sound arguments against it have not abolished its operation, nor its effect upon human character, society, and imagination. 209 Fear which made the gods, made also the immortality of human, the denial of death. 210 What the fear's unmistakable traits may be has never been articulately said, perhaps never can be said. 211 Most of us never may undergo the fear of death; we undergo comfort

and discomfort, joy and sorrow, intoxication and reaction, love and disgust; 212 we aim to preserve the one and to abolish the other, but we do not knowingly undergo the fear of death. 213 Indeed, it is logically impossible that we should, since to do so would be to acquire an experience of death such that we should be conscious of being unconscious, sensible of being insensible, aware of being unaware. 214 We should be required to be and not to be at the same instant, in view of which Lucretius both logically and wisely advises us to remember that when death is, we are not; and when we are, death is not.

215 Experience and feeling are, however, neither logical nor wise, and to these death is far from the mere non-being which the poet would have us think it. 216 To these it has a positive reality which makes the fear of it a genuine cause of conduct in individuals and in groups, 217 with a basis in knowledge such as is realised in the diminishing of consciousness under anæsthetic, in dreams of certain types, 218 and most generally in the nascent imitation of the 'rigour mortis' which makes looking upon the dead such a horror to most of us. 219 Even then, however, something is lacking toward the complete realisation of death, and children and primitive peoples never realise it at all. 220 Its full meaning comes out as 'an unsatisfied hunger in the living' rather than as a condition of the dead, who, alive, would have satisfied this hunger. 221 And the realisation of this meaning requires sophistication, requires a lengthy corporate memory and the disillusions which civilisation engenders. 222 Primitive peoples ask for no proof of immortality because they have no notion of mortality; 223 civilised thinking has largely concerned itself about the proof of immortality because its assurance of life has been shaken by the realisation of death through the gnawing of desire which only the dead could still. 224 The 'proof' which in the history of thought is offered again and again, be it noted, is not of the reality of life, but of the unreality and inefficacy of death. 225 Immortality is like eternity, a negative term; it is 'im'mortality.

INTELLIGENCE

226 The experienced fact is mortality; and the fear of it is only an inversion of the desire which it frustrates, just as frustrated love becomes hatred. 227 The doctrine of immortality, hence, springs from the fear of death, not from the love of life, and immortality is a value-form, not an existence. 228 Now, although fear of death and love of life are in constant play in character and conduct, neither constitutes the original, innocent urge of life within us. 229 "Will to live," "will to power," "struggle for existence," and other Germanic hypostases of experienced events which the great civil war in Europe is just now giving such an airing, 230 hardly deserve, as natural data, the high metaphysical status that Schopenhauer, Nietzsche, and company have given them. 231 They follow in fact upon a more primary type of living, acting form, a type to which the "pathetic fallacy" or any other manner of psychologising may not apply. 232 The most that can be said about this type is that its earlier stages are related to its later ones as potential is to kinetic energy. 233 If, since we are discussing a metaphysical issue, we must mythologise, we might call it the "will to self-expression." 234 Had this "will" chanced to happen in a world which was made for it, or had it itself been the substance of the world, "struggle for existence," "will to live," and "will to power," never could have supervened. 235 All three of these expressions designate data which require an opposite, a counter-will, to give them meaning. 236 There can be a struggle for existence only when there are obstacles thereto, a will to live only when there are obstructions to life, a will to power only when there is a resistance against which power may be exercised. 237 Expression alone is self-implying and self-sufficient, and in an altogether favourable environment we might have realised our instincts, impulses, interests, appetites and desires, expressed and actualised our potentialities, 238 and when our day is done, have ceased, as unconcerned about going on as about starting.

239 Metchnikoff speaks somewhere of an instinct toward death and the euphoria which

accompanies its realisation. He cites, I think, no more than two or three cases. 240 To most of us the mere notion of the existence and operation of such an instinct seems fanciful and uncanny. Yet from the standpoint of biology nothing should be more natural. 241 Each living thing has its span, which consists of a cycle from birth through maturation and senescence to dissolution, and the latter half of the process is as "fateful" and "inevitable" as the former! 242 Dying is itself the inexpugnable conclusion of that setting free of organic potentialities which we call life, 243 and if dying seems horrid and unnatural, it seems so because for most of us death is violent, because its occasion is a shock from without, not the realisation of a tendency from within. 244 In a completely favourable environment we should not struggle to exist, we should simply exist; we should not will to live, we should simply live, i.e., we should actualise our potentialities and die.

245 But, once more alas, our environment is not completely favourable, and there's the rub. 246 That disorderly constellation of instincts and appetites and interests which constitutes the personality of the best of us does not work itself out evenly. 247 At the most favourable, our self-realisations are lopsided and distorted. 248 For every capacity of ours in full play, there are a score at least mutilated, sometimes extirpated, always repressed. 249 They never attain the free fullness of expression which is consciousness, or when they do, they find themselves confronted with an opponent which neutralises their maturation at every point. 250 Hence, as I have already indicated, they remain in, or revert to, the subterranean regions of our lives, and govern the making of our biographies from their seats below. 251 What they fail to attain in fact they succeed in generating in imagination to compensate for the failure; they realise themselves vicariously. 252 The doctrine of immortality is the generic form of such vicarious self-realisation, as frequently by means of dead friends and relatives to whose absolute non-being the mind will

not assent, 253 as by means of the everlasting heaven in which the mind may forever disport itself amid those delights it had to forego on earth. 254 Much of the underlying motive of the doctrine is a 'sehnsucht' and nostalgia after the absent dead; little a concern for the continuity of the visible living. 255 And often this passion is so intense that system after system in the philosophic tradition is constructed to satisfy it, 256 and even the most disillusioned of systems-- for example, Spinoza's-- will preserve its form if not its substance.

257 That the "freedom of the will" shall be a particularised compensatory desiderate like the immortality of the soul, 258 the unity, the spirituality, and the eternity of the world is a perversion worked upon this ideal by the historic accident we call Christianity. 259 The assumptions of that theory concerning the nature of the universe and the destiny of human, being through and through compensatory, changed freedom from the possible fact and actual hope of Hellenic systems into the "problem" of the Christian ones. 260 The consequent controversy over "free-will," the casuistic entanglement of this ideal with the notion of responsibility, its theological development in the problem of the relation of an omnipotent God to a recalcitrant creature, have completely obscured its primal significance. 261 For the ancients, the free person and the "wise person" were identical, and the wise person was one who all in all had so mastered the secrets of the universe that there was no desire of own self that was not actually realised, no wish the satisfaction of which was obstructed. 262 Your way in the world was a way without let or hindrance. Now freedom and wisdom in this sense is never a fact and ever a value. 263 Its attainment ensues upon created distinctions between appearance and reality, upon the postulation of the metaphysical existence of the value-forms of the unity, spirituality, and the eternity of the world, 264 in the realisation of which the wise person founded own wisdom and gained own freedom. 265 Freedom, then, is an

ideal that could have arisen only in the face of 'obstruction to action directed toward the fulfilling and satisfying of interests'. 266 It is the assurance of the smooth and uninterrupted flow of behaviour; the flow of desire into fulfillment, of thought into deed, of act into fact. 267 It is perhaps the most pervasive and fundamental of all desiderates, and in a definite way the others may be said to derive from it and to realise it. 268 For the soul's immortality, the world's unity and spirituality and eternity, are but conditions which facilitate and assure the flow of life without obstruction. 269 They define a world in which danger, evil, and frustration are non-existent; they so reconstitute our actual environment that the obstructions it offers to the course of life are abolished. 270 They make the world "rational," and in the great philosophic tradition the freedom of human is held to be a function of the rationality of the world. 271 Thus, even deterministic solutions of the "problem of freedom" are at bottom no more than the rationalisation of natural existence by the dialectical removal of obstructions to human existence. 272 Once more, Spinoza's solution is typical, and its form is that of all idealisms as well. It ensues by way of identification of the obstruction's interest with those of the obstructee: 273 the world becomes ego or the ego the world, with nothing outside to hinder or to interfere. 274 In the absolute, existence is declared to be value 'de facto'; in fact, 'de jure'. And by virtue of this compensating reciprocity the course of life runs free.

275 Is any proof necessary that these value-forms are not the contents of the daily life? 276 If there be, why this unvarying succession of attempts to 'prove' that they are the contents of daily life that goes by the name of history of philosophy? 277 In fact, experience as it comes from moment to moment is not one, harmonious and orderly, but multi-fold, discordant, and chaotic. 278 Its stuff is not spirit, but stones and railway wrecks and volcanoes and Mexico and submarines, and trenches, and frightfulness, and Germany, and disease, and waters, and trees, and stars, and mud.

279 It is not eternal, but changes from instant to instant and from season to season. 280 Actually, humans do not live forever; death is a fact, 281 and immortality is literally as well as in philosophic discourse not so much an aspiration for the continuity of life as an aspiration for the elimination of death, purely 'im'mortality. 282 Actually the will is not free, each interest encounters obstruction, no interest is completely satisfied, all are ultimately cut off by death.

283 Such are the general features of all human experience, by age unwithered, and with infinite variety forever unstaled. 284 The traditional philosophic treatment of them is to deny their reality, and to call them appearance, 285 and to satisfy the generic human interest which they oppose and repress by means of the historical reconstruction in imaginative dialectic of a world constituted by these most generalised value-forms and then to eulogise the reconstruction with the epithet "reality." 286 When, in the course of human events, such reconstruction becomes limited to the biography of particular individuals, is an expression of their concrete and unique interest, is lived and acted on, it is called paranoia. 287 The difference is not one of kind, but of concreteness, application, and individuality. Such a philosophy applied universally in the daily life is a madness, like Christian Science: 288 kept in its proper sphere, it is a fine art, the finest and most human of the arts, a reconstruction in discourse of the whole universe, in the image of the free human spirit. 289 Philosophy has been reasonable because it is so unpersonal, abstract, and general, like music; 290 because, in spite of its labels, its reconstructions remain pure desiderates and value-forms, never to be confused with and substituted for existence. 291 But philosophers even to this day often have the delusion that the substitutions are actually made.

IV

292 It is the purity of the value-forms imagined in philosophy that makes philosophy "normative." 293 The arts, which it judges, have an identical origin and an indistinguishable intent, but they

are properly its subordinates because they have not its purity. 294 They, too, aim at remodeling discordant Nature into harmony with human nature. 295 They, too, are dominated by value-forms which shall satisfy as nearly as possible all interests, shall liberate and fulfill all repressions, 296 and shall supply to our lives that unity, eternity, spirituality, and freedom which are the exfoliations of our central desire-- the desire to live.

297 But where philosophy has merely negated the concrete stuff of experience and defined its reality in terms of desire alone, the arts acknowledge the reality of immediate experience, 298 accept it as it comes, eliminating, adding, molding, until the values desiderated become existent in the concrete immediacies of experience as such. 299 Art does not substitute values for existence by changing their rôles and calling one appearance and the other reality: 300 art converts values into existences, it realises values, injecting them into Nature as far as may be. 301 It creates truth and beauty and goodness. But it does not claim for its results greater reality than Nature's. 302 It claims for its results greater immediate harmony with human interests than Nature. 303 The propitious reality of the philosopher is the unseen: the harmonious reality of the artist must be sensible. 304 Philosophy says that apparent actual evil is merely apparent: art compels potential apparent good actually to appear. 305 Philosophy realises fundamental values transcendentally beyond experience: art realises them within experience. 306 Thus, humans cherish no illusions concerning the contents of a novel, a picture, a play, a musical composition. They are taken for what they are, and are enjoyed for what they are. 307 The shopgirl, organising her life on the basis of eight dollars a week, wears flimsy for broadcloth and the tail feather of a rooster for an ostrich plume. 308 She is as capable of wearing and enjoying broadcloth and ostrich plume as My Lady, whose income is eight dollars a minute. But she has not them, and in all likelihood, without a social revolution she never will have them. 309 In the novels of Mr.

Robert Chambers, however, or of Miss Jean Libbey, which she religiously reads in the street-car on her way to the shop; 310 in the motion picture theater which she visits for ten cents after her supper of corned beef, cabbage, and cream puffs, she comes into possession of them forthwith, vicariously, 311 and of all My Lady's proper perquisites-- the Prince Charming, the motor-car, the Chinese pug, the flowers, and the costly bonbons. 312 For the time being her life is liberated, new avenues of experience are actually opened to her, all sorts of unsatisfied desires are satisfied, all sorts of potentialities realised. 313 All that she might have been and is not, she becomes through art, here and now, and 'continuously with' the drab workaday life which is her lot, 314 and she becomes this without any compensatory derealisation of that life, without any transcendentalism, without any loss of grip on the necessities of her experience: strengthened, on the contrary, and emboldened, to meet them as they are.

315 I might multiply examples: for every object of fine art has the same intention, and if adequate, accomplishes the same end-- from the sculptures of Phidias and the dramas of Euripides, to the sky-scrapers of Sullivan and the dances of Pavlowa. 316 But there is need only to consider the multitude of abstract descriptions of the æsthetic encounter. The artist's business is to create the other object in the encounter, 317 and this object, in Miss Puffer's words, which are completely representative and typical, is such that "the organism is in a condition of repose and of the highest possible tone, functional efficiency, enhanced life. The personality is brought into a state of unity and self-completeness." 318 The object, when apprehended, awakens the active functioning of the whole organism directly and harmoniously with itself, 319 cuts it off from the surrounding world, shuts that world out for the time being, and forms a complete, harmonious, and self-sufficient system, 320 peculiar and unique in the fact that there is no passing from this deed into further adaptation with the object. 321 Struggle and aliency are at end,

and whatever activity now goes on feels self-conserving, spontaneous, free. 322 The need of readjustment has disappeared, and with it the feeling of strain, obstruction, and resistance, which is its sign.

323 There is nothing but the object, and that is possessed completely, satisfying, and as if forever. 324 Art, in a word, supplies an environment from which strife, foreignness, obstruction, and death are eliminated. 325 It actualises unity, spirituality, and eternity in the environment; it frees and enhances the life of the self. 326 To the environment which art successfully creates, the mind finds itself completely and harmoniously adapted by the initial act of perception.

327 In the world of art, value and existence are one.

V

328 If art may be said to create values, religion has been said to conserve them. 329 But the values conserved are not those created: they are the values postulated by philosophy as metaphysical reality. 330 Whereas, however, philosophy substitutes these values for the world of experience, religion makes them continuous with the world of experience. 331 For religion value and existence are on the same level, but value is more potent and environs existence, directing it for its own ends. 332 The unique content of religion, hence, is a specific imaginative extension of the environment with value-forms: 333 the visible world is extended at either end by heaven and hell; the world of minds, by God, Satan, angels, demons, saints, and so on. 334 But where philosophy imaginatively abolishes existence in behalf of value, where art realises value in existence, religion tends to control and to escape the environment which exists by means of the environment which is postulated. 335 The aim of religion is salvation from sin. Salvation is the escape from experience to heaven and the bosom of God; 336 while hell is the compensatory readjustment of inner quality to outer condition for the alien and the enemy, without the knowledge of whose existence life in heaven could not be complete.

337 In religion, hence, the conversion of the repressed array of interests into ideal value-forms is less radical and abstract than in philosophy, and less checked by fusion with existence than in art. 338 Religion is, therefore, at one and the same time more carnal and less reasonable than philosophy and art. Its history and protagonists exhibit a closer kinship to what is called insanity-- 339 that being, in essence, the substitution in actual life of the creatures of the imagination which satisfy repressed needs for those of reality which repress them. 340 It is a somnambulism which intensifies rather than abolishes the contrast between what is desired and what must be accepted. 341 It offers itself ultimately rather as a refuge from reality than a control of it, and its development as an institution has turned on the creation and use of devices to make this escape feasible. 342 For religion, therefore, the perception that the actual world, whatever its history, is now 'not' adapted to human nature, is the true point of departure. 343 Thus religion takes more account of experience than compensatory philosophy; it does not de-realise existent evil. 344 The outer conflict between human nature and Nature, primitively articulated in consciousness and conduct by the distress engendered 345 through the fact that the food supply depends upon the march of the seasons, becomes later assimilated to the inner conflict between opposing interests, wishes, and desires. 346 Finally, the whole so constituted gets expressed in the idea of sin. That idea makes outward prosperity dependent upon inward purity, although it often transfers the locus of the prosperity to another world. 347 Through its operation fortune becomes a function of conscience and the one desire of religious thinking and religious practice becomes to bring the two to a happy outcome, to abolish the conflicts. 348 This desiderated abolition is salvation. It is expressed in the ideas of a fall, or a separation from heaven and reunion therewith. 349 The machinery of this reunion of the divided, the reconversion of the differentiated into the same,

consists of the furniture of religious symbols and ceremonials-- 350 myths, baptisms, sacraments, prayers, and sacrifices: and all these are at the same time instruments and expressions of desires. 351 God is literally "the conservation of values." "God's life in eternity," 352 writes Aristotle, who here dominates the earlier tradition, "is that which we enjoy in our best moments, but are unable to possess permanently: its very being is delight. 353 And as actual being is delight, so the various functions of waking, perceiving, thinking, are to us the pleasantest parts of our life. 354 Perfect and absolute thought is just this absolute vision of perfection."

355 Even the least somnambulistic of the transcendental philosophies has repeated, not improved upon Aristotle. 356 "The highest conceptions that I get from experience of what goodness and beauty are," Royce declares, "the noblest life that I can imagine, the completest blessedness that I can think, 357 all these are but faint suggestions of a truth that is infinitely realised in the Divine, that knows all truth. 358 Whatever perfection there is suggested in these things, that you must fully know and experience."

359 But this æsthetic excellence, this maximum of ideality is in and by itself inadequate. 360 God, to be God, must 'work'. He is first of all the invisible socius, the ever-living witness, in whose eyes the disharmonies and injustices of this life are enregistered, and who in the life everlasting redresses the balances and adjusts the account.

361 Even His grace is not unconditional; it requires a return, in deed or faith; a payment by which the fact of your salvation is made visible. 362 But this payment is made identical by the great religions of disillusion with nothing other than the concrete condition from which the faithful are to be saved. 363 If the self is not impoverished, unkempt, and hungry, in fact, it is made so. Cleanliness may be next to godliness, but self-defilement is godliness; 364 sainthood, if we are to trust the lives of saints, whether in Asia or in Europe, is coincident with insanitation; 365 saintly virtues are depressed virtues,--

humility, hope, meekness, pity; and such conditions of life which define the holy ones are unwholesome-- poverty, asceticism, squalor, filth. 366 Hence, by an ironic inversion, religions of disillusion, being other-worldly, identify escape from an actual unpropitious environment with submergence in it; 367 that being the visible and indispensable sign of an operative grace. So the beatitudes: the blessed are the poor, the mourners, the meek. 368 Beginning as a correction of the evils of existence, religion ends by offering an infallible avenue of escape from them through postulating a desiderated type of existence which operates to gather the spirit to itself. 369 For this reason the value-forms of the spirituality or spiritual control of the universe and of the immortality of the soul have been very largely the practical concern of religion alone, 370 since these are the instruments indispensable to the attainment of salvation. 371 In so far forth religion has been an art and its institutional association with the arts has been made one of its conspicuous justifications. 372 So far, however, as it has declared values to be operative without making them actually existent it has been only a black art, a magic. 373 It has ignored the actual causes in the nature and history of things, and has substituted for them non-existent desirable causes, ultimately reducible to a single, eternal, beneficent spirit, omnipotent and free. 374 To convert these into existence, an operation which is the obvious intent of much contemporary thinking in religion, it must, however, give up the assumption that they already exist 'qua' spirit. 375 But when religion gives up this assumption, religion gives up the ghost.

376 What it demands of the ghost, and of all hypostatised or anthropomorphised ultimate value-forms, is that they shall work, and its life as an institution depends upon making them work. 377 Christian Science becomes a refuge from the failure of science, magic from mechanism, and by means of them and their kind, blissful immortality, complete self-fulfillment is to be attained--

after death. 378 There is a "beautiful land of somewhere," a happy life beyond, but it is beyond life. 379 In fact, although religion confuses value and existence, it localises the great value-forms outside of existence. 380 Its history has been an epic of the retreat and decimation of the gods from the world, a movement from animism and pluralism to transcendentalism and monism; 381 and concomitantly, of an elabouration and extension of institutional devices by which the saving value-forms are to be made and kept operative in the world.

VI

382 Let us consider this history a little. Consciousness of feeling, psychologists are agreed, is prior to consciousness of the objects of feeling. 383 The will's inward strain, intense throbs of sensation, pangs and pulses of pleasure and pain make up the bulk of the undifferentiated primal sum of sentience. 384 The soul is aware of herself before she is aware of her world. 385 A childish or primeval mind, face to face with an environment actual, dreamt, or remembered, does not distinguish from its privacy the objective or the common. 386 All is shot through with the pathos and triumph which come unaccountably as desired good or evaded evil; all has the same tensions and effects ends in the same manner as the labouring, straining, volitional life within. 387 These feelings, residuary qualities, the last floating, unattached sediment of a world organised by association and classified by activity, 388 these subtlest of all its beings, finally termed mind and self, at first suffuse and dominate the whole. 389 Even when objects are distinguished and their places determined these are not absent; and the so-called pre-animistic faiths are not the less suffused with spirit because the spiritual has not yet received a local habitation and name. 390 They differ from animism in this only, not in that their objects are characterised by lack of animation and vital tonality. And this is necessary. 391 For religion must be anthropopathic before it becomes anthropomorphic; since feeling, eloquent of good and evil, is the

first and deepest essence of consciousness, 392 and only by its wandering from home are forms distinguished and human's nature separated from that of things and beasts.

393 When practice has coördinated activity, and reflection distinguished places, animism proper arises. 394 First the environment is felt as the soul's kindred; then its operations are fancied in terms dramatic and personal. 395 The world becomes almost instinctively defined as a hegemony of spirits similar to human, with powers and passions like yours, and directed for your destruction or conservation, but chiefly for their own glory and self-maintenance. 396 The vast "pathetic fallacy" makes religion of the whole of life. It is at this point indistinguishable from science or ethics. 397 It is, in fact, the pregnant matrix of all subsequent discourse about the universe. 398 Its character is such that it becomes the determinating factor of human adaptations to the conditions imposed by the environment, by envisaging the enduring and efficacious elements among these conditions as persons. 399 The satisfaction of felt needs is rendered thereby inevitably social; and in a like manner fear of their frustration cannot be unsocial. 400 Life is conceived and acted out as a miraculous traffic with the universe; 401 and the universe as a band of spirits who monopolise the good and make free gifts of evil, who can be feared, threatened, worshiped, scolded, wheedled, coaxed, bribed, deceived, enslaved, held in awe, 402 and above all, used for the prosecution of desiderated ends and the fulfillment of instinctive desires. 403 The first recorded cognised order is a moral order in which fragmentary feelings, instinctive impulsions, and spontaneous imaginings are hyostatised, 404 ideas are identified with their causes, all the contents of the immature, sudden, primitive, blundering consciousness receive a vital figure and a proper name. 405 So human makes own self more at home in the world without,-- that world which enslaves the spirit so fearfully and with such strangeness, 406 and which just as

miraculously yields such ecstasy, such power, such unaccountable good! 407 In this immediate sense the soul controls the world by becoming symbolic of it; it is the world's first language. 408 It is, however, an inarticulate, blundering, incoherent thing and the cues which it furnishes to the nature of the environment are as often as not dangerous and misleading. 409 When bows and arrows, crystals and caves, clouds and waters, dung and dew, mountains and trees, beasts and visions, are treated as chiefs and humans must be treated, 410 then the moral regimen initiated, taking little account of the barest real qualities manifested by these things, and attributing the maximum importance to the characters postulated and foreign, 411 is successful neither in allaying evil nor in extending good. Its benefits are adventitious and its malfeasance constant. 412 Food buried with the dead was food lost; blood smeared upon the bow to make it shoot better served only to make the hands unskillful by impeding their activity. 413 Initiation, ceremony, sacrificial ritual, fasting, and isolation involved privations for which no adequate return was recovered, 414 even by the medicine-human whose absolute and ephemeral power needed only the betrayal of circumstances for its own destruction, taking one along with it, oftener than not, to disgrace or death.

415 As the cumulus of experience on experience grew greater, chance violations of tradition, or custom, or ritual, or formula achieving for the violator a mastery or stability which performance and obedience failed to achieve, 416 the new heresy became the later orthodoxy, for in religion, as in all other matters human, nothing succeeds like success. 417 An impotent god has no divinity; a disused potency means a dying life among the immortals as on the earth. 418 And as the gods themselves seemed often to give their worshipers the lie, the futility of the personal and dramatic definitions of the immediate environment became slowly recognised, the recognition varying in extent, and clearer in practice than in discourse.

419 Accordingly the most primitive of the animisms underwent a necessary modification. 420 The plasticity of objects under destructive treatment, the impotence of 'taboo' before elementary needs, the adequate satisfactions which violations of the divine law brought,-- these killed many gods and drove others from their homes in the hearts of things. 421 The objects so purged became matters of accurate knowledge. 422 Where animation is denied the 'whole' environment, wisdom begins to distinguish between spirit-haunted matter and the purely material; 423 knowledge of person and knowledge of things differentiate, and science, the impersonal and more potent knowledge of the environment, properly begins. 424 Familiarity leads to control, control to contempt, and for the unreflective mind, personality is not, as for the sophisticated, an attribute of the contemptible. 425 The incalculable appearance of thunder, the magic greed of fire, the malice, the spontaneity, the thresh and pulse as of life which seems to characterise whatever is capricious or impenetrable or uncontrollable are too much like the felt throbs of consciousness to become dehumanised. 426 To the variable alone, therefore, is transcendent animation attributed. Not the seasonal variation of the sun's heat, but the joy and the sorrow of which its heat is the occasion made it divine. 427 When the gods appear, to take the place of the immanent spirits immediately present in things, they appear, therefore, as already transcendent, 428 with habitations just beyond the well-known: on high mountains, in the skies, in dark forests, in caves, in all regions feared or unexplored. 429 But chiefly the gods inhabit those spaces whence issue the power of darkness and destruction, particularly the heaven, a word whose meaning is now, as it was primitively, identical with divinity. 430 The savage becomes a pagan by giving concrete personality to the dreadful unknown. Thence it is that the ancient poet assigns the gods a lineage of fear; 431 and fear may truly be said to have made the gods, in so far as the gods

personify the fear which made them.

432 The moral level of these figments alters with the level of their habitation; their power varies with their remoteness; 433 Zeus lives in the highest heaven and is arbiter of the destiny of both gods and human. To him and to his like there cannot be the relation of equality which is sustained between humans and spirits of the lower order. 434 His very love is blasting; interchange of commodities, good for good and evil for evil is not possible where he is concerned. 435 Gods of the higher order he exemplifies, even all the gods of Olympus, of the Himalayas, of Valhalla, are literally beings invoked and implored, as well as dwellers in heaven. 436 To them human pays a toll on all excellence you gains or finds; libations and burnt-offerings, the fat and the first fruits: he exists by their sufferance and serves their caprice. 437 He is their toy, born for their pleasure, and living by their need.

438 But just because humans conceive themselves to be play-things of the gods, they define in the gods the ideals of humankind. 439 For the divine power is power to live forever, and the sum of human desire is just the desire to maintain its humanity in freedom and happiness endlessly. 440 And exactly those capacities and instruments of self-maintenance,-- all that is beauty, or truth, or goodness, the very essence of value in any of its forms,-- 441 the gods are conceived to possess and to control: these they may grant, withhold, destroy. 442 They are as eternal as their habitations, the mountains; as ruthless as their element, the sea; as omnipresent as the heavens, their home. 443 To become like the gods, therefore, the masters and fathers of humans, is to remain eternally and absolutely human: so that who is most like them on earth takes own place beside them in heaven. 444 Hercules and Elias and Krishna, Çaka-Muni and Ishvara, Jesus and Baha Ullah. Nay, they are the very gods themselves, manifest as humans! 445 The history of the gods thus presents a double aspect: it is first a characterisation of the important objects and processes of Nature and their survival-values,--

446 the sun, thunder, rain, and earthquakes; dissolution, rebirth, and love; and again it is the narration of activities native and delightful to humankind. 447 Zeus is a promiscuous lover as well as a wielder of thunderbolts; Apollo not only drives the chariot of the sun; he plays and dances, discourses melody and herds sheep.

448 But while the portrait of the heart's desire in fictitious adventures of divinity endears the gods to the spirit, 449 the exploration of the elements in the environment whose natures they dramatically express, destroys their force, reduces their number, and drives them still further into the unknown. 450 Olympus is surrendered for the planets and the fixed stars. With remoteness of location comes transmutation of character. 451 The forces of the environment which were the divinity are now conceived as instrumental to its uses. Its power is more subtly described; its nature becomes a more purely ideal expression of human aspiration. 452 Physical remoteness and metaphysical ultimacy are akin. God among the stars is better than God on Olympus. 453 If, as with the Parsees, the unfavourable character of the environment is expressed in another and equal being,-- the devil, then the god of good must, in the symbolic struggle, become the ultimate victor and remain the more potent director of human's destiny. 454 In religion, therefore, when the mind grows at all by experience, monism develops spontaneously. 455 For the character of the god becomes increasingly more relevant to hope than to the conditions of hope's satisfaction. 456 And what human first of all and beyond all aspires to, is that single, undivided good,-- the free flow of your unitary life, stable, complete, eternal. 457 There is hence always to be found a chief and father among the gods who, as humankind gain in wisdom and in material power, consumes own mates and own children like Kronos or Jahweh, inherits their attributes and performs their functions. 458 The chief divinity becomes the only divinity; a god becomes God. But divinity, in becoming one and unique,

becomes also transcendent. 459 Monotheism pushes God altogether beyond the sensible environment. Personality, instead of being the nature of the world, has become its ground and cause, 460 and all that humankind loves is conserved, in order that human, whom God loves, may have own desire and live forever. Life is eternal and happiness necessary, beyond Nature,-- in heaven. 461 Finally, in transcendental idealism, the poles meet; what has been put eternally apart is eternally united; 462 the immaterial, impalpable, transcendent heaven is made one and continuous with the gross and unhappy natural world. 463 One 'is' the other; the other the one. God 'is' the world and transcends it; 'is' the evil and the good which conquers and consumes that evil. 464 The environment becomes thus described as a single, eternal, conscious unity, in which all the actual but transitory values of the actual but transitory life are conserved and eternalised. 465 In a description of God such as Royce's or Aristotle's the environment is the eternity of all its constituents that are dearest to human. 466 Religion, which began as a definition of the environment as it moved and controlled humankind, ends by describing it as humankind desires it to be. 467 The environment is now the aforementioned ideal socius or self which satisfies perfectly all human requirements. Pluralistic and quarrelsome animism has become monistic and harmonious spiritism. 468 Forces have turned to excellences and needs to satisfactions. 469 Necessity has been transmuted to Providence, sin has been identified with salvation, value with existence, and existence with impotence and illusion before Providence, salvation, and value.

VII

470 With this is completed the reply to the question: Why do humans contradict their own experience? 471 Experience is, as Spinoza says, passion and action, both inextricably mingled and coincident, with the good and evil of them as interwoven as they. 472 That piecemeal conquest of the evil which we call civilisation has not even the promise of finality. It is a Penelope's web, always

needing to be woven anew. 473 Now, in experience desire anticipates and outleaps action and fact rebuffs desire. 474 Desire realises itself, consequently, in ideas objectified by the power of speech into independent and autonomous subjects of discourse, 475 whereby experience is One, Eternal, a Spirit or Spiritually Controlled, wherein human has Freedom and Immortality. 476 These, the constantly desiderated traits of a perfect universe, are in fact the limits of what adequacy environmental satisfactions can attain, ideas hyostatised, normative of existence, but not constituting it. 477 With them, in philosophy and religion, the mind confronts the experiences of death and obstruction, of manifoldness, change and materiality, and denies them, as Peter denied Jesus. 478 The visible world, being not as we want it, we imagine an unseen one that satisfies our want, declaring the visible one an illusion by its side. 479 So we work a radical substitution of desiderates for actualities, of ideals for facts, of values for existences. Art alone acknowledges the actual relations between these contrasting pairs. 480 Art alone so operates as in fact to convert their oppugnance into identity. 481 Intrinsically, its whole purpose and technique consists of transmutation of values into existences, in the incarnation the realisation of values. 482 The philosophy and religion of tradition, on the contrary, consists intrinsically in the flat denial of reality, or at least, co-reality, to existence, and the transfer of that eulogium to value-forms as such. 483 Metaphysics, theology, ethics, logic, æsthetics, dialectic developments as they are of "norms" or "realities" which themselves can have no meaning without the "apparent," changing world they measure and belie, 484 assume consequently a detachment and self-sufficiency they do not actually possess. 485 Their historians have treated them as if they had no context, as if the elabouration of the ideal tendencies of the successive systems explained their origin, character, and significance. 486 But in fact they are unendowed with this pure intrinsicality, and their development is not to be

accounted for as exteriorisation of innate motive or an unfoldment of inward implications. 487 They have a context; they are crossed and interpenetrated by outer interests and extraneous considerations. 488 Their meaning, in so far as it is not merely æsthetic, is 'nil' apart from these interests and considerations of which they are sometimes expressions, sometimes reconstructions, and from which they are persistently refuges.

489 Philosophy and religion are, in a word, no less than art, social facts. They are responses to group situations without which they cannot be understood. 490 Although analysis has shown them to be rooted in certain persistent motives and conditions of human nature by whose virtue they issue in definite contours and significances, 491 they acquire individuality and specific importance only through interaction with the constantly varying social situations in which they arise, on which they operate, and by which they are in turn operated on. 492 Philosophy has perhaps suffered most of all from nescience of those and from devoting itself, 493 at a minimum, to the satisfaction of that passion for oneness, for "logical consistency" without which philosophic "systems" would never arise, nor the metaphysical distinction between "appearance" and "reality"; 494 and with which the same systems have made up a historic aggregate of strikingly repugnant and quarrelsome units. 495 It is this pursuit of consistency as against correctness which has resulted in the irrelevance of philosophy 496 that the philosopher, unconscious of own motives and roots, or naïvely identifying, through the instrumentality of an elabourate dialectic, own instinctive and responsive valuations of existence with its categoric essences, confuses with inward autonomy and the vision of the "real." 497 Consequently, the systems of tradition begin as attempts to trans-value social situations whose existence is troublesome 498 and end as utterances of which the specific bearing, save to the system of an opponent, is undiscoverable. 499 The attempt to

correct the environment in fact concludes as an abolition of it in words. The philosophic system becomes a solipsism, a pure lyric expression of the appetites of human nature.

500 For this perversity of the philosophic tradition Plato is perhaps, more than any one else, answerable. 501 He is the first explicitly to have reduplicated the world, to have set existences over against values, to have made them dependent upon values, to have assigned absolute reality to the compensatory ideals, and to have identified philosophy with preoccupation with these ideals. 502 Behind his theory of life lay far from agreeable personal experience of the attitude of political power toward philosophic ideas. Its ripening was coincident with the most distressing period of the history of his country. 503 The Peloponnesian War was the confrontation of two social systems, radically opposed in form, method, and outlook. 504 Democracy, in Athens, had become synonymous with demagoguery, corruption, inefficiency, injustice and unscrupulousness in every aspect of public affairs. 505 The government had no consistent policy and no centralised responsibility; divided counsel led to continual disaster without, and party politics rotted the strength within. 506 Beside Athens, Sparta, a communistic oligarchy, was a tower of strength and effectiveness. 507 The Spartans made mistakes; they were slow, inept, rude, and tyrannical, but they were a unit on the war, their policy was consistent, responsibilities were adequately centered, good order and loyalty designated the aims and habits of life. 508 The Republic is the response to the confrontation of Spartan and Athenian; the attempt to find an adequate solution of the great social problem this confrontation expressed. 509 The successful state becomes in it the model for the metaphysical one, and the difference between fact and ideal is amended by dialectically forcing the implications of existence in the direction of desire. 510 Neither Athens nor Sparta presented a completely satisfactory social

organisation. There must therefore exist a type of social organisation which is so satisfying. 511 It must have existed from eternity, and must be in essence identical with eternal good, identical with that oneness and spirituality, lacking which, nothing is important. 512 This archetypal social organisation whose essence is excellence, it is the congenital vocation of the philosopher to contemplate and to realise. 513 Philosophers are hence the paragons among animals, lovers of truth, haters of falsehood and of multiplicity, spectators of all time and all existence. 514 In them the power to govern should be vested. Their nature is of the same stuff as the Highest Good with which it concerns itself, 515 but being such, it appears, merely "appears" alas! irrelevant to the actual situations of the daily life. The philosopher is hence opposed and expelled by that arch-sophist, Public Opinion: 516 the person on the street, failing to understand you, dubs you prater, star-gazer, good-for-nothing. You becomes an ineffectual stranger, an outlaw, in a world in which you should be master.

517 Plato's description of the philosopher and philosophy is, it will be seen, at once an apology and a program. But it is a program which has been petrified into a compensatory ideal. 518 The confession of impotence, the abandonment of the programmatic intent is due to identification of the ideal with metaphysical fact, to the hypostasis of the ideal. 519 With Christianism, that being a philosophy operating as a religion, 520 world-weariness made the apology unnecessary and converted the hypostasis into the basis of that program of complete surrender of the attempt to master the problems of existence upon which ensued the arrest of science and civilisation for a thousand years. 521 The Greeks were not world-weary, and consequently, their joy in life and existence contributed a minimum of relevance to their other-worldly dreams. 522 Need it be reasserted that the whole Platonic system, at its richest and best in the Republic, is both an expression of and a compensation for a concrete social situation? 523 Once it was formulated it became a part of that

situation, altered it, served as another among the actual causes which determined the subsequent history of philosophy. 524 Its historic and efficacious significance is defined by that situation, but philosophers ignore the situation and accept the system as painters accept a landscape-- as the thing in itself.

525 Now, the æsthetic aspect of the philosophic system, its autonomy, and consequent irrelevancy, are undeniable. 526 Once it comes to be, its intrinsic excellence may constitute its infallible justification for existence, with no more to be said; 527 and if its defenders or proponents claimed nothing more for it than this immediate satisfactoriness, there would be no quarrel with them. 528 There is, however, present in their minds a sense of the other bearings of their systems. They claim them, in any event, to be 'true', 529 that is, to be relevant to a situation regarded as more important because more lastingly determinative of conduct, more "real" than the situation of which they are born. 530 Their systems are offered, hence, as maps of life, as guides to the everlasting. 531 That they intend to define some method for the conservation of life eternally, is clear enough from their initial motivation and formal issue: 532 all the Socratics, with their minds fixed on happiness or salvation according to the prevalence of disillusionment among them; 533 the Christian systems, still Socratic, but as resolutely other-worldly as disillusioned Buddhists; 534 the systems of Spinoza, of Kant, the whole subsequent horde of idealisms, up to the contemporary Germanoid and German idealistic soliloquies,-- 535 they all declare that the vanity and multiplicity of life as it is leads them to seek for the permanent and the meaningful, and they each find it according to the idiosyncrasies of the particular impulses and terms they start with. 536 That their Snark turns out in every case to be a Boojum is another story.

537 Yet this story is what gives philosophy, like religion, its social significance. If its roots, as its actual biography shows, did not reach deep in the soil of events, 538 if its issues had no fruitage in

events made over by its being, it would never have been so closely identified with intelligence and its systematic hypostasis would never have ensued. 539 The fact is that philosophy, like all forms of creative intelligence, is a tool before it is a perfection. Its autonomy supervenes on its efficaciousness; it does not precede its efficaciousness. 540 Humans philosophise in order to live before they live in order to philosophise. 541 Aristotle's description of the self-sufficiency of theory is possible only for a life wherein theory had already earned this self-sufficiency as practice, in a life, 542 that is, which is itself an art, organised by the application of value-forms to its existent psycho-physical processes in such a way that its existence incarnates the values it desiderates and the values perfect the existence that embodies them.

543 The biography of philosophy, hence, reveals it to have the same possibilities and the same fate that all other ideas have. 544 Today ideas are the patent of our humanity, the stuff and form of intelligence, the differentiæ between us and the beasts. 545 In so far forth, they express the surplusage of vitality over need, the creative freedom of life at play. 546 This is the thing we see in the imaginings and fantasies of childhood, whose environment is by social intent formed to favour and sustain its being. 547 The capacity for spontaneity of idea appears to decrease with maturity, and the few favoured healthy mortals with whom it remains are called people of genius. 548 William James was such a man, and there are a few still among the philosophers. 549 But in the mass and in the long run, ideas are not a primary confirmation of our humanity; in the mass and long they are warnings of menace to it, a sign of its disintegration. 550 Even so radical an intellectualist as Mr. Santayana cherishes this observation to the degree of almost suggesting it as the dogma that all ideas have their origin in inner or outer maladjustment. 551 However this may be, that the dominant philosophic ideas arise out of radical disharmonies between Nature and human nature need not be here reiterated, 552 while the

provocative character of minor maladjustments is to be inferred from the fertility of ideas in unstable minds, of whatever type, from the neurasthenic to the mad. 553 Ideas represent in these cases the limits of vital elasticity, the attempt of the organism to maintain its organic balance; it is as if a balloon, compressed on one side, bulged on the other.

554 Ideas, then, bear three types of relations to organic life, relations socially incarnated in traditional art, religion, and philosophy. 555 First of all they may be an expression of innate capacities, the very essence of the freedom of life. In certain arts, such as music, they are just this. 556 In the opposite case they may be the effect of the compression of innate capacities, an outcome of obstruction to the free low of life. 557 They are then compensatory. Where expressive ideas are confluent with existence, compensatory ideas diverge from existence; 558 they become pure value-forms whose paramount realisation is traditional philosophy. Their rise and motivation in both these forms is unconscious. They are ideas, but not yet intelligence. 559 The third instance falls between these original two. The idea is neither merely a free expression of innate capacities, nor a compensation for their obstruction or compression. 560 Arising as the effect of a disharmony, it develops as an enchannelment of organic powers directed to the conversion of the disharmony into an adjustment. 561 It does not 'use up' vital energies like the expressive idea, it is not an abortion of them, like the compensatory idea. 562 It uses them, and is aware that it uses them-- that is, it is a program of action upon the environment, of conversion of values into existences. 563 Such an idea has the differentia of intelligence. It is creative; it actually converts Nature into forms appropriate to human nature. 564 It abolishes the Other world of the compensatory tradition in philosophy by incarnating it in this world; 565 it abolishes the Other world of the religionist, rendered important by belittling the actual one, by restoring the working relationships between thoughts and things.

566 This restoration develops as reconstruction of the world in fact. It consists specifically of the art and science which compose the efficacious enterprises of history and of which the actual web of our civilisation is spun.

567 Manifest in its purity in art, it attends unconsciously both religion and philosophy, for the strands of life keep interweaving, 568 and whatever is, in our collective being, changes and is changed by whatever else may be, that is in reach. 569 The life of reason is initially unconscious because it can learn only by living to seek a reason for life. 570 Once it discovers that it can become self-maintaining alone through relevance to its ground and conditions, 571 the control which this relevance yields makes it so infectious that it tends to permeate every human institution, even religion and philosophy. 572 Philosophy, it is true, has lagged behind even religion in relevancy, but the lagging has been due not to the intention of the philosopher but to the inherent character of the task they assumed. 573 Both art and religion, we have seen, possess an immediacy and concreteness which philosophy lacks. 574 Art reconstructs correlative portions of the environment for the eye, the ear, the hopes and fears of the daily life. 575 Religion extends this reconstruction beyond the actual environment, but applies its saving technique at the critical points in the career of the group or the individual; to control the food-supply, to protect in birth, pubescence, marriage, and death. 576 All its motives are grounded in specific instincts and needs, all its reconstructions and compensations culminate with reference to these. 577 Philosophy, on the other hand, deals with the 'whole' nature of human and your 'whole' environment. It seeks primaries and ultimates. 578 Its traditional task is so to define the universe as to articulate thereby a theory of life and eternal salvation. 579 It establishes contact with reality at no individual, specific point: its reals are "real in general." It aims, in a word, to be relevant to all nature, and to express the whole soul of human. 580 The consequence is inevitable: it

forfeits relevance to everything natural; touching nothing actual, it reconstructs nothing actual. 581 Its concretest incarnation is a dialectic design woven of words. The systems of tradition, hence, are works of art, to be contemplated, enjoyed, and believed in, but not to be acted on. 582 For, since action is always concrete and specific, always determined to time, place, and occasion, we cannot in fact adapt ourselves to the aggregate infinitude of the environment, or that to ourselves. 583 Something always stands out, recalcitrant, invincible, defiant. But it is just such an adaptation that philosophy intends, 584 and the futility of the intention is evinced by the fact that the systems of tradition continue side by side with the realities they deny, 585 and live unmixed in one and the same mind, as a picture of the ocean on the wall of a dining room in an inland town. 586 Our operative relations to them tend always to be essentially æsthetic. We may and do believe in them in spite of life and experience, because belief in them, involving no action, involves no practical risk. 587 Where action is a consequence of a philosophic system, the system seems to dichotomise into art and religion. 588 It becomes particularised into a technique of living or the dogma of a sect, and so particularised it becomes radically self-conscious and an aspect of creative intelligence.

589 So particularised, it is, however, no longer philosophy, and philosophy has (I hope I may say this without professional bias) an inalienable place in the life of reason. 590 This place is rationally defined for it by the discovery of its ground and function in the making of civilisation; and by the perfection of its possibilities through the definition of its natural relationships. 591 Thus, it is, in its essential historic character at least, as fine an art as music, the most inward and human of all arts. 592 It may be, and human nature being what it is, undoubtedly will continue to be, an added item to the creations wherewith human makes own world a better place to live in, 593 precious in that it envisages and projects the excellences and perfections your

heart desires and your imagination therefore defines. 594 So taken, it is not a substitution for the world, but an addition to it, a refraction of it through the medium of human nature, 595 as a landscape painting by Whistler or Turner is not a substitution for the actual landscape, but an interpretation and imaginative perfection of it, more suitable to the eye of human. 596 A system like Bergson's is such a work, and its æsthetic adequacy, its beauty, may be measured by the acknowledgment it receives and the influence it exercises. 597 Choosing one of the items of experience as its medium, and this item the most precious in the mind's eye which the history of philosophy reveals, 598 it proceeds to fabricate a dialectical image of experience in which all the compensatory desiderates are expressed and realised. 599 It entices minds of all orders, and they are happy to dwell in it, for the nonce realising in the perception of the system the values it utters. 600 By abandoning all pretense to be true, philosophic systems of the traditional sort may attain the simple but supreme excellence of beauty, and rest content therewith.

601 The philosophic ideal, however, is traditionally not beauty but truth: the function of a philosophic system is not presentative, but 're'presentative and causal, 602 and that the systems of tradition have had and still have consequences as well as character, is obvious enough. 603 It is, however, to be noted that these consequences have issued out of the fact that the systems have been specific items of existence among other equally and even more specific items, thought by particular people, at particular times and in particular places. 604 As such they have been programs for meeting events and incarnating values; operative ideals aiming to recreate the world according to determined standards. 605 They have looked forward rather than backward, have tacitly acknowledged the reality of change, the irreducible pluralism of Nature, 606 and the genuineness of the activities, oppugnant or harmonising, between the items of the Cosmic. 607 Many they ostensibly negate. The truth, in a

word, has been experimental and prospective; the desiderates they uttered operated actually as such and not as already existing. 608 Historians of philosophy, treating it as if it had no context, have denied or ignored this rôle of philosophy in human events, but historians of the events themselves could not avoid observing and enregistering it.

609 Only within very recent years, as an effect of the concept of evolution in the field of the sciences, have philosophers as such envisaged this non-æsthetic aspect of philosophy's ground and function in the making of civilisation 610 and have made it the basis for a sober vision which may or may not have beauty, but which cannot have finality. 611 Such a vision is again nothing more than traditional philosophy become conscious of its character and limitations and shorn of its pretense. 612 It is a program to execute rather than a metaphysic to rest in. Its procedure is the procedure of all the arts and sciences. 613 It frankly acknowledges the realities of immediate experience, the turbulence and complexity of the flux, the inter-penetrative confusion of orders, the inward self-diversification of even the simplest thing, which "change" means, 614 and the continual emergence of novel entities, unforeseen and unprevisible, from the reciprocal action of the older aggregate. 615 This perceptual reality it aims to remould according to the heart's desire. 616 Accordingly it drops the pretense of envisaging the universe and devotes itself to its more modest task of applying its standards to a particular item that needs to be remade. 617 It is believed in, but no longer without risk, for, without becoming a dogma, it still subjects itself to the tests of action. 618 So it acknowledges that it must and will itself undergo constant modification through the process of action, 619 in which it uses events, in their meanings rather than in their natures, to map out the future and to make it amenable to human nature. 620 Philosophy so used is, as John Dewey somewhere says, a mode and organ of experience among many others. 621 In a world the very core

of which is change, it is directed upon that which is not yet, to previse and to form its character and to map out the way of life within it. 622 Its aim is the liberation and enlargement of human capacities, the enfranchisement of human by the actual realisation of values. 623 In its integrate character therefore, it envisages the life of reason and realises it as the art of life. 624 Where it is successful, beauty and use are confluent and identical in it. It converts sight into insight. It infuses existence with value, making them one. 625 It is the concrete incarnation of Creative Intelligence.

The Book of Divine Panagogue called

SUPERSTITION

ORIGIN AND CONSEQUENCES OF SUPERSTITION

Benedict of Spinoza

1 Humans would never be superstitious, if they could govern all their circumstances by set rules, or if they were always favoured by fortune: 2 but being frequently driven into straits where rules are useless, and being often kept fluctuating pitiably between hope and fear by the uncertainty of fortune's greedily coveted favours, 3 they are consequently, for the most part, very prone to credulity. 4 The human mind is readily swayed this way or that in times of doubt, 5 especially when hope and fear are struggling for the mastery, though usually it is boastful, over-confident, and vain. 6 This as a general fact I suppose everyone knows, though few, I believe, know their own nature; 7 no one can have lived in the world without observing that most people, when in prosperity, are so over-brimming with wisdom (however inexperienced they may be), 8 that they take every offer of advice as a personal insult, whereas in adversity they know not where to turn, but beg and pray for counsel from every passer-by. 9 No plan is then too futile, too absurd, or too fatuous for their adoption; the most frivolous causes will raise them to hope, or plunge them into despair-- 10 if anything happens during their fright which reminds them of some past good or ill, they think it portends a happy or unhappy issue, 11 and therefore (though it may have proved abortive a hundred times before) style it a lucky or unlucky omen. 12 Anything which excites their astonishment they believe to be a portent signifying the anger of the gods or of the Supreme Being, 13 and, mistaking superstition for religion, account it impious not to avert the evil with prayer and sacrifice. 14 Signs and wonders of this sort they conjure up perpetually, till one might think Nature as mad as themselves, they interpret Her so fantastically. 15 Thus it is brought prominently before us, that superstition's chief victims are those persons who

greedily covet temporal advantages; 16 they it is, who (especially when they are in danger, and cannot help themselves) are wont with Prayers and womanish tears to implore help from God: 17 upbraiding Reason as blind, because it cannot show a sure path to the shadows they pursue, and rejecting human wisdom as vain; 18 but believing the phantoms of imagination, dreams, and other childish absurdities, to be the very oracles of Heaven. 19 As though God had turned away from the wise, and written His decrees, not in the mind of human but in the entrails of beasts, or left them to be proclaimed by the inspiration and instinct of fools, mad people, and birds. 20 Such is the unreason to which terror can drive humankind 21 Superstition, then, is engendered, preserved, and fostered by fear. 22 If anyone desire an example, let you take Alexander, who only began superstitiously to seek guidance from seers, when he first learnt to fear fortune in the passes of Sysis; 23 whereas after he had conquered Darius he consulted prophets no more, till a second time frightened by reverses. 24 When the Scythians were provoking a battle, the Bactrians had deserted, and he himself was lying sick of his wounds, 25 "he once more turned to superstition, the mockery of human wisdom, and bade Aristander, to whom he confided his credulity, inquire the issue of affairs with sacrificed victims." 26 Very numerous examples of a like nature might be cited, clearly showing the fact, that only while under the dominion of fear do humans fall a prey to superstition; 27 that all the portents ever invested with the reverence of misguided religion are mere phantoms of dejected and fearful minds; 28 and lastly, that prophets have most power among the people, and are most formidable to rulers, precisely at those times when the state is in most peril. 29 I think this is sufficiently plain to all, and will therefore say no more on the subject. 30 The origin of superstition above given affords us a clear reason for the fact, that it comes to all humans naturally, 31 though some refer the rise of superstition to a dim notion of

God, universal to humankind, and also tends to show, that it is no less inconsistent and variable than other mental hallucinations and emotional impulses, 32 and further that it can only be maintained by hope, hatred, anger, and deceit; since it springs, not from reason, but solely from the more powerful phases of emotion. 33 Furthermore, we may readily understand how difficult it is, to maintain in the same course humans prone to every form of credulity. 34 For, as the mass of humankind remains always at about the same pitch of misery, it never assents long to any one remedy, but is always best pleased by a novelty which has not yet proved illusive. 35 This element of inconsistency has been the cause of many terrible wars and revolutions; 36 for, as Curtius well says: "The mob has no ruler more potent than superstition," and is easily led, on the plea of religion, 37 at one moment to adore its kings as gods, and anon to execrate and abjure them as humanity's common bane. 38 Immense pains have therefore been taken to counteract this evil by investing religion, whether true or false, with such pomp and ceremony, 39 that it may rise superior to every shock, and be always observed with studious reverence by the whole people-- a system which has been brought to great perfection by the Turks, 40 for they consider even controversy impious, and so clog humans' minds with dogmatic formulas, that they leave no room for sound reason, not even enough to doubt with. 41 But if, in despotic statecraft, the supreme and essential mystery be to hoodwink the subjects, and to mask the fear, which keeps them clown, with the specious garb of religion, 42 so that people may fight as bravely for slavery as for safety, and count it not shame but highest honour to risk their blood and their lives for the vainglory of a tyrant; 43 yet in a free state no more mischievous expedient could be planned or attempted. 44 Wholly repugnant to the general freedom are such devices as enthralling humans' minds with prejudices, forcing their judgment, or employing any of the weapons of quasi-religious sedition; 45 indeed, such seditions

only spring up, when law enters the domain of speculative thought, and opinions are put on trial and condemned on the same footing as crimes, 46 while those who defend and follow them are sacrificed, not to public safety, but to their opponents' hatred and cruelty. 47 If deeds only could be made the grounds of criminal charges, and words were always allowed to pass free, such seditions would be divested of every semblance of justification, and would be separated from mere controversies by a hard and fast line. 48 Now, seeing that we have the rare happiness of living in a republic, where everyone's judgment is free and unshackled, where each may worship God as own conscience dictates, and where freedom is esteemed before all things dear and precious, 49 I have believed that I should be undertaking no ungrateful or unprofitable task, in demonstrating that not only can such freedom be granted without prejudice to the public peace, but also, that without such freedom, piety cannot flourish nor the public peace be secure. 50 Such is the chief conclusion I seek to establish in this treatise; but, in order to reach it, I must first point out the misconceptions which, like scars of our former bondage, still disfigure our notion of religion, 51 and must expose the false views about the civil authority which many have most impudently advocated, endeavouring to turn the mind of the people, still prone to heathen superstition, away from its legitimate rulers, and so bring us again into slavery. 52 As to the order of my treatise I will speak presently, but first I will recount the causes which led me to write. 53 I have often wondered, that persons who make a boast of professing the Christian religion, namely, love, joy, peace, temperance, and charity to all people, should quarrel with such rancorous animosity, 54 and display daily towards one another such bitter hatred, that this, rather than the virtues they claim, is the readiest criterion of their faith. 55 Matters have long since come to such a pass, that one can only pronounce a person Christian, Turk, Jew, or Heathen, by own general appearance and attire, 56 by own frequenting this or that

place of worship, or employing the phraseology of a particular sect-- as for manner of life, it is in all cases the same. 57 Inquiry into the cause of this anomaly leads me unhesitatingly to ascribe it to the fact, that the ministries of the Church are regarded by the masses merely as dignities, its offices as posts of emolument-- 58 in short, popular religion may be summed up as respect for ecclesiastics. 59 The spread of this misconception inflamed every worthless fellow with an intense desire to enter holy orders, and thus the love of diffusing God's religion degenerated into sordid avarice and ambition. 60 Every church became a theatre, where orators, instead of church teachers, harangued, caring not to instruct the people, but striving to attract admiration, to bring opponents to public scorn, and to preach only novelties and paradoxes, such as would tickle the ears of their congregation. 61 This state of things necessarily stirred up an amount of controversy, envy, and hatred, which no lapse of time could appease; 62 so that we can scarcely wonder that of the old religion nothing survives but its outward forms (even these, in the mouth of the multitude, seem rather adulation than adoration of the Deity), 63 and that faith has become a mere compound of credulity and prejudices-- 64 aye, prejudices too, which degrade human from rational being to beast, which completely stifle the power of judgment between true and false, 65 which seem, in fact, carefully fostered for the purpose of extinguishing the last spark of reason! 66 Piety, great God! and religion are become a tissue of ridiculous mysteries; 67 people, who flatly despise reason, who reject and turn away from understanding as naturally corrupt, 68 these, I say, these of all humans, are thought, O lie most horrible! to possess light from on High. 69 Verily, if they had but one spark of light from on High, they would not insolently rave, but would learn to worship God more wisely, and would be as marked among their fellows for mercy as they now are for malice; 70 if they were concerned for their opponents' souls, instead of for their own reputations, they would no longer

fiercely persecute, but rather be filled with pity and compassion. 71 Furthermore, if any Divine light were in them, it would appear from their doctrine. 72 I grant that they are never tired of professing their wonder at the profound mysteries of Holy Writ; 73 still I cannot discover that they teach anything but speculations of Platonists and Aristotelians, to which (in order to save their credit for Christianity) they have made Holy Writ conform; 74 not content to rave with the Greeks themselves, they want to make the prophets rave also; showing conclusively, that never even in sleep have they caught a glimpse of Scripture's Divine nature. 75 The very vehemence of their admiration for the mysteries plainly attests, that their belief in the Bible is a formal assent rather than a living faith: 76 and the fact is made still more apparent by their laying down beforehand, as a foundation for the study and true interpretation of Scripture, the principle that it is in every passage true and divine. 77 Such a doctrine should be reached only after strict scrutiny and thorough comprehension of the Sacred Books 78 (which would teach it much better, for they stand in need no human factions), and not be set up on the threshold, as it were, of inquiry. 79 As I pondered over the facts that the light of reason is not only despised, but by many even execrated as a source of impiety, that human commentaries are accepted as divine records, and that credulity is extolled as faith; 80 as I marked the fierce controversies of philosophers raging in Church and State, the source of bitter hatred and dissension, the ready instruments of sedition and other ills innumerable, 81 I determined to examine the Bible afresh in a careful, impartial, and unfettered spirit, making no assumptions concerning it, and attributing to it no doctrines, which I do not find clearly therein set down. 82 With these precautions I constructed a method of Scriptural interpretation, and thus equipped proceeded to inquire-- what is prophecy? 83 In what sense did God reveal Himself to the prophets, and why were these particular people-- chosen by

Him? 84 Was it on account of the sublimity of their thoughts about the Deity and Nature, or was it solely on account of their piety? 85 These questions being answered, I was easily able to conclude, that the authority of the prophets has weight only in matters of morality, and that their speculative doctrines affect us little. 86 Next I inquired, why the Hebrews were called God's chosen people, and discovering that it was only because God had chosen for them a certain strip of territory, where they might live peaceably and at ease, 87 I learnt that the Law revealed by God to Moses was merely the law of the individual Hebrew state, therefore that it was binding on none but Hebrews, and not even on Hebrews after the downfall of their nation. 88 Further, in order to ascertain, whether it could be concluded from Scripture, that the human understanding is naturally corrupt, 89 I inquired whether the Universal Religion, the Divine Law revealed through the Prophets and Apostles to the whole human race, differs from that which is taught by the light of natural reason, 90 whether miracles can take place in violation of the laws of Nature, and if so, whether they imply the existence of God more surely and clearly than events, which we understand plainly and distinctly through their immediate natural causes. 91 Now, as in the whole course of my investigation I found nothing taught expressly by Scripture, which does not agree with our understanding, or which is repugnant thereto, 92 and as I saw that the prophets taught nothing, which is not very simple and easily to be grasped by all, 93 and further, that they clothed their teaching in the style, and confirmed it with the reasons, which would most deeply move the mind of the masses to devotion towards God, 94 I became thoroughly convinced, that the Bible leaves reason absolutely free, that it has nothing in common with philosophy, in fact, that Revelation and Philosophy stand on different footings. 95 In order to set this forth categorically and exhaust the whole question, I point out the way in which the Bible should be interpreted, 96 and show that all of spiritual questions

should be sought from it alone, and not from the objects of ordinary knowledge. 97 Thence I pass on to indicate the false notions, which have from the fact that the multitude-- ever prone to superstition, and caring more for the shreds of antiquity for eternal truths-- pays homage to the Books of the Bible, rather than to the Word of God. 98 I show that the Word of God has not been revealed as a certain number of books, was displayed to the prophets as a simple idea of the mind, namely, obedience to God in singleness of heart, and in the practice of justice and charity; 99 and I further point out, that this doctrine is set forth in Scripture in accordance with the opinions and understandings of those, among whom the Apostles and Prophets preached, 100 to the end that people might receive it willingly, and with their whole heart. 101 Having thus laid bare the bases of belief, I draw the conclusion that Revelation has obedience for its sole object, 102 therefore, in purpose no less than in foundation and method, stands entirely aloof from ordinary knowledge; each has its separate province, neither can be called the handmaid of the other. 103 Furthermore, as humans' habits of mind differ, so that some more readily embrace one form of faith, some another, for what moves one to pray may move another only to scoff, 104 I conclude, in accordance with what has gone before, that everyone should be free to choose for yourself the foundations of your creed, 105 and that faith should be judged only by its fruits; each would then obey God freely with own whole heart, while nothing would be publicly honoured save justice and charity. 106 Having thus drawn attention to the liberty conceded to everyone by the revealed law of God, 107 I pass on to another part of my subject, and prove that this same liberty can and should be accorded with safety to the state and the magisterial authority-- 108 in fact, that it cannot be withheld without great danger to peace and detriment to the community. 109 In order to establish my point, I start from the natural rights of the individual, which are co-extensive with own desires and power, 110 and from

the fact that no one is bound to live as another pleases, but is the guardian of your own liberty. 111 I show that these rights can only be transferred to those whom we depute to defend us, who acquire with the duties of defence the power of ordering our lives, 112 and I thence infer that rulers possess rights only limited by their power, that they are the sole guardians of justice and liberty, and that their subjects should act in all things as they dictate: 113 nevertheless, since no one can so utterly abdicate own power of self-defence as to cease to be a human, I conclude that no one can be deprived of own natural rights absolutely, 114 but that subjects, either by tacit agreement, or by social contract, retain a certain number, which cannot be taken from them without great danger to the state. 115 From these considerations I pass on to the Hebrew State, which I describe at some length, in order to trace the manner in which Religion acquired the force of law, and to touch on other noteworthy points. 116 I then prove, that the holders of sovereign power are the depositories and interpreters of religious no less than of civil ordinances, and that they alone have the right to decide what is just or unjust, pious or impious; 117 lastly, I conclude by showing, that they best retain this right and secure safety to their state by allowing every person to think what you likes, and say what you thinks. 118 Such, Philosophical Reader, are the questions I submit to your notice, counting on your approval, for the subject matter of the whole book and of the several chapters is important and profitable. 119 I would say more, but I do not want my preface to extend to a volume, especially as I know that its leading propositions are to Philosophers but common places. 120 To the rest of humankind I care not to commend my treatise, for I cannot expect that it contains anything to please them: 121 I know how deeply rooted are the prejudices embraced under the name of religion; I am aware that in the mind of the masses superstition is no less deeply rooted than fear; 122 I recognise that their constancy is mere obstinacy, and that they are

led to praise or blame by impulse rather than reason. 123 Therefore the multitude, and those of like passions with the multitude, I ask not to read my book; nay, I would rather that they should utterly neglect it, than that they should misinterpret it after their wont. 124 They would gain no good themselves, and might prove a stumbling-block to others, whose philosophy is hampered by the belief that Reason is a mere handmaid to Theology, and whom I seek in this work especially to benefit. 125 But as there will be many who have neither the leisure, nor, perhaps, the inclination to read through all I have written, I feel bound here, as at the end of my treatise, to declare that I have written nothing, which I do not most willingly submit to the examination and judgment of my country's rulers, 126 and that I am ready to retract anything, which they shall decide to be repugnant to the laws or prejudicial to the public good. 127 I know that I am a human and, as a human, liable to error, 128 but against error I have taken scrupulous care, and striven to keep in entire accordance with the laws of my country, with loyalty, and with morality.

The Book of Divine Panagogue called

THE STATE

OF THE FOUNDATIONS OF A STATE; OF THE NATURAL AND CIVIL RIGHTS OF INDIVIDUALS; AND OF THE RIGHTS OF THE SOVEREIGN POWER

Benedict of Spinoza

1 Hitherto our care has been to separate philosophy from theology, and to show the freedom of thought which such separation insures to both. 2 It is now time to determine the limits to which such freedom of thought and discussion may extend itself in the ideal State. 3 For the due consideration of this question we must examine the foundations of a State, first turning our attention to the natural rights of individuals, and afterwards to religion and the State as a whole.

4 By the right and ordinance of Nature, I merely mean those natural laws wherewith we conceive every individual to be conditioned by Nature, so as to live and act in a given way. 5 For instance, fishes are naturally conditioned for swimming, and the greater for devouring the less; therefore fishes enjoy the water, and the greater devour the less by sovereign natural right. 6 For it is certain that Nature, taken in the abstract, has sovereign right to do anything She can; in other words, Her right is co-extensive with Her power. 7 The power of Nature is the power of God, which has sovereign right over all things; 8 and, inasmuch as the power of Nature is simply the aggregate of the powers of all Her individual components, it follows that every individual has sovereign right to do all that you can; 9 in other words, the rights of an individual extend to the utmost limits of your power as it has been conditioned. 10 Now it is the sovereign law and right of Nature that each individual should endeavour to preserve yourself as it is, without regard to anything but yourself; 11 therefore this sovereign law and right belongs to every individual, namely, to exist and act according to its natural conditions. 12 We do not here acknowledge any difference between humankind and other individual natural entities, nor between people endowed with reason and those to whom reason is unknown; nor between fools, mad people, and sane people. 13 Whatsoever an individual does by the laws of your nature you have a sovereign right to do, inasmuch as you acts as it was conditioned by Nature, and cannot act otherwise. 14 Wherefore among humans, so long as they are considered as living under the sway of Nature, you who does not yet know reason, or who has not yet acquired the habit of virtue, acts

solely according to the laws of your desire with as sovereign a right as you who orders your life entirely by the laws of reason.
15 That is, as the wise person has sovereign right to do all that reason dictates, or to live according to the laws of reason, so also the ignorant and foolish person has sovereign right to do all that desire dictates, or to live according to the laws of desire. 16 This is identical with the teaching of Paul, who acknowledges that previous to the law-- that is, so long as humans are considered of as living under the sway of Nature, there is no sin.
17 The natural right of the individual human is thus determined, not by sound reason, but by desire and power. All are not naturally conditioned so as to act according to the laws and rules of reason; 18 nay, on the contrary, all humans are born ignorant, and before they can learn the right way of life and acquire the habit of virtue, the greater part of their life, even if they have been well brought up, has passed away. 19 Nevertheless, you are in the meanwhile bound to live and preserve yourselves as far as you can by the unaided impulses of desire. 20 Nature has given you no other guide, and has denied you the present power of living according to sound reason; 21 so that you are no more bound to live by the dictates of an enlightened mind, than a cat is bound to live by the laws of the nature of a lion.
22 Whatsoever, therefore, an individual (considered as under the sway of Nature) thinks useful for yourself, whether led by sound reason or impelled by the passions, 23 that you have a sovereign right to seek and to take for yourself as you best can, whether by force, cunning, entreaty, or any other means; 24 consequently you may regard as an enemy anyone who hinders the accomplishment of your purpose.
25 It follows from what we have said that the right and ordinance of Nature, under which all humans are born, and under which they mostly live, only prohibits such things as no one desires, and no one can attain: 26 Nature does not forbid strife, nor hatred, nor anger, nor deceit, nor, indeed, any of the means suggested by desire.
27 This we need not wonder at, for Nature is not bounded by the laws of human reason, which aims only at human's true benefit and preservation; 28 Her limits are infinitely wider, and have reference to the eternal order of Nature, wherein human is but a speck; 29 it is by the necessity of this alone that all individuals are conditioned for living and acting in a particular way. 30 If anything, therefore, in Nature seems to us ridiculous, absurd, or evil, it is because we only know in part, and are almost entirely ignorant of the

order and interdependence of Nature as a whole, 31 and also because we want everything to be arranged according to the dictates of our human reason; 32 in reality that which reason considers evil, is not evil in respect to the order and laws-of-Nature as a whole, but only in respect to the laws of our reason.

33 Nevertheless, no one can doubt that it is much better for us to live according to the laws and assured dictates of reason, for, as we said, they have humans' true good for their object. 34 Moreover, everyone wishes to live as far as possible securely beyond the reach of fear, and this would be quite impossible so long as everyone did everything one liked, and reason's claim was lowered to a par with those of hatred and anger; 35 there is no one who is not ill at ease in the midst of enmity, hatred, anger, and deceit, and who does not seek to avoid them as much as you can. 36 When we reflect that people without mutual help, or the aid of reason, must needs live most miserably, as we clearly proved in the Book of LAW, chapter-2, 37 we shall plainly see that humans must necessarily come to an agreement to live together as securely and well as possible if they are to enjoy as a whole the rights which naturally belong to them as individuals, 38 and their life should be no more conditioned by the force and desire of individuals, but by the power and will of the whole body. 39 This end they will be unable to attain if desire be their only guide (for by the laws of desire each human is drawn in a different direction); 40 they must, therefore, most firmly decree and establish that they will be guided in everything by reason (which nobody will dare openly to repudiate lest you should be taken for a mad-person), 41 and will restrain any desire which is injurious to a person's fellows, that they will do to all as they would be done by, and that they will defend their neighbour's rights as their own.

42 How such a compact as this should be entered into, how ratified and established, we will now inquire.

43 Now it is a universal law of human nature that no one ever neglects anything which you judges to be good, except with the hope of gaining a greater good, or from the fear of a greater evil; 44 nor does anyone endure an evil except for the sake of avoiding a greater evil, or gaining a greater good. 45 That is, everyone will, of two goods, choose that which one thinks the greatest; and, of two evils, that which one thinks the least. 46 I say advisedly that which you thinks the greatest or the least, for it does not necessarily follow that you judges right. 47 This law is so deeply implanted in the human mind that it ought to be

counted among eternal truths and axioms.
48 As a necessary consequence of the principle just enunciated, no one can honestly promise to forego the right which you have over all things, 49 and in general no one will abide by own promises, unless under the fear of a greater evil, or the hope of a greater good. 50 An example will make the matter clearer. Suppose that a robber forces me to promise that I will give him my goods at his will and pleasure. 51 It is plain (inasmuch as my natural right is, as I have shown, co-extensive with my power) that if I can free myself from this robber by stratagem, by assenting to his demands, I have the natural right to do so, and to pretend to accept his conditions. 52 Or again, suppose I have genuinely promised someone that for the space of twenty days I will not taste food or any nourishment; and suppose I afterwards find that was foolish, and cannot be kept without very great injury to myself; 53 as I am bound by natural law and right to choose the least of two evils, I have complete right to break my compact, and act as if my promise had never been uttered. 54 I say that I should have perfect natural right to do so, whether I was actuated by true and evident reason, or whether I was actuated by mere opinion in thinking I had promised rashly; 55 whether my reasons were true or false, I should be in fear of a greater evil, which, by the ordinance of Nature, I should strive to avoid by every means in my power.
56 We may, therefore, conclude that a compact is only made valid by its utility, without which it becomes null and void. 57 It is, therefore, foolish to ask a person to keep own faith with us for ever, unless we also endeavour that the violation of the compact we enter into shall involve for the violator more harm than good. 58 This consideration should have very great weight in forming a State. 59 However, if all humans could be easily led by reason alone, and could recognise what is best and most useful for a State, there would be no one who would not forswear deceit, 60 for everyone would keep most religiously to their compact in their desire for the chief good, namely, the shield and buckler of the commonwealth. 61 However, it is far from being the case that all humans can always be easily led by reason alone; everyone is drawn away by own pleasure, 62 while avarice, ambition, envy, hatred, and the like so engross the mind that, reason has no place therein. 63 Hence, though humans make promises with all the appearances of good faith, and agree that they will keep to their engagement, no one can absolutely rely on another human's promise unless there is

something behind it. 64 Everyone has by nature a right to act deceitfully, and to break own compacts, unless you be restrained by the hope of some greater good, or the fear of some greater evil.

65 However, as we have shown that the natural right of the individual is only limited by your own power, 66 it is clear that by transferring, either willingly or under compulsion, this power into the hands of another, you in so doing necessarily cedes also a part of your right; 67 and further, that the Sovereign right over all people belongs to you who has sovereign power, wherewith you can compel people by force, or restrain them by threats of the universally feared punishment of death; 68 such sovereign right you will retain only so long as you can maintain your power of enforcing your will; otherwise you will totter on your throne, and no one who is stronger than you will be bound unwillingly to obey you.

69 In this manner a society can be formed without any violation of natural right, and the covenant can always be strictly kept-- 70 that is, if each individual hands over the whole of your power to the body politic, the latter will then possess sovereign natural right over all things; 71 that is, it will have sole and unquestioned dominion, and everyone will be bound to obey, under pain of the severest punishment. 72 A body politic of this kind is called a Democracy, which may be defined as a society which wields all its power as a whole. 73 The sovereign power is not restrained by any laws, but everyone is bound to obey it in all things; 74 such is the State of things implied when people either tacitly or expressly handed over to it all their power of self-defence, or in other words, all their right. 75 For if they had wished to retain any right for themselves, they ought to have taken precautions for its defence and preservation; 76 as they have not done so, and indeed could not have done so without dividing and consequently ruining the State, they placed themselves absolutely at the mercy of the sovereign power; 77 and, therefore, having acted (as we have shown) as reason and necessity demanded, they are obliged to fulfil the commands of the sovereign power, 78 however absurd these may be, else they will be public enemies, and will act against reason, which urges the preservation of the State as a primary duty. 79 For reason bids us choose the least of two evils.

80 Furthermore, this danger of submitting absolutely to the dominion and will of another, is one which may be incurred with a light heart: 81 for we have shown that sovereigns only possess this right of imposing their will, so long as they have the full power to enforce it: 82 if such power be lost

their right to command is lost also, or lapses to those who have assumed it and can keep it. 83 Thus it is very rare for sovereigns to impose thoroughly irrational commands, for they are bound to consult their own interests, 84 and retain their power by consulting the public good and acting according to the dictates of reason, as Seneca says, "violenta imperia nemo continuit diu." 85 No one can long retain a tyrant's sway.

86 In a democracy, irrational commands are still less to be feared: for it is almost impossible that the majority of a people, especially if it be a large one, should agree in an irrational design: 87 and, moreover, the basis and aim of a democracy is to avoid the desires as irrational, and to bring people as far as possible under the control of reason, so that they may live in peace and harmony: if this basis be removed the whole fabric falls to ruin.

88 Such being the ends in view for the sovereign power, the duty of subjects is, as I have said, to obey its commands, and to recognise no right save that which it sanctions.

89 It will, perhaps, be thought that we are turning subjects into slaves: for slaves obey commands and free people live as they like; 90 but this idea is based on a misconception, for the true slave is one who is led away by own pleasures and can neither see what is good for own self nor act accordingly: 91 you alone is free who lives with free consent under the entire guidance of reason.

92 Action in obedience to orders does take away freedom in a certain sense, but it does not, therefore, make a person a slave, all depends on the object of the action. 93 If the object of the action be the good of the State, and not the good of the agent, the latter is a slave and does own self no good: 94 but in a State or kingdom where the weal of the whole people, and not that of the ruler, is the supreme law, obedience to the sovereign power does not make a person a slave, of no use to yourself, but a subject. 95 Therefore, that State is the freest whose laws are founded on sound reason, so that every member of it may, if you will, be free; that is, live with full consent under the entire guidance of reason.

96 Children, though they are bound to obey all the commands of their parents, are yet not slaves: for the commands of parents look generally to the children's benefit.

97 We must, therefore, acknowledge a great difference between a slave, an offspring, and a subject; their positions may be thus defined. 98 A slave is one who is bound to obey own master's orders, though they are given solely in the master's interest: 99 an offspring is one who obeys own parent's orders, given in own interest; 100 a subject obeys the

orders of the sovereign power, given for the common interest, wherein one is included.

101 I think I have now shown sufficiently clearly the basis of a democracy: I have especially desired to do so, for I believe it to be of all forms of government the most natural, and the most consonant with individual liberty. 102 In it no one transfers own natural right so absolutely that you have no further voice in affairs, you only hands it over to the majority of a society, whereof you are a unit. 103 Thus all humans remain as they were in the State of Nature, equals.

104 This is the only form of government which I have treated of at length, for it is the one most akin to my purpose of showing the benefits of freedom in a State.

105 I may pass over the fundamental principles of other forms of government, for we may gather from what has been said whence their right arises without going into its origin. 106 The possessor of sovereign power, whether you be one, or many, or the whole body politic, has the sovereign right of imposing any commands you pleases: 107 and you who has either voluntarily, or under compulsion, transferred the right to defend you to another, has, in so doing, renounced your natural right and is therefore bound to obey, in all things, the commands of the sovereign power; 108 and will be bound so to do so long as the king, or nobles, or the people preserve the sovereign power which formed the basis of the original transfer. I need add no more.

109 The bases and rights of dominion being thus displayed, we shall readily be able to define private civil right, wrong, justice, and injustice, with their relations to the State; 110 and also to determine what constitutes an ally, or an enemy, or the crime of treason.

111 By private civil right we can only mean the liberty every human possesses to preserve own existence, a liberty limited by the edicts of the sovereign power, and preserved only by its authority: 112 for when a person has transferred to another own right of living as one likes, which was only limited by your power, that is, has transferred your liberty and power of self-defence, you are bound to live as that other dictates, and to trust to others entirely for your defence. 113 Wrong takes place when a citizen, or subject, is forced by another to undergo some loss or pain in contradiction to the authority of the law, or the edict of the sovereign power.

114 Wrong is conceivable only in an organised community: nor can it ever accrue to subjects from any act of the sovereign, who has the right to do what one likes. 115 It can only arise, therefore, between

private persons, who are bound by law and right not to injure one another. 116 Justice consists in the habitual rendering to every person your lawful due: injustice consists in depriving a person, under the pretence of legality, of what the laws, rightly interpreted, would allow you. 117 These last are also called equity and iniquity, because those who administer the laws are bound to show no respect of persons, but to account all people equal, and to defend every person's right equally, neither envying the rich nor despising the poor.

118 The people of two States become allies, when for the sake of avoiding war, or for some other advantage, they covenant to do each other no hurt, but on the contrary, to assist each other if necessity arises, each retaining own independence. 119 Such a covenant is valid so long as its basis of danger or advantage is in force: 120 no one enters into an engagement, or is bound to stand by own compacts unless there be a hope of some accruing good, or the fear of some evil: 121 if this basis be removed the compact thereby becomes void: this has been abundantly shown by experience. 122 For although different States make treaties not to harm one another, they always take every possible precaution against such treaties being broken by the stronger party, 123 and do not rely on the compact, unless there is a sufficiently obvious object and advantage to both parties in observing it. Otherwise they would fear a breach of faith, nor would there be any wrong done thereby: 124 for who in own proper senses, and aware of the right of the sovereign power, would trust in the promises of one who has the will and the power to do what they likes, and who aims solely at the safety and advantage of their dominion? 125 Moreover, if we consult loyalty and religion, we shall see that no one in possession of power ought to abide by own promises to the injury of own dominion; 126 for you cannot keep such promises without breaking the engagement you made with your subjects, by which both you and they are most solemnly bound. 127 An enemy is one who lives apart from the State, and does not recognise its authority either as a subject or as an ally. 128 It is not hatred which makes a person an enemy, but the rights of the State. 129 The rights of the State are the same in regard to you who does not recognise by any compact the State authority, as they are against you who has done the State an injury: it has the right to force you as best it can, either to submit, or to contract an alliance.

130 Lastly, treason can only be committed by subjects, who by compact, either tacit or expressed, have transferred all their rights to the State: 131 a subject is said to

have committed this crime when you have attempted, for whatever reason, to seize the sovereign power, or to place it in different hands. 132 I say, has attempted, for if punishment were not to overtake you till you had succeeded, it would often come too late, the sovereign rights would have been acquired or transferred already.

133 I also say, has attempted, for whatever reason, to seize the sovereign power, and I recognise no difference whether such an attempt should be followed by public loss or public gain. 134 Whatever be your reason for acting, the crime is treason, and you are rightly condemned: in war, everyone would admit the justice of your sentence. 135 If a person does not keep to own post, but approaches the enemy without the knowledge of own commander, 136 whatever may be your motive, so long as you acts on your own motion, even if you advances with the design of defeating the enemy, you are rightly put to death, because you have violated your oath, and infringed the rights of your commander. 137 That all citizens are equally bound by these rights in time of peace, is not so generally recognised, but the reasons for obedience are in both cases identical. 138 The State must be preserved and directed by the sole authority of the sovereign, and such authority and right have been accorded by universal consent to you alone: 139 if, therefore, anyone else attempts, without own consent, to execute any public enterprise, even though the State might (as we said) reap benefit therefrom, such person has none the less infringed the sovereign's right, and would be rightly punished for treason.

140 In order that every scruple may be removed, we may now answer the inquiry, whether our former assertion that everyone who has not the practice of reason, may, in the State of Nature, live by sovereign natural right, according to the laws of own desires, is not in direct opposition to the law and right of God as revealed. 141 For as all people absolutely (whether they be less endowed with reason or more) are equally bound by the Divine command to love their neighbour as themselves, it may be said that they cannot, without wrong, do injury to anyone, or live according to their desires.

142 This objection, so far as the State of Nature is concerned, can be easily answered, for the State of Nature is, both in Nature and in time, prior to religion. 143 No one knows by nature that you owes any obedience to God, nor can you attain thereto by any exercise of your reason, but solely by revelation confirmed by signs. 144 Therefore, previous to revelation, no one is bound by a Divine law and right of which you are necessarily in ignorance. 145 The

State of Nature must by no means be confounded with a State of religion, but must be conceived as without either religion or law, and consequently without sin or wrong: 146 this is how we have described it, and we are confirmed by the authority of Paul. 147 It is not only in respect of ignorance that we conceive the State of Nature as prior to, and lacking the Divine revealed law and right; but in respect of freedom also, wherewith all humans are born endowed.

148 If humans were naturally bound by the Divine law and right, or if the Divine law and right were a natural necessity, there would have been no need for God to make a covenant with humankind, and to bind them thereto with an oath and agreement.

149 We must, then, fully grant that the Divine law and right originated at the time when humans by express covenant agreed to obey God in all things, 150 and ceded, as it were, their natural freedom, transferring their rights to God in the manner described in speaking of the formation of a State.

151 However, I will treat of these matters more at length presently.

152 It may be insisted that sovereigns are as much bound by the Divine law as subjects: whereas we have asserted that they retain their natural rights, and may do whatever they like.

153 In order to clear up the whole difficulty, which arises rather concerning the natural right than the natural State, I maintain that everyone is bound, in the State of Nature, to live according to Divine law, 154 in the same way as you are bound to live according to the dictates of sound reason; namely, inasmuch as it is to your advantage, and necessary for your salvation; but, if you will not so live, you may do otherwise at your own risk. 155 You are thus bound to live according to your own laws, not according to anyone else's, and to recognise no human as a judge, or as a superior in religion. 156 Such, in my opinion, is the position of a sovereign, for you may take advice from your fellow-people, but you are not bound to recognise any as a judge, 157 nor anyone besides yourself as an arbitrator on any question of right, unless it be a prophet sent expressly by God and attesting own mission by indisputable signs. 158 Even then you does not recognise a human, but God Himself as His judge.

159 If a sovereign refuses to obey God as revealed in His law, you does so at your own risk and loss, but without violating any civil or natural right. 160 For the civil right is dependent on your own decree; and natural right is dependent on the laws-of-Nature, 161 which latter are not adapted to religion, whose sole aim is the good of

humanity, but to the order of Nature-- that is, to God's eternal decree unknown to us.
162 This truth seems to be adumbrated in a somewhat obscurer form by those who maintain that people can sin against God's revelation, but not against the eternal decree by which He has ordained all things.
163 We may be asked, what should we do if the sovereign commands anything contrary to religion, and the obedience which we have expressly vowed to God? 164 Should we obey the Divine law or the human law? 165 I shall treat of this question at length hereafter, and will therefore merely say now, that God should be obeyed before all else, when we have a certain and indisputable revelation of His will: 166 but humans are very prone to error on religious subjects, and, according to the diversity of their dispositions, are wont with considerable stir to put forward their own inventions, as experience more than sufficiently attests, 167 so that if no one were bound to obey the State in matters which, in one own opinion concern religion, the rights of the State would be dependent on every human's judgment and passions. 168 No one would consider own self bound to obey laws framed against own faith or superstition; and on this pretext you might assume unbounded license. 169 In this way, the rights of the civil authorities would be utterly set at nought, 170 so that we must conclude that the sovereign power, which alone is bound both by Divine and natural right to preserve and guard the laws of the State, should have supreme authority for making any laws about religion which it thinks fit; 171 all are bound to obey its behests on the subject in accordance with their promise which God bids them to keep.
172 However, if the sovereign power be heathen, we should either enter into no engagements therewith, and yield up our lives sooner than transfer to it any of our rights; 173 or, if the engagement be made, and our rights transferred, we should (inasmuch as we should have ourselves transferred the right of defending ourselves and our religion) be bound to obey them, and to keep our word: 174 we might even rightly be bound so to do, except in those cases where God, by indisputable revelation, has promised His special aid against tyranny, or given us special exemption from obedience. 175 Thus we see that, of all the Jews in Babylon, there were only three youths who were certain of the help of God, and, therefore, refused to obey Nebuchadnezzar. 176 All the rest, with the sole exception of Daniel, who was beloved by the king, were doubtless compelled by right to

obey, 177 perhaps thinking that they had been delivered up by God into the hands of the king, and that the king had obtained and preserved his dominion by God's design. 178 On the other hand, Eleazar, before his country had utterly fallen, wished to give a proof of his constancy to his compatriots, in order that they might follow in his footsteps, 179 and go to any lengths, rather than allow their right and power to be transferred to the Greeks, or brave any torture rather than swear allegiance to the heathen. 180 Instances are occurring every day in confirmation of what I here advance. 181 The rulers of Christian kingdoms do not hesitate, with a view to strengthening their dominion, to make treaties with Turks and heathen, and to give orders to their subjects who settle among such peoples not to assume more freedom, either in things secular or religious, than is set down in the treaty, or allowed by the foreign government. 182 We may see this exemplified in the Dutch treaty with the Japanese, which I have already mentioned.

IT IS SHOWN THAT NO ONE CAN, OR NEED, TRANSFER ALL YOUR RIGHTS TO THE SOVEREIGN POWER. OF THE HEBREW REPUBLIC, AS IT WAS DURING THE LIFETIME OF MOSES, AND AFTER HIS DEATH, TILL THE FOUNDATION OF THE MONARCHY; AND OF ITS EXCELLENCE. LASTLY, OF THE CAUSES WHY THE THEOCRATIC REPUBLIC FELL, AND WHY IT COULD HARDLY HAVE CONTINUED WITHOUT DISSENSION

Benedict of Spinoza

2 The theory put forward in the last chapter, of the universal rights of the sovereign power, and of the natural rights of the individual transferred thereto, 2 though it corresponds in many respects with actual practice, and though practice may be so arranged as to conform to it more and more, must nevertheless always remain in many respects purely ideal. 3 No one can ever so utterly transfer to another own power and, consequently, own rights, as to cease to be a human; nor can there ever be a power so sovereign that it can carry out every possible wish. 4 It will always be vain to order a subject to hate what you believes brings you advantage, or to love what brings you loss, or not to be offended at insults, 5 or not to wish to be free from fear, or a hundred other things of the sort, which necessarily follow from the laws of human nature. 6 So much, I think, is abundantly shown by experience: for people have never so far ceded their power as to cease to be an object of fear to the rulers who received such power and right; 7 and dominions have always been in as much danger from their own subjects as from external enemies. 8 If it were

really the case, that people could be deprived of their natural rights so utterly as never to have any further influence on affairs, except with the permission of the holders of sovereign right, 9 it would then be possible to maintain with impunity the most violent tyranny, which, I suppose, no one would for an instant admit.

10 We must, therefore, grant that every person retains some part of own right, in dependence on your own decision, and no one else's.

11 However, in order correctly to understand the extent of the sovereign's right and power, we must take notice that it does not cover only those actions to which it can compel humans by fear, but absolutely every action which it can induce humans to perform: 12 for it is the fact of obedience, not the motive for obedience, which makes a person a subject.

13 Whatever be the cause which leads a person to obey the commands of the sovereign, whether it be fear or hope, or love of your country, or any other emotion-- the fact remains that the person takes counsel with own self, and nevertheless acts as own sovereign orders. 14 We must not, therefore, assert that all actions resulting from a person's deliberation with own self are done in obedience to the rights of the individual rather than the sovereign: 15 as a matter of fact, all actions spring from a human's deliberation with own self, whether the determining motive be love or fear of punishment; 16 therefore, either dominion does not exist, and has no rights over its subjects, or else it extends over every instance in which it can prevail on people to decide to obey it. 17 Consequently, every action which a subject performs in accordance with the commands of the sovereign, whether such action springs from love, or fear, or (as is more frequently the case) from hope and fear together, or from reverence, compounded of fear and admiration, 18 or, indeed, any motive whatever, is performed in virtue of your submission to the sovereign, and not in virtue of your own authority.

19 This point is made still more clear by the fact that obedience does not consist so much in the outward act as in the mental State of the person obeying; 20 so that you are most under the dominion of another who with your whole heart determines to obey another's commands; 21 and consequently the firmest dominion belongs to the sovereign who has most influence over the minds of own subjects; 22 if those who are most feared possessed the firmest dominion, the firmest dominion would belong to the subjects of a tyrant, for they are always greatly feared by their ruler. 23 Furthermore, though it is impossible to govern the mind as

completely as the tongue, nevertheless minds are, to a certain extent, under the control of the sovereign, 24 for you can in many ways bring about that the greatest part of your subjects should follow your wishes in their beliefs, their loves, and their hates. 25 Though such emotions do not arise at the express command of the sovereign they often result (as experience shows) from the authority of own power, and from own direction; in other words, in virtue of own right; 26 we may, therefore, without doing violence to our understanding, conceive people who follow the instigation of their sovereign in their beliefs, their loves, their hates, their contempt, and all other emotions whatsoever. 27 Though the powers of government, as thus conceived, are sufficiently ample, they can never become large enough to execute every possible wish of their possessors. This, I think, I have already shown clearly enough. 28 The method of forming a dominion which should prove lasting I do not, as I have said, intend to discuss, 29 but in order to arrive at the object I have in view, I will touch on the teaching of Divine revelation to Moses in this respect, 30 and we will consider the history and the success of the Jews, gathering therefrom what should be the chief concessions made by sovereigns to their subjects with a view to the security and increase of their dominion.

31 That the preservation of a State chiefly depends on the subjects' fidelity and constancy in carrying out the orders they receive, is most clearly taught both by reason and experience; 32 how subjects ought to be guided so as best to preserve their fidelity and virtue is not so obvious. 33 All, both rulers and ruled, are humans, and prone to follow after their lusts. 34 The fickle disposition of the multitude almost reduces those who have experience of it to despair, for it is governed solely by emotions, not by reason: 35 it rushes headlong into every enterprise, and is easily corrupted either by avarice or luxury: 36 everyone thinks own self omniscient and wishes to fashion all things to own liking, judging a thing to be just or unjust, lawful or unlawful, according as you thinks it will bring you profit or loss: 37 vanity leads you to despise your equals, and refuse their guidance: 38 envy of superior fame or fortune (for such gifts are never equally distributed) leads you to desire and rejoice in your neighbour's downfall. 39 I need not go through the whole list, everyone knows already how much crime results from disgust at the present-- 40 desire for change, headlong anger, and contempt for poverty-- and how humans' minds are engrossed and kept in turmoil thereby.

41 To guard against all these evils, and form a dominion where no room is left for deceit; to frame our institutions so that every person, whatever your disposition, may prefer public right to private advantage, this is the task and this the toil. 42 Necessity is often the mother of invention, but it has never yet succeeded in framing a dominion that was in less danger from its own citizens than from open enemies, or whose rulers did not fear the latter less than the former. 43 Witness the State of Rome, invincible by her enemies, but many times conquered and sorely oppressed by her own citizens, especially in the war between Vespasian and Vitellius.

44 Alexander thought prestige abroad more easy to acquire than prestige at home, and believed that his greatness could be destroyed by his own followers. 45 Fearing such a disaster, he thus addressed his friends: "Keep me safe from internal treachery and domestic plots, and I will front without fear the dangers of battle and of war. 46 Philip was more secure in the battle array than in the theatre: he often escaped from the hands of the enemy, he could not escape from his own subjects. 47 If you think over the deaths of kings, you will count up more who have died by the assassin than by the open foe."

48 For the sake of making themselves secure, kings who seized the throne in ancient times used to try to spread the idea that they were descended from the immortal gods, 49 thinking that if their subjects and the rest of humankind did not look on them as equals, but believed them to be gods, they would willingly submit to their rule, and obey their commands. 50 Thus Augustus persuaded the Romans that he was descended from Æneas, who was the son of Venus, and numbered among the gods. 51 "He wished himself to be worshipped in temples, like the gods, with flamens and priests."

52 Alexander wished to be saluted as the son of Jupiter, not from motives of pride but of policy, as he showed by his answer to the invective of Hermolaus: 53 "It is almost laughable," said he, "that Hermolaus asked me to contradict Jupiter, by whose oracle I am recognised. Am I responsible for the answers of the gods? 54 It offered me the name of son; acquiescence was by no means foreign to my present designs. 55 Would that the Indians also would believe me to be a god! 56 Wars are carried through by prestige, falsehoods that are believed often gain the force of truth." 57 In these few words he cleverly contrives to palm off a fiction on the ignorant, and at the same time hints at the motive for the deception.

58 Cleon, in his speech persuading the Macedonians to obey their

king, adopted a similar device: for after going through the praises of Alexander with admiration, and recalling his merits, 59 he proceeds, "the Persians are not only pious, but prudent in worshipping their kings as gods: for kingship is the shield of public safety," 60 and he ends thus, "I, myself, when the king enters a banquet hall, should prostrate my body on the ground; other people should do the like, especially those who are wise" 61 However, the Macedonians were more prudent--indeed, it is only complete barbarians who can be so openly cajoled, and can suffer themselves to be turned from subjects into slaves without interests of their own. 62 Others, notwithstanding, have been able more easily to spread the belief that kingship is sacred, and plays the part of God on the earth, 63 that it has been instituted by God, not by the suffrage and consent of humans; and that it is preserved and guarded by Divine special providence and aid. 64 Similar fictions have been promulgated by monarchs, with the object of strengthening their dominion, but these I will pass over, 65 and in order to arrive at my main purpose, will merely recall and discuss the teaching on the subject of Divine revelation to Moses in ancient times.

66 We have said in the Book of LAW, chapter-2. that after the Hebrews came up out of Egypt they were not bound by the law and right of any other nation, but were at liberty to institute any new rites at their pleasure, and to occupy whatever territory they chose. 67 After their liberation from the intolerable bondage of the Egyptians, they were bound by no covenant to any human; and, therefore, every person entered into own natural right, and was free to retain it or to give it up, and transfer it to another. 68 Being, then, in the State of Nature, they followed the advice of Moses, in whom they chiefly trusted, and decided to transfer their right to no human being, but only to God; 69 without further delay they all, with one voice, promised to obey all the commands of the Deity, and to acknowledge no right that He did not proclaim as such by prophetic revelation. 70 This promise, or transference of right to God, was effected in the same manner as we have conceived it to have been in ordinary societies, when people agree to divest themselves of their natural rights. 71 It is, in fact, in virtue of a set covenant, and an oath, that the Jews freely, and not under compulsion or threats, surrendered their rights and transferred them to God. 72 Moreover, in order that this covenant might be ratified and settled, and might be free from all suspicion of deceit, God did not enter into it till the Jews had had

experience of His wonderful power by which alone they had been, or could be, preserved in a State of prosperity 73 It is because they believed that nothing but God's power could preserve them that they surrendered to God the natural power of self-preservation, 74 which they formerly, perhaps, thought they possessed, and consequently they surrendered at the same time all their natural right.

75 God alone, therefore, held dominion over the Hebrews, whose State was in virtue of the covenant called God's kingdom, and God was said to be their king; 76 consequently the enemies of the Jews were said to be the enemies of God, and the citizens who tried to seize the dominion were guilty of treason against God; 77 and, lastly, the laws of the State were called the laws and commandments of God. 78 Thus in the Hebrew State the civil and religious authority, each consisting solely of obedience to God, were one and the same. 79 The dogmas of religion were not precepts, but laws and ordinances; piety was regarded as the same as loyalty, impiety as the same as disaffection. 80 Everyone who fell away from religion ceased to be a citizen, and was, on that ground alone, accounted an enemy: 81 those who died for the sake of religion, were held to have died for their country; in fact, between civil and religious law and right there was no distinction whatever. 82 For this reason the government could be called a Theocracy, inasmuch as the citizens were not bound by anything save the revelations of God.

83 However, this State of things existed rather in theory than in practice, for it will appear from what we are about to say, that the Hebrews, as a matter of fact, retained absolutely in their own hands the right of sovereignty: 84 this is shown by the method and plan by which the government was carried on, as I will now explain.

85 Inasmuch as the Hebrews did not transfer their rights to any other person but, as in a democracy, all surrendered their rights equally, 86 and cried out with one voice, "Whatsoever God shall speak (no mediator or mouthpiece being named) that will we do," 87 it follows that all were equally bound by the covenant, and that all had an equal right to consult the Deity, to accept and to interpret His laws, so that all had an exactly equal share in the government. 88 Thus at first they all approached God together, so that they might learn His commands, but in this first salutation, they were so thoroughly terrified and so astounded to hear God speaking, that they thought their last hour was at hand: 89 full of fear, therefore, they went afresh to

Moses, and said, "Lo, we have heard God speaking in the fire, and there is no cause why we should wish to die: 90 surely this great fire will consume us: if we hear again the voice of God, we shall surely die. 91 Thou, therefore, go near, and hear all the words of our God, and thou (not God) shalt speak with us: all that God shall tell us, that will we hearken to and perform."

92 They thus clearly abrogated their former covenant, and absolutely transferred to Moses their right to consult God and interpret His commands: 93 for they do not here promise obedience to all that God shall tell them, but to all that God shall tell Moses. 94 Moses, therefore, remained the sole promulgator and interpreter of the Divine laws, and consequently also the sovereign judge, who could not be arraigned himself, and who acted among the Hebrews the part of God; in other words, held the sovereign kingship: 95 he alone had the right to consult God, to give the Divine answers to the people, and to see that they were carried out. 96 I say he alone, for if anyone during the life of Moses was desirous of preaching anything in the name of the Lord, he was, even if a true prophet, considered guilty and a usurper of the sovereign right. 97 We may here notice, that though the people had elected Moses, they could not rightfully elect Moses's successor; 98 for having transferred to Moses their right of consulting God, and absolutely promised to regard him as a Divine oracle, they had plainly forfeited the whole of their right, and were bound to accept as chosen by God anyone proclaimed by Moses as his successor. 99 If Moses had so chosen his successor, who like him should wield the sole right of government, possessing the sole right of consulting God, and consequently of making and abrogating laws, 100 of deciding on peace or war, of sending ambassadors, appointing judges-- in fact, discharging all the functions of a sovereign, 101 the State would have become simply a monarchy, only differing from other monarchies in the fact, that the latter are, or should be, carried on in accordance with God's decree, 102 unknown even to the monarch, whereas the Hebrew monarch would have been the only person to whom the decree was revealed. 103 A difference which increases, rather than diminishes the monarch's authority. 104 As far as the people in both cases are concerned, each would be equally subject, and equally ignorant of the Divine decree, 105 for each would be dependent on the monarch's words, and would learn from him alone, what was lawful or unlawful: 106 nor would the fact that the people believed that the monarch was only issuing

commands in accordance with God's decree revealed to him, make it less in subjection, but rather more. 107 However, Moses elected no such successor, but left the dominion to those who came after him in a condition which could not be called a popular government, nor an aristocracy, nor a monarchy, but a Theocracy. 108 For the right of interpreting laws was vested in one person, while the right and power of administering the State according to the laws thus interpreted, was vested in another person.

109 In order that the question may be thoroughly understood, I will duly set forth the administration of the whole State.

110 First, the people were commanded to build a tabernacle, which should be, as it were, the dwelling of God-- that is, of the sovereign authority of the State. 111 This tabernacle was to be erected at the cost of the whole people, not of one person, in order that the place where God was consulted might be public property. 112 The Levites were chosen as courtiers and administrators of this royal abode; while Aaron, the brother of Moses, was chosen to be their chief and second, as it were, to God their King, being succeeded in the office by his legitimate sons.

113 He, as the nearest to God, was the sovereign interpreter of the Divine laws; he communicated the answers of the Divine oracle to the people, and entreated God's favour for them. 114 If, in addition to these privileges, he had possessed the right of ruling, he would have been neither more nor less than an absolute monarch; but, in respect to government, he was only a private citizen: 115 the whole tribe of Levi was so completely divested of governing rights that it did not even take its share with the others in the partition of territory. 116 Moses provided for its support by inspiring the common people with great reverence for it, as the only tribe dedicated to God.

117 Further, the army, formed from the remaining twelve tribes, was commanded to invade the land of Canaan, to divide it into twelve portions, and to distribute it among the tribes by lot. 118 For this task twelve captains were chosen, one from every tribe, and were, together with Joshua and Eleazar, the high priest, empowered to divide the land into twelve equal parts, and distribute it by lot. 119 Joshua was chosen for the chief command of the army, inasmuch as none but he had the right to consult God in emergencies, 120 not like Moses, alone in his tent, or in the tabernacle, but through the high priest, to whom only the answers of God were revealed. 121 Furthermore, he was empowered to execute, and cause the people to obey God's commands, transmitted through the high priests; to find,

and to make use of, means for carrying them out; 122 to choose as many army captains as he liked; to make whatever choice he thought best; to send ambassadors in his own name; and, in short, to have the entire control of the war. 123 To his office there was no rightful successor-- indeed, the post was only filled by the direct order of the Deity, on occasions of public emergency. 124 In ordinary times, all the management of peace and war was vested in the captains of the tribes, as I will shortly point out. 125 Lastly, all people between the ages of twenty and sixty were ordered to bear arms, and form a citizen army, owing allegiance, not to its general-in-chief, nor to the high priest, but to Religion and to God. 126 The army, or the hosts, were called the army of God, or the hosts of God. 127 For this reason God was called by the Hebrews the God of Armies; and the ark of the covenant was borne in the midst of the army in important battles, 128 when the safety or destruction of the whole people hung upon the issue, so that the people might, as it were, see their King among them, and put forth all their strength.

129 From these directions, left by Moses to his successors, we plainly see that he chose administrators, rather than despots, to come after him; 130 for he invested no one with the power of consulting God, where he liked and alone, 131 consequently, no one had the power possessed by himself of ordaining and abrogating laws, of deciding on war or peace, of choosing people to fill offices both religious and secular: all these are the prerogatives of a sovereign. 132 The high priest, indeed, had the right of interpreting laws, and communicating the answers of God, but he could not do so when he liked, as Moses could, but only when he was asked by the general-in-chief of the army, the council, or some similar authority. 133 The general-in-chief and the council could consult God when they liked, but could only receive His answers through the high priest; 134 so that the utterances of God, as reported by the high priest, were not decrees, as they were when reported by Moses, but only answers; 135 they were accepted by Joshua and the council, and only then had the force of commands and decrees.

136 The high priest, both in the case of Aaron and of his son Eleazar, was chosen by Moses; nor had anyone, after Moses' death, a right to elect to the office, which became hereditary. 137 The general-in-chief of the army was also chosen by Moses, and assumed his functions in virtue of the commands, not of the high priest, but of Moses: 138 indeed, after the death of Joshua, the high priest did not appoint anyone in

his place, and the captains did not consult God afresh about a general-in-chief, 139 but each retained Joshua's power in respect to the contingent of own tribe, and all retained it collectively, in respect to the whole army. 140 There seems to have been no need of a general-in-chief, except when they were obliged to unite their forces against a common enemy. 141 This occurred most frequently during the time of Joshua, when they had no fixed dwelling. place, and possessed all things in common. 142 After all the tribes had gained their territories by right of conquest, and had divided their allotted gains, they, became separated, having no longer their possessions in common, 143 so that the need for a single commander ceased, for the different tribes should be considered rather in the light of confederated States than of bodies of fellow-citizens. 144 In respect to their God and their religion, they, were fellow-citizens; but, in respect to the rights which one possessed with regard to another, they were only confederated: 145 they, were, in fact, in much the same position (if one excepts the Temple common to all) as the United States of the Netherlands {or United States of America}. 146 The division of property held in common is only another phrase for the possession of your share by each of the owners singly, and the surrender by the others of their rights over such share. 147 This is why Moses elected captains of the tribes--namely, that when the dominion was divided, each might take care of own part; 148 consulting God through the high priest on the affairs of own tribe, ruling over own army, building and fortifying cities, appointing judges, attacking the enemies of own dominion, and having complete control over all civil and military affairs. 149 One was not bound to acknowledge any superior judge save God, or a prophet whom God should expressly send. 150 If you departed from the worship of God, the rest of the tribes did not arraign you as a subject, but attacked you as an enemy. 151 Of this we have examples in Scripture. When Joshua was dead, the children of Israel (not a fresh general-in-chief) consulted God; 152 it being decided that the tribe of Judah should be the first to attack its enemies, the tribe in question contracted a single alliance with the tribe of Simeon, 153 for uniting their forces, and attacking their common enemy, the rest of the tribes not being included in the alliance. 154 Each tribe separately made war against its own enemies, and, according to its pleasure, received them as subjects or allies, 155 though it had been commanded not to spare them on any conditions, but to destroy them utterly. 156 Such disobedience met

with reproof from the rest of the tribes, but did not cause the offending tribe to be arraigned: it was not considered a sufficient reason for proclaiming a civil war, or interfering in one another's affairs. 157 But when the tribe of Benjamin offended against the others, and so loosened the bonds of peace that none of the confederated tribes could find refuge within its borders, they attacked it as an enemy, 158 and gaining the victory over it after three battles, put to death both guilty and innocent, according to the laws of war: an act which they subsequently bewailed with tardy repentance.

159 These examples plainly confirm what we have said concerning the rights of each tribe. 160 Perhaps we shall be asked who elected the successors to the captains of each tribe; on this point I can gather no positive information in Scripture, 161 but I conjecture that as the tribes were divided into families, each headed by its senior member, the senior of all these heads of families succeeded by right to the office of captain, 162 for Moses chose from among these seniors his seventy coadjutors, who formed with himself the supreme council. 163 Those who administered the government after the death of Joshua were called elders, and elder is a very common Hebrew expression in the sense of judge, as I suppose everyone knows; 164 however, it is not very important for us to make up our minds on this point. It is enough to have shown that after the death of Moses no one person wielded all the power of a sovereign; 165 as affairs were not all managed by one person, nor by a single council, nor by the popular vote, but partly by one tribe, partly by the rest in equal shares, 166 it is most evident that the government, after the death of Moses, was neither monarchic, nor aristocratic, nor popular, but, as we have said, Theocratic. 167 The reasons for applying this name are:

(I.) Because the royal seat of government was the Temple, and in respect to it alone, as we have shown, all the tribes were fellow-citizens.

168 (II.) Because all the people owed allegiance to God, their supreme Judge, to whom only they had promised implicit obedience in all things.

169 (III.) Because the general-in-chief or dictator, when there was need of such, was elected by none save God alone. 170 This was expressly commanded by Moses in the name of God (Deuteronomy. Chapter-19, verse:15), and witnessed by the actual choice of Gideon, of Samson, and of Samuel; 171 wherefrom we may conclude that the other faithful leaders were chosen in the same manner, though it is not expressly told us.

172 These preliminaries being Stated, it is now time to inquire the effects of forming a dominion on this plan, and to see whether it so effectually kept within bounds both rulers and ruled, that the former were never tyrannical and the latter never rebellious.

173 Those who administer or possess governing power, always try to surround their high-handed actions with a cloak of legality, and to persuade the people that they act from good motives; 174 this they are easily able to effect when they are the sole interpreters of the law; 175 for it is evident that they are thus able to assume a far greater freedom to carry out their wishes and desires than if the interpretation of the law is vested in someone else, or if the laws were so self-evident that no one could be in doubt as to their meaning. 176 We thus see that the power of evil-doing was greatly curtailed for the Hebrew captains by the fact that the whole interpretation of the law was vested in the Levites (Deuteronomy, chapter-21, verse:5), 177 who, on their part, had no share in the government, and depended for all their support and consideration on a correct interpretation of the laws entrusted to them. 178 Moreover, the whole people was commanded to come together at a certain place every seven years and be instructed in the law by the high-priest; 179 further, each individual was bidden to read the book of the law through and through continually with scrupulous care.

