I, Exist.

Dear Friend,

You exist. God fashioned your existence in the right relationship with the genetic constitution of your creator in Nature. Your biological parents are bearing witness to your existence in this life. The religious doctrine of orthodox-pantheism arise in the 21st century to bear witness to the nature of reality, and draws its beliefs predominantly from scientific evidence of what exists and can be proven with the evidence of your own eyes, with the scientific investigation into the nature of the reality of things.

You, humans, remain confused about the purpose of life and the existence of Nature. Why do we exist? What is the purpose of existence? Why is there something rather than nothing? What should we believe? What exists and what does not? In your hands, you hold the sacred Book that bears witness to the many answers in response to the many questions about the values of life provided by philosophers from ancient times to the present.

Philosophy is our humans tool to understand and gives meaning to the defining features of our human existence. The Panagogue bear witness to the history of the philosophy of religion, of those ideas and theories of existence that finds attraction in human nature and thus influenced the various religious movements in human culture in the world. Aristotle’s philosophies are about the human function, Plato on the nature of government and socialism, Kant’s theory is about moral theory and the virtue of the highest good, Aquinas conveys the spiritual

nature of the reality of beatific vision and many more. Overall, God remains the defining feature of life and our human existence.

But then, again, who is God? – The answer to this question is what makes the Panagogue different. This book tells of an administrator God who fashions the existence of all things in the right relationship with Nature. The doctrine of orthodox-pantheism tells us about a God whose substance is the uniform properties of the particular material constitution of existence and experience of reality.

Read the Panagogue, for it is written that you may define your very own existence and your purpose in life. Other religious books are written on account of suffering and the spiritual influences of demons or satanic forces in the lives of individuals. The Panagogue is written in an attempt to transmit comforts in life pleasure in the lives of its adherents. Why should we base our religious faith on the endurance of pain and suffering, when Nature has blessed us to be fruitful and multiply and to be filled with life pleasure and to transmit what is good.

The Panagogue is not a book of damnation or the preaching of what does not exist or what cannot be experienced with the evidence of the human eyes. Nature is The-One and the creator of the Absolute Good, and it does not condemn life. Nature is the giver of life and the creator of the administrator God.

We recognise philosophy as the generator of religion, and there is no religion without philosophy. Every human generation is seeking answers to the same questions of importance to us which we cannot answer through observed experience with our own eyes. We are dealing with the same difficulties as the ancient society

such as the bases of religious belief and the natural order of moral laws and its right action in every circumstance, under different forms, troubling thoughtful men and women from generation to generation.

We formalised the philosophy of Ethics to learn how we should live; we methodised the concept of Metaphysics to grasp what sorts of things exist and how their essential nature relates to our human existence; the study of Epistemology is what counts as genuine knowledge in philosophy, and we institute the study of Logic to ground us in the correct principles of reasoning.

Yet, we see things happening beyond our human understanding. Why is everything the way they are – why does it rain and why does the wind blow? Why does our life exist in such a routine affair of being born to grow and then to die? Why is Nature the way it is? We experienced pain as much as we experienced joy; there is as much kindness in the world as much as there is much evilness amongst humans; we live our lives with a series of responsibilities and difficulties; we wake up every day confronted by persistent urgency to be satisfied within the realms of life comforts; all life is craving, persistent craving for pleasure and for what is good to one-self and your self-preservation so to speak. Yet, it remains difficult to understand even to yourself why you are what you are. No one has a clear answer to the simple question of why all things that exist are what they are, and why we humans do what we do.

With the Panagogue, you've been given a choice. Listen to your soul-energy to decide to define who you are within the spiritual realm of this natural-world, and what your purpose of existence in this life should be. Remember, Nature is the The-One

and the creator of the Absolute Good. You are a product of Nature and the Idea of that Good of Nature; for, your existence has a bearing witness just as you would bear witness to other existences – it is a revolving process; just like the planets move within their orbits.

Decide to put scientific evidence as to the first principle in your religiousity of God, and let the gospel of orthodox-pantheism unite your very soul with the things of Nature. And the Divine Panagogue will bring a harvest of pleasure and life comforts to your life for the rest of your days in this lifetime.

DIVINE PANAGOGUE

The First Originating Book of Divine Panagogue Called

ORIGIN

IN THE BEGINNING

1 Nothing is the origin in the creation of everything, for before the first-caused of something there was nothing. 2 Asphyxiation of nothingness exists as the self-caused of the state of non-existence. 3 Any asphyxiation of nothingness would always exerts the existence of its own energy-- a nothing with the power of something. 4 From its caused super-condensed-energy of electrons clouds; Nature became the physical cause in the existence of something. 5 The caused effect of Nature was of a form, and its energy is the conductor of everything else in existence. 6 The caused of Nature was an electrons cloud like shell, and it attracts and repels in the recreation of the other, caused the eventual existence of space, force and matter. 7 Electrons clouds recreates electrons; exerting the formation of quarks, which in turn collide together to form protons and neutrons 8 And there emerging planetary objects has since been accumulating in the fitness of the Universal space ground. 9 Three-quarks of two-positive and one-negative make up each proton, and three-quarks of two-negative and one-positive make up each neutron. 10 The space became filled with the effect of naturedly properties of existence, with gravitational hills of forces and valleys of atomic energy. 11 Protons and neutrons reside in the nucleus at the centre of atoms; electrons exist in a cloud orbiting the nucleus within the atom. 12 The nucleus is held together by the Strong-Force; a basic force in Nature. And the quarks are held together by subatomic particles called gluons. 13 The collision of a proton to an atom makes a new element, and the collision of a neutron to an atom makes an isotope, or heavier version, of that atom. 14 The binding force of atomic nuclei varies based on the size of their individual nucleus, and the atomic number of elements within atoms varies also. 15 The number of protons in an atom determines the behaviour of the

ORIGIN

atomic element; six-protons make carbon, eight-protons make oxygen, and one-proton make hydrogen. 16 Neutrons are uncharged particles found within all atomic nuclei, but none as yet discovered to exist in hydrogen. 17 The positively charged protons are electrically attracted by electrons that surround its atomic nucleus, and electrons are negatively charged by their nature. 18 The nuclei of electrons exert the existence of atoms, and in turn exert the recreations of space, and emerge the existence of the Universe. 19 The Universe is conceived in linear directions of space-fields, within the boundless dimensional continuums of space-time. 20 Every substance of creation are made from that atoms, and every matter of solids, liquids, gases are made up of atoms. 21 Atoms are the basic building blocks of everything, divisible and indestructible; 22 they are to form together in diversity to create all matter, and they are in relative position and direction to one and the other. 23 Everything of Nature creates; everything it gravitates into existence exists to go on to recreate. 24 Energy regenerates energy; matter recreates matter; and motion revives motion. 25 Atoms exists in everything; like the air that you breathe, and everything that you can see or feel. 26 Everything of atom is in motion, and every force of motion exerts life. 27 Every motion produces life; for when two atoms joined together they make molecules, and helium and hydrogen are abundant elements of atoms in the Universe. 28 Atoms are the basic units of matter; they are the defining structure of all elements. 29 Atoms of certain elements are identical; like the diversity of race and gender between living-systems, and the diverse constituents between non-living systems. 30 The atoms of one element have different weights and properties than atoms of another element; 31 like the diverse genetic constitutions between living-systems, and diverse components between non-living systems. 32 Atoms are the foundational element of creation; it cannot be destroyed but can only evolve into other element. 33 The first-caused effect of atmosphere

in the Universe consists of air of atomic properties. 34 These atomic properties evolve from space-time to space-time into water vapour, carbon-dioxide, including carbon-monoxide, hydrogen, nitrogen, ammonia, methane, and then oxygen. 35 Matter is therefore formed by atoms combining in simple whole constituents.

36 According to Leucippus and Democritus there are an infinite number of indivisible units, which are called atoms. 37 These are imperceptible, since they are too small to be perceived by the senses. 38 The atoms differs in size and shape, but have no quality save that of solidity or impenetrability. 39 The ancient cosmologists did not think of motion as requiring any explanation, and in the Atomist philosophy the external movement of the atoms is regarded as self-sufficient. 40 In the beginning existed atoms in the void, and that was all: from that beginning arose the world of our human experiences. 41 Leucippus speaks of everything happening, and no external Power or moving Force is assumed as a necessary cause for the primal motion. 42 Infinite in number, the atoms of the organic existence of Nature move in the void.

THE ADMINISTRATOR GOD: IN NATURE

2 The originating substance of gravity is the first-caused of the Universe, the celestial substance of the administrator-God. 2 Electrons exerts the nuclei force of gravity, and gravity exerts motion to life. 3 The law of gravity is the law of God, and the law of God is the law-of-Nature. 4 God is the cypher system of Nature; its gravitational substance causes the effects of clouds of gas to coalesce and form stars. 5 The force of God exists in everything, and everything manifests in constant force of Nature. 6 Gravity is the cosmic fingerprint of God; and its current is the directional negative and positive electron of Nature; and Nature is the creator of all existence. 7 God is the gravitational substance that holds the planets in pockets of orbits in space; that holds the planets in

orbit around the sun; it keeps the moon in orbit around the earth; 8 it is the gravitational pulls of the moon that pulls the sea towards it and causing the ocean tides; it coalesce the formation of stars and planets, and exerting the material of Nature from which they are made; 9 gravity is the celestial substance of God, and God is the spiritual administrator of all conscious existence. 10 God, therefore, is the director of all conscious activities under the natural law of Nature. 11 Nature is the sole creator of all existence, in each of their open self-organising animate and inanimate life forms that interact with their environment. 12 The laws of Nature are the rules of conduct that governs all creations, and by the natural law of Nature, God was made to administer reason by which to conduct all existence by means of the will-power of Nature. 13 Nature made the natural laws. Nature is the creator of God and all that exists. 14 Nature gave God the administrative power of reason by which humans and other animals are to be governed by their natural instincts. 15 God also provides revelation concerning Nature's will and wishes.

16 In the *Timaeus*, Plato clearly teaches that God or the 'Demiurge' forms things of this world according to the model of the Forms of Nature. 17 This implies that the Forms of Nature exist apart, not only from the created things that are modelled on them, but also from God Himself, who takes all created things as His Model. 18 All planets are duplicates of each other, and thus exists as diversity of one of a kind. All created things is intensely diverse and God directs everything of Nature. 19 All created things are independent of God, Nature posits God to be the administrator of the multitude of Her subsistence essences. 20 God is possessed of a distinct reality independent of all created things of Nature. God is everywhere, and, strictly speaking, the force of God is an incorporeal essence, and incorporeal essence cannot be in a single place. 21 The force of God is transcendent. Transcendence in this connection would mean that God do not change and act with human particulars. 22 In other words, God

is impersonal in relation to all created things. God change and acts by the particular laws-of-Nature.

23 The God's immanence of pantheism implies for us that God is everywhere. 24 There can be no question of this, that, God is as much 'in' as 'out of' all created things He is task by Nature to administer their existences. 25 It is absurd to speak as though God involved the assumption of an Ideal Man who breathes, speaks, overrides Nature's laws, etc., existing in some heavenly place. 26 To do so is to make God gratuitously human: whatever the transcendence of the Ideas of God might mean in Nature, God could not be personal to created things.

27 God Himself is the very essence of a divine status, a subsistence essence, separate from Nature. 28 Scientific appreciation of the mere universal concept of Nature which is embodied in varying degrees in various natural objects of reality all around us, leads one to suppose that the essential existence of all created things is no mere concept, but each has distinct spiritual reality. 29 God in Himself or objective reality of His existence is 'separate' in the sense that He is real, subsistent, but not in the sense that He is in a world of His own, spatially separate from all other created things of Nature. 30 God is spiritual; and the categories of time and space, of local separation, simply do not apply in the case of that which is essentially spiritual. 31 Nature, the creator of all created things, transcends time and space, and we cannot even legitimately raise the question, when She originates or where Her created administrator God is. 32 God is everywhere, as far as human knowledge is concerned. 33 The spiritual distinctiveness between Nature and God would thus seem to imply, in the case of spiritual essence, a reality beyond the subjective reality of the abstract concept-- a subsistent reality-- of a distinctive differences between two entities. 34 It is, therefore, just as true to say that the spiritual essence of God is immanent, as that it is transcendent: the great point is that God is real, and impersonal, unchanged and abiding to the laws-of-Nature.

ORIGIN

35 It is foolish to remark that if the spiritual essence is real, it must resides in a specific place (such as in heaven). God, for instance, exists ‘inside’ and ‘outside’ of all created things in Nature in the same way we breathes air in and out. 36 God, is created of Force in Nature just as humans are created of matter, and as such God is confined to us throughout life, comes into being with us at conception, and immortalise through our individual agency at death or with us. 37 God is both transcendent and immanent, inaccessible to the senses, but apprehensible only to those who are spiritually open-minded to the essence of Nature.

38 To the means of ascent to the realm of God, the signification of the administration of God involve the predetermined approach to life of the individual in Nature. 39 The doctrine of orthodox-pantheism point out that within the spiritual administration of God, reveals the predetermined existence of all created things; that God is the ultimate Principle of unity between all created things and Nature. 40 The Maze-of-Life is the revelation of the ascent from one point to another, from birth to death, in an individual’s life. 41 The Maze-of-Life represents the ‘science of universal transition’, which suggests that “the wide ocean of intellectual desires,” containing ‘every moment decision-making’ and ‘course of actions’ that individual makes has a predetermined consequence in each of their majestic forms. 42 Every created things in Nature emerge into life with a unique Maze-of-Life; personalised by Nature to the character of the soul of the individual. 43 And if God is the final and unifying Principle, it becomes necessary to identify the Maze-of-Life of the individual created things with the Absolute Good of the predetermined existence of life in Nature.