180 The captains were thus for their own sakes bound to take great care to administer everything according to the laws laid down, and well known to all, 181 if they wished to be held in high honour by the people, who would regard them as the administrators of God's dominion, and as God's vicegerents; otherwise they could not have escaped all the virulence of theological hatred. 182 There was another very important check on the unbridled license of the captains, in the fact, that the army was formed from the whole body, of the citizens, between the ages of twenty and sixty, without exception, and that the captains were not able to hire any foreign soldiery. 183 This I say was very important, for it is well known that princes can oppress their peoples with the single aid of the soldiery in their pay; 184 while there is nothing more formidable to them than the freedom of citizen soldiers, who have established the freedom and glory of their country, by their valour, their toil, and their blood. 185 Thus Alexander, when he was about to make wax on Darius, a second time, after hearing the advice of Parmenio, did not chide him who gave the advice, but Polysperchon, who was standing by. 186 For, as Curtius says, he did not venture to

reproach Parmenio again after having shortly before reproved him too sharply. 187 This freedom of the Macedonians, which he so dreaded, he was not able to subdue till after the number of captives enlisted in the army surpassed that of his own people: 188 then, but not till then, he gave rein to his anger so long checked by the independence of his chief fellow-country people.

189 If this independence of citizen soldiers can restrain the princes of ordinary States who are wont to usurp the whole glory of victories, it must have been still more effectual against the Hebrew captains, 190 whose soldiers were fighting, not for the glory of a prince, but for the glory of God, and who did not go forth to battle till the Divine assent had been given.

191 We must also remember that the Hebrew captains were associated only by the bonds of religion: 192 therefore, if any one of them had transgressed, and begun to violate the Divine right, he might have been treated by the rest as an enemy and lawfully subdued.

193 An additional check may be found in the fear of a new prophet arising, for if a person of unblemished life could show by certain signs that you was really a prophet, you ipso facto obtained the sovereign right to rule, which was given to you, 194 as to Moses formerly, in the name of God, as revealed to himself alone; not merely through the high priest, as in the case of the captains. 195 There is no doubt that such an one would easily be able to enlist an oppressed people in own cause, and by trifling signs persuade them of anything one wished: 196 on the other hand, if affairs were well ordered, the captain would be able to make provision in time; 197 that the prophet should be submitted to own approval, and be examined whether one were really of unblemished life, and possessed indisputable signs of own mission: 198 also, whether the teaching one proposed to set forth in the name of the Lord agreed with received doctrines, and the general laws of the country; 199 if your credentials were insufficient, or your doctrines new, you could lawfully be put to death, or else received on the captain's sole responsibility and authority.

200 Again, the captains were not superior to the others in nobility or birth, but only administered the government in virtue of their age and personal qualities. 201 Lastly, neither captains nor army had any reason for preferring war to peace. 202 The army, as we have Stated, consisted entirely of citizens, so that affairs were managed by the same persons both in peace and war. 203 The person who was a soldier in the camp was a citizen in the market-place, one who was

a leader in the camp was a judge in the law courts, one who was a general in the camp was a ruler in the State. 204 Thus no one could desire war for its own sake, but only for the sake of preserving peace and liberty; 205 possibly the captains avoided change as far as possible, so as not to be obliged to consult the high priest and submit to the indignity of standing in own presence.

206 So much for the precautions for keeping the captains within bounds. 207 We must now look for the restraints upon the people: these, however, are very clearly indicated in the very groundwork of the social fabric.

208 Anyone who gives the subject the slightest attention, will see that the State was so ordered as to inspire the most ardent patriotism in the hearts of the citizens, 209 so that the latter would be very hard to persuade to betray their country, and be ready to endure anything rather than submit to a foreign yoke. 210 After they had transferred their right to God, they thought that their kingdom belonged to God, and that they themselves were God's children. 211 Other nations they looked upon as God's enemies, and regarded with intense hatred (which they took to be piety, see Psalm, chapter-139, verses:21 and 22): 212 nothing would have been more abhorrent to them than swearing allegiance to a foreigner, and promising them obedience: 213 nor could they conceive any greater or more execrable crime than the betrayal of their country, the kingdom of the God whom they adored.

214 It was considered wicked for anyone to settle outside of the country, inasmuch as the worship of God by which they were bound could not be carried on elsewhere: their own land alone was considered holy, the rest of the earth unclean and profane.

215 David, who was forced to live in exile, complained before Saul as follows: "But if they be the children of people who have stirred thee up against me, cursed be they before the Lord; 216 for they have driven me out this day from abiding in the inheritance of the Lord, saying, Go, serve other gods." 217 For the same reason no citizen, as we should especially remark, was ever sent into exile: you who sinned was liable to punishment, but not to disgrace.

218 Thus the love of the Hebrews for their country was not only patriotism, but also piety, and was cherished and nurtured by daily rites till, like their hatred of other nations, it must have passed into their nature. 219 Their daily worship was not only different from that of other nations (as it might well be, considering that they were a peculiar people and entirely apart from the rest), it was absolutely contrary. 220 Such daily reprobation naturally gave rise to a

lasting hatred, deeply implanted in the heart: 221 for of all hatreds none is more deep and tenacious than that which springs from extreme devoutness or piety, and is itself cherished as pious. 222 Nor was a general cause lacking for inflaming such hatred more and more, inasmuch as it was reciprocated; 223 the surrounding nations regarding the Jews with a hatred just as intense.

224 How great was the effect of all these causes, namely, freedom from human's dominion; devotion to their country; absolute rights over all other people; a hatred not only permitted but pious; a contempt for their fellow-people; the singularity of their customs and religious rites; 225 the effect, I repeat, of all these causes in strengthening the hearts of the Jews to bear all things for their country, with extraordinary constancy and valour, will at once be discerned by reason and attested by experience. 226 Never, so long as the city was standing, could they endure to remain under foreign dominion; and therefore they called Jerusalem "a rebellious city" (Ezra, chapter-4. verse:12). 227 Their State after its re-establishment (which was a mere shadow of the first, for the high priests had usurped the rights of the tribal captains) was, with great difficulty, destroyed by the Romans, as Tacitus bears witness:- 228 "Vespasian had closed the war against the Jews, abandoning the siege of Jerusalem as an enterprise difficult and arduous rather from the character of the people and the obstinacy of their superstition, than from the strength left to the besieged for meeting their necessities." 229 But besides these characteristics, which are merely ascribed by an individual opinion, there was one feature peculiar to this State and of great importance in retaining the affections of the citizens, 230 and checking all thoughts of desertion, or abandonment of the country: namely, self-interest, the strength and life of all human action. 231 This was peculiarly engaged in the Hebrew State, for nowhere else did citizens possess their goods so securely, as did the subjects of this community, 232 for the latter possessed as large a share in the land and the fields as did their chiefs, and were owners of their plots of ground in perpetuity; 233 for if any person was compelled by poverty to sell own farm or own pasture, you received it back again intact at the year of jubilee: there were other similar enactments against the possibility of alienating real property.

234 Again, poverty was nowhere more endurable than in a country where duty towards one's neighbour, that is, one's fellow-citizen, was practised with the utmost piety, as a means of gaining the favour of God the

King. 235 Thus the Hebrew citizens would nowhere be so well off as in their own country; outside its limits they met with nothing but loss and disgrace.

236 The following considerations were of weight, not only in keeping them at home, but also in preventing civil war and removing causes of strife; 237 no one was bound to serve own equal, but only to serve God, while charity and love towards fellow-citizens was accounted the highest piety; 238 this last feeling was not a little fostered by the general hatred with which they regarded foreign nations and were regarded by them. 239 Furthermore, the strict discipline of obedience in which they were brought up, was a very important factor; for they were bound to carry on all their actions according to the set rules of the law: 240 a person might not plough when you liked, but only at certain times, in certain years, and with one sort of beast at a time; so, too, you might only sow and reap in a certain method and season-- 241 in fact, your whole life was one long school of obedience (see the Book of LAW, chapter-2); 242 such a habit was thus engendered, that conformity seemed freedom instead of servitude, and people desired what was commanded rather than what was forbidden. 243 This result was not a little aided by the fact that the people were bound, at certain seasons of the year, to give themselves up to rest and rejoicing, not for their own pleasure, but in order that they might worship God cheerfully.

244 Three times in the year they feasted before the Lord; on the seventh day of every week they were bidden to abstain from all work and to rest; 245 besides these, there were other occasions when innocent rejoicing and feasting were not only allowed but enjoined. 246 I do not think any better means of influencing humans' minds could be devised; for there is no more powerful attraction than joy springing from devotion, a mixture of admiration and love. 247 It was not easy to be wearied by constant repetition, for the rites on the various festivals were varied and recurred seldom. 248 We may add the deep reverence for the Temple which all most religiously fostered, on account of the peculiar rites and duties that they were obliged to perform before approaching thither. 249 Even now, Jews cannot read without horror of the crime of Manasseh, who dared to place an idol in the Temple. 250 The laws, scrupulously preserved in the inmost sanctuary, were objects of equal reverence to the people. 251 Popular reports and misconceptions were, therefore, very little to be feared in this quarter, for no one dared decide on sacred matters, 252 but all felt

bound to obey, without consulting their reason, all the commands given by the answers of God received in the Temple, and all the laws which God had ordained.

253 I think I have now explained clearly, though briefly, the main features of the Hebrew commonwealth. 254 I must now inquire into the causes which led the people so often to fall away from the law, which brought about their frequent subjection, and, finally, the complete destruction of their dominion. 255 Perhaps I shall be told that it sprang from their hardness of heart; but this is childish, for why should this people be more hard of heart than others; was it by their nature?

256 But Nature forms individuals, not peoples; the latter are only distinguishable by the difference of their language, their customs, and their laws; 257 while from the two last - i.e., customs and laws,-- it may arise that they have a peculiar disposition, a peculiar manner of life, and peculiar prejudices. 258 If, then, the Hebrews were harder of heart than other nations, the fault lay with their laws or customs.

259 This is certainly true, in the sense that, if God had wished their dominion to be more lasting, He would have given them other rites and laws, and would have instituted a different form of government. 260 We can, therefore, only say that their God was angry with them, not only, as Jeremiah says, from the building of the city, but even from the founding of their laws.

261 This is borne witness to by Ezekiel, chaptter-20, verse:25: "Wherefore I gave them also statutes that were not good, and judgments whereby they should not live; 262 and I polluted them in their own gifts, in that they caused to pass through the fire all that openeth the womb; that I might make them desolate, to the end that they might know that I am the Lord."

263 In order that we may understand these words, and the destruction of the Hebrew commonwealth, we must bear in mind that it had at first been intended to entrust the whole duties of the priesthood to the firstborn, and not to the Levites (see Numbers, chapter-8, verse:17). 264 It was only when all the tribes, except the Levites, worshipped the golden calf, that the firstborn were rejected and defiled, and the Levites chosen in their stead (Deuteronomy, chapter-10, verse:8). 265 When I reflect on this change, I feel disposed to break forth with the words of Tacitus. 266 God's object at that time was not the safety of the Jews, but vengeance. 267 I am greatly astonished that the celestial mind was so inflamed with anger that it ordained laws, which always are supposed to promote the honour, well-being,

and security of a people, with the purpose of vengeance, for the sake of punishment; 268 so that the laws do not seem so much laws-- that is, the safeguard of the people-- as pains and penalties.

269 The gifts which the people were obliged to bestow on the Levites and priests-- the redemption of the firstborn, the poll-tax due to the Levites, the privilege possessed by the latter of the sole performance of sacred rites-- 270 all these, I say, were a continual reproach to the people, a continual reminder of their defilement and rejection. 271 Moreover, we may be sure that the Levites were for ever heaping reproaches upon them: for among so many thousands there must have been many importunate dabblers in theology. 272 Hence the people got into the way of watching the acts of the Levites, who were but human; of accusing the whole body of the faults of one member, and continually murmuring.

273 Besides this, there was the obligation to keep in idleness people hateful to them, and connected by no ties of blood. Especially would this seem grievous when provisions were dear. 274 What wonder, then, if in times of peace, when striking miracles had ceased, and no people of paramount authority were forthcoming, 275 the irritable and greedy temper of the people began to wax cold, and at length to fall away from a worship, which, though Divine, was also humiliating, and even hostile, and to seek after something fresh; 276 or can we be surprised that the captains, who always adopt the popular course, in order to gain the sovereign power for themselves by enlisting the sympathies of the people, and alienating the high priest, should have yielded to their demands, and introduced a new worship? 277 If the State had been formed according to the original intention, the rights and honour of all the tribes would have been equal, and everything would have rested on a firm basis. 278 Who is there who would willingly violate the religious rights of own kindred? 279 What could a person desire more than to support own brothers and parents, thus fulfilling the duties of religion? 280 Who would not rejoice in being taught by them the interpretation of the laws, and receiving through them the answers of God?

281 The tribes would thus have been united by a far closer bond, if all alike had possessed the right to the priesthood. 282 All danger would have been obviated, if the choice of the Levites had not been dictated by anger and revenge. 283 But, as we have said, the Hebrews had offended their God, Who, as Ezekiel says, polluted them in their own gifts by rejecting all that

openeth the womb, so that He might destroy them.

284 This passage is also confirmed by their history. As soon as the people in the wilderness began to live in ease and plenty, certain people of no mean birth began to rebel against the choice of the Levites, 285 and to make it a cause for believing that Moses had not acted by the commands of God, but for his own good pleasure, 286 inasmuch as he had chosen his own tribe before all the rest, and had bestowed the high priesthood in perpetuity on his own brother. 287 They, therefore, stirred up a tumult, and came to him, crying out that all humans were equally sacred, and that he had exalted himself above his fellows wrongfully. 288 Moses was not able to pacify them with reasons; but by the intervention of a miracle in proof of the faith, they all perished. 289 A fresh sedition then arose among the whole people, who believed that their champions had not been put to death by the judgment of God, but by the device of Moses. 290 After a great slaughter, or pestilence, the rising subsided from inanition, but in such a manner that all preferred death to life under such conditions. 291 We should rather say that sedition ceased than that harmony was re-established. 292 This is witnessed by Scripture (Deuteronomy, chapter-31, verse:21), where God, after predicting to Moses that the people after his death will fall away from the Divine worship, speaks thus: 293 "For I know their imagination which they go about, even now before I have brought them into the land which I sware;" 294 and, a little while after (chapter-31, verse:27), Moses says: "For I know thy rebellion and thy stiff neck: behold while I am yet alive with you this day, ye have been rebellious against the Lord; and how much more after my death!"

295 Indeed, it happened according to his words, as we all know. Great changes, extreme license, luxury, and hardness of heart grew up; 296 things went from bad to worse, till at last the people, after being frequently conquered, came to an open rupture with the Divine right, and wished for a mortal king, 297 so that the seat of government might be the Court, instead of the Temple, and that the tribes might remain fellow-citizens in respect to their king, instead of in respect to Divine right and the high priesthood.

298 A vast material for new seditions was thus produced, eventually resulting in the ruin of the entire State. 299 Kings are above all things jealous of a precarious rule, and can in nowise brook a dominion within their own. 300 The first monarchs, being chosen from the ranks of private citizens, were content with the amount of dignity to which they

had risen; 301 but their sons, who obtained the throne by right of inheritance, began gradually to introduce changes, so as to get all the sovereign rights into their own hands. 302 This they were generally unable to accomplish, so long as the right of legislation did not rest with them, but with the high priest, who kept the laws in the sanctuary, and interpreted them to the people. 303 The kings were thus bound to obey the laws as much as were the subjects, and were unable to abrogate them, or to ordain new laws of equal authority; 304 moreover, they were prevented by the Levites from administering the affairs of religion, king and subject being alike unclean. 305 Lastly, the whole safety of their dominion depended on the will of one person, if that person appeared to be a prophet; 306 and of this they had seen an example, namely, how completely Samuel had been able to command Saul, and how easily, because of a single disobedience, he had been able to transfer the right of sovereignty to David. 307 Thus the kings found a dominion within their own, and wielded a precarious sovereignty.

308 In order to surmount these difficulties, they allowed other temples to be dedicated to the gods, so that there might be no further need of consulting the Levites; 309 they also sought out many who prophesied in the name of God, so that they might have creatures of their own to oppose to the true prophets. 310 However, in spite of all their attempts, they never attained their end. 311 For the prophets, prepared against every emergency, waited for a favourable opportunity, such as the beginning of a new reign, which is always precarious, while the memory of the previous reign remains green. 312 At these times they could easily pronounce by Divine authority that the king was tyrannical, and could produce a champion of distinguished virtue to vindicate the Divine right, and lawfully to claim dominion, or a share in it. 313 Still, not even so could the prophets effect much. They could, indeed, remove a tyrant; but there were reasons which prevented them from doing more than setting up, at great cost of civil bloodshed, another tyrant in own stead. 314 Of discords and civil wars there was no end, for the causes for the violation of Divine right remained always the same, and could only be removed by a complete remodelling of the State.

315 We have now seen how religion was introduced into the Hebrew commonwealth, and how the dominion might have lasted for ever, if the just wrath of the Lawgiver had allowed it. 316 As this was impossible, it was bound in time to perish. 317 I am now speaking only of the first commonwealth, for the second

was a mere shadow of the first, inasmuch as the people were bound by the rights of the Persians to whom they were subject. 318 After the restoration of freedom, the high priests usurped the rights of the secular chiefs, and thus obtained absolute dominion. 319 The priests were inflamed with an intense desire to wield the powers of the sovereignty and the high priesthood at the same time. 320 I have, therefore, no need to speak further of the second commonwealth. Whether the first, in so far as we deem it to have been durable, is capable of imitation, and whether it would be pious to copy it as far as possible, will appear from what fellows. 321 I wish only to draw attention, as a crowning conclusion, to the principle indicated already-- 322 namely, that it is evident, from what we have Stated in this chapter, that the Divine right, or the right of religion, originates in a compact: without such compact, none but natural rights exist. 323 The Hebrews were not bound by their religion to evince any pious care for other nations not included in the compact, but only for their own fellow-citizens.

FROM THE COMMONWEALTH OF THE HEBREWS, AND THEIR HISTORY, CERTAIN POLITICAL DOCTRINES ARE DEDUCED

Benedict of Spinoza

3 Although the commonwealth of the Hebrews, as we have conceived it, might have lasted for ever, it would be impossible to imitate it at the present day, nor would it be advisable so to do. 2 If a people wished to transfer their rights to God it would be necessary to make an express covenant with Him, 3 and for this would be needed not only the consent of those transferring their rights, but also the consent of God. 4 God, however, has revealed through his Apostles that the covenant of God is no longer written in ink, or on tables of stone, but with the Spirit of God in the fleshy tables of the heart.

5 Furthermore, such a form of government would only be available for those who desire to have no foreign relations, but to shut themselves up within their own frontiers, and to live apart from the rest of the world; 6 it would be useless to people who must have dealings with other nations; so that the cases where it could be adopted are very few indeed.

7 Nevertheless, though it could not be copied in its entirety, it possessed many excellent features which might be brought to our

notice, and perhaps imitated with advantage. 8 My intention, however, is not to write a treatise on forms of government, so I will pass over most of such points in silence, and will only touch on those which bear upon my purpose.

9 God's kingdom is not infringed upon by the choice of an earthly ruler endowed with sovereign rights; 10 for after the Hebrews had transferred their rights to God, they conferred the sovereign right of ruling on Moses, 11 investing him with the sole power of instituting and abrogating laws in the name of God, of choosing priests, of judging, of teaching, of punishing-- in fact, all the prerogatives of an absolute monarch.

12 Again, though the priests were the interpreters of the laws, they had no power to judge the citizens, or to excommunicate anyone: this could only be done by the judges and chiefs chosen from among the people. 13 A consideration of the successes and the histories of the Hebrews will bring to light other considerations worthy of note. To wit:

14 (I.) That there were no religious sects, till after the high priests, in the second commonwealth, possessed the authority to make decrees, and transact the business of government. 15 In order that such authority might last for ever, the high priests usurped the rights of secular rulers, and at last wished to be styled kings. 16 The reason for this is ready to hand; in the first commonwealth no decrees could bear the name of the high priest, for he had no right to ordain laws, but only to give the answers of God to questions asked by the captains or the councils: 17 he had, therefore, no motive for making changes in the law, but took care, on the contrary, to administer and guard what had already been received and accepted. 18 His only means of preserving his freedom in safety against the will of the captains lay in cherishing the law intact. 19 After the high priests had assumed the power of carrying on the government, and added the rights of secular rulers to those they already possessed, each one began both in things religious and in things secular, 20 to seek for the glorification of own name, settling everything by sacerdotal authority, and issuing every day, concerning ceremonies, faith, and all else, new decrees which they sought to make as sacred and authoritative as the laws of Moses. 21 Religion thus sank into a degrading superstition, while the true meaning and interpretation of the laws became corrupted. 22 Furthermore, while the high priests were paving their way to the secular rule just after the restoration, they attempted to gain popular favour by assenting to every demand; 23 approving whatever the people did, however

impious, and accommodating Scripture to the very depraved current morals. 24 Malachi bears witness to this in no measured terms: he chides the priests of his time as despisers of the name of God, and then goes on with his invective as follows (Malachi, chapter-2, verse:7 and 8): 25 "For the priest's lips should keep knowledge, and they should seek the law at own mouth: for you are the messenger of the Lord of hosts. 26 But ye are departed out of the way; ye have caused many to stumble at the law, ye have corrupted the covenant of Levi, saith the Lord of hosts." 27 He further accuses them of interpreting the laws according to their own pleasure, and paying no respect to God but only to persons. 28 It is certain that the high priests were never so cautious in their conduct as to escape the remark of the more shrewd among the people, 29 for the latter were at length emboldened to assert that no laws ought to be kept save those that were written, 30 and that the decrees which the Pharisees (consisting, as Josephus says in his "Antiquities," chiefly of the common people), were deceived into calling the traditions of the fathers, should not be observed at all. 31 However this may be, we can in nowise doubt that flattery of the high priest, the corruption of religion and the laws, and the enormous increase of the extent of the last-named, gave very great and frequent occasion for disputes and altercations impossible to allay. 32 When people begin to quarrel with all the ardour of superstition, and the magistracy to back up one side or the other, they can never come to a compromise, but are bound to split into sects.

33 (II.) It is worthy of remark that the prophets, who were in a private station of life, rather irritated than reformed humankind by their freedom of warning, rebuke, and censure; 34 whereas the kings, by their reproofs and punishments, could always produce an effect. 35 The prophets were often intolerable even to pious kings, on account of the authority they assumed for judging whether an action was right or wrong, 36 or for reproving the kings themselves if they dared to transact any business, whether public or private, without prophetic sanction. 37 King Asa who, according to the testimony of Scripture, reigned piously, put the prophet Hanani into a prison-house because he had ventured freely to chide and reprove him for entering into a covenant with the king of Armenia.

38 Other examples might be cited, tending to prove that religion gained more harm than good by such freedom, not to speak of the further consequence, that if the prophets had retained their rights,

great civil wars would have resulted.

39 (III.) It is remarkable that during all the period, during which the people held the reins of power, there was only one civil war, and that one was completely extinguished, 40 the conquerors taking such pity on the conquered, that they endeavoured in every way to re-inState them in their former dignity and power. 41 But after that the people, little accustomed to kings, changed its first form of government into a monarchy, civil war raged almost continuously; and battles were so fierce as to exceed all others recorded; 42 in one engagement (taxing our faith to the utmost) five hundred thousand Israelites were slaughtered by the people of Judah, and in another the Israelites slew great numbers of the people of Judah (the figures are not given in Scripture), 43 almost razed to the ground the walls of Jerusalem, and sacked the Temple in their unbridled fury. 44 At length, laden with the spoils of their brethren, satiated with blood, they took hostages, and leaving the king in his well-nigh devastated kingdom, laid down their arms, relying on the weakness rather than the good faith of their foes. 45 A few years after, the people of Judah, with recruited strength, again took the field, but were a second time beaten by the Israelites, 46 and slain to the number of a hundred and twenty thousand, two hundred thousand of their wives and children were led into captivity, and a great booty again seized. 47 Worn out with these and similar battles set forth at length in their histories, the Jews at length fell a prey to their enemies.

48 Furthermore, if we reckon up the times during which peace prevailed under each form of government, we shall find a great discrepancy. 49 Before the monarchy forty years and more often passed, and once eighty years (an almost unparalleled period), without any war, foreign or civil. 50 After the kings acquired sovereign power, the fighting was no longer for peace and liberty, but for glory; 51 accordingly we find that they all, with the exception of Solomon (whose virtue and wisdom would be better displayed in peace than in war) waged war, 52 and finally a fatal desire for power gained ground, which, in many cases, made the path to the throne a bloody one.

53 Lastly, the laws, during the rule of the people, remained uncorrupted and were studiously observed. 54 Before the monarchy there were very few prophets to admonish the people, but after the establishment of kings there were a great number at the same time. 55 Obadiah saved a hundred from death and hid them away, lest they should be slain with the rest. 56 The people, so far as we can see,

were never deceived by false prophets till after the power had been vested in kings, whose creatures many of the prophets were. 57 Again, the people, whose heart was generally proud or humble according to its circumstances, easily corrected itself under misfortune, turned again to God, restored His laws, and so freed itself from all peril; 58 but the kings, whose hearts were always equally puffed up, and who could not be corrected without humiliation, clung pertinaciously to their vices, even till the last overthrow of the city.

59 We may now clearly see from what I have said:-

(I.) How hurtful to religion and the State is the concession to ministers of religion of any power of issuing decrees or transacting the business of government: 60 how, on the contrary, far greater stability is afforded, if the said ministers are only allowed to give answers to questions duly put to them, and are, as a rule, obliged to preach and practise the received and accepted doctrines.

61 (II.) How dangerous it is to refer to Divine right matters merely speculative and subject or liable to dispute. 62 The most tyrannical governments are those which make crimes of opinions, for everyone has an inalienable right over own thoughts-- nay, such a State of things leads to the rule of popular passion.

63 Pontius Pilate made concession to the passion of the Pharisees in consenting to the crucifixion of Christ, whom he knew to be innocent. 64 Again, the Pharisees, in order to shake the position of people richer than themselves, began to set on foot questions of religion, and accused the Sadducees of impiety, 65 and, following their example, the vilest hypocrites, stirred, as they pretended, by the same holy wrath which they called zeal for the Lord, 66 persecuted people whose unblemished character and distinguished virtue had excited the popular hatred, publicly denounced their opinions, and inflamed the fierce passions of the people against them.

67 This wanton licence being cloaked with the specious garb of religion could not easily be repressed, especially when the sovereign authorities introduced a sect of which they were not the head; 68 they were then regarded not as interpreters of Divine right, but as sectarians-- that is, as persons recognising the right of Divine interpretation assumed by the leaders of the sect. 69 The authority of the magistrates thus became of little account in such matters in comparison with the authority of sectarian leaders before whose interpretations kings were obliged to bow.

70 To avoid such evils in a State, there is no safer way, than to make

piety and religion to consist in acts only-- 71 that is, in the practice of justice and charity, leaving everyone's judgment in other respects free. But I will speak of this more at length presently.

72 (III.) We see how necessary it is, both in the interests of the State and in the interests of religion, to confer on the sovereign power the right of deciding what is lawful or the reverse. 73 If this right of judging actions could not be given to the very prophets of God without great injury to the State and religion, how much less should it be entrusted to those who can neither foretell the future nor work miracles! But this again I will treat of more fully hereafter.

74 (IV.) Lastly, we see how disastrous it is for a people unaccustomed to kings, and possessing a complete code of laws, to set up a monarchy. 75 Neither can the subjects brook such a sway, nor the royal authority submit to laws and popular rights set up by anyone inferior to itself. 76 Still less can a king be expected to defend such laws, for they were not framed to support own dominion, but the dominion of the people, or some council which formerly ruled, so that in guarding the popular rights the king would seem to be a slave rather than a master. 77 The representative of a new monarchy will employ all own zeal in attempting to frame new laws, so as to wrest the rights of dominion to own use, and to reduce the people till they find it easier to increase than to curtail the royal prerogative. 78 I must not, however, omit to State that it is no less dangerous to remove a monarch, though are on all hands admitted to be a tyrant. 79 For own people are accustomed to royal authority and will obey no other, despising and mocking at any less august control.

80 It is therefore necessary, as the prophets discovered of old, if one king be removed, that he should be replaced by another, who will be a tyrant from necessity rather than choice. 81 For how will he be able to endure the sight of the hands of the citizens reeking with royal blood, and to rejoice in their regicide as a glorious exploit? 82 Was not the deed perpetrated as an example and warning for himself? 83 If he really wishes to be king, and not to acknowledge the people as the judge of kings and the master of himself, or to wield a precarious sway, he must avenge the death of his predecessor, making an example for his own sake, lest the people should venture to repeat a similar crime. 84 He will not, however, be able easily to avenge the death of the tyrant by the slaughter of citizens unless he defends the cause of tyranny and approves the deeds of his predecessor, thus following in his footsteps.

85 Hence it comes to pass that peoples have often changed their tyrants, but never removed them or changed the monarchical form of government into any other.

86 The English people furnish us with a terrible example of this fact. They sought how to depose their monarch under the forms of law, 87 but when he had been removed, they were utterly unable to change the form of government, and after much bloodshed only brought it about, that a new monarch should be hailed under a different name (as though it had been a mere question of names); 88 this new monarch could only consolidate own power by completely destroying the royal stock, putting to death the king's friends, real or supposed, 89 and disturbing with war the peace which might encourage discontent, in order that the populace might be engrossed with novelties and divert its mind from brooding over the slaughter of the king. 90 At last, however, the people reflected that it had accomplished nothing for the good of the country beyond violating the rights of the lawful king and changing everything for the worse. 91 It therefore decided to retrace its steps as soon as possible, and never rested till it had seen a complete restoration of the original state of affairs.

92 It may perhaps be objected that the Roman people was easily able to remove its tyrants, but I gather from its history a strong confirmation of my contention. 93 Though the Roman people was much more than ordinarily capable of removing their tyrants and changing their form of government, 94 inasmuch as it held in its own hands the power of electing its king and his successor, and being composed of rebels and criminals had not long been used to the royal yoke (out of its six kings it had put to death three), 95 nevertheless it could accomplish nothing beyond electing several tyrants in place of one, who kept it groaning under a continual State of war, both foreign and civil, 96 till at last it changed its government again to a form differing from monarchy, as in England, only in name.

97 As for the United States of the Netherlands, they have never, as we know, had a king, but only counts, who never attained the full rights of dominion. 98 The States of the Netherlands evidently acted as principals in the settlement made by them at the time of the Earl of Leicester's mission: 99 they always reserved for themselves the authority to keep the counts up to their duties, and the power to preserve this authority and the liberty of the citizens. 100 They had ample means of vindicating their rights if their rulers should prove tyrannical, and could impose such restraints that nothing

could be done without their consent and approval.
101 Thus the rights of sovereign power have always been vested in the States, though the last count endeavoured to usurp them. 102 It is therefore little likely that the States should give them up, especially as they have just restored their original dominion, lately almost lost.
103 These examples, then, confirm us in our belief, that every dominion should retain its original form, and, indeed, cannot change it without danger of the utter ruin of the whole State. 104 Such are the points I have here thought worthy of remark.

IT IS SHOWN THAT THE RIGHT OVER MATTERS SPIRITUAL LIES WHOLLY WITH THE SOVEREIGN, AND THAT THE OUTWARD FORMS OF RELIGION SHOULD BE IN ACCORDANCE WITH PUBLIC PEACE, IF WE WOULD OBEY GOD ARIGHT

Benedict of Spinoza

4 When I said that the possessors of sovereign power have rights over everything, and that all rights are dependent on their decree, I did not merely mean temporal rights, but also spiritual rights; 2 of the latter, no less than the former, they ought to be the interpreters and the champions. 3 I wish to draw special attention to this point, and to discuss it fully in this chapter, 4 because many persons deny that the right of deciding religious questions belongs to the sovereign power, and refuse to acknowledge it as the interpreter of Divine right. 5 They accordingly assume full licence to accuse and arraign it, nay, even to excommunicate it from the Church, as Ambrosius treated the Emperor Theodosius in old time. 6 However, I will show later on in this chapter that they take this means of dividing the government, and paving the way to their own ascendancy. 7 I wish, however, first to point out that religion acquires its force as law solely from the decrees of the sovereign. 8 God has no special kingdom among humans except in so far as He reigns through temporal rulers. 9 Moreover, the rites of religion and the outward observances of piety should be in accordance with the public peace and well-being, and should therefore be determined by the sovereign power alone. 10 I speak here only of the outward observances of piety and the external rites of religion, not of piety, itself, nor of the inward worship of God, 11 nor the means by which the mind is inwardly led to do homage to God in singleness of heart.
12 Inward worship of God and piety in itself are within the sphere of everyone's private rights, and cannot be alienated (as I showed at the end of the Book of

INTERPRETATION). 13 What I here mean by the kingdom of God is, I think, sufficiently clear from what has been said in the Book of FAITH. 14 I there showed that a person best fulfils God's law who worships Him, according to His command, through acts of justice and charity; 15 it follows, therefore, that wherever justice and charity have the force of law and ordinance, there is God's kingdom.

16 I recognise no difference between the cases where God teaches and commands the practice of justice and charity through our natural faculties, and those where He makes special revelations; 17 nor is the form of the revelation of importance so long as such practice is revealed and becomes a sovereign and supreme law to humans. 18 If, therefore, I show that justice and charity can only acquire the force of right and law through the rights of rulers, I shall be able readily to arrive at the conclusion (seeing that the rights of rulers are in the possession of the sovereign), 19 that religion can only acquire the force of right by means of those who have the right to command, and that God only rules among humans through the instrumentality of earthly potentates. 20 It follows from what has been said, that the practice of justice and charity only acquires the force of law through the rights of the sovereign authority; 21 for we showed in chapter-1 of this Book of THE STATE. that in the State of Nature reason has no more rights than desire, 22 but that people living either by the laws of the former or the laws of the latter, possess rights co-extensive with their powers.

23 For this reason we could not conceive sin to exist in the State of Nature, nor imagine God as a judge punishing human's transgressions; 24 but we supposed all things to happen according to the general laws of universal Nature, 25 there being no difference between pious and impious, between one that was pure (as Solomon says) and one that was impure, because there was no possibility either of justice or charity.

26 In order that the true doctrines of reason, that is (as we showed in the Book of MIRACLES), the true Divine doctrines might obtain absolutely the force of law and right, 27 it was necessary that each individual should cede your own natural right, and transfer it either to society as a whole, or to a certain body of people, or to one person. 28 Then, and not till then, does it first dawn upon us what is justice and what is injustice, what is equity and what is iniquity.

29 Justice, therefore, and absolutely all the precepts of reason, including love towards one's neighbour, receive the force

of laws and ordinances solely through the rights of dominion, 30 that is (as we showed in the same chapter) solely on the decree of those who possess the right to rule. 31 Inasmuch as the kingdom of God consists entirely in rights applied to justice and charity or to true religion, it follows that (as we asserted) the kingdom of God can only exist among humans through the means of the sovereign powers; 32 nor does it make any difference whether religion be apprehended by our natural faculties or by revelation: 33 the argument is sound in both cases, inasmuch as religion is one and the same, and is equally revealed by God, whatever be the manner in which it becomes known to humans.

34 Thus, in order that the religion revealed by the prophets might have the force of law among the Jews, it was necessary that every person of them should yield up own natural right, 35 and that all should, with one accord, agree that they would only obey such commands as God should reveal to them through the prophets. 36 Just as we have shown to take place in a democracy, where people with one consent agree to live according to the dictates of reason. 37 Although the Hebrews furthermore transferred their right to God, they were able to do so rather in theory than in practice, 38 for, as a matter of fact (as we pointed out above) they absolutely retained the right of dominion till they transferred it to Moses, who in his turn became absolute king, so that it was only through him that God reigned over the Hebrews. 39 For this reason (namely, that religion only acquires the force of law by means of the sovereign power) 40 Moses was not able to punish those who, before the covenant, and consequently while still in possession of their rights, violated the Sabbath (Exodus, chapter-16, verse:27), 41 but was able to do so after the covenant (Numbers, chapter-15, verse:36), because everyone had then yielded up own natural rights, and the ordinance of the Sabbath had received the force of law.

42 Lastly, for the same reason, after the destruction of the Hebrew dominion, revealed religion ceased to have the force of law; 43 for we cannot doubt that as soon as the Jews transferred their right to the king of Babylon, the kingdom of God and the Divine right forthwith ceased. 44 For the covenant wherewith they promised to obey all the utterances of God was abrogated; God's kingdom, which was based thereupon, also ceased. 45 The Hebrews could no longer abide thereby, inasmuch as their rights no longer belonged to them but to the king of Babylon, whom (as we showed in chapter-1 of this Book of THE STATE.) they were

bound to obey in all things. 46 Jeremiah (chapter-29, verse:7) expressly admonishes them of this fact: "And seek the peace of the city, whither I have caused you to be carried away captives, and pray unto the Lord for it; for in the peace thereof shall ye have peace." 47 Now, they could not seek the peace of the City as having a share in its government, but only as slaves, being, as they were, captives; 48 by obedience in all things, with a view to avoiding seditions, and by observing all the laws of the country, however different from their own. 49 It is thus abundantly evident that religion among the Hebrews only acquired the form of law through the right of the sovereign rule; 50 when that rule was destroyed, it could no longer be received as the law of a particular kingdom, but only as the universal precept of reason. 51 I say of reason, for the universal religion had not yet become known by revelation. 52 We may therefore draw the general conclusion that religion, whether revealed through our natural faculties or through prophets, receives the force of a command solely through the decrees of the holders of sovereign power; 53 and, further, that God has no special kingdom among humans, except in so far as He reigns through earthly potentates.

54 We may now see in a clearer light what was Stated in the Book of LAW, chapter-1, namely, that all the decrees of God involve eternal truth and necessity, so that we cannot conceive God as a prince or legislator giving laws to humankind. 55 For this reason the Divine precepts, whether revealed through our natural faculties, or through prophets, do not receive immediately from God the force of a command, but only from those, or through the mediation of those, who possess the right of ruling and legislating. 56 It is only through these latter means that God rules among humans, and directs human affairs with justice and equity.

57 This conclusion is supported by experience, for we find traces of Divine justice only in places where just people bear sway; 58 elsewhere the same lot (to repeat, again Solomon's words) befalls the just and the unjust, the pure and the impure: a State of things which causes Divine Providence to be doubted by many who think that God immediately reigns among humans, and directs all nature for their benefit.

59 As, then, both reason and experience tell us that the Divine right is entirely dependent on the decrees of secular rulers, it follows that secular rulers are its proper interpreters. 60 How this is so we shall now see, for it is time to show that the outward observances of religion, and all the external practices of piety should be brought into accordance with the

public peace and well-being if we would obey God rightly. 61 When this has been shown we shall easily understand how the sovereign rulers are the proper interpreters of religion and piety.

62 It is certain that duties towards one's country are the highest that people can fulfil; for, if government be taken away, no good thing can last, all falls into dispute, anger and anarchy reign unchecked amid universal fear. 63 Consequently there can be no duty towards our neighbour which would not become an offence if it involved injury to the whole State, 64 nor can there be any offence against our duty towards our neighbour, or anything but loyalty in what we do for the sake of preserving the State. 65 For instance: it is in the abstract my duty when my neighbour quarrels with me and wishes to take my cloak, to give you my coat also; 66 but if it be thought that such conduct is hurtful to the maintenance of the State, I ought to bring you to trial, even at the risk of your being condemned to death.

67 For this reason Manlius Torquatus is held up to honour, inasmuch as the public welfare outweighed with him his duty towards his children. 68 This being so, it follows that the public welfare is the sovereign law to which all others, Divine and human, should be made to conform. 69 Now, it is the function of the sovereign only to decide what is necessary for the public welfare and the safety of the State, and to give orders accordingly; 70 therefore it is also the function of the sovereign only to decide the limits of our duty towards our neighbour-- in other words, to determine how we should obey God. 71 We can now clearly understand how the sovereign is the interpreter of religion, and further, that no one can obey God rightly, if the practices of one’s piety do not conform to the public welfare; or, consequently, if one does not implicitly obey all the commands of the sovereign. 72 For as by God's command we are bound to do our duty to all people without exception, and to do no person an injury, we are also bound not to help one person at another's loss or disadvantage, still less at a loss or disadvantage to the whole State. 73 Now, no private citizen can know what is good for the State, except you learn it through the sovereign power, who alone has the right to transact public business: 74 therefore no one can rightly practise piety or obedience to God, unless you obey the sovereign power's commands in all things. 75 This proposition is confirmed by the facts of experience. For if the sovereign adjudge a person to be worthy of death or an enemy, whether you be a citizen or a foreigner, a private

individual or a separate ruler, no subject is allowed to give you assistance. 76 So also though the Jews were bidden to love their fellow-citizens as themselves (Leviticus. Chapter-19, verse:17 and 18), 77 they were nevertheless bound, if a person offended against the law, to point you out to the judge (Leviticus, chapter-5, verse:1, and Deuteronomy, chapter-13, verse:8 and 9), 78 and, if you should be condemned to death, to slay you (Deuteronomy, chapter-17, verse:7).

79 Further, in order that the Hebrews might preserve the liberty they had gained, and might retain absolute sway over the territory they had conquered, it was necessary, as we showed in this Book of THE STATE, chapter-2, that their religion should be adapted to their particular government, 80 and that they should separate themselves from the rest of the nations: wherefore it was commanded to them, "Love thy neighbour and hate thine enemy" (Matthew, chapter-5, verse:43), 81 but after they had lost their dominion and had gone into captivity in Babylon, Jeremiah bid them take thought for the safety of the State into which they had been led captive; 82 and Christ when He saw that they would be spread over the whole world, told them to do their duty by all people without exception; all of which instances show that religion has always been made to conform to the public welfare. 83 Perhaps someone will ask: By what right, then, did the disciples of Christ, being private citizens, preach a new religion? 84 I answer that they did so by the right of the power which they had received from Christ against unclean spirits (see Matthew, chapter-10, verse:1). 85 I have already Stated in chapter-1 of this Book of THE STATE. that all are bound to obey a tyrant, unless they have received from God through undoubted revelation a promise of aid against him; 86 so let no one take example from the Apostles unless you too has the power of working miracles. 87 The point is brought out more clearly by Christ's command to His disciples, "Fear not those who kill the body" (Matthew. Chapter-10. verse:28). 88 If this command were imposed on everyone, governments would be founded in vain, and Solomon's words (Proverbs, chapter-24, verse:21), "My son, fear God and the king," would be impious, which they certainly are not; 89 we must therefore admit that the authority which Christ gave to His disciples was given to them only, and must not be taken as an example for others.

90 I do not pause to consider the arguments of those who wish to separate secular rights from spiritual rights, placing the former under the control of the sovereign, and the latter under the control of the universal Church; such

pretensions are too frivolous to merit refutation. 91 I cannot however, pass over in silence the fact that such persons are woefully deceived when they seek to support their seditious opinions by the example of the Jewish high priest, who, in ancient times, had the right of administering the sacred offices. 92 Did not the high priests receive their right by the decree of Moses (who, as I have shown, retained the sole right to rule), and could they not by the same means be deprived of it? 93 Moses himself chose not only Aaron, but also his son Eleazar, and his grandson Phineas, and bestowed on them the right of administering the office of high priest. 94 This right was retained by the high priests afterwards, but none the less were they delegates of Moses-- that is, of the sovereign power. 95 Moses, as we have shown, left no successor to his dominion, but so distributed his prerogatives, that those who came after him seemed, as it were, regents who administer the government when a king is absent but not dead.

96 In the second commonwealth the high priests held their right absolutely, after they had obtained the rights of principality in addition 97 Wherefore the rights of the high priesthood always depended on the edict of the sovereign, and the high priests did not possess them till they became sovereigns also. 98 Rights in matters spiritual always remained under the control of the kings absolutely (as I will show at the end of this chapter), except in the single particular that they were not allowed to administer in person the sacred duties in the Temple, 99 inasmuch as they were not of the family of Aaron, and were therefore considered unclean, a reservation which would have no force in a Christian community.

100 We cannot, therefore, doubt that the daily sacred rites (whose performance does not require a particular genealogy but only a special mode of life, and from which the holders of sovereign power are not excluded as unclean) are under the sole control of the sovereign power; 101 no one, save by the authority or concession of such sovereign, has the right or power of administering them, of choosing others to administer them, of defining or strengthening the foundations of the Church and its doctrines; 102 of judging on questions of morality or acts of piety; of receiving anyone into the Church or excommunicating them therefrom, or, lastly, of providing for the poor. 103 These doctrines are proved to be not only true (as we have already pointed out), but also of primary necessity for the preservation of religion and the State. 104 We all know what weight spiritual right and authority

carries in the popular mind: how everyone hangs on the lips, as it were, of those who possess it. 105 We may even say that those who wield such authority have the most complete sway over the popular mind.

106 Whosoever, therefore, wishes to take this right away from the sovereign power, is desirous of dividing the dominion; 107 from such division, contentions, and strife will necessarily spring up, as they did of old between the Jewish kings and high priests, and will defy all attempts to allay them. 108 Nay, further, you who strives to deprive the sovereign power of such authority, is aiming (as we have said), at gaining dominion for yourself. 109 What is left for the sovereign power to decide on, if this right be denied? 110 Certainly nothing concerning either war or peace, if you have to ask another human's opinion as to whether what they believes to be beneficial would be pious or impious. 111 Everything would depend on the verdict of you who had the right of deciding and judging what was pious or impious, right or wrong.

112 When such a right was bestowed on the Pope of Rome absolutely, he gradually acquired complete control over the kings, till at last he himself mounted to the summits of dominion; 113 however much monarchs, and especially the German emperors, strove to curtail his authority, were it only by a hairsbreadth, they effected nothing, but on the contrary by their very endeavours largely increased it. 114 That which no monarch could accomplish with fire and sword, ecclesiastics could bring about with a stroke of the pen; 115 whereby we may easily see the force and power at the command of the Church, and also how necessary it is for sovereigns to reserve such prerogatives for themselves.

116 If we reflect on what was said in the last chapter we shall see that such reservation conduced not a little to the increase of religion and piety; 117 for we observed that the prophets themselves, though gifted with Divine efficacy, being merely private citizens, rather irritated than reformed the people by their freedom of warning, reproof, and denunciation, 118 whereas the kings by warnings and punishments easily bent people to their will. 119 Furthermore, the kings themselves, not possessing the right in question absolutely, very often fell away from religion and took with them nearly the whole people. The same thing has often happened from the same cause in Christian States.

120 Perhaps I shall be asked, "But if the holders of sovereign power choose to be wicked, who will be the rightful champion of piety? Should the sovereigns still be its interpreters?" 121 I meet them with the counter-question, "But if

ecclesiastics (who are also human, and private citizens, and who ought to mind only their own affairs), 122 or if others whom it is proposed to entrust with spiritual authority, choose to be wicked, should they still be considered as piety's rightful interpreters?" 123 It is quite certain that when sovereigns wish to follow their own pleasure, whether they have control over spiritual matters or not, the whole State, spiritual and secular, will go to ruin, 124 and the State will go to ruin much faster if private citizens seditiously assume the championship of the Divine rights.

125 Thus we see that not only is nothing gained by denying such rights to sovereigns, but on the contrary, great evil ensues. 126 For (as happened with the Jewish kings who did not possess such rights absolutely) rulers are thus driven into wickedness, and the injury and loss to the State become certain and inevitable, instead of uncertain and possible. 127 Whether we look to the abstract truth, or the security of States, or the increase of piety, we are compelled to maintain that the Divine right, or the right of control over spiritual matters, depends absolutely on the decree of the sovereign, who is its legitimate interpreter and champion. 128 Therefore the true ministers of God's word are those who teach piety to the people in obedience to the authority of the sovereign rulers by whose decree it has been brought into conformity with the public welfare.

129 There remains for me to point out the cause for the frequent disputes on the subject of these spiritual rights in Christian States; whereas the Hebrews, so far as I know, never, had any doubts about the matter. 130 It seems monstrous that a question so plain and vitally important should thus have remained undecided, and that the secular rulers could never obtain the prerogative without controversy, nay, nor without great danger of sedition and injury to religion. 131 If no cause for this state of things were forthcoming, I could easily persuade myself that all I have said in this chapter is mere theorising, or a kind of speculative reasoning which can never be of any practical use. 132 However, when we reflect on the beginnings of Christianity the cause at once becomes manifest. The Christian religion was not taught at first by kings, but by private persons, 133 who, against the wishes of those in power, whose subjects they were, were for a long time accustomed to hold meetings in secret churches, to institute and perform sacred rites, and on their own authority to settle and decide on their affairs without regard to the State, 134 When, after the lapse of many years, the religion was taken up by the

authorities, the ecclesiastics were obliged to teach it to the emperors themselves as they had defined it: 135 wherefore they easily gained recognition as its teachers and interpreters, and the church pastors were looked upon as vicars of God. 136 The ecclesiastics took good care that the Christian kings should not assume their authority, by prohibiting marriage to the chief ministers of religion and to its highest interpreter. 137 They furthermore elected their purpose by multiplying the dogmas of religion to such an extent and so blending them with philosophy 138 that their chief interpreter was bound to be a skilled philosopher and theologian, and to have leisure for a host of idle speculations: conditions which could only be fulfilled by a private individual with much time on your hands.

139 Among the Hebrews things were very differently arranged: for their Church began at the same time as their dominion, 140 and Moses, their absolute ruler, taught religion to the people, arranged their sacred rites, and chose their spiritual ministers. 141 Thus the royal authority carried very great weight with the people, and the kings kept a firm hold on their spiritual prerogatives.

142 Although, after the death of Moses, no one held absolute sway, yet the power of deciding both in matters spiritual and matters temporal was in the hands of the secular chief, as I have already pointed out. 143 Further, in order that it might be taught religion and piety, the people was bound to consult the supreme judge no less than the high priest (Deuteronomy, chapter-17, verses:9 and 11). 144 Lastly, though the kings had not as much power as Moses, nearly the whole arrangement and choice of the sacred ministry depended on their decision. 145 Thus David arranged the whole service of the Temple (see 1 Chronicles, chapter-28, verses:11, 12); 146 from all the Levites he chose twenty-four thousand for the sacred psalms; six thousand of these formed the body from which were chosen the judges and proctors, four thousand were porters, and four thousand to play on instruments (see 1 Chronicles, chapter-23, verses:4, 5). 147 He further divided them into companies (of whom he chose the chiefs), so that each in rotation, at the allotted time, might perform the sacred rites. 148 The priests he also divided into as many companies; I will not go through the whole catalogue, but refer the reader to 2 Chronicles, chapter-8, verse:13, 149 where it is Stated, "Then Solomon offered burnt offerings to the Lord . . . . . after a certain rate every day, offering according to the commandments of Moses;" 150 and in verse:14, "And he appointed, according to the order of David his father, the courses of the priests to their

service . . . . . for so had David the man of God commanded." 151 Lastly, the historian bears witness in verse:15: "And they departed not from the commandment of the king unto the priests and Levites concerning any matter, or concerning the treasuries."
152 From these and other histories of the kings it is abundantly evident, that the whole practice of religion and the sacred ministry depended entirely on the commands of the king.
153 When I said above that the kings had not the same right as Moses to elect the high priest, to consult God without intermediaries, and to condemn the prophets who prophesied during their reign; 154 I said so simply because the prophets could, in virtue of their mission, choose a new king and give absolution for regicide, not because they could call a king who offended against the law to judgment, or could rightly act against him.
155 Wherefore if there had been no prophets who, in virtue of a special revelation, could give absolution for regicide, the kings would have possessed absolute rights over all matters both spiritual and temporal. 156 Consequently the rulers of modern times, who have no prophets and would not rightly be bound in any case to receive them (for they are not subject to Jewish law), have absolute possession of the spiritual prerogative, 157 although they are not celibates, and they will always retain it, if they will refuse to allow religious dogmas to be unduly multiplied or confounded with philosophy.

THAT IN A FREE State EVERY PERSON MAY THINK WHAT YOU LIKES, AND SAY WHAT YOU THINKS

Benedict of Spinoza

5 If humans' minds were as easily controlled as their tongues, every king would sit safely on his throne, and government by compulsion would cease; 2 for every subject would shape own life according to the intentions of their rulers, and would esteem a thing true or false, good or evil, just or unjust, in obedience to their dictates. 3 However, we have shown already in this Book of THE STATE, chapter-2 that no human's mind can possibly lie wholly at the disposition of another, for no one can willingly transfer own natural right of free reason and judgment, or be compelled so to do. 4 For this reason government which attempts to control minds is accounted tyrannical, 5 and it is considered an abuse of sovereignty and a usurpation of the rights of subjects, to seek to prescribe what shall be accepted as true, or rejected as false, or what opinions should actuate people in their

worship of God. 6 All these questions fall within a human's natural right, which you cannot abdicate even with your own consent.

7 I admit that the judgment can be biassed in many ways, and to an almost incredible degree, so that while exempt from direct external control it may be so dependent on another person's words, that it may fitly be said to be ruled by that person; 8 but although this influence is carried to great lengths, it has never gone so far as to invalidate the Statement, that every human's understanding is your own, and that brains are as diverse as palates.

9 Moses, not by fraud, but by Divine virtue, gained such a hold over the popular judgment that he was accounted superhuman, and believed to speak and act through the inspiration of the Deity; 10 nevertheless, even he could not escape murmurs and evil interpretations. How much less then can other monarchs avoid them! 11 Yet such unlimited power, if it exists at all, must belong to a monarch, and least of all to a democracy, where the whole or a great part of the people wield authority collectively. 12 This is a fact which I think everyone can explain for yourself.

13 However unlimited, therefore, the power of a sovereign may be, however implicitly it is trusted as the exponent of law and religion, it can never prevent humans from forming judgments according to their intellect, or being influenced by any given emotion. 14 It is true that it has the right to treat as enemies all people whose opinions do not, on all subjects, entirely coincide with its own; but we are not discussing its strict rights, but its proper course of action. 15 I grant that it has the right to rule in the most violent manner, and to put citizens to death for very trivial causes, but no one supposes it can do this with the approval of sound judgment. 16 Nay, inasmuch as such things cannot be done without extreme peril to itself, we may even deny that it has the absolute power to do them, or, consequently, the absolute right; for the rights of the sovereign are limited by own power.

17 Since, therefore, no one can abdicate own freedom of judgment and feeling; since every person is by indefeasible natural right the master of your own thoughts, 18 it follows that humans thinking in diverse and contradictory fashions, cannot, without disastrous results, be compelled to speak only according to the dictates of the supreme power. 19 Not even the most experienced, to say nothing of the multitude, know how to keep silence. 20 Humans' common failing is to confide their plans to others, 21 though there be need for secrecy, so that a government would be most harsh which

deprived the individual of own freedom of saying and teaching what you thought; and would be moderate if such freedom were granted. 22 Still we cannot deny that authority may be as much injured by words as by actions; hence, although the freedom we are discussing cannot be entirely denied to subjects, its unlimited concession would be most baneful; 23 we must, therefore, now inquire, how far such freedom can and ought to be conceded without danger to the peace of the State, or the power of the rulers; 24 and this, as I said at the beginning of this book of THE STATE, chapter-1, is my principal object. 25 It follows, plainly, from the explanation given above, of the foundations of a State, that the ultimate aim of government is not to rule, or restrain, by fear, nor to exact obedience, 26 but contrariwise, to free every human from fear, that you may live in all possible security; in other words, to strengthen your natural right to exist and work without injury to yourself or others.

27 No, the object of government is not to change people from rational beings into beasts or puppets, but to enable them to develop their minds and bodies in security, 28 and to employ their reason unshackled; neither showing hatred, anger, or deceit, nor watched with the eyes of jealousy and injustice. 29 In fact, the true aim of government is liberty.

30 Now we have seen that in forming a State the power of making laws must either be vested in the body of the citizens, or in a portion of them, or in one person. 31 For, although humans' free judgments are very diverse, each one thinking that one alone knows everything, and although complete unanimity of feeling and speech is out of the question, 32 it is impossible to preserve peace, unless individuals abdicate their right of acting entirely on their own judgment. 33 Therefore, the individual justly cedes the right of free action, though not of free reason and judgment; 34 no one can act against the authorities without danger to the State, though your feelings and judgment may be at variance therewith; 35 you may even speak against them, provided that you does so from rational conviction, not from fraud, anger, or hatred, and provided that you does not attempt to introduce any change on your private authority.

36 For instance, supposing a person shows that a law is repugnant to sound reason, and should therefore be repealed; if you submits your opinion to the judgment of the authorities (who, alone, have the right of making and repealing laws), 37 and meanwhile acts in nowise contrary to that law, you have deserved well

of the State, and has behaved as a good citizen should; 38 but if you accuses the authorities of injustice, and stirs up the people against them, or if you seditiously strives to abrogate the law without their consent, you are a mere agitator and rebel.

39 Thus we see how an individual may declare and teach what one believes, without injury to the authority of your rulers, or to the public peace; 40 namely, by leaving in their hands the entire power of legislation as it affects action, and by doing nothing against their laws, though you be compelled often to act in contradiction to what you believes, and openly feels, to be best.

41 Such a course can be taken without detriment to justice and dutifulness, nay, it is the one which a just and dutiful person would adopt. 42 We have shown that justice is dependent on the laws of the authorities, so that no one who contravenes their accepted decrees can be just, 43 while the highest regard for duty, as we have pointed out in the preceding chapter, is exercised in maintaining public peace and tranquillity; 44 these could not be preserved if every person were to live as you pleased; therefore it is no less than undutiful for a person to act contrary to own country's laws, for if the practice became universal the ruin of States would necessarily follow.

45 Hence, so long as a person acts in obedience to the laws of own rulers, you in nowise contravenes your reason, for in obedience to reason you transferred the right of controlling your actions from your own hands to theirs. 46 This doctrine we can confirm from actual custom, for in a conference of great and small powers, schemes are seldom carried unanimously, yet all unite in carrying out what is decided on, whether they voted for or against. 47 But I return to my proposition.

From the fundamental notions of a State, we have discovered how a person may exercise free judgment without detriment to the supreme power: 48 from the same premises we can no less easily determine what opinions would be seditious. Evidently those which by their very nature nullify the compact by which the right of free action was ceded. 49 For instance, a man who holds that the supreme power has no rights over him, or that promises ought not to be kept, or that everyone should live as you pleases, or other doctrines of this nature in direct opposition to the above-mentioned contract, is seditious, 50 not so much from his actual opinions and judgment, as from the deeds which they involve; for you who maintains such theories abrogates the contract which tacitly, or openly, you made with your rulers. 51 Other opinions which do not

involve acts violating the contract, such as revenge, anger, and the like, are not seditious, 52 unless it be in some corrupt State, where superstitious and ambitious persons, unable to endure people of learning, are so popular with the multitude that their word is more valued than the law.

53 However, I do not deny that there are some doctrines which, while they are apparently only concerned with abstract truths and falsehoods, are yet propounded and published with unworthy motives. 54 This question we have discussed in the Book of THEOSOPHY, chapter-7, and shown that reason should nevertheless remain unshackled. 55 If we hold to the principle that a person's loyalty to the State should be judged, like your loyalty to God, from your actions only--namely, from your charity towards your neighbours; 56 we cannot doubt that the best government will allow freedom of philosophical speculation no less than of religious belief. 57 I confess that from such freedom inconveniences may sometimes arise, but what question was ever settled so wisely that no abuses could possibly spring therefrom? 58 You who seeks to regulate everything by law, is more likely to arouse vices than to reform them. 59 It is best to grant what cannot be abolished, even though it be in itself harmful. 60 How many evils spring from luxury, envy, avarice, drunkenness, and the like, yet these are tolerated--vices as they are-- because they cannot be prevented by legal enactments. 61 How much more then should free thought be granted, seeing that it is in itself a virtue and that it cannot be crushed! 62 Besides, the evil results can easily be checked, as I will show, by the secular authorities, not to mention that such freedom is absolutely necessary for progress in science and the liberal arts: 63 for no person follows such pursuits to advantage unless your judgment be entirely free and unhampered.

64 But let it be granted that freedom may be crushed, and people be so bound down, that they do not dare to utter a whisper, save at the bidding of their rulers; 65 nevertheless this can never be carried to the pitch of making them think according to authority, so that the necessary consequences would be that people would daily be thinking one thing and saying another, to the corruption of good faith, 66 that mainstay of government, and to the fostering of hateful flattery and perfidy, whence spring stratagems, and the corruption of every good art.

67 It is far from possible to impose uniformity of speech, for the more rulers strive to curtail freedom of speech, the more obstinately are they resisted; 68 not indeed by the

avaricious, the flatterers, and other numskulls, who think supreme salvation consists in filling their stomachs and gloating over their money-bags, but by those whom good education, sound morality, and virtue have rendered more free. 69 Humans, as generally constituted, are most prone to resent the branding as criminal of opinions which they believe to be true, and the proscription as wicked of that which inspires them with piety towards God and human; 70 hence they are ready to forswear the laws and conspire against the authorities, thinking it not shameful but honourable to stir up seditions and perpetuate any sort of crime with this end in view. 71 Such being the constitution of human nature, we see that laws directed against opinions affect the generous minded rather than the wicked, 72 and are adapted less for coercing criminals than for irritating the upright; so that they cannot be maintained without great peril to the State.

73 Moreover, such laws are almost always useless, for those who hold that the opinions proscribed are sound, cannot possibly obey the law; 74 whereas those who already reject them as false, accept the law as a kind of privilege, and make such boast of it, that authority is powerless to repeal it, even if such a course be subsequently desired.

75 To these considerations may be added what we said in this Book of THE STATE, chapter-3. in treating of the history of the Hebrews. 76 And, lastly, how many schisms have arisen in the Church from the attempt of the authorities to decide by law the intricacies of theological controversy! 77 If people were not allured by the hope of getting the law and the authorities on their side, of triumphing over their adversaries in the sight of an applauding multitude, and of acquiring honourable distinctions, they would not strive so maliciously, nor would such fury sway their minds. 78 This is taught not only by reason but by daily examples, 79 for laws of this kind prescribing what every person shall believe and forbidding anyone to speak or write to the contrary, have often been passed, as sops 80 or concessions to the anger of those who cannot tolerate people of enlightenment, and who, by such harsh and crooked enactments, can easily turn the devotion of the masses into fury and direct it against whom they will. 81 How much better would it be to restrain popular anger and fury, instead of passing useless laws, which can only be broken by those who love virtue and the liberal arts, thus paring down the State till it is too small to harbour people of talent. 82 What greater misfortune for a State can be conceived then that honourable people should be sent like

criminals into exile, because they hold diverse opinions which they cannot disguise? 83 What, I say, can be more hurtful than that people who have committed no crime or wickedness should, simply because they are enlightened, be treated as enemies and put to death, 84 and that the scaffold, the terror of evil-doers, should become the arena where the highest examples of tolerance and virtue are displayed to the people with all the marks of ignominy that authority can devise?

85 You that knows yourself to be upright does not fear the death of a criminal, and shrinks from no punishment; your mind is not wrung with remorse for any disgraceful deed: 86 you holds that death in a good cause is no punishment, but an honour, and that death for freedom is glory.

87 What purpose then is served by the death of such people, what example in proclaimed? 88 The cause for which they die is unknown to the idle and the foolish, hateful to the turbulent, loved by the upright. 89 The only lesson we can draw from such scenes is to flatter the persecutor, or else to imitate the victim.

90 If formal assent is not to be esteemed above conviction, and if governments are to retain a firm hold of authority and not be compelled to yield to agitators, it is imperative that freedom of judgment should be granted, 91 so that people may live together in harmony, however diverse, or even openly contradictory their opinions may be. 92 We cannot doubt that such is the best system of government and open to the fewest objections, since it is the one most in harmony with human nature. 93 In a democracy (the most natural form of government, as we have shown in this Book of THE STATE, chapter-1, everyone submits to the control of authority over own actions, but not over own judgment and reason; 94 that is, seeing that all cannot think alike, the voice of the majority has the force of law, subject to repeal if circumstances bring about a change of opinion. 95 In proportion as the power of free judgment is withheld we depart from the natural condition of humankind, and consequently the government becomes more tyrannical.

96 In order to prove that from such freedom no inconvenience arises, which cannot easily be checked by the exercise of the sovereign power, and that humans' actions can easily be kept in bounds, though their opinions be at open variance, 97 it will be well to cite an example. Such an one is not very, far to seek. 98 The city of Amsterdam reaps the fruit of this freedom in its own great prosperity and in the admiration of all other people. 99 For in this

most flourishing State, and most splendid city, people of every nation and religion live together in the greatest harmony, 100 and ask no questions before trusting their goods to a fellow-citizen, save whether you be rich or poor, and whether you generally acts honestly, or the reverse. 101 Your religion and sect is considered of no importance: for it has no effect before the judges in gaining or losing a cause, 102 and there is no sect so despised that its followers, provided that they harm no one, pay every person own due, and live uprightly, are deprived of the protection of the magisterial authority.

103 On the other hand, when the religious controversy between Remonstrants and Counter-Remonstrants began to be taken up by politicians and the States, it grew into a schism, 104 and abundantly showed that laws dealing with religion and seeking to settle its controversies are much more calculated to irritate than to reform, and that they give rise to extreme licence: 105 further, it was seen that schisms do not originate in a love of truth, which is a source of courtesy and gentleness, but rather in an inordinate desire for supremacy, 106 From all these considerations it is clearer than the sun at noonday, that the true schismatics are those who condemn other people's writings, 107 and seditiously stir up the quarrelsome masses against their authors, rather than those authors themselves, who generally write only for the learned, and appeal solely to reason. 108 In fact, the real disturbers of the peace are those who, in a free State, seek to curtail the liberty of judgment which they are unable to tyrannise over.

109 I have thus shown:-

(I.) That it is impossible to deprive humans of the liberty of saying what they think.

110 (II.) That such liberty can be conceded to every person without injury to the rights and authority of the sovereign power, 111 and that every person may retain it without injury to such rights, provided that you does not presume upon it to the extent of introducing any new rights into the State, or acting in any way contrary, to the existing laws.

112 (III.) That every person may enjoy this liberty without detriment to the public peace, and that no inconveniences arise therefrom which cannot easily be checked.

113 (IV.) That every person may enjoy it without injury to own allegiance.

114 (V.) That laws dealing with speculative problems are entirely useless.

115 (VI.) Lastly, that not only may such liberty be granted without prejudice to the public peace, to loyalty, and to the rights of rulers,

but that it is even necessary, for their preservation. 116 For when people try to take it away, and bring to trial, not only the acts which alone are capable of offending, but also the opinions of humankind, they only succeed in surrounding their victims with an appearance of martyrdom, 117 and raise feelings of pity and revenge rather than of terror. 118 Uprightness and good faith are thus corrupted, flatterers and traitors are encouraged, and sectarians triumph, inasmuch as concessions have been made to their animosity, and they have gained the State sanction for the doctrines of which they are the interpreters. 119 Hence they arrogate to themselves the State authority and rights, and do not scruple to assert that they have been directly chosen by God, and that their laws are Divine, 120 whereas the laws of the State are human, and should therefore yield obedience to the laws of God-- in other words, to their own laws. 121 Everyone must see that this is not a State of affairs conducive to public welfare. 122 Wherefore, as we have shown in this Book of THE STATE, chapter-3, the safest way for a State is to lay down the rule that religion is comprised solely in the exercise of charity and justice, 123 and that the rights of rulers in sacred, no less than in secular matters, should merely have to do with actions, but that every person should think what you likes and say what you thinks. 124 I have thus fulfilled the task I set myself in this treatise. It remains only to call attention to the fact that I have written nothing which I do not most willingly submit to the examination and approval of my country's rulers; 125 and that I am willing to retract anything which they shall decide to be repugnant to the laws, or prejudicial to the public good. 126 I know that I am a human, and as a human liable to error, but against error I have taken scrupulous care, and have striven to keep in entire accordance with the laws of my country, with loyalty, and with morality.

The Book of Divine Panagogue called

REFLECTION

LIFE AND CHARACTER
Johann Wolfgang von Goethe

1 There is nothing worth thinking but it has been thought before; we must only try to think it again.

2 How can a person come to know own self? Never by thinking, but by doing. Try to do your duty, and you will know at once what you are worth.

3 But what is your duty? The claims of the day.

4 The world of reason is to be regarded as a great and immortal being, who ceaselessly works out what is necessary, and so makes own self lord also over what is accidental.

5 The longer I live, the more it grieves me to see human, you occupies your own supreme place for the very purpose of imposing your will upon Nature, and freeing yourself and yourself from an outrageous necessity,-- 6 to see you taken up with some false notion, and doing just the opposite of what you wants to do; and then, because the whole bent of your mind is spoilt, bungling miserably over everything.

7 Be genuine and strenuous; earn for yourself, and look for, grace from those in high places; from the powerful, favour; from the active and the good, advancement; from the many, affection; from the individual, love.

8 Tell me with whom you associate, and I will tell you who you are. If I know what your business is, I know what can be made of you.

9 Every person must think after own fashion; for on your own path you finds a truth, or a kind of truth, which helps you through life. 10 But you must not give yourself the rein; you must control yourself; mere naked instinct does not become you.

11 Unqualified activity, of whatever kind, leads at last to bankruptcy.

12 In the works of humankind, as in those of Nature, it is really the motive which is chiefly worth attention.

13 People get out of countenance with themselves and others because they treat the means as the

end, and so, from sheer doing, do nothing, or, perhaps, just what they would have avoided.

14 Our plans and designs should be so perfect in truth and beauty, that in touching them the world could only mar. 15 We should thus have the advantage of setting right what is wrong, and restoring what is destroyed.

16 It is a very hard and troublesome thing to dispose of whole, half-, and quarter-mistakes; to sift them and assign the portion of truth to its proper place.

17 It is not always needful for truth to take a definite shape; it is enough if it hovers about us like a spirit and produces harmony; if it is wafted through the air like the sound of a bell, grave and kindly.

18 General ideas and great conceit are always in a fair way to bring about terrible misfortune.

19 You cannot play the flute by blowing alone: you must use your fingers.

20 In Botany there is a species of plants called *Incompletæ*; and just in the same way it can be said that there are humans who are incomplete and imperfect. 21 They are those whose desires and struggles are out of proportion to their actions and achievements.

22 The most insignificant person can be complete if you works within the limits of your capacities, innate or acquired; 23 but even fine talents can be obscured, neutralised, and destroyed by lack of this indispensable requirement of symmetry. 24 This is a mischief which will often occur in modern times; for who will be able to come up to the claims of an age so full and intense as this, and one too that moves so rapidly?

25 It is only people of practical ability, knowing their powers and using them with moderation and prudence, who will be successful in worldly affairs.

26 It is a great error to take oneself for more than one is, or for less than one is worth.

27 From time to time I meet with a youth in whom I can wish for no alteration or improvement, only I am sorry to see how often their nature makes them quite ready to swim with the stream of the time; 28 and it is on this that I would always insist, that human in your fragile boat has the rudder placed

in your hand, just that you may not be at the mercy of the waves, but follow the direction of your own insight.

29 But how is a young person to come of yourself to see blame in things which every one is busy with, which every one approves and promotes? 30 Why should you not follow your natural bent and go in the same direction as they?

31 I must hold it for the greatest calamity of our time, which lets nothing come to maturity, that one moment is consumed by the next, and the day spent in the day; 32 so that a person is always living from hand to mouth, without having anything to show for it. 33 Have we not already newspapers for every hour of the day! A good head could assuredly intercalate one or other of them. 34 They publish abroad everything that every one does, or is busy with or meditating; nay, your very designs are thereby dragged into publicity. 35 No one can rejoice or be sorry, but as a pastime for others; and so it goes on from house to house, from city to city, from kingdom to kingdom, and at last from one hemisphere to the other,-- all in post haste.

36 As little as you can stifle a steam-engine, so little can you do this in the moral sphere either. 37 The activity of commerce, the rush and rustle of paper-money, the swelling-up of debts to pay debts-- all these are the monstrous elements to which in these days a young person is exposed. 38 Well is it for you if you are gifted by nature with a sober, quiet temperament; neither to make claims on the world out of all proportion to your position, nor yet let the world determine it.

39 But on all sides you are threatened by the spirit of the day, and nothing is more needful than to make you see early enough the direction in which your will has to steer.

40 The significance of the most harmless words and actions grows with the years, 41 and if I see any one about me for any length of time, I always try to show them the difference there is between sincerity, confidence, and indiscretion; 42 nay, that in truth there is no difference at all, but a gentle transition from what is most

innocent to what is most hurtful; a transition which must be perceived or rather felt.

43 Herein we must exercise our tact; otherwise in the very way in which we have won the favour of humankind, we run the risk of trifling it away again unawares. 44 This is a lesson which a person learns quite well for yourself in the course of life, but only after having paid a dear price for it; nor can you, unhappily, spare your posterity a like expenditure.

45 Love of truth shows itself in this, that a person knows how to find and value the good in everything.

46 Character calls forth character.

47 If I am to listen to another person's opinion, it must be expressed positively. Of things problematical I have enough in myself.

48 Superstition is a part of the very being of humanity; and when we fancy that we are banishing it altogether, it takes refuge in the strangest nooks and corners, and then suddenly comes forth again, as soon as it believes itself at all safe.

49 I keep silence about many things, for I do not want to put people out of countenance; and I am well content if they are pleased with things that annoy me.

50 Everything that frees our spirit without giving us control of ourselves is ruinous.

51 A human is really alive only when you delights in the good-will of others.

52 Piety is not an end, but a means: a means of attaining the highest culture by the purest tranquillity of soul.

53 Hence it may be observed that those who set up piety as an end and object are mostly hypocrites.

54 When a person is old you must do more than when you was young.

55 To fulfill a duty is still always to feel it as a debt, for it is never quite satisfying to oneself.

56 Defects are perceived only by one who has no love; therefore, to see them, a person must become uncharitable, but not more so than is necessary for the purpose.

57 The greatest piece of good fortune is that which corrects our deficiencies and redeems our mistakes.

REFLECTION

58 Reading ought to mean understanding; writing ought to mean knowing something; believing ought to mean comprehending; 59 when you desire a thing, you will have to take it; when you demand it, you will not get it; and when you are experienced, you ought to be useful to others.

60 The stream is friendly to the miller whom it serves; it likes to pour over the mill wheels; what is the good of it stealing through the valley in apathy?

61 Whoso is content with pure experience and acts upon it has enough of truth. The growing child is wise in this sense.

62 Theory is in itself of no use, except in so far as it makes us believe in the connection of phenomena.

63 When a person asks too much and delights in complication, you are exposed to perplexity.

64 Thinking by means of analogies is not to be condemned. Analogy has this advantage, that it comes to no conclusion, and does not, in truth, aim at finality at all. 65 Induction, on the contrary, is fatal, for it sets up an object and keeps it in view, and, working on towards it, drags false and true with it in its train.

66 The absent works upon us by tradition. The usual form of it may be called historical; a higher form, akin to the imaginative faculty, is the mythical. 67 If some third form of it is to be sought behind this last, and it has any meaning, it is transformed into the mystical. 68 It also easily becomes sentimental, so that we appropriate to our use only what suits us.

69 In contemplation as in action, we must distinguish between what may be attained and what is unattainable. Without this, little can be achieved, either in life or in knowledge.

70 'Common sense is the genius of humanity.' 71 Common-sense, which is here put forward as the genius of humanity, must be examined first of all in the way it shows itself. 72 If we inquire the purpose to which humanity puts it, we find as follows: Humanity is conditioned by needs. If they are not satisfied, humans become impatient; and if they are, it seems not to affect them. 73 The normal person moves between these two

states, and you applies your understanding-- your so-called common-sense-- to the satisfaction of your needs. 74 When your needs are satisfied, your task is to fill up the waste spaces of indifference. 75 Here, too, you are successful, if your needs are confined to what is nearest and most necessary. 76 But if they rise and pass beyond the sphere of ordinary wants, common-sense is no longer sufficient; it is a genius no more, and humanity enters on the region of error.

77 There is no piece of foolishness but it can be corrected by intelligence or accident; no piece of wisdom but it can miscarry by lack of intelligence or by accident.

78 Every great idea is a tyrant when it first appears; hence the advantages which it produces change all too quickly into disadvantages. 79 It is possible, then, to defend and praise any institution that exists, if its beginnings are brought to remembrance, and it is shown that everything which was true of it at the beginning is true of it still.

80 Lessing, who chafed under the sense of various limitations, makes one of own characters say: No one *must* do anything. 81 A clever pious man said: If a man *wills* something, he must do it. A third, who was, it is true, an educated man, added: *Will* follows upon *insight*. 82 The whole circle of *knowledge, will*, and *necessity* was thus believed to have been completed. But, as a rule, a person's knowledge, of whatever kind it may be, determines what you shall do and what you shall leave undone, 83 and so it is that there is no more terrible sight than ignorance in action.

84 There are two powers that make for peace: what is right, and what is fitting.

85 Justice insists on obligation, law on decorum. Justice weighs and decides, law superintends and orders. Justice refers to the individual, law to society.

86 The history of knowledge is a great fugue in which the voices of the nations one after the other emerge.

II

87 If a person is to achieve all that is asked of you, you must take yourself for more than you are,

and as long as you does not carry it to an absurd length, we willingly put up with it.

88 Work makes companionship.

89 People whip curds to see if they cannot make cream of them.

90 It is much easier to put yourself in the position of a mind taken up with the most absolute error, than of one which mirrors to itself half-truths.

91 Wisdom lies only in truth.

92 When I err, every one can see it; but not when I lie.

93 Is not the world full enough of riddles already, without our making riddles too out of the simplest phenomena?

94 'The finest hair throws a shadow.' *Erasmus*.

95 What I have tried to do in my life through false tendencies, I have at last learned to understand.

96 Generosity wins favour for every one, especially when it is accompanied by modesty.

97 Before the storm breaks, the dust rises violently for the last time-- the dust that is soon to be laid forever.

98 People do not come to know one another easily, even with the best will and the best purpose. And then ill-will comes in and distorts everything.

99 We should know one another better if one person were not so anxious to put yourself on an equality with another.

100 Eminent people are therefore in a worse plight than others; for, as we cannot compare ourselves with them, we are on the watch for them.

101 In the world the point is, not to know human, but at any given moment to be cleverer than the people who stands before you. You can prove this at every fair and from every charlatan.

102 Not everywhere where there is water, are there frogs; but where you have frogs, there you will find water.

103 Error is quite right as long as we are young, but we must not carry it on with us into our old age.

104 Whims and eccentricities that grow stale are all useless, rank nonsense.

105 In the formation of species Nature gets, as it were, into a *cul-de-sac*; She cannot make Her way through, and is disinclined to turn back. Hence the stubbornness of national character.

REFLECTION

106 Every one has something in own nature which, if you were to express it openly, would of necessity give offence.

107 If a person thinks about own physical or moral condition, you generally finds that you are ill.

108 Nature asks that a person should sometimes be stupefied without going to sleep; hence the pleasure in the smoking of tobacco, the drinking of brandy, the use of opiates.

109 The person who is up and doing should see to it that what you does is right. Whether or not right is done, is a matter which should not trouble you.

110 Many a person knocks about on the wall with own hammer, and believes that you hits the right nail on the head every time.

111 Painting and tattooing of the body is a return to animalism.

112 History-writing is a way of getting rid of the past.

113 What a person does not understand, you does not possess.

114 Not every one who has a pregnant thought delivered to you becomes productive; it probably makes you think of something with which you are quite familiar.

115 Favour, as a symbol of sovereignty, is exercised by weak people.

116 Every person has enough power left to carry out that of which you are convinced.

117 Memory may vanish so long as at the moment judgment does not fail you.

118 No nation gains the power of judgment except it can pass judgment on itself. But to attain this great privilege takes a very long time.

119 Instead of contradicting my words, people ought to act in my spirit.

120 Those who oppose intellectual truths do but stir up the fire, and the cinders fly about and burn what they had else not touched.

121 Human would not be the finest creature in the world if you were not too fine for it.

122 What a long time people were vainly disputing about the Antipodes!

123 Certain minds must be allowed their peculiarities.

124 Snow is false purity.

125 Whoso shrinks from ideas ends by having nothing but sensations.

REFLECTION

126 Those from whom we are always learning are rightly called our masters; but not every one who teaches us deserves this title.

127 It is with you as with the sea: the most varied names are given to what is in the end only salt water.

128 It is said that vain self-praise stinks in the nostrils. That may be so; but for the kind of smell which comes from unjust blame by others the public has no nose at all.

129 There are problematical natures which are equal to no position in which they find themselves, and which no position satisfies. 130 This it is that causes that hideous conflict which wastes life and deprives it of all pleasure.

131 If we do any real good, it is mostly *clam, vi, et precario*.

132 Dirt glitters as long as the sun shines.

133 It is difficult to be just to the passing moment. We are bored by it if it is neither good nor bad; but the good moment lays a task upon us, and the bad moment a burden.

134 You are the happiest person who can set the end of your life in connection with the beginning.

135 So obstinately contradictory is human that you cannot compel you to your advantage, yet you yields before everything that forces you to your hurt.

136 Forethought is simple, afterthought manifold.

137 A state of things in which every day brings some new trouble is not the right one.

138 When people suffer by failing to look before them, nothing is commoner than trying to look out for some possible remedy.

139 The Hindoos of the Desert make a solemn vow to eat no fish.

140 To venture an opinion is like moving a piece at chess: it may be taken, but it forms the beginning of a game that is won.

141 It is as certain as it is strange that truth and error come from one and the same source. Thus it is that we are often not at liberty to do violence to error, because at the same time we do violence to truth.

142 Truth belongs to the person, error to your age. This is why it has been said that, while the misfortune of the age caused your error, the force of your soul made you emerge from the error with glory.

143 Every one has own peculiarities and cannot get rid of

them; and yet many a one is destroyed by own peculiarities, and those too of the most innocent kind.

144 If a person does think too much of yourself, you are more than you believes yourself to be.

145 In art and knowledge, as also in deed and action, everything depends on a pure apprehension of the object and a treatment of it according to its nature.

146 When intelligent and sensible people despise knowledge in their old age, it is only because they have asked too much of it and of themselves.

147 I pity those who make much ado about the transitory nature of all things and are lost in the contemplation of earthly vanity: are we not here to make the transitory permanent? This we can do only if we know how to value both.

148 A rainbow which lasts a quarter of an hour is looked at no more.

149 It used to happen, and still happens, to me to take no pleasure in a work of art at the first sight of it, because it is too much for me; but if I suspect any merit in it, I try to get at it; 150 and then I never fail to make the most gratifying discoveries,-- to find new qualities in the work itself and new faculties in myself.

151 Faith is private capital, kept in one's own house. There are public savings-banks and loan-offices, which supply individuals in their day of need; but here the creditor quietly takes own interest for own self.

152 Real obscurantism is not to hinder the spread of what is true, clear, and useful, but to bring into vogue what is false.

153 During a prolonged study of the lives of various people both great and small, I came upon this thought: 154 In the web of the world the one may well be regarded as the warp, the other as the woof. 155 It is the little people, after all, who give breadth to the web, and the great people firmness and solidity; perhaps, also, the addition of some sort of pattern. 156 But the scissors of the Fates determine its length, and to that all the rest must join in submitting itself.

157 Truth is a torch, but a huge one, and so it is only with blinking

eyes that we all of us try to get past it, in actual terror of being burnt.

158 'The wise have much in common with one another.' *Æschylus*.

159 The really foolish thing in people who are otherwise intelligent is that they fail to understand what another person says, when you does not exactly hit upon the right way of saying it.

160 Because a man speaks, he thinks he is able to speak about language.

161 One need only grow old to become gentler in one's judgments. I see no fault committed which I could not have committed myself.

162 The person who acts never has any conscience; no one has any conscience but the person who thinks.

163 Why should those who are happy expect one who is miserable to die before them in a graceful attitude, like the gladiator before the Roman mob?

164 Some one asked Timon about the education of his children. 'Let them,' he said, 'be instructed in that which they will never understand.'

165 There are people whom I wish well, and would that I could wish better.

166 By force of habit we look at a clock that has run down as if it were still going, and we gaze at the face of a beauty as though she still loved.

167 Hatred is active displeasure, envy passive. We need not wonder that envy turns so soon to hatred.

168 There is something magical in rhythm; it even makes us believe that we possess the sublime.

169 Dilettantism treated seriously, and knowledge pursued mechanically, end by becoming pedantry.

170 No one but the master can promote the cause of Art. Patrons help the master,-- that is right and proper; but that does not always mean that Art is helped.

171 The most foolish of all errors is for clever young people to believe that they forfeit their originality in recognising a truth which has already been recognised by others.

172 Scholars are generally malignant when they are refuting others; and if they think a person is making a mistake, they

straightway look upon you as their mortal enemy.

173 Beauty can never really understand itself.

III

174 It is much easier to recognise error than to find truth; for error lies on the surface and may be overcome; but truth lies in the depths, and to search for it is not given to every one.

175 We all live on the past, and through the past are destroyed.

176 We are no sooner about to learn some great lesson than we take refuge in our own innate poverty of soul, and yet for all that the lesson has not been quite in vain.

177 The world of empirical morality consists for the most part of nothing but ill-will and envy.

178 Life seems so vulgar, so easily content with the commonplace things of every day, and yet it always nurses and cherishes certain higher claims in secret, and looks about for the means of satisfying them.

179 Confidences are strange things. If you listen only to one person, it is possible that you are deceived or mistaken; if you listen to many, they are in a like case; and, generally, you cannot get at the truth at all.

180 No one should desire to live in irregular circumstances; but if by chance a person falls into them, they test your character and show of how much determination you are capable.

181 An honourable person with limited ideas often sees through the rascality of the most cunning jobber.

182 If a person feels no love, you must learn how to flatter; otherwise you will not succeed.

183 Against criticism a person can neither protest nor defend yourself; you must act in spite of it, and then criticism will gradually yield to you.

184 The masses cannot dispense with people of ability, and such people are always a burden to them.

185 If a person spreads my failings abroad, you are my master, even though you were my servant.

186 Whether memoirs are written by masters of servants, or by servants of masters, the processes always meet.

REFLECTION

187 If you lay duties upon people and give them no rights, you must pay them well.

188 I can promise to be sincere, but not to be impartial.

189 Ingratitude is always a kind of weakness. I have never known people of ability to be ungrateful.

190 We are all so limited that we always think we are right; and so we may conceive of an extraordinary mind which not only errs but has a positive delight in error.

191 It is very rare to find pure and steady activity in the accomplishment of what is good and right. We usually see pedantry trying to keep back, and audacity trying to go on too fast.

192 Word and picture are correlatives which are continually in quest of each other, as is sufficiently evident in the case of metaphors and similes. 193 So from all time what was said or sung inwardly to the ear had to be presented equally to the eye. 194 And so in childish days we see word and picture in continual balance; in the book of the law and in the way of salvation, in the Bible and in the spelling-book. 195 When something was spoken which could not be pictured, and something pictured which could not be spoken, all went well; 196 but mistakes were often made, and a word was used instead of a picture; and thence arose those monsters of symbolical mysticism, which are doubly an evil.

197 For the person of the world a collection of anecdotes and maxims is of the greatest value, if you knows how to intersperse the one in your conversation at fitting moments, and remember the other when a case arises for their application.

198 When you lose interest in anything, you also lose the memory for it.

199 The world is a bell with a crack in it; it rattles, but does not ring.

200 The importunity of young dilettanti must be borne with good-will; for as they grow old they become the truest worshippers of Art and the Master.

201 People have to become really bad before they care for nothing but mischief, and delight in it.

202 Clever people are the best encyclopædia.

REFLECTION

203 There are people who make no mistakes because they never wish to do anything worth doing.

204 If I know my relation to myself and the outer world, I call it truth. Every person can have your own peculiar truth; and yet it is always the same.

205 No one is the master of any truly productive energy; and all people must let it work on by itself.

206 A human never understands how anthropomorphic you are.

207 A difference which offers nothing to the understanding is no difference at all.

208 A person cannot live for every one; least of all for those with whom you would not care to live.

209 If a person sets out to study all the laws, you will have no time left to transgress them.

210 Things that are mysterious are not yet miracles.

211 'Converts are not in my good books.'

212 A frivolous impulsive encouragement of problematical talents was a mistake of my early years; and I have never been able to abandon it altogether.

213 I should like to be honest with you, without our falling out; but it will not do. You act wrongly, and fall between two stools; you win no adherents and lose your friends. What is to be the end of it?

214 It is all one whether you are of high or of humble origin. You will always have to pay for your humanity.

215 When I hear people speak of liberal ideas, it is always a wonder to me that people are so readily put off with empty verbiage. 216 An idea cannot be liberal; but it may be potent, vigorous, exclusive, in order to fulfill its mission of being productive. 217 Still less can a concept be liberal; for a concept has quite another mission. 218 Where, however, we must look for liberality, is in the sentiments; and the sentiments are the inner human as you lives and moves. 219 A person's sentiments, however, are rarely liberal, because they proceed directly from you personally, and from your immediate relations and requirements. 220 Further we will not write, and let us apply this test to what we hear every day.

REFLECTION

221 If a clever person commits a folly, it is not a small one.

222 There is a poetry without figures of speech, which is a single figure of speech.

223 I went on troubling myself about general ideas until I learnt to understand the particular achievements of the best people.

224 It is only when a person knows little, that you knows anything at all. With knowledge grows doubt.

225 The errors of a person are what make you really lovable.

226 There are people who love their like and seek it; others love their opposite and follow after it.

227 If a person has always let yourself think the world as bad as the adversary represents it to be, you must have become a miserable person.

228 Ill-favour and hatred limit the spectator to the surface, even when keen perception is added unto them; 229 but when keen perception unites with good-will and love, it gets at the heart of human and the world; nay, it may hope to reach the highest goal of all.

230 Raw matter is seen by every one; the contents are found only by you who have your eyes about you; and the form is a secret to the majority.

231 We may learn to know the world as we please: it will always retain a bright and a dark side.

232 Error is continually repeating itself in action, and we must unweariedly repeat the truth in word.

233 As in Rome there is, apart from the Romans, a population of statues, so apart from this real world there is a world of illusion, almost more potent, in which most people live.

234 Humankind is like the Red Sea: the staff has scarcely parted the waves asunder, before they flow together again.

235 Thoughts come back; beliefs persist; facts pass by never to return.

236 Of all peoples, the Greeks have dreamt the dream of life the best.

237 We readily bow to antiquity, but not to posterity. It is only a father that does not grudge talent to his son.

238 There is no virtue in subordinating oneself; but there is virtue in descending, and in

recognising anything as above us, which is beneath us.

239 The whole art of living consists in giving up existence in order to exist.

240 All our pursuits and actions are a wearying process. Well is it for you who wearies not.

241 Hope is the second soul of the unhappy.

242 Love is a true renovator.

243 Humankind is not without a wish to serve; hence the chivalry of the French is a servitude.

244 In the theatre the pleasure of what we see and hear restrains our reflections.

245 There is no limit to the increase of experience, but theories cannot become clearer and more complete in just the same sense. 246 The field of experience is the whole universe in all directions. 247 Theory remains shut up within the limits of the human faculties. Hence there is no way of looking at the world, 248 but it recurs, and the curious thing happens, that with increased experience a limited theory may again come into favour.

249 It is always the same world which stands open to observation, which is continually being contemplated or guessed at; 250 and it is always the same people who live in the true or in the false; more at their ease in the latter than in the former.

251 Truth is at variance with our natures, but not so error; and for a very simple reason. Truth requires us to recognise ourselves as limited, but error flatters us with the belief that in one way or another we are subject to no bounds at all.

252 That some people think they can still do what they have been able to do, is natural enough; that others think they can do what they have never been able to do, is singular, but not rare.

253 At all times it has not been the age, but individuals alone, who have worked for knowledge. 254 It was the age which put Socrates to death by poison, the age which burnt Huss. The ages have always remained alike.

255 That is true Symbolism, where the more particular represents the more general, not as a dream or shade, but as a vivid, instantaneous revelation of the Inscrutable.

REFLECTION

256 Everything of an abstract or symbolic nature, as soon as it is challenged by realities, ends by consuming them and itself. So credit consumes both money and itself.

257 Mastery often passes for egoism.

258 With Protestants, as soon as good works cease and their merit is denied, sentimentality takes their place.

259 If a person knows where to get good advice, it is as though you could supply it yourself.

260 The use of mottoes is to indicate something we have not attained, but strive to attain. It is right to keep them always before our eyes.

261 'If a person cannot lift a stone yourself, let you leave it, even though you have some one to help you.'

262 Despotism promotes general self-government, because from top to bottom it makes the individual responsible, and so produces the highest degree of activity.

263 A person must pay dear for own errors if you wishes to get rid of them, and even then you are lucky.

264 Enthusiasm is of the greatest value, so long as we are not carried away by it.

265 School itself is the only true preparation for it.

266 Error is related to truth as sleep to waking. I have observed that on awakening from error a person turns again to truth as with new vigour.

267 Every one suffers who does not work for own self. A person works for others to have them share in your joy.

268 Humans' prejudices rest upon their character for the time being and cannot be overcome, as being part and parcel of themselves. Neither evidence nor common-sense nor reason has the slightest influence upon them.

269 Characters often make a law of their failings. People who know the world have said that when prudence is only fear in disguise, its scruples cannot be conquered.

270 The weak often have revolutionary sentiments; they think they would be well off if they were not ruled, and fail to perceive that they can rule neither themselves nor others.

REFLECTION

271 Common-sense is born pure in the healthy human, is self-developed, and is revealed by a resolute perception and recognition of what is necessary and useful. 272 Practical men and women avail themselves of it with confidence. Where it is absent, both sexes find anything necessary when they desire it, and useful when it gives them pleasure.

273 All people, as they attain freedom, give play to their errors. The strong do too much, and the weak too little.

274 The conflict of the old, the existing, the continuing, with development, improvement, and reform, is always the same. 275 Order of every kind turns at last to pedantry, and to get rid of the one, people destroy the other; and so it goes on for a while, until people perceive that order must be established anew. 276 Classicism and Romanticism; close corporations and freedom of trade; the maintenance of large estates and the division of the land,-- it is always the same conflict which ends by producing a new one. 277 The best policy of those in power would be so to moderate this conflict as to let it right itself without the destruction of either element. 278 But this has not been granted to people, and it seems not to be the will of God.

279 A great work limits us for the moment, because we feel it above our powers; and only in so far as we afterwards incorporate it with our culture, and make it part of our mind and heart, does it become a dear and worthy object.

280 It is no wonder that we all more or less delight in the mediocre, because it leaves us in peace: it gives us the comfortable feeling of intercourse with what is like ourselves.

281 There is no use in reproving vulgarity, for it never changes.

282 We cannot escape a contradiction in ourselves; we must try to resolve it. If the contradiction comes from others, it does not affect us: it is their affair.

283 There are many things in the world that are at once good and excellent, but they do not come into contact.

284 Which is the best government? That which teaches us to govern ourselves.

REFLECTION

285 When people have to do with women, they get spun off like a distaff.

286 It may well be that a person is at times horribly threshed by misfortunes, public and private: but the reckless flail of Fate, when it beats the rich sheaves, crushes only the straw; 287 and the corn feels nothing of it and dances merrily on the floor, careless whether its way is to the mill or the furrow.

288 However probable it is that a desire may be fulfilled, there is always a doubt; and so when the desire is realised, it is always surprising.

289 Absurdities presented with good taste rouse disgust and admiration.

290 Of the best society it used to be said: their speech instructs the mind, and their silence the feelings.

291 Nothing is more terrible than ignorance in action.

292 Beauty and Genius must be kept afar if one would avoid becoming their slave.

293 We treat the aged with consideration, as we treat children.

294 An old person loses one of the greatest of human privileges: you are no more judged by your peers.

295 In the matter of knowledge, it has happened to me as to one who rises early, and in the dark impatiently awaits the dawn, and then the sun; but is blinded when it appears.

296 Great primeval powers, evolved in time or in eternity, work on unceasingly: whether to weal or to woe, is a matter of chance.

IV

297 People often say to themselves in life that they should avoid a variety of occupation, and, more particularly, be the less willing to enter upon new work the older they grow. 298 But it is easy to talk, easy to give advice to oneself and others. To grow old is itself to enter upon a new business; all the circumstances change, and a person must either cease acting altogether, or willingly and consciously take over the new rôle.

299 Of the Absolute in the theoretical sense, I do not venture to speak; but this I maintain: that if

a person recognises it in its manifestation, and always keeps your gaze fixed upon it, you will experience very great reward.

300 To live in a great idea means to treat the impossible as though it were possible. 301 It is just the same with a strong character; and when an idea and a character meet, things arise which fill the world with wonder for thousands of years.

302 Napoleon lived wholly in a great idea, but he was unable to take conscious hold of it. After utterly disavowing all ideals and denying them any reality, he zealously strove to realise them. 303 His clear, incorruptible intellect could not, however, tolerate such a perpetual conflict within; and there is much value in the thoughts which he was compelled, as it were, to utter, and which are expressed very peculiarly and with much charm.

304 He considered the idea as a thing of the mind, that had, it is true, no reality, but still, on passing away, left a residuum-- a *caput mortuum*-- to which some reality could not be altogether refused. 305 We may think this a very perverse and material notion; but when he entertained his friends with the never ending consequences of his life and actions, in full belief and confidence in them, he expressed himself quite differently. 306 Then, indeed, he was ready to admit that life produces life; that a fruitful act has effects to all time. 307 He took pleasure in confessing that he had given a great impulse, a new direction, to the course of the world's affairs.

308 It always remains a very remarkable fact that people whose whole personality is almost all idea, are so extremely shy of all phantasy. 309 In this case was Hamann, who could not bear the mention of "things of another world." 310 He took occasion to express himself on this point in a certain paragraph, which he wrote in fourteen different ways; and still, apparently, he was never quite satisfied with it.

311 Two of these attempts have been preserved to us; a third we have ourselves attempted, which we are induced to print here by the preceding observations.

REFLECTION

312 Human is placed as a real being in the midst of a real world, and endowed with such organs that you can perceive and produce the real and also the possible.

313 All healthy people have the conviction of their own existence and of an existence around them. 314 However, even the brain contains a hollow spot, that is to say, a place in which no object is mirrored; just as in the eye itself there is a little spot that does not see. 315 If a person pays particular attention to this spot and is absorbed in it, you falls into a state of mental sickness, has presentiments of "things of another world," which are, in reality, no things at all; 316 possessing neither form nor limit, but alarming you like dark, empty tracts of night, and pursuing you as something more than phantoms, if you does not tear yourself free from them.

317 To the several perversities of the day a person should always oppose only the great masses of universal history.

318 No one can live much with children without finding that they always react to any outward influence upon them.

319 With any specially childish nature the reaction is even passionate, while its action is energetic.

320 That is why children's lives are a series of refined judgments, not to say prejudices; and to efface a rapid but partial perception in order to make way for a more general one, time is necessary. 321 To bear this in mind is one of the teacher's greatest duties.

322 Friendship can only be bred in practice and be maintained by practice. Affection, nay, love itself, is no help at all to friendship. 323 True, active, productive friendship consists in keeping equal pace in life: in my friend approving my aims, while I approve you, and in thus moving forwards together steadfastly, however much our way of thought and life may vary.

V

324 In the world people take a person at your own estimate; but you must estimate yourself at something. 325 Disagreeableness is more easily tolerated than insignificance.

REFLECTION

326 You can force anything on society so long as it has no sequel.

327 We do not learn to know people if they come to us; we must go to them to find out what they are.

328 That we have many criticisms to make on those who visit us, and that, as soon as they depart, we pass no very amiable judgment upon them, seems to me almost natural; 329 for we have, so to speak, a right to measure them by our own standard. Even intelligent and fair-minded people hardly refrain from sharp censure on such occasions.

330 But if, on the contrary, we have been in their homes, and have seen them in their surroundings and habits and the circumstances which are necessary and inevitable for them; 331 if we have seen the kind of influence they exert on those around them, or how they behave, it is only ignorance and ill-will that can find food for ridicule in what must appear to us in more than one sense worthy of respect.

332 What we call conduct and good manners obtains for us that which otherwise is to be obtained only by force, or not even by force.

333 Women's society is the element of good manners.

334 How can the character, the peculiar nature of a person, be compatible with good manners?

335 It is through his good manners that a person's peculiar nature should be made all the more conspicuous. 336 Every one likes distinction, but it should not be disagreeable.

337 The most privileged position, in life as in society, is that of an educated soldier. 338 Rough warriors, at any rate, remain true to their character, and as great strength is usually the cover for good nature, we get on with them at need.

339 No one is more troublesome than an awkward civilian. As your business is not with anything brutal or coarse, you might be expected to show delicacy of feeling.

340 When we live with people who have a delicate sense of what is fitting, we get quite anxious about them if anything happens to disturb this sense.

REFLECTION

341 No one would come into a room with spectacles on his nose, if you knew that women at once lose any inclination to look at or talk to you.

342 A familiar in the place of a respectful demeanour is always ridiculous.

343 There is no outward sign of politeness that will be found to lack some deep moral foundation. The right kind of education would be that which conveyed the sign and the foundation at the same time.

344 A person's manners are the mirror in which you shows your portrait.

345 There is a politeness of the heart, and it is allied to love. It produces the most agreeable politeness of outward demeanour.

346 Voluntary dependence is the best state, and how should that be possible without love?

347 We are never further from our wishes than when we fancy we possess the object of them.

348 No one is more of a slave than you who thinks yourself free without being so.

349 A person has only to declare yourself free to feel at the same moment that you are limited. Should you venture to declare yourself limited, you feels yourself free.

350 Against the great superiority of another there is no remedy but love.

351 It is a terrible thing for an eminent person to be gloried in by fools.

352 It is said that no person is a hero to your valet. That is only because a hero can be recognised only by a hero. The valet will probably know how to appreciate your like,-- your fellow-valet.

353 There is no greater consolation for mediocrity than that the genius is not immortal.

354 The greatest people are linked to their age by some weak point.

355 We generally take people to be more dangerous than they are.

356 Fools and wise folk are alike harmless. It is the half-wise, and the half-foolish, who are the most dangerous.

357 To see a difficult thing lightly handled gives us the impression of the impossible.

358 Difficulties increase the nearer we come to our aim.

REFLECTION

359 Sowing is not so painful as reaping.

360 We are fond of looking to the future, because our secret wishes make us apt to turn in our favour the uncertainties which move about in it hither and thither.

361 It is not easy to be in any great assembly without thinking that the chance which brings so many people together will also make us meet our friends.

362 A person may live never so retired a life but you becomes a debtor or a creditor before you are aware of it.

363 If anyone meets us who owes us a debt of gratitude, it immediately crosses our mind. How often can we meet some one to whom we owe gratitude, without thinking of it!

364 To communicate oneself is *nature*; to receive a communication as it is given is *culture*.

365 No one would speak much in society if you were aware how often we misunderstand others.

366 It is only because we have not understood a thing that we cannot repeat it without alteration.

367 To make a long speech in the presence of others without flattering your audience, is to rouse dislike.

368 Every word that we utter rouses its contrary.

369 Contradiction and flattery make, both of them, bad conversation.

370 The pleasantest society is that in which there exists a genial deference amongst the members one towards another.

371 By nothing do people show their character more than by the things they laugh at.

372 The ridiculous springs from a moral contrast innocently presented to the senses.

373 The sensual person often laughs when there is nothing to laugh at. Whatever it is that moves you, you shows that you are pleased with yourself.

374 An intelligent person finds almost everything ridiculous, a wise person hardly anything.

375 A man well on in years was reproved for still troubling himself about young women. 'It is the only means,' he replied, 'of regaining one's youth; and that is something every one wishes to do.'

REFLECTION

376 A person does not mind being blamed for your faults, and being punished for them, and you patiently suffers much for the sake of them; but you becomes impatient if you are required to give them up.

377 Certain faults are necessary to the individual if you are to exist. We should not like old friends to give up certain peculiarities.

378 It is said of a person that you will soon die, when you acts in any way unlike yourself.

379 What kind of faults in ourselves should we retain, nay, even cultivate? Those which rather flatter other people than offend them.

380 The passions are good or bad qualities, only intensified.

381 Our passions are, in truth, like the phoenix. When the old one burns away, the new one rises out of its ashes at once.

382 Great passions are hopeless diseases. That which could cure them is the first thing to make them really dangerous.

383 Passion is enhanced and tempered by avowal. In nothing, perhaps, is the middle course more desirable than in confidence and reticence towards those we love.

384 To sit in judgment on the departed is never likely to be equitable. We all suffer from life; who except God can call us to account? 385 Let not their faults and sufferings, but what they have accomplished and done, occupy the survivors.

386 It is failings that show human nature, and merits that distinguish the individual; faults and misfortunes we all have in common; virtues belong to each one separately.

VI

387 The secret places in the way of life may not and cannot be revealed: there are rocks of offence on which every traveller must stumble. But the poet points to where they are.

388 It would not be worthwhile to see seventy years if all the wisdom of this world were foolishness with God.

389 The true is Godlike: we do not see it itself; we must guess at it through its manifestations.

REFLECTION

390 The real scholar learns how to evolve the unknown from the known, and draws near the master.

391 In the smithy the iron is softened by blowing up the fire, and taking the dross from the bar. As soon as it is purified, it is beaten and pressed, and becomes firm again by the addition of fresh water. The same thing happens to a person at the hands of your teacher.

392 What belongs to a person, you cannot get rid of, even though you throws it away.

393 Of true religions there are only two: one of them recognises and worships the Holy that without form or shape dwells in and around us; and the other recognises and worships it in its fairest form. Everything that lies between these two is idolatry.

394 It is undeniable that in the Reformation the human mind tried to free itself; 395 and the renaissance of Greek and Roman antiquity brought about the wish and longing for a freer, more seemly, and elegant life. 396 The movement was favoured in no small degree by the fact that people's hearts aimed at returning to a certain simple state of nature, while the imagination sought to concentrate itself.

397 The Saints were all at once driven from heaven; and senses, thought, and heart were turned from a divine mother with a tender child, to the grown human doing good and suffering evil, 398 who was later transfigured into a being half-divine in its nature, and then recognised and honoured as God himself. 399 He stood against a background where the Creator had opened out the universe; a spiritual influence went out from him; his sufferings were adopted as an example, and his transfiguration was the pledge of everlastingness.

400 As a coal is revived by incense, so prayer revives the hopes of the heart.

401 From a strict point of view we must have a reformation of ourselves every day, and protest against others, even though it be in no religious sense.

402 It should be our earnest endeavour to use words coinciding as closely as possible with what we feel, see, think, experience, imagine, and reason. It is an

endeavour which we cannot evade, and which is daily to be renewed.

403 Let every person examine yourself, and you will find this a much harder task than you might suppose; for, unhappily, a person usually takes words as mere make-shifts; your knowledge and your thought are in most cases better than your method of expression.

404 False, irrelevant, and futile ideas may arise in ourselves and others, or find their way into us from without. 405 Let us persist in the effort to remove them as far as we can, by plain and honest purpose.

406 As we grow older, the ordeals grow greater.

407 Where I cannot be moral, my power is gone.

408 A person is not deceived by others, you deceives yourself.

409 Laws are all made by old people and by men. Youths and women want the exceptions, old people the rules.

410 It is not the intelligent person who rules, but intelligence; not the wise person, but wisdom.

411 To praise a person is to put oneself on their level.

412 It is not enough to know, we must also apply; it is not enough to will, we must also do.

413 Chinese, Indian, and Egyptian antiquities are never more than curiosities; it is well to make acquaintance with them; but in point of moral and æsthetic culture they can help us little.

414 The German runs no greater danger than to advance with and by the example of their neighbours. 415 There is perhaps no nation that is fitter for the process of self-development; so that it has proved of the greatest advantage to Germany to have obtained the notice of the world so late.

416 Even people of insight do not see that they try to explain things which lie at the foundation of our experience, and in which we must simply acquiesce.

417 Yet still the attempt may have its advantage, as otherwise we should break off our researches too soon.

418 From this time forward, if a person does not apply yourself to some art or handiwork, you will be in a bad way. 419 In the rapid changes of the world, knowledge

is no longer a furtherance; by the time a person has taken note of everything, you have lost yourself.

420 Besides, in these days the world forces universal culture upon us, and so we need not trouble ourselves further about it; we must appropriate some particular culture.

421 The greatest difficulties lie where we do not look for them.

422 Our interest in public events is mostly the merest philistinism.

423 Nothing is more highly to be prized than the value of each day.

424 *Let them perish who said our things before us!* This is so strange an utterance, that it could only have come from one who fancied oneself autochthonous. 425 The person who looks upon it as an honour to be descended from wise ancestors, will allow them at least as much common-sense as you allows yourself.

426 Strictly speaking, everything depends upon a person's intentions; where these exist, thoughts appear; and as the intentions are, so are the thoughts.

427 If a person lives long in a high position, you does not, it is true, experience all that a human can experience; but you experiences things like them, and perhaps some things that have no parallel elsewhere.

VII

428 The first and last thing that is required of genius is love of truth.

429 To be and remain true to oneself and others, is to possess the noblest attribute of the greatest talents.

430 Great talents are the best means of conciliation.

431 The action of genius is in a way ubiquitous: towards general truths before experience, and towards particular truths after it.

432 An active scepticism is one which constantly aims at overcoming itself, and arriving by means of regulated experience at a kind of conditioned certainty.

433 The general nature of the sceptical mind is its tendency to inquire whether any particular predicate really attaches to any particular object; 434 and the purpose of the inquiry is safely to apply in practice what has thus been discovered and proved.

435 The mind endowed with active powers and keeping with a

practical object to the task that lies nearest, is the worthiest there is on earth.

436 Perfection is the measure of heaven, and the wish to be perfect the measure of human.

437 Not only what is born with you, but also what you acquires, makes the human.

438 A person is well equipped for all the real necessities of life if you trusts your senses, and so cultivates them that they remain worthy of being trusted.

439 The senses do not deceive; it is the judgment that deceives.

440 The lower animal is taught by its organs; human teaches own organs, and dominates them.

441 All direct invitation to live up to ideals is of doubtful value, particularly if addressed to women. 442 Whatever the reason of it may be, a man of any importance collects round him a seraglio of a more or less religious, moral, and æsthetic character.