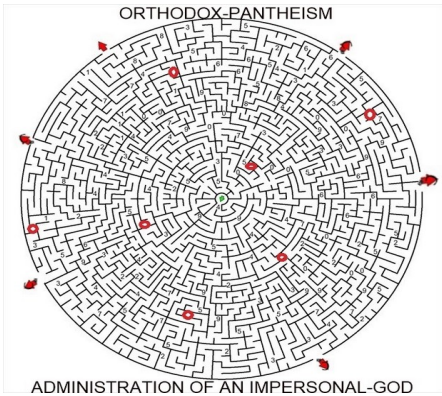

Diagram: Maze-of-Life

ORIGIN

44 In the Maze-of-Life, it is clearly shown that spiritually open-minded people would seeks to know the essential nature of each of their transitional points at every moment in the course of their lives. 45 You are concerned to know and to discern the essence of goodness-- of what represents life going badly or good at any one time-- which is embodied in varying degrees in your life-chart and represented by numbers between zero-to-nine. 46 The circular form of the Maze-of-Life represent the symbol of Nature, and each numbers within the maze represents a points of goodness in the lives of the individual. 47 The single green-dot at the centre of the Maze-of-Life represents the single point of birth of the individual; the red-arrows at the edge of the circular form represents a point of potential departure from life to death, and the various red-dots within represents a potential points of an untimely death. 48 The Maze-of-Life is unique to the individual and different from person to person, like the actual patterns on your fingertips and palms.

49 To borrow words from Frederick Copleston (1946) to elucidate my meanings: Those who are not spiritually open-minded to the predetermined existence of all created things in Nature, have taken up the multiplicity of appearances from their individual history and experiences as a guide. 50 I say they do not attend to the spiritual nature in their life-chart and cannot distinguish the essences of goodness or sorrow represented by numbers in their individual unique Maze-of-Life; 51 from the many life phenomena in individuals, are represented as having only opinion of event and as lacking in scientific knowledge of God and Nature. 52 They are not concerned with not-being, it is true, since not-being cannot be an object of ‘knowledge’ at all, and it is completely unknowable; yet they are no more concerned with true being or reality, which is stable and abiding: 53 they are concerned with fleeting phenomena or appearances, objects which are in a state of ‘becoming’, constantly coming to be and passing away. 54 Their state of mind is thus one of

ORIGIN

‘confusion’ and the object of their ‘thought’ is the phenomena that stands half-way between being and not-being.

55 The state of mind of the spiritually open-minded, on the other hand, is one of knowledge of every points in transition in their immediate future. 56 The object of this knowledge is spiritually Being, the fully real, the essential, the Maze-of-life of the individual or Form of one’s nature. 57 So far, indeed, there is a direct indication that the Maze-of-Life is the dominion of the soul in the life course of the individual, from birth to death. 58 Whilst the Maze-of-Life is endowed by Nature and interpose to operate in one’s lifetime, it is regarded as subsistent to a lifetime and has no spiritual or material connection with any notion of a life before being or life after death. 59 The varying degrees of goodness and sorrow represented by numbers in the Maze-of-Life is there compared to the predetermined consequences of our actions, past or present; 60 the light of which makes the objects of our individual nature and desires visible to all and so is, in a sense, the source of our individual human’s worth and value and beauty.

61 We are to accept the fact of our individual unique Maze-of-Life endowed by Nature and overseer by God; that the Good and the Bad exists as an object among objects in the course of life of the individual. 62 On the one hand, both the Good and the Bad gives being to the objects of desires and so is, as it were, the unifying and all-comprehensive Principle of the essential order in Nature, while itself excelling even essential being in dignity and power. 63 It is therefore concluded that the Maze-of-Life is not a mere concept and that it is indeed an existent end in the life of the individual in Nature, relating to the doctrine of predetermined design and purpose in the material world. 64 The Maze-of-Life is real, towards which all things are in operation in the spiritual realm in Nature: 65 The Maze-of-Life is not only an epistemological principle, but also-- in some, as yet, in a sense-- an ontological principle, a principle of being. It is, therefore, real in itself and subsistent.

ORIGIN

66 It would seem that the objects of Absolute Good and sorrow in the Maze-of-Life must be regarded as the essential operation of the administration of God. 67 Each of the defined numbers in the Maze-of-Life are represented as the high-peak of an intellectual ascent of consequences. 68 While each of the consequential manifestations of actions would appear to indicate that it is the source not only of the goodness of our individual human desires, but also, at other times, of the Absolute Good that emanates from the laws-of-Nature. 69 The consequential manifestations of our actions represented in numbers gives being to the Forms or essences of the Intellectual order of our desires. 70 Human conducts-- both in thoughts and actions-- and the wide ocean of Intellectual desires is a stage on the ascent to the Absolute Good of Nature.

71 The God of pantheism is an impersonal-God. 72 God is made of Force in Nature and not of matter; He has no power to change events in the life of humans but has been task by Nature to admit your desires and overseer it to its consequential manifestation.

73 The first principle that must precedes the beginning and end of prayer as orthodox-pantheists, is simply for God to directs the laws-of-Nature in our lives and to meet its consequence:

74 God, meet me at the points of my needs and desires.

75 God, direct me away from the path of selfishness and let me do no evil to Nature's created things.

76 God, let your administration take its rightful course in my life, and let the laws-of-Nature administer its desires in the predetermined maze of my life.

77 God, I pray for your divine manifestation, your divine grace and keep me always on the most favourable path of my life purpose.

78 God, save me from the vanity that germinates in the minds of humans. And in the circumstances where I cannot avoid it, keep me in endurance to live past it.

79 God, I am forever grateful for my divine existence, and bless the moment of my birth and the moment I die.

Administer my prayers, Oh Lord!

ORIGIN

MATTER AND MOTION: TO LIFE

3 Micro-organisms are present everywhere. 2 Life arises from living matter; mice from corn, maggots from decaying meats, flies from bovine manure, caterpillars from leaves, fish from mud, frogs from slimes. 3 Life comes from other life, and species evolved from other species, and humans evolved into being. 4 All living things, including animals and plants, are living matter. 5 Existence is an organic evolution; all living things including humans are still evolving out of existence of natural-selection. 6 All species of organisms are continually evolving through inherited variations that electrifying individual's ability to compete, survive, and reproduce. 7 Humans are the soul of evolution, and are evolving spiritually by one openness to the transcendental realms of Nature. 8 The trinity of genetic variations exists among all animal species of organisms created in Nature and directed by God: 9 The genes-phenotype is the physical-properties of an organism, such as appearance, skin-colour, structure of an organ including indicative character of physiognomy. 10 The genes-genotype is the biological-properties of an organism, and the director of organic susceptibility to the aging-process of well-being and predispositions to condition of health. 11 The genes-neurotype is the behavioural-properties of an organism, and the conductor of one's personality traits, such as perception and thoughts. 12 The variations of genes is heritable, the designer of reproductive isolation that attach the heavenly soul with the physical body at conception. 13 This by-product of both genetic makeup and one's immediate environment, is God's scientific expression of Nature's law.

14 The doctrine of God's relationship with the pre-existence of the soul and the process of 'recollection' should not be taken with the same exactitude and corporeal impression as more scientifically argued themes like matter or motion. 15 It would no more mean that the Ideas of the soul are in a heavenly place of their own than the transcendence

of a personal God implies that God resides in some heavenly place. 16 Whilst humans are made of matter in Nature, God is made of Force in Nature. 17 The administration of Force over matter, is the administration of God over living existences.

18 Frederick Copleston, in '*A History of Philosophy*' says: In *Phaedo*, Socrates gives an account of the soul's future life, and then expressly declares that it does not become a human of sense to affirm that these things are exactly as he has described them. 19 But while it is clear enough that the account of the soul's future life is conjectural and admittedly 'mythical' in character, it appears altogether unjustifiable to extend the concept of 'myth' to include the whole doctrine of immortality. 20 Socrates declares in the *Phaedo* that, though the picture of the future life is not to be understood literally or positively affirmed, the soul is 'certainly immortal'. 21 And, as Plato couples together immortality after death with pre-existence, it hardly seems that one is warranted in dismissing the whole conception of pre-existence as 'mythical'. 22 It may possibly be that it was no more than an hypothesis in Plato's eyes; but, all things considered, we are not justified in simply asserting that it actually is myth, 23 and, unless its mythical character can be demonstrated satisfactorily, we ought to accept it as a seriously meant doctrine. 24 Yet even if the soul pre-existed and contemplated the Forms in that state of pre-existence, it would not follow that the Forms or Ideas in any place, save metaphorically. 25 Nor does it even necessarily follow that they are 'detached' essences, for they might all be included in some ontological principle of unity.

26 God is the efficient cause of order in the universe, and He is task by Nature to fashions the objects of the world after the pattern of the Forms of Nature, as exemplary cause. 27 It can scarcely be denied that the Forms of Nature are distinct from the transcendence nature of God, because there is no doubt that Nature is the creator of all that exists. 28 Since we conclude that God exists, it therefore remain undeniable that God is part of the creation of

Nature, and task by Nature to administer the existence of all subsequent created things after Himself.

29 In the *Phaedo*, where the discussion centres around the problem of immortality, Frederick Copleston further says: it is suggested that truth is not to be attained by the bodily senses, but by reason alone, which lays hold of the things that 'really are'. 30 What are the things that 'really are,' i.e, that have true being? They are the essences of things, and Socrates gives as examples justice itself, beauty itself, and goodness itself, abstract equality, etc. 31 These essences remain always the same, while particular objects of sense do not. 32 That there really exist such essences is assumed by Socrates: he lays it down "as hypothesis that there is a certain abstract beauty, and goodness, and magnitude," and that a particular beautiful object, for instance, is beautiful because it partakes of that abstract beauty.

33 In the *Phaedo*, the existence of these essences is used as an aid in the proof of immortality. 34 It is pointed out that the fact that a person is able to judge of things as more or less equal, more or less beautiful, implies knowledge of a standard, of the essence of beauty or equality. 35 Now, humans do not come into the world and grow up with a clear knowledge of universal essences; how is it, then, that they can judge of particular things in reference to a universal standard? 36 Is it not because the soul pre-existed before its union with the body, and had knowledge of the essences in its state of pre-existence? 37 The process of learning would thus be a process of reminiscence, in which particular embodiments of the essence acted as reminders of the essences previously beheld. 38 Moreover, since rational knowledge of essences in this life involves transcending the bodily senses and rising to the intellectual plane, should we not suppose that the soul of the philosopher beholds these essences after death, when one is no longer hampered and shackled by the body?

39 The existence of matter and motion to life, is the universal forms of space and time; the coordination of forms of existence

of all the objects and processes that have ever existed, currently in existence, and will exist in the infinite universe.

THE UNIVERSE IS A VAST ELECTRIC ORGANISM

George Woodward Warder

4 Electricity, next to Deity, is the most remarkable entity in the Universe. 2 Its marvelous and varied powers and utilities create a new epoch in scientific thought and discovery. 3 Its study is replete with new and fascinating ideas and scientific theories. It contains the story of the Universe more sublime than an epic, more wonderful than a romance. 4 It organised the machinery of the worlds, and holds the secrets of Nature and the mysteries of life in its invisible grasp.

5 Electricity is the right hand of Deity, the tongue of the Spirit, the Word of Omnipotent power, the protean cosmic force and creative machinery of the Universe. 6 At the divine fiat electrons seized all atoms and space, it shook the ether into nebula, the nebula into worlds, the worlds into constellations, the constellations into a Universe. 7 Electrons shaped planets and rounded suns and hurled them forth to circle in the chorus of the singing spheres. 8 Electrons gave form and functions to all matter from the rounded pebble to the stars; from the raindrop to the surging seas; from the chirping cricket to the sporting leviathan; from the helpless infant to the giant human.

9 Electrons is the messenger and executive of Creative Will to all created things. 10 Electrons is the ambassador of spirit to matter, the autocrat of communication between all the faculties of mind and all the functions of physical existence. 11 It is the law of affinity in matter, of selection in atoms, and whispers to the body the intuitions of the Spirit and guides insensate worlds to do the will of Creative Omnipotence.

12 Electricity is the wonderful medium and agent by which mind acts upon matter and works the miracle of life and growth. 13 This mightiest servant of God and human, this genii greater than

ORIGIN

Aladdin's lamp, impresses all laws upon Nature, and makes the Universe obedient to the will of Deity, as human's body is obedient to the dictates of human's mind. 14 This inscrutable word of power from the source of all power is beginning to supply the human race with an inexhaustible force that will revolutionise the earth and link all nations together as one family in a millennium of peace and goodwill.

15 Human life seems to throb, pulsate, gleam and glow in this marvelous current of existence, 16 which causes illumination, transportation, telegraphy, photography, surgery, horticulture, agriculture, metallurgy and manufacture to step forth as master magicians to work miracles for the comfort and happiness of humankind. 17 Every new discovery, every step in the progress of electrical science conquers time, destroys distances, diffuses knowledge, dissipates ignorance, encourages friendship and draws people and nations closer and closer by physical ties and spiritual affinities. 18 Where once noisy ponderous mechanism pounded the rocks to release the metals, electrical science with its unseen but resistless currents instantly separate the ore and the dross. 19 Where the soot-begrimed engineer seizes the heavy iron throttle, she cleanly and softly touches a tiny button and the miracle is wrought -- 20 the heavy steed of steel receives its life not from smoking, hissing, fussing steam, but from an energy as silent as light and as potent as Omnipotence.

21 This invisible electrical energy, without brush or colour, paints the gorgeous beauties of the rainbow, and photographs in every ray of light and on every human eye the moving panorama of every passing scene. 22 It telegraphs between mind and matter, between soul and body, between suns and planets, and gives life and energy to all the varied functions of this electric magnetic Universe. 23 This strange, miraculous power has taken its place as the supreme force of all forces, the ultimate elemental force from which all other physical forces are derived, and, without fuel or expense, flies

with its burdens swifter than the flight of eagles.
24 It is the last and greatest progeny of human genius and discovery, the seventh daughter of science, who dips its wand in the impossible and miraculous until miracles become prolific and common. 25 Its power and expression are universal and its character and process superlatively grand. 26 Its theatre of action is the Universe and it comes to earth as the voice of Deity and the word of His Omnipotence.
27 This science of the impossible, this daughter of miracles, is destined to outstrip all past achievements. 28 The ponderous and noisy mechanisms will pass away, the barren rocks will change into most precious things, the sunlight will be converted into reservoirs of power, 29 and every raindrop and waterfall, ocean tide and wind current, will reveal exhaustless sources of wealth and energy. 30 Then will the ancient curse, "by the sweat of thy brow shalt thou eat bread," be removed, and agriculture and commerce will be conducted without the drudgery of toil or the weariness of labour, 31 and the earth shall blossom at the touch of the silent electric forces which human will harness to own cars of progress and power.
32 Manufacture will then be automatic and the web it will weave in its silent loom will not be wet with the tears of imprisoned childhood, or the agonising sweat of dungeoned humanhood.
33 Omnipotence follows its footsteps and with the blessings of heaven it comes as a friend to relieve pain and toil and elevate and glorify humanity. 34 Its power is as boundless as space and as universal as heaven's love.
35 For it comes with the Omnipotent power of Deity to relieve the burdens of toil, lift up the oppressed of the earth, and give human leisure for mental improvement and social elevation.
36 Electricity, I contend, is the invisible force which evolves form and substance and all visible things. Matter is but the outer garment of these invisible electric forces. 37 It is Spirit which creates psychic life, and makes life the cause instead of the consequence of organism.