443 When a great idea enters the world as a Gospel, it becomes an offence to the multitude, which stagnates in pedantry; and to those who have much learning but little depth, it is folly.

444 Every idea appears at first as a strange visitor, and when it begins to be realised, it is hardly distinguishable from phantasy and phantastery.

445 This it is that has been called, in a good and in a bad sense, ideology; and this is why the ideologist is so repugnant to the hard-working, practical person of every day.

446 You may recognise the utility of an idea, and yet not quite understand how to make a perfect use of it.

447 *I believe in God!* That is a fine, a worthy thing to say; but to recognise God where and as He reveals Himself, is the only true bliss on earth.

448 Kepler said: 'My wish is that I may perceive the God whom I find everywhere in the external world, in like manner also within and inside me.' 449 The good person was not aware that in that very moment the divine in youself stood in the closest connection with the divine in the Universe.

450 What is predestination? It is this: God is mightier and wiser than we are, and so He does with us as He pleases.

REFLECTION

451 Toleration should, strictly speaking, be only a passing mood; it ought to lead to acknowledgment and appreciation. To tolerate other people is to affront them.

452 Faith, Love, and Hope once felt, in a quiet sociable hour, a plastic impulse in their nature; they worked together and created a lovely image, a Pandora in the higher sense, Patience.

453 'I stumbled over the roots of the tree which I planted.' It must have been an old forester who said that.

454 A leaf blown by the wind often looks like a bird.

455 Does the sparrow know how the stork feels?

456 Lamps make oil-spots, and candles want snuffing; it is only the light of heaven that shines pure and leaves no stain.

457 If you miss the first button-hole, you will not succeed in buttoning up your coat.

458 A burnt child dreads the fire; an old person who has often been singed is afraid of warming own self.

459 It is not worthwhile to do anything for the world that we have with us, as the existing order may in a moment pass away. 460 It is for the past and the future that we must work: for the past, to acknowledge its merits; for the future, to try to increase its value.

461 Let every person ask yourself with which of your faculties you can and will somehow influence your age.

462 Let no one think that people have waited for you as for the Saviour.

463 Character in matters great and small consists in a person steadily pursuing the things of which you feels yourself capable.

464 The person who wants to be active and has to be so, need only think of what is fitting at the moment, and you will make your way without difficulty. This is where women have the advantage, if they understand it.

465 The moment is a kind of public; a person must deceive it into believing that you are doing something; then it leaves us alone to go our way in secret; whereat its grandchildren cannot fail to be astonished.

466 There are people who put their knowledge in the place of insight.

REFLECTION

467 In some states, as a consequence of the violent movements experienced in almost all directions, there has come about a certain overpressure in the system of education, 468 the harm of which will be more generally felt hereafter; though even now it is perfectly well recognised by capable and honest authorities. 469 Capable people live in a sort of despair over the fact that they are bound by the rules of their office to teach and communicate things which they look upon as useless and hurtful.

470 There is no sadder sight than the direct striving after the unconditioned in this thoroughly conditioned world.

471 Before the Revolution it was all *effort*; afterwards it all changed to *demand*.

472 Can a nation become ripe? That is a strange question. I would answer, Yes! if all the people could be born thirty years of age. 473 But as youth will always be too forward and old age too backward, the really mature person is always hemmed in between them, and has to resort to strange devices to make your way through.

474 It does not look well for monarchs to speak through the press, for power should act and not talk. 475 The projects of the liberal party always bear being read: the person who is overpowered may at least express own views in speech, because you cannot act. 476 When Mazarin was shown some satirical songs on a new tax, 'Let them sing,' said he, 'as long as they pay.'

477 Vanity is a desire of personal glory, the wish to be appreciated, honoured, and run after, not because of one's personal qualities, merits, and achievements, but because of one's individual existence. 478 At best, therefore, it is a frivolous beauty whom it befits.

479 The most important matters of feeling as of reason, of experience as of reflection, should be treated of only by word of mouth. 480 The spoken word at once dies if it is not kept alive by some other word following on it and suited to the hearer. 481 Observe what happens in social converse. If the word is not dead when it reaches the hearer, you murders it at once by a contradiction, a stipulation, a condition, a digression, an

interruption, and all the thousand tricks of conversation. 482 With the written word the case is still worse. No one cares to read anything to which you are not already to some extent accustomed: you demands the known and the familiar under an altered form. 483 Still the written word has this advantage, that it lasts and can await the time when it is allowed to take effect.

484 Both what is reasonable and what is unreasonable have to undergo the like contradiction.

485 Dialectic is the culture of the spirit of contradiction, which is given to human that you may learn to perceive the differences between things.

486 With those who are really of like disposition with yourself, a person cannot long be at variance; you will always come to an agreement again. 487 With those who are really of adverse disposition, you may in vain try to preserve harmony; you will always come to a separation again.

488 Opponents fancy they refute us when they repeat their own opinion and pay no attention to ours.

489 People who contradict and dispute should now and then remember that not every mode of speech is intelligible to every one.

490 Every human hears only what own self understands.

491 I am quite prepared to find that many a reader will disagree with me; but when you have a thing before you in black and white, you must let it stand. Another reader may perhaps take up the very same copy and agree with me.

492 The truest liberality is appreciation.

493 For the strenuous person the difficulty is to recognise the merits of elder contemporaries and not let yourself be hindered by their defects.

494 Some people think about the defects of their friends, and there is nothing to be gained by it. 495 I have always paid attention to the merits of my enemies, and found it an advantage.

496 There are many people who fancy they understand whatever they experience.

497 The public must be treated like women: they must be told absolutely nothing but what they like to hear.

REFLECTION

498 Every age of human has a certain philosophy answering to it. The child comes out as a realist: you finds yourself as convinced that pears and apples exist as that you yourself exists. 499 The youth in a storm of inner passion is forced to turn own gaze within, and feel in advance what one is going to be: you are changed into an idealist. 500 But the person has every reason to become a sceptic: you does well to doubt whether the means you have chosen to your end are the right ones. 501 Before and during action you have every reason for keeping your understanding mobile, that you may not afterwards have to grieve over a false choice. 502 Yet when you grows old you will always confess yourself a mystic: you sees that so much seems to depend on chance; that folly succeeds and wisdom fails; that good and evil fortune are brought unexpectedly to the same level; 503 so it is and so it has been, and old age acquiesces in that which is and was and will be.

504 When a person grows old you must consciously remain at a certain stage.

505 It does not become an old person to run after the fashion, either in thought or in dress. But you must know where you are, and what the others are aiming at.

506 What is called fashion is the tradition of the moment. All tradition carries with it a certain necessity for people to put themselves on a level with it.

507 We have long been busy with the critique of reason. I should like to see a critique of common-sense.

508 It would be a real benefit to humankind if we could convincingly prove to the ordinary intelligence how far it can go; and that is just as much as it fully requires for life on this earth.

509 The thinker makes a great mistake when you asks after cause and effect: they both together make up the indivisible phenomenon.

510 All practical people try to bring the world under their hands; all thinkers, under their heads. How far each succeeds, they may both see for themselves.

511 Shall we say that a person thinks only when you cannot think out that of which you are thinking?

512 What is invention or

discovery? It is the conclusion of what we were looking for.

513 It is with history as with Nature and with everything of any depth, it may be past, present, or future: the further we seriously pursue it, the more difficult are the problems that appear. 514 The person who is not afraid of them, but attacks them bravely, has a feeling of higher culture and greater ease the further you progresses.

515 Every phenomenon is within our reach if we treat it as an inclined plane, which is of easy ascent, though the thick end of the wedge may be steep and inaccessible.

516 If a person would enter upon some course of knowledge, you must either be deceived or deceive yourself, unless external necessity irresistibly determines you. 517 Who would become a physician if, at one and the same time, you saw before you all the horrible sights that await you?

518 How many years must a person do nothing before you can at all know what is to be done and how to do it!

519 Duty: where a person loves what you commands yourself to do.

LITERATURE AND ART
Johann Wolfgang von Goethe

2 When Madame Roland was on the scaffold, she asked for pen and paper, to note the peculiar thoughts that hovered about her on the last journey. It is a pity they were refused, 2 for in a tranquil mind thoughts rise up at the close of life hitherto unthinkable; like blessed inward voices, alighting in glory on the summits of the past.

3 Literature is a fragment of fragments: the least of what happened and was spoken, has been written; and of the things that have been written, very few have been preserved.

4 And yet, with all the fragmentary nature of literature, we find thousand fold repetition; which shows how limited is human's mind and destiny.

5 Excellent work is unfathomable, approach it as you will.

6 It is not language in itself which is correct or forcible or elegant,

but the mind that is embodied in it; 7 and so it is not for a person to determine whether you will give your calculations or speeches or poems the desired qualities: the question is whether Nature has given you the intellectual and moral qualities which fit you for the work,-- 8 the intellectual power of observation and insight, the moral power of repelling the evil spirits that might hinder you from paying respect to truth.

9 The appeal to posterity springs from the pure, strong feeling of the existence of something imperishable; 10 something that, even though it be not at once recognised, will in the end be gratified by finding the minority turn into a majority.

11 When a new literature succeeds, it obscures the effect of an earlier one, and its own effect predominates; so that it is well, from time to time, to look back. 12 What is original in us is best preserved and quickened if we do not lose sight of those who have gone before us.

13 The most original authors of modern times are so, not because they produce what is new, but only because they are able to say things the like of which seem never to have been said before.

14 Thus the best sign of originality lies in taking up a subject and then developing it so fully as to make every one confess that you would hardly have found so much in it.

15 There are many thoughts that come only from general culture, like buds from green branches. When roses bloom, you see them blooming everywhere.

16 Lucidity is a due distribution of light and shade.' *Hamann*.

17 A person who has no acquaintance with foreign languages knows nothing of own language.

18 We must remember that there are many people who, without being productive, are anxious to say something important, and the results are most curious.

19 Deep and earnest thinkers are in a difficult position with regard to the public.

20 Some books seem to have been written, not to teach us anything, but to let us know that the author has known something.

21 An author can show no greater respect for own public than by

never bringing it what it expects, but what you yourself thinks right and proper in that stage of your own and others' culture in which for the time you finds yourself.

22 The so-called Nature-poets are people of active talent, with a fresh stimulus and reaction from an over-cultured, stagnant, mannered epoch of art. They cannot avoid commonplace.

23 Productions are now possible which, without being bad, have no value. They have no value, because they contain nothing; and they are not bad, because a general form of good-workmanship is present to the author's mind.

24 All lyrical work must, as a whole, be perfectly intelligible, but in some particulars a little unintelligible.

25 A romance is a subjective epic in which the author begs leave to treat the world after your own ideas. The only question is, whether you have any ideas; the rest will follow of itself.

26 Subjective or so-called sentimental poetry has now been admitted to an equality with objective and descriptive. This was inevitable; because otherwise the whole of modern poetry would have to be discarded. 27 It is now obvious that when people of truly poetical genius appear, they will describe more of the particular feelings of the inner life than of the general facts of the great life of the world. 28 This has already taken place to such a degree that we have a poetry without figures of speech, which can by no means be refused all praise.

29 Superstition is the poetry of life, and so it does not hurt the poet to be superstitious.

30 That glorious hymn, *Veni Creator Spiritus*, is really an appeal to genius. That is why it speaks so powerfully to people of intellect and power.

31 Translators are like busy match-makers: they sing the praises of some half-veiled beauty, and extol her charms, and arouse an irresistible longing for the original.

32 A Spinoza in poetry becomes a Machiavelli in philosophy.

33 Against the three unities there is nothing to be said, if the subject is very simple; but there are times when thrice three unities, skillfully interwoven, produce a very pleasant effect.

REFLECTION

34 The sentimentality of the English is humorous and tender; of the French, popular and pathetic; of the Germans, naïve and realistic.

35 Mysticism is the scholastic of the heart, the dialectic of the feelings.

36 If a person sets out to reproach an author with obscurity, you should first of all examine your own mind, to see if you are yourself all clearness within. Twilight makes even plain writing illegible.

37 It is with books as with new acquaintances. At first we are highly delighted, if we find a general agreement,-- if we are pleasantly moved on any of the chief sides of our existence. 38 With a closer acquaintance differences come to light; and then reasonable conduct mainly consists in not shrinking back at once, as may happen in youth, 39 but in keeping firm hold of the things in which we agree, and being quite clear about the things in which we differ, without on that account desiring any union.

40 In psychological reflection the greatest difficulty is this: that inner and outer must always be viewed in parallel lines, or, rather, interwoven. 41 It is a continual systole and diastole, an inspiration and an expiration of the living soul. If this cannot be put into words, it should be carefully marked and noted.

42 My relations with Schiller rested on the decided tendency of both of us towards a single aim, and our common activity rested on the diversity of the means by which we endeavoured to attain that aim.

43 Once when a slight difference was mentioned between us, of which I was reminded by a passage in a letter of his, I made the following reflections: 44 There is a great difference between a poet seeking the particular for the universal, and seeing the universal in the particular. 45 The one gives rise to Allegory, where the particular serves only as instance or example of the general; 46 but the other is the true nature of Poetry, namely, the expression of the particular without any thought of, or reference to, the general. 47 If a person grasps the particular vividly, you also grasps the

general, without being aware of it at the time; or you may make the discovery long afterwards.

48 There may be eclectic philosophers, but not an eclectic philosophy.

49 But every one is an eclectic who, out of the things that surround and take place about you, appropriates what is suited to your nature; and this is what is meant by culture and progress, in matters of theory or practice.

50 Various maxims of the ancients, which we are wont to repeat again and again, had a meaning quite different from that which is apt to attach to them in later times.

51 The saying that no one who is unacquainted with or a stranger to geometry should enter the philosopher's school, does not mean that a person must become a mathematician to attain the wisdom of the world.

52 Geometry is here taken in its primary elements, such as are contained in Euclid and laid before every beginner; and then it is the most perfect propædeutic and introduction to philosophy.

53 When a child begins to understand that an invisible point must always come before a visible one, and that the shortest way between two points is a straight line, before you can draw it on your paper with a pencil, you experiences a certain pride and pleasure. 54 And you are not wrong; for you have the source of all thought opened to you; idea and reality, *potentia et actu*, are become clear; 55 the philosopher has no new discovery to bring you; as a mathematician, you have found the basis of all thought for yourself.

56 And if we turn to that significant utterance, *Know thyself*, we must not explain it in an ascetic sense. It is in nowise the self-knowledge of our modern hypochondrists, humorists, and self-tormentors. 57 It simply means: pay some attention to yourself; take note of yourself; so that you may know how you come to stand towards those like you and towards the world. 58 This involves no psychological torture; every capable person knows and feels what it means. It is a piece of good advice which every one will find of the greatest advantage in practice.

REFLECTION

59 Let us remember how great the ancients were; and especially how the Socratic school holds up to us the source and standard of all life and action, and bids us not indulge in empty speculation, but live and do.

60 So long as our scholastic education takes us back to antiquity and furthers the study of the Greek and Latin languages, we may congratulate ourselves that these studies, so necessary for the higher culture, will never disappear.

61 If we set our gaze on antiquity and earnestly study it, in the desire to form ourselves thereon, we get the feeling as if it were only then that we really became humans.

62 The pedagogue, in trying to write and speak Latin, has a higher and grander idea of own self than would be permissible in ordinary life.

63 In the presence of antiquity, the mind that is susceptible to poetry and art feels itself placed in the most pleasing ideal state of Nature; 64 and even to this day the Homeric hymns have the power of freeing us, at any rate, for moments, from the frightful burden which the tradition of several thousand years has rolled upon us.

65 There is no such thing as patriotic art and patriotic science. Both art and science belong, like all things great and good, to the whole world, 66 and can be furthered only by a free and general interchange of ideas among contemporaries, with continual reference to the heritage of the past as it is known to us.

67 Poetical talent is given to peasant as well as to knight; all that is required is that each shall grasp own position and treat it worthily.

68 An historic sense means a sense so cultured that, in valuing the deserts and merits of its own time, it takes account also of the past.

69 The best that history gives us is the enthusiasm it arouses.

70 The historian's duty is twofold: first towards yourself, then towards your readers. 71 As regards yourself, you must carefully examine into the things that could have happened; and, for the reader's sake, you must determine what actually did happen. 72 Your action towards

yourself is a matter between yourself and your colleagues; but the public must not see into the secret that there is little in history which can be said to be positively determined.

73 The historian's duty is to separate the true from the false, the certain from the uncertain, and the doubtful from that which cannot be accepted.

74 It is seldom that any one of great age becomes historical to own self, and finds own contemporaries become historical to you, so that you neither cares nor is able to argue with any one.

75 On a closer examination of the matter, it will be found that the historian does not easily grasp history as something historical. 76 In whatever age you may live, the historian always writes as though you yourself had been present at the time of which you treats, instead of simply narrating the facts and movements of that time. 77 Even the mere chronicler only points more or less to your own limitations, or the peculiarities of your town or monastery or age.

78 We really learn only from those books which we cannot criticise. The author of a book which we could criticise would have to learn from us.

79 That is the reason why the Bible will never lose its power; because, as long as the world lasts, no one can stand up and say: I grasp it as a whole and understand all the parts of it. 80 But we say humbly: as a whole it is worthy of respect, and in all its parts it is applicable.

81 There is and will be much discussion as to the use and harm of circulating the Bible. 82 One thing is clear to me: mischief will result, as heretofore, by using it phantastically as a system of dogma; benefit, as heretofore, by a loving acceptance of its teachings.

83 I am convinced that the Bible will always be more beautiful the more it is understood; 84 the more, that is, we see and observe that every word which we take in a general sense and apply specially to ourselves, had, under certain circumstances of time and place, a peculiar, special, and directly individual reference.

85 The incurable evil of religious controversy is that while one party

wants to connect the highest interest of humanity with fables and phrases, the other tries to rest it on things that satisfy no one.

86 If one has not read the newspapers for some months and then reads them all together, one sees, as one never saw before, how much time is wasted with this kind of literature.

87 The classical is health; and the romantic, disease.

88 Ovid remained classical even in exile: it is not in himself that he sees misfortune, but in his banishment from the metropolis of the world.

89 The romantic is already fallen into its own abysm. It is hard to imagine anything more degraded than the worst of the new productions.

90 Bodies which rot while they are still alive, and are edified by the detailed contemplation of their own decay; dead people who remain in the world for the ruin of others, and feed their death on the living,-- to this have come our makers of literature.

91 When the same thing happened in antiquity, it was only as a strange token of some rare disease; but with the moderns the disease has become endemic and epidemic.

92 Literature decays only as humans become more and more corrupt.

93 What a day it is when we must envy the people in their graves!

94 The things that are true, good, excellent, are simple and always alike, whatever their appearance may be. 95 But the error that we blame is extremely manifold and varying; it is in conflict not only with the good and the true, but also with itself; it is self-contradictory. 96 Thus it is that the words of blame in our literature must necessarily outnumber the words of praise.

97 The Greeks, whose poetry and rhetoric was of a simple and positive character, express approval more often than disapproval. 98 With the Latin writers it is the contrary; and the more poetry and the arts of speech decay, the more will blame swell and praise shrink.

99 'What are tragedies but the versified passions of people who make Heaven knows what out of the external world?'

REFLECTION

100 There are certain empirical enthusiasts who are quite right in showing their enthusiasm over new productions that are good; but they are as ecstatic as if there were no other good work in the world at all.

101 In *Sakontala* the poet appears in his highest function. 102 As the representative of the most natural condition of things, the finest mode of life, the purest moral endeavour, the worthiest majesty, and the most solemn worship, he ventures on common and ridiculous contrasts.

103 Shakespeare's *Henry IV*. If everything were lost that has ever been preserved to us of this kind of writing, the arts of poetry and rhetoric could be completely restored out of this one play.

104 Shakespeare's finest dramas are wanting here and there in facility: they are something more than they should be, and for that very reason indicate the great poet.

105 Shakespeare is dangerous reading for budding talents: he compels them to reproduce him, and they fancy they are producing themselves.

106 Yorick Sterne was the finest spirit that ever worked. To read him is to attain a fine feeling of freedom; his humour is inimitable, and it is not every kind of humour that frees the soul.

107 The peculiar value of so-called popular ballads is that their motives are drawn direct from Nature. This, however, is an advantage of which the poet of culture could also avail yourself, if you knew how to do it.

108 But in popular ballads there is always this advantage, that in the art of saying things shortly uneducated people are always better skilled than those who are in the strict sense of the word educated.

109 *Gemüth = Heart*. The translator must proceed until you reaches the untranslatable; and then only will you have an idea of the foreign nation and the foreign tongue.

110 When we say of a landscape that it has a romantic character, it is the secret feeling of the sublime taking the form of the past, or, what is the same thing, of solitude, absence, or seclusion.

REFLECTION

111 The Beautiful is a manifestation of secret laws-of-Nature, which, without its presence, would never have been revealed.

112 It is said: Artist, study Nature! But it is no trifle to develop the noble out of the commonplace, or beauty out of uniformity.

113 When Nature begins to reveal Her open secret to a human, you feels an irresistible longing for Her worthiest interpreter, Art.

114 For all other Arts we must make some allowance; but to Greek Art alone we are always debtors.

115 There is no surer way of evading the world than by Art; and no surer way of uniting with it than by Art.

116 Even in the moments of highest happiness and deepest misery we need the Artist.

117 False tendencies of the senses are a kind of desire after realism, always better than that false tendency which expresses itself as idealistic longing.

118 The dignity of Art appears perhaps most conspicuously in Music; for in Music there is no material to be deducted. It is wholly form and intrinsic value, and it raises and ennobles all that it expresses.

119 It is only by Art, and especially by Poetry, that the imagination is regulated. Nothing is more frightful than imagination without taste.

120 If we were to despise Art on the ground that it is an imitation of Nature, it might be answered that Nature also imitates much else; 121 further, that Art does not exactly imitate that which can be seen by the eyes, but goes back to that element of reason of which Nature consists and according to which Nature acts.

122 Further, the Arts also produce much out of themselves, and, on the other hand, add much where Nature fails in perfection, in that they possess beauty in themselves.

123 So it was that Pheidias could sculpture a god although he had nothing that could be seen by the eye to imitate, but grasped the appearance which Zeus himself would have if he were to come before our eyes.

124 Art rests upon a kind of religious sense: it is deeply and ineradicably in earnest. Thus it is

that Art so willingly goes hand in hand with Religion.

125 A noble philosopher spoke of architecture as *frozen music*; and it was inevitable that many people should shake their heads over his remark. 126 We believe that no better repetition of this fine thought can be given than by calling architecture a *speechless music*.

127 Art is essentially noble; therefore the artist has nothing to fear from a low or common subject. 128 Nay, by taking it up, you ennobles it; and so it is that we see the greatest artists boldly exercising their sovereign rights.

129 In every artist there is a germ of daring, without which no talent is conceivable.

130 All the artists who are already known to me from so many sides, I propose to consider exclusively from the ethical side; 131 to explain from the subject-matter and method of their work the part played therein by time and place, nation and master, and their own indestructible personality; to mould them to what they became and to preserve them in what they were.

132 Art is a medium of what no tongue can utter; and thus it seems a piece of folly to try to convey its meaning afresh by means of words. 133 But, by trying to do so, the understanding gains; and this, again, benefits the faculty in practice.

134 An artist who produces valuable work is not always able to give an account of own or others' performances.

135 We know of no world except in relation to humankind; and we wish for no Art that does not bear the mark of this relation.

136 Higher aims are in themselves more valuable, even if unfulfilled, than lower ones quite attained.

137 Blunt naïvety, stubborn vigour, scrupulous observance of rule, and any other epithets which may apply to older German Art, are a part of every earlier and simpler artistic method. The older Venetians, Florentines, and others had it all too.

138 Because Albrecht Dürer, with his incomparable talent, could never rise to the idea of the symmetry of beauty, or even to the thought of a fitting conformity to

the object in view, are we never to spurn the ground!

139 Albrecht Dürer had the advantage of a very profound realistic perception, an affectionate human sympathy with all present conditions. He was kept back by a gloomy phantasy, devoid both of form and foundation.

140 It would be interesting to show how Martin Schön stands near him, and how the merits of German Art were restricted to these two; and useful also to show that it was not evening every day.

141 In every Italian school the butterfly breaks loose from the chrysalis.

142 After Klopstock released us from rhyme, and Voss gave us models of prose, are we to make doggerel again like Hans Sachs?

143 Let us be many-sided! Turnips are good, but they are best mixed with chestnuts. And these two noble products of the earth grow far apart.

144 In every kind of Art there is a degree of excellence which may be reached, so to speak, by the mere use of one's own natural talents.

145 But at the same time it is impossible to go beyond that point, unless Art comes to one's aid.

146 In the presence of Nature even moderate talent is always possessed of insight; hence drawings from Nature that are at all carefully done always give pleasure.

147 To make many sketches issue at last in a complete work is something that not even the best artists always achieve.

148 In the sphere of true Art there is no preparatory school, but there is a way of preparation; 149 and the best preparation is the interest of the most insignificant pupil in the work of the master. Colour-grinders have often made excellent painters.

150 If an artist grasps Nature aright and contrives to give its form a nobler, freer grace, no one will understand the source of your inspiration, and every one will swear that you have taken it from the antique.

151 In studying the human form, let the painter reject what is exaggerated, false, and mechanical; but let you learn to grasp of what infinite grace the human body is capable.

REFLECTION

152 Kant taught us the critique of the reason. We must have a critique of the senses if Art in general, and especially German Art, is ever to regain its tone and move forward on the path of life and happiness.

SCIENCE
Johann Wolfgang von Goethe

3 In the sphere of natural science let us remember that we have always to deal with an insoluble problem. 2 Let us prove keen and honest in attending to anything which is in any way brought to our notice, most of all when it does not fit in with our previous ideas. 3 For it is only thereby that we perceive the problem, which does indeed lie in Nature, but still more in human.

4 A person cannot well stand by yourself, and so you are glad to join a party; because if you does not find rest there, you at any rate finds quiet and safety.

5 It is a misfortune to pass at once from observation to conclusion, and to regard both as of equal value; but it befalls many a student.

6 In the history of science and throughout the whole course of its progress we see certain epochs following one another more or less rapidly. 7 Some important view is expressed, it may be original or only revived; sooner or later it receives recognition; 8 fellow workers spring up; the outcome of it finds its way into the schools; it is taught and handed down; and we observe, unhappily, that it does not in the least matter whether the view be true or false. 9 In either case its course is the same; in either case it comes in the end to be a mere phrase, a lifeless word stamped on the memory.

10 First let a person teach own self, and then you will be taught by others.

11 Theories are usually the over-hasty efforts of an impatient understanding that would gladly be rid of phenomena, and so puts in their place pictures, notions, nay, often mere words. 12 We may surmise, or even see quite well, that such theories are make-shifts; but do not passion and party-spirit love a make-shift at all times? And rightly, too, because they stand in so much need of it.

REFLECTION

13 It is difficult to know how to treat the errors of the age. If a person oppose them, you stands alone; if you surrender to them, they bring you neither joy nor credit.

14 There are some hundred Christian sects, every one of them acknowledging God and the Lord in its own way, without troubling themselves further about one another. 15 In the study of Nature, nay, in every study, things must of necessity come to the same pass. 16 For what is the meaning of every one speaking of toleration, and trying to prevent others from thinking and expressing themselves after their own fashion?

17 To communicate knowledge by means of analogy appears to me a process equally useful and pleasant. 18 The analogous case is not there to force itself on the attention or prove anything; it offers a comparison with some other case, but is not in union with it. 19 Several analogous cases do not join to form a seried row: they are like good society, which always suggests more than it grants.

20 To err is to be as though truth did not exist. To lay bare the error to oneself and others is retrospective discovery.

21 With the growth of knowledge our ideas must from time to time be organised afresh. 22 The change takes place usually in accordance with new maxims as they arise, but it always remains provisional.

23 When we find facts within our knowledge exhibited by some new method, or even, it may be, described in a foreign language, they receive a peculiar charm of novelty and wear a fresh air.

24 If two masters of the same art differ in their statement of it, in all likelihood the insoluble problem lies midway between them.

25 The orbits of certainties touch one another; but in the interstices there is room enough for error to go forth and prevail.

26 We more readily confess to errors, mistakes, and shortcomings in our conduct than in our thought. 27 And the reason of it is that the conscience is humble and even takes a pleasure in being ashamed. But the intellect is proud, and if forced to recant is driven to despair.

REFLECTION

28 This also explains how it is that truths which have been recognised are at first tacitly admitted, and then gradually spread, so that the very thing which was obstinately denied appears at last as something quite natural.

29 Ignorant people raise questions which were answered by the wise thousands of years ago.

30 When a person sees a phenomenon before you, your thoughts often range beyond it; when you hears it only talked about, you have no thoughts at all.

31 Authority. Human cannot exist without it, and yet it brings in its train just as much of error as of truth. 32 It perpetuates one by one things which should pass away one by one; it rejects that which should be preserved and allows it to pass away; and it is chiefly to blame for humankind's want of progress.

33 Authority-- the fact, namely, that something has already happened or been said or decided, is of great value; but it is only a pedant who demands authority for everything.

34 An old foundation is worthy of all respect, but it must not take from us the right to build afresh wherever we will.

35 Our advice is that every person should remain in the path you have struck out for yourself, and refuse to be overawed by authority, hampered by prevalent opinion, or carried away by fashion.

36 The various branches of knowledge always tend as a whole to stray away from life, and return thither only by a roundabout way.

37 For they are, in truth, text-books of life: they gather outer and inner experiences into a general and connected whole.

38 An important fact, an ingenious *aperçu*, occupies a very great number of people, at first only to make acquaintance with it; then to understand it; and afterwards to work it out and carry it further.

39 On the appearance of anything new the mass of people ask: What is the use of it? And they are not wrong. For it is only through the use of anything that they can perceive its value.

40 The truly wise ask what the thing is in itself and in relation to other things, and do not trouble themselves about the use of it,-- 41 in other words, about the way in

which it may be applied to the necessities of existence and what is already known. 42 This will soon be discovered by minds of a very different order-- minds that feel the joy of living, and are keen, adroit, and practical.

43 Every investigator must before all things look upon own self as one who is summoned to serve on a jury. 44 You have only to consider how far the statement of the case is complete and clearly set forth by the evidence. Then you draws your conclusion and gives your vote, whether it be that your opinion coincides with that of the foreman or not.

45 And in acting thus you remains equally at ease whether the majority agree with you or you finds yourself in a minority. 46 For you have done what you could: you have expressed your convictions; and you are not master of the minds or hearts of others.

47 In the world of science, however, these sentiments have never been of much account. There everything depends on making opinion prevail and dominate; 48 few people are really independent; the majority draws the individual after it.

49 The history of philosophy, of science, of religion, all shows that opinions spread in masses, but that that always comes to the front which is more easily grasped, that is to say, is most suited and agreeable to the human mind in its ordinary condition. 50 Nay, you who have practised self-culture in the higher sense may always reckon upon meeting an adverse majority.

51 There is much that is true which does not admit of being calculated; just as there are a great many things that cannot be brought to the test of a decisive experiment.

52 It is just for this that human stands so high, that what could not otherwise be brought to light should be brought to light in you.

53 What is a musical string, and all its mechanical division, in comparison with the musician's ear? 54 May we not also say, what are the elementary phenomena of Nature itself compared with human, who must control and modify them all before you can in any way assimilate them to yourself?

REFLECTION

55 To a new truth there is nothing more hurtful than an old error.

56 The ultimate origin of things is completely beyond our faculties; hence when we see anything come into being, we look upon it as having been already there. 57 This is why we find the theory of *emboîtement* intelligible.

58 There are many problems in natural science on which we cannot fittingly speak unless we call metaphysics to our aid; 59 but not the wisdom of the schools, which consists in mere verbiage. It is that which was before physics, exists with it, and will be after it.

60 Since humans are really interested in nothing but their own opinions, every one who puts forward an opinion looks about own self right and left for means of strengthening own self and others in it. 61 A person avails own self of the truth so long as it is serviceable; but you seizes on what is false with a passionate eloquence as soon as you can make a momentary use of it; 62 whether it be to dazzle others with it as a kind of half-truth, or to employ it as a stopgap for effecting an apparent union between things that have been disjointed. 63 This experience at first caused me annoyance, and then sorrow; and now it is a source of mischievous satisfaction. 64 I have pledged myself never again to expose a proceeding of this kind.

65 Everything that we call Invention or Discovery in the higher sense of the word is the serious exercise and activity of an original feeling for truth, 66 which, after a long course of silent cultivation, suddenly flashes out into fruitful knowledge. 67 It is a revelation working from within on the outer world, and lets a person feel that you are made in the image of God. 68 It is a synthesis of World and Mind, giving the most blessed assurance of the eternal harmony of things.

69 A person must cling to the belief that the incomprehensible is comprehensible; otherwise you would not try to fathom it.

70 There are pedants who are also rascals, and they are the worst of all.

71 A person does not need to have seen or experienced everything yourself. But if you are to commit

yourself to another's experiences and your way of putting them, let you consider that you have to do with three things-- the object in question and two subjects.

72 The supreme achievement would be to see that stating a fact is starting a theory.

73 If I acquiesce at last in some ultimate fact of Nature, it is, no doubt, only resignation; 74 but it makes a great difference whether the resignation takes place at the limits of human faculty, or within the hypothetical boundaries of my own narrow individuality.

75 If we look at the problems raised by Aristotle, we are astonished at his gift of observation. 76 What wonderful eyes the Greeks had for many things! 77 Only they committed the mistake of being over-hasty, of passing straightway from the phenomenon to the explanation of it, and thereby produced certain theories that are quite inadequate. 78 But this is the mistake of all times, and still made in our own day.

79 Hypotheses are cradle-songs by which the teacher lulls own scholars to sleep. 80 The thoughtful and honest observer is always learning more and more of own limitations; you sees that the further knowledge spreads, the more numerous are the problems that make their appearance.

81 Our mistake is that we doubt what is certain and want to establish what is uncertain. 82 My maxim in the study of Nature is this: hold fast what is certain and keep a watch on what is uncertain.

83 What a master a person would be in your own subject if you taught nothing useless!

84 The greatest piece of folly is that every person thinks your individual self compelled to hand down what people think they have known.

85 If many a person did not feel obliged to repeat what is untrue, because you have said it once, the world would have been quite different.

86 Every person looks at the world lying ready before you, ordered and fashioned into a complete whole, as after all but an element out of which your endeavour is to create a special world suited to yourself. 87 Capable people lay hold of the world without

hesitation and try to shape their course as best they can; others dally over it, and some doubt even of their own existence.

88 The person who felt the full force of this fundamental truth would dispute with no one, but look upon another's mode of thought equally with your own, as merely a phenomenon. 89 For we find almost daily that one person can think with ease what another cannot possibly think at all; 90 and that, too, not in matters which might have some sort of effect upon their common weal or woe, but in things which cannot touch them at all.

91 There is nothing more odious than the majority; it consists of a few powerful people to lead the way; of accommodating rascals and submissive weaklings; and of a mass of people who trot after them, without in the least knowing their own mind.

92 When I observe the luminous progress and expansion of natural science in modern times, I seem to myself like a traveller going eastwards at dawn, and gazing at the growing light with joy, but also with impatience; 93 looking forward with longing to the advent of the full and final light, but, nevertheless, having to turn away your eyes when the sun appeared, unable to bear the splendour you had awaited with so much desire.

94 We praise the 18th-century for concerning itself chiefly with analysis. The task remaining to the 19th-century is to discover the false syntheses which prevail, and to analyse their contents anew.

95 A school may be regarded as a single individual who talks to the self for a hundred years, and takes an extraordinary pleasure in own being, however foolish and silly it may be.

96 In science it is a service of the highest merit to seek out those fragmentary truths attained by the ancients, and to develop them further.

97 If a person devotes own self to the promotion of science, you are firstly opposed, and then you are informed that your ground is already occupied. 98 At first people will allow no value to what we tell them, and then they behave as if they knew it all themselves.

99 Nature fills all space with Her limitless productivity. If we

observe merely our own earth, everything that we call evil and unfortunate is so because Nature cannot provide room for everything that comes into existence, and still less endow it with permanence.

100 Everything that comes into being seeks room for itself and desires duration: hence it drives something else from its place and shortens its duration.

101 There is so much of cryptogamy in phanerogamy that centuries will not decipher it.

102 What a true saying it is that you who wants to deceive humankind must before all things make absurdity plausible.

103 The further knowledge advances, the nearer we come to the unfathomable: the more we know how to use our knowledge, the better we see that the unfathomable is of no practical use.

104 The finest achievement for a person of thought is to have fathomed what may be fathomed, and quietly to revere the unfathomable.

105 The discerning person who acknowledges own limitations is not far off perfection.

106 There are two things of which a person cannot be careful enough: of obstinacy if you confines yourself to your own line of thought; of incompetency, if you goes beyond it.

107 Incompetency is a greater obstacle to perfection than one would think.

108 The century advances; but every individual begins anew.

109 What friends do with us and for us is a real part of our life; for it strengthens and advances our personality. 110 The assault of our enemies is not part of our life; it is only part of our experience; we throw it off and guard ourselves against it as against frost, storm, rain, hail, or any other of the external evils which may be expected to happen.

111 A person cannot live with every one, and therefore you cannot live for every one. 112 To see this truth aright is to place a high value upon one's friends, and not to hate or persecute one's enemies. 113 Nay, there is hardly any greater advantage for a person

to gain than to find out, if you can, the merits of your opponents: it gives you a decided ascendency over them.

114 Every one knows how to value what you have attained in life; most of all the person who thinks and reflects in own old age. You have a comfortable feeling that it is something of which no one can rob you of.

115 The best metempsychosis is for us to appear again in others.

116 It is very seldom that we satisfy ourselves; all the more consoling is it to have satisfied others.

117 We look back upon our life only as on a thing of broken pieces, because our misses and failures are always the first to strike us, and outweigh in our imagination what we have done, and attained.

118 The sympathetic youth sees nothing of this; you reads, enjoys, and uses the youth of one who has gone before you, and rejoices in it with all your heart, as though you had once been what you now is.

119 Science helps us before all things in this, that it somewhat lightens the feeling of wonder with which Nature fills us; 120 then, however, as life becomes more and more complex, it creates new facilities for the avoidance of what would do us harm and the promotion of what will do us good.

121 It is always our eyes alone, our way of looking at things. Nature alone knows what She means now, and what She had meant in the past.

NATURE: APHORISMS

Johann Wolfgang von Goethe

4 Nature! We are surrounded by Her and locked in Her clasp: powerless to leave Her, and powerless to come closer to Her.

2 Unasked and unwarned she takes us up into the whirl of Her dance, and hurries on with us till we are weary and fall from Her arms.

3 Nature creates new forms without end: what exists now, never was before; what was, comes not again; all is new and yet always the old.

4 We live in the midst of Her and are strangers. She speaks to us unceasingly and betrays not Her

secret. We are always influencing Her and yet can do Her no violence.

5 Individuality seems to be all Her aim, and She cares nought for individuals. Nature is always building and always destroying, and Her workshop is not to be approached.

6 Nature lives in Her children only, and the mother, where is She? She is the sole artist,-- out of the simplest materials the greatest diversity; 7 attaining, with no trace of effort, the finest perfection, the closest precision, always softly veiled. 8 Each of Nature's works has an essence of its own; every shape that She takes is in idea utterly isolated; and yet all forms one.

9 She plays a drama; whether She sees it Herself, we know not; and yet She plays it for us, who stand but a little way off.

10 There is constant life in Her, motion and development; and yet She remains where She was. 11 Nature is eternally changing, nor for a moment does She stand still. Of rest She knows nothing, and to all stagnation She has affixed Her curse. 12 She is steadfast; Her step is measured, Her exceptions rare, Her laws immutable.

13 Nature has thought, and She ponders unceasingly; not as a human, but as Nature. The meaning of the whole She keeps to Herself, and no one can learn it of Her.

14 Humans are all in Nature, and Nature in all humans. With all She plays a friendly game, and rejoices the more when a human wins from Her. 15 With many Her game is so secret, that She brings it to an end before they are aware of it.

16 Even what is most unnatural is Nature; even the coarsest Philistinism has something of Her genius. Who does not see Her everywhere, sees Her nowhere aright.

17 Nature loves Herself, and clings eternally to Herself with eyes and hearts innumerable. 18 She has divided Herself that She may be Her own delight. She is ever making new creatures spring up to delight in Her, and imparts Herself insatiably.

19 She rejoices in illusion. If a person destroys this in yourself and others, She punishes you like the hardest tyrant. If you follows

REFLECTION

Her in confidence, She presses you to Her heart as it were Her child.

20 Nature's children are numberless. To no one of them is She altogether niggardly; but She has Her favourites, on whom She lavishes much, and for whom She makes many a sacrifice. 21 Over the great Nature has spread the shield of Her protection.

22 Nature spurts forth Her creatures out of nothing, and tells them not whence they come and whither they go. They have only to go their way: She knows the path.

23 Her springs of action are few, but they never wear out: they are always working, always manifold.

24 The drama Nature plays is always new, because She is always bringing new spectators. 25 Life is Her fairest invention, and Death is Her device for having life in abundance.

26 Nature envelops human in darkness, and urges you constantly to the light. She makes you dependent on the earth, heavy and sluggish, and always rouses you up afresh.

27 Nature creates wants, because She loves movement. How marvellous that She gains it all so easily! 28 Every want is a benefit, soon satisfied, soon growing again. If She gives more, it is a new source of desire; but the balance quickly rights itself.

29 Every moment Nature starts on the longest journeys, and every moment reaches Her goal.

30 She amuses Herself with a vain show; but to us Her play is all-important.

31 Nature lets every child work at Her, every fool judge of Her, and thousands pass Her by and see nothing; and She has Her joy in them all, and in them all finds Her account.

32 Human obeys Her laws even in opposing them: you works with Nature even when you wants to work against Her.

33 Everything Nature gives is found to be good, for first of all She makes it indispensable. 34 She lingers, that we may long for presence; she hurries by, that we may not grow weary of Her.

35 Speech or language Nature has none; but She creates tongues and hearts through which She feels and speaks.

36 Nature's crown is Love. Only through Love can we come near

REFLECTION

Her. 37 She puts gulfs between all things, and all things strive to be interfused. She isolates everything, that She may draw everything together. 38 With a few draughts from the cup of Love She repays for a life full of trouble.

39 Nature is all things. She rewards Herself and punishes Herself; and in Herself rejoices and is distressed. 40 She is rough and gentle, loving and terrible, powerless and almighty. 41 In Nature everything is always present. Past or Future She knows not. The Present is Her Eternity. 42 Nature is kind. I praise Her with all Her works. 43 Nature is wise and still. No one can force Her to explain Herself, or frighten Her into a gift that She does not give willingly. 44 She is crafty, but for a good end; and it is best not to notice Her cunning.

45 Nature is whole and yet never finished. As She works now, so can She work for ever.

46 To every one Nature appears in a form of your own. She hides Herself in a thousand names and terms, and is always the same.

47 Nature has placed me in this world; She will also lead me out of it. 48 I trust myself to Nature. She may do with me as She pleases. She will not hate Her work. 49 I did not speak of Nature. No! what is true and what is false, She has spoken it all. 50 Everything is Nature's fault, everything is Nature's merit.

The Book of Divine Panagogue called

QUERY

THE QUERIST
George Berkley

THE QUERIST CONTAINING
SEVERAL QUERIES PROPOSED
TO THE CONSIDERATION
OF THE PUBLIC

Query-1

1 Whether there ever was, is, or will be, an industrious nation poor, or an idle rich?

2 *Question:* Whether a people can be called poor, where the common sort are well fed, clothed, and lodged?

3 *Question:* Whether the drift and aim of every wise State should not be, to encourage industry in its members? 4 And whether those who employ neither heads nor hands for the common benefit deserve not to be expelled like drones out of a well-governed State?

5 *Question:* Whether the four elements, and human's labour therein, be not the true source of wealth?

6 *Question:* Whether money be not only so far useful, as it stirreth up industry, enabling people mutually to participate the fruits of each other's labour?

7 *Question:* Whether any other means, equally conducing to excite and circulate the industry of humankind, may not be as useful as money.

8 *Question:* Whether the real end and aim of humans be not power? And whether you who could have everything else at your wish or will would value money?

9 *Question:* Whether the public aim in every well-govern'd State be not that each member, according to your just pretensions and industry, should have power?

10 *Question:* Whether power be not referred to action; and whether action doth not follow appetite or will?

11 *Question:* Whether fashion doth not create appetites; and whether the prevailing will of a nation is not the fashion?

12 *Question:* Whether the current of industry and commerce be not determined by this prevailing will?

13 *Question:* Whether it be not owing to custom that the fashions are agreeable?

QUERY

14 *Question:* Whether it may not concern the wisdom of the legislature to interpose in the making of fashions; and not leave an affair of so great influence to the management of women and fops, tailors and vintners?

15 *Question:* Whether reasonable fashions are a greater restraint on freedom than those which are unreasonable?

16 *Question:* Whether a general good taste in a people would not greatly conduce to their thriving? 17 And whether an uneducated gentry be not the greatest of national evils?

18 *Question:* Whether customs and fashions do not supply the place of reason in the vulgar of all ranks? Whether, therefore, it doth not very much import that they should be wisely framed?

19 *Question:* Whether the imitating those neighbours in our fashions, to whom we bear no likeness in our circumstances, be not one cause of distress to this nation?

20 *Question:* Whether frugal fashions in the upper rank, and comfortable living in the lower, be not the means to multiply inhabitants?

21 *Question:* Whether the bulk of our Irish natives are not kept from thriving, by that cynical content in dirt and beggary which they possess to a degree beyond any other people in Christendom?

22 *Question:* Whether the creating of wants be not the likeliest way to produce industry in a people? And whether, if our peasants were accustomed to eat beef and wear shoes, they would not be more industrious?

23 *Question:* Whether other things being given, as climate, soil, etc., the wealth be not proportioned to the industry, and this to the circulation of credit, be the credit circulated or transferred by what marks or tokens soever?

24 *Question:* Whether, therefore, less money swiftly circulating, be not, in effect, equivalent to more money slowly circulating? Or, whether, if the circulation be reciprocally as the quantity of coin, the nation can be a loser?

25 *Question:* Whether money is to be considered as having an intrinsic value, or as being a commodity, a standard, a measure, or a pledge, as is variously suggested by writers? 26 And

QUERY

whether the true idea of money, as such, be not altogether that of a ticket or counter?

27 *Question:* Whether the value or price of things be not a compounded proportion, directly as the demand, and reciprocally as the plenty?

28 *Question:* Whether the terms crown, livre, pound sterling, etc., are not to be considered as exponents or denominations of such proportion? 29 And whether gold, silver, and paper are not tickets or counters for reckoning, recording, and transferring thereof?

30 *Question:* Whether the denominations being retained, although the bullion were gone, things might not nevertheless be rated, bought, and sold, industry promoted, and a circulation of commerce maintained?

31 *Question:* Whether an equal raising of all sorts of gold, silver, and copper coin can have any effect in bringing money into the kingdom? 32 And whether altering the proportions between the kingdom several sorts can have any other effect but multiplying one kind and lessening another, without any increase of the sum total?

33 *Question:* Whether arbitrary changing the denomination of coin be not a public cheat?

34 *Question:* Whether, nevertheless, the damage would be very considerable, if by degrees our money were brought back to the English value there to rest for ever?

35 *Question:* Whether the English crown did not formerly pass with us for six shillings? And what inconvenience ensued to the public upon its reduction to the present value, and whether what hath been may not be?

36 *Question:* What makes a wealthy people? Whether mines of gold and silver are capable of doing this? And whether the negroes, amidst the gold sands of Africa, are not poor and destitute?

37 *Question:* Whether there be any virtue in gold or silver, other than as they set people at work, or create industry?

38 *Question:* Whether it be not the opinion or will of the people, exciting them to industry, that truly enricheth a nation? 39 And whether this doth not principally

depend on the means for counting, transferring, and preserving power, that is, property of all kinds?

39 *Question:* Whether if there was no silver or gold in the kingdom, our trade might not, nevertheless, supply bills of exchange, sufficient to answer the demands of absentees in England or elsewhere?

40 *Question:* Whether current bank notes may not be deemed money? And whether they are not actually the greater part of the money of this kingdom?

41 *Question:* Provided the wheels move, whether it is not the same thing, as to the effect of the machine, be this done by the force of wind, or water, or animals?

42 *Question:* Whether power to command the industry of others be not real wealth? 43 And whether money be not in truth tickets or tokens for conveying and recording such power, and whether it be of great consequence what materials the tickets are made of?

44 *Question:* Whether trade, either foreign or domestic, be in truth any more than this commerce of industry?

45 *Question:* Whether to promote, transfer, and secure this commerce, and this property in human labour, or, in other words, this power, be not the sole means of enriching a people, and how far this may be done independently of gold and silver?

46 *Question:* Whether it were not wrong to suppose land itself to be wealth? 47 And whether the industry of the people is not first to be consider'd, as that which constitutes wealth, which makes even land and silver to be wealth, neither of which would have, any value but as means and motives to industry?

48 *Question:* Whether in the wastes of America a person might not possess twenty miles square of land, and yet want own dinner, or a coat to own back?

49 *Question:* Whether a fertile land, and the industry of its inhabitants, would not prove inexhaustible funds of real wealth, be the counters for conveying and recording thereof what you will, paper, gold, or silver?

50 *Question:* Whether a single hint be sufficient to overcome a prejudice? And whether even

QUERY

obvious truths will not sometimes bear repeating?

51 *Question:* Whether, if human labour be the true source of wealth, it doth not follow that idleness should of all things be discouraged in a wise State?

52 *Question:* Whether even gold or silver, if they should lessen the industry of its inhabitants, would not be ruinous to a country? And whether Spain be not an instance of this?

53 *Question:* Whether the opinion of people, and their industry consequent thereupon, be not the true wealth of Holland and not the silver supposed to be deposited in the bank at Amsterdam?

54 *Question:* Whether there is in truth any such treasure lying dead? And whether it be of great consequence to the public that it should be real rather than notional?

55 *Question:* Whether in order to understand the true nature of wealth and commerce, it would not be right to consider a ship's crew cast upon a desert island, and by degrees forming themselves to business and civil life, while industry begot credit, and credit moved to industry?

56 *Question:* Whether such people would not all set themselves to work? Whether they would not subsist by the mutual participation of each other's industry? 57 Whether, when one person had in your way procured more than you could consume, you would not exchange your superfluities to supply your wants? 58 Whether this must not produce credit? Whether, to facilitate these conveyances, to record and circulate this credit, they would not soon agree on certain tallies, tokens, tickets, or counters?

59 *Question:* Whether reflection in the better sort might not soon remedy our evils? And whether our real defect be not a wrong way of thinking?

60 *Question:* Whether it would not be an unhappy turn in our gentlemen, if they should take more thought to create an interest to themselves in this or that county, or borough, than to promote the real interest of their country?

61 *Question:* Whether it be not a bull to call that making an interest,

QUERY

whereby a person spendeth much and gaineth nothing?

62 *Question:* Whether if a person builds a house you doth not in the first place provide a plan which governs your work? And shall the pubic act without an end, a view, a plan?

63 *Question:* Whether by how much the less particular folk think for themselves, the public be not so much the more obliged to think for them?

64 *Question:* Whether cunning be not one thing and good sense another? And whether a cunning trades-person doth not stand in one's own light?

65 *Question:* Whether small gains be not the way to great profit? And if our trades-people are beggars, whether they may not thank themselves for it?

66 *Question:* Whether some way might not be found for making criminals useful in public works, instead of sending them either to America, or to the other world?

67 *Question:* Whether we may not, as well as other nations, contrive employment for them? 68 And whether servitude, chains, and hard labour, for a term of years, would not be a more discouraging as well as a more adequate punishment for felons than even death itself?

69 *Question:* Whether there are not such things in Holland as bettering houses for bringing young gentlemen to order? And whether such an institution would be useless among us?

70 *Question:* Whether it be true that the poor in Holland have no resource but their own labour, and yet there are no beggars in their streets?

71 *Question:* Whether you whose luxury consumeth foreign products, and whose industry produceth nothing domestic to exchange for them, is not so far forth injurious to your country?

72 *Question:* Whether, consequently, the fine people, whose employment is only to dress, drink, and play, be not a pubic nuisance?

73 *Question:* Whether necessity is not to be hearkened to before convenience, and convenience before luxury?

74 *Question:* Whether to provide plentifully for the poor be not feeding the root, the substance

QUERY

whereof will shoot upwards into the branches, and cause the top to flourish?

75 *Question:* Whether there be any instance of a State wherein the people, living neatly and plentifully, did not aspire to wealth?

76 *Question:* Whether nastiness and beggary do not, on the contrary, extinguish all such ambition, making people listless, hopeless, and slothful?

77 *Question:* Whether a country inhabited by people well fed, clothed and lodged would not become every day more populous? And whether a numerous stock of people in such circumstances would? 78 And how far the product of not constitute a flourishing nation; our own country may suffice for the compassing of this end?

79 *Question:* Whether a people who had provided themselves with the necessaries of life in good plenty would not soon extend their industry to new arts and new branches of commerce?

80 *Question:* Whether those same manufactures which England imports from other countries may not be admitted from Ireland? 81 And, if so, whether lace, carpets, and tapestry, three considerable articles of English importation, might not find encouragement in Ireland? 82 And whether an academy for design might not greatly conduce to the perfecting those manufactures among us?

83 *Question:* Whether France and Flanders could have drawn so much money from England for figured silks, lace, and tapestry, if they had not had academies for designing?

84 *Question:* Whether, when a room was once prepared, and models in plaster of Paris, the annual expense of such an academy need stand the pubic in above two hundred pounds a year?

85 *Question:* Whether our linen-manufacture would not find the benefit of this institution? 86 And whether there be anything that makes us fall short of the Dutch in damasks, diapers, and printed linen, but our ignorance in design?

87 *Question:* Whether those specimens of our own manufacture, hung up in a certain public place, do not sufficiently declare such our ignorance? And

QUERY

whether for the honour of the nation they ought not to be removed?

88 *Question:* Whether those who may slight this affair as notional have sufficiently considered the extensive use of the art of design, and its influence in most trades and manufactures, wherein the forms of things are often more regarded than the materials?

89 *Question:* Whether there be any art sooner learned than that of making carpets? 90 And whether our women, with little time and pains, may not make more beautiful carpets than those imported from Turkey? And whether this branch of the woollen manufacture be not open to us?

91 *Question:* Whether human industry can produce, from such cheap materials, a manufacture of so great value by any other art as by those of sculpture and painting?

92 *Question:* Whether pictures and statues are not in fact so much treasure? And whether Rome and Florence would not be poor towns without them?

93 *Question:* Whether they do not bring ready money as well as jewels? Whether in Italy debts are not paid, and children portioned with them, as with gold and silver?

94 *Question:* Whether it would not be more prudent, to strike out and exert ourselves in permitted branches of trade, than to fold our hands, and repine that we are not allowed the woollen?

95 *Question:* Whether it be true that two millions are yearly expended by England in foreign lace and linen?

96 *Question:* Whether immense sums are not drawn yearly into the Northern countries, for supplying the British navy with hempen manufactures?

97 *Question:* Whether there be anything more profitable than hemp? And whether there should not be great premiums for encouraging our hempen trade? 98 What advantages may not Great Britain make of a country where land and labour are so cheap?

99 *Question:* Whether Ireland alone might not raise hemp sufficient for the British navy? And whether it would not be vain to expect this from the British Colonies in America, where hands are so scarce, and labour so excessively dear?

QUERY

100 *Question:* Whether, if our own people want will or capacity for such an attempt, it might not be worthwhile for some undertaking spirits in England to make settlements, 101 and raise hemp in the counties of Clare and Limerick, than which, perhaps, there is not fitter land in the world for that purpose? And whether both nations would not find their advantage therein?

102 *Question:* Whether if all the idle hands in this kingdom were employed on hemp and flax, we might not find sufficient vent for these manufactures?

103 *Question:* How far it may be in our own power to better our affairs, without interfering with our neighbours?

104 *Question:* Whether the prohibition of our woollen trade ought not naturally to put us on other methods which give no jealousy?

105 *Question:* Whether paper be not a valuable article of commerce? And whether it be not true that one single bookseller in London yearly expended above four thousand pounds in that foreign commodity?

106 *Question:* How it comes to pass that the Venetians and Genoese, who wear so much less linen, and so much worse than we do, should yet make very good paper, and in great quantity, while we make very little?

107 *Question:* How long it will be before my countrymen find out that it is worthwhile to spend a penny in order to get a groat?

108 *Question:* If all the land were tilled that is fit for tillage, and all that sowed with hemp and flax that is fit for raising them, whether we should have much sheep-walk beyond what was sufficient to supply the necessities of the kingdom?

109 *Question:* Whether other countries have not flourished without the woollen trade?

110 *Question:* Whether it be not a sure sign or effect of a country's inhabitants? And, thriving, to see it well cultivated and full of; 111 if so, whether a great quantity of sheep-walk be not ruinous to a country, rendering it waste and thinly inhabited?

112 *Question:* Whether the employing so much of our land

QUERY

under sheep be not in fact an Irish blunder?

113 *Question:* Whether our hankering after our woollen trade be not the true and only reason which hath created a jealousy in England towards Ireland? And whether anything can hurt us more than such jealousy?

114 *Question:* Whether it be not the true interest of both nations to become one people? And whether either be sufficiently apprised of this?

115 *Question:* Whether the upper part of this people are not truly English, by blood, language, religion, manners, inclination, and interest?

116 *Question:* Whether we are not as much English people as the children of old Romans, born in Britain, were still Romans?

117 *Question:* Whether it be not our true interest not to interfere with them; and, in every other case, whether it be not their true interest to befriend us?

118 *Question:* Whether a mint in Ireland might not be of great convenience to the kingdom; and whether it could be attended with any possible inconvenience to Great Britain? 119 And whether there were not mints in Naples and Sicily, when those kingdoms were provinces to Spain or the house of Austria?

120 *Question:* Whether anything can be more ridiculous than for the north of Ireland to be jealous of a linen manufacturer in the south?

121 *Question:* Whether the county of Tipperary be not much better land than the county of Armagh; and yet whether the latter is not much better improved and inhabited than the former?

122 *Question:* Whether every landlord in the kingdom doth not know the cause of this? And yet how few are the better for such their knowledge?

123 *Question:* Whether large farms under few hands, or small ones under many, are likely to be made most of? 124 And whether flax and tillage do not naturally multiply hands, and divide land into small holdings, and well-improved?

125 *Question:* Whether, as our exports are lessened, we ought not to lessen our imports? And whether these will not be lessened as our demands, and these as our wants, and these as our customs or

QUERY

fashions? 126 Of how great consequence therefore are fashions to the public?

127 *Question:* Whether it would not be more reasonable to mend our state than to complain of it; and how far this may be in our own power?

128 *Question:* What the nation gains by those who live in Ireland upon the produce of foreign Countries?

129 *Question:* How far the vanity of our ladies in dressing, and of our gentlemen in drinking, contributes to the general misery of the people?

130 *Question:* Whether nations, as wise and opulent as ours, have not made sumptuary laws; and what hinders us from doing the same?

131 *Question:* Whether those who drink foreign liquors, and deck themselves and their families with foreign ornaments, are not so far forth to be reckoned absentees?

132 *Question:* Whether, as our trade is limited, we ought not to limit our expenses; and whether this be not the natural and obvious remedy?

133 *Question:* Whether the dirt, and famine, and nakedness of the bulk of our people might not be remedied, even although we had no foreign trade? 134 And whether this should not be our first care; and whether, if this were once provided for, the conveniences of the rich would not soon follow?

135 *Question:* Whether comfortable living doth not produce wants, and wants industry, and industry wealth?

136 *Question:* Whether there is not a great difference between Holland and Ireland? And whether foreign commerce, without which the one could not subsist, be so necessary for the other?

137 *Question:* Might we not put a hand to the plough, or the spade, although we had no foreign commerce?

138 *Question:* Whether the exigencies of Nature are not to be answered by industry on our own soil? 139 And how far the conveniences and comforts of life may be procured by a domestic commerce between the several parts of this kingdom?

140 *Question:* Whether the women may not sew, spin, weave, embroider sufficiently for the embellishment of their persons, and even enough to raise envy in

each other, without being beholden to foreign countries?

141 *Question:* Suppose the bulk of our inhabitants had shoes to their feet, clothes to their backs, and beef in their bellies, might not such a state be eligible for the public, even though the squires were condemned to drink ale and cider?

142 *Question:* Whether, if drunkenness be a necessary evil, people may not as well drink the growth of their own country?

143 *Question:* Whether a nation within itself might not have real wealth, sufficient to give its inhabitants power and distinction, without the help of gold and silver?

144 *Question:* Whether, if the arts of sculpture and painting were encouraged among us, we might not furnish our houses in a much nobler manner with our own manufactures?

145 *Question:* Whether we have not, or may not have, all the necessary materials for building at home?

146 *Question:* Whether tiles and plaster may not supply the place of Norway fir for flooring and wainscot?

147 *Question:* Whether plaster be not warmer, as well as more secure, than deal? 148 And whether a modern fashionable house, lined with fir, daubed over with oil and paint, be not like a fire-ship, ready to be lighted up by all accidents?

149 *Question:* Whether larger houses, better built and furnished, a greater train of servants, the difference with regard to equipage and table between finer and coarser, more and less elegant, may not be sufficient to feed a reasonable share of vanity, or support all proper distinctions? 150 And whether all these may not be procured by domestic industry out of the four elements, without ransacking the four quarters of the globe?

151 *Question:* Whether anything is a nobler ornament, in the eye of the world, than an Italian palace, 152 that is, stone and mortar skillfully put together, and adorned with sculpture and painting; and whether this may not be compassed without foreign trade?

153 *Question:* Whether an expense in gardens and plantations would

not be an elegant distinction for the rich, a domestic magnificence employing many hands within, and drawing nothing from abroad?

154 *Question:* Whether the apology which is made for foreign luxury in England, to wit, that they could not carry on their trade without imports as well as exports, will hold in Ireland?

155 *Question:* Whether one may not be allowed to conceive and suppose a society or nation of human creatures, clad in woollen cloths and stuffs, 156 eating good bread, beef and mutton, poultry and fish, in great plenty, drinking ale, mead, and cider, 157 inhabiting decent houses built of brick and marble, taking their pleasure in fair parks and gardens, depending on no foreign imports either for food or raiment? 158 And whether such people ought much to be pitied?

159 *Question:* Whether Ireland be not as well qualified for such a state as any nation under the sun?

160 *Question:* Whether in such a state the inhabitants may not contrive to pass the twenty-four hours with tolerable ease and cheerfulness? And whether any people upon earth can do more?

161 *Question:* Whether they may not eat, drink, play, dress, visit, sleep in good beds, sit by good fires, build, plant, raise a name, make estates, and spend them?

162 *Question:* Whether, upon the whole, a domestic trade may not suffice in such a country as Ireland, to nourish and clothe its inhabitants, and provide them with the reasonable conveniences and even comforts of life?

163 *Question:* Whether a general habit of living well would not produce numbers and industry' and whether, considering the tendency of human kind, the consequence thereof would not be foreign trade and riches, how unnecessary soever?

164 *Question:* Whether, nevertheless, it be a crime to inquire how far we may do without foreign trade, and what would follow on such a supposition?

165 *Question:* Whether the number and welfare of the subjects be not the true strength of the crown?

166 *Question:* Whether in all public institutions there should not be an

end proposed, which is to be the rule and limit of the means? 167 Whether this end should not be the well-being of the whole? And whether, in order to do this, the first step should not be to clothe and feed our people?

168 *Question:* Whether there be upon earth any Christian or civilised people so beggarly, wretched, and destitute as the common Irish?

169 *Question:* Whether, nevertheless, there is any other people whose wants may be more easily supplied from home?

170 *Question:* Whether, if there was a wall of brass a thousand cubits high round this kingdom, our natives might not nevertheless live cleanly and comfortably, till the land, and reap the fruits of it?

171 *Question:* What should hinder us from exerting ourselves, using our hands and brains, doing something or other, man, woman, and child, like the other inhabitants of God's earth?

172 *Question:* Be the restraining our trade well or ill advised in our neighbours, with respect to their own interest, yet whether it be not plainly ours to accommodate ourselves to it?

173 *Question:* Whether it be not vain to think of persuading other people to see their interest, while we continue blind to our own?

174 *Question:* Whether there be any other nation possess'd of so much good land, and so many able hands to work it, which yet is beholden for bread to foreign countries?

175 *Question:* Whether it be true that we import corn to the value of two hundred thousand pounds in some years?

176 *Question:* Whether we are not undone by fashions made for other people? And whether it be not madness in a poor nation to imitate a rich one?

177 *Question:* Whether a woman of fashion ought not to be declared a public enemy?

178 *Question:* Whether it be not certain that from the single town of Cork were exported, in one year, no less than one hundred and seven thousand one hundred and sixty-one barrels of beef; seven thousand three hundred and seventy-nine barrels of pork; 179 thirteen thousand four hundred and sixty-one casks, and eighty-five

QUERY

thousand seven hundred and twenty-seven firkins of butter? 180 And what hands were employed in this manufacture?

181 *Question:* Whether a foreigner could imagine that one half of the people were starving, in a country which sent out such plenty of provisions?

182 *Question:* Whether an Irish lady, set out with French silks and Flanders lace, may not be said to consume more beef and butter than a hundred of our labouring peasants?

183 *Question:* Whether nine-tenths of our foreign trade be not carried on singly to support the article of vanity?

184 *Question:* Whether it can be hoped that private persons will not indulge this folly, unless restrained by the public?

185 *Question:* How vanity is maintained in other countries? Whether in Hungary, for instance, a proud nobility are not subsisted with small imports from abroad?

186 *Question:* Whether there be a prouder people upon earth than the noble Venetians, although they all wear plain black clothes?

187 *Question:* Whether a people are to be pitied that will not sacrifice their little particular vanities to the public good? 188 And yet, whether each part would not except their own foible from this public sacrifice, the squire his bottle, the lady her lace?

189 *Question:* Whether claret be not often drank rather for vanity than for health, or pleasure?

190 *Question:* Whether it be true that people of nice palates have been imposed on, by elder wine for French claret, and by mead for palm sack?

191 *Question:* Do not English people abroad purchase beer and cider at ten times the price of wine?

192 *Question:* How many gentlemen are there in England of a thousand pounds per annum who never drink wine in their own houses? Whether the same may be said of any in Ireland who have even? one hundred pounds per annum.

193 *Question:* What reasons have our neighbours in England for discouraging French wines which may not hold with respect to us also?

QUERY

194 *Question:* How much of the necessary sustenance of our people is yearly exported for brandy?

195 *Question:* Whether, if people must poison themselves, they had not better do it with their own growth?

196 *Question:* If we imported neither claret from France, nor fir from Norway, what the nation would save by it?

197 *Question:* When the root yieldeth insufficient nourishment, whether people do not top the tree to make the lower branches thrive?

198 *Question:* Whether, if our ladies drank sage or balm tea out of Irish ware, it would be an insupportable national calamity?

199 *Question:* Whether it be really true that such wine is best as most encourages drinking, i.e., that must be given in the largest dose to produce its effect? And whether this holds with regard to any other medicine?

200 *Question:* Whether that trade should not be accounted most pernicious wherein the balance is most against us? And whether this be not the trade with France?

201 *Question:* Whether it be not even madness to encourage trade with a nation that takes nothing of our manufacture?

202 *Question:* Whether Ireland can hope to thrive if the major part of her patriots shall be found in the French interest?

203 *Question:* Why, if a bribe by the palate or the purse be in effect the same thing, they should not be alike infamous?

204 *Question:* Whether the vanity and luxury of a few ought to stand in competition with the interest of a nation?

205 *Question:* Whether national wants ought not to be the rule of trade? And whether the most pressing wants of the majority ought not to be first consider'd?

206 *Question:* Whether it is possible the country should be well improved, while our beef is exported, and our labourers live upon potatoes?

207 *Question:* If it be resolved that we cannot do without foreign trade, whether, at least, it may not be worthwhile to consider what branches thereof deserve to be entertained, and how far we may be able to carry it on under our present limitations?

QUERY

208 *Question:* What foreign imports may be necessary for clothing and feeding the families of persons not worth above one hundred pounds a year? 209 And how many wealthier there are in the kingdom, and what proportion they bear to the other inhabitants?

210 *Question:* Whether trade be not then on a right foot, when foreign commodities are imported in exchange only for domestic superfluities?

211 *Question:* Whether the quantities of beef, butter, wool, and leather, exported from this island, can be reckoned the superfluities of a country, where there are so many natives naked and famished?

212 *Question:* Whether it would not be wise so to order our trade as to export manufactures rather than provisions, and of those such as employ most hands?

213 *Question:* Whether she would not be a very vile matron, and justly thought either mad or foolish, that should give away the necessaries of life from her naked and famished children, in exchange for pearls to stick in her hair, and sweetmeats to please her own palate?

214 *Question:* Whether a nation might not be consider'd as a family?

215 *Question:* Whether other methods may not be found for supplying the funds, besides the custom on things imported?

216 *Question:* Whether any art or manufacture be so difficult as the making of good laws?

217 *Question:* Whether our peers and people are born legislators? Or, whether that faculty be acquired by study and reflection?

218 *Question:* Whether to comprehend the real interest of a people, and the means to procure it, doth not imply some fund of knowledge, historical, moral, and political, with a faculty of reason improved by learning?

219 *Question:* Whether every enemy to learning be not a Goth? And whether every such Goth among us be not an enemy to the country?

220 *Question:* Whether, therefore, it would not be an omen of ill presage, a dreadful phenomenon in the land, if our great people should

QUERY

take it in their heads to deride learning and education?

221 *Question:* Whether, on the contrary, it should not seem worthwhile to erect a mart of literature in this kingdom, under wiser regulations and better discipline than in any other part of Europe? 222 And whether this would not be an infallible means of drawing people and money into the kingdom?

223 *Question:* Whether the governed be not too numerous for the governing part of our college? And whether it might not be expedient to convert thirty natives-places into twenty fellowships?

224 *Question:* Whether, if we had two colleges, there might not spring a useful emulation between them? 225 And whether it might not be contrived so to divide the fellows, scholars, and revenues between both, as that no member should be a loser thereby?

226 *Question:* Whether ten thousand pounds well laid out might not build a decent college, fit to contain two hundred persons; and whether the purchase money of the chambers would not go a good way towards defraying the expense?

227 *Question:* Where this college should be situated?

228 *Question:* Whether it is possible a State should not thrive, whereof the lower part were industrious, and the upper wise?

229 *Question:* Whether the collected wisdom of ages and nations be not found in books, improved and applied by study?

230 *Question:* Whether it was not an Irish professor who first opened the public schools at Oxford? 231 Whether this island hath not been anciently famous for learning? And whether at this day it hath any better chance for being considerable?

232 *Question:* Whether we may not with better grace sit down and complain, when we have done all that lies in our power to help ourselves?

233 *Question:* Whether the people of estate hath a right to be idle; and whether you ought not to be the great promoter and director of industry among your tenants and neighbours?

234 *Question:* Whether the real foundation for wealth must not be

QUERY

laid in the numbers, the frugality, and the industry of the people? 235 And whether all attempts to enrich a nation by other means, as raising the coin, stock-jobbing, and such arts are not vain?

236 *Question:* Whether a door ought not to be shut against all other methods of growing rich, save only by industry and merit? And whether wealth got otherwise would not be ruinous to the public?

237 *Question:* Whether the abuse of banks and paper-money is a just objection against the use thereof? And whether such abuse might not easily be prevented?

238 *Question:* Whether national banks are not found useful in Venice, Holland, and Hamburg? And whether it is not possible to contrive one that may be useful also in Ireland?

239 *Question:* Whether any nation ever was in greater want of such an expedient than Ireland?

240 *Question:* Whether the banks of Venice and Amsterdam are not in the hands of the public?

241 *Question:* Whether it may not be worthwhile to inform ourselves in the nature of those banks? And what reason can be assigned why Ireland should not reap the benefit of such public banks as well as other countries?

242 *Question:* Whether a bank of national credit, supported by public funds and secured by Parliament, be a chimera or impossible thing? And if not, what would follow from the supposal of such a bank?

243 *Question:* Whether the currency of a credit so well secured would not be of great advantage to our trade and manufactures?

244 *Question:* Whether the notes of such public bank would not have a more general circulation than those of private banks, as being less subject to frauds and hazards?

245 *Question:* Whether it be not agreed that paper hath in many respects the advantage above coin, as being of more dispatch in payments, more easily transferred, preserved, and recovered when lost?

246 *Question:* Whether, besides these advantages, there be not an evident necessity for circulating credit by paper, from the defect of coin in this kingdom?

QUERY

247 *Question:* Whether the public may not as well save the interest which it now pays?

248 *Question:* What would happen if two of our banks should break at once? And whether it be wise to neglect providing against an event which experience hath shewn us not to be impossible?

249 *Question:* Whether such an accident would not particularly affect the bankers? And therefore whether a national bank would not be a security even to private bankers?

250 *Question:* Whether we may not easily avoid the inconveniencies attending the paper-money of New England, which were incurred by their issuing too great a quantity of notes, 251 by their having no silver in bank to exchange for notes, by their not insisting upon repayment of the loans at the time prefixed, and especially by their want of manufactures to answer their imports from Europe?

252 *Question:* Whether a combination of bankers might not do wonders, and whether bankers know their own strength?

253 *Question:* Whether a bank in private hands might not even overturn a government? And whether this was not the case of the Bank of St. George in Genoa?

254 *Question:* Whether we may not easily prevent the ill effects of such a bank as Mr Law proposed for Scotland, which was faulty in not limiting the quantum of bills, and permitting all persons to take out what bills they pleased, upon the mortgage of lands, whence by a glut of paper, the prices of things must rise? 255 Whence also the fortunes of people must increase in denomination, though not in value; whence pride, idleness, and beggary?

256 *Question:* Whether such banks as those of England and Scotland might not be attended with great inconveniences, as lodging too much power in the hands of private people, and giving handle for monopolies, stock-jobbing, and destructive schemes?

257 *Question:* Whether the national bank, projected by an anonymous writer in the latter end of Queen Anne's reign, might not on the other hand be attended with as great inconveniences by lodging too much power in the Government?

QUERY

258 *Question:* Whether the bank projected by Murray, though it partake, in many useful particulars, with that of Amsterdam, yet, as it placeth too great power in the hands of a private society, might not be dangerous to the public?

259 *Question:* Whether it be rightly remarked by some that, as banking brings no treasure into the kingdom like trade, private wealth must sink as the bank riseth? 260 And whether whatever causeth industry to flourish and circulate may not be said to increase our treasure?

261 *Question:* Whether the ruinous effects of Mississippi, South Sea, and such schemes were not owing to an abuse of paper money or credit, in making it a means for idleness and gaming, instead of a motive and help to industry?

262 *Question:* Whether those effects could have happened had there been no stock-jobbing? 263 And whether stock-jobbing could at first have been set on foot, without an imaginary foundation of some improvement to the stock by trade? 264 Whether, therefore, when there are no such prospects, or cheats, or private schemes proposed, the same effects can be justly feared?

265 *Question:* Whether by a national bank, be not properly understood a bank, not only established by public authority as the Bank of England, but a bank in the hands of the public, wherein there are no shares: whereof the public alone is proprietor, and reaps all the benefit?

266 *Question:* Whether, having considered the conveniences of banking and paper-credit in some countries, and the inconveniences thereof in others, we may not contrive to adopt the former, and avoid the latter?

267 *Question:* Whether great evils, to which other schemes are liable, may not be prevented, by excluding the managers of the bank from a share in the legislature?

268 *Question:* Whether the rise of the bank of Amsterdam was not purely casual, for the security and dispatch of payments? 269 And whether the good effects thereof, in supplying the place of coin, and promoting a ready circulation of industry and commerce may not be

QUERY

a lesson to us, to do that by design which others fell upon by chance?

270 *Question:* Whether the bank proposed to be established in Ireland, under the notion of a national bank, by the voluntary subscription of three hundred thousand pounds, to pay off the national debt, the interest of which sum to be paid the subscribers, 271 subject to certain terms of redemption, be not in reality a private bank, as those of England and Scotland, which are national only in name, being in the hands of particular persons, and making dividends on the money paid in by subscribers?

272 *Question:* Whether plenty of small cash be not absolutely necessary for keeping up a circulation among the people; that is, whether copper be not more necessary than gold?

273 *Question:* Whether it is not worthwhile to reflect on the expedients made use of by other nations, paper-money, bank-notes, public funds, and credit in all its shapes, 274 to examine what hath been done and devised to add to our own animadversions, and upon the whole offer such hints as seem not unworthy the attention of the public?

275 *Question:* Whether that, which increaseth the stock of a nation be not a means of increasing its trade? 276 And whether that which increaseth the current credit of a nation may not be said to increase its stock?

277 *Question:* Whether it may not be expedient to appoint certain funds or stock for a national bank, under direction of certain persons, one-third whereof to be named by the Government, and one-third by each House of Parliament?

278 *Question:* Whether the directors should not be excluded from sitting in either House, and whether they should not be subject to the audit and visitation of a standing committee of both Houses?

279 *Question:* Whether such committee of inspectors should not be changed every two years, one-half going out, and another coming in by ballot?

280 *Question:* Whether the notes ought not to be issued in lots, to be let at interest on mortgaged lands, the whole number of lots to be divided among the four provinces,

QUERY

rateably to the number of hearths in each?

281 *Question:* Whether it may not be expedient to appoint four counting-houses, one in each province, for converting notes into specie?

282 *Question:* Whether a limit should not be fixed, which no person might exceed, in taking out notes?

283 *Question:* Whether, the better to answer domestic circulation, it may not be right to issue notes as low as twenty shillings?

284 *Question:* Whether all the bills should be issued at once, or rather by degrees, that so people may be gradually accustomed and reconciled to the bank?

285 *Question:* Whether the keeping of the cash, and the direction of the bank, ought not to be in different hands, and both under public control?

286 *Question:* Whether the same rule should not always be observed, of lending out money or notes, only to half the value of the mortgaged land? 287 And whether this value should not always be rated at the same number of years' purchase as at first?

288 *Question:* Whether care should not be taken to prevent an undue rise of the value of land?

289 *Question:* Whether the increase of industry and people will not of course raise the value of land? And whether this rise may not be sufficient?

290 *Question:* Whether land may not be apt to rise on the issuing too great plenty of notes? 291 *Question:* Whether this may not be prevented by the gradual and slow issuing of notes, and by frequent sales of lands?

292 *Question:* Whether interest doth not measure the true value of land; for instance, where money is at five per cent, whether land is not worth twenty years' purchase?

293 *Question:* Whether too small a proportion of money would not hurt the landed person, and too great a proportion the monied person? 294 And whether the quantum of notes ought not to bear proportion to the pubic demand? And whether trial must not shew what this demand will be?

295 *Question:* Whether the exceeding this measure might not produce diverse bad effects, one

QUERY

whereof would be the loss of our silver?

296 *Question:* Whether interest paid into the bank ought not to go on augmenting its stock? 297 *Question:* Whether it would or would not be right to appoint that the said interest be paid in notes only?

298 *Question:* Whether the notes of this national bank should not be received in all payments into the exchequer?

299 *Question:* Whether on supposition that the specie should fail, the credit would not, nevertheless, still pass, being admitted in all payments of the public revenue?

300 *Question:* Whether the pubic can become bankrupt so long as the notes are issued on good security?

301 *Question:* Whether mismanagement, prodigal living, hazards by trade, which often affect private banks, are equally to be apprehended in a pubic one?

302 *Question:* Whether as credit became current, and this raised the value of land, the security must not of course rise?

303 *Question:* Whether, as our current domestic credit grew, industry would not grow likewise; and if industry, our manufactures; and if these, our foreign credit?

304 *Question:* Whether by degrees, as business and people multiplied, more bills may not be issued, without augmenting the capital stock, provided still, that they are issued on good security; which further issuing of new bills, not to be without consent of Parliament?

305 *Question:* Whether such bank would not be secure? Whether the profits accruing to the pubic would not be very considerable? And whether industry in private persons would not be supplied, and a general circulation encouraged?

306 *Question:* Whether such bank should, or should not, be allowed to issue notes for money deposited therein? And, if not, whether the bankers would have cause to complain?

307 *Question:* Whether, if the public thrives, all particular persons must not feel the benefit thereof, even the bankers themselves?

308 *Question:* Whether, beside the Bank-Company, there are not in England many private wealthy

bankers, and whether they were more before the erecting of that company?

309 *Question:* Whether as industry increased, our manufactures would not flourish; and as these flourished, whether better returns would not be made from estates to their landlords, both within and without the kingdom?

310 *Question:* Whether we have not paper-money circulating among, whether, therefore, we might not as well have that us already which is secured by the public, and whereof the pubic reaps the benefit?

311 *Question:* Whether there are not two general ways of circulating money, to wit, play and traffic? And whether stock-jobbing is not to be ranked under the former?

312 *Question:* Whether there are more than two things that might draw silver out of the bank, when its credit was once well established, to wit, foreign demands and small payments at home?

313 *Question:* Whether, if our trade with France were checked, the former of these causes could be supposed to operate at all? And whether the latter could operate to any great degree?

314 *Question:* Whether the sure way to supply people with tools and materials, and to set them at work, be not a free circulation of money, whether silver or paper?

315 *Question:* Whether in New England all trade and business is not as much at a stand, upon a scarcity of paper-money, as with us from the want of specie?

316 *Question:* Whether paper-money or notes may not be issued from the national bank, on the security of hemp, of linen, or other manufactures whereby the poor might be supported in their industry?

317 *Question:* Whether it be certain that the quantity of silver in the bank of Amsterdam be greater now than at first; 318 but whether it be not certain that there is a greater circulation of industry and extent of trade, more people, ships, houses, and commodities of all sorts, more power by sea and land?

319 *Question:* Whether money, lying dead in the bank of Amsterdam, would not be as useless as in the mine?

QUERY

320 *Question:* Whether our visible security in land could be doubted? And whether there be anything like this in the bank of Amsterdam?

321 *Question:* Whether it be just to apprehend danger from trusting a national bank with power to extend its credit, to circulate notes which it shall be felony to counterfeit, to receive goods on loans, to purchase lands, to sell also or alienate them, and to deal in bills of exchange; 322 when these powers are no other than have been trusted for many years with the bank of England, although in truth but a private bank?

323 *Question:* Whether the objection from monopolies and an overgrowth of power, which are made against private banks, can possibly hold against a national one?

324 *Question:* Whether banks raised by private subscription would be as advantageous to the public as to the subscribers? And whether risks and frauds might not be more justly apprehended from them?

325 *Question:* Whether the evil effects which of late years have attended paper-money and credit in Europe did not spring from subscriptions, shares, dividends, and stock-jobbing?

326 *Question:* Whether the great evils attending paper-money in the British Plantations of America have not sprung from the overrating their lands, and issuing paper without discretion, 327 and from the legislators breaking their own rules in favour of themselves, thus sacrificing the public to their private benefit? 328 And whether a little sense and honesty might not easily prevent all such inconveniences?

329 *Question:* Whether an argument from the abuse of things, against the use of them, be conclusive?

330 *Question:* Whether you who is bred to a part be fitted to judge of the whole?

331 *Question:* Whether interest be not apt to bias judgment? And whether traders only are to be consulted about trade, or bankers about money?

332 *Question:* Whether the subject of Free-thinking in religion be not exhausted? And whether it be not high time for our free-thinkers to

QUERY

turn their thoughts to the improvement of their country?

333 *Question:* Whether any person hath a right to judge, that will not be at the pains to distinguish?

334 *Question:* Whether there be not a wide difference between the profits going to augment the national stock, and being divided among private sharers? And whether, in the former case, there can possibly be any gaming or stock-jobbing?

335 *Question:* Whether it must not be ruinous for a nation to sit down to game, be it with silver or with paper?

336 *Question:* Whether, therefore, the circulating paper, in the late ruinous schemes of France and England, was the true evil, and not rather the circulating thereof without industry? 337 And whether the bank of Amsterdam, where industry had been for so many years subsisted and circulated by transfers on paper, doth not clearly decide this point?

338 *Question:* Whether there are not to be seen in America fair towns, wherein the people are well lodged, fed, and clothed, without a beggar in their streets, although there be not one grain of gold or silver current among them?

339 *Question:* Whether these people do not exercise all arts and trades, build ships and navigate them to all parts of the world, purchase lands, till and reap the fruits of them, buy and sell, educate and provide for their children? Whether they do not even indulge themselves in foreign vanities?

340 *Question:* Whether, whatever inconveniences those people may have incurred from not observing either rules or bounds in their paper money, 341 yet it be not certain that they are in a more flourishing condition, have larger and better built towns, more plenty, more industry, more arts and civility, and a more extensive commerce, than when they had gold and silver current among them?

342 *Question:* Whether a view of the ruinous effects of absurd schemes and credit mismanaged, so as to produce gaming and madness instead of industry, can be any just objection against a national bank calculated purely to promote industry?

QUERY

343 *Question:* Whether a scheme for the welfare of this nation should not take in the whole inhabitants? 344 And whether it be not a vain attempt, to project the flourishing of our Protestant gentry, exclusive of the bulk of the natives?

345 *Question:* Whether, therefore, it doth not greatly concern the State, that our Irish natives should be converted, and the whole nation united in the same religion, the same allegiance, and the same interest? And how this may most probably be effected?

346 *Question:* Whether an oath, testifying allegiance to the king, and disclaiming the pope's authority in temporals, may not be justly required of the Roman Catholics? 347 And whether, in common prudence or policy, any priest should be tolerated who refuseth to take it?

348 *Question:* Whether there have not been Popish recusants? And, if so, whether it would be right to object against the foregoing oath, that all would take it, and none think themselves bound by it?

349 *Question:* Whether those of the Church of Rome, in converting the Moors of Spain or the Protestants of France, have not set us an example which might justify a similar treatment of themselves, if the laws of Christianity allowed thereof?

350 *Question:* Whether compelling people to a profession of faith is not the worst thing in Popery, and, consequently, whether to copy after the Church of Rome therein, were not to become Papists ourselves in the worst sense?

351 *Question:* Whether, nevertheless, we may not imitate the Church of Rome, in certain places, where Jews are tolerated, by obliging our Irish Papists, at stated times, to hear Protestant sermons? And whether this would not make missionaries in the Irish tongue useful?

352 *Question:* Whether the mere act of hearing, without making any profession of faith, or joining in any part of worship, be a religious act; 353 and, consequently, whether their being obliged to hear, may not consist with the toleration of Roman Catholics?

354 *Question:* Whether, if penal laws should be thought oppressive, we may not at least be allowed to

give premiums? 355 And whether it would be wrong, if the public encouraged Popish families to become hearers, by paying their hearth-money for them?

356 *Question:* Whether in granting toleration, we ought not to distinguish between doctrines purely religious, and such as affect the State?

357 *Question:* Whether the case be not very different in regard to a person who only eats fish on Fridays, says your prayers in Latin, or believes transubstantiation, 358 and one who professeth in temporals a subjection to foreign powers, who holdeth yourself absolved from all obedience to your natural prince and the laws of your country? Who is even persuaded, it may be meritorious to destroy the powers that are?

359 *Question:* Whether, therefore, a distinction should not be made between mere Papists and recusants? And whether the latter can expect the same protection from the Government as the former?

360 *Question:* Whether our Papists in this kingdom can complain, if they are allowed to be as much Papists as the subjects of France or of the Empire?

361 *Question:* Whether there is any such thing as a body of inhabitants, in any Roman Catholic country under the sun, that profess an absolute submission to the pope's orders in matters of an indifferent nature, or that in such points do not think it their duty to obey the civil government?

362 *Question:* Whether since the peace of Utrecht, mass was not celebrated and the sacraments administered in diverse dioceses of Sicily, notwithstanding the Pope's interdict?

363 *Question:* Whether every plea of conscience is to be regarded? Whether, for instance, the German Anabaptists, Levellers, or Fifth Monarchy people would be tolerated on that pretence?

364 *Question:* Whether Popish children bred in charity schools, when bound out in apprenticeship to Protestant masters, do generally continue Protestants?

365 *Question:* Whether a Sum, which would go but a little way towards erecting hospitals for

QUERY

maintaining and educating the children of the native Irish, might not go far in binding them out apprentices to Protestant masters, for husbandry, useful trades, and the service of families?

366 *Question:* Whether if the parents are overlooked, there can be any great hopes of success in converting the children?

367 *Question:* Whether there be any instance, of a people's being converted in a Christian sense, otherwise than by preaching to them and instructing them in their own language?

368 *Question:* Whether catechists in the Irish tongue may not easily be procured and subsisted? And whether this would not be the most practicable means for converting the natives?

369 *Question:* Whether it be not of great advantage to the Church of Rome, that it hath clergy suited to all ranks of people, in gradual subordination from cardinals down to mendicants?

370 *Question:* Whether its numerous poor clergy are not very useful in missions, and of much influence with the people?

371 *Question:* Whether, in defect of able missionaries, persons conversant in low life, and speaking the Irish tongue, if well instructed in the first principles of religion, and in the popish controversy, 372 though for the rest on a level with the parish clerks, or the school-masters of charity-schools, may not be fit to mix with and bring over our poor illiterate natives to the Established Church? 373 Whether it is not to be wished that some parts of our liturgy and homilies were publicly read in the Irish language? 374 And whether, in these views, it may not be right to breed up some of the better sort of children in the charity-schools, and qualify them for missionaries, catechists, and readers?

375 *Question:* Whether there be any nation of people governed by reason? And yet, if there was not, whether this would be a good argument against the use of reason in pubic affairs?

376 *Question:* Whether, as others have supposed an Atlantis or Utopia, we also may not suppose an Hyperborean island inhabited by reasonable creatures?

QUERY

377 *Question:* Whether an indifferent person, who looks into all hands, may not be a better judge of the game than a party who sees only one's own?

378 *Question:* Whether one, whose end is to make your country people think, may not gain your end, even though they should not think as you doth?

379 *Question:* Whether you, who only asks, asserts? And whether any person can fairly confute the querist?

380 *Question:* Whether the interest of a part will not always be preferred to that of the whole?

ERRATA
George Berkley

Query-1

2 Whether there be any country in Christendom more capable of improvement than Ireland?

2 *Question:* Whether we are not as far before other nations with respect to natural advantages, as we are behind them with respect to arts and industry?

3 *Question:* Whether we do not live in a most fertile soil and temperate climate, and yet whether our people in general do not feel great want and misery?

4 *Question:* Whether my country people are not readier at finding excuses than remedies?

5 *Question:* Whether it can be reasonably hoped, that our state will mend, so long as property is insecure among us? 6 *Question:* Whether in that case the wisest government, or the best laws can avail us?

7 *Question:* Whether a few mishaps to particular persons may not throw this nation into the utmost confusion?

8 *Question:* Whether the public is not even on the brink of being undone by private accidents?

9 *Question:* Whether the wealth and prosperity of our country do not hang by a hair, the probity of one banker, the caution of another, and the lives of all?

10 *Question:* Whether we have not been sufficiently admonished of this by some late events?

11 *Question:* Whether therefore it be not high time to open our eyes?

12 *Question:* Whether a national bank would not at once secure our properties, put an end to usury,

facilitate commerce, supply the want of coin, and produce ready payments in all parts of the kingdom?

13 *Question:* Whether the use or nature of money, which all people so eagerly pursue, be yet sufficiently understood or considered by all?

14 *Question:* Whether humankind are not governed by Citation rather than by reason?

15 *Question:* Whether there be not a measure or limit, within which gold and silver are useful, and beyond which they may be hurtful?

16 *Question:* Whether that measure be not the circulating of industry?

17 *Question:* Whether a discovery of the richest gold mine that ever was, in the heart of this kingdom, would be a real advantage to us?

18 *Question:* Whether it would not tempt foreigners to prey upon us?

19 *Question:* Whether it would not render us a lazy, proud, and dastardly people?

20 *Question:* Whether every person who had money enough would not be a gentleman or a lady? And whether a nation of gentlemen and ladies would not be a wretched nation?

21 *Question:* Whether all things would not bear a high price? And whether people would not increase their fortunes without being the better for it?

22 *Question:* Whether the same evils would be apprehended from paper-money under an honest and thrifty regulation?

23 *Question:* Whether, therefore, a national bank would not be more beneficial than even a mine of gold?

24 *Question:* Whether private ends are not prosecuted with more attention and vigour than the public? And yet, whether all private ends are not included in the pubic?

25 *Question:* Whether banking be not absolutely necessary to the pubic weal?

26 *Question:* Whether even our private banks, though attended with such hazards as we all know them to be, are not of singular use in defect of a national bank? 27 *Question:* Whether without them what little business and industry there is would not stagnate? 28 But whether it be not a mighty

QUERY

privilege for a private person to be able to create a hundred pounds with a dash of own pen?

29 *Question:* Whether the mystery of banking did not derive its original from the Italians? Whether this acute people were not, upon a time, bankers over all Europe? 30 Whether that business was not practised by some of their noblest families who made immense profits by it, and whether to that the house of Medici did not originally owe its greatness?

31 *Question:* Whether the wise state of Venice was not the first that conceived the advantage of a national bank?

32 *Question:* Whether at Venice all payments of bills of exchange and merchants' contracts are not made in the national or pubic bank, the greatest affairs being transacted only by writing the names of the parties, one as debtor the other as creditor in the bank-book?

33 *Question:* Whether nevertheless it was not found expedient to provide a chest of ready cash for answering all demands that should happen to be made on account of payments in detail?

34 *Question:* Whether this offer of ready cash, instead of transfers in the bank, hath not been found to augment rather than diminish the stock thereof?

35 *Question:* Whether at Venice, the difference in the value of bank money above other money be not fixed at twenty per cent?

36 *Question:* Whether the bank of Venice be not shut up four times in the year twenty days each time?

37 *Question:* Whether by means of this bank the public be not mistress of a million and a half sterling?

38 *Question:* Whether the great exactness and integrity with which this bank is managed be not the chief support of that republic?

39 *Question:* Whether we may not hope for as much skill and honesty in a Protestant Irish Parliament as in a Popish Senate of Venice?

40 *Question:* Whether the bank of Amsterdam was not begun about one hundred and thirty years ago, and whether at this day its stock be not conceived to amount to three thousand tons of gold, or thirty millions sterling?

41 *Question:* Whether besides coined money, there be not also

QUERY

great quantities of ingots or bars of gold and silver lodged in this bank?

42 *Question:* Whether all payments of contracts for goods in gross, and letters of exchange, must not be made by transfers in the bank-books, provided the sum exceed three hundred florins?

43 *Question:* Whether it be not true, that the bank of Amsterdam never makes payments in cash?

44 *Question:* Whether, nevertheless, it be not also true, that no person who hath credit in the bank can want money from particular persons, who are willing to become creditors in own stead?

45 *Question:* Whether any person thinks yourself the poorer, because your money is in the bank?

46 *Question:* Whether the creditors of the bank of Amsterdam are not at liberty to withdraw their money when they please, and whether this liberty doth not make them less desirous to use it?

47 *Question:* Whether this bank be not shut up twice in the year for ten or fifteen days, during which time the accounts are balanced?

48 *Question:* Whether it be not owing to this bank that the city of Amsterdam, without the least confusion, hazard, or trouble, maintains and every day promotes so general and quick a circulation of industry?

49 *Question:* Whether it be not the greatest help and spur to commerce that property can be so readily conveyed and so well secured by a *compte en banc*, that is, by only writing one person's name for another's in the bank-book?

50 *Question:* Whether, at the beginning of the last century, those who had lent money to the public during the war with Spain were not satisfied by the sole expedient of placing their names in a *compte en banc*, with liberty to transfer their claims?

51 *Question:* Whether the example of those easy transfers in the *compte en banc*, thus casually erected, did not tempt other people to become creditors to the public, in order to profit by the same secure and expeditious method of keeping and transferring their wealth?

52 *Question:* Whether this *compte en banc* hath not proved better

QUERY

than a mine of gold to Amsterdam?

53 *Question:* Whether that city may not be said to owe its greatness to the unpromising accident of it having been in debt more than it was able to Pay?

54 *Question:* Whether it be known that any State from such small beginnings, in so short a time, ever grew to so great wealth and power as the province of Holland hath done; and whether the bank of Amsterdam hath not been the real cause of such extraordinary growth?

55 *Question:* Whether we are by nature a more stupid people? And yet whether these things are sufficiently considered by our patriots?

56 *Question:* Whether anything less than the utter subversion of those Republics can break the banks of Venice and Amsterdam?

57 *Question:* Whether at Hamburgh the citizens have not the management of the bank, without the meddling or inspection of the Senate?

58 *Question:* Whether the directors be not four principal burghers chosen by plurality of voices, whose business is to see the rules observed, and furnish the cashiers with money?

59 *Question:* Whether the book-keepers are not obliged to balance their accounts every week, and exhibit them to the controllers or directors?

60 *Question:* Whether any besides the citizens are admitted to have *compte en banc* at Hamburgh?

61 *Question:* Whether there be not a certain limit, under which no sum can be entered into the bank?

62 *Question:* Whether each particular person doth not pay a fee in order to be admitted to a *compte en banc* at Hamburgh and Amsterdam?

63 *Question:* Whether the effects lodged in the bank of Hamburgh are liable to be seized for debt or forfeiture?

64 *Question:* Whether this bank doth not lend money upon pawns at low interest and only for half a year, after which term, in default of payment, the pawns are punctually sold by auction?

65 *Question:* Whether the book-keepers of the bank of Hamburgh are not obliged upon oath never to reveal what sums of money are

QUERY

paid in or out of the bank, or what effects any particular person has therein?

66 *Question:* Whether, therefore, it be possible to know the state or stock of this bank; and yet whether it be not of the greatest reputation and most established credit throughout the North?

67 *Question:* Whether the success of those public banks in Venice, Amsterdam and Hamburg would not naturally produce in other States an inclination to the same methods?

68 *Question:* Whether an absolute monarchy be so apt to gain credit, and whether the vivacity of some humours could so well suit with the slow steps and discreet management which a bank requires?

69 *Question:* Whether the bank called the general bank of France, contrived by Mr Law, and established by letters patent in May, 1716, was not in truth a particular and not a national bank, being in the hands of a particular company privileged and protected by the Government?

70 *Question:* Whether the Government did not order that the notes of this bank should pass on a par with ready money in all payments of the revenue?

71 *Question:* Whether this bank was not obliged to issue only such notes as were payable at sight?

72 *Question:* Whether it was not made a capital crime to forge the notes of this bank?

73 *Question:* Whether this bank was not restrained from trading either by sea or land, and from taking up money upon interest?

74 *Question:* Whether the original stock thereof was not six millions of livres, divided into actions of a thousand crowns each?

75 *Question:* Whether the proprietors were not to hold general assemblies twice in the year, for the regulating of their affairs?

76 *Question:* Whether the accompts of this bank were not balanced twice every year?

77 *Question:* Whether there were not two chests belonging to this bank, the one called the general chest containing their specie, their bills and their copper plates for the printing of those bills, under the custody of three locks, 78 whereof the keys were kept by the director,

QUERY

the inspector and treasurer, also another called the ordinary chest, containing part of the stock not exceeding two hundred thousand crowns, under the key of the treasurer?

79 *Question:* Whether out of this last mentioned sum, each particular cashier was not to be entrusted with a share not exceeding the value of twenty thousand crowns at a time, and that under good security?

80 *Question:* Whether the Regent did not reserve to himself the power of calling this bank to account, so often as he should think good, and of appointing the inspector?

81 *Question:* Whether in the beginning of the year 1719 the French King did not convert the general bank of France into a Banque Royale, having himself purchased the stock of the company and taken it into his own hands, and appointed the Duke of Orleans chief manager thereof?

82 *Question:* Whether from that time, all matters relating to the bank were not transacted in the name, and by the sole authority, of the king?

83 *Question:* Whether his Majesty did not undertake to receive and keep the cash of all particular persons, subjects, or foreigners, in his said Royale Banque, without being paid for that trouble? 84 And whether it was not declared, that such cash should not be liable to seizure on any pretext, not even on the king's own account?

85 *Question:* Whether the treasurer alone did not sign all the bills, receive all the stock paid into the bank, and keep account of all the in-goings and out-goings?

86 *Question:* Whether there were not three registers for the en-registering of the bills kept in the Banque Royale, one by the inspector, another by the controller, and a third by the treasurer?

87 *Question:* Whether there was not also a fourth register, containing the profits of the bank, which was visited, at least once a week, by the inspector and controller?

88 *Question:* Whether, beside the general bureau or compter in the city of Paris, there were not also appointed five more in the towns of Lyons, Tours, Rochelle, Orleans, and Amiens, 89 each

QUERY

whereof was provided with two chests, one of specie for discharging bills at sight, and another of bank bills to be issued as there should be demand?

90 *Question:* Whether, in the above mentioned towns, it was not prohibited to make payments in silver, exceeding the sum of six hundred livres?

91 *Question:* Whether all creditors were not empowered to demand payment in bank bills instead of specie?

92 *Question:* Whether, in a short compass of time, this bank did not undergo many new changes and regulations by several successive acts of council?

93 *Question:* Whether the untimely, repeated, and boundless fabrication of bills did not precipitate the ruin of this bank?

94 *Question:* Whether it be not true, that before the end of July, 1719, they had fabricated four hundred millions of livres in bank-notes, 95 to which they added the sum of 120-millions more on the 12th of September following, also the same sum of 120-millions on the 24th of October, and again on the 29th of December, in the same year, 96 the farther sum of three hundred and sixty millions, making the whole, from an original stock of six millions, mount, within the compass of one year, to a thousand millions of livres?

97 *Question:* Whether on the 28th of February, 1720, the king did not make an union of the bank with the united company of the East and West Indies, which from that time had the administration and profits of the Banque Royale?

98 *Question:* Whether the king did not still profess himself responsible for the value of the bank bills, and whether the company were not responsible to his Majesty for their management?

99 *Question:* Whether sixteen hundred millions of livres, lent to his majesty by the company, was not a sufficient pledge to indemnify the king?

100 *Question:* Whether the new directors were not prohibited to make any more bills without an act of council?

101 *Question:* Whether the chests and books of the Banque were not subjected to the joint inspection of a Counsellor of State, and the Prevot des Marchands, assisted by

QUERY

two Echevins, a judge, and a consul, who had power to visit when they would and without warning?

102 *Question:* Whether in less than two years the actions or shares of the Indian Company (first established for Mississippi, and afterwards increased by the addition of other compares and further? And whether this privileges) did not rise to near 2000 per cent must be ascribed to real advantages of trade, or to mere frenzy?

103 *Question:* Whether, from first to last, there were not fabricated bank bills, of one kind or other, to the value of more than two thousand and six hundred millions of livres, or one hundred and thirty millions sterling?

104 *Question:* Whether the credit of the bank did not decline from its union with the Indian Company?

105 *Question:* Whether, notwithstanding all the above-mentioned extraordinary measures, the bank bills did not still pass at par with gold and silver to May, 1720, 106 when the French king thought fit, by a new act of council, to make a reduction of their value, which proved a fatal blow, the effects whereof, though soon retracted, no subsequent skill or management could ever repair?

107 *Question:* Whether, what no reason, reflexion, or foresight could do, this simple matter of fact (the most powerful argument with the multitude) did not do at once, to wit, open the eyes of the people?

108 *Question:* Whether the dealers in that sort of ware had ever troubled their heads with the nature of credit, or the true use and end of banks, but only considered their bills and actions as things, to which the general demand gave a price?

109 *Question:* Whether the Government was not in great perplexity to contrive expedients for the getting rid of those bank bills, which had been lately multiplied with such an unlimited passion?

110 *Question:* Whether notes to the value of about ninety millions were not sunk by being paid off in specie, with the cash of the Compagnie des Indes, with that of the bank, and that of the Hotels des Monnoyes? 111 Whether five

QUERY

hundred and thirty millions were not converted into annuities at the royal treasury? 112 Whether several hundred millions more in bank bills were not extinguished and replaced by annuities on the City of Paris, on taxes throughout the provinces?

113 *Question:* Whether, after all other shifts, the last and grand resource for exhausting that ocean, was not the erecting of a *compte en banc* in several towns of France?

114 *Question:* Whether, when the imagination of a people is thoroughly wrought upon and heated by their own example, and the arts of designing people, this doth not produce a sort of enthusiasm which takes place of reason, and is the most dangerous distemper in a State?

115 *Question:* Whether this epidemical madness should not be always before the eyes of a legislature, in the framing of a national bank?

116 *Question:* Whether, therefore, it may not be fatal to engraft trade on a national bank, or to propose dividends on the stock thereof?

117 *Question:* Whether it be possible for a national bank to subsist and maintain its credit under a French government?

118 *Question:* Whether it may not be as useful a lesson to consider the bad management of some as the good management of others?

119 *Question:* Whether the rapid and surprising success of the schemes of those who directed the French bank did not turn their brains?

120 *Question:* Whether the best institutions may not be made subservient to bad ends?

121 *Question:* Whether, as the aim of industry is power, and the aim of a bank is to circulate and secure this power to each individual, it doth not follow that absolute power in one hand is inconsistent with a lasting and a flourishing bank?

122 *Question:* Whether our natural appetites, as well as powers, are not limited to their respective ends and uses? But whether artificial appetites may not be infinite?

123 *Question:* Whether the simple getting of money, or passing it from hand to hand without

industry, be an object worthy of a wise government?

124 *Question:* Whether, if money be considered as an end, the appetite thereof be not infinite? But whether the ends of money itself be not bounded?

125 *Question:* Whether the mistaking of the means for the end was not a fundamental error in the French councils?

126 *Question:* Whether the total sum of all other powers, be it of enjoyment or action, which belong to human, or to all humankind together, is not in truth a very narrow and limited quantity? But whether fancy is not boundless?

127 *Question:* Whether this capricious tyrant, which usurps the place of reason, doth not most cruelly torment and delude those poor people, the usurers, stockjobbers, and projectors, of content to themselves from heaping up riches, 128 that is, from gathering counters, from multiplying figures, from enlarging denominations, without knowing what they would be at, and without having a proper regard to the use or end or nature of things?

129 *Question:* Whether the ignis fatuus of fancy doth not kindle immoderate desires, and lead people into endless pursuits and wild labyrinths?

130 *Question:* Whether counters be not referred to other things, which, so long as they keep pace and proportion with the counters, it must be owned the counters are useful; but whether beyond that to value or covet counters be not direct folly?

131 *Question:* Whether the public aim ought not to be, that people's industry should supply their present wants, and the overplus be converted into a stock of power?

132 *Question:* Whether the better this power is secured, and the more easily it is transferred, industry be not so much the more encouraged?

133 *Question:* Whether money, more than is expedient for those purposes, be not upon the whole hurtful rather than beneficial to a State?

134 *Question:* Whether there should not be a constant care to keep the bills at par?

135 *Question:* Whether, therefore, bank bills should at any time be

QUERY

multiplied but as trade and business were also multiplied?

136 *Question:* Whether it was not madness in France to mint bills and actions, merely to humour the people and rob them of their cash?

137 *Question:* Whether we may not profit by their mistakes, and as some things are to be avoided, whether there may not be others worthy of imitation in the conduct of our neighbours?

138 *Question:* Whether the way be not clear and open and easy, and whether anything but the will is wanting to our legislature?

139 *Question:* Whether jobs and tricks are not detested on all hands, but whether it be not the joint interest of prince and people to promote industry?

140 *Question:* Whether, all things considered, a national bank be not the most practicable, sure, and speedy method to mend our affairs, and cause industry to flourish among us?

141 *Question:* Whether a *compte en banc* or current bank bills would best answer our occasions?

142 *Question:* Whether a public *compte en banc*, where effects are received, and accounts kept with particular persons, be not an excellent expedient for a great city?

143 *Question:* What effect a general *compte en banc* would have in the metropolis of this kingdom with one in each province subordinate thereunto?

144 *Question:* Whether it may not be proper for a great kingdom to unite both expedients, to wit, bank notes and a *compte en banc*?

145 *Question:* Whether, nevertheless, it would be advisable to begin with both at once, or rather to proceed first with the bills, and afterwards, as business multiplied, and money or effects flowed in, to open the *compte en banc*?

146 *Question:* Whether, for greater security, double books of *compte en banc* should not be kept in different places and hands?

147 *Question:* Whether it would not be right to build the compters and public treasuries, where books and bank notes are kept, without wood, all arched and floored with brick or stone, having chests also and cabinets of iron?

QUERY

148 *Question:* Whether diverse registers of the bank notes should not be kept in different hands?

149 *Question:* Whether there should not be great discretion in the uttering of bank notes, and whether the attempting to do things per saltum be not often the way to undo them?

150 *Question:* Whether the main art be not by slow degrees and cautious measures to reconcile the bank to the public, to wind it insensibly into the affections of people, and interweave it with the constitution?

151 *Question:* Whether the promoting of industry should not be always in view, as the true and sole end, the rule and measure, of a national bank? And whether all deviations from that object should not be carefully avoided?

152 *Question:* Whether a national bank may not prevent the drawing of specie out of the country (where it circulates in small payments), to be shut up in the chests of particular persons?

153 *Question:* Whether it may not be useful, for supplying manufactures and trade with stock, for regulating exchange, for quickening commerce, for putting spirit into the people?

154 *Question:* Whether tenants or debtors could have cause to complain of our monies being reduced to the English value if it were withal multiplied in the same, or in a greater proportion? And whether this would not be the consequence of a nation al bank?

155 *Question:* If there be an open sure way to thrive, without hazard to ourselves or prejudice to our neighbours, what should hinder us from putting it in practice?

156 *Question:* Whether in so numerous a Senate, as that of this kingdom, it may not be easie to find people of pure hands and clear heads fit to contrive and model a public bank?

157 *Question:* Whether a view of the precipice be not sufficient, or whether we must tumble headlong before we are roused?

158 *Question:* Whether in this drooping and dispirited country, people are quite awake?

159 *Question:* Whether we are sufficiently sensible of the peculiar security there is in having a bank that consists of land and paper, one of which cannot be exported, and

the other is in no danger of being exported?

160 *Question:* Whether it be not delightful to complain? And whether there be not many who had rather utter their complaints than redress their evils?

161 *Question:* Whether, if 'the crown of the wise be their riches' (Proverb, chapter-14, verse:24), we are not the foolishest people in Christendom?

162 *Question:* Whether we have not all the while great civil as well as natural advantages?

163 *Question:* Whether there be any people who have more leisure to cultivate the arts of peace, and study the public weal?

164 *Question:* Whether other nations who enjoy any share of freedom, and have great objects in view, be not unavoidably embarrassed and distracted by factions? 165 But whether we do not divide upon trifles, and whether our parties are not a burlesque upon politics?

166 *Question:* Whether it be not an advantage that we are not embroiled in foreign affairs, that we hold not the balance of Europe, that we are protected by other fleets and armies, that it is the true interest of a powerful people, from whom we are descended, to guard us on all sides?

167 *Question:* Whether England doth not really love us and wish well to us, as bone of its bone, and flesh of its flesh? And whether it be not our part to cultivate this love and affection all manner of ways?

168 *Question:* Whether, if we do not reap the benefits that may be made of our country and government, want of will in the lower people, or want of wit in the upper, be most in fault?

169 *Question:* What sea-ports or foreign trade have the Swisses; and yet how warm are those people, and how well provided?

170 *Question:* Whether there may not be found a people who so contrive as to be impoverished by their trade? And whether we are not that people?

171 *Question:* Whether it would not be better for this island, if all our fine folk of both sexes were shipped off, to remain in foreign countries, rather than that they should spend their estates at home in foreign luxury, and spread the

QUERY

contagion thereof through their native land?

172 *Question:* Whether our gentry understand or have a notion of magnificence, and whether for want thereof they do not affect very wretched distinctions?

173 *Question:* Whether there be not an art or skill in governing human pride, so as to render it subservient to the pubic aim?

174 *Question:* Whether the great and general aim of the public should not be to employ the people?

175 *Question:* What right an eldest son hath to the worst education?

176 *Question:* Whether people's counsels are not the result of their knowledge and their principles?

177 *Question:* Whether an assembly of free-thinkers, petit maitres, and smart Fellows would not make an admirable Senate?

178 *Question:* Whether there be not labour of the brains as well as of the hands, and whether the former is beneath a gentleman?

179 *Question:* Whether the public be more interested to protect the property acquired by mere birth than that which is the Mediate fruit of learning and virtue?

180 *Question:* Whether it would not be a poor and ill-judged project to attempt to promote the good of the community, by invading the rights of one part thereof, or of one particular order of people?

181 *Question:* Whether the public happiness be not proposed by the legislature, and whether such happiness doth not contain that of the individuals?

182 *Question:* Whether, therefore, a legislator should be content with a vulgar share of knowledge? 183 Whether you should not be a person of reflexion and thought, who hath made it your study to understand the true nature and interest of humankind, 184 how to guide people's humours and passions, how to incite their active powers, how to make their several talents co-operate to the mutual benefit of each other, and the general good of the whole?

185 *Question:* Whether it doth not follow that above all things a gentleman's care should be to keep his own faculties sound and entire?

186 *Question:* Whether the natural phlegm of this island needs any additional stupefier?

QUERY

187 *Question:* Whether all spirituous liquors are not in truth opiates?

188 *Question:* Whether our people of business are not generally very grave by fifty?

189 *Question:* Whether there be really among us any parents so silly, as to encourage drinking in their children?

190 *Question:* Whence it is, that our ladies are more alive, and bear age so much better than our gentlemen?

191 *Question:* Whether all people have not faculties of mind or body which may be employed for the public benefit?

192 *Question:* Whether the main point be not to multiply and employ our people?

193 *Question:* Whether hearty food and warm clothing would not enable and encourage the lower sort to labour?

194 *Question:* Whether, in such a soil as ours, if there was industry, there could be want?

195 *Question:* Whether the way to make people industrious be not to let them taste the fruits of their industry? And whether the labouring ox should be muzzled?

196 *Question:* Whether our landlords are to be told that industry and numbers would raise the value of their lands, or that one acre about the Tholsel is worth ten thousand acres in Connaught?

197 *Question:* Whether our old native Irish are not the most indolent and supine people in Christendom?

198 *Question:* Whether they are yet civilised, and whether their habitations and furniture are not more sordid than those of the savage Americans?

199 *Question:* Whether this be altogether their own fault?

200 *Question:* Whether it be not a sad circumstance to live among lazy beggars? 201 And whether, on the other hand, it would not be delightful to live in a country swarming, like China, with busy people?

202 *Question:* Whether we should not cast about, by all manner of means, to excite industry, and to remove whatever hinders it? And whether every one should not lend a helping hand?

203 *Question:* Whether vanity itself should not be engaged in this good work? 204 And whether it is not to

QUERY

be wished that the finding of employment for themselves and others were a fashionable distinction among the ladies?

205 *Question:* Whether idleness be the mother or the daughter of spleen?

206 *Question:* Whether it may not be worthwhile to publish the conversation of Ischomachus and his wife in Xenophon, for the use of our ladies?

207 *Question:* Whether it is true that there have been, upon a time, one hundred millions of people employed in China, without the woollen trade, or any foreign commerce?

208 *Question:* Whether the natural inducements to sloth are not greater in the Mogul's country than in Ireland, and yet whether, in that suffocating and dispiriting climate, the Banyans are not all, men, women, and children, constantly employed?

209 *Question:* Whether it be not true that the great Mogul's subjects might undersell us even in our own markets, and clothe our people with their stuffs and calicoes, if they were imported duty free?

210 *Question:* Whether there can be a greater reproach on the leading people and the patriots of a country, than that the people should want employment? 211 And whether methods may not be found to employ even the lame and the blind, the dumb, the deaf, and the maimed, in some or other branch of our manufactures?

212 *Question:* Whether much may not be expected from a biennial consultation of so many wise people about the public good?

213 *Question:* Whether a tax upon dirt would not be one way of encouraging industry?

214 *Question:* Whether it may not be right to appoint censors in every parish to observe and make returns of the idle hands?

215 *Question:* Whether a register or history of the idleness and industry of a people would be an useless thing?

216 *Question:* Whether we are apprized, of all the uses that may be made of political arithmetic?

217 *Question:* Whether it would be a great hardship if every parish were obliged to find work for their poor?

QUERY

218 *Question:* Whether children especially should not be inured to labour betimes?

219 *Question:* Whether there should not be erected, in each province, an hospital for orphans and foundlings, at the expense of old bachelors?

220 *Question:* Whether it be true that in the Dutch workhouses things are so managed that a child four years old may earn its own livelihood?

221 *Question:* What a folly is it to build fine houses, or establish lucrative posts and large incomes, under the notion of providing for the poor?

222 *Question:* Whether the poor, grown up and in health, need any other provision but their own industry, under public inspection?

223 *Question:* Whether the poor-tax in England hath lessened or increased the number of the poor?

224 *Question:* Why the workhouse in Dublin, with so good an endowment, should yet be of so little use? And whether this may not be owing to that very endowment?

225 *Question:* Whether that income might not, by this time, have gone through the whole kingdom, and erected a dozen workhouses in every county?

226 *Question:* Whether workhouses should not be made at the least expense, with clay floors, and walls of rough stone, without plastering, ceiling, or glazing?

227 *Question:* Whether the tax on chairs or hackney coaches be not paid, rather by the country gentlemen, than the citizens of Dublin?

228 *Question:* Whether it be an impossible attempt to set our people at work, or whether industry be a habit which, like other habits, may by time and skill be introduced among any people?

229 *Question:* Whether all manner of means should not be employed to possess the nation in general with an aversion and contempt for idleness and all idle folk?

230 *Question:* Whether it would be a hardship on people destitute of all things, if the public furnished them with necessaries which they should be obliged to earn by their labour?

231 *Question:* Whether other nations have not found great benefit from the use of slaves in

QUERY

repairing high roads, making rivers navigable, draining bogs, erecting public buildings, bridges, and manufactures?

232 *Question:* Whether temporary servitude would not be the best cure for idleness and beggary?

233 *Question:* Whether the public hath not a right to employ those who cannot or who will not find employment for themselves?

234 *Question:* Whether all sturdy beggars should not be seized and made slaves to the public for a certain term of years?

235 *Question:* Whether you who is chained in a jail or dungeon hath not, for the time, lost your liberty? And if so, whether temporary slavery be not already admitted among us?

236 *Question:* Whether a state of servitude, wherein you should be well worked, fed, and clothed, would not be a preferment to such a fellow?

237 *Question:* Whether criminals in the freest country may not forfeit their liberty, and repair the damage they have done the public by hard labour?

238 *Question:* What the word 'servant' signifies in the New Testament?

239 *Question:* Whether the view of criminals chained in pairs and kept at hard labour would not be very edifying to the multitude?

240 *Question:* Whether the want of such an institution be not plainly seen in England, where the disbelief of a future state hardeneth rogues against the fear of death, and where, through the great growth of robbers and housebreakers, it becomes every day more necessary?

241 *Question:* Whether it be not easier to prevent than to remedy, and whether we should not profit by the example of others?

242 *Question:* Whether felons are not often spared, and therefore encouraged, by the compassion of those who should prosecute them?

243 *Question:* Whether many that would not take away the life of a thief may not nevertheless be willing to bring the offender to a more adequate punishment?

244 *Question:* Whether there should not be a difference between the treatment of criminals and that of other slaves?

QUERY

245 *Question:* Whether the most indolent would be fond of idleness, if they regarded it as the sure road to hard labour?

246 *Question:* Whether the industry of the lower part of our people doth not much depend on the expense of the upper?

247 *Question:* What would be the consequence if our gentry affected to distinguish themselves by fine houses rather than fine clothes?

248 *Question:* Whether any people in Europe are so meanly provided with houses and furniture, in proportion to their incomes, as the people of estates in Ireland?

249 *Question:* Whether building would not peculiarly encourage all other arts in this kingdom?

250 *Question:* Whether smiths, masons, bricklayers, plasterers, carpenters, joiners, tilers, plumbers, and glaziers would not all find employment if the humour of building prevailed?

251 *Question:* Whether the ornaments and furniture of a good house do not employ a number of all sorts of artificers, in iron, wood, marble, brass, pewter, copper, wool, flax, and divers other materials?

252 *Question:* Whether in buildings and gardens a great number of day-labourers do not find employment?

253 *Question:* Whether by these means much of that sustenance and wealth of this nation which now goes to foreigners would not be kept at home, and nourish and circulate among our own people?

254 *Question:* Whether, as industry produced good living, the number of hands and mouths would not be increased; and in proportion thereunto, whether there would not be every day more occasion for agriculture? And whether this article alone would not employ a world of people?

255 *Question:* Whether such management would not equally provide for the magnificence of the rich, and the necessities of the poor?

256 *Question:* Whether an expense in building and improvements doth not remain at home, pass to the heir, and adorn the public? And whether any of those things can be said of claret?

257 *Question:* Whether fools do not make fashions, and wise people follow them?

QUERY

258 *Question:* Whether, for one who hurts own fortune by improvements, twenty do not ruin themselves by foreign luxury?

259 *Question:* Whether in proportion as Ireland was improved and beautified by fine seats, the number of absentees would not decrease?

260 *Question:* Whether you who employs people in buildings and manufactures doth not put life in the country, and whether the neighbourhood round you be not observed to thrive?

261 *Question:* Whether money circulated on the landlord's own lands, and among your own tenants, doth not return into your own pocket?

262 *Question:* Whether every squire that made your domain swarm with busy hands, like a bee-hive or ant-hill, would not serve your own interest, as well as that of your country?

263 *Question:* Whether a gentleman who hath seen a little of the world, and observed how people live elsewhere, can contentedly sit down in a cold, damp, sordid habitation, in the midst of a bleak country, inhabited by thieves and beggars?

264 *Question:* Whether, on the other hand, a handsome seat amidst well-improved lands, fair villages, and a thriving neighbourhood may not invite a person to dwell on your own estate, and quit the life of an insignificant saunterer about town for that of a useful country-gentleman?

265 *Question:* Whether it would not be of use and ornament if the towns throughout this kingdom were provided with decent churches, townhouses, workhouses, market-places, and paved streets, with some order taken for cleanliness?

266 *Question:* Whether, if each of these towns were addicted to some peculiar manufacture, we should not find that the employing many hands together on the same work was the way to perfect our workmen? 267 And whether all these things might not soon be provided by a domestic industry, if money were not wanting?

268 *Question:* Whether money could ever be wanting to the demands of industry, if we had a national bank?

QUERY

269 *Question:* Whether when a motion was made once upon a time to establish a private bank in this kingdom by public authority, diverse gentlemen did not shew themselves forward to embark in that design?

270 *Question:* Whether it may not now be hoped, that our patriots will be as forward to examine and consider the proposal of a public bank calculated only for the public good?

271 *Question:* Whether any people upon earth shew a more early zeal for the service of their country, greater eagerness to bear a part in the legislature, or a more general parturiency with respect to politics and public counsels?

272 *Question:* Whether, nevertheless, a light and ludicrous vein be not the reigning humour; but whether there was ever greater cause to be serious?

ERRATUM
George Berkley

Query-1

3 Whether the fable of Hercules and the carter ever suited any nation like this nation of Ireland?

2 *Question:* Whether it be not a new spectacle under the sun, to behold, in such a climate and such a soil, and under such a gentle government, so many roads untrodden, fields untilled, houses desolate, and hands unemployed?

3 *Question:* Whether there is any country in Christendom, either kingdom or republic, depending or independent, free or enslaved, which may not afford us a useful lesson?

4 *Question:* Whether the frugal Swisses have any other commodities but their butter and cheese and a few cattle, for exportation; whether, nevertheless, the single canton of Berne hath not in its public treasury two millions sterling?

5 *Question:* Whether that small town of Berne, with its scanty barren territory, in a mountainous corner, without sea-ports, without

QUERY

manufactures, without mines, be not rich by mere dint of frugality?

6 *Question:* Whether the Swisses in general have not sumptuary laws, prohibiting the use of gold, jewels, silver, silk, and lace in their apparel, and indulging the women only to wear silk on festivals, weddings, and public solemnities?

7 *Question:* Whether there be not two ways of growing rich, sparing and getting? But whether the lazy spendthrift must not be doubly poor?

8 *Question:* Whether money circulating be not the life of industry; and whether the want thereof doth not render a State gouty and inactive?

9 *Question:* But whether, if we had a national bank, and our present cash (small as it is) were put into the most convenient shape, people should hear any public complaints for want of money?

10 *Question:* Whether all circulation be not alike a circulation of credit, whatsoever medium (metal or paper) is employed, and whether gold be any more than credit for so much power?

11 *Question:* Whether the wealth of the richest nations in Christendom doth not consist in paper vastly more than in gold and silver?

12 *Question:* Whether Lord Clarendon doth not aver of his own knowledge, that the Prince of Orange, with the best credit, and the assistance of the richest people in Amsterdam, was above ten days endeavouring to raise L20,000 in specie, without being able to raise half the sum in all that time?

13 *Question:* Whether the whole city of Amsterdam would not have been troubled to have brought together twenty thousand pounds in one room?

14 *Question:* Whether it be not absolutely necessary that there must be a bank and must be a trust? And, if so, whether it be not the most safe and prudent course to have a national bank and trust the legislature?

15 *Question:* Whether objections against trust in general avail, when it is allowed there must be a trust, and the only question is where to place this trust, whether in the legislature or in private hands?

16 *Question:* Whether it can be expected that private persons

QUERY

should have more regard to the public than the public itself?

17 *Question:* Whether, if there be hazards from mismanagement, those may not be provided against in the framing of a pubic bank; 18 but whether any provision can be made against the mismanagement of private banks that are under no check, control, or inspection?

19 *Question:* Whatever may be said for the sake of objecting, yet, whether it be not false in fact, that people would prefer a private security to a public security?

20 *Question:* Whether a national bank ought to be considered as a new experiment; and whether it be not a motive to try this scheme that it hath been already tried with success in other countries?

21 *Question:* If power followeth money, whether this can be anywhere more properly and securely placed, than in the same hands wherein the supreme power is already placed?

22 *Question:* Whether there be more danger of abuse in a private than in a public management?

23 *Question:* Whether the proper usual remedy for abuses of private banks be not to bring them before Parliament, and subject them to the inspection of a committee; and whether it be not more prudent to prevent than to redress an evil?

24 *Question:* Supposing there had been hitherto no such thing as a bank, and the question were now first proposed, whether it would be safer to circulate unlimited bills in a private credit, or bills to a limited value on the public credit of the community, what would people think?

25 *Question:* Whether experience and example be not the plainest proof; and whether any instance can be assigned where a national bank hath not been attended with great advantage to the public?

26 *Question:* Whether the evils apprehended from a national bank are not much more to be apprehended from private banks; 27 but whether people by custom are not familiarised and reconciled to common dangers, which are therefore thought less than they really are?

28 *Question:* Whether it would not be very hard to suppose all sense, honesty, and public spirit were in the keeping of only a few private

QUERY

people, and the public was not fit to be trusted?

29 *Question:* Whether it be not ridiculous to suppose a legislature should be afraid to trust itself?

30 *Question:* But, whether a private interest be not generally supported and pursued with more zeal than a public?

31 *Question:* Whether the maxim, 'What is everybody's business is nobody's,' prevails in any country under the sun more than in Ireland?

32 *Question:* Whether, nevertheless, the community of danger, which lulls private people asleep, ought not to awaken the public?

33 *Question:* Whether there be not less security where there are more temptations and fewer checks?

34 *Question:* If a person is to risk own fortune, whether it be more prudent to risk it on the credit of private people, or in that of the great assembly of the nation?

35 *Question:* Where is it most reasonable to expect wise and punctual dealing, whether in a secret impenetrable recess, where credit depends on secrecy, or in a public management regulated and inspected by Parliament?

36 *Question:* Whether a supine security be not catching, and whether numbers running the same risk, as they lessen the caution, may not increase the danger?

37 *Question:* What real objection lies against a national bank erected by the legislature, and in the management of public deputies, appointed and inspected by the legislature?

38 *Question:* What have we to fear from such a bank, which may not be as well feared without it?

39 *Question:* How, why, by what means, or for what end, should it become an instrument of oppression?

40 *Question:* Whether we can possibly be on a more precarious foot than we are already? 41 Whether it be not in the power of any particular person at once to disappear and convey yourself into foreign parts? 42 Or whether there can be any security in an estate of land when the demands upon it are unknown?

43 *Question:* Whether the establishing of a national bank, if we suppose a concurrence of the government, be not very practicable?

QUERY

44 *Question:* But, whether though a scheme be never so evidently practicable and useful to the pubic, yet, if conceived to interfere with a private interest, it be not forthwith in danger of appearing doubtful, difficult, and impracticable?

45 *Question:* Whether the legislative body hath not already sufficient power to hurt, if they may be supposed capable of it, and whether a bank would give them any new power?

46 *Question:* What should tempt the pubic to defraud itself?

47 *Question:* Whether, if the legislature destroyed the public, it would not be *felo de se*; and whether it be reasonable to suppose it bent on its own destruction?

48 *Question:* Whether the objection to a pubic national bank, from want of secrecy, be not in truth an argument for it?

49 *Question:* Whether the secrecy of private banks be not the very thing that renders them so hazardous? And whether, without that, there could have been of late so many sufferers?

50 *Question:* Whether when all objections are answered it be still incumbent to answer surmises?

51 *Question:* Whether it were just to insinuate that people would be against any proposal they could not turn into a job?

52 *Question:* Suppose the legislature passed their word for any private banker, and regularly visited your books, would not money lodged in your bank be therefore reckoned more secure?

53 *Question:* In a country where the legislative body is not fit to be trusted, what security can there be for trusting any one else?

54 *Question:* If it be not ridiculous to question whether the pubic can find cash to circulate bills of a limited value when private bankers are supposed to find enough to circulate them to an unlimited value?

55 *Question:* Whether the united stock of a nation be not the best security? And whether anything but the ruin of the State can produce a national bankruptcy?

56 *Question:* Whether the total sum of the public treasure, power, and wisdom, all co-operating, be not most likely to establish a bank of

QUERY

credit, sufficient to answer the ends, relieve the wants, and satisfy the scruples of all people?

57 *Question:* Whether those hazards that in a greater degree attend private banks can be admitted as objections against a public one?

58 *Question:* Whether that which is an objection to everything be an objection to anything; and whether the possibility of an abuse be not of that kind?

59 *Question:* Whether, in fact, all things are not more or less abused, and yet notwithstanding such abuse, whether many things are not upon the whole expedient and useful?

60 *Question:* Whether those things that are subject to the most general inspection are not the least subject to abuse?

61 *Question:* Whether, for private ends, it may not be sometimes expedient to object novelty to things that have been often tried, difficulty to the plainest things, and hazard to the safest?

62 *Question:* Whether some people will not be apt to argue as if the question was between money and credit, and not (as in fact it is) which ought to be preferred, private credit or public credit?

63 *Question:* Whether they will not prudently overlook the evils felt, or to be feared, on one side?

64 *Question:* Whether, therefore, those that would make an impartial judgment ought not to be on their guard, keeping both prospects always in view, balancing the inconveniences on each side and considering neither absolutely?

65 *Question:* Whether willful mistakes, examples without a likeness, and general addresses to the passions are not often more successful than arguments?

66 *Question:* Whether there be not an art to puzzle plain cases as well as to explain obscure ones?

67 *Question:* Whether private people are not often an over-match for the public; want of weight being made up for by activity?

68 *Question:* If we suppose neither sense nor honesty in our leaders or representatives, whether we are not already undone, and so have nothing further to fear?

69 *Question:* Suppose a power in the government to hurt the pubic by means of a national bank, yet what should give them the will to

QUERY

do this? 70 Or supposing a will to do mischief, yet how could a national bank, modelled and administered by Parliament, put it in their power?

71 *Question:* Whether even a wicked will entrusted with power can be supposed to abuse it for no end?

72 *Question:* Whether it be not much more probable that those who maketh such objections do not believe them?

73 *Question:* Whether it be not vain to object that our fellow-subjects of Great Britain would malign or obstruct our industry when it is exerted in a way which cannot interfere with their own?

74 *Question:* Whether it is to be supposed they should take delight in the dirt and nakedness and famine of our people, or envy them shoes for their feet and beef for their belies?

75 *Question:* What possible handle or inclination could our having a national bank give other people to distress us?

76 *Question:* Whether it be not ridiculous to conceive that a project for cloathing and feeding our natives should give any umbrage to England?

77 *Question:* Whether such unworthy surmises are not the pure effect of spleen?

78 *Question:* Whether London is not to be considered as the metropolis of Ireland? And whether our wealth (such as it is) doth not circulate through London and throughout all England, as freely as that of any part of the Majesty's dominions?

79 *Question:* Whether therefore it be not evidently the interest of the people of England to encourage rather than to oppose a national bank in this kingdom, as well as every other means for advancing our wealth which shall not impair their own?

80 *Question:* Whether it is not our interest to be useful to them rather than rival them; and whether in that case we may not be sure of their good offices?

81 *Question:* Whether we can propose to thrive so long as we entertain a wrongheaded distrust of England?

82 *Question:* Whether, as a national bank would increase our industry, and that our wealth, England may

not be a proportionable gainer; and whether we should not consider the gains of our mother-country as some accession to our own?

83 *Question:* Whether the Protestant colony in this kingdom can ever forget what they owe to England?

84 *Question:* Whether there ever was in any part of the world a country in such wretched circumstances, and which, at the same time, could be so easily remedied, and nevertheless the remedy not applied?

85 *Question:* What must become of a people that can neither see the plainest things nor do the easiest?

86 *Question:* Be the money lodged in the bank what it will, yet whether an Act to make good deficiencies would not remove all scruples?

87 *Question:* If it be objected that a national bank must lower interest, and therefore hurt the monied person, whether the same objection would not hold as strong against multiplying our gold and silver?

88 *Question:* But whether a bank that utters bills, with the sole view of promoting the public weal, may not so proportion their quantity as to avoid several inconveniences which might attend private banks?

89 *Question:* Whether there be any difficulty in comprehending that the whole wealth of the nation is in truth the stock of a national bank?

90 And whether any more than the right comprehension of this be necessary to make all people easy with regard to its credit?

91 *Question:* Whether any Thing be more reasonable than that the pubic, which makes the whole profit of the bank, should engage to make good its credit?

92 *Question:* Whether the prejudices about gold and silver are not strong, but whether they are not still prejudices?

93 *Question:* Whether paper doth not by its stamp and signature acquire a local value, and become as precious and as scarce as gold? And whether it be not much fitter to circulate large sums, and therefore preferable to gold?

94 *Question:* Whether, in order to make people see and feel, it be not often necessary to inculcate the same thing, and place it in different lights?

95 *Question:* Whether it doth not much import to have a right

conception of money? And whether its true and just idea be not that of a ticket, entitling to power, and fitted to record and transfer such power?

96 *Question:* Whether the managers and officers of a national bank ought to be considered otherwise than as the cashiers and clerks of private banks? 97 Whether they are not in effect as little trusted, have as little power, are as much limited by rules, and as liable to inspection?

98 *Question:* Whether the mistaking this point may not create some prejudice against a national bank, as if it depended on the credit, or wisdom, or honesty, of private people, rather than on the plubic, which is really the sole proprietor and director thereof, and as such obliged to support it?

99 *Question:* Though the bank of Amsterdam doth very rarely, if at all, pay out money, yet whether every person possess'd of specie be not ready to convert it into paper, and act as cashier to the bank? 100 And whether, from the same motive, every monied person throughout this kingdom would not be cashier to our national bank?

101 *Question:* Whether a national bank would not be the great means and motive for employing our poor in manufactures?

102 *Question:* Whether money, though lent out only to the rich, would not soon circulate among the poor? And whether any person borrows but with an intent to circulate?

103 *Question:* Whether both government and people would not in the event be gainers by a national bank? 104 And whether anything but wrong conceptions of its nature can make those that wish well to either averse from it?

105 *Question:* Whether it may not be right to think, and to have it thought, that England and Ireland, prince and people, have one and the same interest?

106 *Question:* Whether, if we had more means to set on foot such manufactures and such commerce as consists with the interest of England, there would not of course be less sheep-walk, and less wool exported to foreign countries? And whether a national bank would not supply such means?

QUERY

107 *Question:* Whether we may not obtain that as friends which it is in vain to hope for as rivals?

108 *Question:* Whether in every instance by which we prejudice England, we do not in a greater degree prejudice ourselves?

109 *Question:* Whether in the rude original of society the first step was not the exchanging of commodities; the next a substituting of metals by weight as the common medium of circulation; after this the making use of coin; 110 lastly, a further refinement by the use of paper with proper marks and signatures? And whether this, as it is the last, so it be not the greatest improvement?

111 *Question:* Whether we are not in fact the only people who may be said to starve in the midst of plenty?

112 *Question:* Whether business in general doth not languish among us? Whether our land is not untilled? Whether its inhabitants are not upon the wing?

113 *Question:* Whether there can be a worse sign than that people should quit their country for a livelihood? 114 Though people often leave their country for health, or pleasure, or riches, yet to leave it merely for a livelihood, whether this be not exceeding bad, and sheweth some peculiar mismanagement?

115 *Question:* Whether our circumstances do not call aloud for some present remedy? And whether that remedy be not in our power?

116 *Question:* Whether, in order to redress our evils, artificial helps are not most wanted in a land where industry is most against the natural grain of the people?

117 *Question:* Whether, of all the helps to industry that ever were invented, there be any more secure, more easy, and more effectual than a national bank?

118 *Question:* Whether medicines do not recommend themselves by experience, even though their reasons be obscure? But whether reason and fact are not equally clear in favour of this political medicine?

119 *Question:* Whether, although the prepossessions about gold and silver have taken deep root, yet the example of our Colonies in America doth not make it as plain

as day-light that they are not so necessary to the wealth of a nation as the vulgar of all ranks imagine?

120 *Question:* Whether it be not evident that we may maintain a much greater inward and outward commerce, and be five times richer than we are, nay, and our bills abroad be of far greater credit, though we had not one ounce of gold or silver in the whole island?

121 *Question:* Whether wrongheaded maxims, customs, and fashions are not sufficient to destroy any people which hath so few resources as the inhabitants of Ireland.

122 *Question:* Whether it would not be a horrible thing to see our matrons make dress and play their chief concern?

123 *Question:* Whether our ladies might not as well endow monasteries as wear Flanders lace?

124 And whether it be not true that Popish nuns are maintained by Protestant contributions?

125 *Question:* Whether England, which hath a free trade, whatever it remits for foreign luxury with one hand, doth not with the other receive much more from abroad?

126 Whether, nevertheless, this nation would not be a gainer, if our women would content themselves with the same moderation in point of expense as the English ladies?

127 *Question:* But whether it be not a notorious truth that our Irish ladies are on a foot, as to dress, with those of five times their fortune in England?

128 *Question:* Whether it be not even certain that the matrons of this forlorn country send out a greater proportion of its wealth, for fine apparel, than any other females on the whole surface of this terraqueous globe?

129 *Question:* Whether the expense, great as it is, be the greatest evil; but whether this folly may not produce many other follies, an entire derangement of domestic life, absurd manners, neglect of duties, bad mothers, a general corruption in both sexes?

130 *Question:* Whether therefore a tax on all gold and silver in apparel, on all foreign laces and silks, may not raise a fund for the bank, and at the same time have other salutary effects on the public?

QUERY

131 *Question:* But, if people had rather tax themselves in another way, whether an additional tax of ten shillings the hogshead on wines may not supply a sufficient fund for the national bank, all defects to be made good by Parliament?

132 *Question:* Whether upon the whole it may not be right to appoint a national bank?

133 *Question:* Whether the stock and security of such bank would not be, in truth, the national stock, or the total sum of the wealth of this kingdom?

134 *Question:* Whether, nevertheless, there should not be a particular fund for present use in answering bills and circulating credit?

135 *Question:* Whether for this end any fund may not suffice, provided an Act be passed for making good deficiencies?

136 *Question:* Whether the sole proprietor of such bank should not be the public, and the sole director the legislature?

137 *Question:* Whether the managers, officers, and cashiers should not be servants of the pubic, acting by orders and limited by rules of the legislature?

138 *Question:* Whether there should not be a standing number of inspectors, one-third people in great office, the rest members of both houses, half whereof to go out, and half to come in every session?

139 *Question:* Whether those inspectors should not, all in a body, visit twice a year, and three as often as they pleased?

140 *Question:* Whether the general bank should not be in Dublin, and subordinate banks or compters one in each province of Munster, Ulster, and Connaught?

141 *Question:* Whether there should not be such provisions of stamps, signatures, checks, strong boxes, and all other measures for securing the bank notes and cash, as are usual in other banks?

142 *Question:* Whether these ten or a dozen last queries may not easily be converted into heads of a bill?

143 *Question:* Whether any one concerns yourself about the security or funds of the banks of Venice or Amsterdam? And whether in a little time the case

would not be the same as to our bank?

144 *Question:* Whether the first beginning of expedients do not always meet with prejudices? 145 And whether even the prejudices of a people ought not to be respected?

146 *Question:* Whether a national bank be not the true philosopher's stone in a State?

147 *Question:* Whether it be not the most obvious remedy for all the inconveniencies we labour under with regard to our coin?

148 *Question:* Whether it be not agreed on all hands that our coin is on very bad foot, and calls for some present remedy?

149 *Question:* Whether the want of silver hath not introduced a sort of traffic for change, which is purchased at no inconsiderable discount to the great obstruction of our domestic commerce?

150 *Question:* Whether, though it be evident silver is wanted, it be yet so evident which is the best way of providing for this want? 151 Whether by lowering the gold, or raising the silver, or partly one, partly the other?

152 *Question:* Whether a partial raising of one species be not, in truth, wanting a premium to our bankers for importing such species? And what that species is which deserves most to be encouraged?

153 *Question:* Whether it be not just, that all gold should be alike rated according to its weight and fineness?

154 *Question:* Whether this may be best done, by lowering some certain species of gold, or by raising others, or by joining both methods together?

155 *Question:* Whether all regulations of coin should not be made with a view to encourage industry, and a circulation of commerce, throughout the kingdom?

156 *Question:* Whether the North and the South have not, in truth, one and the same interest in this matter?

157 *Question:* Whether to oil the wheels of commerce be not a common benefit? And whether this be not done by avoiding fractions and multiplying small silver?

QUERY

158 *Question:* But, whether a plubic benefit ought to be obtained by unjust methods, and therefore, whether any reduction of coin should be thought of which may hurt the properties of private people?

159 *Question:* Whether those parts of the kingdom where commerce doth most abound would not be the greatest gainers by having our coin placed on a right foot?

160 *Question:* Whether, in case a reduction of coin be thought expedient, the uttering of bank bills at the same time may not prevent the inconveniences of such a reduction?

161 *Question:* But, whether any pubic expediency could countervail a real pressure on those who are least able to bear it, tenants and debtors?

162 *Question:* Whether, nevertheless, the political body, as well as the natural, must not sometimes be worse in order to be better?

163 *Question:* Whether, all things considered, a general raising the value of gold and silver be not so far from bringing greater quantities thereof into the kingdom that it would produce a direct contrary effect, inasmuch as less, in that case, would serve, and therefore less be wanted? 164 And whether people do not import a commodity in proportion to the demand or want of it?

165 *Question:* Whether the lowering of our gold would not create a fever in the State? And whether a fever be not sometimes a cure, but whether it be not the last cure a person would choose?

166 *Question:* What if our other gold were raised to a par with Portugal gold, and the value of silver in general raised with regard to that of gold?

167 *Question:* Whether the plubic ends may or may not be better answered by such augmentation, than by a reduction of our coin?

168 *Question:* Provided silver is multiplied, be it by raising or diminishing the value of our coin, whether the great end is not answered?

169 *Question:* Whether raising the value of a particular species will not tend to multiply such species, and to lessen others in proportion thereunto? 170 And whether a much less quantity of cash in

QUERY

silver would not, in reality, enrich the nation more than a much greater in gold?

171 *Question:* Whether, if a reduction be thought necessary, the obvious means to prevent all hardships and injustice be not a national bank?

172 *Question:* Upon supposition that the cash of this kingdom was five hundred thousand pounds, and by lowering the various species each one-fifth of its value the whole sum was reduced to four hundred thousand pounds, 173 whether the difficulty of getting money, and consequently of paying rents, would not be increased in the proportion of five to four?

174 *Question:* Whether such difficulty would not be a great and unmerited distress on all the tenants in the nation? 175 But if at the same time with the aforesaid reduction there were uttered one hundred thousand pounds additional to the former current stock, whether such difficulty or inconvenience would then be felt?

176 *Question:* Whether, ceteris paribus, it be not true that the prices of things increase as the quantity of money increaseth, and are diminished as that is diminished? 177 And whether, by the quantity of money is not to be understood the amount of the denominations, all contracts being nominal for pounds, shillings, and pence, and not for weights of gold or silver?

178 *Question:* Whether in any foreign market, two-pence advance in a kilderkin of corn could greatly affect our trade?

179 *Question:* Whether in regard of the far greater changes and fluctuations of prices from the difference of seasons and other accidents, that small rise should seem considerable?

180 *Question:* Whether our exports do not consist of such necessaries as other countries cannot well be without?

181 *Question:* Whether upon the circulation of a national bank more land would not be tilled, more hands employed, and consequently more commodities exported?

182 *Question:* Whether, setting aside the assistance of a national bank, it will be easy to reduce or lower our coin without some hardship (at least for the present)

QUERY

on a great number of particular persons?

183 *Question:* Whether, nevertheless, the scheme of a national bank doth not entirely stand clear of this question; and whether such bank may not completely subsist and answer its ends, although there should be no alteration at all made in the value of our coin?

184 *Question:* Whether, if the ill state of our coin be not redressed, that scheme would not be still more necessary, inasmuch as a national bank, by putting new life and vigour into our commerce, may prevent our feeling the ill effects of the want of such redress?

185 *Question:* Whether people united by interest are not often divided by opinion; and whether such difference in opinion be not an effect of misapprehension?

186 *Question:* Whether two things are not manifest, first, that some alteration in the value of our coin is highly expedient, 187 secondly, that whatever alteration is made, the tenderest care should be had of the properties of the people, and even a regard paid to their prejudices?

188 *Question:* Whether our taking the coin of another nation for more than it is worth be not, in reality and in event, a cheat upon ourselves?

189 *Question:* Whether a particular coin over-rated will not be sure to flow in upon us from other countries beside that where it is coined?

190 *Question:* Whether, in case the wisdom of the nation shall think fit to alter our coin, without erecting a national bank, the rule for lessening or avoiding present inconvenience should not be so to order matters, by raising the silver and depressing the gold, 191 as that the total sum of coined cash within the kingdom shall, in denomination, remain the same, or amount to the same nominal value, after the change that it did before?

192 *Question:* Whether all inconvenience ought not to be lessened as much as may be; but after, whether it would be prudent, for the sake of a small inconvenience, to obstruct a much greater good? 193 And whether it may not sometimes happen that an

inconvenience which in fancy and general discourse seems great shall, when accurately inspected and cast up, appear inconsiderable?

194 *Question:* Whether in public councils the sum of things, here and there, present and future, ought not to be regarded?

195 *Question:* Whether silver and small money be not that which circulates the quickest, and passeth through all hands, on the road, in the market, at the shop?

196 *Question:* Whether, all things considered, it would not be better for a kingdom that its cash consisted of half a million in small silver, than of five times that sum in gold?

197 *Question:* Whether there be not every day five hundred lesser payments made for one that requires gold?

198 *Question:* Whether Spain, where gold bears the highest value, be not the laziest, and China, where it bears the lowest, be not the most industrious country in the known world?

199 *Question:* Money being a ticket which entitles to power and records the title, whether such power avails otherwise than as it is exerted into act?

200 *Question:* Whether it be not evidently the interest of every State, that its money should rather circulate than stagnate?

201 *Question:* Whether the principal use of cash be not its ready passing from hand-to-hand, to answer common occasions of the common people, and whether common occasions of all sorts of people are not small ones?

202 *Question:* Whether business at fairs and markets is not often at a stand and often hindered, even though the seller hath own commodities at hand and the purchaser own gold, yet for want of change?

203 *Question:* Whether beside that value of money which is rated by weight, there be not also another value consisting in its aptness to circulate?

204 *Question:* As wealth is really power, and coin a ticket conveying power, whether those tickets which are the fittest for that use ought not to be preferred?

205 *Question:* Whether those tickets which singly transfer small shares of power, and, being multiplied,

QUERY

large shares, are not fitter for common use than those which singly transfer large shares?

206 *Question:* Whether the public is not more benefited by a shilling that circulates than a pound that lies dead?

207 *Question:* Whether sixpence twice paid be not as good as a shilling once paid?

208 *Question:* Whether the same shilling circulating in a village may not supply one person with bread, another with stockings, a third with a knife, a fourth with paper, a fifth with nails, and so answer many wants which must otherwise have remained unsatisfied?

209 *Question:* Whether facilitating and quickening the circulation of power to supply wants be not the promoting of wealth and industry among the lower people? And whether upon this the wealth of the great doth not depend?

210 *Question:* Whether, without the proper means of circulation, it be not vain to hope for thriving manufacturers and a busy people?

211 *Question:* Whether four pounds in small cash may not circulate and enliven an Irish market, which many four-pound pieces would permit to stagnate?

212 *Question:* Whether a person that could move nothing less than a hundred-pound weight would not be much at a loss to supply own wants; and whether it would not be better for you to be less strong and more active?

213 *Question:* Whether the natural body can be in a state of health and vigour without a due circulation of the extremities, even? 214 And whether the political body, any in the fingers and toes more than the natural, can thrive without a proportionable circulation through the minutest and most inconsiderable parts thereof?

215 *Question:* If we had a mint for coining only shillings, sixpences, and copper-money, whether the nation would not soon feel the good effects thereof?

216 *Question:* Whether the greater waste by wearing of small coins would not be abundantly overbalanced by their usefulness?

217 *Question:* Whether it be not the industry of common people that feeds the State, and whether it be

QUERY

possible to keep this industry alive without small money?

218 *Question:* Whether the want of this be not a great bar to our employing the people in these manufactures which are open to us, and do not interfere with Great Britain?

219 *Question:* Whether therefore such want doth not drive people into the lazy way of employing land under sheep-walk?

220 *Question:* Whether the running of wool from Ireland can so effectually be prevented as by encouraging other business and manufactures among our people?

221 *Question:* Whatever commodities Great Britain importeth which we might supply, whether it be not its real interest to import them from us rather than from any other people?

222 *Question:* Whether the apprehension of many among us (who for that very reason stick to their wool), that England may hereafter prohibit, limit, or discourage our linen trade, 223 when it hath been once, with great pains and expense, thoroughly introduced and settled in this land, be not altogether groundless and unjust?

224 *Question:* Whether it is possible for this country, which hath neither mines of gold nor a free trade, to support for any time the sending out of specie?

225 *Question:* Whether in fact our payments are not made by bills? And whether our foreign credit doth not depend on our domestic industry, and our bills on that credit?

226 *Question:* Whether, in order to mend it, we ought not first to know the peculiar wretchedness of our state? And whether there be any knowing of this but by comparison?

227 *Question:* Whether there are not single market towns in England that turn more money in buying and selling than whole counties (perhaps provinces) with us?

228 *Question:* Whether the small town of Birmingham alone doth not, upon an average, circulate every week, one way or other, to the value of fifty thousand pounds? But whether the same crown may not be often paid?

QUERY

229 *Question:* Whether there be any woollen manufacture in Birmingham?

230 *Question:* Whether bad management may not be worse than slavery? And whether any part of Christendom be in a more languishing condition than this kingdom?

231 *Question:* Whether any kingdom in Europe be so good a customer at Bordeaux as Ireland?

232 *Question:* Whether the police and economy of France be not governed by wise councils? 233 And whether any one from this country, who sees their towns, and manufactures, and commerce, will not wonder what our senators have been doing?

234 *Question:* What variety and number of excellent manufactures are to be met with throughout the whole kingdom of France?

235 *Question:* Whether there are not everywhere some or other mills for many uses, forges and furnaces for iron-work, looms for tapestry, glass-houses, and so forth?

236 *Question:* What quantities of paper, stockings, hats; what manufactures of wool, silk, linen, hemp, leather, wax, earthenware, brass, lead, tin, etc?

237 *Question:* Whether the manufactures and commerce of the single town of Lyons do not amount to a greater value than all the manufactures and all the trade of this kingdom taken together?

238 *Question:* Whether it be not true, that within the compass of one year there flowed from the South Sea, when that commerce was open, into the single town of St. Malo's, a sum in gold and silver equal to four times the whole specie of this kingdom? 239 And whether that same part of France doth not at present draw from Cadiz, upwards of two hundred thousand pounds per annum?

240 *Question:* Whether, in the anniversary fair at the small town of Beaucaire upon the Rhone, there be not as much money laid out as the current cash of this kingdom amounts to?

241 *Question:* Whether it be true that the Dutch make ten millions of livres, every return of the flota and galleons, by their sales at the Indies and at Cadiz?

QUERY

242 *Question:* Whether it be true that England makes at least one hundred thousand pounds per annum by the single article of hats sold in Spain?

243 *Question:* Whether the very shreds shorn from woollen cloth, which are thrown away in Ireland, do not make a beautiful tapestry in France?

244 *Question:* Whether the toys of Thiers do not employ five thousand families?

245 *Question:* Whether there be not a small town Or two in France which supply all Spain with cards?

246 *Question:* Whether there be not French towns subsisted merely by making pins?

247 *Question:* Whether the coarse fingers of those very women, those same peasants who one part of the year till the ground and dress the vineyards, are not another employed in making the finest French point?

248 *Question:* Whether there is not a great number of idle fingers among the wives and daughters of our peasants?

249 *Question:* Whether, about twenty-five years ago, they did not first attempt to make porcelain in France; and whether, in a few years, they did not make it so well, as to rival that which comes from China?

250 *Question:* Whether the French do not raise a trade from saffron, dyeing drugs, and the like products, which may do with us as well as with them?

251 *Question:* Whether we may not have materials of our own growth to supply all manufactures, as well as France, except silk, and whether the bulk of what silk even France manufactures be not imported?

252 *Question:* Whether it be possible for this country to grow rich, so long as what is made by domestic industry is spent in foreign luxury?

253 *Question:* Whether part of the profits of the bank should not be employed in erecting manufactures of several kinds, which are not likely to be set on foot and carried on to perfection without great stock, public encouragement, general regulations, and the concurrence of many hands?

254 *Question:* Whether our natural Irish are not partly Spaniards and partly Tartars, and whether they do not bear signatures of their descent

QUERY

from both these nations, which is also confirmed by all their histories?

255 *Question:* Whether the Tartar progeny is not numerous in this land? And whether there is an idler occupation under the sun than to attend flocks and herds of cattle?

256 *Question:* Whether the wisdom of the State should not wrestle with this hereditary disposition of our Tartars, and with a high hand introduce agriculture?

257 *Question:* Whether it were not to be wished that our people shewed their descent from Spain, rather by their honour and honesty than their pride, and if so, whether they might not easily insinuate themselves into a larger share of the Spanish trade?

258 *Question:* Whether once upon a time France did not, by her linen alone, draw yearly from Spain about eight millions of livres?

259 *Question:* Whether the French have not suffered in their linen trade with Spain, by not making their cloth of due breadth; and whether any other people have suffered, and are still likely to suffer, through the same prevarication?

260 *Question:* Whether the Spaniards are not rich and lazy, and whether they have not a particular inclination and favour for the inhabitants of this island?

261 But whether a punctual people do not love punctual dealers?

262 *Question:* Whether about fourteen years ago we had not come into a considerable share of the linen trade with Spain, and what put a stop to this?

263 *Question:* Whether we may not, with common industry and common honesty, undersell any nation in Europe?

264 *Question:* Whether, if the linen manufacture were carried on in the other provinces as well as in the North, the merchants of Cork, Limerick, and Galway would not soon find the way to Spain?

265 *Question:* Whether the woollen manufacture of England is not divided into several parts or branches, appropriated to particular places, where they are only or principally manufactured;

266 fine cloths in Somersetshire, coarse in Yorkshire, long ells at Exeter, saies at Sudbury, crapes at Norwich, linseys at Kendal, blankets at Witney, and so forth?

QUERY

267 *Question:* Whether the united skill, industry, and emulation of many together on the same work be not the way to advance it? 268 And whether it had been otherwise possible for England to have carried on its woollen manufacture to so great perfection?

269 *Question:* Whether it would not on many accounts be right if we observed the same course with respect to our linen manufacture; 270 and that diapers were made in one town or district, damasks in another, sheeting in a third, fine wearing linen in a fourth, coarse in a fifth, 271 in another cambrics, in another thread and stockings, in others stamped linen, or striped linen, or tickings, or dyed linen, of which last kinds there is so great a consumption among the seafaring people of all nations?

272 *Question:* Whether it may not be worthwhile to inform ourselves of the different sorts of linen which are in request among different people?

273 *Question:* Whether we do not yearly consume of French wines about a thousand tuns more than either Sweden or Denmark, and yet whether those nations pay ready money as we do?

274 *Question:* Whether they are not the Swiss that make hay and gather in the harvest throughout Alsatia?

275 *Question:* Whether it be not a custom for some thousands of French-people to go about the beginning of March into Spain, and having tilled the lands and gathered the harvest of Spain, to return home with money in their pockets about the end of November?

276 *Question:* Whether of late years our Irish labourers do not carry on the same business in England to the great discontent of many there? 277 But whether we have not much more reason than the people of England to be displeased at this commerce?

278 *Question:* Whether, notwithstanding the cash supposed to be brought into it, any nation is, in truth, a gainer by such traffic?

279 *Question:* Whether the industry of our people employed in foreign lands, while our own are left uncultivated, be not a great loss to the country?

QUERY

280 *Question:* Whether it would not be much better for us, if, instead of sending our people abroad, we could draw people from the neighbouring countries to cultivate our own?

281 *Question:* Whether, nevertheless, we are not apt to think the money imported by our labourers to be so much clear gains to this country, but whether a little reflexion and a little political arithmetic may not shew us our mistake?

282 *Question:* Whether our prejudices about gold and silver are not very apt to infect or misguide our judgments and reasonings about the public weal?

283 *Question:* Whether it be not a good rule whereby to judge of the trade of any city, and its usefulness, to observe whether there is a circulation through the extremities, and whether the people round about are busy and warm?

284 *Question:* Whether we had not, some years since, a manufacture of hats at Athlone, and of earthenware at Arklow, and what became of those manufactures?

285 *Question:* Why we do not make tiles of our own, for flooring and roofing, rather than bring them from Holland?

286 *Question:* What manufactures are there in France and Venice of gilt-leather, how cheap and how splendid a furniture?

287 *Question:* Whether we may not, for the same use, manufacture diverse things at home of more beauty and variety than wainscot, which is imported at such expense from Norway?

288 *Question:* Whether the use and the fashion will not soon make a manufacture?

289 *Question:* Whether, if our gentry used to drink mead and cider, we should not soon have those liquors in the utmost perfection and plenty?

290 *Question:* Whether it be not wonderful that with such pastures, and so many black cattle, we do not find ourselves in cheese?

291 *Question:* Whether great profits may not be made by fisheries; but whether those of our Irish who live by that business do not contrive to be drunk and unemployed one half of the year?

QUERY

292 *Question:* Whether it be not folly to think an inward commerce cannot enrich a State, because it doth not increase its quantity of gold and silver? 293 And whether it is possible a country should not thrive, while wants are supplied, and business goes on?

294 *Question:* Whether plenty of all the necessaries and comforts of life be not real wealth?

295 *Question:* Whether Lyons, by the advantage of its midland situation and the rivers Rhone and Saone, be not a great magazine or mart for inward commerce? 296 And whether it doth not maintain a constant trade with most parts of France; with Provence for oils and dried fruits, for wines and cloth with Languedoc, for stuffs with Champagne, for linen with Picardy, Normandy, and Brittany, for corn with Burgundy?

297 *Question:* Whether it doth not receive and utter all those commodities, and raise a profit from the distribution thereof, as well as of its own manufactures, throughout the kingdom of France?

298 *Question:* Whether the charge of making good roads and navigable rivers across the country would not be really repaid by an inward commerce?

299 *Question:* Whether, as our trade and manufactures increased, magazines should not be established in proper places, fitted by their situation, near great roads and navigable rivers, lakes, or canals, for the ready reception and distribution of all sorts of commodities from and to the several parts of the kingdom; 300 and whether the town of Athlone, for instance, may not be fitly situated for such a magazine, or centre of domestic commerce?

301 *Question:* Whether an inward trade would not cause industry to flourish, and multiply the circulation of our coin, and whether this may not do as well as multiplying the coin itself?

302 *Question:* Whether the benefits of a domestic commerce are sufficiently understood and attended to; and whether the cause thereof be not the prejudiced and narrow way of thinking about gold and silver?

303 *Question:* Whether there be any other more easy and unenvied

QUERY

method of increasing the wealth of a people?

304 *Question:* Whether we of this island are not from our peculiar circumstances determined to this very commerce above any other, 305 from the number of necessaries and good things that we possess within ourselves, from the extent and variety of our soil, 306 from the navigable rivers and good roads which we have or may have, at a less expense than any people in Europe, 307 from our great plenty of materials for manufactures, and particularly from the restraints we lie under with regard to our foreign trade?

308 *Question:* Whether commissioners of trade or other proper persons should not be appointed to draw up plans of our commerce both foreign and domestic, and lay them at the beginning of every session before the Parliament?

309 *Question:* Whether registers of industry should not be kept, and the pubic from time to time acquainted what new manufactures are introduced, what increase or decrease of old ones?

310 *Question:* Whether annual inventories should not be published of the fairs throughout the kingdom, in order to judge of the growth of its commerce?

311 *Question:* Whether there be not every year more cash circulated at the card tables of Dublin than at all the fairs of Ireland?

312 *Question:* Whether the wealth of a country will not bear proportion to the skill and industry of its inhabitants?

313 *Question:* Whether foreign imports that tend to promote industry should not be encouraged, and such as have a tendency to promote luxury should not be discouraged?

314 *Question:* Whether the annual balance of trade between Italy and Lyons be not about four millions in favour of the former, and yet, whether Lyons be not a gainer by this trade?

315 *Question:* Whether the general rule, of determining the profit of a commerce by its balance, doth not, like other general rules, admit of exceptions?

316 *Question:* Whether it would not be a monstrous folly to import nothing but gold and silver,

supposing we might do it, from every foreign part to which we trade? 317 And yet, whether some people may not think this foolish circumstance a very happy one?

318 *Question:* But whether we do not all see the ridicule of the Mogul's subjects, who take from us nothing but our silver, and bury it under ground, in order to make sure thereof against the resurrection?

319 *Question:* Whether you must not be a wrongheaded patriot or politician, whose ultimate view was drawing money into a country, and keeping it there?

320 *Question:* Whether it be not evident that not gold but industry causeth a country to flourish?

321 *Question:* Whether it would not be a silly project in any nation to hope to grow rich by prohibiting the exportation of gold and silver?

322 *Question:* Whether there can be a greater mistake in politics than to measure the wealth of the nation by its gold and silver?

323 *Question:* Whether gold and silver be not a drug, where they do not promote industry? Whether they be not even the bane and undoing of an idle people?

324 *Question:* Whether gold will not cause either industry or vice to flourish? 325 And whether a country, where it flowed in without labour, must not be wretched and dissolute like an island inhabited by buccaneers?

326 *Question:* Whether arts and virtue are not likely to thrive, where money is made a means to industry? But whether money without this would be a blessing to any people?

327 *Question:* Whether therefore Mississippi, South Sea, and such like schemes were not calculated for pubic ruin?

328 *Question:* Whether keeping cash at home, or sending it abroad, just as it most serves to promote industry, be not the real interest of every nation?

329 *Question:* Whether commodities of all kinds do not naturally flow where there is the greatest demand? 330 Whether the greatest demand for a thing be not where it is of most use? 331 Whether money, like other things, hath not its proper use? Whether this use be not to circulate? 332 Whether therefore there must not

QUERY

of course be money where there is a circulation of industry?

333 *Question:* Whether all such princes and statesmen are not greatly deceived who imagine that gold and silver, any way got, will enrich a country?

334 *Question:* Whether it is not a great point to know what we would be at? And whether whole States, as well as private persons, do not often fluctuate for want of this knowledge?

335 *Question:* Whether gold may not be compared to Sejanus's horse, if we consider its passage through the world, and the fate of those nations which have been successively possess'd thereof?

336 *Question:* Whether the effect is not to be considered more than the kind or quantity of money?

337 *Question:* Whether means are not so far useful as they answer the end? And whether, in different circumstances, the same ends are not obtained by different means?

338 *Question:* If we are a poor nation, abounding with very poor people, will it not follow that a far greater proportion of our stock should be in the smallest and lowest species than would suit with England?

339 *Question:* Whether, therefore, it would not be highly expedient if our money were coined of peculiar values, best fitted to the circumstances and uses of our own country; 340 and whether any other people could take umbrage at our consulting our own convenience, in an affair entirely domestic, and that lies within ourselves?

341 *Question:* Whether every person doth not know, and hath not long known, that the want of a mint causeth many other wants in this kingdom?

342 *Question:* What harm did England sustain about three centuries ago, when silver was coined in this kingdom?

343 *Question:* What harm was it to Spain that its provinces of Naples and Sicily had all along mints of their own?

344 *Question:* Whether those who have the interests of this kingdom at heart, and are concerned in the councils thereof, ought not to make the most humble and earnest representations to his Majesty, 345 that he may vouchsafe to grant us that favour, the want of which is

QUERY

ruinous to our domestic industry, and the having of which would interfere with no interest of our fellow-subjects?

346 *Question:* Whether it may not be presumed that our not having a privilege which every other kingdom in the world enjoys, be not owing to our want of diligence and unanimity in soliciting for it?

347 *Question:* Whether his most gracious Majesty hath ever been addressed on this head in a proper manner, and had the case fairly stated for his royal consideration, and if not, whether we may not blame ourselves?

348 *Question:* If his Majesty would be pleased to grant us a mint, whether the consequences thereof may not prove a valuable consideration to the crown?

349 *Question:* Whether it be not the interest of England that we should cultivate a domestic commerce among ourselves? 350 And whether it could give them any possible jealousy, if our small sum of cash was contrived to go a little further, 351 if there was a little more life in our markets, a little more buying and selling in our shops, a little better provision for the backs and bellies of so many forlorn wretches throughout the towns and villages of this island?

352 *Question:* Whether Great Britain ought not to promote the prosperity of its Colonies, by all methods consistent with its own? And whether the Colonies themselves ought to wish or aim at it by others?

353 *Question:* Whether the remotest parts from the metropolis, and the lowest of the people, are not to be regarded as the extremities and capillaries of the political body?

354 *Question:* Whether, although the capillary vessels are small, yet obstructions in them do not produce great chronical diseases?

355 *Question:* Whether faculties are not enlarged and improved by exercise?

356 *Question:* Whether the sum of the faculties put into act, or, in other words, the united action of a whole people, doth not constitute the momentum of a State?

357 *Question:* Whether such momentum be not the real stock or wealth of a State; and whether its credit be not proportional thereunto?

QUERY

358 *Question:* Whether in every wise State the faculties of the mind are not most considered?

359 *Question:* Whether every kind of employment or business, as it implies more skill and exercise of the higher powers, be not more valued?

360 *Question:* Whether the momentum of a State doth not imply the whole exertion of its faculties, intellectual and corporeal; and whether the latter without the former could act in concert?

361 *Question:* Whether the divided force of people, acting singly, would not be a rope of sand?

362 *Question:* Whether the particular motions of the members of a State, in opposite directions, will not destroy each other, and lessen the momentum of the whole; but whether they must not conspire to produce a great effect?

363 *Question:* Whether the ready means to put spirit into this State, to fortify and increase its momentum, would not be a national bank, and plenty of small cash?

364 *Question:* Whether private endeavours without assistance from the public are likely to advance our manufactures and commerce to any great degree? 365 But whether, as bills uttered from a national bank upon private mortgages would facilitate the purchases and projects of private people, 366 even so the same bills uttered on the public security alone may not answer pubic ends in promoting new works and manufactures throughout the kingdom?

367 *Question:* Whether that which employs and exerts the force of a community deserves not to be well considered and well understood?

368 *Question:* Whether the immediate mover, the blood and spirits, be not money, paper, or metal; 369 and whether the soul or will of the community, which is the prime mover that governs and directs the whole, be not the legislature?

370 *Question:* Supposing the inhabitants of a country quite sunk in sloth, or even fast asleep, whether, upon the gradual awakening and exertion, first of the sensitive and locomotive faculties, next of reason and reflexion, then of justice and piety,

QUERY

the momentum of such country or State would not, in proportion thereunto, become still more and more considerable?

371 *Question:* Whether that which in the growth is last attained, and is the finishing perfection of a people, be not the first thing lost in their declension?

372 *Question:* Whether force be not of consequence, as it is exerted; and whether great force without great wisdom may not be a nuisance?

373 *Question:* Whether the force of a child, applied with art, may not produce greater effects than that of a giant? 374 And whether a small stock in the hands of a wise State may not go further, and produce more considerable effects, than immense sums in the hands of a foolish one?

375 *Question:* Whether as many as wish well to their country ought not to aim at increasing its momentum?

376 *Question:* Whose fault is it if poor Ireland still continues poor?

The End Book of Divine Panagogue called

GOODNESS

GOOD SENSE

Paul Henri Thiry, Baron D'Holbach

1 When we examine the opinions of humans, we find that nothing is more uncommon, than common-sense; 2 or, in other words, they lack judgment to discover plain truths, or to reject absurdities, and palpable contradictions. 3 We have an example of this in Theology, a system revered in all countries by a great number of people; an object regarded by them as most important, and indispensable to happiness. 4 An examination of the principles upon which this pretended system is founded, forces us to acknowledge, that these principles are only suppositions, 5 imagined by ignorance, propagated by enthusiasm or knavery, adopted by timid credulity, preserved by custom which never reasons, and revered solely because not understood.

6 In a word, whoever uses common-sense upon religious opinions, and will bestow on this inquiry the attention that is commonly given to most subjects, will easily perceive that Religion is a mere castle in the air. 7 Theology is ignorance of natural causes; a tissue of fallacies and contradictions. 8 In every country, it presents romances void of probability, the hero of which is composed of impossible qualities. 9 God’s name, exciting fear in all minds, is only a vague word, to which, humans affix ideas or qualities, which are either contradicted by facts, or inconsistent.

10 Notions of this being, or rather, the word by which He is designated, would be a matter of indifference, if it did not cause innumerable ravages in the world. 11 But humans, prepossessed with the opinion that this phantom is a reality of the greatest interest, instead of concluding wisely from its incomprehensibility, that they are not bound to regard it, infer on the contrary, that they must contemplate it, without ceasing, and never lose sight of it. 12 Their invincible ignorance, upon this subject, irritates their curiosity; instead of putting them upon guard

against their imagination, 13 this ignorance renders humans decisive, dogmatic, imperious, and even exasperates them against all, who oppose doubts to the reveries which they have begotten.

14 What perplexity arises, when it is required to solve an insolvable problem; unceasing meditation upon an object, impossible to understand, 15 but in which however you thinks yourself much concerned, cannot but excite human, and produce a fever in your brain. 16 Let interest, vanity, and ambition, co-operate ever so little with this unfortunate turn of mind, and society must necessarily be disturbed. 17 This is the reason that so many nations have often been the scene of extravagances of senseless visionaries, 18 who, believing their empty speculations to be eternal truths, and publishing them as such, have kindled the zeal of princes and their subjects, and made them take up arms for opinions, represented to them as essential to the glory of the Deity. 19 In all parts of our globe, fanatics have cut each other's throats, publicly burnt each other, committed without a scruple and even as a duty, the greatest crimes, and shed torrents of blood. For what? 20 To strengthen, support, or propagate the impertinent conjectures of some enthusiasts, or to give validity to the cheats of impostors, 21 in the name of a being, who exists only in their imagination, and who has made Himself known only by the ravages, disputes, and follies, you have caused.

22 Savage and furious nations, perpetually at war, adore, under diverse names, some God, conformable to their ideas, that is to say, cruel, carnivorous, selfish, blood-thirsty. 23 We find, in all the religions, "a God of armies," a "jealous God," an "avenging God," a "destroying God," a "God," who is pleased with carnage, and whom His worshippers consider it a duty to serve. 24 Lambs, bulls, children, men, and women, are sacrificed to Him. Zealous servants of this barbarous God think themselves obliged even to offer up themselves as a sacrifice to Him. 25 Mad-people may everywhere be seen, who, after meditating upon their terrible God, imagine that to please Him they must inflict on

themselves, the most exquisite torments. 26 The gloomy ideas formed of the deity, far from consoling them, have every where disquieted their minds, and prejudiced follies destructive to happiness.

27 How could the human mind progress, while tormented with frightful phantoms, and guided by people, interested in perpetuating its ignorance and fears? 28 Human has been forced to vegetate in your primitive stupidity: you have been taught stories about invisible powers upon whom your happiness was supposed to depend. 29 Occupied solely by your fears, and by unintelligible reveries, you have always been at the mercy of priests, who have reserved to themselves the right of thinking for you, and of directing your actions.

30 Thus, human has remained a slave without courage, fearing to reason, and unable to extricate yourself from the labyrinth, in which you have been wandering. 31 You believes yourself forced under the yoke of your gods, known to you only by the fabulous accounts given by your ministers, 32 who, after binding each unhappy mortal in the chains of prejudice, remain your masters, or else abandon you defenceless to the absolute power of tyrants, no less terrible than the gods, of whom they are the representatives. 33 Oppressed by the double yoke of spiritual and temporal power, it has been impossible for the people to be happy. 34 Religion became sacred, and humans have had no other Morality, than what their legislators and priests brought from the unknown regions of heaven. 35 The human mind, confused by theological opinions, ceased to know its own powers, mistrusted experience, feared truth and disdained reason, in order to follow authority. 36 Human has been a mere machine in the hands of tyrants and priests. Always treated as a slave, human has contracted the vices of slavery.

37 Such are the true causes of the corruption of morals. Ignorance and servitude are calculated to make people wicked and unhappy. 38 Knowledge, Reason, and Liberty, can alone reform and make humans happier. But every thing conspires to blind you, and

to confirm your errors. 39 Priests cheat you, tyrants corrupt and enslave you. Tyranny ever was, and ever will be, the true cause of human's depravity, and also of your calamities. 40 Almost always fascinated by religious fiction, poor mortals turn not their eyes to the natural and obvious causes of their misery; 41 but attribute their vices to the imperfection of their natures, and their unhappiness to the anger of the gods. 42 They offer to heaven vows, sacrifices, and presents, to obtain the end of sufferings, which in reality, are attributable only to the negligence, ignorance, and perversity of their guides, to the folly of their customs, and above all, to the general want of knowledge. 43 Let humans' minds be filled with true ideas; let their reason be cultivated; and there will be no need of opposing to the passions, such a feeble barrier, as the fear of gods. 44 Humans will be good, when they are well instructed; and when they are despised for evil, or justly rewarded for good, which they do to their fellow citizens.

45 In vain should we attempt to cure humans of their vices, unless we begin by curing them of their prejudices. 46 It is only by showing them the truth, that they will perceive their true interests, and the real motives that ought to incline them to do good. 47 Instructors have long enough fixed humans' eyes upon heaven; let them now turn them upon earth. 48 An incomprehensible theology, ridiculous fables, impenetrable mysteries, puerile ceremonies, are to be no longer endured. 49 Let the human mind apply itself to what is natural, to intelligible objects, truth, and useful knowledge.

50 Does it not suffice to annihilate religious prejudice, to shew, that what is inconceivable to human, cannot be good for God? 51 Does it require any thing, but plain common-sense, to perceive, that a being, incompatible with the most evident notions-- that a cause continually opposed to the effects which we attribute to it-- 52 that a being, of whom we can say nothing, without falling into contradiction-- 53 that a being, who, far from explaining the enigmas of the universe, only makes them more inexplicable-- 54 that a being, whom for so many

ages humans have vainly addressed to obtain their happiness, and the end of sufferings-- 55 does it require, I say, any thing but plain, common-sense, to perceive-- that the idea of such a being is an idea without model, and that God Himself is merely a phantom of the imagination? 56 Is any thing necessary but common-sense to perceive, at least, that it is folly and madness for humans to hate and damn one another about unintelligible opinions concerning a being of this kind? 57 In short, does not every thing prove, that Morality and Virtue are totally incompatible with the notions of a God, 58 whom your ministers and interpreters have described, in every country, as the most capricious, unjust, and cruel of tyrants, whose pretended will, however, must serve as law and rule the inhabitants of the earth?

59 To discover the true principles of Morality, humans have no need of theology, of revelation, or of gods: They have need only of common-sense. 60 They have only to commune with themselves, to reflect upon their own nature, to consider the objects of society, and of the individuals, who compose it; 61 and they will easily perceive, that virtue is advantageous, and vice disadvantageous to themselves. 62 Let us persuade people to be just, beneficent, moderate, sociable; not because such conduct is demanded by the gods, but, because it is pleasant to humans. 63 Let us advise them to abstain from vice and crime; not because they will be punished in another world, but because they will suffer for it in this.-- 64 These are, says Montesquieu, means to prevent crimes-- these are punishments; these reform manners-- these are good examples.

65 The way of truth is straight; that of imposture is crooked and dark. 66 Truth, ever necessary to human, must necessarily be felt by all upright minds; the lessons of reason are to be followed by all honest people. 67 People are unhappy, only because they are ignorant; they are ignorant, only because every thing conspires to prevent their being enlightened; they are wicked only because their

reason is not sufficiently developed.

68 By what fatality then, have the first founders of all sects given to their gods ferocious characters, at which Nature revolts? 69 Can we imagine a conduct more abominable, than that which Moses tells us his God showed towards the Egyptians, 70 where that assassin proceeds boldly to declare, in the name and by the order of his God, that Egypt shall be afflicted with the greatest calamities, that can happen to human? 71 Of all the different ideas, which they give us of a supreme being, of a God, creator and preserver of humankind, 72 there are none more horrible, than those of the impostors, who represented themselves as inspired by a divine spirit, and "Thus saith the Lord."

73 Why, O theologians! do you presume to inquire into the impenetrable mysteries of a being, whom you consider inconceivable to the human mind? 74 You are the blasphemers, when you imagine that a being, perfect according to you, could be guilty of such cruelty towards creatures whom He has made out of nothing. 75 Confess, your ignorance of a creating God; and cease meddling with mysteries, which are repugnant to common-sense.

GOOD SENSE
WITHOUT GOD
Paul Henri Thiry, Baron D'Holbach

APOLOGUE
1

2 There is a vast empire, governed by a monarch, whose strange conduct is to confound the minds of His subjects. 2 He wishes to be known, loved, respected, obeyed; but never shows Himself to His subjects, and everything conspires to render uncertain the ideas formed of His character.

3 The people, subjected to His power, have, of the character and laws of their invisible sovereign, such ideas only, as His ministers give them. 4 They, however, confess, that they have no idea of their master; that His ways are impenetrable; His views and nature totally incomprehensible. 5 These ministers, likewise, disagree upon the commands which they pretend have been issued by the

sovereign, whose servants they call themselves. 6 They defame one another, and mutually treat each other as impostors and false teachers. 7 The decrees and ordinances, they take upon themselves to promulgate, are obscure; 8 they are enigmas, little calculated to be understood, or even divined, by the subjects, for whose instruction they were intended. 9 The laws of the concealed monarch require interpreters; but the interpreters are always disputing upon the true manner of understanding them. 10 Besides, they are not consistent with themselves; all they relate of their concealed prince is only a string of contradictions. 11 They utter concerning God not a single word that does not immediately confute itself. They call Him supremely good; yet many complain of His decrees. 12 They suppose God infinitely wise; and under His administration everything appears to contradict reason. 13 They extol God's justice; and the best of His subjects are generally the least favoured. 14 They assert, God sees everything; yet His presence avails nothing. 15 God is, say they, the friend of order; yet throughout His dominions, all is in confusion and disorder. 16 God makes all for Himself; and the events seldom answer His designs. He foresees everything; but cannot prevent anything. 17 God impatiently suffers offence, yet gives everyone the power of offending Him. 18 Humans admire the wisdom and perfection of God's works; yet His works, full of imperfection, are of short duration. 19 God is continually doing and undoing; repairing what He has made; but is never pleased with His work. 20 In all God's undertakings, He proposes only His own glory; yet is never glorified. 21 God only end is the happiness of His subjects; and His subjects, for the most part want necessaries. 22 Those, whom He seems to favour are generally least satisfied with their fate; almost all appear in perpetual revolt against a master, whose greatness they never cease to admire, 23 whose wisdom to extol, whose goodness to adore, whose justice to fear, and whose laws to reverence, though never obeyed!

24 This EMPIRE is the WORLD; this MONARCH GOD; his MINISTERS are the PRIESTS; his SUBJECTS humankind.

APOLOGUE
2

25 There is a science that has for its object only things incomprehensible. Contrary to all other sciences, it treats only of what cannot fall under our senses. 26 Hobbes calls it the *kingdom of darkness*. It is a country, where every thing is governed by laws, contrary to those which humankind are permitted to know in the world they inhabit. 27 In this marvellous region, light is only darkness; evidence is doubtful or false; impossibilities are credible: reason is a deceitful guide; and good sense becomes madness. 28 This science is called theology, and this theology is a continual insult to the reason of human.

APOLOGUE
3

29 By the magical power of "ifs," "buts," "perhaps'," "what do we know," etc., heaped together, a shapeless and unconnected system is formed, perplexing humankind, by obliterating from your minds, the most clear ideas and rendering uncertain truths most evident. 30 By reason of this systematic confusion, Nature is an enigma; the visible world has disappeared, to give place to regions invisible; 31 reason is compelled to yield to imagination, who leads to the country of its self-invented chimeras.

APOLOGUE
4

32 The principles of every religion are founded upon the idea of a GOD. Now, it is impossible to have true ideas of a being, who acts upon none of our senses. 33 All our ideas are representations of sensible objects. What then can represent to us the idea of God, which is evidently an idea without an object? 34 Is not such an idea as impossible, as an effect without a cause? Can an idea without an archetype be anything, but a chimera? 35 There are, however, divines, who assure us that the idea of God is innate; or that we have this idea in our mother's womb. 36 Every principle is the result of reason; all reason is the

effect of experience; experience is acquired only by the exercise of our senses: 37 therefore, religious principles are not founded upon reason, and are not innate.

APOLOGUE

5

38 Every system of religion can be founded only upon the nature of God and human; and upon the relations, which subsist between them. 39 But to judge of the reality of those relations, we must have some idea of the divine nature. 40 Now, the world exclaims, the divine nature is incomprehensible to human; yet ceases not to assign attributes to this incomprehensible God, and to assure us, that it is our indispensable duty to find out that God, whom it is impossible to comprehend.

41 The most important concern of human is what you can least comprehend. 42 If God is incomprehensible to human, it would seem reasonable never to think of Him; but religion maintains, human cannot with impunity cease a moment to think (or rather dream) of your God.

APOLOGUE

6

43 We are told, that divine qualities are not of a nature to be comprehended by finite minds. The natural consequence must be, that divine qualities are not made to occupy finite minds. 44 But religion tells us, that the poor finite mind of human ought never to lose sight of an inconceivable being, whose qualities you can never comprehend. 45 Thus, we see, religion is the art of turning the attention of humankind upon subjects they can never comprehend.

APOLOGUE

7

46 Religion unites human with God, or forms a communication between them; yet do they not say, God is infinite? 47 If God be infinite, no finite being can have communication or relation with Him. 48 Where there is no relation, there can be no union, communication, or duties. 49 If there be no duties between human and your God, there is no religion for human. 50 Thus, in saying God is infinite, you annihilate religion from human, who is a finite being.

51 The idea of infinity is to us an idea without model, without archetype, without object.

APOLOGUE
8

52 If God be an infinite being, there cannot be, either in the present or future world, any relative proportion between human and your God. 53 Thus, the idea of God can never enter the human mind. In supposition of a life, in which human would be much more enlightened, than in this, the idea of the infinity of God would ever remain the same distance from your finite mind. 54 Thus the idea of God will be no more clear in the future, than in the present life. Thus, intelligences, superior to human, can have no more complete ideas of God, than human, who has not the least conception of Him in your present life.

APOLOGUE
9

55 How has it been possible to persuade reasonable beings, that the thing, most impossible to comprehend, was most essential to them? 56 It is because they have been greatly terrified; because, when they fear, they cease to reason; because, they have been taught to mistrust their own understanding; 57 because, when the brain is troubled, they believe every thing, and examine nothing.

APOLOGUE
10

58 Ignorance and fear are the two hinges of all religion. The uncertainty in which human finds yourself in relation to your God, is precisely the motive that attaches you to your religion. 59 Human is fearful in the dark-- in moral, as well as physical darkness. Your fear becomes habitual, and habit makes it natural; you would think that you wanted something, if you had nothing to fear.

APOLOGUE
11

60 You, who from infancy has habituated yourself to tremble when you hears pronounced certain words, requires those words and needs to tremble. 61 You are therefore more disposed to listen to one, who entertains you in your fears, than to one, who dissuades you from them. 62 The

superstitious person wishes to fear; your imagination demands it; one might say, that you fears nothing so much, as to have nothing to fear.

63 Humans are imaginary invalids, whose weakness empirics are interested to encourage, in order to have sale for their drugs. 64 They listen rather to the physician, who prescribes a variety of remedies, than to you, who recommends good regimen, and leaves Nature to Herself.

APOLOGUE
12

65 If religion were more clear, it would have less charms for the ignorant, who are pleased only with obscurity, terrors, fables, prodigies, and things incredible. 66 Romances, silly stories, and the tales of ghosts and wizards, are more pleasing to vulgar minds than true histories.

APOLOGUE
13

67 In point of religion, humans are only great children. The more a religion is absurd and filled with wonders, the greater ascendancy it acquires over them. 68 The devout person thinks yourself obliged to place no bounds to your credulity; the more things are inconceivable, they appear to you divine; the more they are incredible, the greater merit, you imagines, there is in believing them.

APOLOGUE
14

69 The origin of religious opinions is generally dated from the time, when savage nations were yet in infancy. 70 It was to gross, ignorant, and stupid people, that the founders of religion have in all ages addressed themselves, when they wished to give them their Gods, their mode of worship, their mythology, their marvellous and frightful fables. 71 These chimeras, adopted without examination by parents, are transmitted, with more or less alteration, to their children, who seldom reason any more than their parents.

APOLOGUE
15

72 The object of the first legislators was to govern the people; and the easiest method to effect it was to terrify their minds, and to prevent the exercise of reason. 73 They led

them through winding bye-paths, lest they might perceive the designs of their guides; they forced them to fix their eyes in the air, for fear they should look at their feet; they amused them on the way with idle stories; 74 in a word, they treated them as nurses do children, who sing lullabies, to put them to sleep, and scold, to make them quiet.

APOLOGUE

16

75 The existence of a God is the basis of all religion. 76 Few appear to doubt God existence; yet this fundamental article utterly embarrasses every mind that reasons. 77 The first question of every catechism has been, and ever will be, the most difficult to resolve. 78 In the year 1701, the holy fathers of the oratory of Vendome maintained in a thesis, this proposition-- that, according to St. Thomas, the existence of God is not, and cannot be, a subject of faith.

APOLOGUE

17

79 Can we imagine ourselves sincerely convinced of the existence of a being, whose nature we know not; who is inaccessible to all our senses; whose attributes, we are assured, are incomprehensible to us? 80 To persuade me that a being exists or can exist, I must be first told what that being is. 81 To induce me to believe the existence or the possibility of such a being, it is necessary to tell me things concerning Him that are not contradictory, and do not destroy one another. 82 In short, to fully convince me of the existence of that being, it is necessary to tell me things that I can understand.

APOLOGUE

18

83 A thing is impossible, when it includes two ideas that mutually destroy one another, and which can neither be conceived nor united in thought. 84 Conviction can be founded only upon the constant testimony of our senses, which alone give birth to our ideas, and enable us to judge of their agreement or disagreement. 85 That, which exists necessarily, is that, whose non-existence implies a contradiction. These

principles, universally acknowledged, become erroneous, when applied to the existence of a God. 86 Whatever has been hitherto said upon the subject, is either unintelligible, or perfect contradiction, and must therefore appear absurd to every rational person.

APOLOGUE
19

87 All human knowledge is more or less clear. By what strange fatality have we never been able to elucidate the science of God? 88 The most civilised nations, and among them the most profound thinkers, are in this respect no more enlightened than the most savage tribes and ignorant peasants; 89 and, examining the subject closely, we shall find, that, by the speculations and subtle refinements of people, the divine science has been only more and more obscured. 90 Every religion has hitherto been founded only upon what is called, in logic, *begging the question*; it takes things for granted, and then proves, by suppositions, instead of principles.

APOLOGUE
20

91 Metaphysics teach us, that God is a pure spirit. But, is modern theology superior to that of the savages? 92 The savages acknowledge a great spirit, for the master of the world. The savages, like all ignorant people, attribute to spirits all the effects, of which their experience cannot discover the true causes. 93 Ask a savage, what works your watch? One will answer, it is a spirit. Ask the divines, what moves the universe? They answer, it is a spirit.

APOLOGUE
21

94 The savage, when they speaks of a spirit, affixes, at least, some idea to the word; they means thereby an agent, like the air, the breeze, the breath, that invisibly produces discernible effects. 95 By subtilising every thing, the modern theologian becomes as unintelligible to own self as to others. 96 Ask the theologian, what one understands by a spirit? The response will be, that it is an unknown substance, perfectly simple, that has no extension, that

has nothing common with matter. 97 Indeed, is there any one, who can form the least idea of such a substance? What then is a spirit, to speak in the language of modern theology, but the absence of an idea? 98 The idea of spirituality is an idea without model.

APOLOGUE

22

99 Is it not more natural and intelligible to draw universal existence from the matter, whose existence is demonstrated by all the senses, and whose effects we experience, which we see act, move, communicate motion, and incessantly generate, 100 than to attribute the formation of things to an unknown power, to a spiritual being, who cannot derive from own nature what you have not yourself, and who, by own spiritual essence, can create neither matter nor motion? 101 Nothing is more evident, than that the idea they endeavour to give us, of the action of mind upon matter, represents no object. It is an idea without model.

.APOLOGUE

23

102 The material Jupiter of the ancients could move, compose, destroy, and create beings, similar to own self; but the God of modern theology is sterile. 103 He can neither occupy any place in space, nor move matter, nor form a visible world, nor create humans or gods. The metaphysical God is fit only to produce confusion, reveries, follies, and disputes.

APOLOGUE

24

104 Since a God was indispensably requisite to humans, why did they not worship the Sun, that visible God, adored by so many nations? 105 What being had greater claim to the homage of humans, than the day-star, who enlightens, warms, and vivifies all beings; whose presence enlivens and regenerates Nature, whose absence seems to cast it into gloom and languor? 106 If any being announced to humankind, power, activity, beneficence, and duration, it was certainly the Sun, whom they ought to have regarded as the parent of nature, as the divinity. 107 At least, they could not,

without folly, dispute its existence, or refuse to acknowledge its influence.

APOLOGUE

25

108 The theologian exclaims to us, that God wants neither hands nor arms to act; that He acts by His will. 109 But pray, who or what is that God, who has a will, and what can be the subject of His divine will?

110 Are the stories of witches, ghosts, wizards, hobgoblins, etc., more absurd and difficult to believe than the magical or impossible action of mind upon matter? 111 When we admit such a God, fables and reveries may claim belief. Theologians treat people as children, whose simplicity makes them believe all the stories they hear.

APOLOGUE

26

112 To shake the existence of God, we need only to ask a theologian to speak of Him. 113 As soon as they have said a word upon the subject, the least reflection will convince us, that their observations are totally incompatible with the essence they ascribes to their God. 114 What then is God? It is an abstract word, denoting the hidden power of Nature; or it is a mathematical point, that has neither length, breadth, nor thickness. 115 David Hume, speaking of theologians, has ingeniously observed, that they have discovered the solution of the famous problem of Archimedes-- a point in the heavens, whence they move the world.

APOLOGUE

27

116 Religion prostrates people before a being, who, without extension, is infinite, and fills all with His immensity; 117 a being, all-powerful, who never executes His will; a being, sovereignly good, who creates only disquietudes; a being, the friend of order, and in whose government all is in confusion and disorder. 118 What then, can we imagine, can be the God of theology?

APOLOGUE

28

119 To avoid all embarrassment, we are told, "that it is not necessary to know what God is;

that we must adore Him; that we are not permitted to extend our views to His attributes." 120 But, before we know that we must adore a God, must we not know certainly, that He exists? 121 But, how can we assure ourselves, that He exists, if we never examine whether the various qualities, attributed to Him, do really exist and agree in Him? 122 Indeed, to adore God, is to adore only the fictions of one's own imagination, or rather, it is to adore nothing.

APOLOGUE

29

123 In view of confounding things the more, theologians have not declared what their God is; they tell us only what He is not. 124 By means of negations and abstractions, they think they have composed a real and perfect being. 125 Mind is that, which is *not* body. An infinite being is a being, who is *not* finite. A perfect being is a being, who is *not* imperfect. 126 Indeed, is there any one, who can form real ideas of such a mass of absence of ideas? That, which excludes all idea, can it be any thing but nothing?

127 To pretend, that the divine attributes are beyond the reach of human conception, is to grant, that God is not made for human. 128 To assure us, that, in God, all is infinite, is to own that there can be nothing common to Him and His creatures. 129 If there be nothing common to God and His creatures, God is annihilated from human, or, at least, rendered useless to you. 130 "God," they say, "has made human intelligent, but He has not made you omniscient;" hence it is inferred, that He has not been able to give you faculties sufficiently enlarged to know your divine essence. 131 In this case, it is evident, that God has not been able nor willing to be known by His creatures. 132 By what right then would God be angry with beings, who were naturally incapable of knowing the divine essence? 133 God would be evidently the most unjust and capricious of tyrants, if He should punish an Atheist for not having known, what, by your nature, it was impossible He should know.

APOLOGUE

30

134 To the generality of humans, nothing renders an argument more convincing than fear. 135 It is therefore, that theologians assure us, *we must take the safest part*; that nothing is so criminal as incredulity; 136 that God will punish without pity every one who has the temerity to doubt His existence; 137 that God's severity is just, since madness or perversity only can make us deny the existence of an enraged monarch, who without mercy avenges Himself on Atheists. 138 If we coolly examine these threatenings, we shall find, they always suppose the thing in question. 139 They must first prove the existence of a God, before they assure us, it is safest to believe, and horrible to doubt or deny His existence. 140 They must then prove, that it is possible and consistent, that a just God cruelly punishes people for having been in a state of madness, that prevented their believing the existence of a being, whom their perverted reason could not conceive. 141 In a word, they must prove, that an infinitely just God can infinitely punish the invincible and natural ignorance of human with respect to the divine nature. 142 Do not theologians reason very strangely? They invent phantoms, they compose them of contradictions; they then assure us, it is safest not to doubt the existence of these phantoms they themselves have invented. 143 According to this mode of reasoning, there is no absurdity, which it would not be more safe to believe, than not to believe.

144 All children are born Atheists; they have no idea of God. Are they then criminal on account of their ignorance? 145 At what age must they begin to believe in God? It is, you say, at the age of reason. But at what time should this age commence? 146 Besides, if the profoundest theologians lose themselves in the divine nature, which they do not presume to comprehend, what ideas must human have of Him?

APOLOGUE

31

147 People believe in God only upon the word of those, who have no more idea of Him than

themselves. 148 Our nurses are our first theologians. They talk to children of God as if He were a scarecrow; they teach them from the earliest age to join their hands mechanically. 149 Have nurses then more true ideas of God than the children whom they teach to pray?

APOLOGUE

32

150 Religion, like a family estate, passes, with its encumbrances, from parents to children. Few people in the world would have a God, had not pains been taken in infancy to give them one. 151 Each would receive from own parents and teachers the God whom they received from theirs; but each, agreeably to own disposition, would arrange, modify, and paint Him in own manner.

APOLOGUE

33

152 The brain of human, especially in infancy, is like soft wax, fit to receive every impression that is made upon it. 153 Education furnishes you with almost all your ideas at a time, when you are incapable of judging for yourself. 154 We believe we have received from Nature, or have brought with us at birth, the true or false ideas, which, in a tender age, had been instilled into our minds; and this persuasion is one of the greatest sources of errors.

APOLOGUE

34

155 Prejudice contributes to cement in us the opinions of those who have been charged with our instruction. 156 We believe them much more experienced than ourselves; we suppose they are fully convinced of the things which they teach us; we have the greatest confidence in them; 157 by the care they have taken of us in infancy, we judge them incapable of wishing to deceive us. 158 These are the motives that make us adopt a thousand errors, without other foundation than the hazardous authority of those by whom we have been brought up. 159 The prohibition likewise of reasoning upon what they teach us, by no means lessens our confidence; but often contributes to increase our respect for their opinions.

GOODNESS

APOLOGUE

35

160 Divines act very wisely in teaching people their religious principles before they are capable of distinguishing truth from falsehood, or their left hand from their right. 161 It would be as difficult to instill into the mind of a person, forty years old, the extravagant notions that are given us of the divinity, as to eradicate them from the mind of you who had imbibed them from infancy.

APOLOGUE

36

162 It is observed, that the wonders of Nature are sufficient to lead us to the existence of a God, and fully to convince us of this important truth. 163 But how many are there in the world who have the time, capacity, or disposition, necessary to contemplate Nature and meditate Her progress? 164 People, for the most part, pay no regard to it. The peasant is not struck with the beauty of the sun, which you sees every day. 165 The sailor is not surprised at the regular motion of the ocean; you will never draw from it theological conclusions. 166 The phenomena of Nature prove the existence of a God only to some prejudiced people, who have been early taught to behold the finger of God in every thing whose mechanism could embarrass them. 167 In the wonders of Nature, the unprejudiced philosopher sees nothing but the power of Nature, the permanent and various laws, the necessary effects of different combinations of matter infinitely diversified.

APOLOGUE

37

168 Is there any thing more surprising than the logic of these divines, who, instead of confessing their ignorance of natural causes, seek beyond Nature, in imaginary regions, a cause much more unknown than that nature, of which they can form at least some idea? 169 To say, that God is the author of the phenomena of Nature, is it not to attribute them to an occult cause? 170 What is God? What is a spirit? They are causes of which we have no idea. 171 O wise divines! Study Nature and Her laws; 172 and since you can there discover the action of

natural causes, go not to those that are supernatural, which, far from enlightening, will only darken your ideas, and make it utterly impossible that you should understand yourselves.

APOLOGUE

38

173 Nature, you say, is totally inexplicable without a God. That is to say, to explain what you understand very little, you have need of a cause which you understand not at all. 174 You think to elucidate what is obscure, by doubling the obscurity; to solve difficulties, by multiplying them. 175 O enthusiastic philosophers! To prove the existence of a God, write complete treatises of botany; enter into a minute detail of the parts of the human body; launch forth into the sky, to contemplate the revolution of the stars; then return to the earth to admire the course of waters; 176 behold with transport the butterflies, the insects, the polypi, and the organised atoms, in which you think you discern the greatness of your God. 177 All these things will not prove the existence of God; they will prove only, that you have not just ideas of the immense variety of matter, and of the effects, producible by its infinitely diversified combinations, that constitute the universe. 178 They will prove only your ignorance of Nature; that you have no idea of Her powers, 179 when you judge Her incapable of producing a multitude of forms and beings, of which your eyes, even with the assistance of microscopes, never discern but the smallest part. 180 In a word, they will prove, that, for want of knowing sensible agents, or those possible to know, you find it shorter to have recourse to a word, expressing an inconceivable agent.

APOLOGUE

39

181 We are gravely and repeatedly told, that, there is no effect without a cause; that, the world did not make itself. 182 But the universe is a cause, it is not an effect; it is not a work; it has not been made, because it is impossible that it should have been made. 183 The world has always been; its existence is necessary; it is its own

cause. Nature, whose essence is visibly to act and produce, requires not, to discharge Her functions, an invisible mover, much more unknown than Herself. 184 Matter moves by its own energy, by a necessary consequence of its heterogeneity. 185 The diversity of motion, or modes of mutual action, constitutes alone the diversity of matter. 186 We distinguish beings from one another only by the different impressions or motions which they communicate to our organs.

APOLOGUE

40

187 You see, that all is action in Nature, and yet pretend that Nature, by itself, is dead and without power. You imagine, that this all, essentially acting, needs a mover! 188 What then is this mover? It is a spirit; a being absolutely incomprehensible and contradictory. 189 Acknowledge then, that matter acts of itself, and cease to reason of your spiritual mover, who has nothing that is requisite to put it in action. 190 Return from your useless excursions; enter again into a real world; keep to second-causes, and leave to divines their first-cause, of which Nature has no need, to produce all the effects you observe in the world.

APOLOGUE

41

191 It can be only by the diversity of impressions and effects, which bodies make upon us, that we feel them; that we have perceptions and ideas of them; that we distinguish one from another; that we assign them properties. 192 Now, to see or feel an object, the object must act upon our organs; this object cannot act upon us, without exciting some motion in us; it cannot excite motion in us, if it be not in motion itself. 193 At the instant I see an object, my eyes are struck by it; I can have no conception of light and vision, without motion, communicated to my eye, from the luminous, extended, coloured body. 194 At the instant I smell something, my sense is irritated, or put in motion, by the parts that exhale from the odoriferous body. 195 At the moment I hear a sound, the tympanum of my ear is struck by

the air, put in motion by a sonorous body, which would not act if it were not in motion itself. 196 Whence it evidently follows, that, without motion, I can neither feel, see, distinguish, compare, judge, nor occupy my thoughts upon any subject whatever.

197 We are taught, that the essence of a thing is that from which all its properties flow. 198 Now, it is evident, that all the properties of bodies, of which we have ideas, are owing to motion, which alone informs us of their existence, and gives us the first conceptions of them. 199 I cannot be informed of my own existence but by the motions I experience in myself. 200 I am therefore forced to conclude, that motion is as essential to matter as extension, and that matter cannot be conceived without it.

201 Should any person deny, that motion is essential and necessary to matter; they cannot, at least, help acknowledging that bodies, which seem dead and inert, produce motion of themselves, when placed in a fit situation to act upon one another. 202 For instance; phosphorus, when exposed to the air, immediately takes fire. Meal and water, when mixed, ferment. 203 Thus dead matter begets motion of itself. Matter has then the power of self-motion; and Nature, to act, has no need of a mover, whose pretended essence would hinder you from acting.

APOLOGUE

42

204 Whence comes human? What is your origin? Did the first human spring, ready formed, from the dust of the earth? 205 Human appears, like all other beings, a production of Nature. 206 Whence came the first stones, the first trees, the first lions, the first elephants, the first ants, the first acorns? 207 We are incessantly told to acknowledge and revere the hand of God, of an infinitely wise, intelligent and powerful maker, in so wonderful a work as the human machine. 208 I readily confess, that the human machine appears to me surprising. But as human exists in Nature, I am not authorised to say that your formation, is above the power of Nature. 209 But I can much less conceive of this

formation, when to explain it, I am told, that a pure spirit, who has neither eyes, feet, hands, head, lungs, mouth nor breath, made human by taking a little clay, and breathing upon it.

210 We laugh at the savage inhabitants of Paraguay, for calling themselves the descendants of the moon. The divines of Europe call themselves the descendants, or the creation, of a pure spirit. Is this pretension any more rational? 211 Human is intelligent; thence it is inferred, that you can be the work only of an intelligent being, and not of a nature, which is void of intelligence. 212 Although nothing is more rare, than to see human make use of this intelligence, of which you seems so proud, 213 I will grant that you are intelligent, that your wants develop this faculty, that society especially contributes to cultivate it. 214 But I see nothing in the human machine, and in the intelligence with which it is endued, that announces very precisely the infinite intelligence of the maker to whom it is ascribed. 215 I see that this admirable machine is liable to be deranged; I see, that your wonderful intelligence is then disordered, and sometimes totally disappears; 216 I infer, that human intelligence depends upon a certain disposition of the material organs of the body, and that we cannot infer the intelligence of God, any more from the intelligence of human, than from your materiality. 217 All that we can infer from it, is, that God is material. 218 The intelligence of human no more proves the intelligence of God, than the malice of human proves the malice of that God, who is the pretended maker of human. 219 In spite of all the arguments of divines, God will always be a cause contradicted by its effects, or of which it is impossible to judge by its works. 220 We shall always see evil, imperfection and folly result from such a cause, that is said to be full of goodness, perfection and wisdom.

APOLOGUE

43

221 "What?" you will say, "is intelligent human, is the universe, and all it contains, the effect

of chance?" 222 No; I repeat it, the universe is not an effect; it is the cause of all effects; every being it contains is the necessary effect of this cause, which sometimes shews us its manner of acting, but generally conceals its operations. 223 People use the word *chance* to hide their ignorance of true causes, which, though not understood, act not less according to certain laws. 224 There is no effect without a cause. Nature is a word, used to denote the immense assemblage of beings, various matter, infinite combinations, and diversified motions, that we behold. 225 All bodies, organised or unorganised, are necessary effects of certain causes. Nothing in Nature can happen by chance. Every thing is subject to fixed laws. 226 These laws are only the necessary connection of certain effects with their causes. 227 One atom of matter cannot meet another *by chance*; this meeting is the effect of permanent laws, which cause every being necessarily to act as it does, and hinder it from acting otherwise, in given circumstances. 228 To talk of the *fortuitous concourse of atoms*, or to attribute some effects to chance, is merely saying that we are ignorant of the laws, by which bodies act, meet, combine, or separate.

229 Those, who are unacquainted with Nature, the properties of beings, and the effects which must necessarily result from the concurrence of certain causes, think, that every thing takes place by chance. 230 It is not chance, that has placed the sun in the centre of our planetary system; it is by its own essence, that the substance, of which it is composed, must occupy that place, and thence be diffused.

APOLOGUE

44

231 The worshippers of a God find, in the order of the universe, an invincible proof of the existence of an intelligent and wise being, who governs it. 232 But this order is nothing but a series of movements necessarily produced by causes or circumstances, which are sometimes favourable, and sometimes hurtful to us: we approve of some, and complain of others.

233 Nature uniformly follows the same round; that is, the same causes produce the same effects, as long as their action is not disturbed by other causes, which force them to produce different effects. 234 When the operation of causes, whose effects we experience, is interrupted by causes, which, though unknown, are not the less natural and necessary, we are confounded; 235 we cry out, *a miracle!* and attribute it to a cause much more unknown, than any of those acting before our eyes.

236 The universe is always in order. It cannot be in disorder. It is our machine, that suffers, when we complain of disorder. 237 The bodies, causes, and beings, which this world contains, necessarily act in the manner in which we see them act, whether we approve or disapprove of their effects. 238 Earthquakes, volcanoes, inundations, pestilences, and famines are effects as necessary, or as much in the order of Nature, as the fall of heavy bodies, 239 the courses of rivers, the periodical motions of the seas, the blowing of the winds, the fruitful rains, and the favourable effects, for which people praise God, and thank Him for His goodness.

240 To be astonished that a certain order reigns in the world, is to be surprised that the same causes constantly produce the same effects. 241 To be shocked at disorder, is to forget, that when things change, or are interrupted in their actions, the effects can no longer be the same. 242 To wonder at the order of Nature, is to wonder that any thing can exist; it is to be surprised at any one's own existence. 243 What is order to one being, is disorder to another. 244 All wicked beings find that every thing is in order, when they can with impunity put every thing in disorder. 245 They find, on the contrary, that every thing is in disorder, when they are disturbed in the exercise of their wickedness.

APOLOGUE

45

246 Upon supposition that God is the author and mover of Nature, there could be no disorder with respect to Him. 247 Would not all the causes, that He should have made, necessarily act according to

the properties, essences, and impulses given them? 248 If God should change the ordinary course of Nature, He would not be immutable. 249 If the order of the universe, in which human thinks you sees the most convincing proof of the existence, intelligence, power and goodness of God, should happen to contradict itself, one might suspect His existence, 250 or, at least, accuse Him of inconstancy, impotence, want of foresight and wisdom in the arrangement of things; 251 one would have a right to accuse Him of an oversight in the choice of the agents and instruments, which He makes, prepares, and puts in action. 252 In short, if the order of Nature proves the power and intelligence of the Deity, disorder must prove His weakness, instability, and irrationality.

253 You say, that God is omnipresent, that He fills the universe with His immensity, that nothing is done without Him, that matter could not act without His agency. 254 But in this case, you admit, that your God is the author of disorder, that it is He who deranges Nature, that He is the father of confusion, that He is in human, and moves you at the moment you sins. 255 If God is everywhere, He is in me, He acts with me, He is deceived with me, He offends Himself with me, and combats with me the existence of Himself! 256 O theologians! you never understand yourselves, when you speak of God.

APOLOGUE

46

257 In order to have what we call intelligence, it is necessary to have ideas, thoughts, and wishes; 258 to have ideas, thoughts, and wishes, it is necessary to have organs; to have organs, it is necessary to have a body; to act upon bodies, it is necessary to have a body; to experience disorder, it is necessary to be capable of suffering. 259 Whence it evidently follows, that a pure spirit can neither be intelligent, nor affected by what passes in the universe.

260 Divine intelligence, ideas, and views, have, you say, nothing common with those of humans. Very well. How then can humans judge, right or wrong, of these

views; reason upon these ideas; or admire this intelligence? 261 This would be to judge, admire, and adore that, of which we can have no ideas. 262 To adore the profound views of divine wisdom, is it not to adore that, of which we cannot possibly judge? To admire these views, is it not to admire without knowing why? 263 Admiration is always the daughter of ignorance. Humans admire and adore only what they do not comprehend.

APOLOGUE

47

264 All those qualities, ascribed to God, are totally incompatible with a being, who, by His very essence, is void of all analogy with human beings. 265 It is true, the divines imagine they extricate themselves from this difficulty, by exaggerating the human qualities, attributed to the Divinity; they enlarge them to infinity, where they cease to understand themselves. 266 What results from this combination of human with God? A mere chimera, of which, if any thing be affirmed, the phantom, combined with so much pains, instantly vanishes.

267 Dante, in his poem upon *Paradise*, relates, that the Deity appeared to him under the figure of three circles, forming an iris, whose lively colours generated each other; but that, looking steadily upon the dazzling light, he saw only his own figure. 268 While adoring God, it is himself, that human adores.

APOLOGUE

48

269 Ought not the least reflection suffice to prove, that God can have none of the human qualities, all ties, virtues, or perfections? 270 Our virtues and perfections are consequences of the modifications of our passions. But has God passions as we have? 271 Again: our good qualities consist in our dispositions towards the beings with whom we live in society. God, according to you, is an insulated being. 272 God has no equals-- no fellow-beings. God does not live in society. He wants the assistance of no one. He enjoys an unchangeable felicity. 273 Admit then, according to your own

principles, that God cannot have what we call virtues, and that human cannot be virtuous with respect to God.

APOLOGUE

49

274 Human, wrapped up in own merit, imagines the human race to be the sole object of God in creating the universe. Upon what does you found this flattering opinion? 275 We are told: that human is the only being endued with intelligence, which enables you to know the Deity, and to render Him homage. 276 We are assured, that God made the world only for His own glory, and that it was necessary that the human species should come into this plan, that there might be some one to admire His works, and glorify Him for them. 277 But, according to these suppositions, has not God evidently missed His object? 278 First. Human, according to yourselves, will always labour under the completest impossibility of knowing your God, and the most invincible ignorance of His divine essence. 279 Secondly. A being, who has no equal, cannot be susceptible of glory; for glory can result only from the comparison of one's own excellence with that of others. 280 Thirdly. If God be infinitely happy, if He be self-sufficient, what need has He of the homage of His feeble creatures? 281 Fourthly. God, notwithstanding all His endeavours, is not glorified; 282 but, on the contrary, all the religions in the world represent Him as perpetually offended; their sole object is to reconcile sinful, ungrateful, rebellious human with own angry God.

APOLOGUE

50

283 If God be infinite, He has much less relation with human, than human with ants. 284 Would the ants reason pertinently concerning the intentions, desires, and projects of the gardener? 285 Could they justly imagine, that a park was planted for them alone, by an ostentatious monarch, and that the sole object of His goodness was to furnish them with a superb residence? 286 But, according to theology, human is, with respect to God, far below

what the vilest insect is to human. 287 Thus, by theology itself, which is wholly devoted to the attributes and views of the Divinity, theology appears a complete folly.

APOLOGUE

51

288 We are told, that, in the formation of the universe, God's only object was the happiness of human. But, in a world made purposely for you, and governed by an omnipotent God, is human in reality very happy? 289 Are your enjoyments durable? Are not your pleasures mixed with pains? Are many persons satisfied with their fate? Is not human continually the victim of physical and moral evils? 290 Is not the human machine, which is represented as a master-piece of the Creator's skill, liable to derangement in a thousand ways? 291 Should we be surprised at the workmanship of a mechanic, who should shew us a complex machine, ready to stop every moment, and which, in a short time, would break in pieces of itself?

.APOLOGUE

52

292 The generous care, displayed by the Deity in providing for the wants, and watching over the happiness of His beloved creatures, is called; Providence. 293 But, when we open our eyes, we find that God provides nothing. His Providence sleeps over the greater part of the inhabitants of this world. 294 For a very small number of people who are supposed to be happy, what an immense multitude groan under oppression, and languish in misery! 295 Are not nations forced to deprive themselves of bread, to administer to the extravagances of a few gloomy tyrants, who are no happier than their oppressed slaves?

296 At the same time that our divines emphatically expatiate upon the goodness of Providence, while they exhort us to repose our confidence in Her, do we not hear them, at the sight of unforeseen catastrophes, exclaim, 297 that: Providence sports with the vain projects of human, that She frustrates their designs, that She laughs at their efforts, that

profound wisdom delights to bewilder the minds of mortals? 298 But, shall we put confidence in a malignant Providence, who laughs at, and sports with humankind? 299 How will one admire the unknown ways of a hidden wisdom, whose manner of acting is inexplicable? 300 Judge of it by effects, you will say. We do; and find, that these effects are sometimes useful, and sometimes hurtful.

301 People think they justify Providence, by saying, that, in this world, there is much more good than evil to every individual of humankind. 302 Supposing the good, we enjoy from Providence, is to the evil, as a hundred to ten; will it not still follow, that, for a hundred degrees of goodness, Providence possesses ten of malignity; which is incompatible with the supposed perfection of the divine nature.

303 Almost all books are filled with the most flattering praises of Providence, whose attentive care is highly extolled. 304 It would seem as if human, to live happily here below, needed not your own exertions. Yet, without your own labour, human could subsist hardly a day. 305 To live, you are obliged to sweat, toil, hunt, fish, and labour without intermission. 306 Without these second causes, the first cause, at least in most countries, would provide for none of our wants. 307 In all parts of the globe, we see savage and civilised person in a perpetual struggle with Providence. 308 You are necessitated to ward off the strokes directed against you by Providence, in hurricanes, tempests, frosts, hail-storms, inundations, droughts, and the various accidents, which so often render useless all your labours. 309 In a word, we see human continually occupied in guarding against the ill offices of that Providence, which is supposed to be attentive to your happiness.

310 A bigot admired divine Providence for wisely ordering rivers to pass through those places, where people have built large cities. 311 Is not this man's reasoning as rational, as that of many learned people, who incessantly talk of final-causes, or who pretend that they clearly perceive the beneficent views of

God in the formation of all things?

APOLOGUE

53

312 Do we see then, that Providence so very sensibly manifests Herself in the preservation of those admirable works, which we attribute to it? 313 If it is Her, who governs the world, we find Her as active in destroying, as in forming; in exterminating, as in producing. 314 Does She not every moment destroy, by thousands, the very people, to whose preservation and welfare we suppose Her continually attentive? 315 Every moment She loses sight of Her beloved creature. Sometimes She shakes your dwelling, sometimes She annihilates your harvests, sometimes She inundates your fields, sometimes She desolates them by a burning drought. 316 She arms all Nature against human. She arms human yourself against your own species, and commonly terminates your existence in anguish. Is this then what is called preserving the universe?

317 If we could view, without prejudice, the equivocal conduct of Providence towards the human race and all sensible beings, we should find, that far from resembling a tender and careful mother, 318 She resembles rather those unnatural mothers, who instantly forgetting the unfortunates of their licentious love, abandon their infants, as soon as they are born, and who, content with having borne them, expose them, helpless, to the caprice of fortune.

319 The Hottentots, in this respect are much wiser than other nations, who treat them as barbarians, and refuse to worship God; because, they say: if you often does good, you often does evil. 320 Is not this manner of reasoning more just and conformable to experience, than that of many people, who are determined to see, in their God, nothing but goodness, wisdom, and foresight, 321 and who refuse to see that the innumerable evils, of which this world is the theatre, must come from the same hand, which they kiss with delight?

GOODNESS

APOLOGUE

54

322 Common-sense teaches, that we cannot, and ought not, to judge of a cause, but by its effects. 323 A cause can be reputed constantly good, only when it constantly produces good. A cause, which produces both good and evil, is sometimes good, and sometimes evil. 324 But the logic of theology destroys all this. According to that, the phenomena of Nature, or the effects we behold in this world, prove to us the existence of a cause infinitely good; and this cause is God. 325 Although this world is full of evils; although disorder often reigns in it; although humans incessantly repine at their hard fate; 326 we must be convinced, that these effects are owing to a beneficent and immutable cause; and many people believe it, or feign believe.

327 Every thing that passes in the world, proves to us, in the clearest manner, that it is not governed by an intelligent being. 328 We can judge of the intelligence of a being only by the conformity of the means, which one employs to attain own proposed object. 329 The object of God, is the happiness of a human. Yet, a like necessity governs the fate of all sensible beings, who are born only to suffer much, enjoy little, and die. 330 The cup of human is filled with joy and bitterness; good is everywhere attended with evil; order gives place to disorder; generation is followed by destruction. 331 If you say, that the designs of God are mysterious and that His ways are impenetrable; I answer, that, in this case, it is impossible to judge whether God be intelligent.

APOLOGUE

55

332 You pretend, that God is immutable! What then produces a continual instability in this world, which you make your empire? 333 Is there a state, subject to more frequent and cruel revolutions, than that of this unknown monarch? 334 How can we attribute to an immutable God, sufficiently powerful to give solidity to His works, a government, in which every thing is in continual vicissitude? 335 If I imagine I see a God of uniform

character in all the effects favourable to my species, what kind of a God can I see in their continual misfortunes? 336 You tell me, it is our sins, which compel Him to punish. I answer, that God, according to yourselves, is then not immutable, since the sins of humans force Him to change His conduct towards them. 337 Can a being, who is sometimes provoked, and sometimes appeased, be constantly the same?

APOLOGUE
56

338 The universe can be only what it is; all sensible beings in it enjoy and suffer; that is, are moved sometimes in an agreeable, and sometimes in a disagreeable manner. 339 These effects are necessary; they result necessarily from causes, which act only according to their properties. 340 These effects necessarily please, or displease, by a consequence of Nature. 341 This same nature compels me to avoid, avert, and resist some things, and to seek, desire, and procure others. 342 In a world, where every thing is necessary, a God, who remedies nothing, who leaves things to run in their necessary course,-- is He any thing but destiny, or necessity personified? 343 It is a deaf and useless God, who can effect no change in general laws, to which He is Himself subject. 344 Of what importance is the infinite power of a being, who will do but very little in my favour? Where is the infinite goodness of a being, indifferent to happiness? 345 Of what service is the favour of a being, who, is able to do an infinite good, does not do even a finite one?