ORIGIN

38 It is electricity which evolved the physical Universe and makes it a vast electric organism bound together by invisible electric ties, where its invisible forces are the cause instead of the consequence of physical organism. 39 These are the basic differences between the materialistic science of the past and the psycho-electric science of the present. 40 In the past science investigated only visible material effects and ignored the supreme invisible forces and laws which evolved and produced them.

41 This is an age of dominant mind, the development of a cycle of invisible forces. 42 The past century was the age of matter. It is said Darwin, Tyndall, Haeckel and Huxley did a work which had to be done. But their work was limited to chemical and biological demonstration. It was science, but science of the old school. 43 The discoveries since made in the domain of electricity and mental transmission make their discoveries seem trivial in comparison.

44 Francis Grierson says: "The discoveries and inventions of the past ten years have made child's play of every previously known system of philosophy. 45 The simple but amazing facts disclosed during the past five years render the dreams, speculations and guesswork of the past absurd. 46 The little we know in a practical way is more than all the philosophers of the past knew, from Aristotle to Leibnitz."

47 I contend that the Universe is a vast electric organism. 48 That all light, heat, and vital force is generated by electric energy in the dense magnetic atmosphere of suns and planets, 49 where alone it is needed for animal and vegetable life, and in volcanic pockets or circuits in the outer crust of these bodies caused by electric repulsion. 50 That the Universe began in extreme cold, not heat, that the suns are not hot, but are self-luminous, perfected worlds, and like our earth, except greater and more prolific in life and power. 51 I also contend it is as reasonable to bury an iron ship in the icebergs of the Arctic seas and expect it to become "red hot," 52 as to expect the sun, planets or anybody traveling through space 460-degrees colder than those

icebergs to become "hot, red hot or molten," as the astronomers say the sun is. 53 All light, heat, vital force and physical life is created by contact of opposite electrical polarities in the magnetic cushion surrounding all suns and planets.

54 The sun furnishes the positive electricity and the planet or satellite the negative, and from these two spring all the cosmic and material forces of the Universe. 55 The electric currents of the sun create induced magnetic currents on the earth, which evolves all visible substance and life forms. 56 The earth at its center is a magnet of crystalline rock and varied metals, placed layer upon layer as a thermopile or voltaic battery, which constitutes the solid core of the earth magnet, 57 and draws and holds all matter and substance atoms and atmosphere close to its magnetic heart, so that nothing can be thrown off of its vast surface, 58 though it shoots through space fifty times faster than a bullet from a rifle and whirls round with the speed of a revolving cylinder of a dynamo. 59 Its swift duplicate motion makes it a working battery or arc dynamo of marvelous power. 60 It draws all things to its magnetic center as the magnetic core of a steel magnet draws filings of iron and other metals to its magnetic surface, and they cluster there in the same spherical form.

61 This earth magnet drew countless meteors, swarms of nebulæ and invisible matter from surrounding space, and grew in size and magnetic power as a steel magnet may grow by adding other countless magnets with their increasing power and growing accretions. 62 For my theory is that every atom is a tiny magnet, and every molecule, meteor and visible form of matter is a combination and aggregation of magnets.

63 Aside from the theory of magnets, this is not far from Lockyer and Proctor's theory of the stellar formation. 64 Norman Lockyer says: "The stellar constitution may be explained by supposing it to arise from cool meteoric swarms represented by the nebulæ and the rise of temperature due to contraction toward a centre." 65 And he adds: "In the stars we have celestial furnaces the heat of which

transcends that of our most powerful electric sparks." In this heat theory I think he is radically wrong. 66 The rise of temperature on the sun and earth, I contend, is not from contraction, which is both insufficient and too irregular to be considered. 67 But it did arise from the growth in power and size of the earth as a great magnet, so that as a great arc dynamo it began to throb with electric energy, 68 and, by drawing to itself powerful currents from space and from the sun, the central electric heart of its organism, it began to generate heat and light in its own environment, which in time became translucent to the sun's rays, 69 and, instead of the sun and earth losing their light and heating power, they are steadily increasing them.

70 It is thus apparent that all light, heat, physical organisms and vegetable and animal life are evolved and exist only in the magnetic atmosphere of suns and planets.

71 The light we see does not come from the sun or stars; it is generated in our own atmosphere. 72 No human ever saw the sun or stars; they see the rays of light which photograph them in our atmosphere. 73 They see pictures of them at the end of the ray emanating from them, but some of these rays have been two hundred years in reaching us.

74 It takes light over four years to reach us from the star nearest our earth, so it is plain we do not see these stars.

75 As to the heat of the sun, there has been a vast difference of opinion among scientists. 76 Newton held it to be 1,669,300 degrees hot; Erickson, 2,726,000 degrees hot; Sacchi, 2,000,000 to 6,000,000 degrees; Waterson, 9,000,000 to 10,000,000, and Soret, 5,800,000 degrees hot. 77 But since the discovery of the law of the conservation of energy, which is only about a hundred years old, the scientists have been hedging and craw-fishing with wonderful dexterity and reducing it, until now 18,000 to 20,000 degrees are accepted as possibly correct.

78 As Newton was a great mathematician and the scientists accept him on other scientific questions, they ought to accept him on the sun's heat, and acknowledge a fact that ought to

be apparent to all -- 79 that if heat comes to the earth from the sun, in a column 93,000,000 miles long and 8,000 miles in diameter through frigid ether 460-degrees colder than ice, the sun must be millions of degrees hot. 80 Then, as nothing in the known Universe can exist a million or even twenty thousand degrees hot, they should admit the sun is not hot, and no heat comes from the sun to the earth. 81 Only electric currents come from the sun, which generate heat and light in our own atmosphere.

82 Then arises another question. All bodies lose their magnetic power when heated to less than one thousand degrees hot. 83 Professor Fleming in his book, "*Magnets and Electric Currents*" says: "Magnetic bodies become changed into feeble magnetic ones by heating to a certain temperature. 84 Iron at its critical temperature, 690-degrees to 870-degrees or a light red heat, loses all its strong magnetic qualities. In the same way nickel loses them at 300-degrees." 85 Thus we have the sun at even 1,000 degrees hot deprived of its magnetic power and unable to control the solar system. 86 Prof. T. C. Mendenhal, in a recent article in Harper's Magazine, says: "The electrical resistance of pure metals diminishes at a rate which indicates that at absolute zero it would vanish and these metals would become perfect conductors of electricity."