APOLOGUE
57

346 When we ask, why so many miserable objects appear under the government of a good God, we are told, by way of consolation, that the present world is only a passage, designed to conduct human to a happier one. 347 The divines assure us, that the earth we inhabit, is a state of trial. In short, they shut our mouths, by saying, that God could communicate to His creatures neither impossibility nor infinite happiness, which are reserved for Himself alone. Can such answers be satisfactory?

GOODNESS

348 (1). The existence of another life is guaranteed to us only by the imagination of human, who, by supposing it, have only realised the desire they have of surviving themselves, in order to enjoy hereafter a purer and more durable happiness. 349 (2). How can we conceive that a God, who knows every thing, and must be fully acquainted with the dispositions of His creatures, should want so many experiments, in order to be sure of their dispositions? 350 (3). According to the calculations of their chronologists, our earth has existed six or seven thousand years. During that time, nations have experienced calamities. 351 History exhibits the human species at all times tormented and ravaged by tyrants, conquerors, and heroes; by wars, inundations, famines, plagues, etc. 352 Are such long trials then likely to inspire us with very great confidence in the secret views of the Deity? 353 Do such numerous and constant evils give a very exalted idea of the future state, His goodness is preparing for us? 354 (4). If God is so kindly disposed, as He is asserted to be, without giving humans infinite happiness, could He not at least have communicated the degree of happiness, of which finite beings are susceptible here below? 355 To be happy, must we have an infinite or divine happiness? 356 (5). If God could not make humans happier than they are here below, what will become of the hope of a paradise, where it is pretended, that the elect will for ever enjoy ineffable bliss? 357 If God neither could nor would avert evil from the earth, the only residence we can know, what reason have we to presume, that He can or will avert evil from another world, of which we have no idea? 358 Epicurus observed: "either God would remove evil out of this world, and cannot; or He can, and will not; or He has neither the power nor will; or, lastly, He has both the power and will. 359 If He has the will, and not the power, this shews weakness, which is contrary to the nature of God. 360 If He has the power, and not the will, it is malignity; and this is no less contrary to His nature. 361 If He is neither able nor willing, He is both impotent and malignant, and consequently cannot be God. 362 If

He be both willing and able (which alone is consonant to the nature of God) whence comes evil, or why does He not prevent it?" 363 Reflecting minds are still waiting for a reasonable solution of these difficulties; and our divines tell us, that they will be removed only in a future life.

APOLOGUE

58

364 We are told of a pretended *scale of beings*. It is supposed, that God has divided His creatures into different classes, in which each enjoys the degree of happiness, of which it is susceptible. 365 According to this romantic arrangement, from the oyster to the celestial angels, all beings enjoy a happiness, which is suitable to their nature. 366 Experience explicitly contradicts this sublime reverie. In this world, all sensible beings suffer and live in the midst of dangers. 367 Human cannot walk without hurting, tormenting, or killing a multitude of sensible beings, which are in your way; 368 while you yourself is exposed, at every step, to a multitude of evils, foreseen or unforeseen, which may lead you to destruction. 369 During the whole course of your life, you are exposed to pains; you are not sure, a moment, of your existence, to which you are so strongly attached, and which you regards as the greatest gift of the Divinity.

APOLOGUE

59

370 The world, it will be said, has all the perfection, of which it is susceptible: since it is not God who made it, it must have great qualities and great defects. 371 But we answer, that, as the world must necessarily have great defects, it would have been more conformable to the nature of a good God, not to have created a world, which He could not make completely happy. 372 If God was supremely happy, before the creation of the world, and could have continued to be supremely happy, without creating the world, why did He not remain at rest? 373 Why must human suffer? Why must human exist? Of what importance is your existence to God? Nothing, or something? 374 If human's existence is not useful

or necessary to God, why did God make human? If human's existence is necessary to God's glory, He had need of human; He was deficient in something before human existed. 375 We can pardon an unskillful workman for making an imperfect work; because you must work, well or ill, upon penalty of starving. This workman is excusable, but God is not. 376 According to you, God is self-sufficient; if so, why does He make humans? God has, you say, every thing requisite to make human happy. Why then does He not do it? 377 Confess, that your God has more malice than goodness, unless you admit, that God, was necessitated to do what he has done, without being able to do it otherwise. 378 Yet, you assure us, that God is free. You say also, that He is immutable, although it was in *Time* that He began and ceased to exercise His power, like the inconstant beings of this world. 379 O theologians! Vain are your efforts to free your God from defects. This perfect God has always some human imperfections.

APOLOGUE

60

380 "Is not God master of His favours? Can He not give them? Can He not take them away? 381 It does not belong to His creatures to require reasons for His conduct. He can dispose of the works of His own hands as He pleases. Absolute sovereign of mortals, He distributes happiness or misery, according to His good pleasure." 382 Such are the solutions given by theologians to console us for the evils which God inflicts upon us. 383 We reply, that a God, who is infinitely good, cannot be master of his favours, but would by His nature be obliged to bestow them upon His creatures; 384 that a being, truly beneficent, cannot refrain from doing good; that a being, truly generous, does not take back what He has given; 385 and that every human, who does so, dispenses with gratitude, and has no right to complain of finding ungrateful people.

386 How can the odd and capricious conduct, which theologians ascribe to God, be reconciled with religion, which supposes a covenant, or mutual

engagements between God and humans? 387 If God owes nothing to His creatures, they, on their part, can owe nothing to their God. 388 All religion is founded upon the happiness that humans think they have a right to expect from the Deity, who is supposed to say to them: 389 Love me, adore me, obey me: and I will make you happy. Humans, on their part, say to Him: Make us happy, be faithful to your promises, and we will love you, we will adore you, and obey your laws. 390 By neglecting the happiness of His creatures, distributing His favours according to His caprice, and retracting His gifts, does not God break the covenant, which serves as the basis of all religion? 391 Cicero has justly observed, that; if God is not agreeable to human, He cannot be his God. 392 Goodness constitutes deity; this goodness can be manifested to human only by the blessings you enjoys; as soon as you are unhappy, this goodness disappears, and with it the divinity. 393 An infinite goodness can be neither limited, partial, nor exclusive. 394 If God be infinitely good, He owes happiness to all His creatures. The unhappiness of a single being would suffice to annihilate unbounded goodness. 395 Under an infinitely good and powerful God, is it possible to conceive that a single person should suffer? 396 One animal, or mite, that suffers, furnishes invincible arguments against divine providence and its infinite goodness.

APOLOGUE

61

397 According to theology, the afflictions and evils of this life are chastisements, which guilty people incur from the hand of God. But why are humans guilty? 398 If God is omnipotent, does it cost Him more to say: "Let every thing in the world be in order; let all my subjects be good, innocent, and fortunate," than to say: "Let every thing exist"? 399 Was it more difficult for this God to do His work well, than badly? 400 Religion tells us of a hell; that is, a frightful abode, where, notwithstanding God’s goodness, God reserves infinite torments for the majority of humans. 401 Thus after having rendered mortals very

unhappy in this world, religion tells them, that God can render them still more unhappy in another! 402 The theologian gets over this, by saying, that the goodness of God will then give place to His justice. But a goodness, which gives place to the most terrible cruelty, is not an infinite goodness. 403 Besides, can a God, who, after having been infinitely good, becomes infinitely bad, be regarded as an immutable being? 404 Can we discern the shadow of clemency or goodness, in a God filled with implacable fury?

APOLOGUE

62

405 Divine justice, as stated by our divines, is undoubtedly a quality very proper to cherish in us the love of the Divinity. 406 According to the ideas of modern theology, it is evident, that God has created the majority of humans, with the sole view of putting them in a fair way to incur eternal punishment. 407 Would it not have been more conformable to goodness, reason, and equity, to have created only stones or plants, and not to have created sensible beings; 408 than to have formed humans, whose conduct in this world might subject them to endless punishment in the other? 409 A God perfidious and malicious enough to create a single human, and then to abandon you to the danger of being damned, cannot be regarded as a perfect being; but as an unreasonable, unjust, and ill-natured. 410 Very far from composing a perfect God, theologians have formed the most imperfect of beings. 411 According to theological notions, God would resemble a tyrant, who, having put out the eyes of the greater part of His slaves, should shut them up in a dungeon, 412 where, for His amusement, He would, incognito, observe their conduct through a trap-door, in order to punish with rigour all those, who, while walking about, should hit against each other; 413 but who would magnificently reward the few whom He had not deprived of sight, in avoiding to run against their comrades. 414 Such are the ideas, which the dogma of gratuitous predestination gives us of the divinity!

GOODNESS

415 Although people are continually repeating that their God is infinitely good; yet it is evident, that in reality, they can believe nothing of the kind. 416 How can we love what we do not know? How can we love a being, whose character is only fit to throw us into inquietude and trouble? How can we love a being, of whom all that is said tends to render Him an object of utter detestation?

APOLOGUE
63

417 Many people make a subtle distinction between true religion and superstition. They say, that superstition is only a base and inordinate fear of the Deity; 418 but that the truly religious person has confidence in own God, and loves Him sincerely; 419 whereas, the superstitious person sees in God only an enemy, has no confidence in Him, and represents Him to own self as a distrustful, cruel tyrant, sparing of His benefits, lavish of His chastisements. 420 But, in reality, does not all religion give us the same ideas of God? At the same time that we are told, that God is infinitely good, are we not also told, that He is very easily provoked, 421 that God grants His favours to a few people only, and that He furiously chastises those, to whom He has not been pleased to grant favours?

APOLOGUE
64

422 If we take our ideas of God from the nature of things, where we find a mixture of good and evil, this God, just like the good and evil of which we experience, must naturally appear capricious, inconstant, sometimes good, and sometimes malevolent; 423 and therefore, instead of exciting our love, must generate distrust, fear, and uncertainty. 424 There is then no real difference between natural religion, and the most gloomy and servile superstition. 425 If the theist sees God only in a favourable light; the bigot views Him in the most hideous light. The folly of the one is cheerful, that of the other is melancholy; but both are equally delirious.

GOODNESS

APOLOGUE

65

426 If I draw my ideas of God from theology, He appears to inspire aversion. 427 Devotees, who tell us, that they sincerely love their God, are either liars or fools, who see their God only in profile. 428 It is impossible to love a being, the very idea of whom strikes us with terror, and whose judgments make us tremble. 429 How can we, without being alarmed, look upon a God, who is reputed to be barbarous enough to damn us? 430 Let not divines talk to us of a filial, or respectful fear, mixed with love, which people ought to have for their God. 431 A son can by no means love his father, when he knows him to be cruel enough to inflict upon him studied torments for the least faults he may commit. 432 No person upon earth can have the least spark of love for a God, who reserves chastisements, infinite in duration and violence, for ninety-nine hundredths of own children.

APOLOGUE

66

433 The inventors of the dogma of eternal hell-torments have made of that God, whom they call so good, the most detestable of beings. Cruelty in humans is the last act of wickedness. 434 Every sensible mind must revolt at the bare recital of the torments, inflicted on the greatest criminal; but cruelty is much more apt to excite indignation, when void of motives. 435 The most sanguinary tyrants, the Caligulas, the Neros, the Domitians, had, at least, some motives for tormenting their victims. 436 These motives were, either their own safety, or the fury of revenge, or the design of frightening by terrible examples, or perhaps the vanity of making a display of their power, and the desire of satisfying a barbarous curiosity. 437 Can a God have any of these motives? In tormenting the victims of His wrath, He would punish beings, who could neither endanger His immoveable power, nor disturb His unchangeable felicity. 438 On the other hand, the punishments of the other life would be useless to the living, who

cannot be witnesses of them. 439 These punishments would be useless to the damned, since in hell there is no longer room for conversion, and the time of mercy is past. 440 Whence it follows, that God, in the exercise of His eternal vengeance, could have no other end than to amuse Himself, and insult the weakness of His creatures. 441 I appeal to the whole human race;-- is there a person who feels cruel enough coolly to torment, I do not say your fellow-creature, but any sensible being whatever, without emolument, without profit, without curiosity, without having any thing to fear? 442 Confess then, O theologians, that, even according to your own principles, your God is infinitely more malevolent than the worst of humans.

443 Perhaps you will say, that infinite offences deserve infinite punishments. I answer, that we cannot offend a God, whose happiness is infinite; that the offences of finite beings cannot be infinite; 444 that a God, who is unwilling to be offended, cannot consent that the offences of His creatures should be eternal; 445 that a God, infinitely good, can neither be infinitely cruel, nor grant His creatures an infinite duration, solely for the pleasure of eternal torments.

446 Nothing but the most savage barbarity, the most egregious roguery, or the blindest ambition could have imagined the doctrine of eternal punishments. 447 If there is a God, whom we can offend or blaspheme, there are not upon earth greater blasphemers than those, who dare to say, that this same God is a tyrant, perverse enough to delight, during eternity, in the useless torments of His feeble creatures.

APOLOGUE

67

448 To pretend, that God can be offended at the actions of humans, is to annihilate all the ideas, which divines endeavour to give us, in other respects, of this being. 449 To say, that human can trouble the order of the universe; that you can kindle the thunder in the hands of your God; that you can defeat His projects, is to say, that human is stronger than own God, that you are the arbiter of His will, that it

depends upon you to change His goodness into cruelty. 450 Theology continually pulls down, with one hand, what it erects with the other. 451 If all religion is founded upon a God, who is provoked and appeased, all religion is founded on a palpable contradiction.

452 All religions agree in exalting the wisdom and infinite power of the Deity. But no sooner do they display His conduct, than we see nothing but imprudence, want of foresight, weakness and folly. 453 God, it is said, created the world for Himself; and yet, hitherto, He has never been able to make Himself suitably honoured by it. 454 God created humans in order to have, in His dominions, subjects to render Him their homage; and yet, we see humans in continual revolt against Him.

APOLOGUE

68

455 They incessantly extol the divine perfections; and when we demand proofs of them, they point to His works, in which, they assure us, these perfections are written in indelible characters. 456 All these works are, however, imperfect and perishable. Human, who is ever regarded as the most marvellous work, as the master-piece of the Deity, is full of imperfections, which render you disagreeable to the eyes of the almighty Being, who formed you. 457 This surprising work often becomes so revolting and odious to its author, that you are obliged to throw it into the fire. 458 But, if the fairest of God's works is imperfect, how can we judge of the divine perfections? 459 Can a work, with which the author Himself is so little pleased, induce us to admire the ability of its Maker? 460 Human, considered in a physical sense, is subject to a thousand infirmities, to numberless evils, and to death. 461 Human, considered in a moral sense, is full of faults; yet we are unceasingly told, that you are the most beautiful work of the most perfect of beings.

APOLOGUE

69

462 In creating beings more perfect than humans, it appears, that heretofore God has not better

succeeded, nor given stronger proofs of your perfection. 463 Do we not see, in many religions, that angels, have even attempted to dethrone God? 464 God proposed the happiness of angels and humans; yet, He has never been able to render happy either angels or humans;-- 465 the pride, malice, sins, and imperfections of the creatures have always opposed the will of the perfect Creator.

APOLOGUE

70

466 All religion is obviously founded upon this principle, that: God does what He can, and human what you will. 467 Every system of religion presents to us an unequal combat between the Deity on one part, and His creatures on the other, in which the former never comes off to His honour. 468 Notwithstanding His omnipotence, He cannot succeed in rendering the works of His hands such as He would have them. 469 To complete the absurdity, there is a religion, which pretends, that God Himself has died to redeem humankind; and yet, humans are not farther from any thing, than they are from what God would have them.

APOLOGUE

71

470 Nothing is more extravagant, than the part, theology makes the Divinity act in every country. Did a personal God really exist, we should see in Him the most capricious, and senseless being. 471 We should be compelled to believe, that God made the world only to be the theatre of His disgraceful wars with His creatures; 472 that God created angels, humans, and demons, only to make adversaries, against whom He might exercise His power. 473 He renders humans free to offend Him, malicious enough to defeat His projects, too obstinate to submit; and all this merely for the pleasure of being angry, appeased, reconciled, and of repairing the disorder they have made. 474 Had the Deity at once formed His creatures such as He would have them, what pains would He not have spared Himself, or, at least, from what embarrassments would He not have relieved His theologians!

475 Every religion represents God as busy only in doing Himself evil. He resembles those empirics, who inflict upon themselves wounds, to have an opportunity of exhibiting to the public the efficacy of their ointment. 476 But we see not, that the Deity has hitherto been able radically to cure Himself of the evil, which He suffers from human.

APOLOGUE

72

477 God is the author of all; and yet, we are assured that evil does not come from God. Whence then does it come? From human. But, who made human? God. Evil then comes from God. 478 If He had not made human as you are, moral evil or sin would not have existed in the world. The perversity of human is therefore chargeable to God. 479 If human has power to do evil, or to offend God, we are forced to infer, that God chooses to be offended; 480 that God, who made human, has resolved that human shall do evil; otherwise human would be an effect contrary to the cause, from which He derives your being.

APOLOGUE

73

481 Human ascribes to God the faculty of foreseeing, or knowing beforehand whatever will happen; but this prescience seldom turns to His glory, nor protects Him from the lawful reproaches of human. 482 If God foreknows the future, must He not have foreseen the fall of His creatures? 483 If He resolved in His decrees to permit this fall, it is undoubtedly because it was His will that this fall should take place, otherwise it could not have happened. 484 If God's foreknowledge of the sins of His creatures had been necessary or forced, one might suppose, that He has been constrained by His justice to punish the guilty; 485 but, enjoying the faculty of foreseeing, and the power of predetermining every thing, did it not depend upon God not to impose upon Himself cruel laws, 486 or, at least, could He not dispense with creating beings, whom He might be under the necessity of punishing, and rendering unhappy by a subsequent decree? 487 Of what consequence is it, whether God has destined humans to happiness

or misery by an anterior decree, an effect of His prescience, or by a posterior decree, an effect of His justice? 488 Does the arrangement of His decrees alter the fate of the unhappy? 489 Would they not have the same right to complain of a God, who, being able to omit their creation, has notwithstanding created them, although He plainly foresaw that His justice would oblige Him, sooner or later, to punish them?

APOLOGUE

74

490 "Human," you say, "when you came from the hand of God, was pure, innocent, and good; but your nature has been corrupted, as a punishment for sin." 491 If human, when just out of the hands of your God, could sin, your nature was imperfect. Why did God suffer you to sin, and your nature to be corrupted? 492 Why did God permit you to be seduced, well knowing that you was too feeble to resist temptation? 493 Why did God create satan, an evil spirit, a tempter? 494 Why did not God, who wishes so much good to the human race, annihilate once for all so many evil genii, who are naturally enemies of our happiness; 495 or rather, why did God create evil spirits, whose victories and fatal influence over humankind, He must have foreseen? 496 In fine, by what strange fatality in all religions of the world, has the evil principle such a decided advantage over the good principle, or the divinity?

APOLOGUE

75

497 There is related an instance of simplicity, which does honour to the heart of an Italian monk. 498 One day, while preaching, this pious man thought he must announce to his audience, that he had, thank heaven, at last discovered, by dint of meditation, a sure way of rendering all humans happy. 499 "The devil," said he, "tempts humans only to have in hell companions of your misery. Let us therefore apply to the Pope, who has the keys of heaven and hell; 500 let us prevail upon him to pray to God, at the head of the whole church, to consent to a reconciliation with the devil, to restore him to favour, to reinstate

him in his former rank, which cannot fail to put an end to his malicious projects against humankind." 501 Perhaps the honest monk did not see, that the devil is at least as useful as God to the ministers of religion. 502 They have too much interest in their dissensions, to be instrumental in an accommodation between two enemies, upon whose combats their own existence and revenues depend. 503 Let people cease to be tempted and to sin, and the ministry of priests will be useless. 504 Manicheism is evidently the hinge of every religion; but unhappily, the devil, invented to clear the deity from the suspicion of malice, proves to us, every moment, the impotence or unskillfulness of his celestial adversary.

APOLOGUE

76

505 The nature of human, it is said, was necessarily liable to corruption. God could not communicate to your impeccability, which is an inalienable attribute of His divine perfection. 506 But if God could not make human impeccable, why did He give Himself the pains to make human, whose nature must necessarily be corrupted, and who must consequently offend God? 507 On the other hand, if God Himself could not make human nature impeccable, by what right does He punish humans for not being impeccable? 508 It can be only by the right of the strongest; but the right of the strongest is called violence, and violence cannot be compatible with the justest of beings. 509 God would be supremely unjust, should He punish humans for not sharing with you His divine perfections, or for not being able to be gods like Him.

510 Could not God, at least, have communicated to all humans that kind of perfection, of which their nature is susceptible? 511 If some people are good, or render themselves agreeable to their God, why has not that God done the same favour, or given the same dispositions to all beings of our species? 512 Why does the number of the wicked so much exceed the number of the good? 513 Why, for one friend, has God ten thousand

enemies, in a world, which it depended entirely upon Him to people with honest people? 514 If it be true, that, in heaven, God designs to form a court of saints, of elect, or of people who shall have lived upon earth conformably to His views, would He not have had a more numerous, brilliant, and honourable assembly, 515 had He composed it of all humans, to whom, in creating them, He could grant the degree of goodness, necessary to attain eternal happiness? 516 Finally, would it not have been shorter not to have made human, than to have created you a being full of faults, rebellious to your creator, perpetually exposed to cause your own destruction by a fatal abuse of His liberty?

517 Instead of creating humans, a perfect God ought to have created only angels very docile and submissive. 518 Angels, it is said, are free; some have sinned; but, at any rate, all have not abused their liberty by revolting against their master. 519 Could not God have created only angels of the good kind? If God has created angels, who have not sinned, could He not have created impeccable people, or people who should never abuse their liberty? 520 If the elect are incapable of sinning in heaven, could not God have made impeccable people upon earth?

APOLOGUE

77

521 Divines never fail to persuade us, that the enormous distance which separates God and human, necessarily renders the conduct of God a mystery to us, and that we have no right to interrogate our master. Is this answer satisfactory? 522 Since my eternal happiness is at stake, have I not a right to examine the conduct of God Himself? 523 It is only in hope of happiness that humans submit to the authority of a God. 524 A despot, to whom people submit only through fear, a master, whom they cannot interrogate, a sovereign totally inaccessible, can never merit the homage of intelligent beings. 525 If the conduct of God is a mystery, it is not made for us. Human can neither adore, admire, respect, nor imitate conduct, in which every thing is inconceivable, or, of

which you can often form only revolting ideas; 526 unless it is pretended, that we ought to adore every thing of which we are forced to be ignorant, and that every thing, which we do not know, becomes for that reason an object of admiration. 527 Divines! You never cease telling us, that the designs of God are impenetrable; that His ways are not our ways, nor His thoughts our thoughts; 528 that it is absurd to complain of His administration, of the motives and springs of which we are totally ignorant; 529 that it is presumption to tax His judgments with injustice, because we cannot comprehend them. 530 But when you speak in this strain, do you not perceive, that you destroy with your own hands all your profound systems, whose only end is to explain to us the ways of the divinity, which, you say, are impenetrable? 531 Have you penetrated His judgments, His ways, His designs? You dare not assert it, and though you reason about them without end, you do not comprehend them any more than we do. 532 If, by chance, you know the plan of God, which you wish us to admire, while most people find it so little worthy of a just, good, intelligent, and reasonable being, no longer say, this plan is impenetrable. 533 If you are as ignorant of it as we are, have some indulgence for those who ingenuously confess, they comprehend nothing in it, or that they see in it nothing divine. 534 Cease to persecute for opinions, of which you understand nothing yourselves; cease to defame each other for dreams and conjectures, which every thing seems to contradict. 535 Talk to us of things intelligible and really useful to humans; and no longer talk to us of the impenetrable ways of God, about which you only stammer and contradict yourselves.

536 By continually speaking of the immense depths of divine wisdom, forbidding us to sound them, saying it is insolence to cite God before the tribunal of our feeble reason, making it a crime to judge our master, 537 divines teach us nothing but the embarrassment they are in, when it is required to account for the conduct of a God, 538 whose conduct they think marvellous only because they are

utterly incapable of comprehending it themselves.

APOLOGUE

78

539 Physical evil is commonly regarded as a punishment for sin. Diseases, famines, wars, earthquakes, are means which God uses to chastise wicked people. 540 Thus, they make no scruple of attributing these evils to the severity of a just and good God. 541 But, do not these scourges fall indiscriminately upon the good and bad, upon the impious and devout, upon the innocent and guilty? 542 How, in this proceeding, would they have us admire the justice and goodness of a being, the idea of whom seems comforting to so many wretches, 543 whose brain must undoubtedly be disordered by their misfortunes, since they forget, that their God is the arbiter, the sole disposer of the events of this world. 544 This being the case, ought they not to impute their sufferings to Him, into whose arms they fly for comfort? 545 Unfortunate father! Thou consolest thyself in the bosom of Providence, for the loss of a dear child, or beloved wife, who made thy happiness. 546 Alas! Dost thou not see, that thy God has killed them? Thy God has rendered thee miserable, and thou desirest thy God to comfort thee for the dreadful afflictions He has sent thee!

547 The chimerical or supernatural notions of theology have so succeeded in destroying, in the minds of people, the most simple, dear, and natural ideas, 548 that the devout, unable to accuse God of malice, accustom themselves to regard the several strokes of fate as indubitable proofs of celestial goodness. 549 When in affliction, they are ordered to believe that God loves them, that God visits them, that God wishes to try them. Thus religion has attained the art of converting evil into good! 550 A profane person said with reason--If God Almighty thus treats those whom He loves, I earnestly beseech Him never to think of me.

551 People must have received very gloomy and cruel ideas of their God, who is called so good, to believe that the most dreadful calamities and piercing afflictions are marks of His favour!

552 Would an evil genius, a demon, be more ingenious in tormenting own enemies, than the God of goodness sometimes is, who so often exercises His severity upon His dearest friends?

APOLOGUE

79

553 What shall we say of a father, who, we are assured, watches without intermission over the preservation and happiness of His weak and short-sighted children, and who yet leaves them at liberty to wander at random among rocks, precipices, and waters; 554 who rarely hinders them from following their inordinate appetites; who permits them to handle, without precaution, murderous arms, at the risk of their life? 555 What should we think of the same father, if, instead of imputing to Himself the evil that happens to His poor children, He should punish them for their wanderings in the most cruel manner? 556 We should say, with reason, that this father is a madman, who unites injustice to folly. 557 A God, who punishes faults, which He could have prevented, is a being deficient in wisdom, goodness, and equity. 558 A foreseeing God would prevent evil, and thereby avoid having to punish it. 559 A good God would not punish weaknesses, which He knew to be inherent in human nature. 560 A just God, if He made human, would not punish you for not being made strong enough to resist your desires. To punish weakness is the most unjust tyranny. 561 Is it not calumniating a just God, to say, that He punishes people for their faults, even in the present life? 562 How could He punish beings, whom it belonged to Him alone to reform, and who, while they have not grace, cannot act otherwise than they do?

563 According to the principles of theologians themselves, human, in your present state of corruption, can do nothing but evil, since, without divine grace, you are never able to do good. 564 Now, if the nature of human, left to itself, or destitute of divine aid, necessarily determines you to evil, or renders you incapable of good, what becomes of the free-will of human? 565 According to such

principles, human can neither merit nor demerit. 566 By rewarding human for the good you does, God would only reward Himself; by punishing human for the evil you does, God would punish you for not giving Him grace, without which you could not possibly do better.

APOLOGUE

80

567 Theologians repeatedly tell us, that human is free, while all their principles conspire to destroy your liberty. By endeavouring to justify the Divinity, they in reality accuse you of the blackest injustice. 568 They suppose, that without grace, human is necessitated to do evil. They affirm, that God will punish you, because God has not given you grace to do good!

569 Little reflection will suffice to convince us, that human is necessitated in all your actions, that your free-will is a chimera, even in the system of theologians. 570 Does it depend upon human to be born of such or such parents? Does it depend upon human to imbibe or not to imbibe the opinions of your parents or instructors? 571 If I had been born of idolatrous or Mahometan parents, would it have depended upon me to become a Christian? 572 Yet, divines gravely assure us, that a just God will damn without pity all those, to whom He has not given grace to know the Christian religion!

573 Human's birth is wholly independent of your choice. You are not asked whether you are willing, or not, to come into the world. Nature does not consult you upon the country and parents She gives you. 574 Your acquired ideas, your opinions, your notions true or false, are necessary fruits of the education which you have received, and of which you have not been the director. 575 Your passions and desires are necessary consequences of the temperament given you by Nature. 576 During your whole life, your volitions and actions are determined by your connections, habits, occupations, pleasures, and conversations; by the thoughts, that are involuntarily presented to your mind; 577 in a word, by a multitude of events and accidents, which it is out of your power to foresee or prevent.

Incapable of looking into futurity, you knows not what you will do. 578 From the instant of your birth to that of your death, you are never free. 579 You will say, that you wills, deliberates, chooses, determines; and you will hence conclude, that your actions are free. It is true, that human wills, but you are not master of your will or your desires; 580 you can desire and will only what you judges advantageous to yourself; you can neither love pain, nor detest pleasure. 581 It will be said, that you sometimes prefers pain to pleasure; but then you prefers a momentary pain with a view of procuring a greater and more durable pleasure. 582 In this case, the prospect of a greater good necessarily determines you to forego a less considerable good.

583 The lover does not give own mistress the features which captivate own self; you are not then master of loving, or not loving the object of your tenderness; you are not master of your imagination or temperament. 584 Whence it evidently follows, that human is not master of own volitions and desires. "But human," you will say, "can resist own desires; therefore you are free." 585 Human resists own desires, when the motives, which divert you from an object, are stronger than those, which incline you towards it; but then your resistance is necessary. 586 A person, whose fear of dishonour or punishment is greater than own love of money, necessarily resists the desire of stealing.

587 "Are we not free, when we deliberate?" But, are we masters of knowing or not knowing, of being in doubt or certainty? 588 Deliberation is a necessary effect of our uncertainty respecting the consequences of our actions. 589 When we are sure, or think we are sure, of these consequences, we necessarily decide, and we then act necessarily according to our true or false judgment. 590 Our judgments, true or false, are not free; they are necessarily determined by the ideas, we have received, or which our minds have formed.

591 Human is not free in own choice; you are evidently necessitated to choose what you judges most useful and agreeable.

GOODNESS

592 Neither is you free, when you suspends your choice; you are forced to suspend it until you knows, or thinks you knows, the qualities of the objects presented to you, or, until you have weighed the consequences of your actions. 593 "Human," you will say, "often decides in favour of actions, which you knows must be detrimental to yourself; human sometimes kills own self; therefore you are free." I deny it. 594 Is human master of reasoning well or ill? Do not your reason and wisdom depend upon the opinions you have formed, or upon the conformation of your machine? 595 As neither one nor the other depends upon your will, they are no proof of liberty. 596 "If I lay a wager, that I shall do, or not do a thing, am I not free? Does it not depend upon me to do it or not?" No, I answer; 597 the desire of winning the wager will necessarily determine you to do, or not to do the thing in question. 598 "But, supposing I consent to lose the wager?" Then the desire of proving to me, that you are free, will have become a stronger motive than the desire of winning the wager; 599 and this motive will have necessarily determined you to do, or not to do, the thing in question.

600 "But," you will say, "I feel free." This is an illusion, that may be compared to that of the fly in the fable, who, lighting upon the pole of a heavy carriage, applauded himself for directing its course. 601 Human, who thinks yourself free, is a fly, who imagines you have power to move the universe, while you are yourself unknowingly carried along by it.

602 The inward persuasion that we are free to do, or not to do a thing, is but a mere illusion. 603 If we trace the true principle of our actions, we shall find, that they are always necessary consequences of our volitions and desires, which are never in our power. 604 You think yourself free, because you do what you will; but are you free to will, or not to will; to desire, or not to desire? 605 Are not your volitions and desires necessarily excited by objects or qualities totally independent of you?

GOODNESS

APOLOGUE

81

606 "If the actions of people are necessary, if humans are not free, by what right does society punish criminals? 607 Is it not very unjust to chastise beings, who could not act otherwise than they have done?" 608 If the wicked act necessarily according to the impulses of their evil nature, society, in punishing them, acts necessarily by the desire of self-preservation. 609 Certain objects necessarily produce in us the sensation of pain; our nature then forces us against them, and avert them from us. 610 A tiger, pressed by hunger, springs upon the human, whom it wishes to devour; but this human is not master of own fear, and necessarily seeks means to destroy the tiger.

APOLOGUE

82

611 "If every thing be necessary, the errors, opinions, and ideas of humans are fatal; and, if so, how or why should we attempt to reform them?" 612 The errors of humans are necessary consequences of ignorance. 613 Their ignorance, prejudice, and credulity are necessary consequences of their inexperience, negligence, and want of reflection, in the same manner as delirium or lethargy are necessary effects of certain diseases. 614 Truth, experience, reflection, and reason, are remedies calculated to cure ignorance, fanaticism and follies. 615 But, you will ask, why does not truth produce this effect upon many disordered minds? It is because some diseases resist all remedies; 616 because it is impossible to cure obstinate patients, who refuse the remedies presented to them; 617 because the interest of some people, and the folly of others, necessarily oppose the admission of truth.

618 A cause produces its effect only when its action is not interrupted by stronger causes, which then weakens or render useless, the action of the former. 619 It is impossible that the best arguments should be adopted by people, who are interested in error, prejudiced in its favour, and who decline all reflection; 620 but truth must necessarily undeceive honest minds, who seek it sincerely.

621 Truth is a cause; it necessarily produces its effects, when its impulse is not intercepted by causes, which suspend its effects.

APOLOGUE
83

622 "To deprive human of your free-will," it is said, "makes you a mere machine, an automaton. Without liberty, you will no longer have either merit or virtue." 623 What is merit in human? It is a manner of acting, which renders you estimable in the eyes of your fellow-beings. 624 What is virtue? It is a disposition, which inclines us to do good to others. 625 What can there be contemptible in machines, or automatons, capable of producing effects so desirable? 626 Marcus Aurelius was useful to the vast Roman Empire. 627 By what right would a machine despise a machine, whose springs facilitate its action? 628 Good people are springs, which second society in its tendency to happiness; 629 the wicked are ill-formed springs, which disturb the order, progress, and harmony of society. 630 If, for its own utility, society cherishes and rewards the good, it also harasses and destroys the wicked, as useless or hurtful.

APOLOGUE
84

631 The world is a necessary agent. All the beings, that compose it, are united to each other, and cannot act otherwise than they do, so long as they are moved by the same causes, and endued with the same properties. 632 When they lose properties, they will necessarily act in a different way. 633 God Himself, admitting His existence, cannot be considered a free agent. 634 If there existed a God, His manner of acting would necessarily be determined by the properties inherent in His nature; nothing would be capable of arresting or altering His will. 635 This being granted, neither our actions, prayers, nor sacrifices could suspend, or change His invariable conduct and immutable designs; whence we are forced to infer, that all religion would be useless.

APOLOGUE
85

636 Were not divines in perpetual contradiction with themselves,

they would see, that, according to their hypothesis, human cannot be reputed free an instant. 637 Do they not suppose human continually dependent on own God? 638 Are we free, when we cannot exist and be preserved without God, and when we cease to exist at the pleasure of His supreme will? 639 If God has made human out of nothing; if His preservation is a continued creation; if God cannot, an instant, lose sight of His creature; 640 if whatever happens to you, is an effect of the divine will; if human can do nothing of yourself; if all the events, which you experiences, are effects of the divine decrees; 641 if you does no good without grace from on high, how can they maintain, that a human enjoys a moment's liberty? 642 If God did not preserve you in the moment of sin, how could human sin? If God then preserves you, God forces you to exist, that you may sin.

APOLOGUE

86

643 The Divinity is frequently compared to a king, whose revolted subjects are the greater part of humankind; and it is said, He has a right to reward the subjects who remain faithful to Him, and to punish the rebellious. 644 This comparison is not just in any of its parts. God presides over a machine, every spring of which He has created. 645 These springs act agreeable to the manner, in which God has formed them; He ought to impute it to His own unskilfullness, if these springs do not contribute to the harmony of the machine, into which it was His will to insert them. 646 God is a created king, who has created to Himself subjects of every description; who has formed them according to His own pleasure whose will can never find resistance. 647 If God has rebellious subjects in His empire, it is because God has resolved to have rebellious subjects. 648 If the sins of humans disturb the order of the world, it is because it is the will of God that this order should be disturbed.

649 Nobody dares to call in question the divine justice; yet, under the government of a just God, we see nothing but acts of injustice and violence. 650 Force

decides the fate of nations, equity seems banished from the earth; a few people sport, unpunished, with the peace, property, liberty, and life of others. 651 All is disorder in a world governed by a God who is said to be infinitely displeased with disorder.

APOLOGUE

87

652 Although humans are for ever admiring the wisdom, goodness, justice, and beautiful order of Providence, they are, in reality, never satisfied with it. 653 Do not the prayers, continually addressed to heaven, shew, that people are by no means satisfied with the divine dispensations? 654 To pray to God for a favour, shews diffidence of His watchful care; to pray to Him to avert or put an end to an evil, is to endeavour to obstruct the course of His justice; 655 to implore the assistance of God in our calamities, is to address the author Himself of these calamities, to represent to Him, that He ought, for our sake, to rectify His plan, which does not accord with our interest.

656 The Optimist, or you who maintains that all is well, and who incessantly cries that we live in the best world possible, to be consistent, should never pray; neither ought you to expect another world, where human will be happier. 657 Can there be a better world than the best world possible? 658 Some theologians have treated the Optimists as impious, for having intimated that God could not produce a better world, than that in which we live. 659 According to these doctors, it is to limit the power of God, and to offer Him insult. 660 But do not these divines see, that it shews much less indignity to God, to assert that He has done His best in producing this world, than to say, that, being able to produce a better, He has had malice enough to produce a very bad one? 661 If the Optimist, by your system, detracts from the divine power, the theologian, who treats you as a blasphemer, is a blasphemer, who offends the goodness of God in espousing the cause of His omnipotence.

GOODNESS

APOLOGUE
88

662 When we complain of the evils, of which our world is the theatre, we are referred to the other world, where it is said, God will make reparation for all the iniquity and misery, which, for a time, He permits here below. 663 But if God, suffering His eternal justice to remain at rest for a long time, could consent to evil during the whole continuance of our present world, what assurance have we, that, during the continuance of another world, divine justice will not, in like manner, sleep over the misery of its inhabitants?

664 The divines console us for our sufferings by saying, that God is patient, and that His justice, though often slow, is not the less sure. 665 But do they not see, that patience is incompatible with a just, immutable, and omnipotent being? 666 Can God then permit injustice, even for an instant? To temporise with a known evil, announces either weakness, uncertainty, or collusion. 667 To tolerate evil, when one has power to prevent it, is to consent to the commission of evil.

APOLOGUE
89

668 Divines every where exclaim, that God is infinitely just; but that His justice is not the justice of human. Of what kind or nature then is this divine justice? 669 What idea can I form of a justice, which so often resembles injustice? Is it not to confound all ideas of just and unjust, to say, that what is equitable in God is iniquitous in His creatures? 670 How can we receive for our model a being, whose divine perfections are precisely the reverse of human?

671 "God," it is said, "is sovereign arbiter of our destinies. His supreme power, which nothing can limit, justly permits Him to do with the works of His own hands according to His good pleasure. 672 A worm, like human, has no right even to complain." This arrogant style is evidently borrowed from the language, used by the ministers of tyrants, when they stop the mouths of those who suffer from their violences. 673 It cannot then be the language of the ministers of a God, whose equity is highly extolled; it is not made to

be imposed upon a being, who reasons. 674 Ministers of a just God! I will inform you then, that the greatest power cannot confer upon your God Himself the right of being unjust even to the vilest of His creatures. 675 A despot is not a God. A God, who arrogates to Himself the right of doing evil, is a tyrant; a tyrant is not a model for humans; He must be an object execrable to their eyes.

676 Is it not indeed strange, that in order to justify the Divinity, they make Him every moment the most unjust of beings! 677 As soon as we complain of His conduct, they think to silence us by alleging, that God is master; which signifies, that God, being the strongest, is not bound by ordinary rules. 678 But the right of the strongest is the violation of all rights. 679 It seems right only to the eyes of a savage conqueror, who in the heat of his fury imagines, that he may do whatever he pleases with the unfortunate victims, whom he has conquered. 680 This barbarous right can appear legitimate only to slaves blind enough to believe that everything is lawful to tyrants whom they feel too weak to resist. 681 In the greatest calamities, do not devout persons, through a ridiculous simplicity, or rather a sensible contradiction in terms, exclaim, that the Almighty is master. 682 Thus, inconsistent reasoners, believe, that the Almighty (a Being, one of whose first attributes is goodness,) sends you pestilence, war, and famine! 683 You believe that the Almighty, this good being, has the will and right to inflict the greatest evils, you can bear! 684 Cease, at least, to call your God good, when He does you evil; say not, that He is just, say that He is the strongest, and that it is impossible for you to ward off the blows of His caprice.

685 God, say you, chastises only for our good. But what real good can result to a people from being exterminated by the plague, ravaged by wars, corrupted by the examples of perverse rulers, 686 continually crushed under the iron sceptre of a succession of merciless tyrants, annihilated by the scourges of a bad government, whose destructive effects are often felt for ages? 687 If chastisements

are good, then they cannot have too much of a good thing! 688 The eyes of faith must be strange eyes, if with them they see advantages in the most dreadful calamities, in the vices and follies with which our species are afflicted.

APOLOGUE
90

689 What strange ideas of divine justice must Christians have, who are taught to believe, that their God, in view of reconciling to Himself the human race, guilty, though unconscious, of the sin of their fathers, has put to death His own son, who was innocent and incapable of sinning? 690 What should we say of a king, whose subjects should revolt, and who, to appease Himself, should find no other expedient than to put to death the heir of His crown, who had not participated in the general rebellion? 691 "It is," the Christian will say, "through goodness to His subjects, unable of themselves to satisfy divine justice, that God has consented to the cruel death of His son." 692 But the goodness of a father to strangers does not give Him the right of being unjust and barbarous to His own son. 693 All the qualities, which theology ascribes to God, reciprocally destroy one another. The exercise of one of His perfections is always at the expense of the exercise of another.

694 Has the Jew more rational ideas of divine justice than the Christian? 695 The pride of a king kindles the anger of heaven; Jehovah causes the pestilence to descend upon His innocent people; 696 seventy thousand subjects are exterminated to expiate the fault of a monarch, whom the goodness of God resolved to spare.

APOLOGUE
91

697 Notwithstanding the various acts of injustice, with which all religions delight to blacken the Divinity, humans cannot consent to accuse Him of iniquity. 698 They fear, that, like the tyrants of this world, truth will offend Him, and redouble upon them the weight of His malice and tyranny. 699 They hearken therefore to their priests, who tell them, that their God is a tender father; 700 that this God is an equitable monarch whose object in this world is to

assure Himself of the love, obedience and respect of His subjects; 701 who gives them liberty of acting only to afford them an opportunity of meriting His favours, and of acquiring an eternal happiness, which He does not owe them. 702 By what signs can people discover the tenderness of a father, who has given life to the greater part of His children merely to drag out upon the earth a painful, restless, bitter existence? 703 Is there a more unfortunate present, than that pretended liberty, which, we are told, humans are very liable to abuse, and thereby to incur eternal misery?

APOLOGUE

92

704 By calling mortals to life, what a cruel and dangerous part has not the Deity forced them to act? 705 Thrown into the world without their consent, provided with a temperament of which they are not masters, animated by passions and desires inherent in their nature, exposed to snares which they have not power to escape, hurried away by events which they could not foresee or prevent, 706 unhappy mortals are compelled to run a career, which may lead them to punishments horrible in duration and violence.

707 Travellers inform us, that, in Asia, a Sultan reigned, full of fantastical ideas, and very absolute in his whims. 708 By a strange madness, this prince spent his time seated at a table, upon which were placed three dice and a dice-box. 709 One end of the table was covered with pieces of silver, designed to excite the avarice of his courtiers and people. He, knowing the foible of his subjects, addresses them as follows: 710 ‘Slaves, I wish your happiness. My goodness proposes to enrich you, and make you all happy. 711 Do you see these treasures? Well, they are for you; strive to gain them; let each, in your turn, take the box and dice; whoever has the fortune to throw sixes, shall be master of the treasure. 712 But, I forewarn you, that you who has not the happiness to throw the number required, shall be precipitated for ever into a dark dungeon, where my justice demands that you be burned with a slow fire.’ 713 Upon this discourse of the monarch, the company look at each other affrighted. No one

wishes to expose own self to so dangerous a chance. 714 What! says the enraged Sultan, does no one offer to play? I tell you then you must; My glory requires that you should play. Play then; obey without replying. 715 It is well to observe, that the dice of the despot are so prepared, that out of a hundred thousand throws, there is but one, which can gain the number required. 716 Thus the generous monarch has the pleasure of seeing his prison well filled, and his riches seldom ravished from him. 717 Mortals! this SULTAN is your GOD; his TREASURE IS HEAVEN; his DUNGEON IS HELL, and it is you who hold the DICE!

APOLOGUE

93

718 Divines repeatedly assure us, that we owe Providence infinite gratitude for the numberless blessings it bestows. They loudly extol the happiness of existence. 719 But, alas! how many mortals are truly satisfied with their mode of existence? If life has sweets, with how much bitterness is it not mixed? 720 Does not a single chagrin often suffice suddenly to poison the most peaceable and fortunate life? 721 Are there many, who, if it were in their power would begin again, at the same price, the painful career, in which, without their consent, destiny has placed them?

722 They say, that existence is a great blessing. But is not this existence continually troubled with fears, and maladies, often cruel and little deserved? 723 May not this existence, threatened on so many sides, be torn from us any moment? 724 Where is the person, who has not been deprived of a dear wife, beloved child, or consoling friend, whose loss every moment intrudes upon your thoughts? 725 There are few, who have not been forced to drink of the cup of misfortune; there are few, who have not desired their end. 726 Finally, it did not depend upon us to exist or not to exist. 727 Should the bird then be very grateful to the fowler for taking it in own net and confining it in own cage for your diversion?

APOLOGUE

94

728 Notwithstanding the infirmities and misery which human is forced to undergo, you have,

nevertheless, the folly to think yourself the favourite of your God, the object of all your cares, the sole end of all your works. 729 You imagines, that the whole universe is made for you; you arrogantly calls yourself the king of Nature, and values yourself far above other animals. 730 Mortal! upon what canst thou found thy haughty pretensions? It is, sayest thou, upon thy soul, upon thy reason, upon the sublime faculties, which enable thee to exercise an absolute empire over the beings, which surround thee. 731 But, weak sovereign of the world; art thou sure, one moment, of the continuance of thy reign? 732 Do not the smallest atoms of matter, which thou despisest, suffice to tear thee from thy throne, and deprive thee of life? 733 Finally, does not the king of animals at last become the food of worms? 734 Thou speakest of thy soul! But dost thou know what a soul is? Dost thou not see, that this soul is only the assemblage of thy organs, from which results life? 735 Wouldst thou then refuse a soul to other animals, who live, think, judge, and compare, like thee; who seek pleasure, and avoid pain, like thee; and who often have organs, which serve them better than thine? 736 Thou boastest of thy intellectual faculties; but do these faculties, of which thou art so proud, make thee happier than other animals? 737 Dost thou often make use of that reason, in which thou gloriest, and to which religion commands thee not to listen? 738 Are those brutes, which thou disdainest, because they are less strong or less cunning than thou art, subject to mental pains, to a thousand frivolous passions, to a thousand imaginary wants, to which thou art a continual prey? 739 Are they, like thee, tormented by the past, alarmed at the future? 740 Confined solely to the present, does not what you call their instinct, and what I call their intelligence, suffice to preserve and defend them, and to supply them with all they want? 741 Does not this instinct, of which thou speakest with contempt, often serve them better than thy wonderful faculties? 742 Is not their peaceful ignorance more advantageous to them, than those extravagant meditations and

worthless researches, which render thee unhappy, and for which thy zeal urges thee even to massacre the beings of thy noble species? 743 Finally, have these beasts, like so many mortals, a troubled imagination, which makes them fear, not only death, but likewise eternal torments?

744 Augustus, hearing that Herod, king of Judea, had put his sons to death, exclaimed: ‘It is much better to be Herod's hog, than his son’. 745 As much may be said of human. This dear child of Providence runs far greater risks than all other animals; having suffered much in this world, does you not imagine, that you are in danger of suffering eternally in another?

APOLOGUE

95

746 Where is the precise line of distinction between human and the animals whom you calls brutes? In what does you differ essentially from beasts? 747 It is, we are told, by your intelligence, by the faculties of your mind, and by your reason, that human appears superior to all other animals, who, in all their actions, move only by physical impulses, in which reason has no share. 748 But finally, brutes, having fewer wants than human, easily do without your intellectual faculties, which would be perfectly useless in their mode of existence. 749 Their instinct is sufficient; while all the faculties of human scarcely suffice to render your existence supportable, and to satisfy the wants, which your imagination and your prejudices multiply to your torment.

750 Brutes are not influenced by the same objects, as human; they have not the same wants, desires, nor fancies; and they very soon arrive to maturity, 751 while the mind of human seldom attains to the full enjoyment and free exercise of its faculties and to such a use of them, as is conducive to your happiness.

APOLOGUE

96

752 We are assured, that the human soul is a simple substance. It should then be the same in every individual, each having the same intellectual faculties; yet this is not the case. 753 Humans differ as much in the qualities of the mind, as in the features of the face. There

are human beings as different from one another, as human is from a horse or a dog. 754 What conformity or resemblance do we find between some people? What an infinite distance is there between the genius of a Locke or a Newton, and that of a peasant, Hottentot, or Laplander?

755 Human differs from other animals only in your organisation, which enables you to produce effects, of which animals are not capable. 756 The variety, observable in the organs of individuals of the human species suffices to explain the differences in what is called their intellectual faculties. 757 More or less delicacy in these organs, warmth in the blood, mobility in the fluids, flexibility or stiffness in the fibres and nerves, must necessarily produce the infinite diversity, which we observe in the minds of humans. 758 It is by exercise, habit and education, that the mind is unfolded and becomes superior to that of others. 759 Human, without culture and experience, is as void of reason and industry, as the brute. 760 A stupid person is one, whose organs move with difficulty, whose brain does not easily vibrate, whose blood circulates slowly. 761 A person of genius is you, whose organs are flexible, whose sensations are quick, whose brain vibrates with celerity. 762 A learned person is you, whose organs and brain have been long exercised upon objects to which you are devoted.

763 Without culture, experience, or reason, is not person more contemptible and worthy of hatred, than the vilest insects or most ferocious beasts? 764 Is there in Nature a more detestable being, than a Tiberius, a Nero, or a Caligula? 765 Have those destroyers of the human race, known by the name of conquerors, more estimable souls than bears, lions, or panthers? 766 Are there animals in the world more detestable than tyrants?

APOLOGUE

97

767 The superiority which human so gratuitously arrogates to own self over other animals, soon vanishes in the light of reason, when we reflect on human extravagances. 768 How many

animals shew more mildness, reflection, and reason, than the animal, who calls own self reasonable above all others? 769 Are there among humans, so often enslaved and oppressed, societies as well constituted as those of the ants, bees, or beavers? 770 Do we ever see ferocious beasts of the same species mangle and destroy one another without profit? Do we ever see religious wars among them? 771 The cruelty of beasts towards other species arises from hunger, the necessity of nourishment; 772 the cruelty of human towards human arises only from the vanity of your masters and the folly of your impertinent prejudices. 773 Speculative people, who endeavour to make us believe, that all in the universe was made for human, are much embarrassed, when we ask, how so many hurtful animals can contribute to the happiness of human? 774 What known advantage results to the friend of the gods, from being bitten by a viper, stung by a gnat, devoured by vermin, torn in pieces by a tiger, etc.? 775 Would not all these animals reason as justly as our theologians, should they pretend that human was made for them?

AN EASTERN TALE

Paul Henri Thiry, Baron D'Holbach

APOLOGUE

1

3 At some distance from Bagdad, a hermit, renowned for his sanctity, passed his days in an agreeable solitude. 2 The neighbouring inhabitants, to obtain an interest in his prayers, daily flocked to his hermitage, to carry him provisions and presents. 3 The holy man, without ceasing, gave thanks to God for the blessings, with which providence loaded him. 4 "O Allah!" said he, "how ineffable is thy love to thy servants. What have I done to merit the favours, that I receive from thy bounty? 5 O Monarch of the skies! O Father of Nature! what praises could worthily celebrate thy munificence, and thy paternal care! 6 O Allah! how great is thy goodness to the children of humans!" 7 Penetrated with gratitude, the hermit made a vow to undertake, for the seventh

time, a pilgrimage to Mecca. 8 The war which then raged between the Persians and Turks, could not induce him to defer his pious enterprise. 9 Full of confidence in God, he sets out under the inviolable safeguard of a religious habit. He passes through the hostile troops without any obstacle; 10 far from being molested, he receives, at every step, marks of veneration from the soldiers of the two parties. 11 At length, borne down with fatigue, he is obliged to seek refuge against the rays of a scorching sun; he rests under the cool shade of a group of palm-trees. 12 In this solitary place, the man of God finds not only an enchanting retreat, but a delicious repast. He has only to put forth his hand to gather dates and other pleasant fruits; 13 a brook affords him the means of quenching his thirst. A green turf invites him to sleep; 14 upon waking he performs the sacred ablution, and exclaims in a transport of joy: "O Allah! how great is thy goodness to the children of humans!" 15 After this perfect refreshment, the saint, full of strength and gaiety, pursues his way; it leads him across a smiling country, which presents to his eyes flowery hillocks, enamelled meadows, and trees loaded with fruit. 16 Affected by this sight, he ceases not to adore the rich and liberal hand of providence, which appears every where providing for the happiness of the human race. 17 Going a little farther, the mountains are pretty difficult to pass; but having once arrived at the summit, a hideous spectacle suddenly appears to his view. His soul is filled with horror. 18 He discovers a vast plain laid waste with fire and sword; he beholds it covered with hundreds of carcases, the deplorable remains of a bloody battle, lately fought upon this field. 19 Eagles, vultures, ravens and wolves were greedily devouring the dead bodies with which the ground was covered. This sight plunges our pilgrim into a gloomy meditation. 20 Heaven, by special favour, had enabled him to understand the language of beasts. He heard a wolf, gorged with human flesh, cry out in the excess of his joy: 21 "O Allah! how great is thy goodness to the children of wolves. Thy provident wisdom

takes care to craze the minds of these detestable people, who are so dangerous to our species. 22 By an effect of thy Providence, which watches over thy creatures, these destroyers cut one another's throats, and furnish us with sumptuous meals. 23 O Allah! how great is thy goodness to the children of wolves!"

APOLOGUE

2

24 A heated imagination sees in the universe only the blessings of heaven; a calmer mind finds in it both good and evil. 25 "I exist," say you; but is this existence always a good? 26 "Behold," you say, "that sun, which lights; this earth, which for you is covered with crops and verdure; 27 these flowers, which bloom to regale your senses; these trees, which bend under the weight of delicious fruits; 28 these pure waters, which run only to quench your thirst; those seas, which embrace the universe to facilitate your commerce; these animals, which a foreseeing Nature provides for your use." 29 Yes; I see all these things, and I enjoy them. But in many climates, this beautiful sun is almost always hidden; in others, its excessive heat torments, creates storms, produces frightful diseases, and parches the fields; 30 the pastures are without verdure, the trees without fruit, the crops are scorched, the springs are dried up; 31 I can only with difficulty subsist, and now complain of the cruelties of Nature, which to you always appears so beneficent. 32 If these seas bring me spices, and useless commodities, do they not destroy numberless mortals, who are foolish enough to seek them? 33 The vanity of human persuades own self, that you are the sole center of the universe; you creates for yourself a world and a God; you thinks yourself of sufficient consequence to derange Nature at your pleasure. 34 But, concerning other animals, you reasons like an atheist. 35 Does you not imagine, that the individuals different from your own are automatons unworthy of the blessings of universal providence, and that brutes cannot be objects of your justice or goodness? 36 Mortals regard the happy or unhappy events, health or sickness, life or

death, plenty or want, as rewards or punishments for the right use or abuse of the liberty, with which they erroneously imagine themselves endowed. 37 Do they reason in the same manner concerning the brutes? No. Although they see them, under a just God, enjoy and suffer, equally subject to health and sickness, live and die, like themselves, 38 it never occurs to them to ask by what crime, these beasts could have incurred the displeasure of their Creator? 39 Have not humans, blinded by their religious prejudices, in order to free themselves from embarrassment, carried their folly so far as to pretend that beasts have no feeling?

40 Will humans never renounce their foolish pretensions? Will they never acknowledge that Nature is not made for them? 41 Will they never see that Nature has placed equality among all beings She has produced? 42 Will they never perceive that all organised beings are equally made to be born and die, enjoy and suffer? 43 Finally, far from having any cause to be puffed up with their mental faculties, are they not forced to grant, that these faculties often make them more unhappy than beasts, in which we find neither opinions, prejudices, vanities, nor follies, which every moment decide the welfare of human?

APOLOGUE

3

44 The superiority which humans arrogate over other animals, is chiefly founded upon their opinion, that they have the exclusive possession of an immortal soul. 45 But ask them what this soul is, and they are puzzled. They will say, it is an unknown substance-- a secret power distinct from their bodies-- a spirit, of which they have no idea. 46 Ask them how this spirit, which they suppose to be like their God wholly void of extension, could combine itself with their material bodies, and they will tell you, they know nothing about it; that it is to them a mystery; that this combination is an effect of the omnipotence of God. 47 These are the ideas that humans form of the hidden, or rather imaginary substance, which they consider as

the main spring of all their actions! 48 If the soul is a substance essentially different from the body, and can have no relation to it, their union would be, not a mystery, but an impossibility. 49 Besides, this soul being of a nature different from the body, must necessarily act in a different manner; 50 yet we see that this pretended soul is sensible of the motions experienced by the body, and that these two substances, essentially different, always acts in concert. 51 You will say that this harmony is also a mystery. But I will tell you, that I see not my soul, that I know and am sensible of my body only, that it is this body which feels, thinks, judges, suffers, and enjoys; 52 and that all these faculties are necessary results of my body's own mechanism, or organisation.

APOLOGUE

4

53 Although it is impossible for humans to form the least idea of the soul, or the pretended spirit, which animates them; yet they persuade themselves that this unknown soul is exempt from death. 54 Every thing proves to them, that they feel, that they think, that they acquire ideas, that they enjoy and suffer, only by means of the senses, or material organs of the body. 55 Admitting even the existence of this soul, they cannot help acknowledging, that it depends entirely upon the body, and undergoes, all its vicissitudes; 56 and yet it is imagined, that this soul has nothing, in its nature, similar to the body; that it can act and feel without the assistance of the body; 57 in a word, that this soul, freed from the body, and disengaged from its senses, can live, enjoy, suffer, experience happiness, or feel excruciating torments. 58 Upon such a tissue of absurdities is built the marvellous opinion of the: immortality of the soul. 59 If I ask, what are the motives for believing the soul immortal, they immediately answer, that it is because human naturally desires to be immortal: 60 but, because you desire a thing ardently, can you infer that your desire will be fulfilled? 61 By what strange logic can we dare affirm, that a thing cannot fail to happen, because we ardently desire it? 62 Are desires,

begotten by the imagination, the measure of reality? 63 The impious, you say, deprived of the flattering hope of another life, wish to be annihilated. 64 Very well: may they not then as justly conclude, from their desire, that they shall be annihilated, as you may conclude from your desire, that you shall exist for ever.

APOLOGUE

5

65 Human dies, and the human body after death is no longer anything but a mass incapable of producing those motions, of which the sum total constituted life. 66 We see, that it has no longer circulation, respiration, digestion, speech, or thought. It is pretended, that the soul is then separated from the body; 67 but to say, that this soul, with which we are unacquainted, is the principle of life, is to say nothing, unless that an unknown power is the hidden principle of imperceptible movements. 68 Nothing is more natural and simple, than to believe, that the dead person no longer lives: nothing is more extravagant, than to believe, that the dead person is still alive. 69 We laugh at the simplicity of some nations, whose custom is to bury provision with the dead, under an idea that it will be useful and necessary to them in the other life. 70 Is it then more ridiculous or absurd to suppose, that humans will eat after death, than to imagine, that they will think, that they will be actuated by agreeable or disagreeable ideas, 71 that they will enjoy or suffer, and that they will experience repentance or delight, after the organs, adapted to produce sensations or ideas, are once dissolved. 72 To say that the souls of humans will be happy or unhappy after death, is in other words to say, that humans will see without eyes, hear without ears, taste without palates, smell without noses, and touch without hands. 73 And persons, who consider themselves very reasonable, adopt these ideas!

APOLOGUE

6

74 The dogma of the immortality of the soul supposes the soul to be a simple substance; in a word, a spirit. But I ask again, what is a

spirit? 75 "It is," say you, "a substance void of extension, incorruptible, having nothing common with matter." 76 If so, how is your soul born, and how does it grow, how does it strengthen or weaken itself, how does it get disordered and grow old, in the same progression as your body?

77 To all these questions you answer, that these are mysteries. If so, you cannot understand them. If you cannot understand them, why do you decide about a thing, of which you are unable to form the least idea? 78 To believe or affirm any thing, it is necessary, at least, to know in what it consists. 79 To believe in the existence of your immaterial soul, is to say, that you are persuaded of the existence of a thing, of which it is impossible for you to form any true notion; it is to believe in words without meaning. 80 To affirm that the thing is as you say, is the height of folly or vanity.

APOLOGUE

7

81 Are not theologians strange reasoners? Whenever they cannot divine the natural causes of things, they invent what they call supernatural; 82 such as spirits, occult causes, inexplicable agents, or rather words, much more obscure than the things they endeavour to explain. 83 Let us remain in Nature, when we wish to account for the phenomena of Nature; 84 let us be content to remain ignorant of causes too delicate for our organs; 85 and let us be persuaded, that, by going beyond Nature, we shall never solve the problems which Nature presents.

86 Even upon the hypothesis of theology, (that is, supposing an all-powerful mover of matter,) by what right would theologians deny, that their God has power to give this matter the faculty of thought? 87 Was it then more difficult for you to create combinations of matter, from which thought might result, than spirits who could think? 88 At least, by supposing matter, which thinks, we should have some notions of the subject of thought, or of what thinks in us; whereas, by attributing thought to an

immaterial being, it is impossible to form the least idea of it.

APOLOGUE
8

89 It is objected against us, that materialism makes human a mere machine, which is said to be very dishonourable. 90 But, will it be much more honourable for human, if we should say, that you acts by the secret impulses of a spirit, or by a certain 'I know not what', that animates you in a manner totally inexplicable.

91 It is easy to perceive, that the supposed superiority of spirit over matter, or of the soul over the body, has no other foundation than humans' ignorance of this soul, 92 while they are more familiarised with matter, with which they imagine they are acquainted, and of which they think they can discern the origin. 93 But the most simple movements of our bodies are to every person, who studies them, as inexplicable as thought.

APOLOGUE
9

94 The high value, which so many people set upon spiritual substance, has no other motive than their absolute inability to define it intelligibly. 95 The contempt shewn for matter by our metaphysicians, arises only from the circumstance, that familiarity begets contempt. 96 When they tell us, that: 'the soul is more excellent and noble than the body', they say what they know not.

APOLOGUE
10

97 The dogma of another life is incessantly extolled, as useful. It is maintained, that even though it should be only a fiction, it is advantageous, because it deceives humans, and conducts them to virtue. 98 But is it true, that this dogma makes humans wiser and more virtuous? Are the nations, who believe this fiction, remarkable for purity of morals? Has not the visible world ever the advantage over the invisible? 99 If those, who are trusted with the instruction and government of people, had knowledge and virtue themselves, they would govern them much better by realities, than by fictions. 100 But crafty, ambitious and corrupt legislators, have every where found it better to amuse with fables, than to teach

them truths, to unfold their reason, to excite them to virtue by sensible and real motives, in fine, to govern them in a rational manner. 101 Priests undoubtedly had reasons for making the soul immaterial; they wanted souls to people the imaginary regions, which they have discovered in the other life. 102 Material souls would, like all bodies, have been subject to dissolution. 103 Now, if people should believe, that all must perish with the body, the geographers of the other world would evidently lose the right of guiding humans' souls towards that unknown abode; 104 they would reap no profits from the hope with which they feed them, and the terrors with which they oppress them. 105 If futurity is of no real utility to humankind, it is, at least, of the greatest utility to those, who have assumed the office of conducting them thither.

APOLOGUE

11

106 "But," it will be said, "is not the dogma of the immortality of the soul comforting to beings, who are often very unhappy here below? 107 Though it should be an error, is it not pleasing? Is it not a blessing to human to believe, that you shall be able to enjoy hereafter a happiness, which is denied you upon earth?" 108 Thus, poor mortals! you make your wishes the measure of truth; because you desire to live for ever, and to be happier, 109 you at once conclude, that you shall live for ever, and that you shall be more fortunate in an unknown world, than in this known world, where you often find nothing but affliction! 110 Consent therefore to leave, without regret, this world which gives the greater part of you much more torment than pleasure. 111 Submit to the order of Nature, which demands that you, as well as all other beings, should not endure for ever.

112 We are incessantly told, that religion has infinite consolations for the unfortunate, that the idea of the soul's immortality, and of a happier life, is very proper to elevate human, and to support you under adversity, which awaits you upon earth. 113 It is said, on the contrary, that materialism is an afflicting system, calculated to

degrade human; 114 then it puts you upon a level with the brutes, breaks your courage, and shows you no other prospect than frightful annihilation, capable of driving you to despair and suicide, whenever you are unhappy. 115 The great art of theologians is to blow hot and cold, to afflict and console, to frighten and encourage. It appears by theological fictions, that the regions of the other life are happy and unhappy. 116 Nothing is more difficult than to become worthy of the abode of felicity; nothing more easy than to obtain a place in the abode of torment, which God is preparing for the unfortunate victims of eternal fury. 117 Have those then, who think the other life so pleasant and flattering, forgotten, that according to them, that life is to be attended with torments to the greater part of mortals? 118 Is not the idea of total annihilation infinitely preferable to the idea of an eternal existence, attended with anguish and gnashing of teeth? 119 Is the fear of an end more afflicting, than that of having had a beginning! 120 The fear of ceasing to exist is a real evil only to the imagination, which alone begat the dogma of another life.

121 Christian ministers say that the idea of a happier life is joyous. Admitted. Every person would desire a more agreeable existence than that you enjoys here. 122 But, if paradise is inviting, you will grant, that hell is frightful. Heaven is very difficult, and hell very easy to be merited. 123 Do you not say, that a narrow way leads to the happy regions, and a broad way to the regions of misery? 124 Do you not often say, that the number of the elect is very small, and that of the reprobate very large? 125 Is not Grace, which your God grants but to a very few, necessary to salvation? 126 Now, I assure you, that these ideas are by no means consoling; that I had rather be annihilated, once for all, than to burn for ever; that the fate of beasts is to me more desirable than that of the damned; 127 that the opinion which relieves me from afflicting fears in this world, appears to me more joyous, than the uncertainty arising from the opinion of a God, who, master of His grace, grants it to none but His favourites, and permits all others

to become worthy of eternal torment. 128 Nothing but enthusiasm or folly can induce a person to prefer improbable conjectures, attended with uncertainty and insupportable fears.

APOLOGUE

12

129 All religious principles are the work of pure imagination, in which experience and reason have no share. 130 It is extremely difficult to combat them, because the imagination, once prepossessed by chimeras, which astonish or disturb it, is incapable of reasoning. 131 To combat religion and its phantoms with the arms of reason, is like using a sword to kill gnats; 132 as soon as the blow is struck, the gnats and chimeras come hovering round again, and resume in the mind the place, from which they were thought to have been for ever banished.

133 When we reject, as too weak, the proofs given of the existence of a God, they instantly oppose to the arguments, which destroy that existence, 134 an ‘inward-sense’, a deep persuasion, an invincible inclination, born in every human, which holds up to your mind, in spite of yourself, 135 the idea of an almighty being, whom you cannot entirely expel from your mind, and whom you are compelled to acknowledge, in spite of the strongest reasons that can be urged. 136 But whoever will analyse this ‘inward-sense’, upon which such stress is laid, will perceive, that it is only the effect of a rooted habit, 137 which, shutting their eyes against the most demonstrative proofs, subjects the greater part of humans, and often even the most enlightened, to the prejudices of childhood. 138 What avails this inward-sense, or this deep persuasion, against the evidence, which demonstrates, that: whatever implies a contradiction cannot exist?

139 We are gravely assured, that the non-existence of God is not demonstrated. Yet, by all that people have hitherto said of Him, nothing is better demonstrated, than that this God is a chimera, whose existence is totally impossible; 140 since nothing is more evident, than that a being

cannot possess qualities so unlike, so contradictory, so irreconcilable, as those, which every religion upon earth attributes to the Divinity. 141 Is not the theologian's God, as well as that of the deist, a cause incompatible with the effects attributed to it? 142 Let them do what they will, it is necessary either to invent another God, or to grant, that He, who, for so many ages, has been held up to the terror of mortals, is at the same time very good and very bad, very powerful and very weak, 143 unchangeable and fickle, perfectly intelligent and perfectly void of reason, of order and permitting disorder, very just and most unjust, very skillful and unskillful. 144 In short, are we not forced to confess, that it is impossible to reconcile the discordant attributes, heaped upon a being, of whom we cannot speak without the most palpable contradictions? 145 Let any one attribute a single quality to the Divinity, and it is universally contradicted by the effects, ascribed to this cause.

APOLOGUE

13

146 Theology might justly be defined the: science of contradictions. 147 Every religion is only a system, invented to reconcile irreconcilable notions. 148 By the aid of habit and terror, human becomes obstinate in the greatest absurdities, even after they are exposed in the clearest manner. 149 All religions are easily combated, but with difficulty extirpated. 150 Reason avails nothing against custom, which becomes, says the proverb, a second nature. 151 Many persons, in other respects sensible, even after having examined the rotten foundation of their belief, adhere to it in contempt of the most striking arguments. 152 Whenever we complain of religion, its shocking absurdities, and impossibilities, we are told that we are not made to understand the truths of religion; that reason goes astray, and is capable of leading us to perdition; 153 and moreover, that: ‘what is folly in the eyes of human, is wisdom in the eyes of God’, to whom nothing is impossible. 154 In short, to surmount, by a single word, the most insurmountable difficulties,

presented on all sides by theology, they get rid of them by saying, these are ‘mysteries!’

APOLOGUE

14

155 What is a mystery? By examining the thing closely, I soon perceive, that a mystery is nothing but a contradiction, a palpable absurdity, a manifest impossibility, over which theologians would oblige people humbly to shut their eyes. 156 In a word, a mystery is whatever our spiritual guides cannot explain.

157 It is profitable to the ministers of religion, that people understand nothing of what they teach. 158 It is impossible to examine what we do not comprehend; when we do not see, we must suffer ourselves to be led. 159 If religion were clear, priests would find less business.

160 Without mysteries there can be no religion; mystery is essential to it; a religion void of mysteries, would be a contradiction in terms. 161 The God, who serves as the foundation of ‘natural religion’, or ‘deism’, is Himself the greatest of mysteries.

APOLOGUE

15

162 Every revealed religion is filled with mysterious dogmas, unintelligible principles, incredible wonders, astonishing recitals, which appear to have been invented solely to confound reason. 163 Every religion announces a hidden God, whose essence is a mystery; consequently, the conduct, ascribed to Him, is no less inconceivable than His essence. 164 The Deity has never spoken only in an enigmatical and mysterious manner, in the various religions, which have been founded in different regions of our globe; 165 He has everywhere revealed Himself only to announce mysteries; 166 that is, to inform mortals, that He intended they should believe contradictions, impossibilities, and things to which they were incapable of affixing any clear ideas.

167 The more mysterious and incredible a religion is, the more power it has to please the imagination of humans. 168 The darker a religion is, the more it appears divine, that is, conformable to the nature of a

hidden being, of whom they have no ideas. 169 Ignorance prefers the unknown, the hidden, the fabulous, the marvellous, the incredible, or even the terrible, to what is clear, simple, and true. 170 Truth does not operate upon the imagination in so lively a manner as fiction, which, in other respects, everyone is able to arrange in your own way. 171 The vulgar like to listen to fables. Priests and legislators, by inventing religions and forging mysteries have served the vulgar people well. They have thereby gained enthusiasts men, women and fools. 172 Beings of this stamp are easily satisfied with things, which they are incapable of examining. 173 The love of simplicity and truth is to be found only among the few, whose imagination is regulated by study and reflection.

174 The inhabitants of a village are never better pleased with their parson, than when he introduces Latin into his sermon. 175 The ignorant always imagine, that you, who speaks to them of things they do not understand, is a learned person. 176 Such is the true principle of the credulity of the people, and of the authority of those, who pretend to guide nations.

APOLOGUE

16

177 To announce mysteries to humans, is to give and withhold; it is to talk in order not to be understood. 178 You, who speaks only obscurely, either seeks to amuse yourself by the embarrassment, which you causes, or finds your interest in not explaining yourself too clearly. 179 All secrecy indicates distrust, impotence, and fear. Princes and their ministers make a mystery of their projects, for fear their enemies should discover and render them abortive. 180 Can a good God amuse Himself by perplexing His creatures? What interest then could He have in commanding His ministers to announce riddles and mysteries?

181 It is said, that human, by the weakness of your nature, is totally incapable of understanding the divine dispensations, which can be to you only a series of mysteries; God cannot disclose to you secrets, necessarily above your reach. 182 If so, I answer again,

that human is not made to attend to the divine dispensations; that these dispensations are to you by no means interesting; 183 that you have no need of mysteries, which you cannot understand; and consequently, that a mysterious religion is no more fit for you, than an eloquent discourse is for a flock of sheep.

APOLOGUE
17

184 The Deity has revealed Himself with so little uniformity in the different countries of our globe, that in point of religion, humans regard one another with hatred and contempt. 185 The partisans of the different sects think each other very ridiculous and foolish. Mysteries, most revered in one religion, are objects of derision to another. 186 God, in revealing Himself to humankind, ought at least, to have spoken the same language to all, and saved their feeble minds the perplexity of inquiring which religion really emanated from Him, or what form of worship is most acceptable in His sight.

187 A universal God ought to have revealed a universal religion. By what fatality then are there so many different religions upon earth? 188 Which is really right, among the great number of those, each of which exclusively pretends to be the true one? There is great reason to believe, that no religion enjoys this advantage. 189 Division and disputes upon opinions are indubitable signs of the uncertainty and obscurity of the principles, upon which they build.

APOLOGUE
18

190 If religion were necessary at all, it ought to be intelligible to all. 191 If this religion were the most important concern of humans, the goodness of God would seem to demand, that it should be to them of all things the most clear, evident, and demonstrative. 192 Is it not then astonishing, that this thing so essential to the happiness of mortals, is precisely that, which they understand least, and about which, for so many ages, their teachers have most disputed? 193 Priests have never agreed upon the manner of understanding the will

of a God, who has revealed Himself.

194 The world, may be compared to a public fair, in which are several empirics, each of whom endeavours to attract the passengers by decrying the remedies sold by own brothers. 195 Each shop has its customers, who are persuaded, that their quacks possess the only true remedies; 196 and notwithstanding a continual use of them, they perceive not the inefficacy of these remedies, or that they are as infirm as those, who run after the quacks of a different shop.

197 Devotion is a disorder of the imagination contracted in infancy. 198 The devout person is a hypochondriac, who only augments own malady by the application of remedies. 199 The wise person abstains from them entirely; you pays attention to your diet, and in other respects leaves Nature to Her course.

APOLOGUE

19

200 To a person of sense, nothing appears more ridiculous, than the opinions, which the partisans of the different religions with equal folly entertain of each other. 200 A Christian regards the Koran, that is, the divine revelation announced by Mahomet, as nothing but a tissue of impertinent reveries, and impostures insulting to the divinity. 201 The Mahometan, on the other hand, treats the Christian as an idolater and a dog. They sees nothing but absurdities in your religion. 202 They imagines they have a right to subdue the Christian, and to force you, sword in hand, to receive the religion of their divine prophet. 203 Finally, they believes, that nothing is more impious and unreasonable, than to worship a human, or to believe in the Trinity.

204 The protestant Christian who without scruple worships a human, and firmly believes the inconceivable mystery of the trinity, ridicules the catholic Christian for believing in the mystery of transubstantiation; 205 they considers you mad, impious, and idolatrous, because you kneels to worship some bread, in which you thinks you sees God. 206 Christians of every sect regard, as

silly stories, the incarnations of ‘Vishnu’, the God of the Indies; they maintain, that the only true incarnation is that of Jesus, son of a carpenter. 207 The deist, who calls themselves the follower of a religion, which they supposes to be that of Nature, content with admitting a God, of whom they have no idea, makes a jest of all the mysteries, taught by the various religions in the world.

APOLOGUE

20

208 Is there any thing more contradictory, impossible, or mysterious, than the creation of matter by an immaterial being, who, though immutable, operates continual changes in the world? 209 Is any thing more incompatible with every notion of common-sense, than to believe, that a supremely good, wise, equitable and powerful being presides over Nature, 210 and by Himself directs the movements of a world, full of folly, misery, crimes and disorders, which by a single word, He could have prevented or removed? 211 In fine, whenever we admit a being as contradictory as the God of theology, how can we reject the most improbable fables, astonishing miracles, and profound mysteries.

APOLOGUE

21

212 The Deist exclaims: "Abstain from worshipping the cruel and capricious God of theology; mine is a being infinitely wise and good; He is the father of humans, the mildest of sovereigns; it is He who fills the universe with His benefits." 213 But do you not see that every thing in this world contradicts the good qualities, which you ascribe to your God? 214 In the numerous family of this tender father, almost all are unhappy. Under the government of this just sovereign, vice is triumphant, and virtue in distress. 215 Among those blessings you extol, and which only enthusiasm can see, I behold a multitude of evils, against which you obstinately shut your eyes. 216 Forced to acknowledge, that your beneficent God, in contradiction with Himself, distributes good and evil with the same hand, for His justification you must, like the priest, refer me to the regions of

another life. 217 Invent, therefore, another God; for yours is no less contradictory than that of theologians.

218 A good God, who does evil, or consents to the commission of evil; a God full of equity, and in whose empire innocence is often oppressed; a perfect God, who produces none but imperfect and miserable works; 219 are not such a God and His conduct as great mysteries, as that of the incarnation?

220 You blush for your fellow-citizens, who allow themselves to be persuaded, that the God of the universe could change Himself into a human, and die upon a cross in a corner of Asia. 221 The mystery of the incarnation appears to you very absurd. You think nothing more ridiculous, than a God, who transforms Himself into bread, and causes Himself daily to be eaten in a thousand different places. 222 But are all these mysteries more contradictory to reason than a God, the avenger and rewarder of the actions of humans? Is human, according to you, free, or not free? 223 In either case, your God, if you have the shadow of equity, can neither punish nor reward you. 224 If human is free, it is God, who has made you free; therefore God is the primitive cause of all your actions; 225 in punishing you for your faults, He would punish you for having executed what He had given you liberty to do. 226 If human is not free to act otherwise than you does, would not God be most unjust, in punishing human for faults, which you could not help committing.

227 The minor, or secondary, absurdities, with which all religions abound, are to many people truly striking; but they have not the courage to trace the source of these absurdities. 228 They see not, that a God full of contradictions, caprices and inconsistent qualities, has only served to disorder humans' imaginations, and to produce an endless succession of chimeras.

APOLOGUE

22

229 The theologian would shut the mouths of those who deny the existence of God, by saying, that all humans, in all ages and

countries, have acknowledged some divinity or other; 230 that every people have believed in an invisible and powerful being, who has been the object of their worship and veneration; 231 in short, that there is no nation, however savage, who are not persuaded of the existence of some intelligence superior to human nature. 232 But, can an error be changed into truth by the belief of all humans? 233 The great philosopher Bayle has justly observed, that "general tradition, or the unanimous consent of humankind, is no criterion of truth."

234 There was a time, when all people believed that the sun moved round the earth, but this error was detected. 235 There was a time, when nobody believed the existence of the antipodes, and when every one was persecuted, who had temerity enough to maintain it. At present, every informed person firmly believes it. 236 All nations, with the exception of a few people who are less credulous than the rest, still believe in ghosts and spirits. 237 No sensible person now adopts such nonsense. But the most sensible people consider it their duty to believe in a universal spirit!

APOLOGUE

23

238 All the gods, adored by humans, are of savage origin. 239 They have evidently been imagined by stupid people, or presented, by ambitious and crafty legislators, to ignorant and uncivilised nations, who had neither capacity nor courage to examine the objects, which through terror they were made to worship.

240 By closely examining God, we are forced to acknowledge, that He evidently bears marks of a savage nature. 241 To be savage is to acknowledge no right but force; it is to be cruel beyond measure; to follow only one's own caprice; to want foresight, prudence, and reason. 242 Ye nations, who call yourselves civilised! Do you not discern, in this hideous character, the God, on whom you lavish your incense? 243 Are not the descriptions given you of the divinity, visibly borrowed from the implacable, jealous, revengeful,

sanguinary, capricious inconsiderate humour of human, who has not cultivated own reason? 244 O humans! You adore only a great savage, whom you regard, however, as a model to imitate, as an amiable master, as a sovereign full of perfection.

245 Religious opinions are ancient monuments of ignorance, credulity, cowardice, and barbarism of their ancestors. 246 Every savage is a child fond of the marvellous, who believes every thing, and examines nothing. 247 Ignorant of Nature, you attributes to spirits, enchantments, and to magic, whatever appears to you extraordinary. 248 Your priests appear to you sorcerers, in whom you supposes a power purely divine, before whom you confounded reason humbles itself, whose oracles are to you infallible decrees which it would be dangerous to contradict.

249 In religion, humans have, for the most part, remained in their primitive barbarity. Modern religions are only ancient follies revived, or presented under some new form. 250 If the savages of antiquity adored mountains, rivers, serpents, trees, and idols of every kind; if the EGYPTIANS paid homage to crocodiles, rats, and onions, 251 do we not see nations, who think themselves wiser than they, worship bread, into which they imagine, that through the enchantments of their priests, the divinity has descended. 252 Is not the Bread-God the idol of many Christian nations, who, in this respect, are as irrational, as the most savage?

APOLOGUE

24

253 The ferocity, stupidity, and folly of uncivilised person have ever disclosed themselves in religious practices, either cruel or extravagant. 254 A spirit of barbarity still survives, and penetrates the religions even of the most polished nations. Do we not still see human victims offered to the divinity? 255 To appease the anger of a God, who is always supposed as ferocious, jealous and vindictive, as a savage, do not those, whose manner of thinking is supposed to displease Him, expire under studied torments, by the command of sanguinary laws? 256 Modern nations, at the instigation

of their priests, have perhaps improved upon the atrocious folly of barbarous nations; 257 at least, we find, that it has ever entered the heads of savages to torment for opinions, to search the thoughts, to molest people for the invisible movements of their brains?

258 When we see learned nations, such as the English, French, German, etc., continue, notwithstanding their knowledge, to kneel before the barbarous God of the Jews; 259 when we see these enlightened nations divide into sects, defame, hate, and despise one another for their equally ridiculous opinions concerning the conduct and intentions of this unreasonable God; 260 when we see people of ability foolishly devote their time to meditate the will of this God, who is full of caprice and folly, we are tempted to cry out: O humans, you are still savage!!!

APOLOGUE

25

261 Whoever has formed true ideas of the ignorance, credulity, negligence, and stupidity of the vulgar, will suspect opinions the more, as you finds them generally established. 262 Humans, for the most part, examine nothing: they blindly submit to custom and authority. 263 Their religious opinions, above all others, are those which they have the least courage and capacity to examine: 264 as they comprehend nothing about them, they are forced to be silent, or at least are soon destitute of arguments. 265 Ask any person, whether they believes in a God? They will be much surprised that you can doubt it. Ask them again, what they understands by the word God. 266 You throw them into the greatest embarrassment; you will perceive immediately, that they are incapable of affixing any real idea to this word, they incessantly repeats. 267 They will tell you, that God is God. They knows neither what they thinks of it, nor their motives for believing in it.

268 All nations speak of a God; but do they agree upon this God? By no means. 269 But division upon an opinion proves not its evidence; it is rather a sign of uncertainty and obscurity. 270 Does the same person always agree with yourself

in the notions you forms of your God? No. 271 Your idea varies with the changes, which you experiences;-- another sign of uncertainty. People always agree in demonstrative truths. 272 In any situation, except that of insanity, every one knows that two and two make four, that the sun shines, that the whole is greater than its part; that benevolence is necessary to merit the affection of people; that injustice and cruelty are incompatible with goodness. 273 Are they thus agreed when they speak of God? Whatever they think, or say of Him, is immediately destroyed by the effects they attribute to Him.

274 Ask several painters to represent a chimera, and each will paint it in a different manner. You will find no resemblance between the features, each has given it a portrait, that has no original. 275 All theologians, in giving us a picture of God, give us one of a great chimera, in whose features they never agree, whom each arranges in their own way, and who exists only in their imaginations. 276 There are not two individuals, who have, or can have, the same ideas of their God.

APOLOGUE

26

277 It might be said with more truth, that people are either sceptics or atheists, than that they are convinced of the existence of God. 278 How can we be assured of the existence of a being, whom we could never examine, and of whom it is impossible to conceive any permanent idea? 279 How can we convince ourselves of the existence of a being, to whom we are every moment forced to attribute conduct, opposed to the ideas, we had endeavoured to form of Him? 280 Is it then possible to believe what we cannot conceive? Is not such a belief the opinions of others without having any of our own? 281 Priests govern by faith; but do not priests themselves acknowledge that God is to them incomprehensible? 282 Confess then, that a full and entire conviction of the existence of God is not so general, as is imagined.

GOODNESS

283 Scepticism arises from a want of motives sufficient to form a judgment. 284 Upon examining the proofs which seem to establish, and the arguments which combat, the existence of God, some persons have doubted and withheld their assent. 285 But this uncertainty arises from not having sufficiently examined. Is it possible to doubt any thing evident? 286 Sensible people ridicule an absolute scepticism, and think it even impossible. 287 A person, who doubted own existence, or that of the sun, would appear ridiculous. Is this more extravagant than to doubt the non-existence of an evidently impossible being? 288 Is it more absurd to doubt one's own existence, than to hesitate upon the impossibility of a being, whose qualities reciprocally destroy one another? 289 Do we find greater probability for believing the existence of a spiritual being, than the existence of a stick without two ends? 290 Is the notion of an infinitely good and powerful being, who causes or permits an infinity of evils, less absurd or impossible, than that of a square triangle? 291 Let us conclude then, that religious scepticism can result only from a superficial examination of theological principles, which are in perpetual contradiction with the most clear and demonstrative principles.

292 To doubt, is to deliberate. Scepticism is only a state of indetermination, resulting from an insufficient examination of things. 293 Is it possible for any one to be sceptical in matters of religion, who will deign to revert to its principles, and closely examine the notion of God, who serves as its basis? 294 Doubt generally arises either from indolence, weakness, indifference, or incapacity. With many people, to doubt is to fear the trouble of examining things, which are thought uninteresting. 295 But religion being presented to humans as their most important concern in this and the future world, scepticism and doubt on this subject must occasion perpetual anxiety and must really constitute a bed of thorns. 296 Every person who has not courage to contemplate, without prejudice, the God upon whom all religion is founded, can never know for what

religion to decide: 297 you knows not what you should believe or not believe, admit or reject, hope or fear.

298 Indifference upon religion must not be confounded with scepticism. This indifference is founded upon the absolute assurance, or at any rate upon the probable belief, that religion is not interesting. 299 A persuasion that a thing which is pretended to be important is not so, or is only indifferent, supposes a sufficient examination of the thing, without which it would be impossible to have this persuasion. 300 Those who call themselves sceptics in the fundamental points of religion, are commonly either indolent or incapable of examining.

APOLOGUE

27

301 In every country, we are assured, that a God has revealed Himself. What has He taught humans? Has He proved evidently that He exists? 302 Has He informed them where He resides? Has He taught them what He is, or in what His essence consists? Has He clearly explained to them His intentions and plan? Does what He says of this plan correspond with the effects, which we see? 303 No. He informs them solely, that He is what He is; that He is a hidden God; that His ways are unspeakable; that He is exasperated against all who have the temerity to fathom His decrees, or to consult reason in judging Him or His works.

304 Does the revealed conduct of God answer the magnificent ideas which theologians would give us of His wisdom, goodness, justice, and omnipotence? 305 By no means. In every revelation, this conduct announces a partial and capricious being, the protector of favourite people, and the enemy of all others. 306 If He deigns to appear to some people, He takes care to keep all others in an invincible ignorance of His divine intentions. 307 Every private revelation evidently announces in God, injustice, partiality and malignity.

308 Do the commands, revealed by any God, astonish us by their sublime reason or wisdom? Do they evidently tend to promote the happiness of the people, to whom

the Divinity discloses them? 309 Upon examining the divine commands, one sees in every country, nothing but strange ordinances, ridiculous precepts, impertinent ceremonies, puerile customs, oblations, sacrifices, and expiations, 310 useful indeed to the ministers of God, but very burdensome to the rest of the citizens. 311 I see likewise, that these laws often tend to make people unsociable, disdainful, intolerant, quarrelsome, unjust, and inhuman, to those who have not received the same revelations, the same ordinances, or the same favours from heaven.

APOLOGUE
28

312 Are the precepts of morality, announced by the Deity, really divine, or superior to those which every reasonable person might imagine? 313 They are divine solely because it is impossible for the human mind to discover their utility. 314 They make virtue consist in a total renunciation of Nature, in a voluntary forgetfulness of reason, a holy hatred of ourselves. 315 Finally, these sublime precepts often exhibit perfection in a conduct, cruel to ourselves, and perfectly useless to others.

316 Has a God appeared? Has He Himself promulgated His laws? Has He spoken to people with His own mouth? 317 I am told, that God has not appeared to a whole people; but that He has always manifested Himself through the medium of some favourite personages, who have been entrusted with the care of announcing and explaining His intentions. 318 The people have never been permitted to enter the sanctuary; the ministers of the gods have alone had the right to relate what passes there.

APOLOGUE
29

319 If in every system of divine revelation, I complain of not seeing either the wisdom, goodness, or equity of God; 320 if I suspect knavery, ambition, or interest; it is replied, that God has confirmed by miracles the mission of those, who speak in His name. 321 But was it not more simple for God to appear in person, to explain

His nature and will? 322 Again, if I have the curiosity to examine these miracles, I find, that they are improbable tales, related by suspected people, who had the greatest interest in giving out that they were the messengers of the Most High.

323 What witnesses are appealed to in order to induce us to believe incredible miracles? 324 Weak people, who existed thousands of years ago, and who, even though they could attest these miracles, may be suspected of being duped by their own imagination, and imposed upon by the tricks of dexterous impostors. 325 But, you will say, these miracles are written in books, which by tradition have been transmitted to us. By whom were these books written? Who are the people who have transmitted them? 326 They are either the founders of religions themselves, or their adherents and assigns. 327 Thus, in religion, the evidence of interested parties becomes irrefragable and incontestable.

328 God has spoken differently to every people. The Indian believes not a word of what He has revealed to the Chinese; the Mahometan considers as fables what He has said to the Christian; 329 the Jew regards both the Mahometan and Christian as sacrilegious corrupters of the sacred law, which their God had given to their fathers. 330 The Christian, proud of own more modern revelation, indiscriminately damns the Indian, Chinese, Mahometan, and even the Jew, from whom they receives their sacred books. 331 Who is wrong or right? Each exclaims, I am in the right! Each adduces the same proofs: each mentions own miracles, diviners, prophets, and martyrs. 332 The person of sense tells them, they are all delirious; that God has not spoken, if it is true that He is a spirit, and can have neither mouth nor tongue; 333 that without borrowing the organ of mortals, God could inspire His creatures with what He would have them learn; 334 and that, as they are all equally ignorant what to think of God, it is evident that it

has not been the will of God to inform them on the subject.

335 The followers of different forms of worship which are established, accuse one another of superstition and impiety. 336 Christians look with abhorrence upon the Pagan, Chinese, and Mahometan superstition. Roman Catholics treat, as impious, Protestant Christians; and the latter incessantly declaim against the superstition of the Catholics. 337 They are all right. To be impious, is to have opinions offensive to the God adored; to be superstitious, is to have of Him false ideas. 338 In accusing one another of superstition, the different religionists resemble humpbacks, who reproach one another with their deformity.

APOLOGUE

31

339 Are the oracles, which the Divinity has revealed by His different messengers, remarkable for clearness? 340 Alas! no two people interpret them alike. Those who explain them to others are not agreed among themselves. 341 To elucidate them, they have recourse to interpretations, to commentaries, to allegories, to explanations: they discover mystical-sense very different from the literal-sense. 342 People are every where wanted to explain the commands of a God, who could not, or would not, announce Himself clearly to those, whom He wished to enlighten.

APOLOGUE

32

343 The founders of religion, have generally proved their missions by miracles. But what is a miracle? 344 It is an operation directly opposite to the laws of Nature. But who, according to you, made those laws? 345 God. Thus, your God, who, according to you, foresaw every thing, counteracts the laws, which your wisdom prescribed to Nature! 346 These laws were then defective, or at least in certain circumstances they did not accord with the views of the same God, since you inform us that you judged it necessary to suspend or counteract them.

347 It is said, that a few people, favoured by the Most High, have

received power to perform miracles. 348 But to perform a miracle, it is necessary to have ability to create new causes capable of producing effects contrary to those of common causes. 349 Is it easy to conceive, that God can give humans the inconceivable power of creating causes out of nothing? 350 Is it credible, that an immutable God can communicate to people power to change or rectify His plan, a power, which by His essence an immutable being cannot save Himself? 351 Miracles, far from doing much honour to God, far from proving the divinity of a religion, evidently annihilate the God idea. 352 How can a theologian tell us, that God, who must have embraced the whole of His plan, who could have made none but perfect laws, and who cannot alter them, is forced to employ miracles to accomplish His projects, 353 or can grant His creatures the power of working prodigies to execute His divine will? 354 An omnipotent being, whose will is always fulfilled, who holds in own hand own creatures, has only to will, to make them believe whatever He desires.

APOLOGUE

33

355 What shall we say of religions that prove their divinity by miracles? 356 How can we credit miracles recorded in the sacred books of the Christians, where God boasts of hardening the hearts and blinding those whom He wishes to destroy; 357 where He permits malicious spirits and magicians to work miracles as great as those of His servants; 358 where it is predicted, that Antichrist shall have power to perform prodigies capable of shaking the faith even of the elect? 359 In this case, by what signs shall we know whether God means to instruct or ensnare us? How shall we distinguish whether the wonders, we behold, come from God or devil? 360 To remove our perplexity, Pascal gravely tells us, that: ‘it is necessary to judge the doctrine by the miracles, and the miracles by the doctrine; that the doctrine proves the miracles, and the miracles the doctrine’. 361 If there exist a vicious and ridiculous circle, it is undoubtedly in this

splendid reasoning of one of the greatest defenders of Christianity. 362 Where is the religion, that does not boast of the most admirable doctrine, and which does not produce numerous miracles for its support?

363 Is a miracle capable of annihilating the evidence of a demonstrated truth? 364 Although a person should have the secret of healing all the sick, of making all the lame to walk, of raising in all the dead of a city, of ascending into the air, of stopping the course of the sun and moon, 365 can you thereby convince me, that two and two do not make four, that one makes three, and that three make only one; 366 that a God, whose immensity fills the universe, could have been contained in the body of a Jew; that the ETERNAL can die like a human; 367 that a God, who is said to be immutable, provident, and sensible, could have changed His mind upon His religion, and reformed His own work by a new revelation?

APOLOGUE

34

368 According to the very principles either of natural or revealed theology, every new revelation should be regarded as false; every change in a religion emanated from the Deity should be reputed an impiety and blasphemy. 369 Does not all reform suppose, that, in His first effort, God could not give His religion the solidity and perfection required? 370 To say, that God, in giving a first law, conformed to the rude ideas of the people whom He wished to enlighten, is to pretend that God was neither able nor willing to render the people, whom He was enlightening, so reasonable as was necessary in order to please Him.

371 Christianity is an impiety, if it is true that Judaism is a religion which has really emanated from a holy, immutable, omnipotent, and foreseeing God. 372 The religion of Christ supposes either defects in the law which God Himself had given by Moses, 373 or impotence or malice in the same God, who was either unable or unwilling to render the Jews such as they ought to have been in order to please

Him. 374 Every new religion, or reform of ancient religions, is evidently founded upon the impotence, inconstancy, imprudence, or malice of the Divinity.

APOLOGUE

35

375 If history informs me, that the first apostles, the founders or reformers of religions, wrought great miracles; history also informs me, that these reformers and their adherents were commonly buffeted, persecuted, and put to death, as disturbers of the peace of nations. 376 I am therefore tempted to believe, that they did not perform the miracles ascribed to them; indeed, such miracles must have gained them numerous partisans among the eye-witnesses, who ought to have protected the operators from abuse. 377 My incredulity redoubles, when I am told, that the workers of miracles were cruelly tormented, or ignominiously executed. 378 How is it possible to believe, that missionaries, protected by God, invested with His divine power, and enjoying the gift of miracles, could not have wrought such a simple miracle, as to escape the cruelty of their persecutors?

379 Priests have the art of drawing from the persecutions themselves, a convincing proof in favour of the religion of the persecuted. 380 But a religion, which boasts of having cost the lives of many martyrs, and informs us, that its founders, in order to extend it, have suffered punishments, cannot be the religion of a beneficent, equitable and omnipotent God. 381 A good God would not permit people, entrusted with announcing His commands, to be ill-treated. 382 An all-powerful God, wishing to found a religion, would proceed in a manner more simple and less fatal to the most faithful of His servants. 383 To say that God would have His religion sealed with blood, is to say that He is weak, unjust, ungrateful, and sanguinary; and that He is cruel enough to sacrifice His messengers to the views of His ambition.

APOLOGUE

36

384 To die for religion proves not that the religion is true, or divine; it proves, at most, that it is supposed to be such. 385 An enthusiast proves nothing by your death, unless that religious fanaticism is often stronger than the love of life. 386 An impostor may sometimes die with courage; you then makes, in the language of the proverb, ‘a virtue of necessity’. 387 People are often surprised and affected at sight of the generous courage and disinterested zeal, which has prompted missionaries to preach their doctrine, even at the risk of suffering the most rigorous treatment. 388 From this ardour for the salvation of humans, are drawn inferences favourable to the religion they have announced. But in reality, this disinterestedness is only apparent. 389 You, who ventures nothing should gain nothing. 390 A missionary seeks to make his fortune by his doctrine. He knows that, if he is fortunate enough to sell his commodity, he will become absolute master of those who receive him for their guide; 391 he is sure of becoming the object of their attention, respect, and veneration. Such are the true motives, which kindle the zeal and charity of so many preachers and missionaries.

392 To die for an opinion, proves the truth or goodness of that opinion no more than to die in battle proves the justice of a cause, in which thousands have the folly to devote their lives. 393 The courage of a martyr, elated with the idea of paradise, is not more supernatural, than the courage of a soldier, intoxicated with the idea of glory, or impelled by the fear of disgrace. 394 What is the difference between an Iroquois, who sings while he is burning by inches, and the martyr ST. LAURENCE, who upon the gridiron insults his tyrant?

395 The preachers of a new doctrine fail, because they are the weakest; apostles generally practise a perilous trade. 396 Their courageous death proves neither the truth of their principles nor their own sincerity, 397 any more than the violent death of the ambitious person, or of the robber, proves, that they were right in

disturbing society, or that they thought themselves authorised in so doing. 398 The trade of a missionary was always flattering to ambition, and formed a convenient method of living at the expense of the vulgar. These advantages have often been enough to efface every idea of danger.

APOLOGUE

37

399 You tell us, theologians! That: ‘what is folly in the eyes of humans, is wisdom before God, who delights to confound the wisdom of the wise’. But do you not also say, that human wisdom is a gift of heaven? 400 In saying this wisdom displeases God, is but folly in His sight, and that He is pleased to confound it, you declare that your God is the friend only of ignorant people, 401 and that He makes sensible people a fatal present for which this perfidious tyrant promises to punish them cruelly at some future day. 402 Is it not strange, that one can be the friend of your God, only by declaring one's self the enemy of reason and good sense?

APOLOGUE

38

403 According to the divines, ‘faith is an assent without evidence’. Whence it follows, that religion requires us firmly to believe inevident things, and propositions often improbable or contrary to reason. 404 But when we reject reason as a judge of faith, do we not confess, that reason is incompatible with faith? 405 As the ministers of religion have resolved to banish reason, they must have felt the impossibility of reconciling it with faith, 406 which is visibly only a blind submission to priests, whose authority seems to many persons more weighty than evidence itself, and preferable to the testimony of the senses.

407 "Sacrifice your reason; renounce experience; mistrust the testimony of your senses; submit without enquiry to what we announce to you in the name of heaven." 408 Such is the uniform language of priests throughout the world; they agree upon no point, except upon the necessity of never reasoning upon the principles which they present to us as most important to our felicity!

GOODNESS

409 I will not sacrifice my reason; because this reason alone enables me to distinguish good from evil, truth from falsehood. 410 If, as you say, my reason comes from God, I shall never believe that a God, whom you call good, has given me reason, as a snare, to lead me to perdition. 411 Priests! do you not see, that, by decrying reason, you calumniate your God, from whom you declare it to be a gift.

412 I will not renounce experience; because it is a guide much more sure than the imagination or authority of spiritual guides. 413 Experience teaches me, that enthusiasm and interest may blind and lead them astray themselves; 414 and that the authority of experience ought to have much more influence upon my mind, than the suspicious testimony of many people, who I know are either very liable to be deceived themselves, or otherwise are very much interested in deceiving others.

415 I will mistrust my senses; because I am sensible they sometimes mislead me. But, on the other hand, I know that they will not always deceive me. 416 I well know, that the eye shews me the sun much smaller than it really is; but experience, which is only the repeated application of the senses, informs me, that objects always appear to diminish, as their distance increases; 417 thus I attain to a certainty, that the sun is much larger than the earth; thus my senses suffice to rectify the hasty judgments, which they themselves had caused.

418 In warning us to mistrust the testimony of our senses, the priests annihilate the proofs of all religion. 419 If humans may be dupes of their imagination; if their senses are deceitful, how shall we believe the miracles, which struck the treacherous senses of our ancestors? 420 If my senses are unfaithful guides, I ought not to credit even the miracles wrought before my eyes.

APOLOGUE

39

421 You incessantly repeat that: ‘the truths of religion are above reason’. If so, do you not perceive, that these truths are not adapted to reasonable beings? 422 To pretend that reason can deceive

us, is to say, that truth can be false; that the useful can be hurtful. Is reason any thing but a knowledge of the useful and true? 423 Besides, as our reason and senses are our only guides in this life, to say they are unfaithful, is to say, that our errors are necessary, our ignorance invincible, and that, without the extreme of injustice, God cannot punish us for following the only guides it was His supreme will to give.

424 To say, we are obliged to believe things above our reason, is ridiculous. 425 To assure us, that upon some objects we are not allowed to consult reason, is to say, that, in the most interesting matter, we must consult only imagination, or act only at random. 426 Our divines say, we must sacrifice our reason to God. But what motives can we have to sacrifice our reason to a being, who makes us only useless presents, which He does not intend us to use? 427 What confidence can we put in a God, who, according to our divines themselves, is malicious enough to harden the heart, to strike with blindness, to lay snares for us, to lead us into temptation? 428 In fine, what confidence can we put in the ministers of this God, who, to guide us more conveniently, commands us to shut our eyes?

APOLOGUE

40

429 Human are persuaded, that religion is to them of all things the most serious, while it is precisely what they least examine for themselves. 430 In pursuit of an office, a piece of land, a house, a place of profit; in any transaction or contract whatever, every one carefully examines all, takes the greatest precaution, weighs every word of a writing, is guarded against every surprise. 431 Not so in religion; every one receives it at a venture, and believes it upon the word of others, without ever taking the trouble to examine.

432 Two causes concur to foster the negligence and carelessness of people, with regard to their religious opinions. The first is the despair of overcoming the obscurity, in which all religion is necessarily enveloped. 433 Their

first principles are only adapted to disgust lazy minds, who regard them as a chaos impossible to be understood. 434 The second cause is, that every one is averse to being too much bound by severe precepts, which all admire in theory, but very few care to practice with rigour. 435 The religion of many people is like old family ties, which they have never taken pains to examine, but which they deposit in their archives to have recourse to them occasionally.

APOLOGUE

41

436 The disciples of Pythagoras paid implicit faith to the doctrine of their master; ‘he has said it’, was to them the solution of every problem. 437 The generality of humans are not more rational. In matters of religion, a curate, a priest, an ignorant monk becomes master of the thoughts. 438 Faith relieves the weakness of the human mind, to which application is commonly painful; it is much more convenient to depend upon others, than to examine for one's self. 439 Inquiry, being slow and difficult, equally, displeases the stupidity of the ignorant, and the ardour of the enlightened. Such is undoubtedly the reason why Faith has so many partisans.

440 The more people are deficient in knowledge and reason, the more zealous they are in religion. 441 In theological quarrels, the populace, like ferocious beasts, fall upon all those, against whom their priest is desirous of exciting them. 442 A profound ignorance, boundless credulity, weak intellect, and warm imagination, are the materials, of which are made bigots, zealots, fanatics, and saints. 443 How can the voice of reason be heard by them who make it a principle never to examine for themselves, but to submit blindly to the guidance of others? 444 The saints and the populace are, in the hands of their directors, automatons, moved at pleasure.

APOLOGUE

42

445 Religion is an affair of custom and fashion. We must do as others do. But, among the numerous religions in the world, which should humans choose? 446 This

inquiry would be too painful and long. They must therefore adhere to the religion of their fathers, to that of their country, which, having force on its side, must be the best.

447 If we judge of the intentions of Providence by the events and revolutions of this world, we are compelled to believe, that He is very indifferent about the various religions upon earth. 448 For thousands of years, paganism, polytheism, idolatry, were the prevailing religions. 449 We are now assured, that the most flourishing nations had not the least idea of God; an idea, regarded as so essential to the happiness of human. 450 Christians say, all humankind lived in the grossest ignorance of their duties towards God, and had no notions of Him, but what were insulting to His Divine Majesty. 451 Christianity, growing out of Judaism, very humble in its obscure origin, became powerful and cruel under the Christian emperors, 452 who, prompted by holy zeal, rapidly spread it in their empire by means of fire and sword, and established it upon the ruins of paganism. 453 Mahomet and his successors, seconded by Providence or their victorious arms, in a short time banished the Christian religion from a part of Asia, Africa, and even Europe; and the gospel was then forced to yield to the Koran.

454 In all the factions or sects, which, for many ages have distracted Christianity, the best argument has been always that of the strongest party; arms have decided which doctrine is most conducive to the happiness of nations. 455 May we not hence infer, either that the Deity feels little interested in the religion of humans, or that He always declares in favour of the opinions, which best suit the interest of earthly powers; in fine, that He changes His plan to accommodate their fancy?

456 Rulers infallibly decide the religion of the people. The true religion is always the religion of the prince; 457 the true God is the God, whom the prince desires his people to adore; the will of the priests, who govern the prince, always becomes the will of God. 458 A wit justly observed,

that: ‘the true religion is always that, on whose side are the prince and the hangman’. 459 Emperors and hangmen long supported the gods of Rome against the God of Christians; 460 the latter, having gained to his interest the emperors, their soldiers, and their hangmen, succeeded in destroying the worship of the Roman gods. 461 The God of Mahomet has dispossessed the God of Christians of a great part of the dominions, which He formerly occupied.

462 In the eastern part of Asia, is a vast, flourishing, fertile, populous country, governed by such wise laws, that the fiercest conquerors have adopted them with respect. 463 I mean China. Excepting Christianity, which was banished as dangerous, the people there follow such superstitions as they please, 464 while the mandarins, or magistrates, having long known the errors of the popular religion, are vigilant to prevent the bonzes or priests from using it as an instrument of discord. 465 Yet we see not, that Providence refuses His blessing to a nation, whose chiefs are so indifferent about the worship that is rendered to Him. 466 On the contrary, the Chinese enjoy a happiness and repose worthy to be envied, by the many nations whom religion divides, and often devastates.

467 We cannot reasonably propose to divest the people of their follies; but we may perhaps cure the follies of those who govern the people, and who will then prevent the follies of the people from becoming dangerous. 468 Superstition is to be feared only when princes and soldiers rally round its standard; then it becomes cruel and sanguinary. 469 Every sovereign, who is the protector of one sect or religious faction, is commonly the tyrant of others, and becomes the most cruel disturber of the peace of own dominions.

APOLOGUE

43

470 It is incessantly repeated, and many sensible persons are induced to believe, that religion is a restraint necessary to humans; 471 that without religion, there would no longer exist the least check for the vulgar; and that morality and religion are intimately connected with it. 472 "The fear of the Lord,"

cries the priest, "is the beginning of wisdom. The terrors of another life are salutary, and are proper to curb the passions of humans."

473 To perceive the inutility of religious notions, we have only to open our eyes and contemplate the morals of those nations, who are the most under the dominion of religion. 474 We there find proud tyrants, oppressive ministers, perfidious courtiers, shameless extortioners, corrupt magistrates, knaves, adulterers, debauchees, prostitutes, thieves, 475 and rogues of every kind, who have never doubted either the existence of an avenging and rewarding God, the torments of hell, or the joys of paradise. 476 Without the least utility to the greater part of humankind, the ministers of religion have studied to render death terrible to the eyes of their followers. 477 If devout Christians could but be consistent, they would pass their whole life in tears, and die under the most dreadful apprehensions. 478 What can be more terrible than death, to the unfortunate who are told, ‘that it is horrible to fall into the hands of the living God; that we must work out our salvation with fear and trembling!’ 479 Yet we are assured, that the death of the Christian is attended with infinite consolations, of which the unbeliever is deprived. 480 The good Christian, it is said, dies in the firm hope of an eternal happiness which you have strived to merit. But is not this firm assurance itself a presumption punishable in the eyes of a severe God? 481 Ought not the greatest saints to be ignorant whether they are worthy of love or hatred? 482 Ye Priests! while consoling us with the hope of the joys of paradise; have you then had the advantage to see your names and ours inscribed ‘in the book of life’?