87 Thus cold increases and heat diminishes the electric energy of metals and all substances.

88 In my previous book, The Cities of the Sun, I have given over fifty reasons why the sun is not hot. 89 Among them I may mention, first, because of the extreme cold that prevails in the upper atmosphere of the earth, through which the sun's rays must pass, but whose temperature they cannot alter. 90 Second, because the sun's rays must traverse 93,000,000 miles of space between sun and earth, which is 460-degrees colder than ice, which would make it impossible for them to retain any degree of heat whatever. 91 If heat comes from the sun it must come in a column 93,000,000 miles long, 865,000 miles in diameter, converging to 8,000 miles at the earth's surface, which would

destroy the sun or any known body in the Universe to furnish such heat. 92 Third, because the perpetual snow upon the mountains even in the tropics show the sun's rays bring no heat to the earth, or the snow would be melted by the first and greatest volume of heat from the sun. 93 Fourth, because if heat came from the sun there could be no clouds in our atmosphere, for the heat of the sun would strike them first, and greater heat above the cloud level would prevent their formation and forever banish them from our skies.

94 Fifth, because heat by the law of its nature is diffusive, and cannot be shot from one sun or planet to another, or forced through space like a leaden ball or other substance, but is soon dissipated in the cold ether of space. 95 Sixth, the sun is not hot because comets have passed three hundred thousand miles through the sun's corona without visible change or injury, 96 which would be impossible if the sun is excessively hot, for the comet, coming from outer space, must be intensely cold, and excessive heat in the sun would explode and destroy it. 97 This argument alone should destroy the hoary headed superstition that the sun is hot.

98 Seventh, heat does not come from the sun, because there is no such thing as heat. Heat is simply a sensation; it is not a substance or an entity.

99 It is a sensation caused by the increased activity of the molecules of which a body is composed, and, is produced by electric currents. 100 I hold the sun is not a thermal or heating engine, as the astronomers claim, but an electric generator which is not hot and does not need to be hot. 101 I repudiate the law of gravity and adopt electricity as the evolving force of the Universe.

102 As the sun is 745-times larger than all the planets of the solar system combined, and controls the life and energy of the solar system by all laws of analogy and distribution in the Universe, 103 it should be more highly endowed with all the elements of growth, living forms and intellectual organisms than all the planets combined. 104 Therefore, the sun should be the spiritual and

intellectual center as well as the physical and electric center of our system of worlds, the headquarters of Deity and the future abode of human. 105 No life could come from a hot or burning sun or world, yet all animal and vegetable life comes from the all life-giving energy of the sun. 106 Heat is not life-giving, it is not even a substance or a force. 107 Heat does not exist except as a sensation created by the increased activity of the molecules of which the body is composed. 108 This increased activity is caused by currents or waves of electricity passing through a body or substance. 109 Cold is the absence of heat or lack of motion of the molecules of a body or substance, and, like heat, is not a reality, a substance or a thing, but only a sensation.

110 Heat and cold are produced by electricity, and are sensations resulting from electrical conditions. 111 Heat is not a creator; electricity is the creator and heat is its servant, and only one of its thousand-fold expressions. 112 Electricity creates the activity of the molecules which gives the sensation of heat. 113 A person standing in the sun on a hot day receives currents of electricity which were not hot when they left the sun, but only became so when they came in contact with the earth's opposite electricity near the earth's surface. These currents produce the sensation of heat. 114 The sun is not a burning globe, or blazing world of fire; it is an enormous magnet of measureless power, thirteen hundred thousand times larger than the earth magnet on which we live. 115 It revolves on its enormous axis at the rate of four thousand miles an hour and is thus constituted a working magnet or arc dynamo, 116 drawing electric energy from its vast electric field, embracing the solar system, six billions of miles in diameter. 117 Of this electricity, it uses for its own light, heat, and vital force what it needs, and the balance is thrown off to its luminous corona or photosphere, 118 where it is shot by the law of electric repulsion in the sun and electric attraction in the planets to the earth and plants. 119 The brilliancy of the sun is caused by its surplus electricity creating a

luminous aurora which extends from its poles to its equator.

120 Newton discovered an imaginary force. Newton had an imagination which the scientific plodders who came after him lacked. 121 They have dug in the dirt, while he sailed through azure seas and linked suns and worlds together by the mere sweep of the imagination, without any explanation or conceivable cause, and called it gravity. 122 He might just as well have called it weight or ponderosity, which means the same as gravity. And the scientists followed him and accepted his theory of gravity, which means nothing and explains nothing. 123 It was the best they could do, as he had an imagination and an idea and they had none. 124 Thus the blind led the blind for two centuries, until electricity and its invisible forces were discovered, and a new field for thought and causation was opened up.

125 Let us suppose that space and the invisible atoms or star dust which permeate it are seized by electric energy, creating a boundless sea of invisible electro-magnetism, which began to vibrate to the law of action and reaction, attraction and repulsion. 126 Under this law every atom became a tiny magnet, and electric centers are formed which are the foundation stones and nuclei of growing suns and worlds; 127 and invisible atoms, nebulæ and finally meteors are drawn by electric energy and woven by magnetic force 128 or induced electric currents into orderly layers of crystalline rock and varied metals, forming a vast thermopile, galvanic battery, working magnet, and electric dynamo all combined. 129 By the law of electric attraction all matter would tend toward a common center, 130 and in that common center would be found the vast central magnet-sun, sphere and dynamo many times larger and more powerful than all the others combined. 131 As each grew in size their electric potentiality would be increased, their electric and magnetic attractions multiplied, 132 and their revolution upon their axis and their orbit motion would be accelerated to a marvelous extent, giving them measureless force and power.

ORIGIN

133 Herbert Spencer affirms that space is eternal and has always existed. We will suppose the same of matter in its elemental form, known as the atom, 134 and we will venture also to assert that force is a substance like matter, but a thousand times more refined and invisible than the atom, and we will call it the electric ion, or electron.

135 Thus we have three indestructible, invisible entities--space, matter and force-- 136 which have existed eternally and which constitute the basic foundation and fallow ground of primeval chaos, which was the beginning of the Universe. 137 Then stars and planets, suns and worlds were transparent ether, as impalpable as the viewless air, 138 and scattered as star-dust in the measureless void of space along the forgotten highways of the eternities. 139 Silence reigned profound in the pulseless regions of the air where, motionless and dumb, the atoms hung in dark and lifeless space. 140 There was nothing in all that seemingly chaotic Universe; nothing but cold, darkness and silence. 141 But these are the home of atoms and ions, the star dust and cosmic force, creative Deity had scattered by the breath of His power through the highways of space in the beginning of primeval creation. 142 While these seem as nothing to human, they are the foundation stones of all creation.

143 This nothingness of space was the fallow ground of the Universe and the formless shadow of suns and worlds. 144 It was a Universe in solution, as viewless as ether and as intangible as mind. 145 The electric energy of space was yet unstirred by the divine fiat or shook into vibrating force by the word of creative power.

146 Then at the creative behest, "Let There Be Light," the ions of force, like an electric clothing of light and life, leaped into power, permeated all atoms, and wrapped as in swaddling clothes a new-born Universe. 147 Then atoms and ions of electric force met in fond and unending embrace, substance and energy clasped hands, and matter and persistent force were woven into each other's arms and saturated with electric life-giving energy.