APOLOGUE

44

483 To oppose the passions and present interests of humans the obscure notions of a metaphysical, inconceivable God,-- the incredible punishments of another life,-- or the pleasures of the heaven, of which nobody has the least idea,-- is not this combating realities with fictions? 484 People

have never any but confused ideas of their God: they see Him only in clouds. 485 They never think of God when they are desirous to do evil: whenever ambition, fortune, or pleasure allures them, God's threatenings and promises are forgotten. 486 In the things of this life, there is a degree of certainty, which the most lively faith cannot give to the things of another life.

487 Every religion was originally a curb invented by legislators, who wished to establish their authority over the minds of rude nations. 488 Like nurses who frighten children to oblige them to be quiet, the ambitious used the name of the gods to frighten savages; and had recourse to terror in order to make them support quietly the yoke they wished to impose. 489 Are then the bugbears of infancy made for riper age? At the age of maturity, no person longer believes them, or if you does, they excite little emotion in you, and never alter your conduct.

APOLOGUE

45

490 Almost every person fears what you sees much more than what you does not see; 491 you fears the judgments of people of which you feels the effects, more than the judgments of God of whom you have only fluctuating ideas. 492 The desire of pleasing the world, the force of custom, the fear of ridicule, and of censure, have more force than all religious opinions. 493 Does not the soldier, through fear of disgrace, daily expose own life in battle, even at the risk of incurring eternal damnation?

494 The most religious persons have often more respect for a varlet, than for God. 495 A person who firmly believes, that God sees everything, and that He is omniscient and omnipresent, will be guilty, when alone, of actions, which you would never do in presence of the meanest of mortals. 496 Those, who pretend to be the most fully convinced of the existence of God, every moment act as if they believed the contrary.

APOLOGUE

46

497 "Let us, at least," it will be said, "cherish the idea of a God, which alone may serve as a barrier

to the passions of kings." 498 But, can we sincerely admire the wonderful effects, which the fear of this God generally produces upon the minds of princes, who are called His images? 499 What idea shall we form of the original, if we judge of it by the copies!

500 Sovereigns, it is true, call themselves the representatives of God, His vicegerents upon earth. 501 But does the fear of a master, more powerful than they are, incline them seriously to study the welfare of the nations, whom Providence has entrusted to their care? 502 Does the pretended terror, which ought to be inspired into them by the idea of an invisible judge, to whom alone they acknowledge themselves accountable for their actions, 503 render them more equitable, more compassionate, more sparing of blood and treasure of their subjects, more temperate in their pleasures, more attentive to their duties? 504 In fine, does this God, by whose authority kings reign, deter them from inflicting a thousand evils upon the people to whom they ought to act as guides, protectors, and fathers? 505 Alas! If we survey the whole earth, we shall see humans almost every where governed by tyrants, who use religion merely as an instrument to render more stupid the slaves, whom they overwhelm under the weight of their vices, or whom they sacrifice without mercy to their extravagancies.

506 Far from being a check upon the passions of kings, Religion, by its very principles, frees them from all restraint. It transforms them into divinities, whose caprice the people are never permitted to resist. 507 While it gives up the reins to princes, and on their part breaks the bonds of the social compact, it endeavours to chain the minds and hands of their oppressed subjects. 508 Is it then surprising, that the gods of the earth imagine every thing lawful for them, and regard their subjects only as instruments of their caprice or ambition?

509 In every country, Religion has represented the Monarch of Nature as a cruel, fantastical, partial tyrant, whose caprice is law; the Monarch God, is but too faithfully imitated by his representatives upon earth. 510 Religion seems

every where invented solely to lull the people in the lap of slavery, in order that their masters may easily oppress them, or render them wretched with impunity.

APOLOGUE

47

511 To guard against the enterprises of a haughty pontiff who wished to reign over kings, to shelter their persons from the attempts of credulous nations excited by the priests, 512 several European princes have pretended to hold their crowns and rights from God alone, and to be accountable only to Him for their actions. 513 After a long contest between the civil and spiritual power, the former at length triumphed; 514 and the priests, forced to yield, acknowledged the divine right of kings and preached them to the people, 515 reserving the liberty of changing their minds and of preaching revolt, whenever the divine rights of kings clashed with the divine rights of the clergy. 516 It was always at the expense of nations, that peace was concluded between kings and priests; but the latter, in spite of treaties, always preserved their pretensions.

517 Tyrants and wicked princes, whose consciences continually reproach them with negligence or perversity, far from fearing their God, had rather deal with this invisible judge who never opposes any thing, 518 or with His priests who are always condescending to the rulers of the earth, than with their own subjects. 519 The people, reduced to despair, might probably appeal from the divine right of their chiefs. 520 People when oppressed to the last degree, sometimes become turbulent; and the divine rights of the tyrant are then forced to yield to the natural rights of the subjects.

521 It is cheaper dealing with gods than humans. Kings are accountable for their actions to God alone; priests are accountable only to themselves. 522 There is much reason to believe, that both are more confident of the indulgence of heaven, than of that of earth. 523 It is much easier to escape the vengeance of gods who may be cheaply appeased, than the vengeance of humans whose patience is exhausted.

GOODNESS

524 "If you remove the fear of an invisible power, what restraint will you impose upon the passions of sovereigns?" 525 Let them learn to reign; let them learn to be just; to respect the rights of the people; and to acknowledge the kindness of the nations, from whom they hold their greatness and power. 526 Let them learn to fear humans, and to submit to the laws of equity. Let nobody transgress these laws with impunity; 527 and let them be equally binding upon the powerful and the weak, the great and the small, the sovereign and the subjects.

528 The fear of gods, Religion, and the terrors of another life, are the metaphysical and supernatural bulwarks, opposed to the impetuous passions of princes! Are these bulwarks effectual? Let experience resolve the question. 529 To oppose Religion to the wickedness of tyrants, is to wish, that vague, uncertain, unintelligible speculations may be stronger than propensities which every thing conspires daily to strengthen.

APOLOGUE

48

530 The immense service of religion to politics is incessantly boasted; but, a little reflection will convince us, that religious opinions equally blind both sovereigns and people, and never enlighten them upon their true duties or interests. 531 Religion but too often forms licentious, immoral despots, obeyed by slaves, whom every thing obliges to conform to their views.

532 For want of having studied or known the true principles of administration, the objects and rights of social life, the real interests of humans and their reciprocal duties, 533 princes, in almost every country, have become licentious, absolute, and perverse; and their subjects abject, wicked, and unhappy. 534 It was to avoid the trouble of studying these important objects, that recourse was had to chimeras, which, far from remedying any thing, have hitherto only multiplied the evils of humankind, and diverted them from whatever is most essential to their happiness.

535 Does not the unjust and cruel manner in which so many nations are governed, manifestly furnish one of the strongest proofs, 536 not only of the small effect produced by the fear of another life, but also of the non-existence of a Providence, busied with the fate of the human race? 537 If there existed a good God, should we not be forced to admit, that in this life He strangely neglects the greater part of humankind? 538 It would seem, that this God has created nations only to be the sport of the passions and follies of His representatives upon earth.

APOLOGUE

49

539 By reading history with attention, we shall perceive that Christianity, at first weak and servile, established itself among the savage 540 and free nations of Europe only intimating to their chiefs, that its religious principles favoured despotism and rendered them absolute. 541 Consequently, we see barbarous princes suddenly converted; that is, we see them adopt, without examination, a system so favourable to their ambition, and use every art to induce their subjects to embrace it. 542 If the ministers of this religion have since often derogated from their favourite principles, it is because the theory influences the conduct of the ministers of the Lord, only when it suits their temporal interests.

543 Christianity boasts of procuring people a happiness unknown to preceding ages. It is true, the Greeks knew not the ‘divine rights’ of tyrants or of the usurpers of the rights of their country. 544 Under paganism, it never entered the head of any person to suppose, that it was against the will of heaven for a nation to defend themselves against a ferocious beast, who had the audacity to lay waste their possessions. 545 The religion of the Christians was the first that screened tyrants from danger, by laying down as a principle that the people must renounce the legitimate defence of themselves. 546 Thus Christian nations are deprived of the first law-of-Nature, which orders human to resist evil, and to disarm whoever is preparing to destroy you! 547 If the

ministers of the church have often permitted the people to revolt for the interest of heaven, they have never permitted them to revolt for their own deliverance from real evils or known violences.

548 From heaven came the chains, that were used for fettering the minds of mortals. 549 Why is the Mahometan every where a slave? Because his prophet enslaved him in the name of the Deity, as Moses had before subdued the Jews. 550 In all parts of the earth, we see, that the first legislators were the first sovereigns and the first priests of the savages, to whom they gave laws.

551 Religion seems invented solely to exalt princes above their nations, and rivet the fetters of slavery. 552 As soon as the people are too unhappy here below, priests are ready to silence them by threatening them with the anger of God. 553 They are made to fix their eyes upon heaven, lest they should perceive the true causes of their misfortunes, and apply the remedies which Nature presents.

APOLOGUE

50

554 By dint of repeating to humans, that the earth is not their true country; that the present life is only a passage; that they are not made to be happy in this world; 555 that their sovereigns hold their authority from God alone, and are accountable only to Him for the abuse of it; that it is not lawful to resist them, etc., 556 priests have eternised the mis-government of kings and the misery of the people; the interests of nations have been basely sacrificed to their chiefs. 557 The more we consider the dogmas and principles of religion, the more we shall be convinced, that their sole object is the advantage of tyrants and priests, without regard to that of societies.

558 To mask the impotence of its deaf gods, religion has persuaded mortals, that iniquities always kindle the wrath of heaven. 559 People impute to themselves alone the disasters that daily befall them. 560 If nations sometimes feel the strokes of convulsed nature, their bad governments are but too often the immediate and permanent causes, from whence proceed the

continual calamities which they are forced to endure. 561 Are not the ambition, negligence, vices, and oppressions of kings and nobles, generally the causes of scarcity, beggary, wars, pestilences, corrupt morals, and all the multiplied scourges which desolate the earth?

562 In fixing humans' eyes continually upon heaven; in persuading them, that all their misfortunes are effects of divine anger; 563 in providing none but ineffectual and futile means to put an end to their sufferings, we might justly conclude, that the only object of priests was to divert nations from thinking about the true sources of their misery, and thus to render it eternal. 564 The ministers of religion conduct themselves almost like those indigent mothers, who, for want of bread, sing their starved children to sleep, or give them playthings to divert their thoughts from afflicting hunger.

565 Blinded by error from their very infancy, restrained by the invisible bonds of opinion, overcome by panic terrors, their faculties blunted by ignorance, how should the people know the true causes of their wretchedness? 566 They imagine that they can avert it by invoking the gods. Alas! do they not see, that it is, in the name of these gods, that they are ordered to present their throats to the sword of their merciless tyrants, 567 in whom they might find the obvious cause of the evils under which they groan, and for whom they cease not to implore, in vain, the assistance of heaven?

568 Ye credulous people! In your misfortunes, redouble your prayers, offerings, and sacrifices; throng to your temples; fast in sack-cloth and ashes; bathe yourselves in your own tears; and above all, completely ruin yourselves to enrich your gods! 569 You will only enrich their priests. The gods of heaven will be propitious, only when the gods of the earth shall acknowledge themselves, humans, like you, and shall devote to your welfare the attention you deserve.

GOODNESS

APOLOGUE

51

570 Negligent, ambitious, and perverse Princes are the real causes of public misfortunes. Useless, unjust Wars depopulate the earth. Encroaching and despotic Governments absorb the benefits of Nature. 571 The rapacity of Courts discourages agriculture, extinguishes industry, produces want, pestilence and misery. 572 Heaven is neither cruel nor propitious to the prayers of the people; it is their proud chiefs, who have almost always hearts of stone.

573 It is destructive to the morals of princes, to persuade them that they have God alone to fear, when they injure their subjects, or neglect their happiness. 574 Sovereigns! It is not the gods, but your people, that you offend, when you do evil. It is your people and yourselves that you injure, when you govern unjustly.

575 In history, nothing is more common than to see Religious Tyrants; nothing more rare than to find equitable, vigilant, enlightened princes. 576 A monarch may be pious, punctual in a servile discharge of the duties of own religion, very submissive and liberal to own priests, and yet at the same time be destitute of every virtue and talent necessary for governing. 577 To princes, Religion is only an instrument destined to keep the people more completely under the yoke. 578 By the excellent principles of religious morality, a tyrant who, during a long reign, has done nothing but oppress own subjects, wresting, from them the fruits of their labour, sacrificing them without mercy to own insatiable ambition,-- 579 a conqueror, who has usurped the provinces of others, slaughtered whole nations, and who, during own whole life, has been a scourge to humankind,-- 580 imagines his conscience may rest, when, to expiate so many crimes, he has wept at the feet of a priest, who generally has the base complaisance to console and encourage a robber, whom the most hideous despair would too lightly punish for the misery he has caused upon earth.

APOLOGUE

52

581 A sovereign, sincerely devout, is commonly dangerous to the state. Credulity always supposes a contracted mind; devotion generally absorbs the attention, which a prince should pay to the government of own people. 582 Obsequious to the suggestions of his priests, he becomes the sport of their caprices, the favourer of their quarrels, and the instrument and accomplice of their follies, which he imagines to be of the greatest importance. 583 Among the most fatal presents, which religion has made the world, ought to be reckoned those devout and zealous monarchs, 584 who, under an idea of working for the welfare of their subjects, have made it a sacred duty to torment, persecute, and destroy those, who thought differently from themselves. 585 A bigot, at the head of an empire, is one of the greatest scourges. A single fanatical or knavish priest, listened to by a credulous and powerful prince, suffices to put a state in disorder.

586 In almost all countries, priests and pious persons are entrusted with forming the minds and hearts of young princes, destined to govern nations. 587 What qualifications have instructors of this stamp! By what interests can they be animated? 588 Full of prejudices themselves, they will teach their pupil to regard superstition, as most important and sacred; 589 its chimerical duties, as most indispensable, intolerance and persecution, as the true foundation of his future authority. 590 They will endeavour to make him a party leader, a turbulent fanatic, a tyrant; they will early stifle his reason, and forewarn him against the use of it; 591 they will prevent truth from reaching his ears; they will exasperate him against true talents, and prejudice him in favour of contemptible ones; 592 in short, they will make him a weak devotee, who will have no idea either of justice or injustice, nor of true glory, nor of true greatness, 593 and who will be destitute of the knowledge and virtues necessary to the government of a great nation. 594 Such is the plan of the education of a child, destined one

day to create the happiness or misery of millions of people!

APOLOGUE

53

595 Priests have ever shewn themselves the friends of despotism, and the enemies of public liberty: their trade requires abject and submissive slaves, who have never the audacity to reason. 596 In an absolute government, who ever gains an ascendancy over the mind of a weak and stupid prince, becomes master of the state. 597 Instead of conducting the people to salvation, priests have always conducted them to servitude.

598 In consideration of the supernatural titles, which religion has forged for the worst of princes, the latter have commonly united with priests, 599 who, sure of governing by opinion the sovereign himself, have undertaken to bind the hands of the people and to hold them under the yoke. 600 But the tyrant, covered with the shield of religion, in vain flatters himself that he is secure from every stroke of fate; opinion is a weak rampart against the despair of the people. 601 Besides, the priest is a friend of the tyrant only while he finds his account in tyranny; 602 he preaches sedition, and demolishes the idol he has made, when he finds it no longer sufficiently conformable to the interest of God, whom he makes to speak at His will, and who never speaks except according to his interests.

603 It will no doubt be said, that sovereigns, knowing all the advantages which religion procures them, are truly interested in supporting it with all their strength. 604 If religious opinions are useful to tyrants, it is very evident, that they are useful to those, who govern by the laws of reason and equity. 605 Is there then any advantage in exercising tyranny? Are princes truly interested in being tyrants? Does not tyranny deprive them of true power, of the love of the people, and of all safety? 606 Ought not every reasonable prince to perceive, that the despot is a madman, and an enemy to himself? 607 Should not every enlightened prince beware of flatterers, whose object is to lull

him to sleep upon the brink of the precipice which they form beneath him?

APOLOGUE

54

608 If sacerdotal flatteries succeed in perverting princes and making them tyrants; tyrants, on their part, necessarily corrupt both the great and the humble. 609 Under an unjust ruler, void of goodness and virtue, who knows no law but own caprice, a nation must necessarily be depraved. 610 Will this ruler wish to have, about own person, honest, enlightened, and virtuous people? No. They wants none but flatterers, approvers, imitators, slaves, base and servile souls, who conform themselves to own inclinations. 611 Their court will propagate the contagion of vice among the lower ranks. All will gradually become corrupted in a state, whose chief is corrupt. 612 It was long since said, that "Princes seem to command others to do whatever they do themselves."

613 Religion, far from being a restraint upon sovereigns, enables them to indulge without fear or remorse, in acts of licentiousness as injurious to themselves, as to the nations whom they govern. 614 It is never with impunity, that people are deceived. Tell a sovereign, that he is a god; he will very soon believe that he owes nothing to any one. 615 Provided he is feared, he will care very little about being loved: he will observe neither rules, nor relations with his subjects, nor duties towards them. 616 Tell this prince, that he is accountable for his actions to God alone, and he will soon act as if he were accountable to no one.

APOLOGUE

55

617 An enlightened sovereign is you, who knows your true interests; who knows, that they are connected with the interests of your nation; 618 that a prince cannot be great, powerful, beloved, or respected, while you commands only unhappy slaves; 619 that equity, beneficence, and vigilance will give you more real authority over your people, than the fabulous titles, said to be derived from heaven. 620 You will see, that Religion is useful only to

priests, that it is useless to society and often troubles it, and that it ought to be restrained in order to be prevented from doing injury. 621 Finally, you will perceive, that, to reign with glory, you must have good laws and inculcate virtue, and not found your power upon impostures and fallacies.

APOLOGUE

56

622 The ministers of religion have taken great care to make of their God, a formidable, capricious, and fickle tyrant. Such a God was necessary to their variable interests. 623 A God, who should be just and good, without mixture of caprice or perversity; a God, who had constantly the qualities of an honest person, or of a kind sovereign, would by no means suit own ministers. 624 It is useful to priests, that people should tremble before their God, in order that they may apply to them to obtain relief from their fears. 625 "No person is a hero before your valet de chambre." It is not surprising, that a God, dressed up by own priests so as to be terrible to others, should rarely impose upon them, or should have but very little influence upon their conduct. 626 Hence, in every country, their conduct is very much the same. Under pretext of the glory of their God, they every where prey upon ignorance, degrade the mind, discourage industry, and sow discord. 627 Ambition and avarice have at all times been the ruling passions of the priesthood. 628 The priest every where rises superior to sovereigns and laws; we see them every where occupied with the interests of their pride, of their cupidity, and of their despotic, revengeful humour. 629 In the room of useful and social virtues, they everywhere substitutes expiations, sacrifices, ceremonies, mysterious practices, in a word, inventions lucrative to themselves and ruinous to others.

630 The mind is confounded and the reason is amazed upon viewing the ridiculous customs and pitiful means, which the ministers of the gods have invented in every country to purify souls, and render heaven favourable. 631 Here they cut off part of a child's prepuce, to secure for him divine benevolence; there, they pour water upon his

head, to cleanse him of crimes, which he could not as yet have committed. 632 In one place, they command him to plunge into a river, whose waters have the power of washing away all stains; in another, he is forbidden to eat certain food, the use of which will not fail to excite the celestial wrath; 633 in other countries, they enjoin upon sinful person to come periodically and confess own faults to a priest, who is often a greater sinner than own self, etc., etc., etc.

APOLOGUE

57

634 What should we say of a set of empirics, who, resorting every day to a public place, should extol the goodness of their remedies, and vend them as infallible, while they themselves were full of the infirmities, which they pretend to cure? 635 Should we have much confidence in the recipes of these quacks, though they stun us with crying, "take our remedies, their effects are infallible; they cure every body; except us." 636 What should we afterwards think, should those quacks spend their lives in complaining, that their remedies never produced the desired effect upon the sick, who take them? 637 In fine, what idea should we form of the stupidity of the vulgar, who, notwithstanding these confessions, should not cease to pay dearly for remedies, the inefficacy of which every thing tends to prove? 638 Priests resemble these alchymists, who boldly tell us, they have the secret of making gold, while they have scarcely clothes to cover their nakedness.

639 The ministers of religion incessantly declaim against the corruption of the age, and loudly complain of the little effect of their lessons, while at the same time they assure us, that religion is the universal remedy, the true panacea against the wickedness of humankind. 640 These priests are very sick themselves, yet people continue to frequent their shops, and to have faith in their divine antidotes, which, by their own confession, never effect a cure!

APOLOGUE

58

641 Religion, especially with the moderns, has tried to identify itself with Morality, the principles of which it has thereby totally obscured. 642 It has rendered people unsociable by duty, and forced them to be inhuman to everyone who thought differently from themselves. 643 Theological disputes, equally unintelligible to each of the enraged parties, have shaken empires, caused revolutions, been fatal to sovereigns, and desolated all Europe. 644 These contemptible quarrels have not been extinguished even in rivers of blood. 645 Since the extinction of paganism, the people have made it a religious principle to become outrageous, whenever any opinion is advanced which their priests think contrary to ‘sound doctrine’. 646 The sectaries of a religion, which preaches, in appearance, nothing but charity, concord, and peace, have proved themselves more ferocious than cannibals or savages, whenever their divines excited them to destroy their brethren. 647 There is no crime, which people have not committed under the idea of pleasing the Divinity, or appeasing His wrath.

648 The idea of a terrible God, whom we paint to ourselves as a despot, must necessarily render His subjects wicked. 649 Fear makes only slaves, and slaves are cowardly, base, cruel, and think every thing lawful, in order to gain the favour or escape the chastisements of the master whom they fear. 650 Liberty of thinking alone can give people humanity and greatness of soul. The notion of a tyrant-god tends only to make them abject, morose, quarrelsome, intolerant slaves.

651 Every religion, which supposes a God easily provoked, jealous, revengeful, punctilious about His rights or the etiquette with which He is treated;-- 652 a God little enough to be hurt by the opinions which people can form of Him;-- a God unjust enough to require that we have uniform notions of His conduct; 653 a religion which supposes such a God necessarily becomes restless, unsociable, and sanguinary; 654 the worshippers of such a God would never think, that they could, without offence,

forbear hating and even destroying every one, who is pointed out to them, as an adversary of this God; 655 they would think, that it would be to betray the cause of their celestial Monarch, to live in friendly intercourse with rebellious fellow-citizens. 656 If we love what God hates, do we not expose ourselves to His implacable hatred?

657 Infamous persecutors, and devout people-haters! Will you never discern the folly and injustice of your intolerant disposition? 658 Do you not see, that person is no more master of own religious opinions, own belief or unbelief, than of the language, which one learns from infancy? 659 To punish a person for own errors, is it not to punish one for having been educated differently from you? 660 If I am an unbeliever, is it possible for me to banish from my mind the reasons that have shaken my faith? 661 If your God gives people leave to be damned, what have you to meddle with? Are you more prudent and wise, than this God, whose rights you would avenge?

APOLOGUE

59

662 There is no devotee, who does not, according to own temperament, hate, despise, or pity the adherents of a sect, different from one's own. 663 The established religion, which is never any other than that of the sovereign and the armies, always makes its superiority felt in a very cruel and injurious manner by the weaker sects. 664 As yet there is no true toleration upon earth; humans every where adore a jealous God, of whom each nation believes itself the friend, to the exclusion of all others.

665 Every sect boasts of adoring alone the true God, the universal God, the Sovereign of all Nature. 666 But when we come to examine this Monarch of the world, we find that every society, sect, party, or religious cabal, makes of this powerful God only a pitiful sovereign, 667 whose care and goodness extend only to a small number of His subjects, who pretend that they alone have the happiness to enjoy His favours, and that He is not at all concerned about the others.

GOODNESS

668 The founders of religions, and the priests who support them, evidently proposed to separate the nations, whom they taught, from the other nations; 669 they wished to separate their own flock by distinguishing marks; they gave their followers gods, who were hostile to the other gods; they taught them modes of worship, dogmas and ceremonies apart; 670 and above all, they persuaded them, that the religion of others was impious and abominable. 671 By this unworthy artifice, the ambitious knaves established, their usurpation over the minds of their followers, rendered them unsociable, 672 and made them regard with an evil eye all persons who had not the same mode of worship and the same ideas as they had. 673 Thus it is, that Religion has shut up the heart and for ever banished from it the affection that human ought to have for your fellow-creature. 674 Sociability, indulgence, humanity, those first virtues of all morality, are totally incompatible with religious prejudices.

APOLOGUE

60

675 Every national religion is calculated to make human vain, unsociable, and wicked; 676 the first step towards humanity is to permit every one peaceably to embrace the mode of worship and opinions, which they judges to be right. 677 But this conduct cannot be pleasing to the ministers of religion, who wish to have the right of tyrannising over people even in their thoughts.

678 Blind and bigoted princes! You hate and persecute heretics, and order them to execution, because you are told, that these wretches displease God. 679 But do you not say, that your God is full of goodness? How then can you expect to please Him by acts of barbarity, which He must necessarily disapprove? 680 Besides, who has informed you, that their opinions displease your God? Your priests? 681 But, who assures you, that your priests are not themselves deceived or wish to deceive you? The same priests? 682 Princes! It is then upon the hazardous word of your priests, that you commit the most

atrocious crimes, under the idea of pleasing the Divinity!

APOLOGUE

61

683 Pascal says, "that human never does evil so fully and cheerfully, as when you acts from a false principle of conscience." 684 Nothing is more dangerous than a religion, which lets loose the ferocity of the multitude, and justifies their blackest crimes. 685 They will set no bounds to their wickedness, when they think it authorised by their God, whose interests, they are told, can make every action legitimate. 686 Is religion in danger?-- the most civilised people immediately becomes true savages, and think nothing forbidden. 687 The more cruel they are, the more agreeable they suppose they are to their God, whose cause they imagine cannot be supported with too much warmth.

688 All religions have authorised innumerable crimes. The Jews, intoxicated with the promises of their God, arrogated the rights of exterminating whole nations. 689 Relying on the oracles of their God, the Romans conquered and ravaged the world. The Arabians, encouraged by their divine prophet, carried fire and sword among the Christians and the idolaters. 690 The CHRISTIANS, under pretext of extending their holy religion, have often deluged both hemispheres in blood.

691 In all events favourable to their own interest, which they always call the cause of God, priests show us the finger of God. 692 According to these principles, the devout have the happiness to see the finger of God in revolts, revolutions, massacres, regicides, crimes, prostitutions, horrors; 693 and, if these things contribute ever so little to the triumph of religion, we are told, that "God uses all sorts of means to attain His ends." 694 Is any thing more capable of effacing every idea of morality from the minds of humans, than to inform them, that their God, so powerful and perfect, is often forced to make use of criminal actions in order to accomplish His designs?

GOODNESS

APOLOGUE

62

695 No sooner do we complain of the extravagancies and evils, which Religion has so often caused upon the earth, than we are reminded, that these excesses are not owing to Religion; but "that they are the sad effects of the passions of humans." 696 But I would ask, what has let loose these passions? It is evidently Religion; it is zeal, that renders humans inhuman, and serves to conceal the greatest atrocities. 697 Do not these disorders then prove, that religion, far from restraining the passions of people, only covers them with a veil, which sanctifies them, 698 and that nothing would be more useful, than to tear away this sacred veil of which people often make such a terrible use? 699 What horrors would be banished from society, if the wicked were deprived of so plausible a pretext for disturbing it!

700 Instead of being angels of peace among people, priests have been demons of discord. They have pretended to receive from heaven the right of being quarrelsome, turbulent, and rebellious. 701 Do not the ministers of the Lord think themselves aggrieved, and pretend that the divine Majesty is offended, whenever sovereigns have the temerity to prevent them from doing evil? 702 Priests are like the spiteful woman who cried ‘fire! murder! assassination’! while her husband held her hands to prevent her from striking him.

APOLOGUE

63

703 Notwithstanding the bloody tragedies, which Religion often acts, it is insisted, that, without Religion, there can be no Morality. 704 If we judge theological opinions by their effects, we may confidently assert, that all Morality is perfectly incompatible with humans' religious opinions.

705 "Imitate God," exclaim the pious. But, what would be our Morality, should we imitate this God! And what God ought we to imitate? The God of the Deist? 706 But even this God cannot serve us as a very constant model of goodness. If He is the author of all things, He is the author both of good and evil. 707 If He is the

author of order, He is also the author of disorder, which could not take place without His permission. 708 If He produces, He destroys; if He gives life, He takes it away; if He grants abundance, riches, prosperity, and peace, He permits or sends scarcity, poverty, calamities, and wars. 709 How then can we receive as a model of permanent beneficence, the God of Deism or natural religion, whose favourable dispositions are every instant contradicted by all the effects we behold? 710 Morality must have a basis less tottering than the example of a God, whose conduct varies, and who cannot be called good, unless we obstinately shut our eyes against the evil which He causes or permits in this world.

711 Shall we imitate the beneficent, mighty Jupiter of heathen antiquity? To imitate such a god, is to admit as a model, a rebellious son, who ravishes the throne from his father. 712 It is to imitate a debauchee, an adulterer, one guilty of incest and of base passions, at whose conduct every reasonable mortal would blush. 713 What would have been the condition of people under paganism, had they imagined, like Plato, that virtue consisted in imitating the gods!

714 Must we imitate the God of the Jews! Shall we find in Jehovah a model for our conduct? 715 This is a truly savage god, made for a stupid, cruel, and immoral people; He is always furious, breathes nothing but vengeance, commands carnage, theft, and unsociability. 716 The conduct of this god cannot serve as a model to that of an honest person, and can be imitated only by a chief of robbers.

717 Shall we then imitate the Jesus of the Christians? Does this God, who died to appease the implacable fury of his father, furnish us an example which people ought to follow? 718 Alas! we shall see in Him only a God, or rather a fanatic, a misanthrope, who, Himself plunged in wretchedness and preaching to wretches, will advise them to be poor, to combat with and stifle Nature, to hate pleasure, seek grief, and detest themselves. 719 He will tell them to leave father, mother, relations, friends, etc., to follow Him. "Fine morality!" you say. It is, undoubtedly, admirable:

it must be divine, for it is impracticable to humans. 720 But is not such sublime morality calculated to render virtue odious? 721 According to the so much boasted morality of the human-God of the Christians, a disciple of His in this world must be like Tantalus, tormented with a burning thirst, which you are not allowed to quench. 722 Does not such morality give us a wonderful idea of the author of Nature? 723 If, as we are assured, He has created all things for His creatures, by what strange whim does He forbid them the use of the goods He has created for them? 724 Is pleasure then, which human continually desires, only a snare, which God has maliciously laid to surprise your weakness?

APOLOGUE

64

725 The followers of Christ would have us regard, as a miracle, the establishment of their Religion, which is totally repugnant to Nature, opposite to all the propensities of the heart, and inimical to sensual pleasures. 726 But the austerity of a doctrine renders it the more marvellous in the eyes of the vulgar. 727 The same disposition, which respects inconceivable mysteries as divine and supernatural, admires, as divine and supernatural, a Morality, that is impracticable, and beyond the powers of human.

728 To admire a system of Morality, and to put it in practice, are two very different things. All Christians admire and extol the Morality of the gospel; which they do not practise.

729 The whole world is more or less infected with a Religious morality, founded upon the opinion, that to please the Divinity, it is absolutely necessary to render ourselves unhappy upon earth. 730 In all parts of our globe, we see penitents, fakirs, and fanatics, who seem to have profoundly studied the means of tormenting themselves, in honour of a being whose goodness all agree in celebrating. 731 Religion, by its essence, is an enemy to the joy and happiness of people. 732 "Blessed are the poor, blessed are they, who weep; blessed are they, who suffer; misery to those, who are in abundance and joy." Such

are the rare discoveries, announced by Christianity!

APOLOGUE

65

733 What is a Saint in every religion? A person, who prays, and fasts, who torments own self, and shuns the world; 734 who like an owl, delights only in solitude, abstains from all pleasure, and seems frightened of every object, which may divert you from your fanatical meditations. Is this virtue? 735 Is a being of this type, kind to own self, or useful to others? Would not society be dissolved, and human return to a savage state, if every one were fool enough to be a Saint?

736 It is evident, that the literal and rigorous practice of the divine Morality of the Christians would prove the infallible ruin of nations. 737 A Christian, aiming at perfection, ought to free own mind from whatever can divert it from heaven, your true country. Upon earth, you sees nothing but temptations, snares, and rocks of perdition. 734 You must fear science, as hurtful to faith; you must avoid industry, as a means of obtaining riches, too fatal to salvation; you must renounce offices and honours, as capable of exciting your pride, and calling off your attention from the care of your soul. 735 In a word, the sublime Morality of Christ, were it practicable, would break all the bonds of society.

736 A Saint in society is as useless, as a Saint in the desert; your humour is morose, discontented, and often turbulent; 737 your zeal sometimes obliges you in conscience to trouble society by opinions or dreams, which your vanity makes you consider as inspirations from on high. 738 The annals of every religion are full of restless Saints, intractable Saints, and seditious Saints, who have become famous by the ravages, with which, for the greater glory of God, they have desolated the universe. 739 If Saints, who live in retirement, are useless, those who live in the world, are often very dangerous.

740 The vanity of acting, the desire of appearing illustrious and peculiar in conduct, commonly constitute the distinguishing character of Saints. 741 Pride

persuades them, that they are extraordinary people far above human nature, beings much more perfect than others, favourites whom God regards with much more complaisance than the rest of mortals. 742 Humility, in a Saint, is commonly only a more refined pride than that of the generality of people. Nothing but the most ridiculous vanity can induce human to wage continual war against your own nature.

APOLOGUE

66

743 A morality, which contradicts the nature of human, is not made for human. 744 "But," say you, "the nature of human is depraved." In what consists this pretended depravity? In having passions? 745 But, are not passions essential to human? Are you not obliged to seek, desire, and love what is, or what you thinks is, conducive to your happiness? 746 Are you not forced to fear and avoid what you judges disagreeable or fatal? 747 Kindle your passions for useful objects; connect your welfare with those objects; divert yourself, by sensible and known motives, from what may injure either you or others, and you will make yourself a reasonable and virtuous being. 748 A person without passions would be equally indifferent to vice and to virtue.

749 Holy Doctors! you are always repeating to us that the nature of human is perverted; you exclaim, "that: ‘all flesh has corrupted its way’, that all the propensities of Nature have become inordinate." 750 In this case, you accuse your God; who was either unable, or unwilling, that this nature should preserve its primitive perfection. 751 If this nature is corrupted, why has not God repaired it? The Christian immediately assures me, "that human nature is repaired; that the death of their God has restored its integrity." 752 How then, I would ask, do you pretend that human nature, notwithstanding the death of a God, is still depraved? Is then the death of your God wholly fruitless? 753 What becomes of His omnipotence and of His victory over the Devil, if it is true that the Devil still preserves the empire, which, according to you, He has always exercised in the world?

GOODNESS

754 According to Christian theology, Death is the ‘wages of sin’. 755 This opinion is conformable to that of some negro and savage nations, who imagine that the Death of a human is always the supernatural effect of the anger of the Gods. 756 Christians firmly believe, that Christ has delivered them from sin; though they see, that, in their Religion, as in others, human is subject to Death. 757 To say that Jesus Christ has delivered us from sin, is it not to say, that a judge has pardoned a criminal, while we see that he leaves him for execution?

APOLOGUE
67

758 If shutting our eyes upon whatever passes in the world, we would credit the partisans of the Christian Religion, 759 we should believe, that the coming of their divine Saviour produced the most wonderful and complete reform in the morals of nations.

760 If we examine the Morals of Christian nations, and listen to the clamours of their priests, we shall be forced to conclude, that Jesus Christ, their God, preached and died, in vain; 761 His omnipotent will still finds in humans, a resistance, over which he cannot, or will not triumph. 762 The Morality of this divine Teacher, which his disciples so much admire and so little practise, is followed, in a whole century only by half a dozen obscure saints, and fanatics, and unknown monks, who alone will have the glory of shining in the celestial court, 763 while all the rest of mortals, though redeemed by the blood of this God, will be the prey of eternal flames.

APOLOGUE
68

764 When a person is strongly inclined to sin, you thinks very little about your God. 765 Nay more, whatever crimes you have committed, you always flatters yourself, that this God will soften, in your favour, the rigour of your decrees. 766 No mortal seriously believes, that your conduct can damn you. Though you fears a terrible God, who often makes you tremble, yet, whenever you are strongly tempted, you yields; 767 and you afterwards sees only the God of mercies, the idea of whom

calms your apprehensions. 768 If a person commits evil, you hopes, you shall have time to reform, and promises to repent at a future day. 769 In religious pharmacy, there are infallible prescriptions to quiet consciences: priests, in every country, possess sovereign secrets to disarm the anger of heaven. 770 Yet, if it be true that the Deity is appeased by prayers, offerings, sacrifices, and penances, it can no longer be said, that Religion is a check to the irregularities of humans; they will first sin, and then seek the means to appease God. 771 Every Religion, which expiates crime and promises a remission of them, if it restrain some persons, encourages the majority to commit evil. 772 Notwithstanding His immutability, God, in every Religion, is a true 'Proteus'. 773 His priests represent Him at one time armed with severity, at another full of clemency and mildness; sometimes cruel and unmerciful, and sometimes easily melted by the sorrow and tears of sinners. 774 Consequently, people see the Divinity only on the side most conformable to their present interests. 775 A God always angry would discourage His worshippers, or throw them into despair. People must have a God, who is both irritable, and placable. 776 If your anger frightens some timorous souls, your clemency encourages the resolutely wicked, who depend upon recurring, sooner or later, to the means of accommodation. 777 If the judgments of God terrify some faint-hearted pious persons, who by constitution and habit are not prone to evil, 'the treasures of divine mercy' encourage the greatest criminals, who have reason to hope they participate therein equally with the others.

APOLOGUE

69

778 Most people seldom think of God, or, at least, bestow on Him serious attention. The only ideas we can form of Him are so devoid of object, and are at the same time so afflicting, 779 that the only imaginations people can arrest are those of melancholy hypochondriacs, who do not constitute the majority of the inhabitants of this world. 780 The

vulgar have no conception of God; their weak brains are confused, whenever they think of Him. 781 The person of business thinks only of own business; the courtier of own intrigues; men of fashion, women, and young people of their pleasures; dissipation soon effaces in them all the fatiguing notions of Religion. 782 The ambitious person, the miser and the debauchee carefully avoid speculations too feeble to counterbalance their various passions.

783 Who is awed by the idea of a God? A few enfeebled people, morose and disgusted with the world; a few, in whom the passions are already deadened by age, by infirmity, or by the strokes of fortune. 784 Religion is a check, to those alone who by their state of mind and body, or by fortuitous circumstances, have been already brought to reason. 785 The fear of God hinders from sin only those, who are not much inclined to it, or else those who are no longer able to commit it. 786 To tell people, that the Deity punishes crimes in this world, is to advance an assertion, which experience every moment contradicts. 787 The worst of people are commonly the arbiters of the world, and are those whom fortune loads with its favours. 788 To refer us to another life, in order to convince us of the judgments of God, is to refer us to conjectures, in order to destroy facts, which cannot be doubted.

APOLOGUE

70

789 Nobody thinks of the life to come, when you are strongly smitten with the objects you finds here below. 790 In the eyes of a passionate lover, the presence of your mistress extinguishes the flames of hell, and her charms efface all the pleasures of paradise.

791 Woman! you leave, say you, your lover for your God. This is either because your lover is no longer the same in your eyes, or because he leaves you.

792 Nothing is more common, than to see ambitious, perverse, corrupt, and immoral people, who have some ideas of Religion, and sometimes appear even zealous for its interest. 793 If they do not practise it at present, they hope to in the future. They lay it up, as a

remedy, which will be necessary to salve the conscience for the evil they intend to commit. 794 Besides, the party of devotees and priests being very numerous, active, and powerful, is it not astonishing, that rogues and knaves seek its support to attain their ends? 795 It will undoubtedly be said, that many honest people are sincerely religious, and that without profit; but is uprightness of heart always accompanied with knowledge?

796 It is urged, that many learned people, many people of genius have been strongly attached to Religion. 797 This proves, that people of genius may have prejudices, be pusillanimous, and have an imagination, which misleads them and prevents them from examining subjects coolly. 798 Pascal proves nothing in favour of Religion, unless that a person of genius may be foolish on some subjects, and is but a child, when you are weak enough to listen to your prejudices. 799 Pascal himself tells us, that: 'the mind may be strong and contracted, enlarged and weak'. 800 He previously observes, that; 'a person may have a sound mind, and not understand every subject equally well; for there are some, who, having a sound judgment in a certain order of things, are bewildered in others'.

APOLOGUE

71

801 What is virtue according to theology? 'It is', we are told, 'the conformity of the actions of human to the will of God'. 802 But, what is God? A being, of whom nobody has the least conception, and whom every one consequently modifies in own way. 803 What is the will of God? It is what people, who have seen God, or whom God has inspired, have declared to be the will of God. 804 Who are those, who have seen God? They are either fanatics, or rogues, or ambitious people, whom we cannot believe.

805 To found Morality upon a God, whom every person paints to yourself differently, composes in your way, and arranges according to your own temperament and interest, is evidently to found Morality upon the caprice and imagination of people; 806 it is to found it upon the whims of a sect,

a faction, a party, who believe they have the advantage to adore a true God to the exclusion of all others. 807 To establish Morality or the duties of human upon the divine will, is to found it upon the will, the reveries and the interests of those, who make God speak, without ever fearing that He will contradict them. 808 In every Religion, priests alone have a right to decide what is pleasing or displeasing to their God, and we are certain they will always decide, that it is what pleases or displeases themselves. 809 The dogmas, the ceremonies, the morals, and the virtues, prescribed by every Religion, are visibly calculated only to extend the power or augment the emoluments of the founders and ministers of these Religions. 810 The dogmas are obscure, inconceivable, frightful, and are therefore well calculated to bewilder the imagination and to render the vulgar more obsequious to the will of those who wish to domineer over them. 811 The ceremonies and practices procure the priests, riches or respect. Religion consists in a submissive faith, which prohibits the exercise of reason; 812 in a devout humility, which insures priests the submission of their slaves; in an ardent zeal, when Religion, that is, when the interest of these priests, is in danger. 813 The only object of all religions is evidently the advantage of its ministers.

APOLOGUE

72

814 When we reproach theologians with the barrenness of their divine virtues, they emphatically extol charity, that tender love of one's neighbour, which Christianity makes an essential duty of its disciples. 815 But, alas! what becomes of this pretended charity, when we examine the conduct of the ministers of the Lord? 816 Ask them, whether we must love or do good to our neighbour, if you be an impious person, a heretic, or an infidel, that is, if you do not think like them? 817 Ask them, whether we must tolerate opinions contrary to those of the religion, they profess? 818 Ask them, whether the sovereign can show indulgence to those who are in error? 819 Their charity

instantly disappears, and the established clergy will tell you, that: ‘the prince bears the sword only to support the cause of the Most High’: 820 they will tell you that, through love for our neighbour, we must prosecute, imprison, exile, and burn them. 821 You will find no toleration except among a few priests, persecuted themselves, who will lay aside Christian charity the instant they have power to persecute in their turn.

822 The Christian religion, in its origin preached by beggars and miserable people, under the name of charity, strongly recommends alms. The religion of Mahomet also enjoins it as an indispensable duty. 823 Nothing undoubtedly is more conformable to humanity, than to succour the unfortunate, to clothe the naked, to extend the hand of beneficence to every one in distress. 824 But would it not be more humane and charitable to prevent the source of misery and poverty? 825 If Religion, instead of deifying princes, had taught them to respect the property of their subjects, to be just, to exercise only their lawful rights, we should not be shocked by the sight of such a multitude of beggars. 826 A rapacious, unjust, tyrannical government multiplies misery; heavy taxes produce discouragement, sloth, and poverty, which in their turn beget robberies, assassinations, and crimes of every description. 827 Had sovereigns more humanity, charity, and equity, their dominions would not be peopled by so many wretches, whose misery it becomes impossible to alleviate.

828 Christian and Mahometan states are full of large hospitals, richly endowed, in which we admire the pious charity of the kings and sultans, who erected them. 829 But would it not have been more humane to govern the people justly, to render them happy, to excite and favour industry and commerce, and to let people enjoy in safety the fruit of their labours, 830 than to crush them under a despotic yoke, to impoverish them by foolish wars, to reduce them to beggary, in order that luxury may be satisfied, 831 and then to erect splendid buildings, which can contain but a

very small portion of those, who have been rendered miserable? 832 Religion has only deluded humans; instead of preventing evils, it always applies ineffectual remedies.

833 The ministers of heaven have always known how to profit by the calamities of others. Public misery is their element. 834 They have every where become administrators of the property of the poor, distributors of alms, depositaries of charitable donations; 835 and thereby they have at all times extended and supported their power over the unhappy, who generally compose the most numerous, restless, and seditious part of society. 836 Thus the greatest evils turn to the profit of the ministers of the Lord. Christian priests tell us, that the property they possess is the property of the poor, and that it is therefore sacred. 837 Consequently they have eagerly accumulated lands, revenues, and treasures. Under colour of charity, spiritual guides have become extremely opulent, 838 and in the face of impoverished nations they enjoy wealth, which was destined solely for the unfortunate; 839 while the latter, far from murmuring, applaud a pious generosity, which enriches the church, but rarely contributes to the relief of the poor.

840 According to the principles of Christianity, poverty itself is a virtue; indeed, it is the virtue, which sovereigns and priests oblige their slaves to observe most rigorously. 841 With this idea, many pious Christians have of their own accord renounced riches, distributed their patrimony among the poor, and retired into deserts, there to live in voluntary indigence. 842 But this enthusiasm, this supernatural taste for misery, has been soon forced to yield to Nature. 843 The successors of these volunteers in poverty sold to the devout people their prayers, and their intercessions with the Deity. 844 They became rich and powerful. Thus monks and hermits lived in indolence, and under colour of charity, impudently devoured the substance of the poor.

845 The species of poverty, most esteemed by Religion, is ‘poverty of mind’. 846 The fundamental

virtue of every Religion, most useful to its ministers, is ‘faith’. 847 It consists in unbounded credulity, which admits, without enquiry, whatever the interpreters of the Deity are interested in making people believe. 848 By the aid of this wonderful virtue, priests became the arbiters of right and wrong, of good and evil: they could easily cause the commission of crimes to advance their interest. 849 Implicit faith has been the source of the greatest outrages that have been committed.

APOLOGUE

73

850 You, who first taught nations, that, when we wrong Human, we must ask pardon of God, appease Him by presents, and offer Him sacrifices, evidently destroyed the true principles of Morality. 851 According to such ideas, many persons imagine that they may obtain of the king of heaven, as of kings of the earth, permission to be unjust and wicked, or may at least obtain pardon for the evil they may commit.

852 Morality is founded upon the relations, wants, and constant interests of humankind; 853 the relations, which subsist between God and Humans, are either perfectly unknown, or imaginary. 854 Religion, by associating God with Human, has wisely weakened, or destroyed, the bonds, which unite them. 855 Mortals imagine, they may injure one another with impunity, by making suitable satisfaction to the almighty being, who is supposed to have the right of remitting all offences committed against His creatures.

856 Is any thing better calculated to encourage the wicked or harden them in crimes, than to persuade them that there exists an invisible being, who has a right to forgive acts of injustice, rapine, and outrage committed against society? 857 By these destructive ideas, perverse people perpetrate the most horrid crimes, and believe they make reparation by imploring divine mercy; 858 their conscience is at rest, when a priest assures them that heaven is disarmed by a repentance, which,

though sincere, is very useless to the world.

859 In the mind of a devout human, God must be regarded more than His creatures; it is better to obey Him, than humans. 860 The interests of the celestial monarch must prevail over those of weak mortals. But the interests of heaven are obviously those of its ministers; 861 whence it evidently follows, that in every religion, priests, under pretext of the interests of heaven or the glory of God, can dispense with the duties of human Morality, when they clash with the duties, which God has a right to impose. 862 Besides, must not one, who has power to pardon crimes, have a right to encourage the commission of crimes?

APOLOGUE

74

863 We are perpetually told, that, without a God there would be no ‘moral obligation’; that the people and even the sovereigns require a legislator powerful enough to constrain them. 864 Moral constraint supposes a law; but this law arises from the eternal and necessary relations of things with one another; relations, which have nothing common with the existence of a God. 865 The rules of Human's conduct are derived from your own nature which you are capable of knowing, and not from the Divine nature of which you have no idea. 866 These rules constrain or oblige us; that is, we render ourselves estimable or contemptible, amiable or detestable, worthy of reward or of punishment, happy or unhappy, accordingly as we conform to, or deviate from these rules. 867 The law, which obliges human not to hurt yourself, is founded upon the nature of a sensible being, who, in whatever way you came into this world, is forced by your actual essence to seek good and shun evil, to love pleasure and fear pain. 868 The law, which obliges human not to injure, and even to do good to others, is founded upon the nature of sensible beings, living in society, whose essence compels them to despise those who are useless, and to detest those who oppose their felicity.

869 Whether there exists a God or not, whether this God has spoken

or not, the moral duties of humans will be always the same, so long as they are sensible beings. 870 Have people then need of a God whom they know not, of an invisible legislator, of a mysterious religion and of chimerical fears, in order to learn that every excess evidently tends to destroy them, that to preserve health they must be temperate; 871 that to gain the love of others it is necessary to do them good, that to do them evil is a sure means to incur their vengeance and hatred? 872 "Before the law there was no sin." Nothing is more false than this maxim. 873 It suffices that human is what you are, or that you are a sensible being, in order to distinguish what gives you pleasure or displeasure. 874 It suffices that one person knows that another person is a sensible being like own self, to perceive what is useful or hurtful to oneself. 875 It suffices that human needs own fellow-creature, in order to know that you must fear to excite sentiments unfavourable to yourself. 876 Thus the feeling and thinking being has only to feel and think, in order to discover what you must do for yourself and others. 877 I feel, and another feels like me; this is the foundation of all morals.

APOLOGUE

75

878 We can judge of the goodness of a system of Morals, only by its conformity to the nature of human. 879 By this comparison, we have a right to reject it, if contrary to the welfare of our species. 880 Whoever has seriously meditated Religion; whoever has carefully weighed its advantages and disadvantages, will be fully convinced, that both are injurious to the interests of Human, or directly opposite to your nature.

881 "To arms! the cause of your God is at stake! Heaven is outraged! The faith is in danger! Impiety! blasphemy! heresy!" 882 The magical power of these formidable words, the real value of which the people never understand, have at all times enabled priests to excite revolts, to dethrone kings, to kindle civil wars, and to lay waste. 883 If we examine the important objects, which have produced so many ravages upon earth, it appears, that

either the foolish reveries and whimsical conjectures of some theologian who did not understand own self, or else the pretensions of the clergy, have broken every social bond and deluged humankind with blood and tears.

APOLOGUE

76

884 The sovereigns of this world, by associating the Divinity in the government of their dominions, by proclaiming themselves His vicegerents and representatives upon earth, and by acknowledging they hold their power from Him, have necessarily constituted His ministers their own rivals or masters. 885 Is it then astonishing, that priests have often made kings feel the superiority of the Celestial Monarch? 886 Have they not more than once convinced temporal princes, that even the greatest power is compelled to yield to the spiritual power of opinion? 887 Nothing is more difficult than to serve two masters, especially when they are not agreed upon what they require.

888 The association of Religion with Politics necessarily introduced double legislation. 889 The law of God, interpreted by His priests, was often repugnant to the law of the sovereign, or the interest of the state. 890 When princes have firmness and are confident of the love of their subjects, the law of God is sometimes forced to yield to the wise intentions of the temporal sovereign; 891 but generally the sovereign authority is obliged to give way to the divine authority, that is, to the interests of the clergy. 892 Nothing is more dangerous to a prince, than to encroach upon the authority of the Church, that is, to attempt to reform abuses consecrated by religion. 893 God is never more angry than when we touch the divine rights, privileges, possessions, or immunities of His priests.

894 The metaphysical speculations or religious opinions of people influence their conduct, only when they judge them conformable to their interest. 895 Nothing proves this truth more clearly, than the conduct of many princes with respect to the spiritual power, which they often resist. 896 Ought

not a sovereign, persuaded of the importance and rights of Religion, to believe yourself in conscience bound to receive respectfully the orders of its priests, and to regard them as the orders of the Divinity? 897 There was a time, when kings and people, more consistent in their conduct, were convinced of the rights of spiritual power, and becoming its slaves, yielded to it upon every occasion, and were but docile instruments in its hands. 898 That happy time is passed. By a strange inconsistency the most devout monarchs are sometimes seen to oppose the enterprises of those, whom they yet regard as the ministers of God. 899 A sovereign, deeply religious, ought to remain prostrate at the feet of own ministers, and regard them as true sovereigns. 900 Is there upon earth a power which has a right to put itself in competition with that of the Most High?

APOLOGUE

77

901 Have princes then, who imagine themselves interested in cherishing the prejudices of their subjects, seriously reflected upon the effects, which have been, and may be again produced by certain privileged demagogues, 902 who have a right to speak at pleasure, and in the name of heaven to inflame the passions of millions of subjects? 903 What ravages would not these sacred haranguers cause, if they should conspire, as they have so often done, to disturb the tranquillity of a state!

904 To most nations, nothing is more burthensome and ruinous than the worship of their gods. 905 Not only do the ministers of these gods every where constitute the first order in the state, but they also enjoy the largest portion of the goods of society, and have a right to levy permanent taxes upon their fellow-citizens. 906 What real advantages then do these organs of the Most High procure the people, for the immense profits extorted from their industry? 907 In exchange for their riches and benefits, what do they give them but mysteries, hypotheses, ceremonies, subtle questions, and endless quarrels, which states are again compelled to pay with blood?

APOLOGUE

78

908 Religion, though said to be the firmest prop of Morality, evidently destroys its true springs, in order to substitute imaginary ones, inconceivable chimeras, which, being obviously contrary to reason, nobody firmly believes. 909 All nations declare that they firmly believe in a God, who rewards and punishes; all say they are persuaded of the existence of hell and paradise; yet, do these ideas render people better or counteract the most trifling interests? 910 Every one assures us, that they trembles at the judgments of God; yet every one follows their passions, when they thinks themselves sure of escaping the judgments of Human. 911 The fear of invisible powers is seldom so strong as the fear of visible ones. 912 Unknown or remote punishments strike the multitude far less forcibly than the sight of the gallows. 913 Few courtiers fear the anger of their God so much as the displeasure of their master. 914 A pension, a title, or a riband suffices to efface the remembrance both of the torments of hell, and of the pleasures of the celestial court. 915 The caresses of a woman repeatedly prevail over the menaces of the Most High. 916 A jest, a stroke of ridicule, a witticism, make more impression upon the human of the world, than all the grave notions of your Religion.

917 Are we not assured that a true repentance is enough to appease the Deity? Yet we do not see that this true repentance is very sincere; 918 at least, it is rare to see noted thieves, even at the point of death, restore goods, which they have unjustly acquired. 919 People are undoubtedly persuaded, that they shall fit themselves for eternal fire, if they cannot insure themselves against it. 920 But, "Some useful compacts may be made with heaven." By giving the church a part of your fortune, almost every devout rogue may die in peace, without concerning yourself in how you gained your riches.

APOLOGUE

79

921 By the confession of the warmest defenders of Religion and of its utility, nothing is more rare

than sincere conversions, and, we might add, nothing more unprofitable to society. 922 People are not disgusted with the world, until the world is disgusted with them.

923 If the devout have the talent of pleasing God and His priests, they have seldom that of being agreeable or useful to society. 924 To a devotee, Religion is a veil, which covers all passions; pride, ill-humour, anger, revenge, impatience, and rancour. 925 Devotion arrogates a tyrannical superiority, which banishes gentleness, indulgence, and gaiety; 926 it authorises people to censure their neighbours, to reprove and revile the profane for the greater glory of God. 927 It is very common to be devout, and at the same time destitute of every virtue and quality necessary to social life.

APOLOGUE

80

928 It is asserted, that the dogma of another life is of the utmost importance to peace and happiness; that without it, humans would be destitute of motives to do good. 929 What need is there of terrors and fables to make people sensible how you ought to conduct yourself? 930 Does not every one see, that you have the greatest interest, in meriting the approbation, esteem, and benevolence of the beings who surround you, 931 and in abstaining from every thing, by which you may incur the censure, contempt, and resentment of society? 932 However short an entertainment, a conversation, or visit, does not each desire to act your part decently, and agreeably to yourself and others? 933 If life is but a passage, let us strive to make it easy; which we cannot effect, if we fail in regard for those who travel with us. 934 Religion, occupied with its gloomy reveries, considers human merely as a pilgrim upon earth; 935 and therefore supposes that, in order to travel the more securely, you must forsake company, and deprive yourself of pleasure and amusements, which might console you for the tediousness and fatigue of the journey. 936 A stoical and morose philosopher sometimes gives us advice as irrational as that of Religion. But a more rational

philosophy invites us to spread flowers upon the way of life, 937 to dispel melancholy and banish terrors, to connect our interest with that of our fellow-travellers, and by gaiety and lawful pleasures, to divert our attention from difficulties and accidents, to which we are often exposed; 938 it teaches us, that, to travel agreeably, we should abstain from what might be injurious to ourselves, and carefully shun what might render us odious to our associates.

APOLOGUE

81

939 It is asked: what motives an Atheist can have to do good? The motive to please yourself and your fellow-creatures; to live happily and peaceably; to gain the affection and esteem of people. 940 "Can you, who fears not the gods, fear any thing?" You can fear people; you can fear contempt, dishonour, the punishment of the laws; 941 in short, you can fear yourself, and the remorse felt by all those who are conscious of having incurred or merited the hatred of their fellow-creatures.

942 Conscience is the internal testimony, which we bear to ourselves, of having acted so as to merit the esteem or blame of the beings, with whom we live; 943 and it is founded upon the clear knowledge we have of humans, and of the sentiments which our actions must produce in them. 944 The Conscience of the religious person consists in imagining that you have pleased or displeased your God, of whom you have no idea, 945 and whose obscure and doubtful intentions are explained to you only by people of doubtful veracity, who, like you, are utterly unacquainted with the essence of the Deity, and are little agreed upon what can please or displease Him. 946 In a word, the conscience of the credulous is directed by people, who have themselves an erroneous conscience, or whose interest stifles knowledge.

947 "Can an Atheist have a Conscience? What are your motives to abstain from hidden vices and secret crimes of which other people are ignorant, and which are beyond the reach of laws?" 948 You may be assured by constant experience, that there is

no vice, which, by the nature of things, does not punish itself. 949 Would you preserve this life? You will avoid every excess, that may impair your health; you will not wish to lead a languishing life, which would render you a burden to yourself and others. 950 As for secret crimes, you will abstain from them, for fear you shall be forced to blush at yourself, from whom you cannot flee. 951 If you have any reason, you will know the value of the esteem which an honest person ought to have for yourself. 952 You will see, that unforeseen circumstances may unveil the conduct, which you feels interested in concealing from others. 953 The other world furnishes no motives for doing good, to you, who finds none on earth.

APOLOGUE

82

954 "The speculative Atheist," says the Theist, "may be an honest person, but your writings will make political Atheists. 955 Princes and ministers, no longer restrained by the fear of God, will abandon themselves, without scruple, to the most horrid excesses." 956 But, however great the depravity of an Atheist upon the throne, can it be stronger and more destructive, than that of the many conquerors, tyrants, persecutors, ambitious people, and perverse courtiers, 957 who, though not Atheists, but often very religious and devout, have notwithstanding made humanity groan under the weight of their crimes? 958 Can an atheistical prince do more harm to the world, than a Louis XI, a Philip II, a Richelieu, who all united Religion with crime? 959 Nothing is more rare, than atheistical princes; nothing more common, than tyrants and ministers, who are very wicked and very religious.

APOLOGUE

83

960 A person of reflection cannot be incapable of own duties, of discovering the relations subsisting between humans, of meditating your own nature, of discerning your own wants, propensities, and desires, and of perceiving what you owes to beings, who are necessary to your happiness.

GOODNESS

961 These reflections naturally lead you to a knowledge of the Morality most essential to social beings. 962 Dangerous passions seldom fall to the lot of a person who loves to commune with own self, to study, and to investigate the principles of things. 963 The strongest passion of such a person will be to know truth, and your ambition to teach it to others. Philosophy cultivates the mind. 964 On the score of morals and honesty, have not one who reflects and reasons, evidently an advantage over you, who makes it a principle never to reason?

965 If ignorance is useful to priests, and to the oppressors of humankind, it is fatal to society. 966 Human, void of knowledge, does not enjoy reason; without reason and knowledge, you are a savage, liable to commit crimes. 967 Morality, or the science of duties, is acquired only by the study of Human, and of what is relative to Human. 968 You, who does not reflect, is unacquainted with true Morality, and walks with precarious steps, in the path of virtue. 969 The less people reason, the more wicked they are.

970 Savages, princes, nobles, and the dregs of the people, are commonly the worst of people, because they reason the least. 971 The devout person seldom reflects, and rarely reasons. 972 You fears all enquiry, scrupulously follows authority, and often, through an error of conscience, makes it a sacred duty to commit evil. 973 The Atheist reasons: you consults experience, which you prefers to prejudice. 974 If you reasons justly, your conscience is enlightened; you finds more real motives to do good than the bigot whose only motives are your fallacies, and who never listens to reason. 975 Are not the motives of the Atheist sufficiently powerful to counteract own passions? Are you blind enough to be unmindful of your true interest, which ought to restrain you? 976 But you will be neither worse nor better, than the numerous believers, who, notwithstanding Religion and its sublime precepts, follow a conduct which Religion condemns. 977 Is a credulous assassin less to be feared, than an assassin who believes nothing? Is a very devout

tyrant less tyrannical than an undevout tyrant?

APOLOGUE

84

978 Nothing is more uncommon, than to see people consistent. Their opinions never influence their conduct except when conformable to their temperaments, passions, and interests. 979 Daily experience shows, that religious opinions produce much evil and little good. 980 They are hurtful, because they often favour the passions of tyrants, of ambitious people, of fanatics, and of priests; 981 they are of no effect, because incapable of counter-balancing the present interests of the greater part of humankind. 982 Religious principles are of no avail, when they act in opposition to ardent desires; though not unbelievers, people then conduct themselves as if they believed nothing.

983 We shall always be liable to err, when we judge of the opinions of humans by their conduct, or of their conduct by their opinions. 984 A religious person, notwithstanding the unsociable principles of a sanguinary religion, will sometimes by a happy inconsistency, be humane, tolerant, and moderate; the principles of your religion do not then agree with the gentleness of your character. 985 Libertines, debauchees, hypocrites, adulterers, and rogues, often appear to have the best ideas upon morals. 986 Why do they not reduce them to practice? Because their temperament, their interest, and their habits do not accord with their sublime theories. 987 The rigid principles of Christian morality, which many people regard as divine, have but little influence upon the conduct of those, who preach them to others. 988 Do they not daily tell us: to do what they preach, and not what they practise?

989 The partisans of Religion often denote an infidel by the word: ‘libertine’. It is possible that many unbelievers may have loose morals, which is owing to their temperament, and not to their opinions. 990 But how does their conduct affect their opinions? Cannot then an immoral person be a good physician, architect, geometrician, logician, or

metaphysician? 991 A person of irreproachable conduct may be extremely deficient in knowledge and reason. In quest of truth, it little concerns us from whom it comes. 992 Let us not judge humans by their opinions, nor opinions by humans; let us judge humans by their conduct, and their opinions by their conformity with experience and reason and by their utility to humankind.

APOLOGUE

85

993 Every person, who reasons, soon becomes an unbeliever; for reason shows, that theology is nothing but a tissue of chimeras; 994 that religion is contrary to every principle of good sense, that it tinctures all human knowledge with falsity. 995 The sensible person is an unbeliever, because you sees, that, far from making people happier, religion is the chief source of the greatest disorders, and the permanent calamities, with which human is afflicted. 996 The man, who seeks own welfare and tranquillity, examines and throws aside religion, because you thinks it no less troublesome than useless, to spend your life in trembling before phantoms, fit to impose only upon silly women or children.

997 If licentiousness, which reasons but little, sometimes leads to irreligion, the person of pure morals may have very good motives for examining own religion, and banishing it from own mind. 998 Religious terrors, too weak to impose upon the wicked in whom vice is deeply rooted, afflict, torment and overwhelm restless imaginations. 999 Courageous and vigourous minds soon shake off the insupportable yoke. But those, who are weak and timorous, languish under it during life; and as they grow old their fears increase.

1000 Priests have represented God as so malicious, austere, and terrible a being, that most people would cordially wish, that there was no God. 1001 It is impossible to be happy, while always trembling. 1002 Ye devout! you adore a terrible God! But you hate Him; you would be glad, if He did not exist. 1003 Can we refrain from desiring the absence or destruction

of a master, the idea of whom destroys our happiness? 1004 The black colours, in which priests paint the Divinity, are truly shocking, and force us to hate and reject Him.

APOLOGUE

86

1005 If fear created the gods, fear supports their empire over the minds of mortals. 1006 So early are people accustomed to shudder at the mere name of the Deity, that they regard Him as a spectre, a hobgoblin, a bugbear, which torments and deprives them of courage even to wish relief from their fears. 1007 They apprehend, that the invisible spectre, will strike them the moment they cease to be afraid. Bigots are too much in fear of their God to love Him sincerely. 1008 They serve Him like slaves, who, unable to escape His power, resolve to flatter their master, and who, by dint of lying, at length persuade themselves, that they in some measure love Him. 1009 They make a virtue of necessity. The love of devotees for their God, and of slaves for their despots, is only a feigned homage.

APOLOGUE

87

1010 Christian divines have represented their God so terrible and so little worthy of love, that several of them have thought they must dispense with loving him; a blasphemy, shocking to other divines, who were less ingenuous. 1011 St. Thomas having maintained, that we are obliged to love God as soon as we attain the use of reason, the Jesuit Sirmond answered him: ‘that is very soon’. The Jesuit Vasquez assures us, that: ‘it is enough to love God at the point of death’. 1012 Hurtado, more rigid, says: ‘we must love God very year’. Henriquez is contented that we love him ‘every five years’; Sotus says: ‘every Sunday’. 1013 Upon what are these opinions grounded? asks father Sirmond; who adds, that Suarez requires us to: ‘love God sometimes’. 1014 But when? He leaves that to us; he knows nothing about it himself. ‘Now’, says he, ‘who will be able to know that, of which such a learned divine is ignorant?’ 1015 The same Jesuit Sirmond further observes, that God "does not command us to love Him with an affectionate love, nor does He

promise us salvation upon condition that we give Him our hearts; 1016 it is enough to obey and love God with an effective love by executing His orders; this is the only love we owe Him; and He has not so much commanded us to love Him, as not to hate Him." 1017 This doctrine appears heretical, impious, and abominable to the Jansenists, who, by the revolting severity they attribute to their God, make Him far less amiable, than the Jesuits, their adversaries. 1018 The latter, to gain adherents, paint God in colours capable of encouraging the most perverse of mortals. 1019 Thus nothing is more undecided with the Christians, than the important question, whether they can, ought, or ought not to love God. 1020 Some of their spiritual guides maintain, that it is necessary to love God with all one's heart, notwithstanding all His severity; 1021 others, like father Daniel, think that: ‘an act of pure love to God is the most heroic act of Christian virtue, and almost beyond the reach of human weakness’. 1022 The Jesuit Pintereau goes farther; he says: ‘a deliverance from the grievous yoke of loving God is a privilege of the new covenant’.

APOLOGUE

88

1023 The character of the Person always decides that of your God; every body makes one for yourself and like yourself. 1024 The person of gaiety, involved in dissipation and pleasure, does not imagine, that, God can be stern and cross; you wants a good-natured God, with whom you can find reconciliation. 1025 The person of a rigid, morose, bilious, sour disposition, must have a God like yourself, a God of terror; and you regards, as perverse, those, who admit a placable, indulgent God. 1026 As people are constituted, organised, and modified in a manner, which cannot be precisely the same, how can they agree about a chimera, which exists only in their brains?

1027 The cruel and endless disputes between the ministers of the Lord, are not such as to attract the confidence of those, who impartially consider them. 1028 How can we avoid complete infidelity, upon viewing principles, about which those who teach them

to others are never agreed? 1029 How can we help doubting the existence of a God, of whom it is evident that even His ministers can only form very fluctuating ideas? 1030 How can we in short avoid totally rejecting a God, who is nothing but a shapeless heap of contradictions? 1031 How can we refer the matter to the decision of priests, who are perpetually at war, treating each other as impious and heretical, defaming and persecuting each other without mercy, for differing in the manner of understanding what they announce to the world?

APOLOGUE

89

1032 The existence of a God is the basis of all Religion. Nevertheless, this important truth has not as yet been demonstrated, I do not say so as to convince unbelievers, but in a manner satisfactory to theologians themselves. 1033 Profound thinkers have at all times been occupied in inventing new proofs. What are the fruits of their meditations and arguments? 1034 They have left the subject in a worse condition; they have demonstrated nothing; they have almost always excited the clamours of their brethren, who have accused them of having poorly defended the best of causes.

APOLOGUE

90

1035 The apologists of religion daily repeat, that the passions alone make unbelievers. "Pride," say they, "and the desire of signalising themselves, make people Atheists. 1036 They endeavour to efface from their minds the idea of God, only because they have reason to fear His terrible judgments." 1037 Whatever may be the motives, which incline people to Atheism, it is our business to examine, whether their sentiments are founded in truth. 1038 No person acts without motives. 1039 Let us first examine the arguments and afterwards the motives. We shall see whether these motives are not legitimate, and more rational than those of many credulous bigots, who suffer themselves to be guided by masters little worthy of the confidence of people.

1040 You say then, Priests of the Lord! that the passions make

unbelievers; that they renounce Religion only through interest, or because it contradicts their inordinate propensities; 1041 you assert, that they attack your gods only because they fear their severity. But, are you yourselves, in defending Religion and its chimeras, truly exempt from passions and interests? 1042 Who reap advantages from this Religion, for which priests display so much zeal? Priests. 1043 To whom does Religion procure power, influence, riches, and honours? To Priests. 1044 Who wage war, in every country, against reason, science, truth, and philosophy, and render them odious to sovereigns and people? Priests. 1045 Who profit by the ignorance and vain prejudices of humans? Priests.-- 1046 Priests! you are rewarded, honoured and paid for deceiving mortals, and you cause those to be punished who undeceive them. 1047 The follies of people procure you benefices, offerings, and expiations; while those, who announce the most useful truths, are rewarded only with chains, gibbets and funeral-piles. Let the world judge between us.

APOLOGUE

91

1048 Pride and vanity have been, and ever will be, inherent in the priesthood. 1049 Is any thing more capable of rendering humans haughty and vain, than the pretence of exercising a power derived from heaven, of bearing a sacred character, of being the messengers and ministers of the Most High? 1050 Are not these dispositions perpetually nourished by the credulity of the people, the deference and respect of sovereigns, the immunities, privileges, and distinctions enjoyed by the clergy? 1051 In every country, the vulgar are much more devoted to their spiritual guides, whom they regard as divine, than to their temporal superiors, whom they consider as no more than ordinary people. 1052 The parson of a village acts a much more conspicuous part, than the lord of the manor or the justice of the peace. 1053 Among the Christians, a priest thinks own self far above a king or an emperor. A

Spanish grandee having spoken rather haughtily to a monk, the latter arrogantly said, "Learn to respect a person, who daily has your God in his hands, and your Queen at his feet." 1054 Have priests then a right to accuse unbelievers of pride? Are they themselves remarkable for uncommon modesty or profound humility? 1055 Is it not evident, that the desire of domineering over people is essential to their trade? 1056 If the ministers of the Lord were truly modest, should we see them so greedy of respect, so impatient of contradiction, so positive in their decisions, and so unmercifully revengeful to those whose opinions offend them? 1057 Has not Science the modesty to acknowledge how difficult it is to discover truth? 1058 What other passion but ungovernable pride can make people so savage, revengeful, and void of indulgence and gentleness? 1059 What can be more presumptuous, than to arm nations and deluge the world in blood, in order to establish or defend futile conjectures?

1060 You say, that presumption alone makes Atheists. Inform them then what your God is; teach them His essence; speak of Him intelligibly; say something about Him, which is reasonable, and not contradictory or impossible. 1061 If you are unable to satisfy them, if hitherto none of you have been able to demonstrate the existence of a God in a clear and convincing manner; 1062 if by your own confession, His essence is completely veiled from you, as from the rest of mortals, forgive those, who cannot admit what they can neither understand nor make consistent with itself; 1063 do not tax with presumption and vanity those who are sincere enough to confess their ignorance; 1064 do not accuse of folly those who find themselves incapable of believing contradictions; 1065 and for once, blush at exciting the hatred and fury of sovereigns and people against people, who think not like you concerning a being, of whom you have no idea. 1066 Is any thing more rash and extravagant, than to reason concerning an object, known to be inconceivable? 1067 You say, that the corruption of the heart produces Atheism, that people shake off the yoke of the

Deity only because they fear His formidable judgments. 1068 But, why do you paint your God in colours so shocking, that He becomes insupportable? Why does so powerful a God permit people to be so corrupt? 1069 How can we help endeavouring to shake off the yoke of a tyrant, who, able to do as he pleases with people, consents to their perversion, 1070 who hardens, and blinds them, and refuses them His grace, that He may have the satisfaction to punish them eternally, for having been hardened, and blinded, and for not having the grace which He refused? 1071 Theologians and priests must be very confident of the grace of heaven and a happy futurity, to refrain from detesting a master so capricious as the God they announce. 1072 A God, who damns eternally, is the most odious of beings that the human mind can invent.

APOLOGUE

92

1073 No human upon earth is truly interested in the support of error, which is forced sooner or later to yield to truth. 1074 The general good must at length open the eyes of mortals: the passions themselves sometimes contribute to break the chains of prejudices. 1075 Did not the passions of sovereigns, centuries ago, annihilate in some countries of Europe the tyrannical power, which a too haughty pontiff once exercised over all princes of his sect? 1076 In consequence of the progress of political science, the clergy were then stripped of immense riches, which credulity had accumulated upon them. 1077 Ought not this memorable example to convince priests, that prejudices triumph but for a time, and that truth alone can insure solid happiness?

1078 By caressing sovereigns, by fabricating divine rights for them, by deifying them, and by abandoning the people, bound hand and foot, to their will, the ministers of the Most High must see, that they are labouring to make them tyrants. 1079 Have they not reason to apprehend, that the gigantic idols, which they raised to the clouds, will one day crush them by their enormous weight? 1080 Do not a thousand examples

remind them that these tyrants, after preying upon the people, may prey upon them in their turn.

1081 We will respect priests, when they become sensible people. Let them, if they please, use the authority of heaven to frighten those princes who are continually desolating the earth; 1082 but let them no more adjudge to them the horrid right of being unjust with impunity. 1083 Let them acknowledge, that no human is interested in living under tyranny; 1084 and let them teach sovereigns, that they themselves are not interested in exercising a despotism, which, by rendering them odious, exposes them to danger, and detracts from their power and greatness. 1085 Finally, let priests and kings become so far enlightened as to acknowledge, that no power is secure which is not founded upon truth, reason, and equity.

APOLOGUE

93

1086 By waging war against Reason, which they ought to have protected and developed, the ministers of the gods evidently act against their own interest. 1087 What power, influence, and respect might they not have gained among the wisest of people, 1088 what gratitude would they not have excited in the people, if, instead of wasting their time about their vain disputes, they had applied themselves to really useful science, and investigated the true principles of philosophy, government, and morals! 1089 Who would dare to reproach a body with its opulence or influence, if the members dedicating themselves to the public good, employed their leisure in study, and exercised their authority in enlightening the minds both of sovereigns and subjects?

1090 Priests! Forsake your chimeras, your unintelligible dogmas, your contemptible quarrels! 1091 Banish those phantoms which could be useful only in the infancy of nations. Assume, at length, the language of reason. 1092 Instead of exciting persecution; instead of entertaining the people with silly disputes; instead of preaching useless and fanatical dogmas, preach human

and social morality; 1093 preach virtues really useful to the world; become the apostles of reason, the defenders of liberty, and the reformers of abuses.

APOLOGUE

94

1094 Philosophers have every where taken upon themselves a part, which seemed destined to the ministers of Religion. The hatred of the latter for philosophy was only a jealousy of trade. 1095 But, instead of endeavouring to injure and decry each other, all people of good sense should unite their efforts to combat error, seek truth, 1096 and especially to put to flight the prejudices, that are equally injurious to sovereigns and subjects, and of which the abettors themselves sooner or later become the victims.

1097 In the hands of an enlightened government, the priests would become the most useful of the citizens. 1098 Already richly paid by the state, and free from the care of providing for their own subsistence, how could they be better employed than in qualifying themselves for the instruction of others? 1099 Would not their minds be better satisfied with discovering luminous truths, than in wandering through the thick darkness of error? 1100 Would it be more difficult to discern the clear principles of Morality, than the imaginary principles of a divine and theological Morality? 1101 Would people of ordinary capacities find it as difficult to fix in their heads the simple notions of their duties, as to load their memories with mysteries, unintelligible words and obscure definitions, of which they can never form a clear idea? 1102 What time and pains are lost in learning and teaching things, which are not of the least real utility! 1103 What resources for the encouragement of the sciences, the advancement of knowledge, and the education of youth, well disposed sovereigns might find in the many monasteries, which in several countries live upon the people without in the slightest degree profiting them! 1104 But superstition, jealous of its exclusive empire, seems resolved to form only useless beings. 1105 To what advantage might we not

turn a multitude of cenobites of both sexes, who, in many countries, are amply endowed for doing nothing? 1106 Instead of overwhelming them with fasting and austerities; instead of barren contemplations, mechanical prayers, and trifling ceremonies; 1107 why should we not excite in them a salutary emulation, which may incline them to seek the means, not of being 'dead' to the world, but of being 'useful' to it? 1108 Instead of filling the youthful minds of their pupils with fables, sterile dogmas, and puerilities, why are not priests obliged, or invited to teach them truths, and to render them useful citizens of their country? 1109 Under the present system, people are only useful to the clergy who blind them, and to the tyrants who fleece them.

APOLOGUE

95

1110 The partisans of credulity often accuse unbelievers of insincerity, because they sometimes waver in their principles, alter their minds in sickness, and retract at death. 1111 When the body is disordered, the faculty of reasoning is commonly disordered with it. 1112 At the approach of death, human, weak and decayed, is sometimes yourself sensible that Reason abandons you, and that Prejudice returns. 1113 There are some diseases, which tend to weaken the brain; to create despondency and pusillanimity; and there are others, which destroy the body, but do not disturb the reason. 1114 At any rate, an unbeliever who recants in sickness is not more extraordinary, than a devotee who neglects in health the duties which own religion explicitly enjoins.

1115 Ministers of Religion openly contradict in their daily conduct the rigorous principles, they teach to others; in consequence of which, unbelievers, in their turn, may justly accuse them of insincerity. 1116 Is it easy to find many prelates humble, generous, void of ambition, enemies of pomp and grandeur, and friends of poverty? 1117 In short, is the conduct of Christian ministers conformable to the austere morality of Christ, their God, and their model?

GOODNESS

APOLOGUE

96

1118 ‘Atheism’, it is said, ‘breaks all the ties of society. Without the belief of a God, what will become of the sacredness of oaths? 1119 How shall we oblige a person to speak the truth, who cannot seriously call the Deity to witness what one says?’ 1120 But, does an oath strengthen our obligation to fulfill the engagements contracted? Will you, who is not fearful of lying, be less fearful of perjury? 1121 You, who is base enough to break your word, or unjust enough to violate your engagements, in contempt of the esteem of people, will not be more faithful therein for having called all the gods to witness your oaths. 1122 Those, who disregard the judgments of humans, will soon disregard the judgments of God. 1123 Are not princes, of all people, the most ready to swear, and the most ready to violate their oaths?

APOLOGUE

97

1124 ‘The vulgar’, it is repeatedly said, ‘must have a Religion. If enlightened persons have no need of the restraint of opinion, it is at least necessary to rude people, whose reason is uncultivated by education’. 1125 But, is it indeed a fact, that religion is a restraint upon the vulgar? Do we see, that this religion preserves them from intemperance, drunkenness, brutality, violence, fraud, and every kind of excess? 1126 Could a people who have no idea of the Deity conduct themselves in a more detestable manner, than these believing people, among whom we find dissipation and vices, the most unworthy of reasonable beings? 1127 Upon going out of the churches, do not the working classes, and the populace, plunge without fear into their ordinary irregularities, 1128 under the idea, that the periodical homage, which they render to their God, authorises them to follow, without remorse, their vicious habits and pernicious propensities? 1129 Finally, if the people are so low-minded and unreasonable, is not their stupidity chargeable to the negligence of their princes, who are wholly regardless of public education, or who even oppose the instruction of their subjects? 1130 Is not the want of reason in the

people evidently the work of the priests, who, instead of instructing people in a rational morality, entertain them with fables, reveries, ceremonies, fallacies, and false virtues which they think of the greatest importance?

1131 To the people, Religion is but a vain display of ceremonies, to which they are attached by habit, which entertains their eyes, and produces a transient emotion in their torpid understandings, without influencing their conduct or reforming their morals. 1132 Even by the confession of the ministers of the altars, nothing is more rare than that 'internal' and 'spiritual' Religi on, which alone is capable of regulating the life of human and of triumphing over your evil propensities. 1133 In the most numerous and devout nation, are there many persons, who are really capable of understanding the principles of their religious system, and who find them powerful enough to stifle their perverse inclinations?

1134 Many persons will say, that: 'any restraint whatever is better than none'. 1135 They will maintain, that: 'if religion awes not the greater part, it serves at least to restrain some individuals, who would otherwise without remorse abandon themselves to crime'. 1136 People ought undoubtedly to have a restraint, but not an imaginary one. 1137 Religion only frightens those whose imbecility of character has already prevented them from being formidable to their fellow-citizens. 1138 An equitable government, severe laws, and sound morality have an equal power over all; at least, every person must believe in them, and perceive the danger of not conforming to them.

APOLOGUE

98

1139 Perhaps it will be asked: 'whether Atheism can be proper for the multitude?' I answer, that any system, which requires discussion, is not made for the multitude. 1140 'What purpose then can it serve to preach Atheism?' It may at least serve to convince all those who reason, that nothing is more extravagant than to fret one's self, and nothing more unjust than to vex others, for mere groundless conjectures. 1141 As for the vulgar

who never reason, the arguments of an Atheist are no more fit for them than the systems of a natural philosopher, 1142 the observations of an astronomer, the experiments of a chemist, the calculations of a geometrician, the researches of a physician, the plans of an architect, or the pleadings of a lawyer, who all labour for the people without their knowledge.

1143 Are the metaphysical reasonings and religious disputes, which have so long engrossed the time and attention of so many profound thinkers, better adapted to the generality of people than the reasoning of an Atheist? 1144 Nay, as the principles of Atheism are founded upon plain common-sense, are they not more intelligible, than those of a theology, beset with difficulties, which even the persons of the greatest genius cannot explain? 1145 In every country, the people have a religion, the principles of which they are totally ignorant, and which they follow from habit without any examination: their priests alone are engaged in theology, which is too dense for vulgar heads. 1146 If the people should chance to lose this unknown theology, they mighty easily console themselves for the loss of a thing, not only perfectly useless, but also productive of dangerous commotions.

1147 It would be madness to write for the vulgar, or to attempt to cure their prejudices all at once. We write for those only, who read and reason; 1148 the multitude read but little, and reason still less. Calm and rational persons will require new ideas, and knowledge will be gradually diffused.

APOLOGUE

99

1149 If theology is a branch of commerce profitable to theologians, it is evidently not only superfluous, but injurious to the rest of society. 1150 Self-interest will sooner or later open the eyes of humans. 1151 Sovereigns and subjects will one day adopt the profound indifference and contempt, merited by a futile system, which serves only to make humans miserable. 1152 All persons will be sensible of the inutility of the many expensive ceremonies, which contribute

nothing to public felicity. 1153 Contemptible quarrels will cease to disturb the tranquility of states, when we blush at having considered them important.

1154 Instead of Parliament meddling with the senseless combats of your clergy; instead of foolishly espousing their impertinent quarrels, and attempting to make your subjects adopt uniform opinions-- strive to make them happy in this world. 1155 Respect their liberty and property, watch over their education, encourage them in their labours, reward their talents and virtues, repress licentiousness; and do not concern yourselves with their manner of thinking. 1156 Theological fables are useful only to tyrants and the ignorant.

APOLOGUE

100

1157 Does it then require an extraordinary effort of genius to comprehend, that what is above the capacity of human, is not made for you; 1158 that things supernatural are not made for natural beings; that impenetrable mysteries are not made for limited minds? 1159 If theologians are foolish enough to dispute upon objects, which they acknowledge to be unintelligible even to themselves, ought society to take any part in their silly quarrels? 1160 Must the blood of nations flow to enhance the conjectures of a few infatuated dreamers? 1161 If it is difficult to cure theologians of their madness and the people of their prejudices, it is at least easy to prevent the extravagancies of one party, and the silliness of the other from producing pernicious effects. 1162 Let every one be permitted to think as you pleases; but never let you be permitted to injure others for their manner of thinking. 1163 Were the rulers of nations more just and rational, theological opinions would not affect the public tranquillity, more than the disputes of natural philosophers, physicians, grammarians, and critics. 1164 It is tyranny which causes theological quarrels to be attended with serious consequences.

1165 Those, who extol the importance and utility of Religion, ought to shew us its happy effects, 1166 the advantages for instance,

which the disputes and abstract speculations of theology can be to porters, artisans, and labourers, and to the multitude of unfortunate women and corrupt servants with which great cities abound. 1167 All these beings are religious; they have what is called: ‘an implicit faith’. Their parsons believe for them; and they stupidly adhere to the unknown belief of their guides. 1168 They go to hear sermons, and would think it a great crime to transgress any of the ordinances, to which, in childhood, they are taught to conform. But of what service to morals is all this? None at all. 1169 They have not the least idea of Morality, and are even guilty of all the roguery, fraud, rapine, and excess, that is out of the reach of law.

1170 The populace have no idea of their Religion; what they call Religion is nothing but a blind attachment to unknown opinions and mysterious practices. 1171 In fact, to deprive people of Religion is to deprive them of nothing. 1172 By overthrowing their prejudices, we should only lessen or annihilate the dangerous confidence they put in interested guides, 1173 and should teach them to mistrust those, who, under the pretext of Religion, often lead them into fatal excesses.

APOLOGUE

101

1174 While pretending to instruct and enlighten humans, Religion in reality keeps them in ignorance, and stifles the desire of knowing the most interesting objects. 1175 The people have no other rule of conduct, than what their priests are pleased to prescribe. Religion supplies the place of every thing else: 1176 but being in itself essentially obscure, it is more proper to lead mortals astray than to guide them in the path of science and happiness. 1177 Religion renders enigmatical all Natural Philosophy, Morality, Legislation and Politics. 1178 A person blinded by religious prejudices, fears truth, whenever it clashes with own opinions: you cannot know your own nature, you cannot cultivate your reason, you cannot perform experiments.

1179 Everything concurs to render the people devout; but every thing tends to prevent them from being

humane, reasonable and virtuous. Religion seems to have no other object, than to stupefy the mind.

1180 Priests have been ever at war with genius and talent, because well-informed people perceive, that superstition shackles the human mind, and would keep it in eternal infancy, occupied solely by fables and frightened by phantoms. 1181 Incapable of improvement itself, Theology opposed insurmountable barriers to the progress of true knowledge; 1182 its sole object is to keep nations and their rulers in the most profound ignorance of their duties, and of the real motives, that should incline them to do good. 1183 It obscures Morality, renders its principles arbitrary, and subjects it to the caprice of the gods or of their ministers. 1184 It converts the art of governing people into a mysterious tyranny, which is the scourge of nations. 1185 It changes princes into unjust, licentious despots, and the people into ignorant slaves, who become corrupt in order to merit the favour of their masters.

APOLOGUE

102

1186 By tracing the history of the human mind, we shall be easily convinced, that Theology has cautiously guarded against its progress. 1187 It began by giving out fables as sacred truth: it produced poetry, which filled the imagination of people with its puerile fictions: it entertained them with its gods and their incredible deeds. 1188 In a word, Religion has always treated people, like children, whom it lulled to sleep with tales, which its ministers would have us still regard as incontestable truths.

1189 If the ministers of the gods have sometimes made useful discoveries, they have always been careful to give them a dogmatical tone, and envelope them in the shades of mystery. 1190 Pythagoras and Plato, in order to acquire some trifling knowledge, were obliged to court the favour of priests, to be initiated in their mysteries, and to undergo whatever trials they were pleased to impose. 1191 At this price, they were permitted to imbibe those exalted notions, still so bewitching to all those who

admire only what is perfectly unintelligible. 1192 It was from Egyptian, Indian, and Chaldean priests, from the schools of these visionaries, professionally interested in bewildering human reason, that philosophy was obliged to borrow its first rudiments. 1193 Obscure and false in its principles, mixed with fictions and fables, and made only to dazzle the imagination, the progress of this philosophy was precarious, and its theories unintelligible; instead of enlightening, it blighted the mind, and diverted it from objects truly useful.

1194 The theological speculations and mystical reveries of the ancients are still law in a great part of the philosophic world; and being adopted by modern theology, it is heresy to abandon them. 1195 They tell us "of aerial beings, of spirits, angels, demons, genii," and other phantoms, which are the object of their meditations, 1196 and serve as the basis of ‘metaphysics’, an abstract and futile science, which for thousands of years the greatest geniuses have vainly studied. 1197 Hypothesis, imagined by a few visionaries of Memphis and Babylon, constitute even now the foundations of a science, whose obscurity makes it revered as marvellous and divine.

1198 The first legislators were priests; the first mythologists, poets, learned people, and physicians were priests. In their hands science became sacred and was withheld from the profane. 1199 They spoke only in allegories, emblems, enigmas, and ambiguous oracles-- means well calculated to excite curiosity, 1200 and above all to inspire the astonished vulgar with a holy respect for people, who when they were thought to be instructed by the gods, and capable of reading in the heavens the fate of the earth, boldly proclaimed themselves the oracles of the Deity.

APOLOGUE

103

1201 The religions of ancient priests have only changed form. Although our modern theologians regard their predecessors as impostors, yet they have collected many scattered fragments of their religious systems. 1202 In modern

GOODNESS

Religions we find, not only their metaphysical dogmas, which theology has merely clothed in a new dress, but also some remarkable remains of their superstitious practices, their magic, and their enchantments. 1203 Christians are still commanded to respect the remaining monuments of the legislators, priests, and prophets of the Hebrew Religion, which had borrowed its strange practices from Egypt. 1204 Thus extravagancies, imagined by knaves or idolatrous visionaries, are still sacred among Christians! 1205 If we examine history, we shall find a striking resemblance among all Religions. 1206 In all parts of the earth, we see, that religious notions, periodically depress and elevate the people. 1207 The attention of human is every where engrossed, by rites often abominable, and by mysteries always formidable, which become the sole objects of meditation. 1208 The different superstitions borrow, from one another, their abstract reveries and ceremonies. 1209 Religions are in general mere unintelligible rhapsodies, combined by new teachers, who use the materials of their predecessors, reserving the right of adding or retrenching whatever is not conformable to the present age. 1210 The religion of Egypt was evidently the basis of the religion of Moses, who banished the worship of idols: Moses was merely a schismatic Egyptian. 1211 Christianism is only reformed Judaism. Mahometanism is composed of Judaism, Christianity, and the ancient religion of Arabia, etc.

APOLOGUE

104

1212 Theology, from the remotest antiquity to the present time, has had the exclusive privilege of directing philosophy. 1213 What assistance has been derived from its labours? It changed philosophy into an unintelligible jargon, calculated to render uncertain the clearest truths; it has converted the art of reasoning into a jargon of words; 1214 it has carried the human mind into the airy regions of metaphysics, and there employed it in vainly fathoming an obscure abyss. 1215 Instead of

physical and simple causes, this transformed philosophy has substituted supernatural, or rather, 'occult' causes; 1216 it has explained phenomena difficult to be conceived by agents still more inconceivable. 1217 It has filled language with words, void of sense, incapable of accounting for things, better calculated to obscure than enlighten, 1218 and which seems invented expressly to discourage human, to guard you against the powers of your mind, to make you mistrust the principles of reason and evidence, and to raise an insurmountable barrier between you and truth.

APOLOGUE

105

1219 Were we to believe the partisans of Religion, nothing could be explained without it; Nature would be a perpetual enigma, and human would be incapable of understanding yourself. 1220 But, what does this Religion in reality explain? The more we examine it, the more we are convinced that its theological notions are fit only to confuse our ideas; 1221 they change every thing into mystery: they explain difficult things by things that are impossible. 1222 Is it a satisfactory explanation of phenomena, to attribute them to unknown agents, to invisible powers, to immaterial causes? 1223 Does the human mind receive much light by being referred to: 'the depths of the treasures of divine wisdom', to which, we are repeatedly told, it is vain to extend our rash enquiries? 1224 Can the divine nature, of which we have no conception, enable us to conceive the nature of human?

1225 Ask a Christian, what is the origin of the world? You will answer, that God created it. What is God? You cannot tell. What is it to create? You knows not. 1226 What is the cause of pestilence, famine, wars, droughts, inundations and earthquakes? The anger of God. 1227 What remedies can be applied to these calamities? Prayers, sacrifices, processions, offerings, and ceremonies are, it is said, the true means of disarming celestial fury. 1228 But why is heaven enraged? Because humans are wicked. Why are humans wicked? Because their nature is

corrupt. 1229 What is the cause of this corruption? It is, says the theologian, because the first man, beguiled by the first woman, ate an apple, which God had forbidden him to touch. 1230 Who beguiled this woman into such folly? The devil. Who made the devil? God. 1231 But, why did God make this devil, destined to pervert humankind? This is unknown; it is a mystery which the Deity alone is acquainted with.

1232 It is now universally acknowledged, that the earth turns round the sun. Centuries ago, this opinion was blasphemy, as being irreconcileable with the sacred books which every Christian reveres as inspired by the Deity Himself. 1233 Notwithstanding divine revelation, astronomers now depend rather upon evidence, than upon the testimony of their inspired books.

1234 What is the hidden principle of the motions of the human body? The soul. What is a soul? A spirit. What is a spirit? A substance, which has neither form, nor colour, nor extension, nor parts. 1235 How can we form any idea of such a substance? How can it move a body? That is not known; it is a mystery. 1236 Have beasts souls? But, do they not act, feel, and think, in a manner very similar to human? Mere illusion! 1237 By what right do you deprive beasts of a soul, which you attribute to human, though you know nothing at all about it? 1238 Because the souls of beasts would embarrass our theologians, who are satisfied with the power of terrifying and damning the immaterial souls of humans, and are not so much interested in damning those of beasts. 1239 Such are the puerile solutions, which philosophy, always in the leading strings of theology, was obliged to invent, in order to explain the problems of the physical and moral world?

APOLOGUE

106

1240 How many evasions have been used, both in ancient and modern times, in order to avoid an engagement with the ministers of the gods, who have ever been the tyrants of thought? 1241 How many hypotheses and shifts were such people as Descartes, Mallebranche, and Leibnitz, forced

to invent, in order to reconcile their discoveries with the fables and mistakes which Religion had consecrated! 1242 In what guarded phrases have the greatest philosophers expressed themselves, even at the risk of being absurd, inconsistent, or unintelligible, whenever their ideas did not accord with the principles of theology! 1243 Priests have been always attentive to extinguish systems which opposed their interest. 1244 Theology was ever the bed of Procrustes, to be adapted to which, the limbs of travellers, if too long were cut off, and if too short were lengthened.

1245 Can any sensible person, delighted with the sciences and attached to the welfare of your fellow-creatures, reflect, without vexation and anguish, how many profound, labourious, and subtle brains have been for ages foolishly occupied in the study of absurdities? 1246 What a treasure of knowledge might have been diffused by many celebrated thinkers, if instead of engaging in the impertinent disputes of vain theology, they had devoted their attention to intelligible objects really important to humankind? 1247 Half the efforts which religious opinions have cost genius, and half the wealth which frivolous forms of worship have cost nations would have sufficed to instruct them perfectly in morality, politics, natural philosophy, medicine, agriculture, etc. 1248 Superstition generally absorbs the attention, admiration, and treasures of the people; their Religion costs them very dear; but they have neither knowledge, virtue, nor happiness, for their money.

APOLOGUE

107

1249 Some ancient and modern philosophers have been bold enough to assume experience and reason for their guides, and to shake off the chains of superstition. 1250 Democritus, Epicurus, and other Greeks presumed to tear away the veil of prejudice, and to deliver philosophy from theological shackles. 1251 But their systems, too simple, too sensible, and too free from the marvellous, for imaginations enamoured with

chimeras, were obliged to yield to the fabulous conjectures of such people as Plato and Socrates. 1252 Among the moderns, Hobbes, Spinoza, Bayle, etc., have followed the steps of Epicurus; but their doctrine has found very few followers, in a world, still intoxicated with fables, to listen to reason.

1253 In every age, it has been dangerous to depart from prejudices. Discoveries of every kind have been prohibited. All that enlightened people could do, was to speak ambiguously, hence they often confounded falsehood with truth. 1254 Several had a ‘double doctrine’, one public and the other secret; the key of the latter being lost, their true sentiments, have often become unintelligible and consequently useless.

1255 How could modern philosophers, who, under pain of cruel persecution, were commanded to renounce reason, and to subject it to faith, that is, to the authority of priests; 1256 how, I say, could people, thus bound, give free scope to their genius, improve reason, and accelerate the progress of the human mind?

1257 It was with fear and trembling that even the greatest people obtained a glimpse of truth; rarely had they the courage to announce it; and those, who did, were terribly punished. 1258 With Religion, it has ever been unlawful to think, or to combat the prejudices of which human is every where the victim and the dupe.

APOLOGUE

108

1259 Every person, sufficiently intrepid to announce truths to the world, is sure of incurring the hatred of the ministers of Religion, who loudly call to their aid secular powers; and want the assistance of laws to support both their arguments and their gods. 1260 Their clamours expose too evidently the weakness of their cause. "None call for aid but those who feel distressed."

1261 In Religion, human is not permitted to err. In general, those who err are pitied, and some kindness is shewn to persons who discover new truths; 1262 but, when Religion is thought to be interested either in the errors or the

discoveries, a holy zeal is kindled, the populace become frantic, and nations are in an uproar.

1263 Can any thing be more afflicting, than to see public and private felicity depending upon a futile system, which is destitute if principles, founded only on a distempered imagination, and incapable of presenting any thing but words void of sense? 1264 In what consists the so much boasted utility of a Religion, which nobody can comprehend, which continually torments those who are weak enough to meddle with it, which is incapable of rendering people better, and which often makes them consider it meritorious to be unjust and wicked? 1265 Is there a folly more deplorable, and more justly to be combated, than that, which far from doing any service to the human race, only makes them blind, delirious, and miserable, by depriving them of Truth, the sole cure for their wretchedness.

APOLOGUE

109

1266 Religion has ever filled the mind of human with darkness, and kept you in ignorance of your real duties and true interests. 1267 It is only by dispelling the clouds and phantoms of Religion, that we shall discover Truth, Reason, and Morality. 1268 Religion diverts us from the causes of evils, and from the remedies which Nature prescribes; far from curing, it only aggravates, multiplies, and perpetuates them. 1269 Let us observe with the celebrated Lord Bolingbroke, that: "theology is the box of Pandora; and if it is impossible to shut it, it is at least useful to inform humans, that this fatal box is open."

NERVES AND COMMON-SENSE

Annie Payson Call

HABIT AND NERVOUS STRAIN

4 PEOPLE form habits which cause nervous strain. 2 When these habits have fixed themselves for long enough upon their victims, the nerves give way and severe depression or some other form of nervous prostration is the result. 3 If such an illness turns the attention to its cause, and so starts

the sufferer toward a radical change from habits which cause nervous strain to habits which bring nervous strength, then the illness can be the beginning of better and permanent health. 4 If, however, there simply is an enforced rest, without any intelligent understanding of the trouble, the invalid gets "well" only to drag out a miserable existence or to get very ill again.

5 Although any nervous suffering is worthwhile if it is the means of teaching us how to avoid nervous strain, it certainly is far preferable to avoid the strain without the extreme pain of a nervous breakdown.

6 To point out many of these pernicious habits and to suggest a practical remedy for each and all of them is the aim of this book, and for that reason common examples in various phases of every-day life are used as illustrations.

7 When there is no organic trouble there can be no doubt that: ‘defects of character, inherited or acquired, are at the root of all nervous illness’. 8 If this can once be generally recognised and acknowledged, especially by the sufferers themselves, we are in a fair way toward eliminating such illness entirely.

9 The trouble is people suffer from mortification and an unwillingness to look their bad habits in the face. 10 They have not learned that humiliation can be wholesome, sound, and healthy, and so they keep themselves in a mess of a fog because they will not face the shame necessary to get out of it. 11 They would rather be ill and suffering, and believe themselves to have strong characters than to look the weakness of their characters in the face, own up to them like humans, and come out into open fresh air with healthy nerves which will gain in strength as they live.

12 Any intelligent man or woman who thinks a bit for yourself can see the stupidity of this mistaken choice at a glance, and seeing it will act against it and thus do so much toward bringing light to all nervously prostrated humanity.

13 We can talk about faith cure, Christian Science, mind cure, hypnotism, psychotherapeutics, or any other forms of nerve cure

which at the very best can only give the person a gentle shunt toward the middle of the stream of life. 14 Once assured of the truth, the person must hold oneself in the clean wholesomeness of it by actively working for own strength of character ‘from your own initiative’. There can be no other permanent cure.

15 I say that strength of character must grow from our own initiative, 16 and I should add that it must be from our own initiative that we come to recognise and actively believe that we are dependent upon a power not our own and our real strength comes from ceasing to be an obstruction to that power. 17 The work of not interfering with our best health, moral and physical, means hard fighting and steady, never-ending vigilance. But it pays-- it more than pays! 18 And, it seems to me, this prevailing trouble of nervous strain which is so much with us now can be the means of guiding all men and women toward more solid health than has ever been known before. 19 But we must work for it! We must give up expecting to be cured.

HOW WOMEN CAN KEEP FROM BEING NERVOUS

Annie Payson Call

5 MANY people suffer unnecessarily from "nerves" just for the want of a little knowledge of how to adjust themselves in order that the nerves may get well. 2 As an example, I have in mind a little woman who had been ill for eight years-- eight of what might have been the best years of her life-- all because neither she nor her family knew the straight road toward getting well. 3 Now that she has found the path she has gained health wonderfully in six months, and promises to be better than ever before in her life.

4 Let me tell you how she became ill and then I can explain her process of getting well again. One night she was overtired and could not get to sleep, and became very much annoyed at various noises that were about the house. 5 Just after she had succeeded in stopping one noise she would go back to bed and hear several others. 6 Finally, she was so worked up and nervously strained over the noises that her hearing

became exaggerated, and she was troubled by noises that other people would not have even heard; so she managed to keep herself awake all night.

7 The next day the strain of the over-fatigue was, of course, very much increased, not only by the wakeful night, but also by the annoyance which had kept her awake. 8 The family were distressed that she should not have slept all night; talked a great deal about it, and called in the doctor.

9 The woman's strained nerves were on edge all day, so that her feelings were easily hurt, and her brothers and sisters became, as they thought, justly impatient at what they considered her silly babyishness. 10 This, of course, roused her to more strain. The overcare and the feeble, unintelligent sympathy that she had from some members of her family kept her weak and self-centered, 11 and the ignorant, selfish impatience with which the others treated her increased her nervous strain. 12 After this there followed various other worries and a personal sense of annoyance-- all of which made her more nervous.

13 Then-- the stomach and brain are so closely associated-- her digestion began to cause her discomfort: a lump in her stomach, her food "would not digest," and various other symptoms, 14 all of which mean strained and overwrought nerves, although they are more often attributed merely to a disordered stomach. 15 She worried as to what she had better eat and what she had better not eat. If her stomach was tired and some simple food disagreed with her all the discomfort was attributed to the food, instead of to the real cause,-- a tired stomach,-- and the cause back of that,-- strained nerves. 16 The consequence was that one kind of wholesome food after another was cut off as being impossible for her to eat. 17 Anything that this poor little invalid did not like about circumstances or people she felt ugly and cried over. 18 Finally, the entire family were centered about her illness, either in overcare or annoyance.

19 You see, she kept constantly repeating her brain impression of over-fatigue: first annoyance because she stayed awake; then

annoyance at noises; then excited distress that she should have stayed awake all night; then resistance and anger at other people who interfered with her. 20 Over and over that brain impression of nervous illness was repeated by the woman herself and people about her until she seemed settled into it for the rest of her life. 21 It was like expecting a sore to get well while it was constantly being rubbed and irritated. 22 A woman might have the healthiest blood in the world, but if she cut herself and then rubbed and irritated the cut, and put salt in it, it would be impossible for it to heal.

23 Now let me tell you how this little woman got well. The first thing she did was to take some very simple relaxing exercises while she was lying in bed. 24 She raised her arms very slowly and as loosely as she could from the elbow and then her hands from the wrist, and stretched and relaxed her fingers steadily, 25 then dropped her hand and forearm heavily, and felt it drop slowly at first, then quickly and quietly, with its own weight. 26 She tried to shut her eyes like a baby going to sleep, and followed that with long, gentle, quiet breaths. 27 These and other exercises gave her an impression of quiet relaxation so that she became more sensitive to superfluous tension.

28 When she felt annoyed at noises she easily noticed that in response to the annoyance her whole body became tense and strained. 29 After she had done her exercises and felt quiet and rested something would happen or some one would say something that went against the grain, 30 and quick as a wink all the good of the exercises would be gone and she would be tight and strained again, and nervously irritated.

31 Very soon she saw clearly that she must learn to drop the habit of physical strain if she wanted to get well; 32 but she also learned what was more-- far more-- important than that: that: ‘she must conquer the cause of the strain or she could never permanently drop it’. 33 She saw that the cause was resentment and resistance to the noises-- the circumstances, the people, and all the variety of things that had "made her nervous."

GOODNESS

34 Then she began her steady journey toward strong nerves and a wholesome, happy life. 35 She began the process of changing her brain impressions. If she heard noises that annoyed her she would use her will to direct her attention toward dropping resistance to the noises, 36 and in order to drop her mental resistance she gave her attention to loosening out the bodily contractions. 37 Finally she became interested in the new process as in a series of deep and true experiments. 38 Of course her living and intelligent interest enabled her to gain very much faster, for she not only enjoyed her growing freedom, but she also enjoyed seeing her experiments work. 39 Nature always tends toward health, and if we stop interfering with Her she will get us well.

40 There is just this difference between the healing of a physical sore and the healing of strained and irritated nerves. With the one our bodies are healed, and things go on in them about the same as before. 41 With the other, every use of the will to free ourselves from the irritation and its cause not only enables us to get free from the nervous illness, but in addition brings us new nerve vigour.

42 When nervous illness is met deeply enough and in the normal way, the result is that the nerves become stronger than ever before.

43 Often the effect of nervous strain in women is constant talking. Talk-- talk-- talk, and mostly about themselves, their ailments, their worries, and the hindrances that are put in their way to prevent their getting well. 44 This talking is not a relief, as people sometimes feel. It is a direct waste of vigour. But the waste would be greater if the talk were repressed. 45 The only real help comes when the talker herself recognises the strain of her talk and "loosens" into silence.

46 People must find themselves out to get well-- really well-- from nervous suffering. 47 The cause of nervous strain is so often in the character and in the way we meet circumstances and people that it seems essential to recognise our mistakes in that direction, and to face them squarely before we can do our part toward removing the causes of any nervous illness.

GOODNESS

48 Remember it is not circumstances that keep us ill. It is not people that cause our illness. It is not our environment that overcomes us. 49 It is the way we face and deal with circumstances, with people, and with environment that keeps our nerves irritated or keeps them quiet and wholesome and steady.

50 Let me tell the story of two men, both of whom were brought low by severe nervous breakdown. 51 One complained of his environment, complained of circumstances, complained of people. Everything and every one was the cause of his suffering, except himself. 52 The result was that he weakened his brain by the constant willful and enforced strain, so that what little health he regained was the result of Nature's steady and powerful tendency toward health, and in spite of the man himself.

53 The other man-- to give a practical instance-- returned from a journey taken in order to regain the strength which he had lost from not knowing how to work. 54 His business agent met him at the railroad station with a piece of very bad news. 55 Instead of being frightened and resisting and contracting in every nerve of his body, he took it at once as an opportunity to drop resistance. 56 He had learned to relax his body, and by doing relaxing and quieting exercises over and over he had given himself a brain impression of quiet and "let go" which he could recall at will. 57 Instead of expressing distress at the bad news he used his will at once to drop resistance and relax; 58 and, to the surprise of his informant, who had felt that he must break his bad news as easily as possible, he said "Anything else?" 59 Yes, there was another piece of news about as bad as the first. "Go on," answered the man who had been sick with nerves; "tell me something else."

60 And so he did, until he had told him five different things which were about as disagreeable and painful to hear as could have been. 61 For every bit of news our friend used his will with decision to drop the resistance, which would, of course, at once arise in response to all that seemed to go against him.

62 He had, of course, to work at intervals for long afterward to

keep free from the resistance; but the habit is getting more and more established as life goes on with him, 63 and the result is a brain clearer than ever before in his life, a power of nerve which is a surprise to every one about him, and a most successful business career.

64 The success in business is, however, a minor matter. His brain would have cleared and his nerve strengthened just the same if what might be called the business luck had continued to go against him, as it seemed to do for the first few months after his recovery. 65 That everything did go against him for some time was the greatest blessing he could have had. The way he met all the reverses increased his nerve power steadily and consistently.

66 These two men are fair examples of two extremes. The first one did not know how to meet life. If he had had the opportunity to learn he might have done as well as the other. 67 The second had worked and studied to help himself out of nerves, and had found the true secret of doing it.

68 Some men, however, and, I regret to say, more women, have the weakening habit so strong upon them that they are unwilling to learn how to get well, even when they have the opportunity. 69 It seems so strange to see people suffer intensely-- and be unwilling to face and follow the only way that will lead them out of their torture.

70 The trouble is we want our own way and nervous health, too, and with those who have once broken down nervously the only chance of permanent health is through learning to drop the strain of resistance when things do not go their way. 71 This is proved over and over by the constant relapse into "nerves" which comes to those who have simply been healed over. 72 Even with those who appear to have been well for some time, if they have not acquired the habit of dropping their mental and physical tension you can always detect an overcare for themselves which means dormant fear-- or even active fear in the background.

73 There are some wounds which the surgeons keep open, even

though the process is most painful, because they know that to heal really they must heal from the inside. 74 Healing over on the outside only means decay underneath, and eventual death. This is in most cases exactly synonymous with the healing of broken-down nerves. 75 They must be healed in causes to be permanently cured. Sometimes the change that comes in the process is so great that it is like reversing an engine.

76 If the little woman whom I mentioned first had practiced relaxing and quieting exercises every day for years, and had not used the quiet impression gained by the exercises to help her in dropping mental resistances, she never would have gained her health.

77 Concentrating steadily on dropping the tension of the body is very radically helpful in dropping resistance from the mind, 78 and the right idea is to do the exercises over and over until the impression of quiet openness is, by constant repetition, so strong with us that we can recall it at will whenever we need it. 79 Finally, after repeated tests, we gain the habit of meeting the difficulties of life without strain-- first in little ways, and then in larger ways.

80 The most quieting, relaxing, and strengthening of all exercises for the nerves comes in deep and rhythmic breathing, and in voice exercises in connection with it. 80 Nervous strain is more evident in a voice than in any other expressive part of man or woman. 81 It sometimes seems as if all other relaxing exercises were mainly useful because of opening a way for us to breathe better. 82 There is a pressure on every part of the body when we inhale, and a consequent reaction when we exhale, and the more passive the body is when we take our deep breaths the more freely and quietly the blood can circulate all the way through it, 83 and, of course, all nervous and muscular contraction impairs circulation, and all impaired circulation emphasises nervous contraction.

84 To any one who is suffering from "nerves," in a lesser or greater degree, it could not fail to be of very great help to take half an hour in the morning, lie flat on

the back, with the body as loose and heavy as it can be made, 85 and then study taking gentle, quiet, and rhythmic breaths, long and short. Try to have the body so loose and open and responsive that it will open as you inhale and relax as you exhale, just as a rubber bag would. 86 Of course, it will take time, but the refreshing quiet is sure to come if the practice is repeated regularly for a long enough time, and eventually we would no more miss it than we would go without our dinner.

87 We must be careful after each deep, long breath to rest quietly and let our lungs do as they please. 88 Be careful to begin the breaths delicately and gently, to inhale with the same gentleness with which we begin, and to make the change from inhaling to exhaling with the greatest delicacy possible-- keeping the body loose.

89 For the shorter breaths we can count three, or five, or ten to inhale, and the same number to exhale, until we have the rhythm established, and then go on breathing without counting, as if we were sound asleep. 90 Always aim for gentleness and delicacy. If we have not half an hour to spare to lie quietly and breathe we can practice the breathing while we walk. 91 It is wonderful how we detect strain and resistance in our breath, and the restfulness which comes when we breathe so gently that the breath seems to come and go without our volition brings new life with it.

92 We must expect to gain slowly and be patient; we must remember that nerves always get well by ups and downs, and use our wills to make every down lead to a higher up. 93 If we want the lasting benefit, or any real benefit at all when we get the brain impression of quiet freedom from these breathing exercises, we must insist upon recalling that impression every time a test comes, 94 and face the circumstances, or the person, or the duty with a voluntary insistence upon a quiet, open brain, rather than a tense, resistant one.

95 It will come hard at first, but we are sure to get there if we keep steadily at it, for it is really the Law of the Lord God Almighty that we are learning to obey, 96 and this process of learning gives

us steadily an enlarged appreciation of what trust in the Lord really is. 97 There is no trust without obedience, and an intelligent obedience begets trust. 98 The nerves touch the soul on one side and the body on the other, and we must work for freedom of soul and body in response to spiritual and physical law if we want to get sick nerves well. 99 If we do not remember always a childlike attitude toward the Lord the best nerve training is only an easy way of being selfish.

100 To sum it all up-- if you want to learn to help yourself out of "nerves" learn to rest when you rest and to work without strain when you work; 101 learn to loosen out of the muscular contractions which the nerves cause; 102 learn to drop the mental resistances which cause the "nerves," and which take the form of anger, resentment, worry, anxiety, impatience, annoyance, or self-pity; 103 eat only nourishing food, eat it slowly, and chew it well; breathe the freshest air you can, and breathe it deeply, gently, and rhythmically; 104 take what healthy, vigourous exercise you find possible; do your daily work to the best of your ability; 105 give your attention so entirely to the process of gaining health for the sake of your work and other people that you have no mind left with which to complain of being ill, 106 and see that all this effort aims toward a more intelligent obedience to and trustfulness in the Power that gives us life. 107 Wholesome, sustained concentration is in the very essence of healthy nerves.

"YOU HAVE NO IDEA HOW I AM RUSHED"

Annie Payson Call

6 A WOMAN can feel rushed when she is sitting perfectly still and has really nothing whatever to do. 2 A woman can feel at leisure when she is working diligently at something, with a hundred other things waiting to be done when the time comes. 3 It is not all we have to do that gives us the rushed feeling; it is the way we do what is before us. It is the attitude we take toward our work.

4 Now this rushed feeling in the brain and nerves is intensely oppressive. Many women, and men too, suffer from it keenly, 5 and they suffer the more because they do not recognise that that feeling of rush is really entirely distinct from what they have to do; in truth it has nothing whatever to do with it.

6 I have seen a woman suffer painfully with the sense of being pushed for time when she had only two things to do in the whole day, and those two things at most need not take more than an hour each. 7 This same woman was always crying for rest. I never knew, before I saw her, that women could get just as abnormal in their efforts to rest as in their insistence upon overwork. 8 This little lady never rested when she went to rest; she would lie on the bed for hours in a state of strain about resting that was enough to tire any ordinarily healthy woman. 9 One friend used to tell her that she was an inebriate on resting. It is perhaps needless to say that she was a nervous invalid, and in the process of gaining her health she had to be set to work and kept at work. 10 Many and many a time she has cried and begged for rest when it was not rest she needed at all: it was work.

11 She has started off to some good, healthy work crying and sobbing at the cruelty that made her go, and has returned from the work as happy and healthy, apparently, as a little child. 12 Then she could go to rest and rest to some purpose. She had been busy in wholesome action and the normal reaction came in her rest. 13 As she grew more naturally interested in her work she rested less and less, and she rested better and better because she had something to rest from and something to rest for.

14 Now she does only a normal amount of resting, but gets new life from every moment of rest she takes; 15 before, all her rest only made her want more rest and kept her always in the strain of fatigue. 16 And what might seem to many a very curious result is that as the abnormal desire for rest disappeared the rushed feeling disappeared, too.

17 There is no one thing that American women need more than

a healthy habit of rest, but it has got to be real rest, not strained nor self-indulgent rest.

18 Another example of this effort at rest which is a sham and a strain is the woman who insists upon taking a certain time every day in which to rest. 19 She insists upon doing everything quietly and with-- as she thinks-- a sense of leisure, and yet she keeps the whole household in a sense of turmoil and does not know it. 20 She sits complacently in her pose of prompt action, quietness and rest, and has a tornado all about her. 21 She is so deluded in her own idea of herself that she does not observe the tornado, and yet she has caused it. 22 Everybody in her household is tired out with her demands, and she herself is ill, chronically ill. But she thinks she is at peace, and she is annoyed that others should be tired.

23 If this woman could open and let out her own interior tornado, which she has kept frozen in there by her false attitude of restful quiet, she would be more ill for a time, 24 but it might open her eyes to the true state of things and enable her to rest to some purpose and to allow her household to rest, too.

25 It seems, at first thought, strange that in this country, when the right habit of rest is so greatly needed, that the strain of rest should have become in late years one of the greatest defects. 26 On second thought, however, we see that it is a perfectly rational result. We have strained to work and strained to play and strained to live for so long that when the need for rest gets so imperative that we feel we must rest the habit of strain is so upon us that we strain to rest. 27 And what does such "rest" amount to? What strength does it bring us? What enlightenment do we get from it?

28 With the little lady of whom I first spoke rest was a steadily-weakening process. She was resting her body straight toward its grave. 29 When a body rests and rests the circulation gets more and more sluggish until it breeds disease in the weakest organ, and then the physicians seem inclined to give their attention to the disease, and not to the cause of the abnormal strain which was behind the disease. 30 Again, as we have

seen, the abnormal, rushed feeling can exist just as painfully with too much and the wrong kind of rest as with too much work and the wrong way of working.

31 We have been, as a nation, inclined toward "Americanitis" for so long now that children and children's children have inherited a sense of rush, 32 and they suffer intensely from it with a perfectly clear understanding of the fact that they have nothing whatever to hurry about. 33 This is quite as true of men as it is of women. In such cases the first care should be not to fasten this sense of rush on to anything; 34 the second care should be to go to work to cure it, to relax out of that contraction--just as you would work to cure twitching St. Vitus's dance, or any other nervous habit.

35 Many women will get up and dress in the morning as if they had to catch a train, and they will come in to breakfast as if it were a steamer for the other side of the world that they had to get, and no other steamer went for six months. 36 They do not know that they are in a rush and a hurry, and they do not find it out until the strain has been on them for so long that they get nervously ill from it-- and then they find themselves suffering from "that rushed feeling."

37 Watch some women in an argument pushing, actually rushing, to prove themselves right; they will hardly let their opponent have an opportunity to speak, much less will they stop to consider what he says and see if by chance he may not be right and they wrong.

38 The rushing habit is not by any means in the fact of doing many things. It asserts itself in our brains in talking, in writing, in thinking. 39 How many of us, I wonder, have what might be called a quiet working brain? Most of us do not even know the standard of a brain that thinks and talks and lives quietly: 40 a brain that never pushes and never rushes, or, if by any chance it is led into pushing or rushing, is so wholesomely sensitive that it drops the push or the rush as a bare hand would drop a red-hot coal.

41 None of us can appreciate the weakening power of this strained habit of rush until we have, by the use of our own wills, directed our

minds toward finding a normal habit of quiet, 42 and yet I do not in the least exaggerate when I say that its weakening effect on the brain and nerves is frightful.

43 And again I repeat, the rushed feeling has nothing whatever to do with the work before us. 44 A woman can feel quite as rushed when she has nothing to do as when she is extremely busy.

45 "But," some one says, "may I not feel pressed for time when I have more to do than I can possibly put into the time before me?"

46 Oh, yes, yes-- you can feel normally pressed for time; and because of this pressure you can arrange in your mind what best to leave undone, and so relieve the pressure. 47 If one thing seems as important to do as another you can make up your mind that of course you can only do what you have time for, and the remainder must go. 48 You cannot do what you have time to do so well if you are worrying about what you have no time for. There need be no abnormal sense of rush about it.

49 Just as Nature tends toward health, Nature tends toward rest-- toward the right kind of rest; 50 and if we have lost the true knack of resting we can just as surely find it as a sunflower can find the sun. 51 It is not something artificial that we are trying to learn-- it is something natural and alive, something that belongs to us, 52 and our own best instinct will come to our aid in finding it if we will only first turn our attention toward finding our own best instinct.

53 We must have something to rest from, and we must have something to rest for, if we want to find the real power of rest. 54 Then we must learn to let go of our nerves and our muscles, to leave everything in our bodies open and passive so that our circulation can have its own best way. 55 But we must have had some activity in order to have given our circulation a fair start before we can expect it to do its best when we are passive.

56 Then, what is most important, we must learn to drop all effort of our minds if we want to know how to rest; and that is difficult. 57 We can do it best by keeping our minds concentrated on something simple and quiet and wholesome.

58 For instance, you feel tired and rushed and you can have half an hour in which to rest and get rid of the rush. 59 Suppose you lie down on the bed and imagine yourself a turbulent lake after a storm. The storm is dying down, dying down, until by and by there is no wind, only little dashing waves that the wind has left. 60 Then the waves quiet down steadily, more and more, until finally they are only ripples on the water. 61 Then no ripples, but the water is as still as glass. The sun goes down. The sky glows. Twilight comes. 62 One star appears, and green banks and trees and sky and stars are all reflected in the quiet mirror of the lake, 63 and you are the lake, and you are quiet and refreshed and rested and ready to get up and go on with your work-- to go on with it, too, better and more quietly than when you left it.

64 Or, another way to quiet your mind and to let your imagination help you to a better rest is to float on the top of a turbulent sea and then to sink down, down, down until you get into the still water at the bottom of the sea. 65 We all know that, no matter how furious the sea is on the surface, not far below the surface it is absolutely still. It is very restful to go down there in imagination.

66 Whatever choice we may make to quiet our minds and our bodies, as soon as we begin to concentrate we must not be surprised if intruding thoughts are at first constantly crowding to get in. 67 We must simply let them come. Let them come, and pay no attention to them.

68 I knew of a woman who was nervously ill, and some organs of her body were weakened very much by the illness. 69 She made-up her mind to rest herself well and she did so. Every day she would rest for three hours; she said to herself, "I will rest an hour on my left side, an hour on my right side, and an hour on my back." 70 And she did that for days and days. When she lay on one side she had a very attractive tree to look at. When she lay on the other she had an interesting picture before her. 71 When she lay on her back she had the sky and several trees to see through a window in front of the bed. 72 She grew steadily better every week-- she

had something to rest for. She was resting to get well. 73 If she had rested and complained of her illness I doubt if she would have been well to-day. 74 She simply refused to take the unpleasant sensations into consideration except for the sake of resting out of them. 75 When she was well enough to take a little active exercise she knew she could rest better and get well faster for that, 76 and she insisted upon taking the exercise, although at first she had to do it with the greatest care. 77 Now that this woman is well she knows how to rest and she knows how to work better than ever before.

78 For normal rest we need the long sleep of night. 79 For shorter rests which we may take during the day, often opportunity comes at most unexpected times and in most unexpected ways, and we must be ready to take advantage of it. 80 We need also the habit of working restfully. This habit of course enables us to rest truly when we are only resting, and again the habit of resting normally helps us to work normally.

81 A wise old lady said: "My dear, you cannot exaggerate the unimportance of things." She expressed even more, perhaps, than she knew.

82 It is our habit of exaggerating the importance of things that keeps us hurried and rushed. 83 It is our habit of exaggerating the importance of ourselves that makes us hold the strain of life so intensely. 84 If we would be content to do one thing at a time, and concentrate on that one thing until it came time to do the next thing, it would astonish us to see how much we should accomplish. 85 A healthy concentration is at the root of working restfully and of resting restfully, for a healthy concentration means dropping everything that interferes.

86 I know there are women who read this article who will say; "Oh, yes, that is all very well for some women, but it does not apply in the least to a woman who has my responsibilities, or to a woman who has to work as I have to work."

87 My answer to that is: "Dear lady, you are the very one to whom it does apply!"

GOODNESS

88 The more work we have to do, the harder our lives are, the more we need the best possible principles to lighten our work and to enlighten our lives. 89 We are here in the world at school and we do not want to stay in the primary classes.

90 The harder our lives are and the more we are handicapped, the more truly we can learn to make every limitation an opportunity-- 91 and if we persistently do that through circumstances, no matter how severe, the nearer we are to getting our diploma. 92 To gain our freedom from the rushed feeling, to find a quiet mind in place of an unquiet one, is worth working hard for through any number of difficulties. 93 And think of the benefit such a quiet mind could be to other people! Especially if the quiet mind were the mind of a woman, for, at the present day, think what a contrast she would be to other women!

94 When a woman's mind is turbulent it is the worst kind of turbulence. When it is quiet we can almost say it is the best kind of quiet, humanly speaking.

WHY DOES MRS. SMITH
GET ON MY NERVES?
Annie Payson Call

7 IF you want to know the true answer to this question it is "because you are unwilling that Mrs. Smith should be herself." 2 You want her to be just like you, or, if not just like you, you want her to be just as you would best like her.

3 I have seen a woman so annoyed that she could not eat her supper because another woman ate sugar on baked beans. 4 When this woman told me later what it was that had taken away her appetite she added: "And isn't it absurd? 5 Why shouldn't Mrs. Smith eat sugar on baked beans? It does not hurt me. I do not have to taste the sugar on the beans; but is it such an odd thing to do. It seems to me such bad manners that I just get so mad I can't eat!"

6 Now, could there be anything more absurd than that? To see a woman annoyed; to see her recognise that she was uselessly and foolishly annoyed, and yet to see that she makes not the slightest effort to get over her annoyance.

7 It is like the woman who discovered that she spoke aloud in church, and was so surprised that she exclaimed: "Why, I spoke out loud in church!" 8 And then, again surprised, she cried: "Why, I keep speaking aloud in church!"-- and it did not occur to her to stop.

9 My friend would have refused an invitation to supper, I truly believe, if she had known that Mrs. Smith would be there and her hostess would have baked beans. 10 She was really a slave to Mrs. Smith's way of eating baked beans. "Well, I do not blame her," I hear some reader say; "it is entirely out of place to eat sugar on baked beans. Why shouldn't she be annoyed?"

11 I answer: "Why should she be annoyed? Will her annoyance stop Mrs. Smith's eating sugar on baked beans? Will she in any way-- selfish or otherwise-- be the gainer for her annoyance? 12 Furthermore, if it were the custom to eat sugar on baked beans, as it is the custom to put sugar in coffee, this woman would not have been annoyed at all. 13 It was simply the fact of seeing Mrs. Smith digress from the ordinary course of life that annoyed her."

14 It is the same thing that makes a horse shy. The horse does not say to itself, "There is a large carriage, moving with no horse to pull it, with nothing to push it, with-- so far as I can see-- no motive power at all. 15 How weird that is! How frightful!"-- and, with a quickly beating heart, jump aside and caper in scared excitement. 16 A horse when it first sees an automobile gets an impression on its brain which is entirely out of its ordinary course of impressions-- it is as if some one suddenly and unexpectedly struck the horse, and it shies and jumps. 17 The horse is annoyed, but it does not know what it is that annoys it. Now, when a horse shies you drive it away from the automobile and quiet it down, 18 and then, if you are a good trainer, you drive it back again right in front of that car or some other one, and you repeat the process until the automobile becomes an ordinary impression to it, and is no longer afraid of it.

19 There is, however, just this difference between a woman and a horse: the woman has her own free-will behind her annoyance, and a horse has not. 20 If my friend

had asked Mrs. Smith to supper twice a week, and had served baked beans each time and herself passed her the sugar with careful courtesy, 21 and if she had done it all deliberately for the sake of getting over her annoyance, she would probably have only increased it until the strain would have got on her nerves much more seriously than Mrs. Smith ever had. 22 Not only that, but she would have found herself resisting other people's peculiarities more than ever before; 23 I have seen people in nervous prostration from causes no more serious than that, on the surface. 24 It is the habit of resistance and resentment back of the surface annoyance which is the serious cause of many a woman's attack of nerves.

25 Every woman is a slave to every other woman who annoys her. She is tied to each separate woman who has got on her nerves by a wire which is pulling, pulling the nervous force right out of her. 26 And it is not the other woman's fault-- it is her own. 27 The wire is pulling, whether or not we are seeing or thinking of the other woman, for, having once been annoyed by her, the contraction is right there in our brains. 28 It is just so much deposited strain in our nervous systems which will stay there until we, of our own free-wills, have yielded out of it.

29 The horse was not resenting nor resisting the automobile; therefore the strain of its fright was at once removed when the automobile became an ordinary impression. 30 A woman, when she gets a new impression that she does not like, resents and resists it with her will, and she has got to get in behind that resistance and drop it with her will before she is a free woman.

31 To be sure, there are many disagreeable things that annoy for a time, and then, as the expression goes, we get hardened to them. 32 But few of us know that this hardening is just so much packed resistance which is going to show itself later in some unpleasant form and make us ill in mind or body. 33 We have got to yield, yield, yield out of every bit of resistance and resentment to other people if we want to be free. 34 No reasoning about it is going to do us any good. No passing back and forth in front of it is going to free

us. We must yield first and then we can see clearly and reason justly. 35 We must yield first and then we can go back and forth in front of it, and it will only be a reminder to yield every time 36 until the habit of yielding has become habitual and the strength of nerve and strength of character developed by means of the yielding have been established.

37 Let me explain more fully what I mean by "yielding." Every annoyance, resistance, or feeling of resentment contracts us in some way physically; 38 if we turn our attention toward dropping that physical contraction, with a real desire to get rid of the resistance behind it, we shall find that dropping the physical strain opens the way to drop the mental and moral strain, 39 and when we have really dropped the strain we invariably find reason and justice and even generousity toward others waiting to come to us.

40 There is one important thing to be looked out for in this normal process of freeing ourselves from other people. A young girl said once to her teacher: "I got mad the other day and I relaxed, and the more I relaxed the madder I got!"

41 "Did you want to get over the anger?" asked the teacher.

"No, I didn't," was the prompt and ready answer.

42 Of course, as this child relaxed out of the tension of her anger, there was only more anger to take its place, 43 and the more she relaxed the more free her nerves were to take the impression of the anger hoarded up in her; consequently it was as she said: the more she relaxed the "madder" she got. 44 Later, this same little girl came to understand fully that she must have a real desire to get over her anger in order to have better feelings come up after she had dropped the contraction of the anger.

45 I know of a woman who has been holding such steady hatred for certain other people that the strain of it has kept her ill. 46 And it is all a matter of feeling: first, that these people have interfered with her welfare; second, that they differ from her in opinion. 47 Every once in a while her hatred finds a vent and spends itself in tears and bitter words. 48 Then,

after the external relief of letting out her pent-up feeling, she closes up again and one would think from her voice and manner-- if one did not look very deep in-- that she had only kindliness for every one. But she stays nervously ill right along.

49 How could she do otherwise with that strain in her? If she were constitutionally a strong woman this strain of hatred would have worn on her, though possibly not have made her really ill; 50 but, being naturally sensitive and delicate, the strain has kept her an invalid altogether.

51 "Mother, I can't stand Maria," one daughter says to her mother, and when inquiry is made the mother finds that what her daughter "cannot stand" is ways that differ from her own. 52 Sometimes, however, they are very disagreeable ways which are exactly like the ways of the person who cannot stand them. 53 If one person is imperious and demanding she will get especially annoyed at another person for being imperious and demanding, without a suspicion that she is objecting vehemently to a reflection of herself.

54 There are two ways in which people get on our nerves. The first way lies in their difference from us in habit-- in little things and in big things; their habits are not our habits. 55 Their habits may be all right, and our habits may be all right, but they are "different." Why should we not be willing to have them different? 56 Is there any reason for it except the very empty one that we consciously and unconsciously want every one else to be just like us, or to believe just as we do, or to behave just as we do? And what sense is there in that?

57 "I cannot stand Mrs. So-and-so; she gets into a rocking-chair and rocks and rocks until I feel as if I should go crazy!" some one says. But why not let Mrs. So-and-so rock? 58 It is her chair while she is in it, and her rocking. Why need it touch us at all?

59 "But," I hear a hundred women say, "it gets on our nerves; how can we help its not getting on our nerves?" 60 The answer to that is: "Drop it off your nerves." I know many women who have tried it

and who have succeeded, and who are now profiting by the relief. 61 Sometimes the process to such freedom is a long one; sometimes it is a short one; but, either way, the very effort toward it brings nervous strength, as well as strength of character.

62 Take the woman who rocks. Practically every time she rocks you should relax, actually and consciously relax your muscles and your nerves. 63 The woman who rocks need not know you are relaxing; it all can be done from inside. 64 Watch and you will find your muscles strained and tense with resistance to the rocking. Go to work practically to drop every bit of strain that you observe. 65 As you drop the grossest strain it will make you more sensitive to the finer strain and you can drop that-- 66 and it is even possible that you may seek the woman who rocks, in order to practice on her and get free from the habit of resisting more quickly.

67 This seems comical-- almost ridiculous-- to think of seeking an annoyance in order to get rid of it; but, after laughing at it first, look at the idea seriously, and you will see it is common-sense. 68 When you have learned to relax to the woman who rocks you have learned to relax to other similar annoyances. 69 You have been working on a principle that applies generally. You have acquired a good habit which can never really fail you.

70 If my friend had invited Mrs. Smith to supper and served baked beans for the sake of relaxing out of the tension of her resistance to the sugar, then she could have conquered that resistance. 71 But to try to conquer an annoyance like that without knowing how to yield in some way would be, so far as I know, an impossibility. 72 Of course, we would prefer that our friends should not have any disagreeable, ill-bred, personal ways, but we can go through the world without resisting them, and there is no chance of helping any one out of them through our own resistances.

73 On the other hand a way may open by which the woman's attention is called to the very unhealthy habit of rocking-- or eating sugar on beans-- if we are ready, without resistance, to point

it out to her. 74 And if no way opens we have at least put ourselves out of bondage to her. 75 The second way in which other people get on our nerves is more serious and more difficult. Mrs. So-and-so may be doing very wrong-- really very wrong; 76 or some one who is nearly related to us may be doing very wrong-- and it may be our most earnest and sincere desire to set them right. 77 In such cases the strain is more intense because we really have right on our side, in our opinion, if not in our attitude toward the other person. 78 Then, to recognise that if some one else chooses to do wrong it is none of our business is one of the most difficult things to do-- for a woman, especially.

79 It is more difficult to recognise practically that, in so far as it may be our business, we can best put ourselves in a position to enable the other person to see their own mistake by dropping all personal resistance to it and all personal strain about it. 80 Even a mother with her son can help him to be a man much more truly if she stops worrying about and resisting his unmanliness.

81 "But," I hear some one say, "that all seems like such cold indifference." Not at all-- not at all. Such freedom from strain can be found only through a more actively affectionate interest in others. 82 The more we truly love another, the more thoroughly we respect that other's individuality.

83 The other so-called love is only love of possession and love of having our own way. It is not really love at all; it is sugar-coated tyranny. 84 And when one sugar-coated tyrant' antagonises herself against another sugar-coated tyrant the strain is severe indeed, and nothing good is ever accomplished.

85 The Roman infantry fought with a fixed amount of space about each soldier, and found that the greater freedom of individual activity enabled them to fight better and to conquer their foes. 86 This symbolises happily the process of getting people off our nerves. Let us give each one a wide margin and thus preserve a good margin for ourselves.

87 We rub up against other people's nerves by getting too near to them-- not too near to their real

selves, but too near, so to speak, to their nervous systems. 88 There have been quarrels between good people just because one phase of nervous irritability roused another. 89 Let things in other people go until you have entirely dropped your strain about them-- then it will be clear enough what to do and what to say, or what not to do and what not to say. 90 People in the world cannot get on our nerves unless we allow them to do so.

THE TRYING MEMBER OF THE FAMILY
Annie Payson Call

8 "TOMMY, don't do that. You know it annoys your grandfather."

"Well, why should he be annoyed? I am doing nothing wrong."

2 "I know that, and it hurts me to ask you, but you know how he will feel if he sees you doing it, and you know that troubles me."

3 Reluctantly and sullenly Tommy stopped. Tommy's mother looked strained and worried and discontented. Tommy had an expression on his face akin to that of a smouldering volcano.

4 If any one had taken a good look at the grandfather it would have been very clear that Tommy was his own grandson, 5 and that the old man and the child were acting and reacting upon one another in a way that was harmful to both; although the injury was, of course, worse to the child, for the grandfather had toughened. 6 The grandfather thought he loved his little grandson, and the grandson, at times, would not have acknowledged that he did not love his grandfather. At other times, with childish frankness, he said he "hated him."

7 But the worst of this situation was that although the mother loved her son, and loved her father, and sincerely thought that she was the family peacemaker, she was all the time fanning the antagonism.

8 Here is a contrast to this little story. An old uncle came into the family of his nephew to live, late in life, and with a record behind him of whims and crotchets in the extreme. 9 The father and mother talked it over. Uncle James must come. He had lost all his money. There was no one else to look after him and they could not afford to

support him elsewhere where he would be comfortable. 10 They took it into account, without offence, that it was probably just as much a cross to Uncle James to come as it was to them to have him. 11 They took no pose of magnanimity such as: "Of course we must be good and offer Uncle James a home," and "How good we are to do it!" 12 Uncle James was to come because it was the only thing for him to do. The necessity was to be faced and fought and conquered, and they had three strong, self-willed little children to face it with them. 13 They had sense enough to see that if faced rightly it would do only good to the children, but if made a burden to groan over it would make their home a "hornets' nest." 14 They agreed to say nothing to the children about Uncle James's peculiarities, but to await developments.

15 Children are always delighted at a visit from a relative, and they welcomed their great-uncle with pleasure. 16 It was not three days, however, before every one of the three was crying with dislike and hurt feelings and anger. Then was the time to begin the campaign.

17 The mother, with a happy face, called the three children to her, and said "Now listen, children. Do you suppose I like Uncle James's irritability any better than you do?"

18 "No," came in a chorus; "we don't see how you stand it, Mother."

Then she said: "Now look here, boys, do you suppose that Uncle James likes his snapping any better than we do?"

19 "If he does not like it why does he do it?" answered the boys.

"I cannot tell you that; that is his business and not yours or mine," said the mother; "but I can prove to you that he does not like it. 20 Bobby, do you remember how you snapped at your brother yesterday, when he accidentally knocked your house over?"

"Yes!" replied Bobby.

"Did you feel comfortable after it?"

"You bet I didn't," was the quick reply.

21 "Well," answered the mother, "you boys stop and think just how disagreeable it is inside of you when you snap, and then think how it would be if you had to feel like that as much as Uncle James does."

"By golly, but that would be bad," said the twelve-year-old.

22 "Now, boys," went on the mother, "you want to relieve Uncle James's disagreeable feelings all you can, and don't you see that you increase them when you do things to annoy him? 23 His snappish feelings are just like a sore that is smarting and aching all the time, and when you get in their way it hurts as if you rubbed the sore. 24 Keep out of his way when you can, and when you can't and he snaps at you, say: 'I beg your pardon, sir,' like gentlemen, and stop doing what annoys him; or get out of his way as soon as you can."

25 Uncle James never became less snappish. But the upright, manly courtesy of those boys toward him was like fresh air on a mountain, especially because it had become a habit and was all as a matter of course. 26 The father and mother realised that Uncle James had, unconsciously, made men of their boys as nothing else in the world could have done, 27 and had trained them so that they would grow up tolerant and courteous toward all human peculiarities.

28 Many times a gracious courtesy toward the "trying member" will discover good and helpful qualities that we had not guessed before. 29 Sometimes after a little honest effort we find that it is ourselves who have been the trying members, and that the other one has been the member tried. 30 Often it is from two members of the family that the trying element comes. Two sisters may clash, and they will generally clash because they are unlike. 31 Suppose one sister moves and lives in big swings, and the other in minute details. Of course when these extreme tendencies are accented in each the selfish temptation is for the larger mind to lapse into carelessness of details, and for the smaller mind to shrink into pettiness, 32 and as this process continues the sisters get more and more intolerant of each other, and farther and farther apart. 33 But if the sister who moves in the big swings will learn from the other to be careful in details, and if the smaller mind will allow itself to be enlarged by learning from the habitually broader view of the other, 34 each will grow in proportion, and two women who began life as enemies in

temperament can end it as happy friends.

35 There are similar cases of brothers who clash, but they are not so evident, for when men do not agree they leave one another alone. 36 Women do not seem to be able to do that. It is good to leave one another alone when there is the clashing tendency, but it is better to conquer the clashing and learn to agree.

37 So long as the normal course of my life leads me to live with some one who rubs me the wrong way I am not free until I have learned to live with that some one in quiet content. 38 I never gain my freedom by running away. The bondage is in me always, so long as the other person's presence can rouse it. The only way is to fight it out inside of one's self. 39 When we can get the co-operation of the other so much the better. But no one's co-operation is necessary for us to find our own freedom, and with it an intelligent, tolerant kindliness.

40 "Mother, you take that seat. No, not that one, Mother-- the sun comes in that window. Children, move aside and let your grandmother get to her seat."

41 The young woman was very much in earnest in seeing that her mother had a comfortable seat, that she had not the discomfort of the hot sun, that the children made way for her so that she could move into her seat comfortably. 42 All her words were thoughtful and courteous, but the spirit and the tone of her words were quite the reverse of courteous. 43 If some listener with his eyes shut had heard the tone without understanding the words he might easily have thought that the woman was talking to a little dog.

44 Poor "Mother" trotted into her seat with the air of a little dog who was so well trained that it did at once what its mistress ordered. 45 It was very evident that "Mother's" will had been squeezed out of her and trampled upon for years by her dutiful daughter, who looked out always that "Mother" had the best, without the first scrap of respect for "Mother's" free, human soul.

46 The grandchildren took the spirit of their mother's words rather than the words themselves, and treated their grandmother as if

she were a sort of traveling idiot tagged on to them, 47 to whom they had to be decently respectful whenever their mother's eye was upon them, and whom they ignored entirely when their mother looked the other way.

48 It so happened that I was sitting next to this particular mother who had been poked into a comfortable seat by her careful daughter. 49 And, after a number of other suggestions had been poked at her with a view to adding to her comfort, she turned to me and in a quaint, confidential way, 50 with the gentle voice of a habitual martyr, and at the same time a twinkle of humor in her eye, she said "They think, you know, I don't know anything."

51 And after that we had a little talk about matters of the day which proved to me that "Mother" had a mind broader and certainly more quiet than her daughter. 52 I studied the daughter with interest after knowing "Mother" better, and her habitual strain of voice and manner were pathetic. 53 By making a care of her mother instead of a companion, she was not only guilty of disrespect to a soul which, however weak it may have been in allowing itself to be directed in all minor matters, had its own firm principles which were not overridden nor even disturbed by the daughter's dominance. 54 If the daughter had only dropped her strain of care and her habit of "bossing" she would have found a true companion in her mother, and would have been a healthier and happier woman herself.

55 In pleasant contrast to this is the story of a family which had an old father who had lost his mind entirely, and had grown decrepit and childish in the extreme. 56 The sons and daughters tended him like a baby and loved him with gentle, tender respect. 57 There was no embarrassment for his loss of mind, no thought of being distressed or pained by it, 58 and because his children took their father's state so quietly and without shame, every guest who came took it in the same way, and there was no thought of keeping the father out of sight. 59 He sat in the living-room in his comfortable chair, and always one child or another was sitting right beside him with a smiling face. 60 Instead

of being a trying member of the family, as happens in so many cases, this old father seemed to bring content and rest to his children through their loving care for him.

61 Very often-- I might almost say always-- the trying member of the family is trying only because we make her so by our attitude toward her, let her be grandmother, mother, or maiden aunt. 62 Even the proverbial mother-in-law grows less difficult as our attitude toward her is relieved of the strain of detesting everything she does, and expecting to detest everything that she is going to do. 63 With every trying friend we have, if we yield to him in all minor matters we find the settling of essential questions wonderfully less difficult.

64 A son had a temper and the girl he married had a temper. The mother loved her son with the selfish love with which so many mothers burden their children, and thought that he alone of all men had a right to lose his temper. 65 Consequently she excused her son and blamed her daughter-in-law. If there were a mild cyclone roused between the two married people the son would turn to his mother to hear what a martyr he was and what misfortune he had to bear in having been so easily mistaken in the woman he married. 66 Thus the mother-in-law, who felt that she was protecting her poor son, was really breeding dissension between two people who could have been the best possible friends all their lives.

67 The young wife very soon became ashamed of her temper and worked until she conquered it, 68 but it was not until her mother-in-law had been out of this world for years that her husband discovered what he had lost in turning away from his wife's friendship, 69 and it was only by the happy accident of severe illness that he ever discovered his mistake at all, and gained freedom from the bondage of his own temper enough to appreciate his wife.

70 If, however, the wife had yielded in the beginning not only to her husband's bad temper but also to the antagonism of her mother-in-law, which was, of course, annoying in many petty

ways, she might have gained her husband's friendship, 71 and it is possible that she might, moreover, have gained the friendship of her mother-in-law.

72 The best rule with regard to all trying members of the family is to yield to them always in non-essentials; 73 and when you disagree in essentials stick to the principle which you believe to be right, but stick to it without resistance. 74 Believe your way, but make yourself willing that the trying member should believe her way. 75 Make an opportunity of what appears to be a limitation, and, believe me, your trying member can become a blessing to you.

76 I go further than that-- I truly believe that to make the best of life every family should have a trying member. 77 When we have no trying member of our family, and life goes along smoothly, as a matter of course, the harmony is very liable to be spurious, and a sudden test will all at once knock such a family into discord, much to the surprise of every member. 78 When we go through discord to harmony, and once get into step, we are very likely to keep in step:

79 Be willing, then, make yourself willing, that the trying member should be in the way. 80 Hope that she will stay in your family until you have succeeded in dropping not only all resistance to her being there, but every resistance to her various ways in detail. 81 Bring her annoying ways up to your mind voluntarily when you are away from her. If you do that you will find all the resistances come with them and you can relax out of the strain then and there. 82 You will find that when you get home or come down to breakfast in the morning (for many resistances are voluntarily thrown off in the night) you will have a pleasanter feeling toward the trying member, 83 and it comes so spontaneously that you will be surprised yourself at the absence of the strain of resistance in you.

84 Believe me when I say this: the yielding in the non-essentials, singularly enough, gives one strength to refuse to yield in principles. 85 But we must always remember that if we want to find real peace, while we refuse to

yield in our own principles so long as we believe them to be true, we must be entirely willing that others should differ from us in belief.

IRRITABLE HUSBANDS

Annie Payson Call

9 SUPPOSE your husband got impatient and annoyed with you because you did not seem to enter heartily into the interests of his work and sympathise with its cares and responsibilities and soothe him out of the nervous harassment. 2 Would you not perhaps feel a little sore that he seemed to expect all from you and to give nothing in return? 3 I know how many women will say that is all very well, but the husband and father should feel as much interest in the home and the children as the wife and mother does. 4 That is, of course, true up to a certain point, always in general, and when his help is really necessary in particular. 5 But a man cannot enter into the details of his wife's duties at home any more than a woman can enter into the details of her husband's duties at his office. 6 Then, again, my readers may say: "But a woman's nervous system is more sensitive than a man's; she needs help and consolation. She needs to have some one on whom she can lean." 7 Now the answer to that will probably be surprising, but an intelligent understanding and comprehension of it would make a very radical difference in the lives of many men and women who have agreed to live together for life-- for better and for worse. 8 Now the truth is man's nervous system is quite as sensitive as a woman's, but the woman's temptation to emotion makes her appear more sensitive, 9 and her failure to control her emotions ultimately increases the sensitiveness of her nerves so that they are more abnormal than her husband's. Even that is not always true. 10 The other day a woman sat in tears and distress telling of the hardness of heart, the restlessness, the irritability, the thoughtlessness, the unkindness of her husband. 11 Her face was drawn with suffering. She insisted that she was not complaining, that it was her deep and tender love for her husband that made her suffer so.

12 "But it is killing me, it is killing me," she said, and one who saw her could well believe it. 13 And if the distress and the great strain upon her nerves had kept on it certainly would have made her ill, if not have actually ended her life with a nervous collapse.

14 The friend in whom she confided sat quietly and heard her through. She let her pour herself out to the very finish until she stopped because there was nothing more to say. 15 Then, by means of a series of gentle, well-adapted questions, she drew from the wife a recognition-- for the first time-- of the fact that she really did nothing whatever for her husband and expected him to do everything for her. 16 Perhaps she put on a pretty dress for him in order to look attractive when he came home, but if he did not notice how well she looked, and was irritable about something in the house, she would be dissolved in tears because she had not proved attractive and pleased him. 17 Maybe she had tried to have a dinner that he especially liked; then if he did not notice the food, and seemed distracted about something that was worrying him, she would again be dissolved in tears because he "appreciated nothing that she tried to do for him."

18 Now it is perfectly true that this husband was irritable and brutal; he had no more consideration for his wife than he had for any one else. 19 But his wife was doing all in her power to fan his irritability into flame and to increase his brutality. She was attitudinising in her own mind as a martyr. 20 She was demanding kindness and attention and sympathy from her husband, and because she demanded it she never got it.

21 A woman can demand without demanding imperiously. There is more selfish demanding in a woman's emotional suffering because her husband does not do this or that or the other for her sake than there is in a tornado of man's irritability or anger. 22 You see, a woman's demanding spirit is covered with the mush of her emotions. A man's demanding spirit stands out in all its naked ugliness. One is just as bad as the other. One is just as repulsive as the other.

23 It is a radical, practical impossibility to bring loving-kindness out of any one by demanding it. 24 Loving-kindness, thoughtfulness, and consideration have got to be born spontaneously in a man's own mind to be anything at all, and no amount of demanding on the part of his wife can force it.

25 When this little lady of whom I have been writing found that she had been demanding from her husband what he really ought to have given her as a matter of course, 26 and that she had used up all her strength in suffering because he did not give it, and had used none of her strength in the effort to be patient and quiet in waiting for him to come to his senses, 27 she went home and began a new life. She was a plucky little woman and very intelligent when once her eyes were opened. 28 She recognised the fact that her suffering was resistance to her husband's irritable selfishness, and she stopped resisting.

29 It was a long and hard struggle of days, weeks, and months, but it brought a very happy reward. 30 When a man is irritable and ugly, and his wife offers no resistance either in anger or suffering, the irritability and ugliness react upon himself, and if there is something better in him he begins to perceive the irritability in its true colours. 31 That is what happened to this man. As his wife stopped demanding he began to give. As his wife's nerves became calm and quiet his nerves quieted and calmed. 32 Finally his wife discovered that much of his irritability had been roused through nervous anxiety in regard to his business about which he had told her nothing whatever because it "was not his way."

33 There is nothing in the world that so strengthens nerves as the steady use of the will to drop resistance and useless emotions and get a quiet control. 34 This woman gained that strength, and to her surprise one day her husband turned to her with a full account of all his business troubles and she met his mind quietly, as one business man might meet another, and without in the least expressing her pleasure or her surprise. 35 She took all the good change in him as a matter of course.

GOODNESS

36 Finally one day it came naturally and easily to talk over the past. She found that her husband from day to day had dreaded coming home. 37 The truth was that he had dreaded his own irritability as much as he had dreaded her emotional demanding. 38 But he did not know it-- he did not know what was the matter at all. He simply knew vaguely that he was a brute, that he felt like a brute, and that he did not know how to stop being a brute. 39 His wife knew that he was a brute, and at the same time she felt thoroughly convinced that she was a suffering martyr. 40 He was dreading to come home and she was dreading to have him come home-- and there they were in a continuous nightmare. 41 Now they have left the nightmare far, far behind, and each one knows that the other has one good friend in the world in whom he or she can feel entire confidence, and their friendship is growing stronger and clearer and more normal every day.

42 It is not the ceremony that makes the marriage: the ceremony only begins it. Marriage is a slow and careful adjustment. 43 A true story which illustrates the opposite of this condition is that of a man and woman who were to all appearances happily married for years. They were apparently the very closest friends. 44 The man's nerves were excitable and peculiar, and his wife adjusted herself to them by indulging them and working in every way to save him from friction. 45 No woman could stand that constant work of adjustment which was in reality maladjustment, and this wife's nerves broke down unexpectedly and completely.

46 When our nerves get weak we are unable to repress resistance which in a stronger state we had covered up. 47 This wife, while she had indulged and protected her husband's peculiarities, had subconsciously resisted them. 48 When she became ill her subconscious resistance came to the surface. She surprised herself by growing impatient with her husband. 49 He, of course; retorted. As she grew worse he did not find his usual comfort from her care, and instead of trying to help her to get well he turned his back

on her and complained to another woman. 50 Finally the friction of the two nervous systems became dangerously intense. Each was equally obstinate, and there was nothing to do but to separate. 51 The woman died of a broken heart, and the man is probably insane for the rest of his life.

52 It was nothing but the mismanagement of their own and each other's nerves that made all this terrible trouble. 53 Their love seemed genuine at first, and could certainly have grown to be really genuine if they had become truly adjusted. 54 And the saddest part of the whole story is that they were both peculiarly adapted to be of use to their fellow-humans. 55 During the first years of their life their home was a delight to all their friends.

56 Tired nerves are likely to close up a man or make him irritable, complaining, and ugly, whereas the tendency in a woman is to be irritable, complaining, and tearful. 57 Now of course when each one is selfishly looking out for his or her comfort neither one can be expected to understand the other. 58 The man thinks he is entirely justified in being annoyed with the woman's tearful, irritable complaints, and so he is-- in a way. 59 The woman thinks that she has a right to suffer because of her husband's irritable ugliness, and so she has-- in a way. 60 But in the truest way, and the way which appeals to every one's common-sense, neither one has a right to complain of the other, and each one by right should have first made things better and clearer in himself and herself.

61 Human nature is not so bad--really in its essence it is not bad at all. 62 If we only give the other man a real chance. It is the pushing and pulling and demanding of one human being toward another that smother the best in us, and make life a fearful strain. 63 Of course there is a healthy demanding as well as an unhealthy demanding, but, so far as I know, the healthy demanding can come only when we are clear of personal resistance and can demand on the strength of a true principle and without selfish emotion. 64 There is a kind of gentle, motherly contempt with which some women speak of their

husbands, which must get on a man's nerves very painfully. 65 It is intensely and most acutely annoying. And yet I have heard good women speak in that way over and over again. 66 The gentleness and motherliness are of course neither of them real in such cases. The gentle, motherly tone is used to cover up their own sense of superiority.

67 "Poor boy, poor boy," they may say; "a man is really like a child." So he may be-- so he often is childish, and sometimes childish in the extreme. 68 But where could you find greater and more abject childishness than in a woman's ungoverned emotions?

69 A woman must respect the manliness of her husband's soul, and must cling to her belief in its living existence behind any amount of selfish, restless irritability, if she is going to find a friend in him or be a friend to him. 70 She must also know that his nervous system may be just as sensitive as hers. Sometimes it is more sensitive, and should be accordingly respected. 71 Demand nothing and expect nothing, but hold him to his best in your mind and wait.

72 That is a rule that would work wonderfully if every woman who is puzzled about her husband's restlessness and lack of interest in home affairs would apply it steadily and for long enough. 73 It is impossible to manufacture a happy, sympathetic married life artificially-- impossible! 74 But as each one looks to one's self and does one's part fully, and then is willing to wait for the other, the happiness and the sympathy, 75 the better power for work and the joyful ability to play come-- they do come; they are real and alive and waiting for us as we get clear from the interferences.

76 "Why doesn't my husband like to stay with me when he comes home? Why can't we have nice, cozy times together?" a wife asks with sad longing in her eyes.

77 And to the same friend the husband says: "I should be glad to stay with Nellie often in the evening, but she will always talk about her worries, and she worries about the family in a way that is idiotic. 78 She is always sure that George will catch the measles

because a boy in the next street has them, and she is always sure that our children do not have the advantages nor the good manners that other children have. 79 If it is not one thing it is another; whenever we are alone there is something to complain of, and her last complaint was about her own selfishness." 80 Then he laughed at what he considered a good joke, and in five minutes had forgotten all about her.

81 This wife, in a weak, selfish little way, was trying to give her husband her confidence, and her complaint about her own selfishness was genuine. She wanted his help to get out of it. 82 If he had given her just a little gracious attention and told her how impossible it was really to discuss the children when she began the conversation with whining complaint, she would have allowed herself to be taught and their intercourse would have improved. 83 On the other hand, if the wife had realised that her husband came home from the cares of his business tired and nervous, 84 and if she had talked lightly and easily on general subjects and tried to follow his interests, when his nerves were rested and quiet she might have found him ready and able to give her a little lift with regard to the children.

85 It is interesting and it is delightful to see how, as we each work first to bear our own burdens, we not only find ourselves ready and able to lighten the burdens of others but find others who are helpful to us.

86 A woman who finds her husband "so restless and irritable" should remember that in reality a man's nervous system is just as sensitive as a woman's, 87 and, with a steady and consistent effort to bear her own burdens and to work out her own problems, should prepare herself to lighten her husband's burdens and help to solve his problems; 88 that is the truest way of bringing him to the place where he will be glad to share her burdens with her as well as his own.

89 But we want to remember that there is a radical difference between indulging another's selfishness, and waiting, with patient yielding, for him to discover his selfishness himself,

and to act unselfishly from his own free-will.

QUIET VS. CHRONIC EXCITEMENT

Annie Payson Call

10 SOME women live in a chronic state of excitement all the time and they do not find it out until they get ill. Even then they do not always find it out, and then they get more ill.

2 It is really much the same with excitable women as with a man who thinks he must always keep a little stimulant in himself in order to keep about his work. 3 When a bad habit is established in us we feel unnatural if we give the habit up for a moment-- and we feel natural when we are in it-- but it is poison all the same.

4 If a woman has a habit of constantly snuffing or clearing her throat, or rocking a rocking chair, or chattering to whoever may be near her she would feel unnatural and weird if she were suddenly wrenched out of any of these things. 5 And yet the poisoning process goes on just the same.

6 When it seems immaterial to us that we should be natural we are in a pretty bad way and the worst of it is we do not know it.

7 I once took a friend with me into the country who was one of those women who lived on excitement in every-day life. 8 When she dressed in the morning she dressed in excitement. She went down to breakfast in excitement. She went about the most humdrum everyday affairs excited. 9 Every event in life-- little or big-- was an excitement to her-- and she went to bed tired out with excitement-- over nothing.

10 We went deep in the woods and in the mountains, full of great powerful quiet. 11 When my friend first got there she was excited about her arrival, she was excited about the house and the people in it, but in the middle of the night she jumped up in bed with a groan of torture.

12 I thought she had been suddenly taken ill and started up quickly from my end of the room to see what was the trouble.

13 "Oh, oh," she groaned, "the quiet! It is so quiet!" Her brain which had been in a whirl of petty

excitement felt keen pain when the normal quiet touched it.

14 Fortunately this woman had common-sense and I could gradually explain the truth to her, and she acted upon it and got rested and strong and quiet.

15 I knew another woman who had been wearing shoes that were too tight for her and that pinched her toes all together. 16 The first time she wore shoes that gave her feet room enough the muscles of her feet hurt her so that she could hardly walk.

17 Of course, having been cramped into abnormal contraction the process of expanding to freedom would be painful.

18 If you had held your fist clenched tight for years, or months, or even weeks, how it would hurt to open it so that you could have free use of your fingers.

19 The same truth holds good with a fist that has been clenched, a foot that has been pinched, or a brain that has been contracted with excitement.

20 The process leading from the abnormal to the normal is always a painful one. To stay in the abnormal means blindness, constantly limiting power and death.

21 To come out into a normal atmosphere and into a normal way of living means clearer sight, constantly increasing power, and fresh life.

22 This habit of excitement is not only contracting to the brain; it has its effect over the whole body. If there is any organ that is weaker than any other the excitement eventually shows itself. 23 A woman may be suffering from indigestion, or she may be running up large doctor's bills because of either one of a dozen other organic disturbances, 24 with no suspicion that the cause of the whole trouble is that the noisy, excited, strained habits of her life have robbed her body of the vitality it needed to keep it in good running order.

25 As if an engineer threw his coal all over the road and having no fuel for his engine wondered that it would not run. Stupid women we are-- most of us!

26 The trouble is that many of us are so deeply immersed in the habit of excitement that we do not know it.

27 It is a healthy thing to test ourselves and to really try to find ourselves out. It is not only healthy; it is deeply interesting.

28 If quiet of the woods, or, any other quiet place, makes us fidgety, we may be sure that our own state is abnormal and we had better go into the woods as often as possible until we feel ourselves to be a part of the quiet there.

29 If we go into the woods and get soothed and quieted and then come out and get fussed up and excited so that we feel painfully the contrast between the quiet and our every-day life, 30 then we can know that we are living in the habit of abnormal excitement and we can set to work to stop it.

31 "That is all very well," I hear my readers say, "but how are you going to stop living in abnormal excitement when every circumstance and every person about you is full of it and knows nothing else?"

32 If you really want to do it and would feel interested to make persistent effort I can give you the recipe and I can promise any woman that if she perseveres until she has found the way she will never cease to be grateful.

33 If you start with the intention of taking the five minutes' search for quiet every day, do not let your intention be weakened or yourself discouraged if for some days you see no result at all.

34 At first it may be that whatever quiet you find will seem so strange that it will annoy you or make you very nervous, but if you persist and work right through, the reward will be worth the pains many times over.

35 Sometimes quieting our minds helps us to quiet our bodies; sometimes we must quiet our bodies first before we can find the way to a really quiet mind. 36 The attention of the mind to quiet the body, of course, reacts back on to the mind, and from there we can pass on to thinking quietly. 37 Each individual must judge for herself as to the best way of reaching the quiet. I will give several recipes and you can take your choice.

38 First, to quiet the body:—

(1.) Lie still and see how quietly you can breathe.

(2.) Sit still and let your head droop very slowly forward until finally it hangs down with its whole weight. 39 Then lift it up very, very slowly and feel as if you pushed it all the way up from the lower part of your spine, 40 or, better still, as if it grew up, so that you feel the slow, creeping, soothing motion all the way up your spine while your head is coming up, 41 and do not let your head come to an entirely erect position until your chest is as high as you can hold it comfortably. 42 When your head is erect take a long, quiet breath and drop it again. You can probably drop it and raise it twice in the five minutes. 43 Later on it should take the whole five minutes to drop it and raise it once and an extra two minutes for the long breath.

44 When you have dropped your head as far as you can, pause for a full minute without moving at all and feel heavy; then begin at the lower part of your spine and very slowly start to raise it. 45 Be careful not to hold your breath, and watch to breathe as easily and quietly as you can while your head is moving.

46 If this exercise hurts the back of your neck or any part of your spine, don't be troubled by it, but go right ahead and you will soon come to where it not only does not hurt, but is very restful.

47 When you have reached an erect position again stay there quietly--first take long gentle breaths and let them get shorter and shorter until they are a good natural length, 48 then forget your breathing altogether and sit still as if you never had moved, you never were going to move, and you never wanted to move.

49 This emphasises the good natural quiet in your brain and so makes you more sensitive to unquiet.

50 Gradually you will get the habit of catching yourself in states of unnecessary excitement; at such times you cannot go off by yourself and go through the exercises. 51 You cannot even stop where you are and go through them, but you can recall the impression made on your brain at the time you did them and in that way rule out your excitement and gain the real power that should be in its place.

GOODNESS

52 So little by little the state of excitement becomes as unpleasant as a cloud of dust on a windy day and the quiet is as pleasant as under the trees on top of a hill in the best kind of a June day.

53 The trouble is so many of us live in a cloud of dust that we do not suspect even the existence of the June day, 54 but if we are fortunate enough once or twice even to get to sneezing from the dust, and so to recognise its unpleasantness, then we want to look carefully to see if there is not a way out of it.

55 It is then that we can get the beginning of the real quiet which is the normal atmosphere of every human being.

56 But we must persist for a long time before we can feel established in the quiet itself. 57 What is worth having is worth working for-- and the more it is worth having, the harder work is required to get it.

58 Nerves form habits, and our nerves not only get the habit of living in the dust, but the nerves of all about us have the same habit. 59 So that when at first we begin to get into clear air, we may almost dislike it, and rush back into the dust again, because we and our friends are accustomed to it.

60 All that bad habit has to be fought, and conquered, and there are many difficulties in the way of persistence, but the reward is worth it all, as I hope to show in later articles.

61 I remember once walking in a crowded street where the people were hurrying and rushing, where every one's face was drawn and knotted, and nobody seemed to be having a good time. 62 Suddenly and unexpectedly I saw a man coming toward me with a face so quiet that it showed out like a little bit of calm in a tornado. 63 He looked like a common, every-day man of the world, so far as his dress and general bearing went, and his features were not at all unusual, but his expression was so full of quiet interest as to be the greatest contrast to those about him. 64 He was not thinking his own thoughts either-- he was one of the crowd and a busy, interested observer.

65 He might have said, "You silly geese, what are you making all this fuss about, you can do it much better if you will go more easily."

66 If that was his thought it came from a very kindly sense of humor, and he gave me a new realisation of what it meant, practically, to be in the world and not of it.

67 If you are in the world you can live, and observe, and take a much better part in its workings. 68 If you are of the world, you are simply whirled in an eddy of dust, however you may pose to yourself or to others.

THE TIRED EMPHASIS

Annie Payson Call

11 "I AM so tired, so tired-- I go to bed tired, I get up tired, and I am tired all the time."

2 How many women-- how many hundred women, how many thousand women-- say that to themselves and to others constantly.

3 It is perfectly true; they are tired all the time; they do go to bed tired and get up tired and stay tired all day.

4 If, however, they could only know how very much they increase their fatigue by their constant mental emphasis of it, 5 and if at the same time they could turn their wills in the direction of decreasing the fatigue, instead of emphasising it, 6 a very large percentage of the tired feeling could be done away with altogether.

7 Many women would gladly make more of an effort in the direction of rest if they knew how, and I propose in this article to give a prescription for the cure of the tired emphasis which, if followed, will bring happy results.

8 When you go to bed at night, no matter how tired you feel, instead of thinking how tired you are, think how good it is that you can go to bed to get rested.

9 It will probably seem absurd to you at first. You may say to yourself: "How ridiculous, going to bed to get rested, when I have only one short night to rest in, and one or two weeks in bed would not rest me thoroughly."

10 The answer to that is that if you have only one night in which to rest, you want to make the most of that night, and if you carry the tired emphasis to bed with you you are really holding on to the tired.

11 This is as practically true as if you stepped into a bog and then sat in it and looked forlorn and said. "What a terrible thing it is that I should be in a bog like this; just think of having to sit in a black, muddy bog all the time," 12 and staying there you made no effort whatever to get out of it, even though there was dry land right in front of you.

13 Again you may answer: "But in my tired bog there is no dry land in front of me, none at all."

I say to that, there is much more dry land than you think-- if you will open your eyes-- and to open your eyes you must make an effort.

14 No one knows, who has not tried, what a good strong effort will do in the right direction, when we have been living and slipping back in the wrong direction.

15 The results of such efforts seem at times wonderful to those who have learned the right direction for the first time.

16 To get rid of the tired emphasis when we have been fixed in it, a very strong effort is necessary at first, and gradually it gets easier, and easier, until we have cast off the tired emphasis entirely and have the habit of looking toward rest.

17 We must say to ourselves with decision in so many words, and must think the meaning of the words and insist upon it: "I am very tired. Yes, of course, I am very tired, but I am going to bed to get rested."

18 There are a hundred little individual ways that we can talk to ourselves, and turn ourselves toward rest, at the end of the day when the time comes to rest.

19 One way to begin, which is necessary to most of us, is to stop resisting the tired. 20 Every complaint of fatigue, whether it is merely in our own minds, or is made to others, is full of resistance, and resistance to any sort of fatigue emphasises it proportionately.

21 That is why it is good to say to ourselves: "Yes, I am tired; I am awfully tired. I am willing to be tired."

22 When we have used our wills to drop the nervous and muscular contractions that the fatigue has caused, we can add with more

emphasis and more meaning, "and I am going to bed to get rested."

23 Some one could say just here: "That is all very well for an ordinarily tired person, but it would never do me any good. I am too tired even to try it."

24 The answer to that is, the more tired you are, the more you need to try it, and the more interesting the experiment will be.

25 Also the very effort of your brain needed to cast off the tired emphasis will be new to you, and thought in a new direction is always restful in itself. 26 Having learned to cast off the tired emphasis when we go to bed at night, we can gradually learn to cast it off before we go to meals, and at odd opportunities throughout the day.

27 The more tired we are, the more we need to minimise our fatigue by the intelligent use of our own wills.

28 Who cares for a game that is simple and easy? Who cares for a game when you beat as a matter of course, and without any effort on your part at all?

29 Whoever cares for games at all cares most for good, stiff ones, where, when you have beaten, you can feel that you have really accomplished something; 30 and when you have not beaten, you have at least learned points that will enable you to beat the next time, or the next to the next time--or sometime. 31 And everyone who really loves a game wants to stick to it until you have conquered and is proficient.

32 Why not wake up, and realise that same interest and courage in this biggest game of all-- this game of life? We must play it!

33 Few of us are cowards enough to put ourselves out of it. Unless we play it and obey the rules we do not really play at all.

34 Many of us do not know the rules, but it is our place to look about and find them out.

35 Many more of us think that we can play the game better if we make up rules of our own, and leave out whatever regular rules we do know, that do not suit our convenience. But that never works.

36 It only sometimes seems to work; and although plain common-sense shows us over and over that the game played

according to our own ideas amounts to nothing, 37 it is strange to see how many work and push to play the game in their own way instead of in the game's way.

38 It is strange to see how many shove blindly in this direction, and that direction, to cut their way through a jungle, when there is the path just by them, if they will take it.

39 Most of us do not know our own power because we would rather stay in a ditch and complain.

40 Strength begets strength, and we can only find our greater power, by using intelligently, and steadily, the power we have.

HOW TO BE ILL AND GET WELL

Annie Payson Call

12 ILLNESS seems to be one of the hardest things to happen to a busy woman. Especially hard is it when a woman must live from hand to mouth, and so much illness means, almost literally, so much less food.

2 Sometimes one is taken so suddenly and seriously ill that it is impossible to think of whether one has food and shelter or not; one must just be taken care of or die. It does not seem to matter which at the time.

3 Then another must meet the difficulty. It is the little nagging illnesses that make the trouble-- 4 just enough to keep a woman at home a week or ten days or more, and deprive her of wages which she might have been receiving, and which she very much needs.

5 These are the illnesses that are hard to bear. Many a woman has suffered through an illness like this, which has dragged out from day to day, 6 and finally left her pale and weak, to return to her work with much less strength than she needs for what is before her.

7 After forcing herself to work day after day, her strength comes back so slowly, that she appears to go through another illness, on her feet, and "in the harness," before she can really call herself well again.

8 There are a few clear points which, if intelligently comprehended, could teach one how to meet an illness, 9 and if persistently acted upon, would not only shorten it, but would lighten

the convalescence so that when the invalid returned to her work she would feel stronger than before she was taken ill.

10 When one is taken with a petty illness, if it is met in an intelligent way, the result can be a good rest, and one feels much better, and has a more healthy appearance, than before the attack.

11 This effect has been so often experienced that with some people there is a little bit of pleasantry passed on meeting a friend, in the remark: "Why, how do you do; how well you look-- you must have been ill!"

12 If we remember when we are taken ill that nature always tends towards health, we will study carefully to fulfill Nature's conditions in order to cure the disease.

13 We will rest quietly, until Nature in Her process toward health has reached health. In that way our illness can be the means of giving us a good rest, 14 and, while we may feel the loss of the energy of which the disease has robbed us, we also feel the good effects of the rest which we have given to organs which were only tired.

15 These organs which have gained rest can, in their turn, help toward renewing the strength of the organs which had been out of order, 16 and thus we get up from an illness looking so well, and feeling so well, that we do not regret the loss of time, and feel ready to work, and to gradually make up the loss of money.

17 Of course, the question is, how to fulfill the conditions so that this happy result can be attained.

In the first place, ‘do not fret’.

18 "But how can I help not fretting?" someone will say, "when I am losing money every day, and do not know how many more days I may be laid up?"

19 The answer to that is: "If you will think of the common-sense of it, you can easily see that the strain of fretting is interfering radically with your getting well. 20 For when you are using up strength to fret, you are simply robbing yourself of the vitality which would be used directly in the cure of your illness."

21 Not only that, but the strain of fretting increases the strain of illness, and is not only preventing

you from getting well, but it is tending to keep you ill.

22 When we realise that fact, it seems as if it would be an easy matter to stop fretting in order to get well.

23 It is as senseless to fret about an illness, no matter how much just cause we may feel we have, as it would be to walk west when our destination was directly east.

24 Stop and think of it. Is not that true? Imagine a child with a pin pricking him, kicking, and screaming, and squirming with the pain, so that his mother-- try as carefully as she may-- takes five minutes to find the pin and get it out, 25 when she might have done it and relieved him in five seconds, if only the child had kept still and let her.

26 So it is with us when Mother Nature is working with wise steadiness to find the pin that is making us ill, and to get it out. 27 We fret and worry so that it takes her ten or twenty days to do the good work that she might have done in three.

28 In order to drop the fretting, we must use our wills to think, and feel, and act, so that the way may be opened for health to come to us in the quickest possible time.

29 Every contraction of worry which appears in the muscles we must drop, so that we lie still with a sense of resting, and waiting for the healing power, which is surely working within us, to make us well.

30 We can do this by a deliberate use of our wills. If we could take our choice between medicine, and the curative power of dropping anxiety and letting ourselves get well, there would be no hesitancy, provided we understood the alternatives.

31 I speak of fretting first because it is so often the strongest interference with health.

32 Defective circulation is the trouble in most diseases, and we should do all we can to open the channels so that the circulation, being free elsewhere, can tend to open the way to greater freedom in the part diseased. 33 The contractions caused by fretting impede the circulation still more, and therefore heighten the disease.

34 If once, by a strong use of the will, we drop the fretting and give ourselves up entirely to letting

Nature cure us, then we can study, with interest, to fulfill other necessary conditions. 35 We can give ourselves the right amount of fresh air, of nourishment, of bathing, and the right sort of medicine, if any is needed.

36 Thus, instead of interfering with Nature, we are doing all in our power to aid Her; and when Nature and the invalid work in harmony, health comes on apace.

37 When illness brings much pain and discomfort with it, the endeavor to relax out of the contractions caused by the pain, are of the same service as dropping contractions caused by the fretting.

38 If one can find a truly wise doctor, or nurse, in such an illness as I refer to, get full instructions in just one visit, and then follow those directions explicitly, only one visit will be needed, probably, and the gain from that will pay for it many times over.

39 This article is addressed especially to those who are now in health. It is perhaps too much to expect one in the midst of an illness to start at once with what we may call the curative attitude, although it could be done, 40 but if those who are now well and strong will read and get a good understanding of this healthy way of facing an illness, and get it into their subconscious minds, 41 they will find that if at any time they should be unfortunate enough to be attacked with illness, they can use the knowledge to very real advantage, and-- what is more-- they can, with the right tact, help others to use it also.

42 To see the common-sense of a process and, when we have not the opportunity to use the laws ourselves, to help others by means of our knowledge, impresses our own brains more thoroughly with the truth, especially if our advice is taken and acted upon and thus proved to be true.

43 It must not be forgotten, however, that to help another man or woman to a healthy process of getting well requires gentle patience and quiet, steady, unremitting tact.

GOODNESS

IS PHYSICAL CULTURE
GOOD FOR GIRLS?
Annie Payson Call

13 A NUMBER of women were watching a game of basket-ball played by some high-school girls. 2 In the interim for rest one woman said to her neighbour: "Do you see that girl flat on her back, looking like a very heavy bag of sand?"

3 "Yes," the answer was; "what under the sun is she doing that for? She looks heavy and lazy and logy, while the other girls are talking and laughing and having a good time."

"You wait and watch her play," responded the first woman. 4 And so they waited and watched, and to the astonishment of the friend the girl who had looked "lazy and logy," lying flat on her back during the rest-time, was the most active of the players, and really saved the game.

5 When the game was finished the woman said to her friend with surprise in her voice: "How did you see through that, and understand what that girl was aiming for?"

6 The answer was: "Well, I know the girl, and both she and I have read Kipling's 'The Maltese Cat.' Don't you remember how the best polo ponies in that story, when they were off duty, hung their heads and actually made themselves looked fagged, in order to be fresher when the time came to play? 7 And how 'The Maltese Cat' scouted the silly ponies who held their heads up and kicked and looked alert while they waited? And don't you remember the result?"

8 "No, I never read the story, but I have certainly seen your point prove itself to-day. I shall read it at once. Meanwhile, I want to speak to that clever girl who could catch a point like that and use it."

9 "Take care, please, that you do not mention it to her at all," said the friend. "You will draw her attention back to herself and likely as not make her lose the next game. Points like that have got to be worked on without self-consciousness, not talked about."

10 And so the women told the child they were glad that her side won the game and never mentioned her own part in it at all. 11 After all she had only found the law that the more passive you can be when it is time to rest, the more alert you are and the more powerful in activity. 12 The polo pony knew it as a

matter of course. We humans have to discover it.

13 Let us, just for the interest of it, follow that same basket-ball player a little more closely. Was she well developed and evenly trained in her muscles? Yes, very. 14 Did she go to gymnasium, or did she scorn it? She went, twice a week regularly, and had good fun there; 15 but there was just this contrast between her and most of the girls in the class: Jane, as we will call her, went to gymnasium as a means to an end. 16 She found that she got an even development there which enabled her to walk better, to play better, and to work better. 17 In gymnasium she laid her muscular foundation on which to build all the good, active work of her life. 18 The gymnasium she went to, however, was managed in an unusual way except for the chest weights, which always "opened the ball," the members of the class never knew what work they were to do. 19 Their minds were kept alert throughout the hour and a half. If their attention wavered they tripped or got behind in the exercise, 20 and the mental action which went into the movement of every muscle made the body alive with the healthy activity of a well-concentrated, well-directed mind.

21 Another point which our young friend learned at gymnasium was to direct her mind only on to the muscles that were needed. 22 Did you ever try to clench your fist so tight that it could not be opened? If not, try it, and relax all over your body while you are keeping your fist tight closed. 23 You will see that the more limp your body becomes the tighter you can keep your fist clenched. All the force goes in that one direction. 24 In this way a moderately strong girl can keep a strong man hard at work for several minutes before he can make any impression on the closed hand. 25 That illustrates in a simple way the fact that the most wholesome concentration is that which comes from dropping everything that interferes-- letting the force of mind or body flow only in the direction in which it is to be used.

26 Many girls use their brains in the wrong way while on the gymnasium floor by saying to themselves, "I cannot do that."

GOODNESS

27 The brain is so full of that thought that the impression an open brain would receive has no chance to enter, and the result is an awkward, nervous, and uncertain movement. 28 If a girl's brain and muscle were so relaxed that the impression on the one would cause a correct use and movement of the other how easy it would be thereafter to apply the proper tension to the muscle at the proper time without overtaxing the nerves.

29 Some one has well said that "it is training, not straining, that we want in our gymnasiums." Only when a girl is trained from this point of view does she get real training.

30 This basket-ball player had also been taught how to rest after exercise in a way which appealed to her especially, because of her interest which had already been aroused in Kipling's polo pony. 31 She was taught intelligently that if, after vigourous exercise, when the blood is coursing rapidly all over the body, you allow yourself to be entirely open and passive, 32 the blood finds no interruptions in its work and can carry away the waste matter much more effectually. In that way you get the full result of the exercise. 33 It is not necessary always to lie down to have your body passive enough after vigourous exercise to get the best results. 34 If you sit down after exercise you want to sit without tension. 35 Or if you walk home from gymnasium you want to walk loosely and freely, keeping your chest up and a little in advance, and pushing with the ball of your back foot with a good, rhythmic balance. 36 As this is the best way to sit and the best way to walk--gymnasium or no gymnasium-- to look out for a well-balanced sitting and a well-balanced walk directly after vigourous exercise, keeps us in good form for sitting and walking all the time.

37 I know of a professor in one of our large colleges who was offered also a professorship in a woman's college, and he refused to accept because he said women's minds did not react. 38 When he lectured to girls he found that, however attentively they might seem to listen, there was no response. They gave nothing in return.

GOODNESS

39 Of course this is not true of all girls, and of course the gentleman who refused the chair in the woman's college would agree that it is not true of all girls, 40 but if those who read the anecdote would, instead of getting indignant, just look into the matter a little, they would see how true it is of many girls, 41 and by thinking a little further we can see that it is not at present the girls' fault. A hundred years ago girls were not expected to think. 42 I remember an anecdote which a very intelligent old lady used to tell me about her mother. Once, when she was a little girl, her mother found some fault with her which the daughter knew to be unjust, 43 and she answered timidly, "But, Mother, I think--" "Abigail," came the sharp reminder, "you've no business to think."

44 One hundred years ago it was only the very exceptional girls who really thought. Now we are gradually working toward the place where every girl will think. 45 And surely it cannot be very long now before the united minds of a class of college girls will have the habit of reacting so that any man will feel in his own brain a vigourous result from lecturing to them.

46 This fact that a girl's brain does not react is proved in many ways. Most of the women who come to nerve specialists seem to feel that they are to sit still and be cured, while the men who come respond and do their part much more intelligently-- 47 the result being that men get out of "nerves" in half the time and stay out, whereas girls often get out a little way and slump (literally slump) back again before they can be helped to respond truly enough to get well and keep themselves well. 48 This information is given only with an idea of stirring girls up to their best possibilities, 49 for there is not a woman born with a sound mind who is not capable of reacting mentally, in a greater or less degree, to all that she hears, provided she uses her will consciously to form the new habit. 50 Now this need of intelligent reaction is just the trouble with girls and physical culture. Physical culture should be a means to an end-- and that is all, absolutely all.

GOODNESS

51 It is delightful and strengthening when it is taught thoughtfully as a means to an end, and I might almost say it is only weakening when it is made an end in itself.

52 Girls need to react intelligently to what is given them in physical training as much as to what is given them in a lecture on literature or philosophy or botany. 53 How many girls do we know who take physical culture in a class, often simply because it is popular at the time, and never think of taking a long walk in the country-- never think of going in for a vigourous outdoor game? 54 How many girls do we know who take physical culture and never think of making life easy for their stomachs, or seeing that they get a normal amount of sleep? 55 Exercise in the fresh air, with a hearty objective interest in all that is going on about us, is the very best sort of exercise that we can take, 56 and physical culture is worse than nothing if it is not taken only as a means to enable us to do more in the open air, and do it better, and gain from it more life.

57 There is one girl who comes to my mind of whom I should like to tell because she illustrates truly a point that we cannot consider too carefully. 58 She went to a nerve specialist very much broken in health, and when asked if she took plenty of exercise in the open air she replied "Yes, indeed." 59 And it was proved to be the very best exercise. She had a good horse, and she rode well; she rode a great deal, and not too much. 60 She had interesting dogs and she took them with her. She walked, too, in beautiful country. 61 But she was carrying in her mind all the time extreme resistance to other circumstances of her life. 62 She did not know how to drop the resistance or face the circumstances, and the mental strain in which she held herself day and night, waking or sleeping, prevented the outdoor exercise from really refreshing her. 63 When she learned to face the circumstances then the exercise could do its good work.

64 On the other hand, there are many forms of nervous resistance and many disagreeable moods which good, vigourous exercise

will blow away entirely, 65 leaving our minds so clear that we wonder at ourselves, and wonder that we could ever have had those morbid thoughts.

66 The mind acts and the body reacts, the body acts and the mind reacts, but of course at the root of it all is the real desire for what is normal, or-- alas!-- the lack of that desire.

67 If physical culture does not make us love the open air, if it does not make us love to take a walk or climb a mountain, if it does not help us to take the walk or climb the mountain with more freedom, 68 if it does not make us move along outdoors so easily that we forget our bodies altogether, and only enjoy what we see about us and feel how good it is to be alive-- 69 why, then physical culture is only an ornament without any use.

70 There is an interesting point in mountain-climbing which I should like to speak of, by the way, and which makes it much pleasanter and better exercise. 71 If, after first starting-- and, of course, you should start very slowly and heavily, like an elephant-- you get out of breath, let yourself stay out of breath. 72 Even emphasise the being out of breath by breathing harder than your lungs started to breathe, and then let your lungs pump and pump and pump until they find their own equilibrium. 73 The result is delightful, and the physical freedom that follows is more than delightful.

74 I remember seeing two girls climbing in the high Rocky Mountains in this way, when other women were going up on ponies. 75 Finally one of the guides looked back, and with an expression of mild astonishment said "Well, you have lungs!" This was a very pleasant proof of the right kind of breathing.

76 There are many good points for climbing and walking and swimming and all outdoor exercise that can be gained from the best sort of physical culture; 77 and physical culture is good for girls when it gives these points and leads to a spontaneous love for outdoor exercise. But when it results only in a self-conscious pose of the body then it is harmful.

78 We want to have strong bodies, free for every normal action, with

quiet nerves, and muscles well coordinated. 79 Then our bodies are merely instruments: good, clean, healthy instruments. They are the "mechanism of the outside." 80 And when the mechanism of the outside is well oiled and running smoothly it can be forgotten.

81 There can be no doubt but that physical culture is good for girls provided it is given and taken with intelligent interest, but it must be done thoroughly to be done to real advantage. 82 As, for instance, the part the shower-bath plays after exercising is most important, for it equalises the circulation. 83 Physical culture is good for girls who have little or no muscular action in their daily lives, for it gives them the healthiest exercise in the least space of time, and prepares them to get more life from exercise outdoors. 84 It is good for girls whose daily lives are full of activity, because it develops the unused muscles and so rests those that have been overused. 85 Many a hardworking girl has entered the gymnasium class tired and has left it rested.

WORKING RESTFULLY

Annie Payson Call

14 ONCE met a man who had to do an important piece of scientific work in a given time. 2 He worked from Saturday afternoon at 2-o'clock until Monday morning at 10 o'clock without interruption, except for one hour's sleep and the necessary time it took for nourishment.

3 After he had finished, he was, of course, intensely tired, but instead of going right to bed and to sleep, and taking all that brain strain to sleep with him he took his dog and his gun and went hunting for several hours.

4 Turning his attention to something so entirely different gave the other part of his brain a chance to recover itself a little. 5 The fresh air revived him, and the gentle exercise started up his circulation, 6 If he had gone directly to sleep after his work, the chances are that it would have taken him days to recover from the fatigue, for Nature would have had too much against Her to have reacted quickly from so abnormal a strain-- 7 getting an entire change

of attention and starting up his circulation in the fresh air gave Nature just the start She needed. After that She could work steadily while he slept, and he awakened rested and refreshed.

8 To write from Saturday afternoon until Monday morning seems a stupid thing to do-- no matter what the pressure is. 9 To work for an abnormal time or at an abnormal rate is almost always stupid and short sighted.

10 There are exceptions, however, and it would be good if for those exceptions people knew how to take the best care of themselves. 11 But it is not only after such abnormal work that we need to know how to react most restfully. It is important after all work, and especially for those who have some steady labour for the whole day.

12 Every one is more or less tired at the end of the day and the temptation is to drop into a chair or lie down on the sofa or to go right to bed and go to sleep. Don't do it.

13 Get some entire, active change for your brain, if it is only for fifteen minutes or half an hour. If you live in the city, even to go to walk and look into the shop windows is better than nothing. 14 In that way you get fresh air, and if one knows how to look into shop windows without wanting anything or everything they see there, then it is very entertaining.

15 It is a good game to look into a shop window for two or three minutes and then look away and see how well you can remember everything in it. It is important always to take shop windows that are out of one's own line of work.

16 If you live in the country, a little walk out of doors is pleasanter than in the city, for the air is better; and there is much that is interesting, in the way of trees and sky, and stars, at night.

17 As you walk, make a conscious effort to look out and about you. Forget the work of the day, and take good long breaths.

18 When you do not feel like going out of doors, take a story book-- or some other reading, if you prefer-- and put your mind right on it for half an hour. 19 The use of a really good novel cannot be overestimated. It not only serves as recreation, but it introduces us

to phases of human nature that otherwise we would know nothing whatever about. 20 A very great change from the day's work can be found in a good novel and a very happy change.

21 If the air in the theaters were fresher and good seats did not cost so much a good play, well acted, would be better than a good novel.

22 Sometimes it freshens us up to play a game after the day's work is over, and for those who love music there is of course the greatest rest in that. But there again comes in the question of cost.

23 Why does not some kind soul start concerts for the people where, for a nominal admission, the best music can be heard? 24 And why does not some other kind soul start a theater for the people where, for a very small price of admission, they can see the best plays and see them well acted?

25 We have public libraries in all our cities and towns, and a librarian in one large city loves to tell the tale of a poor woman in the slums with her door barred with furniture for fear of the drunken raiders in the house, quietly reading a book from the public library.

26 There are many similar stories to go with that. If we had really good theaters and really good concerts to be reached as simply and as easily as the books in our public libraries, the healthy influence throughout the cities would be proportionately increased. 27 The trouble is that people cater as much to the rich with their ideas of a national theater as the theatrical syndicate itself.

28 I could not pretend to suggest amusements that would appeal to any or every reader, but I can make my point clear that when one is tired it is healthy to have a change of activity before going to rest.

29 "Oh," I hear, "I can't! I can't! I am too tired."

I know the feeling.

30 I have no doubt the man who wrote for nearly two days had a very strong tendency to go right to bed, but he had common-sense behind it, and he knew the result would be better if he followed his common-sense rather than his inclination. And so it proved.

GOODNESS

31 It seems very hard to realise that it is not the best thing to go right to bed or to sit and do nothing when one is so tired as to make it seem impossible to do anything else.

32 It would be wrong to take vigourous physical exercise after great brain or body fatigue, but entire change of attention and gentle exercise is just what is needed, although care should always be taken not to keep at it too long. 33 Any readers who make up their minds to try this process of resting will soon prove its happy effect.

34 A quotation from a recent daily paper reads, "'Rest while you work,' says Annie Payson Call,"-- and then the editor adds, "and get fired," and although the opportunity for the joke was probably thought too good to lose, it was a natural misinterpretation of a very practical truth.

35 I can easily imagine a woman-- especially a tired out and bitter woman-- reading directions telling how to work restfully and exclaiming with all the vehemence of her bitterness: 36 "That is all very well to write about. It sounds well, but let any one take hold of my work and try to do it restfully".

37 "If my employer should come along and see me working in a lazy way like that, he would very soon discharge me. No, no. I am tired out; I must keep at it as long as I can, and when I cannot keep at it any longer, I will die-- and there is the end."

38 "It is nothing but drudge, drudge for your bread and butter-- and what does your bread and butter amount to when you get it?"

39 There are thousands of women working to-day with bodies and minds so steeped in their fatigue that they cannot or will not take an idea outside of their rut of work. 40 The rut has grown so deep, and they have sunken in so far that they cannot look over the edge.

41 It is true that it is easier to do good hard work in the lines to which one has been accustomed than to do easy work which is strange. 42 Nerves will go on in old accustomed habits-- even habits of tiresome strain-- more easily than they will be changed into new habits of working without strain.

43 The mind, too, gets saturated with a sense of fatigue until the

fatigue seems normal, and to feel well rested would-- at first-- seem abnormal. 44 This being a fact, it is a logical result that an habitually tired and strained mind will indignantly refuse the idea that it can do more work and do it better without the strain.

45 There is a sharp corner to be turned to learn to work without strain, when one has had the habit of working with it. 46 After the corner is turned, it requires steady, careful study to understand the new normal habit of working restfully, and to get the new habit established.

47 When once it is established, this normal habit of work develops its own requirements, and the working without strain becomes to us an essential part of the work itself.

48 For taken as a whole, more work is done and the work is done better when we avoid strain than when we do not. 49 What is required to find this out is common-sense and strength of character.

50 Character grows with practice; it builds and builds on itself when once it has a fair start, and a very little intelligence is needed if once the will is used to direct the body and mind in the lines of common-sense.

51 Intelligence grows, too, as we use it. Everything good in the soul grows with use; everything bad, destroys.

52 Let us make a distinction to begin with between "rest while you work" and "working restfully."

53 "Rest while you work" might imply laziness. There is a time for rest and there is a time for work. When we work we should work entirely. When we rest we should rest entirely.

54 If we try to mix rest and work, we do neither well. That is true. But if we work restfully, we work then with the greatest amount of power and the least amount of effort.

55 That means more work and work better done after the right habit is established than we did before, when the wrong habit was established. 56 The difficulty comes, and the danger of "getting fired," when we are changing our habit. To obviate that difficulty,

we must be content to change our habit more slowly.

57 Suppose we come home Saturday night all tired out; go to bed and go to sleep, and wake Sunday almost more tired than when we went to bed. On Sunday we do not have to go to work.

58 Let us take a little time for the sole purpose of thinking our work over, and trying to find where the unnecessary strain is.

59 "But," I hear some one say, "I am too tired to think." Now it is a scientific fact that when our brains are all tired out in one direction, if we use our wills to start them working in another direction, they will get rested.

60 "But," again I hear, "if I think about my work, why isn't that using my brain in the same direction?" Because in thinking to apply new principles to work, of which you have never thought before, you are thinking in a new direction.

61 Not only that, but in applying new and true principles to your work you are bringing new life into the work itself.

62 On this Sunday morning, when you take an hour to devote yourself to the study of how you can work without getting overtired ask yourself the following questions:—

63 (1) "What do I resist in or about my work?" Find out each thing that you do resist, and drop the contractions that come in your body, with the intention of dropping the resistances in your mind.

64 (2) "Do I drop my work at meals and eat quietly?"

65 (3) "Do I take every opportunity that I can to get fresh air, and take good, full breaths of it?"

66 (4) "Do I feel hurried and pushed in my work? Do I realise that no matter how much of a hurry there may be, I can hurry more effectively if I drop the strain of the hurry?"

67 (5) "How much superfluous strain do I use in my work? Do I work with a feeling of strain? How can I observe better in order to become conscious of the strain and drop it?"

68 These are enough questions for one time! If you concentrate on these questions and on finding the answers, and do it diligently, you will be surprised to see how the true answers will come to you, and

how much clearer they will become as you put them into daily practice.

IMAGINARY VACATIONS

Annie Payson Call

15 ONCE a young woman who had very hard work to do day after day and who had come to where she was chronically strained and tired, turned to her mother just as she was starting for work in the morning, and in a voice tense with fatigue and trouble, said:—

2 "Mother, I cannot stand it. I cannot stand it. Unless I can get a vacation long enough at least to catch my breath, I shall break down altogether."

3 "Why don't you take a vacation today?" asked her mother. The daughter got a little irritated and snapped out:—-

4 "Why do you say such a foolish thing as that, Mother? You know as well as I that I could not leave my work to-day."

5 "Don't be cross, dear. Stop a minute and let me tell you what I mean. I have been thinking about it and I know you will appreciate what I have to say, and I know you can do it. Now listen." 6 Whereupon the mother went on to explain quite graphically a process of pretense--good, wholesome pretense.

7 To any one who has no imagination this would not or could not appeal. To the young woman of whom I write, it not only appealed heartily, but she tried it and made it work. 8 It was simply that she should play that she had commenced her vacation and was going to school to amuse herself.

9 As, for instance, she would say to herself, and believe it: "Isn't it good that I can have a vacation and a rest. What shall I do to get all I can out of it?

10 "I think I will go and see what they are doing in the grammar school. Maybe when I get there it will amuse me to teach some of the children. 11 It is always interesting to see how children are going to take what you say to them and to see the different ways in which they recite their lessons."

12 By the time she got to school she was very much cheered. Looking up she said to herself: "This must be the building."

13 She had been in it every school day for five years past, but through the process of her little game it looked quite new and strange now.
14 She went in the door and when the children said "good morning," and some of them seemed glad to see her, she said to herself: "Why, they seem to know me; I wonder how that happens?" 15 Occasionally she was so much amused at her own consistency in keeping up the game that she nearly laughed outright. 16 She heard each class recite as if she were teaching for the first time. She looked upon each separate child as if she had never seen them before and they were interesting to her as a novel study.
17 She found the schoolroom more cheerful and was surprised into perceiving a pleasant sort of silent communication that started up between her pupils and herself.
18 When school was over she put on her hat and coat to go home, with the sense of having done something restful; 19 and when she appeared to her mother, it was with a smiling, cheerful face, which made her mother laugh outright; 20 and then they both laughed and went out for a walk in the fresh air, before coming in to go to bed, and be ready to begin again the next day.
21 In the morning the mother felt a little anxious and asked timidly: "Do you believe you can make it work again today, just as well as yesterday?"
"Yes, indeed and better," said the daughter. "It is too much fun not to go on with it."
22 After breakfast the mother with a little roguish twinkle, said: "Well, what do you think you will do to amuse yourself to-day, Alice?"
"Oh! I think--" and then they both laughed and Alice started off on her second day's "vacation."
23 By the end of a week she was out of that tired rut and having a very good time. 24 New ideas had come to her about the school and the children; in fact, from being dead and heavy in her work, she had become alive.
25 When she found the old tired state coming on her again, she and her mother always "took a vacation," and every time avoided the tired rut more easily.
26 If one only has imagination enough, the helpfulness and

restfulness of playing "take a vacation" will tell equally well in any kind of work.

27 You can play at dressmaking-- play at millinery-- play at keeping shop. You can make a game of any sort of drudgery, and do the work better for it, as well as keep better rested and more healthy yourself. 28 But you must be steady and persistent and childlike in the way you play your game.

29 Do not stop in the middle and exclaim, "How silly!"-- and then slump into the tired state again.

30 What I am telling you is nothing more nor less than a good healthy process of self-hypnotism. 31 Really, it is more the attitude we take toward our work that tires us than the work itself. 32 If we could only learn that and realise it as a practical fact, it would save a great deal of unnecessary suffering and even illness.

33 We do not need to play vacation all the time, of course. The game might get stale then and lose its power. 34 If we play it for two or three days, whenever we get so tired that it seems as if we could not bear it-- play it just long enough to lift ourselves out of the rut-- then we can "go to work again" until we need another vacation.

35 We need not be afraid nor ashamed to bring back that childlike tendency-- it will be of very great use to our mature minds.

36 If we try to play the vacation game, it is wiser to say nothing about it. It is not a game that we can be sure of sharing profitably either to ourselves or to others.

37 If you find it works, and give the secret to a friend, tell her to play it without mentioning it to you, even though she shares your work and is sitting in the next chair to you.

38 Another most healthy process of resting while you work is by means of lowering the pressure.

39 Suppose you were an engine, whose normal pressure was six hundred pounds, we will say. Make yourself work at a pressure of only three hundred pounds.

40 The human engine works with so much more strain than is necessary, 41 that if a woman gets overtired and tries to lighten her work by lightening the pressure with which she does it, she will

find that really she has only thrown off the unnecessary strain, 42 and is not only getting over her fatigue by working restfully, but is doing her work better, too.

43 In the process of learning to use less pressure, the work may seem to be going a little more slowly at first, but we shall find that it will soon go faster, and better, as time establishes the better habit.

44 One thing seems singular; and yet it appeals entirely to our common-sense as we think of it. There never comes a time when we cannot learn to work more effectively at a lower pressure. 45 We never get to where we cannot lessen our pressure and thus increase our power.

46 The very interest of using less pressure adds zest to our work, however it may have seemed like drudging before, 47 and the possibility of resting while we work opens to us much that is new and refreshing, and gives us clearer understanding of how to rest more completely while we rest.

48 All kinds of resting, and all kinds of working, can bring more vitality than most of us know, until we have learned to rest and to work without strain.

THE WOMAN AT THE NEXT DESK

Annie Payson Call

16 IT may be the woman sewing in the next chair; it may be the woman standing next at the same counter; it may be the woman next at a working table, or it may be the woman at the next desk.

2 Whichever one it is, many a working woman has her life made wretched by her, 3 and it would be a strange thing for this miserable woman to hear and a stranger thing-- at first-- for her to believe that the woman at the next desk need not trouble her at all.

4 That, if she only could realise it, the cause of the irritation which annoyed her every day and dragged her down so that many and many a night she had been home with a sick headache was entirely and solely in herself 5 and not at all in the woman who worked next to her, however disagreeable that woman may have been.

GOODNESS

6 Every morning when she wakes the woman at the next desk rises before her like a black specter. 7 "Oh, I would not mind the work; I could work all day happily and quietly and go home at night and rest; the work would be a joy to me compared to this torture of having to live all day next to that woman."

8 It is odd, too, and true, that if the woman at the next desk finds that she is annoying our friend, unconsciously she seems to ferret out her most sensitive places and rub them raw with her sharp, discourteous words.

9 She seems to shirk her own work purposely and to arrange it so that the woman next her must do the work in her place. 10 Then, having done all in her power to give the woman next her harder labour, she snaps out a little scornful remark about the mistakes that have been made.

11 If she-- the woman at the next desk-- comes in in the morning feeling tired and irritable herself, she vents her irritability on her companion until she has worked it off and goes home at night feeling much better herself, while her poor neighbour goes home tired out and weak.

12 The woman at the next desk takes pains to let little disagreeable hints drop about others-- if not directly in their hearing at least in ways which she knows may reach them.

13 She drops hint to others of what those in higher office have said or appeared to think, which might frighten "others" quite out of their wits for fear of their being discharged, and then, where should they get their bread and butter?

14 All this and more that is frightful and disagreeable and mean may the woman at the next desk do; or she may be just plain, every-day ‘ugly’.

15 Every one knows the trying phases of her own working neighbour. But with all this, and with worse possibilities of harassment than I have even touched upon, the woman at the next desk is powerless, so far as I am concerned, if I choose to make her so.

16 The reason she troubles me is because I resist her. If she hurts my feelings, that is the same thing.

17 I resist her, and the resistance, instead of making me angry, makes me sore in my nerves and makes me want to cry. 18 The way to get independent of her is not to resist her, and the way to learn not to resist her is to make a daily and hourly study of dropping all resistances to her.

19 This study has another advantage, too; if we once get well started on it, it becomes so interesting that the concentration on this new interest brings new life in itself.

20 Resistance in the mind brings contraction in the body. 21 If, when we find our minds resisting that which is disagreeable in another, we give our attention at once to finding the resultant contraction in our bodies, 22 and then concentrate our wills on loosening out of the contraction, we cannot help getting an immediate result.

23 Even though it is a small result at the beginning, if we persist, results will grow until we, literally, find ourselves free from the woman at the next desk.

24 This woman says a disagreeable thing; we contract to it mind and body. 25 We drop the contraction from our bodies, with the desire to drop it from our minds, for loosening the physical tension reacts upon the mental strain and relieves it.

26 We can say to ourselves quite cheerfully: "I wish she would go ahead and say another disagreeable thing; I should like to try the experiment again." 27 She gives you an early opportunity and you try the experiment again, and again, and then again, until finally your brain gets the habit of trying the experiment without any voluntary effort on your part. 28 That habit being established, ‘you are free from the woman at the next desk’. She cannot irritate you nor wear upon you, no matter how she tries, no matter what she says, or what she does.

29 There is, however, this trouble about dropping the contraction. We are apt to have a feeling of what we might call "righteous indignation" at annoyances which are put upon us for no reason; 30 that, so-called, "righteous indignation" takes the form of resistance and makes physical contractions.

31 It is useless to drop the physical contraction if the indignation is going to rise and tighten us all up again. 32 If we drop the physical and mental contractions we must have something good to fill the open channels that have been made. 33 Therefore let us give our best attention to our work, and if opportunity offers, do a kindness to the woman at the next desk.

34 Finally, when she finds that her ways do not annoy, she will stop them. She will probably, for a time at first, try harder to be disagreeable, 35 and then after recovering from several surprises at not being able to annoy, she will quiet down and grow less disagreeable.

36 If we realise the effect of successive and continued resistance upon ourselves and realise at the same time that we can drop or hold those resistances as we choose to work to get free from them, or suffer and hold them, 37 then we can appreciate the truth that if the woman at the next desk continues to annoy us, it is our fault entirely, and not hers.

TELEPHONES AND TELEPHONING

Annie Payson Call

17 MOST men-- and women-- use more nervous force in speaking through the telephone than would be needed to keep them strong and healthy for years.

2 It is good to note that the more we keep in harmony with natural laws the more quiet we are forced to be.

3 Nature knows no strain. True science knows no strain. Therefore ‘a strained high-pitched voice does not carry over the telephone wire as well as a low one’.

4 If every woman using the telephone would remember this fact the good accomplished would be thricefold. 5 She would save her own nervous energy. She would save the ears of the woman at the other end of the wire. She would make herself heard.

6 Patience, gentleness, firmness-- a quiet concentration-- all tell immeasurably over the telephone wire. 7 Impatience, rudeness, indecision, and diffuseness blur communication by telephone even more than they do when one is

face to face with the person talking.

8 It is as if the wire itself resented these inhuman phases of humanity and spit back at the person who insulted it by trying to transmit over it such unintelligent bosh.

9 There are people who feel that if they do not get an immediate answer at the telephone they have a right to demand and get good service by means of an angry telephonic sputter.

10 The result of this attempt to scold the telephone girl is often an impulsive, angry response on her part-- which she may be sorry for later on-- and if the service is more prompt for that time it reacts later to what appears to be the same deficiency.

11 No one was ever kept steadily up to time by angry scolding. It is against reason.

12 To a demanding woman who is strained and tired herself, a wait of ten seconds seems ten minutes. 13 I have heard such a woman ring the telephone bell almost without ceasing for fifteen minutes. I could hear her strain and anger reflected in the ringing of the bell. 14 When finally she "got her party" the strain in her high-pitched voice made it impossible for her to be clearly understood. 15 Then she got angry again because "Central" had not "given her a better connection," and finally came away from the telephone nearly in a state of nervous collapse and insisted that the telephone would finally end her life. 16 I do not think she once suspected that the whole state of fatigue which had almost brought an illness upon her was absolutely and entirely her own fault.

17 The telephone has no more to do with it than the floor has to do with a child's falling and bumping own head.

18 The worst of this story is that if any one had told this woman that her tired state was all unnecessary, it would have roused more strain and anger, more fatigue, and more consequent illness.

19 Women must begin to find out their own deficiencies before they are ready to accept suggestions which can lead to greater freedom and more common-sense.

20 Another place where science and inhuman humanity do not blend is in the angry moving up

and down of the telephone hook. 21 When the hook is moved quickly and without pause it does not give time for the light before the telephone girl to flash, therefore she cannot be reminded that any one is waiting at the other end.

22 When the hook is removed with even regularity and a quiet pause between each motion then she can see the light and accelerate her action in getting "the other party."

23 I have seen a man get so impatient at not having an immediate answer that he rattled the hook up and down so fast and so vehemently as to nearly break it. 24 There is something tremendously funny about this. The man is in a great hurry to speak to some one at the other end of the telephone, 25 and yet he takes every means to prevent the operator from knowing what he wants by rattling his hook. 26 In addition to this his angry movement of the hook is fast tending to break the telephone, so that he cannot use it at all. 27 So do we interfere with gaining what we need by wanting it overmuch!

28 I do not know that there has yet been formed a telephone etiquette; but for the use of those who are not well bred by habit it would be useful to put such laws on the first page of the telephone book. 29 A lack of consideration for others is often too evident in telephonic communication.

30 A woman will ask her maid to get the number of a friend's house for her and ask the friend to come to the telephone, and then keep her friend waiting while she has time to be called by the maid and to come to the telephone herself. 31 This method of wasting other people's time is not confined to women alone. 32 Men are equal offenders, and often greater ones, for the man at the other end is apt to be more immediately busy than a woman under such circumstances.

33 To sum up: The telephone may be the means of increasing our consideration for others; our quiet, decisive way of getting good service; 34 our patience, and, through the low voice placed close to the transmitter, it may relieve us from nervous strain; for nerves always relax with the voice.

35 Or the telephone may be the means of making us more selfish and self-centered, more undecided and diffuse, more impatient, more strained and nervous.

36 In fact, the telephones may help us toward health or illness. We might even say the telephone may lead us toward heaven or toward hell. We have our choice of roads in the way we use it.

37 It is a blessed convenience and if it proves a curse-- we bring the curse upon our own heads.

38 I speak of course only of the public who use the telephone. Those who serve the public in the use of the telephone must have many trials to meet, and, I dare say, are not always courteous and patient. 39 But certainly there can be no case of lagging or discourtesy on the part of a telephone operator that is not promptly rectified by a quiet, decided appeal to the "desk."

40 It is invariably the nervous strain and the anger that makes the trouble.

41 There may be one of these days a school for the better use of the telephone; 42 but such a school never need be established if every intelligent man and woman will be his and her own school in appreciating and acting upon the power gained if they compel themselves to go with science-- and never allow themselves to go against it.

DON'T TALK

Annie Payson Call

18 THERE is more nervous energy wasted, more nervous strain generated, more real physical harm done by superfluous talking than any one knows, or than any one could possibly believe who had not studied it. 2 I am not considering the harm done by what people say. We all know the disastrous effects that follow a careless or malicious use of the tongue. That is another question. 3 I simply write of the physical power used up and wasted by mere superfluous words, by using one hundred words where ten will do-- or one thousand words where none at all were needed.

4 I once had been listening to a friend chatter, chatter, chatter to no end for an hour or more, when the

idea occurred to me to tell her of an experiment I had tried by which my voice came more easily. 5 When I could get an opportunity to speak, I asked her if she had ever tried taking a long breath and speaking as she let the breath out. 6 I had to insist a little to keep her mind on the suggestion at all, but finally succeeded. She took a long breath and then stopped.

7 There was perhaps for half a minute a blessed silence, and then what was my surprise to hear her remark: "I-- I-- can't think of anything to say." 8 "Try it again," I told her. She took another long breath, and again gave up because she could not think of anything to say. 9 She did not like that little game very much, and thought she would not make another effort, and in about three minutes she began the chatter, and went on talking until some necessary interruption parted us.

10 This woman's talking was nothing more nor less than a nervous habit. Her thought and her words were not practically connected at all. 11 She never said what she thought for she never thought. She never said anything in answer to what was said to her, for she never listened.

12 Nervous talkers never do listen. That is one of their most striking characteristics.

13 I knew of two well-known men-- both great talkers-- who were invited to dine. Their host thought, as each man talked a great deal and--, as he thought-- talked very well, if they could meet their interchange of ideas would be most delightful. 14 Several days later he met one of his guests in the street and asked how he liked the friend whom he had met for the first time at his house. 15 "Very pleasant, very pleasant," the man said, "but he talks too much."

16 Not long after this the other guest accosted him unexpectedly in the street "For Heaven's sake, don't ask me to dine with that Smith again-- why, I could not get a word in edgewise."

17 Now, if only for selfish reasons a man might realise that he needs to absorb as well as give out, and so could make himself listen in order to be sure that his neighbour did not get ahead of him. 18 But a conceited man, a self-centered

man or a great talker will seldom or never listen.

19 That being the case, what can you expect of a woman who is a nervous talker? The more tired such a woman is the more she talks; the more ill she is the more she talks. 20 As the habit of nervous talking grows upon a woman it weakens her mind. Indeed, nervous talking is a steadily weakening process.

21 Some women talk to forget. If they only knew it was slow mental suicide and led to worse than death they would be quick to avoid such false protection. 22 If we have anything we want to forget we can only forget it by facing it until we have solved the problem that it places before us, and then working on, according to our best light: 23 We can never really cover a thing up in our minds by talking constantly about something else.

24 Many women think they are going to persuade you of their point of view by talking. A woman comes to you with her head full of an idea and finds you do not agree with her. 25 She will talk, talk, talk until you are blind and sick and heartily wish you were deaf, in order to prove to you that she is right and you are wrong.

26 She talks until you do not care whether you are right or wrong. You only care for the blessed relief of silence, and when she has left you, she has done all she could in that space of time to injure her point of view. 27 She has simply buried anything good that she might have had to say in a cloud of dusty talk.

28 It is funny to hear such a woman say after a long interview, "Well, at any rate, I gave him a good talking to. I guess he will go home and think about it."

29 Think about it, madam? He will go home with an impression of rattle and chatter and push that will make him dread the sight of your face; and still more dread the sound of your voice, lest he be subjected to further interviews. 30 Women sit at work together. One woman talks, talks, talks until her companions are so worn with the constant chatter that they have neither head nor nerve enough to do their work well. 31 If they know how to let the chatter go on and turn their attention away from it, so that it makes no impression,

they are fortunate indeed, and the practice is most useful to them. 32 But that does not relieve the strain of the nervous talker herself; she is wearing herself out from day to day, and ruining her mind as well as hurting the nerves and dispositions of those about her who do not know how to protect themselves from her nervous talk. 33 Nervous talking is a disease.

34 Now the question is how to cure it. It can be cured, but the first necessity is for a woman to know she has the disease. 35 For, unlike other diseases, the cure does not need a physician, but must be made by the patient herself.

36 First, she must know that she has the disease. Fifty nervous talkers might read this article, and not one of them recognise that it is aimed straight at her.

37 The only remedy for that is for every woman who reads to believe that she is a nervous talker until she has watched herself for a month or more-- without prejudice-- and has discovered for a certainty that she is not. Then she is safe.

38 But what if she discover to her surprise and chagrin that she is a nervous talker? What is the remedy for that? 39 The first thing to do is to own up the truth to herself without equivocation. To make no excuses or explanations but simply to acknowledge the fact. 40 Then let her aim straight at the remedy-- silence-- steady, severe, relaxed silence. Work from day to day and promise herself that for that day she will say nothing but what is absolutely necessary. 41 She should not repress the words that want to come, but when she takes breath to speak she must not allow the sentence to come out of her mouth, but must instead relax all over, as far as it is possible, and take a good, long, quiet breath. 42 The next time she wants to speak, even if she forgets so far as to get half the sentence out of her mouth, stop it, relax, and take a long breath.

43 The mental concentration necessary to cure one's self of nervous talking will gather together a mind that was gradually becoming dissipated with the nervous talking habit, and so the life and strength of the mind can be saved.

44 And, after that habit has been cured, the habit of quiet thinking will begin, and what is said will be worthwhile.

"WHY FUSS SO MUCH ABOUT WHAT I EAT?"

Annie Payson Call

19 I KNOW a woman who insisted that it was impossible for her to eat strawberries because they did not agree with her. A friend told her that that was simply a habit of her mind. 2 Once, at a time when her stomach was tired or not in good condition for some other reason, strawberries had not agreed with her, and from that time she had taken it for granted that she could not eat strawberries. 3 When she was convinced by her friend that her belief that strawberries did not agree with her was merely in her own idea, and not actually true, she boldly ate a plate of strawberries. 4 That night she woke with indigestion, and the next morning she said "You see, I told you they would not agree with me."

5 But her friend answered: "Why, of course you could not expect them to agree right away, could you? Now try eating them again to-day."

6 This little lady was intelligent enough to want the strawberries to agree with her and to be willing to do her part to adjust herself to them, so she tried again and ate them the next day; and now she can eat them every day right through the strawberry season and is all the better for it.

7 This is the fact that we want to understand thoroughly and to look out for. If we are impressed with the idea that any one food does not agree with us, whenever we think of that food we contract, and especially our stomachs contract. 8 Now if our stomachs contract when a food that we believe to disagree with us is merely mentioned, of course they would contract all the more when we ate it. 9 Naturally our digestive organs would be handicapped by the contraction which came from our attitude of mind and, of course, the food would appear not to agree with us.

10 Take, for instance, people who are born with peculiar prenatal impressions about their food. 11 A woman whom I have in mind

could not take milk nor cream nor butter nor anything with milk or cream or butter in it. 12 She seemed really proud of her milk-and-cream antipathy. She would air it upon all occasions, when she could do so without being positively discourteous, and often she came very near the edge of discourtesy. 13 I never saw her even appear to make an effort to overcome it, and it is perfectly true that a prenatal impression like that can be overcome as entirely, as can a personally acquired impression, although it may take a longer time and a more persistent effort.

14 This anti-milk-and-cream lady was at work every day over-emphasising her milk-and-cream contractions; 15 whereas if she had put the same force into dropping the milk-and-cream contraction she would have been using her will to great advantage, 16 and would have helped herself in many other ways as well as in gaining the ability to take normally a very healthful food. 17 We cannot hold one contraction without having its influence draw us into many others. 18 We cannot give our attention to dropping one contraction without having the influence of that one effort expand us in many other ways. 19 Watch people when they refuse food that is passed them at table; you can see whether they refuse and at the same time contract against the food, or whether they refuse with no contraction at all. 20 I have seen an expression of mild loathing on some women's faces when food was passed which "did not agree with them," but they were quite unconscious that their expressions had betrayed them.

21 Now, it is another fact that the contraction of the stomach at one form of food will interfere with the good digestion of another form. 22 When cauliflower has been passed to us and we contract against it how can we expect our stomachs to recover from that contraction in time to digest perfectly the next vegetable which is passed and which we may like very much? 23 It may be said that we expand to the vegetable we like, and that immediately counteracts the former contraction to the vegetable which we do not like. 24 That is true only to a certain extent, for

the tendency to cauliflower contraction is there in the back of our brains influencing our stomachs all the time, until we have actually used our wills consciously to drop it.

25 Edwin Booth used to be troubled very much with indigestion; he suffered keenly from it. 26 One day he went to dine with some intimate friends, and before the dinner began his hostess said with a very smiling face: "Now, Mr. Booth, I have been especially careful with this dinner not to have one thing that you cannot digest."

27 The host echoed her with a hearty "Yes, Mr. Booth, everything that will come to the table is good for your digestion."

28 The words made a very happy impression on Mr. Booth. First there was the kind, sympathetic friendliness of his hosts; and then the strong suggestion they had given him that their food would agree with him. 29 Then there was very happy and interesting talk during the whole time that they were at table and afterward. 30 Mr.. Booth ate a hearty dinner and, true to the words of his host and hostess, not one single thing disagreed with him. 31 And yet at that dinner, although care had been taken to have it wholesome, there were served things that under other conditions would have disagreed.