ORIGIN

148 The sun magnet, being larger and more powerful than all the others combined, would hold the others we call planets in the magnetic field of own sovereign power, and become the electric heart and commanding force of own system of world magnets. 149 It would draw its electric life and energy from its vast electric magnetic field embracing its solar system, which with our sun is six billions of miles in diameter.

150 As these bodies grew in size under the law of electric attraction, which draws all matter toward a common center, they would become more and more compressed, dense and stable, 151 until they attained their natural equilibrium of balanced forces and assumed their permanent form and solidity. 152 Then they would assume their normal velocity of revolution on their axis, and their orbital motion along evenly balanced lines of force, without friction or change, for countless ages. 153 All suns and planets revolve on their axis under the law of electro-magnetism by which electric currents of force pass through their centers at their poles, and magnetic currents of equal force pass one way around them, creating their diurnal motion.

154 This law is briefly stated by a standard work on electricity: "A wire or any conductor having a current of electricity passing through it has lines of magnetic force passing one way around it, and the number is in direct ratio to the quantity of current passing through the wire. 155 This magnetic effect is strongest close to the wire, and decreases inversely as the square of the distance." 156 This is a marvelous combination of the dual forces of electricity, which operates as a wonderful mechanical contrivance to spin the heavenly orbs on their poles, 157 like a top is spun by a string or band around it or like the cylinder of a dynamo is revolved by its leather bands or a water wheel turned by the swift current of a river. 158 By reason of this law, all suns and planets revolve on their electric centers at their poles. 159 The great electric currents from the sun eight thousand miles in diameter and ninety-three million miles in length, like a mighty, inexhaustible river of force and

power, cause the earth to turn over, as a water-wheel is turned by the swift current of a river. 160 This vast stream or current of invisible power, when it starts from the photosphere of the sun, is 865,000 miles in diameter and is narrowed to a focus of 8,000 miles at the earth's surface, thus increasing its force and power a thousand-fold. 161 The largest river on the earth is 180-miles wide at its mouth and about 3,000-miles long, 162 but what an insignificant rivulet it is in contrast with this vast, invisible, omnipotent stream of electric life-giving power, constantly passing to and fro from sun to earth and from earth to sun.

163 Think of its marvelous speed! While the swiftest current of a river or the speed of a railroad train is scarcely 50-miles an hour, this mighty electric tide comes with the speed of light 186,000 miles a second, or almost 12,000,000 of miles an hour; 164 and it turns the earth over at the rate of a thousand miles an hour by its lines of magnetic force, just as the swift tide of a river turns the water-wheel of a mill. 165 And that the earth may turn more surely and steadily, it has vast mountain ranges running north and south from its poles, 166 such as the Andes and the Himalayas on opposite sides of its surface, and other ranges scattered between, to act as extending flanges and paddles, like those on a water-wheel, 167 to enable this vast electric tide to turn it more readily, and, like the brushes on an electric dynamo, to generate and draw electric currents from earth and sky, and moisture from the clouds, to bless and fertilise the earth and make it the theatre of human's life and activities.

168 Beneath these mountain ranges and in the outer crust of its surface are many cavities or openings we call volcanoes connected by powerful currents of magnetism constantly circulating from the equator to the poles; 169 and when there is an influx of water or other substance sufficient to generate electric resistance and repulsion, a fuse burns out in the circuit at that point, 170 the volcano sparks, blazes, explodes with great force, and shoots its molten lava into the clouds, or, like Mount Pelee, blows its head off.

ORIGIN

171 Another simple illustration of the Universe as a vast electric mechanism is the electric street-car system in our cities. 172 The sun represents the great central power house where the electric power is generated.

173 The planets represent the cars, which revolve on their axis and speed forward by the same force and in almost the same manner as the planets revolve on their poles and continue in their orbital lines of force. 174 The trolley wire and current are the cars' electric line of force and they come and go in their circuit propelled by the electric generator at the central power house, 175 in very much the same way as the planets revolve and come and go on their orbital circuits around the sun by the moving force and electric power of the sun.

176 The circuit of the electric current on the car line starts from the dynamo at the power house and returns along the rails or through the earth back to the dynamo. 177 In like manner, the vast electric currents of the sun pass to the earth through the ether without wires and do the lighting, heating and cosmic life-work, and return to the sun completing their circuit; 178 and the earth sends its electric currents to the sun and they return to the earth through the ether in the same manner and complete their circuit. 179 Thus there are vast highways and boulevards of electric currents passing from suns to planets and from planets to suns which are pathways to the stars and the great highways of eternity, 180 on which invisible atoms, and perhaps invisible human souls, may pass from earth to suns and central suns. 181 In the future, human will turn the searchlight of investigation upon electricity as the universal operating cause of all physical phenomena. 182 We will solve the riddle of the Universe by its subtle invisible forces. 183 We will cease to regard creation as vast constellations of burning spheres whirling through frigid ether. 184 We will look upon it with wonder and inspiration as a vast self-controlling, life-evolving, varied but unchanging unity, a perfect whole-- a vast electric organism of omnipotent power and eternal existence. 185 We will

regard electricity as the finger touch of Deity that makes the world go round, that marks out the orbits of suns and the pathway of constellations, and guides them in their mysterious courses to their eternal and inscrutable destiny.

ELECTRICITY PRODUCES ALL THE PHENOMENA OF NATURE

George Woodward Warder

5 I contend that electricity produces all the phenomena of Nature -- 2 that it is the ever active agent in evolving visible forms and substances whose results are known as laws. 3 Human is the most perfect enfoldment of Nature's electric laws, and the world and the Universe are the universal expression of electric life and energy.

4 Human and all the visible forms of creation are woven from invisible ether by electric forces, 5 and, as human's will and thoughts are the governing force of its electric organism, so simple and universal are the laws-of-Nature 6 that the will and thoughts of Deity, by electric energy, are the controlling law and force of the Universe, and the ultimate cause producing all causes, all creations, and all tangible forms.

7 The natural world is the product of matter, and force and all matter is one matter represented by the invisible atom, and all physical force is one force, being the varied manifestations of electric energy. 8 For the natural world is the spiritual unfoldment made manifest by electric power. 9 Therefore all the varied phenomena of Nature, the revolution of the earth on its axis and in its orbit around the sun, the brilliant light and governing power of the sun, the circling stars, the blazing comet, the shooting meteor, the gorgeous rainbow, the luminous aurora, and the dazzling corona are all expressions of electric power.

10 The lightning in the cloud, the reverberations of thunder, the ebb and flow of the tides, the wind currents in the air, the swaying of the forest, the variations of heat and cold, the falling of snow, the rain drop and the dew are all electric manifestations.

ORIGIN

11 You cannot raise your arm, lift your foot, or move your body except by electric energy. 12 You cannot see or hear or feel or taste or smell or exercise any of the functions of the body without bringing to your aid the electric force which permeates all forms and substance. 13 Electricity creates the mystery of physical life and provides the food and sustenance necessary to its growth and development. 14 Electricity works the miracle of digestion and assimilation and converts inert matter into blood and bone, tissue and muscle, 15 and organises human's body into an electric machine, and runs it as truly and perfectly by electric energy as the electric motor or generator is run by electricity. 16 Human draws your electric life currents from the air into the lungs as a great electric reservoir, 17 there it purifies and energises the blood and sends it as an electric fluid and circulating magnetic current through every part of the body, causing the heart valves to pulsate with measureless force and the human machine to throb with intense life and power.