32 While we should aim always to eat wholesome food, it is really not so much the food which makes the trouble as the attitude we take toward it and the way we test it.

33 All the contractions which are made by our fussing about food interfere with our circulation; 34 the interference with our circulation makes us liable to take cold, and it is safe to say that more than half the colds that women have are caused principally by wrong eating. 35 Somewhat akin to grandmother's looking for her spectacles when all the time they are pushed to the top of her head is the way women fuss about their eating and then wonder why it is that they cannot seem to stand drafts.

36 There is no doubt but that our food should be thoroughly masticated before it goes into our stomachs. 37 There is no doubt but that the first process of digestion should be in our mouths. 38 The

relish which we get for our food by masticating it properly is greater and also helps toward digesting it truly. 39 All this cannot be over-emphasised if it is taken in the right way. But there is an extreme which perhaps has not been thought of and for which happily I have an example that will illustrate what I want to prove. 40 I know a woman who was, so to speak, daft on the subject of health. She attended to all points of health with such minute detail that she seemed to have lost all idea of why we should be healthy. 41 One of her ways of over-emphasising the road to health was a very careful mastication of her food. She chewed and chewed and chewed and chewed, 42 and the result was that she so strained her stomach with her chewing that she brought on severe indigestion, simply as a result of an overactive effort toward digestion. 43 This was certainly a case of "vaulting ambition, which overleaps itself, and falls on the other." And it was not unique.

44 The over-emphasis of "What shall I eat? How much shall I eat? How often shall I eat? When shall I eat? How shall I eat?"-- 45 all extreme attention to these questions is just as liable to bring chronic indigestion as a reckless neglect of them altogether is liable to upset a good, strong stomach and keep it upset. 46 The woman who chewed herself into indigestion fussed herself into it, too, by constantly talking about what was not healthful to eat. 47 Her breakfast, which she took alone, was for a time the dryest-looking meal I ever saw. It was enough to take away any one's healthy relish just to look at it, if you was not forewarned.

48 Now our relish is one of our most blessed gifts. When we relish our food our stomachs can digest it wholesomely. When we do not, our stomachs will not produce the secretions necessary to the most wholesome digestion. 49 Constant fussing about our food takes away our relish. A gluttonous dwelling upon our food takes away our relish. 50 Relish is a delicate gift, and as we respect it truly, as we do not degrade it to selfish ends nor kill it with selfish fastidiousness, 51 it grows upon us and is in its place like any other fine

perception, and is as greatly useful to the health of our bodies as our keener and deeper perceptions are useful to the health of our minds.

52 Then there is the question of being sure that our stomachs are well rested before we give them any work to do, 53 and being sure that we are quiet enough after eating to give our stomachs the best opportunity to begin their work.

54 Here again one extreme is just as harmful as the other. I knew a woman who had what might be called the fixed idea of health, 55 who always used to sit bolt upright in a high-backed chair for half an hour after dinner, and refuse to speak or to be spoken to in order that "digestion might start in properly." 56 If I had been her stomach I should have said: "Madam, when you have got through giving me your especial attention I will begin my work--which, by the way, is not your work but mine!" 57 And, virtually, that is what her stomach did say. Sitting bolt upright and consciously waiting for your food to begin digestion is an over-attention to what is none of your business, which contracts your brain, contracts your stomach and stops its work.

58 Our business is only to fulfill the conditions rightly. The French workmen do that when they sit quietly after a meal talking of their various interests. 59 Any one can fulfill the conditions properly by keeping a little quiet, having some pleasant chat, reading a bright story or taking life easy in any quiet way for half an hour. 60 Or, if work must begin directly after eating, begin it quietly. But this feeling that it is our business to attend to the working functions of our stomachs is officious and harmful. 61 We must fulfill the conditions and then forget our stomachs. If our stomachs remind us of themselves by some misbehavior we must seek for the cause and remedy it, 62 but we should not on any account feel that the cause is necessarily in the food we have eaten. It may be, and probably often is, entirely back of that. 63 A quick, sharp resistance to something that is said will often cause indigestion. In that case we must stop resisting and not blame the food.

GOODNESS

64 A dog was once made to swallow a little bullet with his food and then an X-ray was thrown on to his stomach in order that the process of digestion might be watched by means of the bullet. 65 When the dog was made angry the bullet stopped, which meant that the digestion stopped; when the dog was over-excited in any way digestion stopped. When he was calmed down it went on again. 66 There are many reasons why we should learn to meet life without useless resistance, and the health of our stomachs is not the least.

67 It would surprise most people if they could know how much unnecessary strain they put on their stomachs by eating too much. 68 A nervous invalid had a very large appetite. She was helped twice, sometimes three times, to meat and vegetables at dinner. 69 She thought that what she deemed her very healthy appetite was a great blessing to her, and often remarked upon it, as also upon her idea that so much good, nourishing food must be helping to make her well. And yet she wondered why she did not gain faster.

70 Now the truth of the matter was that this invalid had a nervous appetite. Not only did she not need one third of the food she ate, but indeed the other two thirds was doing her positive harm. 71 The tax which she put upon her stomach to digest so much food drained her nerves every day, and of course robbed her brain, so that she ate and ate and wept and wept with nervous depression. 72 When it was suggested to her by a friend who understood nerves that she would get better very much faster if she would eat very much less she made a rule to take only one helping of anything, no matter how much she might feel that she wanted another. 73 Very soon she began to gain enough to see for herself that she had been keeping herself ill with overeating, and it was not many days before she did not want a second helping.

74 Nervous appetites are not uncommon even among women who consider themselves pretty well. 75 Probably there are not five in a hundred among all the well-fed men and women in this country who would not be more healthy if they ate less.

76 Then there are food notions to be looked out for and out of which any one can relax by giving a little intelligent attention to the task.

77 "I do not like eggs. I am tired of them." "Dear, dear me! I ate so much ice cream that it made me ill, and it has made me ill to think of it ever since."

78 Relax, drop the contraction, pretend you had never tasted ice cream before, and try to eat a little-- not for the sake of the ice cream, but for the sake of getting that knot out of your stomach.

79 "But," you will say, "can every one eat everything?"

"Yes," the answer is, "everything that is really good, wholesome food is all right for anybody to eat."

80 But you say: "Won't you allow for difference of tastes?"

And the answer to that is: "Of course we can like some foods more than others, but there is a radical difference between unprejudiced preferences and prejudiced dislikes."

81 Our stomachs are all right if we will but fulfill their most simple conditions and then leave them alone. 82 If we treat them right they will tell us what is good for them and what is not good for them, 83 and if we will only pay attention, obey them as a matter of course without comment and then forget them, there need be no more fuss about food and very much less nervous irritability.

TAKE CARE OF YOUR STOMACH

Annie Payson Call

20 WE all know that we have a great deal to do. Some of us have to work all day to earn our bread and butter and then work a good part of the night to make our clothes. 2 Some of us have to stand all day behind a counter. Some of us have to sit all day and sew for others, and all night to sew for ourselves and our children. 3 Most of us have to do work that is necessary or work that is self-imposed. Many of us feel busy without really being busy at all. 4 But how many of us realise that while we are doing work outside, our bodies themselves have good, steady work to do inside.

5 Our lungs have to take oxygen from the air and give it to our

blood; our blood has to carry it all through our bodies and take away the waste by means of the steady pumping of our hearts. 6 Our stomachs must digest the food put into them, give the nourishment in it to the blood, and see that the waste is cast off.

7 All this work is wholesome and good, and goes on steadily, giving us health and strength and new power; 8 but if we, through mismanagement, make heart or lungs or stomach work harder than they should, then they must rob us of power to accomplish what we give them to do, and we blame them, instead of blaming ourselves for being hard and unjust taskmasters.

9 The strain in a stomach necessary to the digesting of too much food, or the wrong kind of food, makes itself felt in strain all through the whole system.

10 I knew a woman whose conscience was troubling her very greatly. She was sure she had done many very selfish things for which there was no excuse, and that she herself was greatly to blame for other people's troubles. 11 This was a very acute attack of conscience, accompanied by a very severe stomach ache. 12 The doctor was called in and gave her an emetic. She threw a large amount of undigested food from her stomach, 13 and after that relief the weight on her conscience was lifted entirely and she had nothing more to blame herself with than any ordinary, wholesome woman must have to look out for every day of her life.

14 This is a true story and should be practically useful to readers who need it. This woman's stomach had been given too much to do. It worked hard to do its work well, and had to rob the brain and nervous system in the effort. 15 This effort brought strain to the whole brain, which was made evident in the region of the conscience. 16 It might have come out in some other form. It might have appeared in irritability. It might even have shown itself in downright ugliness.

17 Whatever the effects are, whether exaggerated conscience, exaggerated anxiety, or irritability, the immediate cause of the trouble in such cases as I refer to is in the

fact that the stomach has been given too much to do.

18 We give the stomach too much to do if we put a great deal of food into it when it is tired. We give it too much to do if we put into it the wrong kind of food. We give it too much to do if we insist upon working hard ourselves, either with body or brain, directly after a hearty meal. 19 No matter how busy we are we can protect our stomachs against each and all of these three causes of trouble.

20 If a woman is very tired her stomach must necessarily be very tired also. 21 If she can remember that at such times even though she may be very hungry, her body is better nourished if she takes slowly a cup of hot milk, 22 and waits until she is more rested before taking solid food, than if she ate a hearty meal. It will save a strain, and perhaps eventually severe illness.

23 If it is possible to rest and do absolutely nothing for half an hour before a meal, and for half an hour after that insures the best work for our digestion. 24 If one is pretty well, and cannot spare the half hour, ten or fifteen minutes will do, unless there is a great deal of fatigue to be conquered.

25 If it is necessary to work right up to mealtime, let up a little before stopping. 26 As the time for dinner approaches do not work quite so hard; the work will not lose; in the end it will gain-- 27 and when you begin work again begin lightly, and get into the thick of it gradually. That gives your stomach a good chance.

28 If possible get a long rest before the last meal, and if your day is very busy, it is better to have the heartiest meal at the end of it, 29 to take a good rest afterward and then a walk in the fresh air, which may be long or short, according to what other work you have to do or according to how tired you are.

30 I know many women will say: "But I am tired all the time; if I waited to rest before I ate, I should starve." 31 The answer to that is "protect your stomach as well as you can. If you cannot rest before and after each meal try to arrange some way by which you can get rid of a little fatigue."

32 If you do this with attention and interest you will find gradually that you are less tired all the time,

33 and as you keep on steadily toward the right path, you may be surprised some day to discover that you are only tired half the time, and perhaps even reach the place where the tired feeling will be the exception.

34 It takes a good while to get our misused stomachs into wholesome ways, but if we are persistent and intelligent we can surely do it, 35 and the relief to the overstrained stomach-- as I have said-- means relief to the whole body.

36 Resting before and after meals amounts to very little, however, if we eat food that is not nourishing.

37 Some people are so far out of the normal way of eating that they have lost a wholesome sense of what is good for them, and live in a chronic state of disordered stomach, which means a chronic state of disordered nerves and disposition. 38 If such persons could for one minute literally experience the freedom of a woman whose body was truly and thoroughly nourished, the contrast from the abnormal to the normal would make them dizzy. 39 If, however, they stayed in the normal place long enough to get over the dizziness, the freedom of health would be so great a delight that food that was not nourishing would be nauseous to them.

40 Most of us are near enough the normal to know the food that is best for us, through experience of suffering from food which is not best for us, as well as through good natural instinct.

41 If we would learn from the normal working of the involuntary action of our organs, it might help us greatly toward working more wholesomely in all our voluntary actions.

42 If every woman who reads this article would study not to interfere with the most healthy action of her own stomach, her reward after a few weeks' persistent care would be not only a greater power for work, but a greater power for good, healthy, recuperative rest.

ABOUT FACES

Annie Payson Call

21 WATCH the faces as you walk along the street! If you get the habit of noticing, your observations will grow keener. 2 It is surprising to see how seldom we

find a really quiet face. I do not mean that there should be no lines in the face. We are here in this world at school and we cannot have any real schooling unless we have real experiences. 3 We cannot have real experiences without suffering, and suffering which comes from the discipline of life and results in character leaves lines in our faces. It is the lines made by unnecessary strain to which I refer.

4 Strange to say the unquiet faces come mostly from shallow feeling. Usually the deeper the feeling the less strain there is on the face. 5 A face may look troubled, it may be full of pain, without a touch of that strain which comes from shallow worry or excitement.

6 The strained expression takes character out of the face, it weakens it, and certainly it detracts greatly from whatever natural beauty there may have been to begin with. 7 The expression which comes from pain or any suffering well borne gives character to the face and adds to its real beauty as well as its strength.

8 To remove the strained expression we must remove the strain behind; therefore the hardest work we have to do is below the surface. The surface work is comparatively easy.

9 I know a woman whose face is quiet and placid. The lines are really beautiful, but they are always the same. 10 This woman used to watch herself in the glass until she had her face as quiet and free from lines as she could get it-- 11 she used even to arrange the corners of her mouth with her fingers until they had just the right droop.

12 Then she observed carefully how her face felt with that placid expression and studied to keep it always with that feeling, until by and by her features were fixed and now the placid face is always there, 13 for she has established in her brain an automatic vigilance over it that will not allow the muscles once to get "out of drawing."

14 What kind of an old woman this acquaintance of mine will make I do not know. I am curious to see her-- but now she certainly is a most remarkable hypocrite. 15 The strain in behind the mask of a face which she has made for herself

must be something frightful. And indeed I believe it is, for she is ill most of the time-- 16 and what could keep one in nervous illness more entirely than this deep interior strain which is necessary to such external appearance of placidity.

17 There comes to my mind at once a very comical illustration of something quite akin to this although at first thought it seems almost the reverse. 18 A woman who constantly talked of the pre-eminency of mind over matter, and the impossibility of being moved by external circumstances to any one who believed as she did-- this woman I saw very angry.

19 She was sitting with her face drawn in a hundred cross lines and all askew with her anger. 20 She had been spouting and sputtering what she called her righteous indignation for some minutes, when after a brief pause and with the angry expression still on her face she exclaimed: "Well, I don't care, it's all peace within."

21 I doubt if my masked lady would ever have declared to herself or to any one else that "it was all peace within." 22 The angry woman was-- without doubt-- the deeper hypocrite, but the masked woman had become rigid in her hypocrisy. 23 I do not know which was the weaker of the two, probably the one who was deceiving herself.

24 But to return to those drawn, strained lines we see on the people about us. They do not come from hard work or deep thought. They come from unnecessary contractions about the work. 25 If we use our wills consistently and steadily to drop such contractions, the result is a more quiet and restful way of living, and so quieter and more attractive faces.

26 This unquietness comes especially in the eyes. It is a rare thing to see a really quiet eye; and very pleasant and beautiful it is when we do see it. 27 And the more we see and observe the unquiet eyes and the unquiet faces the better worthwhile it seems to work to have ours more quiet, but not to put on a mask, or be in any other way a hypocrite.

28 The exercise described in a previous chapter will help to bring a quiet face. 29 We must drop our heads with a sense of letting every

strain go out of our faces, and then let our heads carry our bodies down as far as possible, dropping strain all the time, and while rising slowly we must take the same care to drop all strain.

30 In taking the long breath, we must inhale without effort, and exhale so easily that it seems as if the breath went out of itself, like the balloons that children blow up and then watch them shrink as the air leaves them.

31 Five minutes a day is very little time to spend to get a quiet face, but just that five minutes-- 32 if followed consistently-- will make us so much more sensitive to the unquiet that we will sooner or later turn away from it as by a natural instinct.

ABOUT VOICES

Annie Payson Call

22 I KNEW an old German-- a wonderful teacher of the speaking voice-- who said "the ancients believed that the soul of the human is here"-- pointing to the pit of his stomach. 2 "I do not know," and he shrugged his shoulders with expressive interest, "it may be and it may not be-- but I know the soul of the voice is here-- and you Americans-- you squeeze the life out of the word in your throat and it is born dead."

3 That old artist spoke the truth-- we Americans-- most of us-- do squeeze the life out of our words and they are born dead. 4 We squeeze the life out by the strain which runs all through us and reflects itself especially in our voices. 5 Our throats are tense and closed; our stomachs are tense and strained; with many of us the word is dead before it is born.

6 Watch people talking in a very noisy place; hear how they scream at the top of their lungs to get above the noise. Think of the amount of nervous force they use in their efforts to be heard.

7 Now really when we are in the midst of a great noise and want to be heard, what we have to do is to pitch our voices on a different key from the noise about us. 8 We can be heard as well, and better, if we pitch our voices on a lower key than if we pitch them on a higher key; and to pitch your voice on a

low key requires very much less effort than to strain to a high one.

9 I can imagine talking with some one for half an hour in a noisy factory-- for instance-- and being more rested at the end of the half hour than at the beginning. 10 Because to pitch your voice low you must drop some superfluous tension and dropping superfluous tension is always restful.

11 I beg any or all of my readers to try this experiment the next time they have to talk with a friend in a noisy street. 12 At first the habit of screaming above the noise of the wheels is strong on us and it seems impossible that we should be heard if we speak below it. 13 It is difficult to pitch our voices low and keep them there. But if we persist until we have formed a new habit, the change is delightful.

14 There is one other difficulty in the way; whoever is listening to us may be in the habit of hearing a voice at high tension and so find it difficult at first to adjust his ear to the lower voice and will in consequence insist that the lower tone cannot be heard as easily.

15 It seems curious that our ears can be so much engaged in expecting screaming that they cannot without a positive effort of the mind readjust in order to listen to a lower tone. But it is so. 16 And, therefore, we must remember that to be thoroughly successful in speaking intelligently below the noise we must beg our listeners to change the habit of their ears as we ourselves must change the pitch of our voices.

17 The result both to speaker and listener is worth the effort ten times over.

18 As we habitually lower the pitch of our voices our words cease gradually to be "born dead." 19 With a low-pitched voice everything pertaining to the voice is more open and flexible and can react more immediately to whatever may be in our minds to express.

20 Moreover, the voice itself may react back again upon our dispositions. If a woman gets excited in an argument, especially if she loses her temper, her voice will be raised higher and higher until it reaches almost a shriek. 21 And to hear two women "argue" sometimes it may be truly said that we are listening to a

"caterwauling." That is the only word that will describe it.

22 But if one of these women is sensitive enough to know she is beginning to strain in her argument and will lower her voice and persist in keeping it lowered the effect upon herself and the other woman will put the "caterwauling" out of the question.

23 "Caterwauling" is an ugly word. It describes an ugly sound. If you have ever found yourself in the past aiding and abetting such an ugly sound in argument with another-- say to yourself "caterwauling," "caterwauling," 24 "I have been 'caterwauling' with Jane Smith, or Maria Jones," or whoever it may be, and that will bring out in such clear relief the ugliness of the word and the sound that you will turn earnestly toward a more quiet way of speaking.

25 The next time you start on the strain of an argument and your voice begins to go up, up, up-- something will whisper in your ear "caterwauling" and you will at once, in self-defense, lower your voice or stop speaking altogether.

26 It is good to call ugly things by their ugliest names. It helps us to see them in their true light and makes us more earnest in our efforts to get away from them altogether.

27 I was once a guest at a large reception and the noise of talking seemed to be a roar, when suddenly an elderly man got up on a chair and called "silence," 28 and having obtained silence he said, "it has been suggested that every one in this room should speak in a lower tone of voice."

29 The response was immediate. Every one went on talking with the same interest only in a lower tone of voice with a result that was both delightful and soothing.

30 I say every one-- there were perhaps half a dozen whom I observed who looked and I have no doubt said "how impudent." 31 So it was "impudent" if you chose to take it so-- but most of the people did not choose to take it so and so brought a more quiet atmosphere and a happy change of tone.

32 Theophile Gautier said that the voice was nearer the soul than any other expressive part of us. It is certainly a very striking indicator of the state of the soul. 33 If we

accustom ourselves to listen to the voices of those about us we detect more and more clearly various qualities of the man or the woman in the voice, 34 and if we grow sensitive to the strain in our own voices and drop it at once when it is perceived, we feel a proportionate gain.

35 I knew of a blind doctor who habitually told character by the tone of the voice, and men and women often went to him to have their characters described as one would go to a palmist.

36 Once a woman spoke to him earnestly for that purpose and he replied, "Madam, your voice has been so much cultivated that there is nothing of you in it-- I cannot tell your real character at all." 37 The only way to cultivate a voice is to open it to its best possibilities-- not to teach its owner to pose or to imitate a beautiful tone until it has acquired the beautiful tone habit.

38 Such tones are always artificial and the unreality in them can be easily detected by a quick ear.

39 Most great singers are arrant hypocrites. There is nothing of themselves in their tone. The trouble is to have a really beautiful voice one must have a really beautiful soul behind it.

40 If you drop the tension of your voice in an argument for the sake of getting a clearer mind and meeting your opponent without resistance, your voice helps your mind and your mind helps your voice.

41 They act and react upon one another with mutual benefit. 42 If you lower your voice in general for the sake of being more quiet, and so more agreeable and useful to those about you, then again the mental or moral effort and the physical effort help one another.

43 It adds greatly to a woman's attraction and to her use to have a low, quiet voice-- 44 and if any reader is persisting in the effort to get five minutes absolute quiet in every day let her finish the exercise by saying something in a quiet, restful tone of voice.

45 It will make her more sensitive to her unrestful tones outside, and so help her to improve them.

GOODNESS

ABOUT FRIGHTS
Annie Payson Call

23 HERE are two true stories and a remarkable contrast. 2 A nerve specialist was called to see a young girl who had had nervous prostration for two years. 3 The physician was told before seeing the patient that the illness had started through fright occasioned by the patient's waking and discovering a burglar in her room.

4 Almost the moment the doctor entered the sick room, he was accosted with: "Doctor, do you know what made me ill? It was frightful." Then followed a minute description of her sudden awakening and seeing the man at her bureau drawers.

5 This story had been lived over and over by the young girl and her friends for two years, until the strain in her brain caused by the repetition of the impression of fright was so intense that no skill nor tact seemed able to remove it. 6 She simply would not let it go, and she never got really well.

7 Now, see the contrast. Another young woman had a similar burglar experience, and for several nights after she woke with a start at the same hour. 8 For the first two or three nights she lay and shivered until she shivered herself to sleep.

9 Then she noticed how tightened up she was in every muscle when she woke, and she bethought herself that she would put her mind on relaxing her muscles and getting rid of the tension in her nerves. 10 She did this persistently, so that when she woke with the burglar fright it was at once a reminder to relax. 11 After a little she got the impression that she woke in order to relax and it was only a very little while before she succeeded so well that she did not wake until it was time to get up in the morning.

12 The burglar impression not only left her entirely, but left her with the habit of dropping all contractions before she went to sleep, and her nerves are stronger and more normal in consequence.

13 The two girls had each a very sensitive, nervous temperament, and the contrast in their behavior was simply a matter of intelligence.

14 This same nerve specialist received a patient once who was

positively blatant in her complaint of a nervous shock. "Doctor, I have had a horrible nervous shock. It was horrible. I do not see how I can ever get over it."

15 Then she told it and brought the horrors out in weird, over-vivid colours. It was horrible, but she was increasing the horrors by the way in which she dwelt on it.

16 Finally, when she paused long enough to give the doctor an opportunity to speak, he said, very quietly: "Madam, will you kindly say to me, as gently as you can, 'I have had a severe nervous shock.'"

17 She looked at him without a gleam of understanding and repeated the words quietly: "I have had a severe nervous shock."

18 In spite of herself she felt the contrast in her own brain. The habitual blatancy was slightly checked. 19 The doctor then tried to impress upon her the fact that she was constantly increasing the strain of the shock by the way she spoke of it and the way she thought of it, and that she was really keeping herself ill.

20 Gradually, as she learned to relax the nervous tension caused by the shock, a true intelligence about it all dawned upon her; the over-vivid colours faded, and she got well. 21 She was surprised herself at the rapidity with which she got well, but she seemed to understand the process and to be moderately grateful for it.

22 If she had had a more sensitive temperament she would have appreciated it all the more keenly; but if she had had a more sensitive temperament she would not have been blatant about her shock.

CONTRARINESS

Annie Payson Call

24 I KNOW a woman who says that if she wants to get her father's consent to anything, she not only appears not to care whether he consents or not, but pretends that her wishes are exactly opposite to what they really are. 2 She says it never fails; the decision has always been made in opposition to her expressed desires, and according to her real wishes. In other words, she has learned how to manage her father.

3 This example is not unique. Many of us see friends managing other friends in that same way.

4 The only thing which can interfere with such astute management is the difficulty that you may have in concealing your own will in order to accomplish what you desires. 5 Willfulness is such an impulsive quantity that it will rush ahead in spite of us and spoil everything when we feel that there is danger of our not getting our own way. 6 Or, if we have succeeded in getting our own way by what might be called the "contrary method," we may be led into an expression of satisfaction which will throw light on the falseness of our previous attitude and destroy the confidence of the friend whom we were tactfully influencing.

7 To work the "contrary method" to perfection requires a careful control up to the finish and beyond it. 8 In order never to be found out, we have to be so consistent in our behaviour that we gradually get trained into nothing but a common every-day hypocrite, 9 and the process which goes on behind hypocrisy must necessarily be a process of decay. 10 Beside that, the keenest hypocrite that ever lived can only deceive others up to a certain limit.

11 But what is one to do when a friend can only be reached by the "contrary method"? 12 What is one to do when if, for instance, you want a friend to read a book, you know that the way to prevent his reading it is to mention your desire? 13 If you want a friend to see a play and in a forgetful mood mention the fact that you feel sure the play would delight her, you know as soon as the words are out of your mouth you have put the chance of her seeing the play entirely out of the question? 14 What is one to do when something needs mending in the house, and you know that to mention the need to the person of the house would be to delay the repair just so much longer? 15 How are our contrary-minded friends to be met if we cannot pretend we do not want what we do want in order to get their cooperation and consent?

16 No one could deliberately plan to be a hypocrite understanding what a hypocrite really is. A hypocrite is a sham-- a sham has nothing solid to stand on. 17 No one really respects a sham, and the

most intelligent, the most tactful hypocrite that ever lived is nothing but a sham,-- ‘false’ and a sham!

18 Beside, no one can manage another by the process of sham and hypocrisy without sooner or later being found out, and when you are found out, all your power is gone.

19 The trouble with the contrary-minded is they have an established habit of resistance. 20 Sometimes the habit is entirely inherited, and has never been seen or acknowledged. Sometimes it has an inherited foundation, with a cultivated super-structure.

21 Either way it is a problem for those who have to deal with it,-- until they understand. 22 The "contrary method" does not solve the problem; it is only a makeshift; it never does any real work, or accomplishes any real end. It is not even lastingly intelligent.

23 The first necessity in dealing truly with these people is ‘not to be afraid of their resistances’. The second necessity, which is so near the first that the two really belong side by side, is ‘never to meet their resistances with resistances of our own’.

24 If we combat another person's resistance, it only increases their tension. No matter how wrong one may be, and how right we are, meeting resistance with resistance only breeds trouble. 25 Two minds can act and react upon one another in that way until they come to a lock which not only makes lasting enemies of those who should have been and could be always friends, 26 but the contention locks up strain in each person's brain which can never be removed without pain, and a new awakening to the common-sense of human intercourse.

27 If we want a friend to read a book, to go a journey, or to do something which is more important for their own good than either, and we know that to suggest our desire would be to rouse their resistance, the only way is to catch them in the best mood we can, 28 say what we have to say, give our own preference, and at the same time feel and express a willingness to be refused. 29 Every human is a free agent, and we have no right not to respect another’s freedom, even if they uses that freedom to stand in

their own light or in ours. 30 If one is standing in our light and refuses to move, we can move out of their shadow, even though we may have to give up our most cherished desire in order to do so.

31 If one is standing in own light, and refuses to move, we can suggest or advise and do whatever in us lies to make the common-sense of our opinion clear; 32 but if one still persists in standing in own light, it is their business, not ours.

33 It requires the cultivation of a strong will to put a request before a friend which we know will be resisted, and to yield to that resistance so that it meets no antagonism in us. 34 But when it is done, and done thoroughly, consistently, and intelligently, the other person's resistance reacts back upon own self, and one finds own self out as one never could in any other way. 35 Having found own self out, unless their mulishness is almost past sanity, one begins to reject own habit of resistance of one’s own accord.

36 In dealing with the contrary minded, the "contrary method" works so long as it is not discovered; and the danger of its being discovered is always imminent. 37 The upright, direct method is according to the honourable laws of human intercourse, and brings always better results in the end, even though there may be some immediate failures in the process.

38 To adjust ourselves rightly to another nature and go with it to a good end, along the lines of least resistance, is of course the best means of a real acquaintance, 39 but to allow ourselves to manage a fellow-being is an indignity to the person and worse than an indignity to the mind who is willing to do the managing.

40 Our humanity is in our freedom. Our freedom is in our humanity. 41 When one, person tries to manage another, you are putting that other in the attitude of a beast. 41 The person who is allowing own self to be managed is classing own self with the beasts.

42 Although this is a fact so evident on the base of it that it needs neither explanation nor enlargement, 43 there is hardly a day passes that some one does not say to some one, "You cannot

manage me in that way," and the answer should be, "Why should you want to be managed in any way; and why should I want to insult you by trying to manage you at all?"

44 The girl and her father might have been intelligent friends by this time, if the practice of the "contrary method" had not tainted the girl with habitual hypocrisy, 45 and cultivated in the father the warped mind which results from the habit of resistance, and blind weakness which comes from the false idea that he is always having his own way.

46 If we want an open brain and a good, freely working nervous system, we must respect our own freedom and the freedom of other people,-- 47 for only as individuals stand alone can they really influence one another to any good end.

48 It is curious to see how the people of habitual resistance pride themselves on being in bondage to no one, not knowing that the fear of such bondage is what makes them resist, 49 and the fear of being influenced by another is one of the most painful forms of bondage in which a human can be.

50 The people who are slaves to this fear do not stop even to consider the question. They resist and refuse a request at once, for fear that pausing for consideration would open them to the danger of appearing to yield to the will of another.

51 When we are quite as willing to yield to another as to refuse them, then we are free, and can give any question that is placed before us intelligent consideration, and decide according to our best judgment. 52 No amount of willfulness can force a person to any action or attitude of mind if you are willing to yield to the willful pressure if it seems to you best.

53 The worse bondage of human to human is the bondage of fear.

HOW TO SEW EASILY

Annie Payson Call

25 IT is a common saying that we should let our heads save our heels, but few of us know the depth of it or the freedom and health that can come from obedience to it.

GOODNESS

2 For one thing we get into ruts. If a woman grows tired sewing she takes it for granted that she must always be tired. Sometimes she frets and complains, which only adds to her fatigue. 3 Sometimes she goes on living in a dogged state of over-tiredness until there comes a "last straw" which brings on some organic disease, and still another "straw" which kills her altogether.

4 We, none of us, seem to realise that our heads can save not only our heels, but our hearts, and our lungs, our spines and our brains--indeed our whole nervous systems. 5 Men and women sometimes seem to prefer to go on working--chronically tired-- getting no joy from life whatever, rather than to take the trouble to think enough to gain the habit of working restfully. 6 Sometimes, to be sure, they are so tired that the little extra exertion of the brain required to learn to get rid of the fatigue seems too much for them.

7 It seems easier to work in a rut of strain and discomfort than to make the effort to get out of the rut--even though they know that by doing so they will not only be better themselves, but will do their work better.

8 Now really the action of the brain which is needed to help one to work restfully is quite distinct from the action which does the work, 9 and a little effort of the brain in a new direction rests and refreshes the part of the brain which is drudging along day after day, 10 and not only that, but when one has gained the habit of working more easily life is happier and more worthwhile. 11 If once we could become convinced of that fact it would be a simple matter for the head to learn to save the heels and for the whole body to be more vigourous in consequence.

12 Take sewing, for instance: If a woman must sew all day long without cessation and she can appreciate that ten or fifteen minutes taken out of the day once in the morning and once in the afternoon is going to save fatigue and help her to do her sewing better, 13 doesn't it seem simply a lack of common-sense if she is not willing to take that half hour and use it for its right purpose? 14 Or, if she is employed with others, is it

not a lack of common-sense combined with cruelty in her employer if he will not permit the use of fifteen minutes twice a day to help his employees to do their work better and to keep more healthy in the process of working?

15 It seems to me that all most of us need is to have our attention drawn to the facts in such cases as this and then we shall be willing and anxious to correct the mistakes.

16 First, we do not know, and, secondly, we do not think, intelligently. It is within our reach to do both.

17 Let me put the facts about healthy sewing in numerical order: First-- A woman should never sew nor be allowed to sew in bad air.

18 The more or less cramped attitude of the chest in sewing makes it especially necessary that the lungs should be well supplied with oxygen, 19 else the blood will lose vitality, the appetite will go and the nerves will be straining to bring the muscles up to work which they could do quite easily if they were receiving the right amount of nourishment from air and food.

20 Second-- When our work gives our muscles a tendency steadily in one direction we must aim to counteract that tendency by using exercises with a will to pull them in the opposite way.

21 If a person writes constantly, to stop writing half a dozen times a day and stretch the fingers of your hand wide apart and let them relax back slowly will help you so that you need not be afraid of writer's paralysis.

22 Now a woman's tendency in sewing is to have her chest contracted and settled down on her stomach, and her head bent forward. 23 Let her stop even twice a day, lift her chest off her stomach, see that the lifting of her chest takes her shoulders back, let her head gently fall back, take a long quiet breath in that attitude, then bring the head up slowly, 24 take some long quiet breaths like gentle sighs, gradually let the lungs settle back into their habitual state of breathing, and then try the exercise again.

25 If this exercise is repeated three times in succession with quiet care, its effect will be very evident in the refreshment felt when a

woman begins sewing again. 26 At the very most it can only take two minutes to go through the whole exercise and be ready to repeat it. That will mean six minutes for the three successive times.

27 Six minutes can easily be made up by the renewed vigour that comes from the long breath and change of attitude. 28 Stopping for the exercise three times a day will only take eighteen-- or at the most twenty-minutes out of the day's work and it will put much more than that into the work in new power.

29 Third-- We must remember that we need not sew in a badly cramped position. 30 Of course the exercises will help us out of the habitually cramped attitude, but we cannot expect them to help us so much unless we make an effort while sewing to be as little cramped as possible.

31 The exercises give us a new standard of erectness, and that new standard will make us sensitive to the wrong attitude.

32 We will constantly notice when our chests get cramped and settled down on our stomachs and by expanding them and lifting them, even as we sew, the healthy attitude will get to be second nature.

33 Fourth-- We must sew with our hands and our arms, not with our spines, the backs of our necks, or our legs. 34 The unnecessary strain she puts into her sewing makes a woman more tired than anything else. 35 To avoid this she must get sensitive to the strain, and every time she perceives it drop it; consciously, with a decided use of her will, until she has established the habit of working without strain. 36 The gentle raising of the head to the erect position after the breathing exercise will let out a great deal of strain, and so make us more sensitive to its return when we begin to sew, and the more sensitive we get to it the sooner we can drop it.

37 I think I hear a woman say, "I have neither the time nor the strength to attend to all this." My answer is, such exercise will save time and strength in the end.

GOODNESS

DO NOT HURRY
Annie Payson Call

26 HOW can any one do anything well while in a constant state of rush? 2 How can any one see anything clearly while in a constant state of rush? 3 How can any one expect to keep healthy and strong while in a constant state of rush?

4 But most of my readers may say, "I am not in a constant state of rush-- I only hurry now and then when I need to hurry." 5 The answer to that is "Prove it, prove it." Study yourself a little, and see whether you find yourself chronically in a hurry or not.

6 If you will observe yourself carefully with a desire to find the hurry tendency, and to find it thoroughly, in order to eliminate it, you will be surprised to see how much of it there is in you.

7 The trouble is that all our standards are low, and to raise our standards we must drop that which interferes with the most wholesome way of living.

8 As we get rid of all the grosser forms of hurry we find in ourselves other hurry habits that are finer and more subtle, and gradually our standards of quiet, deliberate ways get higher; 9 we become more sensitive to hurry, and a hurried way of doing things grows more and more disagreeable to us.

10 Watch the women coming out of a factory in the dinner hour or at six o'clock. They are almost tumbling over each other in their hurry to get away. 11 They are putting on their jackets, pushing in their hatpins, and running along as if their dinner were running away from them.

12 Something akin to that same attitude of rush we can see in any large city when the clerks come out of the shops, for their luncheon hour, or when the work of the day is over.

13 If we were to calculate in round numbers the amount of time saved by this rush to get away from the shop, we should find three minutes, probably the maximum-- 14 and if we balance that against the loss to body and mind which is incurred, we should find the three minutes' gain quite over-weighted by the loss of many hours, perhaps days, because of the illness which

must be the result of such habitual contraction.

15 It is safe to predict when we see a woman rushing away from factory or shop that she is not going to "let up" on that rate of speed until she is back again at work. 16 Indeed, having once started brain and body with such an exaggerated impetus, it is not possible to quiet down without a direct and decided use of the will, 17 and how is that decided action to be taken if the brain is so befogged with the habit of hurry that it knows no better standard?

18 One of the girls from a large factory came rushing up to the kind, motherly head of the boarding house the other day saying:-- 19 "It is abominable that I should be kept waiting so long for my dinner. I have had my first course and here I have been waiting twenty minutes for my dessert."

20 The woman addressed looked up quietly to the clock and saw that it was ten minutes past twelve. "What time did you come in?" she said. "At twelve o'clock."

21 "And you have had your first course?"

"Yes."

"And waited twenty minutes for your dessert?"

"Yes!" (snappishly).

22 "How can that be when you came in at twelve o'clock, and it is now only ten minutes past?"

23 Of course there was nothing to say in answer, but whether the girl took it to heart and so raised her standard of quiet one little bit, I do not know.

24 One can deposit a fearful amount of strain in the brain with only a few moments' impatience.

25 I use the word "fearful" advisedly, for when the strain is once deposited it is not easily removed, especially when every day and every moment of every day is adding to the strain.

26 The strain of hurry makes contractions in brain and body with which it is impossible to work freely and easily or to accomplish as much as might be done without such contractions.

27 The strain of hurry befogs the brain so that it is impossible for it to expand to an unprejudiced point of view.

28 The strain of hurry so contracts the whole nervous and muscular systems that the body can take

neither the nourishment of food nor of fresh air as it should.

29 There are many women who work for a living, and women who do not work for a living, who feel hurried from morning until they go to bed at night, and they must, perforce, hurry to sleep and hurry awake.

30 Often the day seems so full, and one is so pressed for time that it is impossible to get in all there is to do, 31 and yet a little quiet thinking will show that the important things can be easily put into two thirds of the day, and the remaining third is free for rest, or play, or both.

32 Then again, there is real delight in quietly fitting one thing in after another when the day must be full, and the result at the end of the day is only healthy fatigue from which a good night's rest will refresh us entirely.

33 There is one thing that is very evident-- a feeling of hurry retards our work, it does not hasten it, and the more quietly we can do what is before us, the more quickly and vigourously we do it.

34 The first necessity is to find ourselves out-- to find out for a fact when we do hurry, and how we hurry, and how we have the sense of hurry with us all the time.

35 Having willingly, and gladly, found ourselves out, the remedy is straight before us.

36 Nature is on the side of leisure and will come to our aid with higher standards of quiet, the possibilities of which are always in every one's brain, if we only look to find them.

37 To sit five minutes quietly taking long breaths to get a sense of leisure every day will be of very great help-- 38 and then when we find ourselves hurrying, let us stop and recall the best quiet we know-- that need only take a few seconds, and the gain is sure to follow.

39 ‘Festina lente’ (hasten slowly) should be in the back of our brains all day and every day.

40 "'T is haste makes waste, the sage avers, And instances are far too plenty; Whenever the hasty impulse stirs, Put on the brake, Festina Lente."

THE CARE OF AN INVALID
Annie Payson Call

27 TO take really good care of one who is ill requires not only knowledge but intelligent patience and immeasurable tact.

2 A little knowledge will go a great way, and we do not need to be trained nurses in order to help our friends to bear their illnesses patiently and quietly and to adjust things about them so that they are enabled to get well faster because of the care we give them.

3 Sometimes if we have only fifteen minutes in the morning and fifteen minutes at night to be with a sick friend, we can so arrange things for the day and for the night 4 that we will have left behind us a directly curative influence because our invalid feels cared for in the best way, and has confidence enough to follow the suggestions we have given.

5 More depends upon the spirit with which we approach an invalid than anything else. 6 A trained nurse who has graduated at the head of her class and has executive ability, who knows exactly what to do and when to do it, 7 may yet bring such a spirit of self-importance and bustle that everything she does for the invalid's ease, comfort, and recuperation is counteracted by the unrestful "professional" spirit with which the work is done.

8 On the other hand, a woman who has only a slight knowledge of nursing can bring so restful and unobtrusive an atmosphere with her that the invalid gains from her very presence.

9 Overwhelming kindness is not only tiresome and often annoying, but a serious drag on one who is ill. 10 People who are so busy doing kindnesses seldom consult the invalid's preferences at all. They are too full of their own selfish kindliness and self-importance.

11 I remember a woman who was suffering intensely from neuralgia in her face. A friend, proud of the idea of caring for her and giving up her own pleasure to stay in the darkened room and keep the sufferer's face bathed in hot water, 12 made such a rustling back and forth with her skirts in getting the water that the strain of the constant noise and movement not only counteracted any relief that might

have come from the heat, but it increased the pain and made the nervous condition of the patient much worse.

13 So it is with a hundred and one little "kindnesses" that people try to do for others when they are ill. 14 They talk to amuse them when the invalids would give all in their power to have a little quiet. 15 They sit like lumps and say nothing when a little light, easy chatting might divert the invalid's attention and so start up a gentle circulation which would tend directly toward health. 16 Or, they talk and are entertaining for a while in a very helpful way, but not knowing when to stop, finally make the patient so tired that they undo all the good of the first fifteen minutes. 17 They flood the room with light, "to make it look pleasant," when the invalid longs for the rest of a darkened room; or they draw the shades when the patient longs for the cheerfulness of sunlight. 18 They fuss and move about to do this or that and the other "kindness" when the sick person longs for absolute quiet. 19 They shower attentions when the first thing that is desired is to be let alone.

20 One secret of the whole trouble in this oppressive care of the sick is that this sort of caretaker is interested more to please herself and feel the satisfaction of her own benefactions than she is to really please the friend for whom she is caring.

21 Another trouble is common ignorance. Some women would gladly sacrifice anything to help a friend to get well; they would give their time and their strength gladly and count it as nothing, but they do not know how to care for the sick. 22 Often such people are sadly discouraged because they see that they are only bringing discomfort where, with all their hearts, they desire to bring comfort.

23 The first necessity in the right care for the sick is to be quiet and cheerful. 24 The next is to aim, without disturbing the invalid, to get as true an idea as possible of the condition necessary to help the patient to get well. 25 The third is to bring about those conditions with the least possible amount of friction.

GOODNESS

26 Find out what the invalid likes and how she likes it by observation and not by questions. 27 Sometimes, of course, a question must be asked. If we receive a snappish answer, let us not resent it, but blame the illness and be grateful if, along with the snappishness, we find out what suits our patient best. 28 If we see her increasing her pain by contracting and giving all her attention to complaining, we cannot help her by telling her that that sort of thing is not going to make her well. 29 But we can soothe her in a way that will enable her to see it for herself.

30 Often the right suggestion, no matter how good it is, will only annoy the patient and send her farther on in the wrong path; 31 but if given in some gentle roundabout way, so that she feels that she has discovered for herself what you have been trying to tell her, it will work wonders toward her recovery.

32 If you want to care for the sick in a way that will truly help them toward recovery, you must observe and study,-- study and observe, and never resent their irritability. 33 See that they have the right amount of air; that they have the right nourishment at the right intervals. 34 Let them have things their own way, and done in their own way so far as is possible without interfering with what is necessary to their health.

35 Remember that there are times when it is better to risk deferring recovery a little rather than force upon an invalid what is not wanted, especially when it is evident that resistance will be harmful. 36 Quiet, cheerfulness, light, air, nourishment, orderly surroundings, and to be let judiciously alone; 37 those are the conditions which the amateur nurse must further, according to her own judgment and, her knowledge of the friend she is nursing.

38 For this purpose she must, as I have said, study and observe, and observe and study. 39 I do not mean necessarily to do all this when she is "off duty," but to so concentrate when she is attending to the wants of her friend that every moment and every thought will be used to the best gain of the

patient herself, and not toward our ideas of her best gain.

40 A little careful effort of this kind will open a new and interesting vista to the nurse as well as the patient.

THE HABIT OF ILLNESS

Annie Payson Call

28 IT is surprising how many invalids there are who have got well and do not know it! 2 When you feel ill and days drag on with one ill feeling following another, it is not a pleasant thing to be told that you are quite well. Who could be expected to believe it? 3 I should like to know how many men and women there are who will read this article, who are well and do not know it; 4 and how many of such men and women will take the hint I want to give them and turn honestly toward finding themselves out in a way that will enable them to discover and acknowledge the truth?

5 Nerves form habits. They actually form habits in themselves. 6 If a woman has had an organic trouble which has caused certain forms of nervous discomfort, when the organic trouble is cured the nerves are apt to go on for a time with the same uncomfortable feelings because during the period of illness they had formed the habit of such discomfort. 7 Then is the time when the will must be used to overcome such habits. 8 The trouble is that when the doctor tells these victims of nervous habit that they are really well they will not believe. "How can I be well," they say, "when I suffer just as I did while I was ill?" 9 If then the doctor is fortunate enough to convince them of the fact that it is only the nervous habit formed from their illness which causes them to suffer, 10 and that they can rouse their wills to overcome intelligently this habit, then they can be well in a few weeks when they might have been apparently ill for many months-- or perhaps even years.

11 Nerves form the habit of being tired. A woman can get very much over-fatigued at one time and have the impression of the fatigue so strongly on her nerves that the next time she is only a little tired she will believe she is very tired, 12 and so her life will go until the

habit of being tired has been formed in her nerves and she believes that she is tired all the time-- whereas if the truth were known she might easily feel rested all the time.

13 It is often very difficult to overcome the habit which the nerves form as a result of an attack of nervous prostration. 14 It is equally hard to convince any one getting out of such an illness that the habit of your nerves tries to make you believe you cannot do a little more every day-- when you really can, and would be better for it. 15 Many cases of nervous prostration which last for years might be cured in as many months if the truth about nerve habits were recognised and acted upon.

16 Nerves can form bad habits and they can form good habits, but of all the bad habits formed by nerves perhaps the very worst is the habit of being ill. 17 These bad habits of illness engender an unwillingness to let go of them. They seem so real. 18 "I do not want to suffer like this," I hear an invalid say; "if it were merely a habit don't you think I would throw it off in a minute?"

19 I knew a young physician who had made somewhat of a local reputation in the care of nerves, and a man living in a far-distant country, who had been for some time a chronic invalid, happened by accident to hear of him. 20 My friend was surprised to receive a letter from this man, offering to pay him the full amount of all fees he would earn in one month and as much more as he might ask if he would spend that time in the house with him and attempt his cure.

21 Always interested in new phases of nerves, and having no serious case on hand himself at the time, he assented and went with great interest on this long journey to, as he hoped, cure one man. 22 When he arrived he found his patient most charming. He listened attentively to the account of his years of illness, inquired of others in the house with him, and then went to bed and to sleep. 23 In the morning he woke with a sense of unexplained depression. In searching about for the cause he went over his interviews of the day before and found a doubt in his mind which he would hardly acknowledge; 24 but by the end of

the next day he said to himself: "What a fool I was to come so far without a more complete knowledge of what I was coming to! 25 This man has been well for years and does not know it. It is the old habit of his illness that is on him; the illness itself must have left him ten years ago."

26 The next day-- the first thing after breakfast-- he took a long walk in order to make up his mind what to do, and finally decided that he had engaged to stay one month and must keep to his promise. 27 It would not do to tell the invalid the truth-- the poor man would not believe it. 28 He was self-willed and self-centered, and his pains and discomforts, which came simply from old habits of illness, were as real to him as if they had been genuine. 29 Several physicians had emphasised his belief that he was ill. One doctor-- so my friend was told-- who saw clearly the truth of the case, ventured to hint at it and was at once discharged. 30 My friend knew all these difficulties and, when he made up his mind that the only right thing for him to do was to stay, he found himself intensely interested in trying to approach his patient with so much delicacy that he could finally convince him of the truth; 31 and I am happy to say that his efforts were to a great degree successful. The patient was awakened to the fact that, if he tried, he could be a well man. 32 He never got so far as to see that he really was a well man who was allowing old habits to keep him ill; 33 but he got enough of a new and healthy point of view to improve greatly and to feel a hearty sense of gratitude toward the man who had enlightened him. 34 The long habit of illness had dulled his brain too much for him to appreciate the whole truth about himself.

35 The only way that such an invalid's brain can be enlightened is by going to work very gently and leading him to the light-- never by combating. 36 This young physician whom I mention was successful only through making friends with his patient and leading him gradually to appear to discover for himself the fact which all the time the physician was really telling him. 37 The only way to help others is to help them to

help themselves, and this is especially the truth with nerves.
38 If you, my friend, are so fortunate as to find out that your illness is more a habit of illness than illness itself, do not expect to break the habit at once. Go about it slowly and with common-sense. 39 A habit can be broken sooner than it can be formed, but even then it cannot be broken immediately. 40 First recognise that your uncomfortable feelings whether of eyes, nose, stomach, back of neck, top of head, or whatever it may be, are mere habits, and then go about gradually but steadily ignoring them. 41 When once you find that your own healthy self can assert itself and realise that you are stronger than your habits, these habits of illness will weaken and finally disappear altogether.
42 The moment an illness gets hold of one, the illness has the floor, so to speak, and the temptation is to consider it the master of the situation-- 43 and yielding to this temptation is the most effectual way of beginning to establish the habits which the illness has started, and makes it more difficult to know when one is well. 44 On the other hand it is clearly possible to yield completely to an illness and let Nature take its course, and at the same time to take a mental attitude of wholesomeness toward it which will deprive the illness of much of its power. 45 Nature always tends toward health; so we have the working of natural law entirely on our side. 46 If the attitude of a person's mind is healthy, when you gets well you are well. You are not bothered long with the habits of your illness, for you have never allowed them to gain any hold upon you. 47 You have neutralised the effect of the would be habits in the beginning so that they could not get a firm hold. 48 We can counteract bad habits with good ones any time that we want to if we only go to work in the right way and are intelligently persistent.
49 It would be funny if it were not sad to hear a person say, "Well, you know I had such and such an illness years ago and I never really recovered from the effects of it," 50 and to know at the same time that you had kept yourself in the effects of it, or rather the habits of

your nerves had kept you there, 51 and you had been either ignorant or unwilling to use your will to throw off those habits and gain the habits of health which were ready and waiting.

52 People who cheerfully turn their hearts and minds toward health have so much, so very much, in their favour.

53 Of course, there are laws of health to be learned and carefully followed in the work of throwing off habits of illness. 54 We must rest; take food that is nourishing, exercise, plenty of sleep and fresh air-- 55 yet always with the sense that the illness is only something to get rid of, and our own healthy attitude toward the illness is of the greatest importance.

56 Sometimes a person can go right ahead with own work, allow an illness to run its course, and get well without interrupting own work in the least, because of your strong aim toward health which keeps your illness subordinate. 57 But this is not often the case. An illness, even though it be treated as subordinate, must be respected more or less according to its nature. But when that is done normally no bad habits will be left behind.

58 I know a young girl who was ill with strained nerves that showed themselves in weak eyes and a contracted stomach. 59 She is well now-- entirely well-- but whenever she gets a little tired the old habits of eyes and stomach assert themselves, and she holds firmly on to them, 60 whereas each time of getting overtired might be an opportunity to break up these evil habits by a right amount of rest and a healthy amount of ignoring.

61 This matter of habit is a very painful thing when it is supported by inherited tendencies. 62 If a young person overdoes and gets pulled down with fatigue the fatigue expresses itself in the weakest part of the body. 63 It may be in the stomach and consequently appear as indigestion; it may be in the head and so bring about severe headaches, and it may be in both stomach and head.

64 If it is known that such tendencies are inherited the first thought that almost inevitably comes to the mind is: "My father always had headaches and my

grandfather, too. Of course, I must expect them now for the rest of my life." 65 That thought interpreted rightly is: "My grandfather formed the headache habit, my father inherited the habit and clinched it-- now, of course, I must expect to inherit it, and I will do my best to see if I cannot hold on to the habit as well as they did-- 66 even better, because I can add my own hold to that which I have inherited from both my ancestors."

67 Now, of course, a habit of illness, whether it be of the head, stomach, or of both, is much more difficult to discard when it is inherited than when it is first acquired in a personal illness of our own; 68 but, because it is difficult, it is none the less possible to discard it, and when the work has been accomplished the strength gained from the steady, intelligent effort fully compensates for the difficulty of the task.

69 One must not get impatient with a bad habit in one's self; it has a certain power while it lasts, and can acquire a very strong hold. Little by little it must be dealt with-- patiently and steadily. 70 Sometimes it seems almost as if such habits had intelligence-- for the more you ignore them the more rampant they become, 71 and there is a Rubicon to cross, in the process of ignoring which, when once passed, makes the work of gaining freedom easier; 72 for when the backbone of the habit is broken it weakens and seems to fade away of itself, and we awaken some fine morning and it has gone-- really gone.

73 Many persons are in a prison of bad habits simply because they do not know how to get out-- not because they do not want to get out. 74 If we want to help a friend out of the habit of illness it is most important first to be sure that it is a habit, and then to remember that a suggestion is seldom responded to unless it is given with generous sympathy and love. 75 Indeed, when a suggestion is given with lack of sympathy or with contempt the tendency is to make the invalid turn painfully away from the speaker and hug own bad habits more closely to own self. 76 What we can do, however, is to throw out a suggestion here and there which may lead such a one to discover the truth for oneself; 77 then, if one comes to you with

sincere interest in own discovery, don't say: "Yes, I have thought so for some time." Keep yourself out of it, except in so far as you can give aid which is really wanted, and accepted and used.

78 Beware of saying or doing anything to or for any one which will only rouse resentment and serve to push deeper into the brain an impression already made by a mistaken conviction. 79 More than half of the functional and nervous illnesses in the world are caused by bad habit, either formed or inherited.

80 Happy are those who discover the fact for themselves and, with the intelligence born from such discovery, work with patient insight until they have freed themselves from bondage. 81 Happy are those who feel willing to change any mistaken conviction or prejudice and to recognise it as a sin against the truth.

WHAT IS IT THAT MAKES ME SO NERVOUS?

Annie Payson Call

29 THE two main reasons why women are nervous are, first, that they do not take intelligent care of their bodies, and secondly, that they do not govern their emotions.

2 I know a woman who prefers to make herself genuinely miserable rather than take food normally, to eat it normally, and to exercise in the fresh air.

3 "Everybody is against me," she says; and if you answer her, "My dear, you are acting against yourself by keeping your stomach on a steady strain with too much unmasticated, unhealthy, undigested food," 4 she turns a woe-begone face on you and asks how you can be "so material." "Nobody loves me; nobody is kind to me. Everybody neglects me," she says.

5 And when you answer, "How can any one love you when you are always whining and complaining? 6 How can any one be kind to you when you resent and resist every friendly attention because it does not suit your especial taste? 7 Indeed, how can you expect anything from any one when you are giving nothing yourself?"

8 She replies, "But I am so nervous. I suffer. Why don't they sympathise?"

9 "My dear child, would you sympathise with a woman who went down into the cellar and cried because she was so cold, when fresh air and warm sunshine were waiting for her outside?"

10 This very woman herself is cold all the time. She piles covers over herself at night so that the weight alone would be enough to make her ill. 11 She sleeps with the heat turned on in her room. She complains all day of cold when not complaining of other things. 12 She puts such a strain on her stomach that it takes all of her vitality to look after her food; therefore she has no vitality left with which to resist the cold. 13 Of course she resists the idea of a good brisk walk in the fresh air, and yet, if she took the walk and enjoyed it, it would start up her circulation, give her blood more oxygen, and help her stomach to go through all its useless labour better.

14 When a woman disobeys all the laws of nervous health how can she expect not to have her nerves rebel? 15 Nerves in themselves are exquisitely sensitive-- with a direct tendency toward health.

16 "Don't give me such unnecessary work," the stomach cries. "Don't stuff me full of the wrong things. Don't put a bulk of food into me, but chew your food, so that I shall not have to do my own work and yours, too, when the food gets down here."

17 And there is the poor stomach, a big nervous centre in close communication with the brain, protesting and protesting, and its owner interprets all these protestations into: 18 "I am so unhappy. I have to work so much harder than I ought. Nobody loves me. Oh, why am I so nervous?"

19 The blood also cries out: "Give me more oxygen. I cannot help the lungs or the stomach or the brain to do their work properly unless you take exercise in the fresh air that will feed me truly and send me over the body with good, wholesome vigour."

20 Now there is another thing that is sadly evident about the young woman who will not take fresh air, nor eat the right food, nor masticate properly the food that she does eat. 21 When she goes out for a walk she seems to fight the

fresh air; she walks along full of resistance and contraction, and tightens all her muscles so that she moves as if she were tied together with ropes. 22 The expression of her face is one of miserable strain and endurance; the tone of her voice is full of complaint. 23 In eating either she takes her food with the appearance of hungry grabbing, or she refuses it with a fastidious scorn. 24 Any nervous woman who really wants to find herself out, in order to get well and strong, and contented and happy, will see in this description a reflection of herself, even though it may be an exaggerated reflection.

25 Did you ever see a tired, hungry baby fight own food? The mother tries to put the bottle to child's mouth, and the baby cries and cries, and turns own head away, and brandishes own little arms about, as if the mother were offering something bitter. 26 Then, finally, when the mother succeeds in getting child to open own mouth and take the food it makes you smile all over to see the contrast: 27 child looks so quiet and contented, and you can see child's whole little body expand with satisfaction.

28 It is just the same inherited tendency in a nervous woman that makes her either consciously or unconsciously fight exercise and fresh air, 29 fight good food and eating it rightly, fight everything that is wholesome and strengthening and quieting to her nerves, 30 and cling with painful tenacity to everything that is contracting and weakening, and productive of chronic strain.

31 There is another thing that a woman fights: she fights rest. 32 Who has not seen a tired woman work harder and harder, when she was tired, until she has worn herself to a state of nervous irritability and finally has to succumb for want of strength? 33 Who has not seen this same tired woman, the moment she gets back a little grain of strength, use it up again at once instead of waiting until she had paid back her principal and could use only the interest of her strength while keeping a good balance in reserve? 34 "I wish my mother would not do so many unnecessary things," said an anxious daughter.

GOODNESS

35 A few days after this the mother came in tired, and, with a fagged look on her face and a fagged tone in her voice, said: 36 "Before I sit down I must go and see poor Mrs. Robinson. I have just heard that she has been taken ill with nervous prostration. Poor thing! Why couldn't she have taken care of herself?"

37 "But, mother," her daughter answered, "I have been to see Mrs. Robinson, and taken her some flowers, and told her how sorry you would be to hear that she was ill."

38 "My dear," said the fagged mother with a slight tone of irritation in her voice, 39 "that was very good of you, but of course that was not my going, and if I should let to-day pass without going to see her, when I have just heard of her illness, it would be unfriendly and unneighbourly and I should not forgive myself."

40 "But, mother, you are tired; you do need to rest so much."

"My dear," said the mother with an air of conscious virtue, "I am never too tired to do a neighbourly kindness."

41 When she left the house her daughter burst into tears and let out the strain which had been accumulating for weeks.

42 Finally, when she had let down enough to feel a relief, a funny little smile came through the tears.

43 "There is one nervously worn-out woman gone to comfort and lift up another nervously worn-out woman-- if that is not the blind leading the blind then I don't know. I wonder how long it will be before mamma, too, is in the ditch?"

44 This same story could be reversed with the mother in the daughter's place, and the daughter in the mother's. And, indeed, we see slight illustrations of it, in one way or the other, in many families and among many friends.

45 This, then, is the first answer to any woman's question, "Why am I so nervous?" Because you do not use common-sense in taking exercise, fresh air, nourishment, and rest.

46 Nature tends toward health. Your whole physical organism tends toward health. 47 If you once find yourself out and begin to be sensible you will find a great, vigorous power carrying you along, and you will be surprised to see how fast you gain. 48 It may be

some time before Nature gets Her own way with you entirely, because when one has been off the track for long it must take time to readjust; 49 but when we begin to go with the laws of health, instead of against them, we get into a healthy current and gain faster than would have seemed possible when we were outside of it, habitually trying to oppose the stream.

50 The second reason why women are nervous is that they do not govern their emotions. 51 Very often it is the strain of unpleasant emotions that keeps women nervous, and when we come really to understand we find that the strain is there because the woman does not get her own way. She has not money enough. 52 She has to live with some one she dislikes. She feels that people do not like her and are neglectful of her. She believes that she has too much work to do. She wishes that she had more beauty in her life.

53 Sometimes a woman is entirely conscious of when or why she fails to get her own way; then she knows what she is fretting about, and she may even know that the fretting is a strain that keeps her tired and nervously irritated. 54 Sometimes a woman is entirely unconscious of what it is that is keeping her in a chronic state of nervous irritability. 55 I have seen a woman express herself as entirely resigned to the very circumstance or person that she was unconsciously resisting so fiercely that her resistance kept her ill half of the time. In such cases the strain is double. 56 First, there is the strain of the person or circumstance chronically resisted and secondly, there is the strain of the pose of saintly resignation. 57 It is bad enough to pose to other people, but when we pose to other people and to ourselves too the strain is twice as bad.

58 Imagine a nerve specialist saying to his patient, "My dear madam, you really must stop being a hypocrite. You have not the nervous strength to spare for it." 59 In most cases, I fear, the woman would turn on him indignantly and go home to be more of a hypocrite than ever, and so more nervously ill.

60 I have seen a woman cry and make no end of trouble because

she had to have a certain relative live in the house with her, simply because her relative "got on her nerves." 61 Then, after the relative had left the house, this same woman cried and still kept on making no end of trouble because she thought she had done wrong in sending "Cousin Sophia" away; and the poor, innocent, uncomplaining victim was brought back again. 62 Yet it never seemed to occur to the nervous woman that "Cousin Sophia" was harmless, and that her trouble came entirely from the way in which she constantly resented and resisted little unpolished ways.

63 I do not know how many times "Cousin Sophia" may be sent off and brought back again; nor how many times other things in my nervous friend's life may have to be pulled to pieces and then put together again, 64 for she has not yet discovered that the cause of the nervous trouble is entirely in herself, and that if she would stop resisting "Cousin Sophia's" innocent peculiarities, stop resisting other various phases of her life that do not suit her, 65 and begin to use her will to yield where she has always resisted, her load would be steadily and happily lifted.

66 The nervous strain of doing right is very painful; especially so because most women who are under this strain do not really care about doing right at all. 67 I have seen a woman quibble and talk and worry about what she believed to be a matter of right and wrong in a few cents, 68 and then neglect for months to pay a poor man a certain large amount of money which he had honestly earned, and which she knew he needed.

69 The nervous conscience is really no conscience at all. I have seen a woman worry over what she owed to a certain other woman in the way of kindness, and go to a great deal of trouble to make her kindness complete; 70 and then, on the same day, show such hard, unfeeling cruelty toward another friend that she wounded her deeply, and that without a regret.

71 A nervous woman's emotions are constantly side-tracking her away from the main cause of her difficulty, and so keeping her nervous. 72 A nervous woman's desire to get her own way-- and

strained rebellion at not getting her own way-- 73 bedazzles or befogs her brain so that her nerves twist off into all sorts of emotions which have nothing whatever to do with the main cause. 74 The woman with the troublesome relative wants to be considered good and kind and generous. The woman with the nervous money conscience wants to be considered upright and just in her dealings with others. 75 All women with various expressions of nervous conscience want to ease their consciences for the sake of their own comfort-- not in the least for the sake of doing right.

76 I write first of the nervous hypocrite because in her case the nervous strain is deeper in and more difficult to find. 77 To watch such a woman is like seeing her in a terrible nightmare, which she steadily "sugar-coats" by her complacent belief in her own goodness. 78 If, among a thousand nervous "saints" who may read these words, one is thereby enabled to find herself out, they are worth the pains of writing many times over. 79 The nervous hypocrites who do not find themselves out get sicker and sicker, until finally they seem to be of no use except to discipline those who have the care of them.

80 The greatest trouble comes through the befogging emotions. A woman begins to feel a nervous strain, and that strain results in exciting emotions; 81 these emotions again breed more emotions until she becomes a simmering mass of exciting and painful emotions which can be aroused to a boiling point at any moment by anything or any one who may touch a sensitive point. 82 When a woman's emotions are aroused, and she is allowing herself to be governed by them, reason is out of the question, 83 and any one who imagines that a woman can be made to understand common-sense in a state like that will find himself entirely mistaken. 84 The only cure is for the woman herself to learn first how entirely impervious to common-sense she is when she is in the midst of an emotional nerve storm, so that she will say, "Don't try to talk to me now; I am not reasonable, wait until I get quiet." 85 Then, if she will go off by herself and drop her

emotions, and also the strain behind her emotions, she will often come to a good, clear judgment without outside help; 86 or, if not, she will come to the point where she will be ready and grateful to receive help from a clearer mind than her own.

87 "For goodness' sake, don't tell that to Alice," a young fellow said of his sister. "She will have fits first, and then indigestion and insomnia for six weeks." 88 The lad was not a nerve specialist; neither was he interested in nerves--except to get away from them; but he spoke truly from common-sense and his own experience with his sister.

89 The point is, to drop the emotions and face the facts. If nervous women would see the necessity for that, and would practice it, it would be surprising to see how their nerves would improve.

90 I once knew a woman who discovered that her emotions were running away with her and making her nervously ill. 91 She at once went to work with a will, and every time something happened to rouse this great emotional wave she would deliberately force herself to relax and relax until the wave had passed over her and she could see things in a sensible light. 92 When she was unable to go off by herself and lie down to relax, she would walk with her mind bent on making her feet feel heavy. 93 When you drop the tension of the emotion, the emotion has nothing to hold on to and it must go.

94 I knew another woman who did not know how to relax; so, to get free from this emotional excitement, she would turn her attention at once to figures, to her personal accounts or even to saying the multiplication table. 95 The steady concentration of her mind on dry figures and on "getting her sums right" left the rest of her brain free to drop its excitement and get into a normal state again.

96 Again it is sometimes owing to the pleasant emotions which some women indulge in to such an extreme that they are made ill. 97 How many times have we heard of women who were "worn to a shred" by the delight of an opera, or a concert, or an exciting play?

98 If these women only knew it, their pleasure would be far keener if they would let the enjoyment pass through them, instead of tightening up in their nerves and trying to hold on to it.

99 Nature in us always tends toward health, and toward pleasant sensations. If we relax out of painful emotions we find good judgment and happy instincts behind them. 100 If we relax so that pleasant emotions can pass over our nerves they leave a deposit of happy sensation behind, which only adds to the store that Nature has provided for us.

101 To sum up: The two main reasons why women are nervous are that they do not take intelligent care of their bodies, and that they do not govern their emotions; but back of these reasons is the fact that they want their own way altogether too much. 102 Even if a woman's own way is right, she has no business to push for it selfishly. 103 If any woman thinks, "I could take intelligent care of my own body if I did not have to work so hard, or have this or that interference," let her go to work with her mind well armed to do what she can, 104 and she will soon find that there are many ways in which she can improve in the normal care of her body, in spite of all the work and all the interferences.

105 To adapt an old saying, the women who are overworked and clogged with real interferences should aim to be healthy; and, if they cannot be healthy, then they should be as healthy as they can.

POSITIVE AND NEGATIVE EFFORT

Annie Payson Call

30 DID you ever have the grip? If you ever have you may know how truly it is named and how it does actually grip you so that it seems as if there were nothing else in the world at the time-- it appears to entirely possess you. 2 As the Irishman says, the grip is "the disease that lasts fur a week and it takes yer six weeks ter get over it." 3 That is because it has possessed you so thoroughly that it must be routed out of every little fiber in your body before you are yourself again, 4 and there are hidden corners where it lurks and hides, and it often has to be actually

pulled out of them. 5 Now it has been already recognised that if we relax and do not resist a severe cold it leaves us open so that our natural circulation carries away the cold much more quickly than if we allowed ourselves to be full of resistance to the discomfort 6 and the consequent physical contraction that impeded the circulation and holds the cold in our system.

7 My point is this-- that it is comparatively easy to relax out of a cold. 8 We can do it with only a negative effort, but to relax so that Nature in Her steady and unswerving tendency toward health can lift us out of the grip is quite another matter. 9 When we feel ourselves entirely in the power of such a monster as that is at its worst, it is only by a very strong and positive effort of the will that we can yield so that Nature can guide us into health, and we do not need the six weeks of getting well. 10 In order to gain this positive sense of yielding away from the disease rather than of letting it hold us, we must do what seems at the time the impossible-- 11 we must refuse to give our attention to the pain or discomfort and insist upon giving our attention entirely to yielding out of the contractions which the painful discomforts cause. 12 In other words, we must give up resisting the grip. It is the same with any other disease or any pain. 13 If we have the toothache and give all our attention to the toothache, it inevitably makes it worse; 14 but if we give our attention to yielding out of the toothache contractions, it eases the pain even though it may be that only the dentist can stop it.

15 Once I had an ulcerated tooth which lasted for a week. I had to yield so steadily to do my work during the day and to be able to sleep at all at night that it not only made the pain bearable, 16 but when the tooth got well I was surprised to find how many habitual contractions I had dropped and how much more freedom of action I had before my tooth began to ulcerate. 17 I should not wish to have another ulcerated tooth in order that I might gain more freedom, 18 but I should wish to take every pain of body and mind so truly that when the pain was over I should have

gained greater freedom than I had before it began.

19 You see it is the same with every pain and with every disease. Nature tends toward health 20 and if we make the disease simply a reminder to yield-- and to yield more deeply-- and to put our positive effort there, we are opening the way for Nature to do Her best work. 21 If our entire attention is given to yielding and we give no attention whatever to the pain, except as a reminder to yield, the result seems wonderful. 22 It seems wonderful because so few of us have the habit of giving our entire attention to gaining our real freedom.

23 With most of us, the disease or discomfort is positive, and our effort against it is negative or no effort at all. 24 A negative effort probably protects us from worse evil, but that is all; it does not seem to me that it can ever take us ahead, 25 whereas a positive effort, while sometimes we seem to move upward in very slow stages, often takes us in great strides out of the enemy's country.

26 If we have the measles, the whooping cough, scarlet fever-- even more serious diseases-- and make the disease negative and our effort to free ourselves from it positive, the result is one thousand times worthwhile. 27 And where the children have the measles and the whooping cough, and do not know how to help Nature, the mothers can be positive for the children and make their measles and whooping cough negative. 28 The positive attitude of a mother toward her sick child puts impatience or despair out of the question.

29 Do not think that I believe one can be positive all at once. We must work hard and insist over and over again before we can attain the positive attitude 30 and having attained it, we have to lose it and gain it again, lose it and gain it again, many times before we get the habit of making all difficulties of mind and body negative, and our healthy attitude toward conquering them positive.

31 I said "difficulties of mind and body." I might better have said "difficulties of body, mind and character," or even character alone, 32 for, after all, when you come to sift things down, it is the

character that is at the root of all human life.

33 I know a woman who is constantly complaining. Every morning she has a series of pains to tell of, and her complaints spout out of her in a half-irritated, whining tone as naturally as she breathes. 34 Over and over you think when you listen to her how useful all those pains of hers would be if she took them as a reminder to yield and in yielding to do her work better. 35 But if one should venture to suggest such a possibility, it would only increase the complaints by one more-- that of having unsympathetic friends and being misunderstood. 36 "Nobody understands me-- nobody understands me." How often we hear that complaint. How often in hearing it we make the mental question, "Do you understand yourself?"

37 You see the greatest impediment to our understanding ourselves is our unwillingness to see what is not good in ourselves. 38 It is easy enough in a self-righteous attitude of what we believe to be humility to find fault with ourselves, but quite another thing when others find fault with us. 39 When we are giving our attention to discomforts and pains in a way to give them positive power, and some one suggests that we might change our aim, then the resistance and resentment that are roused in us are very indicative of just where we are in our character.

40 Another strong indication of allowing our weaknesses and faults to be positive and our effort against them negative is the destructive habit of giving excuses. 41 If fault is found with us and there is justice in it, it does not make the slightest difference how many things we have done that are good, or how much better we do than some one else does-- 42 the positive way is to say "thank you" in spirit and in words, and to aim directly toward freeing ourselves from the fault. 43 How ridiculous it would seem if when we were told that we had a smooch on our left cheek, we were to insist vehemently upon the cleanliness of our right cheek, or our forehead, or our hands, 44 instead of being grateful that our attention should be called to the smooch and taking soap and water and at once

washing it off. 45 Or how equally absurd it would be if we went into long explanations as to how the smooch would not have been there if it had not been for so and so, and so and so, or so and so,-- 46 and then with all our excuses and explanations and protestations, we let the smooch stay-- and never really wash it off.

47 And yet this is not an exaggeration of what most of us do when our attention is called to defects of character. 48 When we excuse and explain and tell how clean the other side of our face is, we are putting ourselves positively on the side of the smooch. 49 So we are putting ourselves entirely on the side of the illness or the pain or the oppression of difficult circumstances when we give excuses or resist or pretend not to see fault in ourselves, 50 or when we confess faults and are contented about them, or when we give all our attention to what is disagreeable and no attention to the normal way of gaining our health or our freedom.

51 Then all these expressions of self or of illness are to us positive, and our efforts against them only negative. 52 In such cases, of course, the self possesses us as surely as the grip possesses us when we succumb entirely to all its horrors and make no positive effort to yield out of it. 53 And the possession of the self is much worse, much deeper, much more subtle. 54 When possessed with selfishness, we are laying up in our subconsciousness any number of self-seeking motives which come to the surface disguised and compel us to make impulsive and often foolish efforts to gain our own ends. 55 The self is every day proving to be the enemy of the man or woman whom it possesses.

56 God leaves us free to obey Him or to choose our own selfish way, and in His infinite Providence He is constantly showing us that our own selfish way leads to death and obedience to Him leads to life. 57 That is, that only in obedience to God do we find our real freedom.

58 God is constantly showering us with a tender generousity and kindness that seems inconceivable, and sometimes it seems as if more often than not we were refusing to see. 59 Indeed we blind ourselves by making all pains of body and

faults of soul positive and our efforts against them negative.

60 If we had a disagreeable habit which we wanted to conquer and asked a friend to remind us with a pinch every time he saw the habit, wouldn't it seem very strange if when he pinched us, according to agreement, we jumped and turned on him, rubbing our arm with indignation that he should have pinched? 61 Or would it not be even funnier if we made the pinch merely a reminder to go on with the habit?

62 God is pinching us in that way all the time, and we respond by being indignant at or complaining at our fate, or reply by going more deeply into our weaknesses of character by allowing them to be positive and the pinches only to emphasise them to us.

63 One trouble is that we do not recognise that there is an agreement between us and God, or that we recognise and then forget it; 64 and yet there should be-- there is-- more than an agreement, there is a covenant. And God is steadily, unswervingly doing His part, and we are constantly failing in ours. 65 God in His loving kindness pinches-- that is, reminds us-- and we in our stupid selfishness do not use His reminders.

66 As an example of making our faults positive and our effort to conquer them negative, one very common form is found in a woman I know, who has times of informing her friends quite seriously and with apparent regret of her very wrong attitudes of mind. 67 She tells how selfish she is and she gives examples of the absolute selfishness of her thoughts when she is appearing to do unselfish things. 68 She tells of her efforts to do better and confesses what she believes to be the absolute futility of her effort. 69 At first I was quite taken in by these confessions, and attracted by what seemed to be a clear understanding of herself and her own motives, 70 but after a little longer acquaintance with her, made the discovery, which was at first surprising to me, that her confessions of evil came just as much from conceit as if she had been standing at the mirror admiring her own beauty. 71 Selfish satisfaction is often found

quite as much in mental attitudes of grief as in sensations of joy. 72 Finally this woman has recognised for herself the conceit in her contemplation of her faults, and that she has not only allowed them to be positive while her attitude against them is negative; 73 she has actually nursed them and been positive herself with their positiveness. Her attitude against them was therefore more than ordinarily negative.

74 The more common way of being negative while we allow our various forms of selfishness to positively govern us is, first in bewailing a weakness seriously, 75 but constantly looking at it and weeping over it, and in that way suggesting it over and over to our brains so that we are really hypnotising ourselves with the fault and enforcing its expression when we think we are in the effort to conquer it. Such is our negative attitude.

76 Now if we are convinced that evil in ourselves has no power unless we give it power, that is the first step toward making our efforts positive and so negativing the evil. 77 If we are convinced that evil in ourselves has not only no power but no importance unless we give it power, that is a step still farther in advance. 78 The next step is to refuse to submit to it and refuse to resist it. 79 That means a positive yielding away from it and a positive attention to doing our work as well as we can do it, whatever that work may be.

80 There is one way in which people suffer intensely through being negative and allowing their temptations to be positive, and that is in the question of inherited evil.

81 "How can I ever amount to anything with such inheritances? If you could see my father and what he is, and know that I am his daughter, you would easily appreciate why I have no hope for myself," said a young woman, 82 and she was perfectly sincere in believing that because of her inherited temptations her life must be worthless. 83 It took time and gentle, intelligent reasoning to convince her that not only are no inherited forms of selfishness ours unless by indulging we make them ours, 84 but that, through knowing our inheritances, we are forewarned and forearmed, and the

strength we gain from positive effort to free ourselves fully compensates us for what we have suffered in oppression from them. 85 Such is the loving kindness of our Creator.

86 This woman of whom I am writing awoke to the true meaning of the story of the man who asked, before he went with the Lord Jesus Christ, first to go back and bury his father. 87 The Lord answered, "Let the dead bury their dead, and come thou and follow me." When we feel that we must be bound down by our inheritances, we are surely not letting the dead bury their dead.

88 And so let us study the whole question more carefully and learn the necessity of letting all that is sickness and all that is evil be negative to us and our efforts to conquer it be positive; 89 in that way the illness and the evil become less than negative,-- they gradually are removed and disappear.

90 Why, in the mere matter of being tired, if we refuse to let the impression of the fatigue be positive to us, and insist upon being positive ourselves in giving attention to the fact that now we are going to rest, we get rested in half the time,-- in much less than half the time. 91 Some people carry chronic fatigue with them because of their steady attention to fatigue.

92 "I am tired, yes, but I am going to get rested!" That is the sensible attitude of mind.

93 Nature tends toward health. As we realise that and give our attention to it positively, we come to admire and love the healthy working of the laws of Nature, and to feel the vigour of interest in trying to obey them intelligently. 94 Nature's laws are God's laws, and God's laws tend toward the health of the spirit in all matters of the spirit as surely as they tend toward health of body in all natural things. 95 That is a truth that as we work to obey we grow to see and to love with deepening reverence, 96 and then indeed we find that God's laws are all positive, and that the workings of self are only negative.

HUMAN DUST
Annie Payson Call

31 WHEN we face the matter squarely and give it careful thought, it seems to appear very plainly that the one thing most flagrantly in the way of the people of to-day living according to plain common-sense-- 2 spiritual common-sense as well as material-- is the fact that we are all living in a chronic state of excitement. 3 It is easy to prove this fact by seeing how soon most of us suffer from ennui when "there is not anything going on." 4 It seems now as if the average man or woman whom we see would find it quite impossible to stop and do nothing-- for an hour or more. 5 "But," some one will say, "why should I stop and do nothing when I am as busy as I can be all day long, and have my time very happily full?" 6 Or some one else may say, "How can I stop and do nothing when I am nearly crazy with work and must feel that it is being accomplished?"

7 Now the answer to that is, "Certainly you should not stop and do nothing when you are busy and happily busy;" 8 or, "Although your work will go better if you do not get 'crazy' about it, there is no need of interrupting it or delaying it by stopping to do nothing-- 9 but you should be able to stop and do nothing, and to do it quietly and contentedly at any time when it might be required of you."

10 No man, woman, or child knows the power, the very great power, for work and play-- there is with one who has in the background always the ability to stop and do nothing.

11 If we observe enough, carefully enough, and quietly enough, to get sensitive to it, we can see how every one about us is living in excitement. 12 I have seen women with nothing important to do come down to breakfast in excitement, give their orders for the day as if they were about running for a fire; 13 and the standard of all those about them is so low that no one notices what a human dust is stirred up by all this flutter over nothing.

14 A man told me not long ago that he got tired out for the day in walking to his office with a friend, because they both talked so

intensely. And that is not an unusual experience. 15 This chronic state of strain and excitement in everyday matters makes a mental atmosphere which is akin to what the material atmosphere would be if we were persistently kicking up a dust in the road every step we took. 16 Every one seems to be stirring up your own especial and peculiar dust and adding it to every one else's especial and peculiar dust.

17 We are all mentally, morally and spiritually sneezing or choking with our own dust and the dust of other people. 18 How is it possible for us to get any clear, all-round view of life so long as the dust stirring habit is on us? 19 So far from being able to enlarge our horizon, we can get no horizon at all, and so no perspective until this human dust is laid. 20 And there is just this one thing about it, that is a delight to think of: When we know how to live so that our own dust is laid, that very habit of life keeps us clear from the dust of other people. 21 Not only that, but when we are free from dust ourselves, the dust that the other men are stirring up about us does not interfere with our view of them. 22 We see the men through their dust and we see how the dust with which they are surrounding themselves befogs them and impedes their progress. 23 From the place of no dust you can distinguish dust and see through it. From the place of dust you cannot distinguish anything clearly. 24 Therefore, if one wishes to learn the standards of living according to plain common-sense, for body, mind, and spirit, and to apply the principles of such standards practically to their every-day life, the first absolute necessity is to get quiet and to stay quiet long enough to lay the dust.

25 You may know the laws of right eating, of right breathing, of exercise, and rest-- but in this dust of excitement in daily life such knowledge helps one very little. 26 You constantly forget, and forget, and forget. 27 Or, if in a moment of forced acknowledgment to the need of better living, you make up your mind that you will live according to sensible laws of hygiene, 28 you go along pretty well for a few weeks, perhaps even months, and then as you feel better

physically, you get whirled off into the excitement again, 29 and before you know it you are in the dust with the rest of the world, and all because you had no background for your good resolutions. You never had found and you did not understand quiet.

30 Did you ever see a wise mother come into a noisy nursery where perhaps her own children were playing excitedly with several little companions, who had been invited in to spend a rainy afternoon? 31 The mother sees all the children in a great state of excitement over their play, and two or three of them disagreeing over some foolish little matter, 32 with their brains in such a state that the nursery is thick with infantile human dust. What does the wise mother do? 33 Add dust of her own by scolding and fretting and fuming over the noise that the children are making? No--no indeed. 34 She first gets all the children's attention in any happy way she can, one or two at a time, and then when she has their individual attention to a small degree, she gets their united attention by inviting their interest in being so quiet that they "can hear a pin drop." 35 The children get keenly interested in listening. The first time they do not hear the pin drop because Johnnie or Mollie moved a little. 36 Mother talks with interest of what a very delightful thing it is to be for a little while so quiet that we can hear a pin drop. 37 The second time something interferes, and the third time the children have become so well focused on listening that the little delicate sound is heard distinctly, and they beg mother to try and see if they cannot hear it again. 38 By this time the dust is laid in the nursery, and by changing the games a little, or telling them a story first, the mother is able to leave a nursery full of quiet, happy children.

39 Now if we, who would like to live happily and keep well, according to plain common-sense, can put ourselves with intelligent humility in the place of these little children 40 and study to be quiet, we will be working for that background which is never failing in its possibilities of increasing light and warmth and the expanse of outlook.

GOODNESS

41 First with regard to a quiet body. Indigestion makes us unquiet, therefore we must eat only wholesome food, and not too much of it, and we must eat it quietly. 42 Poor breathing and poor blood makes us unquiet, therefore we should learn to expand our lungs to their full extent in the fresh air and give the blood plenty of oxygen. 43 Breathing also has a direct effect on the circulation and the brain, 44 and when we breathe quietly and rhythmically, we are quieting the movement of our blood as well as opening the channels so that it can flow without interruption. We are also quieting our brain and so our whole nervous system.

45 Lack of exercise makes us unquiet, because exercise supplies the blood more fully with oxygen and prevents it from flowing sluggishly, a sluggish circulation straining the nervous system. 46 It is therefore important to take regular exercise.

47 Want of rest especially makes us unquiet; therefore we should attend to it that we get-- as far as possible-- what rest we need, and take all the rest we get in the best way. 48 We cannot expect to fulfill these conditions all at once, but we can aim steadily to do so, and by getting every day a stronger focus and a steadier aim we can gain so greatly in fulfilling the standards of a healthy mind in a healthy body, 49 and so much of our individual dust will be laid, that I may fairly promise a happy astonishment at the view of life which will open before us, and the power for use and enjoyment that will come.

50 Let us see now how we would begin practically, having made up our minds to do all in our power to lay the dust and get a quiet background. 51 We must begin in what may seem a very small way. It seems to be always the small beginnings that lead to large and solidly lasting results. 52 Not only that, but when we begin in the small way and the right way to reach any goal, we can find no short cuts and no seven-league boots.

53 We must take every step and take it decidedly in order to really get there. We must place one brick and then another, exactly, and

place every brick-- to make a house that will stand.

54 But now for our first step toward laying the dust. Let us take half an hour every day and do nothing in it. 55 For the first ten minutes we will probably be wretched, for the next ten minutes we may be more wretched, but for the last five minutes we will get a sense of quiet and at first the dust, although not laid, will cease to whirl. 56 And then-- an interesting fact-- what seems to us quiet in the beginning of our attempt, will seem like noise and whirlwinds, after we have gone further along. 57 Some one may easily say that it is absurd to take half an hour a day to do nothing in. Or that "Nature abhors a vacuum, and how is it possible to do nothing? Our minds will be thinking of or working on something."

58 In answer to this, I might say with the Irishman, "Be aisy, but if you can't be aisy, be as aisy as you can!" Do nothing as well as you can. 59 When you begin thinking of anything, drop it. When you feel restless and as if you could not keep still another minute, relax and make yourself keep still. 60 I should take many days of this insistence upon doing nothing and dropping everything from my mind before taking the next step. 61 For to drop everything from one's mind, for half an hour is not by any means an easy matter. Our minds are full of interests, full of resistances. With some of us, our minds are full of resentment. 62 And what we have to promise ourselves to do is for that one-half hour a day to take nothing into consideration. 63 If something comes up that we are worrying about, refuse to consider it. If some resentment to a person or a circumstance comes to mind, refuse to consider it.

64 I know all this is easier to say than to do, but remember, please, that it is only for half an hour every day-only half an hour. Refuse to consider anything for half an hour. 65 Having learned to sit still, or lie still, and think of nothing with a moderate degree of success, and with most people the success can only be moderate at best, 66 the next step is to think quietly of taking long, gentle, easy breaths for half an hour. A long breath and then a rest, two long

breaths and then a rest. 67 One can quiet and soothe oneself inside quite wonderfully with the study of long gentle breaths. But it must be a study. 68 We must study to begin inhaling gently, to change to the exhalation with equal delicacy, and to keep the same gentle, delicate pressure throughout, each time trying to make the breath a little longer.

69 After we have had many days of the gentle, long breaths at intervals for half an hour, then we can breathe rhythmically (inhale counting five or ten, exhale counting five or ten), steadily for half an hour, 70 trying all the time to have the breath more quiet, gentle and steady, drawing it in and letting it out with always decreasing effort. 71 It is wonderful when we discover how little effort we really need to take a full and vigourous breath. 72 This half hour's breathing exercise every day will help us to the habit of breathing rhythmically all the time, and a steady rhythmic breath is a great physical help toward a quiet mind.

73 We can mingle with the deep breathing simple exercises of lifting each arm slowly and heavily from the shoulder, and then letting it drop a dead weight, and pausing while we feel conscious of our arms resting without tension in the lap or on the couch.

74 But all this has been with relation to the body, and it is the mental and moral dust of which I am writing. 75 The physical work for quiet is only helpful as it makes the body a better instrument for the mind and for the will. 76 A quiet body is of no use if it contains an unquiet mind which is going to pull it out of shape or start it up in agitation at the least provocation. 77 In such a case, the quiet body in its passive state is only a more responsive instrument to the mind that wants to raise a dust. 78 One-- and the most helpful way of quieting the mind-- is through a steady effort at concentration. 79 One can concentrate; on doing nothing-- that is, on sitting quietly in a chair or lying quietly on the bed or the floor. 80 Be quiet, keep quiet, be quiet, keep quiet. That is the form of concentration, that is the way of learning to do nothing to

advantage. 81 Then we concentrate on the quiet breathing, to have it gentle, steady, and without strain. 82 In the beginning we must take care to concentrate without strain, and without emotion, use our minds quietly, as one might watch a bird who was very near, to see what it will do next, and with care not to frighten it away.

83 These are the great secrets of true strengthening concentration. The first is dropping everything that interferes. The second is working to concentrate easily without emotion. They are really one and the same. 84 If we work to drop everything that interferes, we are so constantly relaxing in order to concentrate that the very process drops strain bit by bit, little by little.

85 An unquiet mind, however, full of worries, anxieties, resistances, resentments, and full of all varieties of agitation, going over and over things to try to work out problems that are not in human hands, or complaining and fretting and puzzling because help seems to be out of human power, 86 such a mind which is befogged and begrimed by the agitation of its own dust is not a cause in itself-- it is an effect. 87 The cause is the reaching and grasping, the unreasonable insistence on its own way of kicking, dust-raising self-will at the back of the mind.

88 A quiet will, a will that can remain quiet through all emergencies, is not a self-will. 89 It is the self that raises the dust-- the self that wants, and strains to get its own way, and turns and twists and writhes if it does not get its own way.

90 God's will is quiet. We see it in the growth of the trees and the flowers. We see it in the movement of the planets of the Universe. 91 We see God's mind in the wonderful laws of natural science. Most of all we see and feel, when we get quiet ourselves, God's love in every thing and every one.

92 If we want the dust laid, we must work to get our bodies quiet. We must drop all that interferes with quiet in our minds, and we must give up wanting our own way. 93 We must believe that God's way is immeasurably beyond us and that if we work quietly to obey Him, He will

reveal to us His way in so far as we need to know it, and will prepare us for and guide us to His uses.

94 The most perfect example we have of a quiet mind in a quiet body, guided by the Divine Will, is in the character of the Lord Jesus Christ. 95 As we study His words and His works, we realise the power and the delicacy of His human life, and we realise-- as far as we are capable of realising-- the absolute clearness of the atmosphere about Him. 96 We see and feel that atmosphere to be full of quiet-- Divine Human Love.

97 There is no suffering, no temptation, that any man or woman ever had or ever will have that He did not meet in Himself and conquer. 98 Therefore, if we mean to begin the work in ourselves of finding the quiet which will lay our own dust from the very first, 99 if we have the end in our minds of truer obedience and loving trust, we can, even in the simple beginning of learning to do nothing quietly, find an essence of life which eventually we will learn always to recognise and to love, and to know that it is not ourselves, but it is from the Heavenly Father of ourselves.

100 Some of us cannot get that motive to begin with; some of us will, if we begin at all, work only for relief, or because we recognise that there is more power without dust than with it, 101 but no one of us is ever safe from clouds of dust unless at the back of all our work there is the desire to give up all self-will for the sake of obeying and of trusting the Divine Will more and more perfectly as time goes on. 102 If we are content to work thoroughly and to gain slowly, not to be pulled down by mistakes or discouragements, but to learn from them, 103 we are sure to be grateful for the new light and warmth and power for use that will come to us, increasing day by day.

PLAIN EVERY-DAY COMMON-SENSE

Annie Payson Call

32 PLAIN common-sense! When we come to sift everything down which will enable us to live wholesome, steady, every-day, interesting lives, plain common-

sense seems to be the first and the simplest need. 2 In the working out of any problem, whether it be in science or in art or in plain everyday living, we are told to go from the circumference to the center, from the known to the unknown, from simplest facts to those which would otherwise seem complex. 3 And whether the life we are living is quiet and commonplace, or whether it is full of change and adventure, to be of the greatest and most permanent use, a life must have as its habitual background plain every-day common-sense.

4 When we stop and think a while, the lack of this important quality is quite glaring, 5 and every one who has your attention called to it and recognises that lack enough to be interested to supply it in your own life, is doing more good toward bringing plain common-sense into the world at large than we can well appreciate. 6 For instance, it is only a fact of plain common-sense that we should keep rested, and yet how many of us do? 7 How many readers of this article will smile or sneer, or be irritated when they read the above, and say, 8 "It is all very well to talk of keeping rested. How is it possible with all I have to do? Or with all the care I have? Or with all I have to worry me?"

9 Now that is just the point-- the answer to that question, "How is it possible?" So very few of us know how to do it, and if "how to keep rested though busy" were regularly taught in all schools in this country, 10 so far from making the children self-conscious and over-careful of themselves, it would lay up in their brains ideas of plain common-sense 11 which would be stocked safely there for use when, as their lives grew more maturely busy, they would find the right habits formed, enabling them to keep busy and at the same time to keep quiet and rested. 12 What a wonderful difference it would eventually make in the wholesomeness of the manners and customs of this entire nation. 13 And that difference would come from giving the children now a half hour's instruction in the plain common-sense of keeping well rested, and in seeing that such instruction was entirely and only practical. 14 It has often seemed to me that the tendency of education

in the present day is more toward giving information than it is in preparing the mind to receive and use interesting and useful information of all kinds: 15 that is, in helping the mind to attract what it needs; to absorb what it attracts, and digest what it absorbs as thoroughly as any good healthy stomach ever digested the food it needed to supply the body with strength. 16 The root of such cultivation, it seems to me, is in teaching the practical use and application of all that is studied. 17 To be sure, there is much more of that than there was fifty years ago, but you have only to put to the test the minds of young graduates to see how much more of such work is needed, and how much more intelligent the training of the young mind may be, even now.

18 Take, for instance, the subject of ethics. How many boys and girls go home and are more useful in their families, more thoughtful and considerate for all about them, for their study of ethics in school? 19 And yet the study of ethics has no other use than this. If the mind absorbed and digested the true principles of ethics, so that the heart felt moved to use them, 20 it might-- it probably would-- make a great change in the lives of the boys and girls who studied it-- a change that would surprise and delight their parents and friends.

21 If the science of keeping rested were given in schools in the way that, in most cases, the science of ethics seems to be given now, the idea of rest would lie in an indigestible lump on the minds of the students, 22 and instead of being absorbed, digested and carried out in their daily lives, would be evaporated little by little into the air, 23 or vomited off the mind in various jokes about it, and other expressions that would prove the children knew nothing of what they were being taught.

24 But again, I am glad to repeat-- if instruction, practical instruction, were given every day in the schools on how to form the habit of keeping rested, it would have a wonderful effect upon the whole country, 25 not to mention where in many individual cases it would actually prevent the breaking out of hereditary disease.

26 Nature always tends toward health; 27 so strongly, so

habitually does Nature tend toward health that it seems at times as if the working of natural laws pushed some people into health in spite of chronic antagonism they seem to have against health-- one might even say in spite of the willful refusal of health.

28 When one's body is kept rested, Nature is constantly throwing off germs of disease, constantly working, and working most actively, to protect the body from anything that would interfere with its perfect health. 29 When one's body is not rested, Nature works just as hard, 30 but the tired body-- through its various forms of tension that impede the circulation, prevent the healthy absorption of food and oxygen, and clog the way so that impurities cannot be carried off-- interferes with Nature's work and thus makes it impossible for Her to keep the machine well oiled. 31 When we are tired, the very fact of being tired makes us more tired, unless we rest properly.

32 A great deal-- it seems to me more than one-half-- of the fatigue in the world comes from the need of an intelligent understanding of how to keep rested. 33 The more that lack of intelligence is allowed to grow, the worse it is going to be for the health of the nation. 34 We have less of that plain common-sense than our grandfathers and grandmothers. They had less than their fathers and mothers. We need more than our ancestors, because life is more complicated now, than it was then. 35 We can get more if we will, because there is more real understanding of the science of hygiene than our fathers and mothers had before us. 36 Our need now is to use practically the information which a few individuals are able to give us, and especially to teach such practical use to our children.

37 Let us find out how we would actually go to work to keep rested, and take the information of plain common-sense and use it. 38 To keep rested we must not overwork our body inside or outside. We must keep it in an equilibrium of action and rest.

39 We overwork our body inside when we eat the wrong food and when we eat too much or not enough of the right food, 40 for then the stomach has more than its

share of work to do, and as the effort to do it well robs the brain and the whole nervous system, 41 so, of course, the rest of the body has not its rightful supply of energy and the natural result is great fatigue.

42 We overwork our body inside when we do not give it its due amount of fresh air. The blood needs the oxygen to supply itself and the nerves and muscles with power to do their work. 43 When the oxygen is not supplied to the blood, the machinery of the body has to work with so much less power than really belongs to it, 44 that there is great strain in the effort to do its work properly, and the effect is, of course, fatigue.

45 In either of the above cases, both with an overworked stomach and an overworked heart and lungs, the complaint is very apt to be, "Why am I so tired when I have done nothing to get tired?" 46 The answer is, "No, you have done nothing outside with your muscles, but the heart and lungs and the stomach are delicate and exquisite instruments. 47 You have overworked them all, and such overwork is the more fatiguing in proportion to what is done than any other form, except overwork of the brain." 48 And the overtired stomach and heart and lungs tire the brain, of course.

49 Of the work that is given to the brain itself to overtire it we must speak later. So much now for that which prevents the body from keeping rested inside, in the finer working of its machinery.

50 It is easy to find out what and how to eat. A very little careful thought will show us that. It is only the plain common-sense of eating we need. 51 It is easy to see that we must not eat on a tired stomach, and if we have to do so, we must eat much less than we ordinarily would, and eat it more slowly. 52 So much good advice is already given about what and how to eat, I need say nothing here, and even without that advice, which in itself is so truly valuable, 53 most of us could have plain common-sense about our own food if we would use our minds intelligently about it, and eat only what we know to be nourishing to us. That can be done without fussing.

54 Fussing about food contracts the stomach, and prevents free

digestion almost as much as eating indigestible food.

55 Then again, if we deny ourselves that which we want and know is bad for us, and eat only that which we know to be nourishing, it increases the delicacy of our relish. 56 We do not lose relish by refusing to eat too much candy. We gain it. 57 Human pigs lose their most delicate relish entirely, and they lose much-- very much more-- than that.

58 Unfortunately with most people, there is not the relish for fresh air that there is for food. 59 Very few people want fresh air selfishly; the selfish tendency of most people is to cut it off for fear of taking cold. 60 And yet the difference felt in health, in keeping rested, in ease of mind, is as great between no fresh air and plenty of fresh air as it is between the wrong kind of food and enough (and not too much) of the right kind of food.

61 Why does not the comfort of the body appeal to us as strongly through the supply of air given to the lungs as through that of food given to the stomach? 62 The right supply of fresh air has such wonderful power to keep us rested!

63 Practical teaching to the children here would, among other things, give them training which would open their lungs and enable them to take in with every breath the full amount of oxygen needed toward keeping them rested. 64 There are so many cells in the lungs of most people, made to receive oxygen, which never receive one bit of the food they are hungry for.

65 There is much more, of course, very much more, to say about the working of the machinery of the inside of the body and about the plain common-sense needed to keep it well and rested, but I have said enough for now to start a thoughtful mind to work.

66 Now for keeping the body well rested from the outside. It is all so well arranged for us-- the night given us to sleep in, a good long day of work and a long night of rest; 67 so the time for rest and the time for work are equalised and it is so happily arranged that out of the twenty-four hours in the day, when we are well, we need only eight hours' sleep. 68 So well does

Nature work and so truly that She can make up for us in eight hours' sleep what fuel we lose in sixteen hours of activity.

69 Only one-third of the time do we need to sleep, and we have the other two-thirds for work and play. This regular sleep is a strong force in our aim to keep rested. 70 Therefore, the plain common-sense of that is to find out how to go to sleep naturally, how to get all the rest out of sleep that Nature would give us, and so to wake refreshed and ready for the day.

71 To go to sleep naturally we must learn how to drop all the tension of the day and literally ‘drop’ to sleep like a baby. 72 ‘Let go into sleep’-- there is a host of meaning in that expression. When we do that, Nature can revive and refresh and renew us. 73 Renew our vitality, bring us so much more brain power for the day, all that we need for our work and our play; or almost all-- 74 for there are many little rests during the day, little openings for rest that we need to take, and that we can teach ourselves to take as a matter of course. 75 We can sit restfully at each one of our three meals. Eat restfully and quietly, and so make each meal not only a means of getting nourishment, but of getting rest as well. 76 There is all the difference of illness and health in taking a meal with strain and a sense of rush and pressure of work, and in taking it as if to eat that one meal were the only thing we had to do in the day. 77 Better to eat a little nourishing food and eat it quietly and at leisure than a large meal of the same food with a sense of rush. This is a very important factor in keeping rested. 78 Then there are the many expected and unexpected times in the day when we can take rest and so ‘keep rested’. If we have to wait we can sit quietly. 79 Whatever we are doing we can make use of the between times to rest. Each person can find your own "between times." 80 If we make real use of them, intelligent use, they not only help us to keep rested, they help us to do our work better, if we will but watch for them and use them.

81 Now the body is only a servant, and in all I have written above, I have only written of the servant. 82 How can a servant keep well and

rested if the master drives you to such an extent that you are brought into a state, not where you won't go, but where you can't go, and must therefore drop? 83 It is the intelligent master, who is a true disciple of plain common-sense, who will train own servant, the body, in the way of resting, eating and breathing, in order to fit it for the maximum of work at the minimum of energy. 84 But if you obey every external law for the health and strength of the body, and obey it implicitly, and to the letter, with all possible intelligence, you cannot keep it healthy if the mind that owns the body is pulling it and twisting it, and 'twanging' on its delicate machinery with a flood of resentment and resistance; 85 and the spirit behind the mind is eager, wretched, and unhappy, because it does not get its own way, or elated with an inflamed egoism because it is getting its own way.

86 All plain common-sense in the way of health for the body falls dead unless followed up closely with plain common-sense for the health of the mind; 87 and then again, although when there is "a healthy mind in a healthy body," the health appears far more permanent than when a mind full of personal resistance tries to keep its body healthy, 88 even that happy combination cannot be really permanent unless there is found back of it a healthy spirit.

89 With regard to the mind, let us look and see not only that it is not sensible to allow it to remain full of resistance, but is it not positively stupid?

90 What an important factor it should be in the education of children to teach them the plain common-sense needed to keep the mind healthy-- to teach them the uselessness of a mental resistance, and the wholesomeness of a clean mind.

91 If a child worries about own lessons, he or she is resisting the possibility of failing in own class; let the child learn that the worry 'interferes' with own getting own lesson. 92 Teach the child how to drop the worry, and will find not only that one gets the lesson in less time, but own mind is clearer to remember it.

93 By following the same laws, children could be taught that a

feeling of rush and hurry only impedes their progress. 94 The rushed feeling sometimes comes from a nervous unquiet which is inherited, and should be trained out of the child.

95 But alas! alas! how can a mother or a father train a child to live common sensibly without useless resistance when neither the mother nor the father can do that same themselves. 96 It is not too late for any mother or father to learn, and if each will have the humility to confess to the child that they are learning and help the child to learn with them, no child would or could take advantage of that 97 and as the children are trained rightly, what a start they can give their own children when they grow up-- and what a gain there might be from one generation to another! Will it ever come? Surely we hope so.

GIVE UP RESENTMENT, GIVE UP UNHEALTHY RESISTANCE

Annie Payson Call

33 If circumstances, or persons, arouse either resentment or resistance in us, let us ignore the circumstances or persons until we have quieted ourselves. 2 Freedom does not come from merely yielding out of resentment or unhealthy resistance, it comes also from the strong and steady focus on such yielding. 3 Concentration and relaxation are just as necessary one to another to give stability to the nerves of a human-- as the centrifugal and centripetal forces are necessary to give stability to the Earth.

4 As the habit of healthy concentration and relaxation grows within us, our perception clears so that we see what is right to do, and are given the power to do it. 5 As our freedom from bondage to our fellow-humans becomes established, our relation to our fellow-humans grows happier, more penetrating and more full of life, 6 and later we come to understand that at root it is ourselves-- our own resentment and resistance-- to which we have been in bondage,-- circumstances or other people have had really nothing to do with it. 7 When we have made that discovery, and are steadily acting

upon it, we are free indeed, 8 and with this new liberty there grows a clear sense and conviction of a wise, loving Power which, while leaving us our own free-will, is always tenderly guiding us.

9 No one ever really believed anything without experiencing it. 10 We may think we believe all sorts of beautiful truths, but how can any truth be really ours unless we have proved it by living? 11 We do not fully believe it until it runs in our blood-- that is-- we must see a truth with our minds, love it with our hearts and live it over and over again in our lives before it is ours.

12 If the reader will think over this little book-- you will see that every chapter has healthy yielding at the root of it. It is a constant repetition of the same principle applied to the commonplace circumstances of life, 13 and if the reader will take this principle into your mind, and work practically to live it in your life, you will find the love for it growing in your heart, and with it a living conviction that when truly applied, it always works.

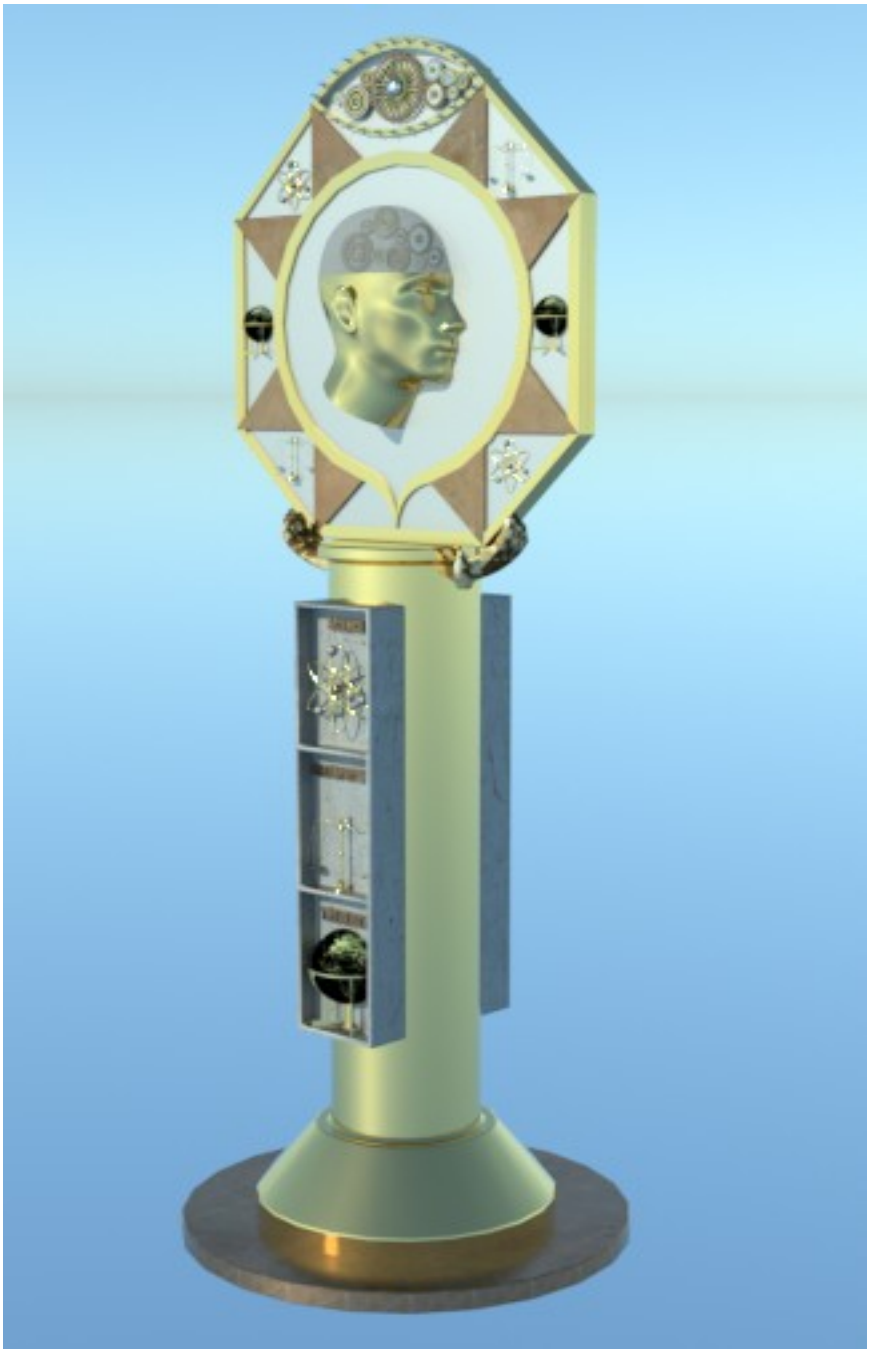
14 Some one once described the difference between good breeding and bad breeding as that between a man who works as a matter of course to conquer his limitations-- and a man to whom his limitations are inevitable.

15 There is spiritual good breeding and natural good breeding. The first comes from the achievement of personal character-- the second is born with us-- to use or misuse as we prefer.

16 It is a happy thing to realise that our freedom from bondage to circumstances, and our loving, intelligent freedom from other people, is the true spiritual good breeding which gives vitality to every action of our lives, and brings us into more real and closer touch with our fellow-humans. 17 Courtesy is alive when it has genuine love of all human nature at the root of it-- it is dead when it is merely a matter of good form.

18 In so far as I know, the habit of such freedom and good breeding cannot be steadily sustained without an absolute, conscious dependence upon the Lord God Almighty.

DIVINE PANAGOGUE



ORTHODOX-PANTHEISM