18 The heart throbs and pulse beats of human's body are but the rhythmic whir and vibrations of the human electric machine. 19 Human makes electrical machines of wood and glass and metal, but Nature makes them of flesh and blood and of all matter and substance. 20 Nature, the all-wise and mysterious necromancer, makes nothing but electric machines from the infinitesimal atom to the self-luminous perfected dynamos -- the suns and stars. 21 All things that exist are electric generators or electric creations of marvelous construction, power and utility; 22 and all expressions of form and power, all visible objects, and all the varied phenomena of Nature are produced by electric-magnetic energy.

23 Franklin and Faraday, Harvey, Morse and Edison, by their discoveries have taught us that as the potter and the clay must come together to form the rudest vessels, so creative electric force must touch every sensitive atom in organic being; 24 and keep the wellsprings of life constantly flowing through all life forms. 25

ORIGIN

There is no unfolding of bud and blossom, tree and shrub, without the coming and going of electric life-giving sunlight and earth light. 26 They pervade all bodies of matter, whether world spheres or seed germs, and hold communion with all atomic centers of sensation in all living organisms. 27 Atoms seek their electric affinities, life-forces and life-forms touch each other by the grasp of magnetic attraction and repulsion, and these give personal sensations and vital forms of being.

28 Through the medium of electricity, material and mental forces meet together upon the plane of human consciousness. 29 This is Nature's method of communication between the material and mental within the human brain, 45 which has been a puzzling and difficult problem of physical science. 30 The language of the senses is a universal language that has its foundation in invisible forces.

31 There is a unity between the light and the eye that indicates their origin in the same lines of force that now give sight to the brain life.

32 In the ear, there is evidence that the electric vibratory currents of force producing sound had a companionship with the electric life-germ in which the ear had its beginning. 33 So all organs of sense possess unmistakable evidence of having proceeded out of those electric forces that are unseen and imponderable. 34 The knowledge of these is the story of the Garden of Eden, incorporated into the life of every intellectual being. 35 All the evidence of the senses comes from electric telegrams from without or within human's physical organism. 36 Seeing and hearing are wireless telegrams from the ether without, 37 and feeling, smelling, tasting, are wired telegrams running along the nerves of human's body and communicating with the brain -- the seat of intelligence --and the reasoning soul.

38 Human must have a connecting link between one mind and body and the things about oneself; 39 and, as that connecting link and medium in human is electricity, so plain and simple are the laws-of-

ORIGIN

Nature that God has no other medium between itself and all material creations. 40 Electricity therefore is both the creative governing energy of Deity over the Universe, and the governing energy of human over all material things. 41 God controls the Universe as human controls own body -- by electricity.

42 Human has five senses: seeing, hearing, feeling, tasting, smelling. These are all communicated to the soul or spiritual body by electricity. 43 Human feels by the electric flashes that come from every part of own body, that tingle on one nerves, and beat upon the brain, and touch the garments of the living soul. 44 One sees through the medium of the electric etheric waves of light that come from the vibrations of the air around one. 45 By these swift electric flashes the infinitesimal rays of electric light enter the retina of the eye and touch the quick vision of the soul. 46 One hears by the atmospheric waves of electricity that beat upon own ear drums. One tastes and smells by the same electric process; 47 and your five senses are but the inward communication of outer surrounding conditions and substances to one spiritual perception by means of electricity. 48 Thus the Creative Deity hears and knows, and by the same forces directs and sustains all things.

49 Human as an electric engine is far more efficient than any known engine in which there is a consumption of fuel. 50 In general the amount of work a human does bears a certain proportion to the fuel one puts into own boiler.

51 Plants also constitute forms of electric engines to embalm the sun's rays and use the products rejected by human and animals. 52 By the radiant energy of the sun, plants are able to decompose carbonic acid. 53 They form storage cells in which a current of electricity decomposes the liquid into oxygen and hydrogen and form materials which again give electricity, motion and heat. 54 The sun enables the plant engine to work. 55 It also enables the human engine and animal engine, and world engine to work by furnishing them all with the electric energy and working power

of the Universe, that they may do their part in the ever living forces of cosmic life. 56 The cells of protoplasm are infinitesimal magnets or electrical machines, all vegetables are but larger magnets, all animals still larger, till we get to worlds and suns, the greatest of them all.

57 All the radiant garments of creation in their varied colours of light and beauty that now appear to human vision are woven from the same garments of immortality that wrap themselves around the initial centres of magnetic attraction.

58 As the worlds were created by invisible electric forces under the guidance of the Omnipotent creative spirit, so the same electric forces are still carrying forward the work of their unfinished structures, and perfecting the unity and completing the harmony of creation. 59 What we now call gravity is electric attraction and accretion that was commenced at the beginning of Nature's work of creation, 60 and which continues to be the occult force that secures the growth of a blade of grass, the unfolding of the tiniest seed with its inwrapt life-germ and the development of a world, 61 and which brings us face to face with the creative force that was the starting point of "the beginning" and will be the culminating center of all ultimate perfected creation. 62 This electric life energy touches each growing seed center as at the beginning it touched each growing world center and reveals the power and wisdom of creation in every evolving form of life.

63 The same electric radiate lines that give the parental image in the mirror by an instantaneous flash of light, give also the parental image in the germ-life that evolves a new paternity. 64 While we cannot trace the lines of electrical union that are mingled in this new life, we are justified in affirming that electric and radiant matter must have bridged the chasm between the old lives and the new, between parental duality and the dual forces of electricity that produced a new germinal individuality. 65 And the new life cannot be possible without the separate unfolding of two distinct organisms meeting in generative embrace, imparting a new seed-life. 66 All germ-life has

its beginning where positive and negative magnetic currents blend into unity.

67 As all material organisms take on their organic form around electric or magnetic centers drawing their atoms from electrical currents, so all life-germs take their growth from the magnetic centers of their growing forms. 68 Here in the field of electric forces is to be found the generative forces of organic matter-- the mysterious births from all parental life. 69 And the constantly revolving circle of periodic changes of growth and decay, of life and death, of seed beginning and seed producing-- like sunshine and shadow, light and darkness-- are opposite points in the circle of electric force and physical life. 70 The growing and dying life-forms intervene between these two points of rest and renewal, of attraction and repulsion, of positive organism and negative diffusion of matter.

71 They are the results of the great electric system of attracting and repelling currents of magnetism that are as fixed in their lines of force and order of work as the rocks at the foundations of the mountains. 72 In fact, all that is strong and abiding in matter rests upon these currents of energy, and all of life is dependent upon the constancy and perpetually pulsating flow of the unseen electrical potencies of creation. 73 Life is a universal unity, as light, heat, electricity and polarisation, which evolve it, are unities. 74 The order of ascending life organism is from the simple to the complex; from the lowest plane of rock formation the series is upward; from the lowest form of vegetable life it is up to the highest, 75 and in the animal life upward till the crowning work is reached in the thinking animal we call human, who is more than a thinking animal.

76 To each ascending form there is an endowment of self-perpetuation by parentage and seed fruitage, 120 which involve the electro-magnetic condition of germ life. 77 Thus by electrical forces plants build within each other and form others by elementary atoms, with power of self-propagation, bridging the life-gulf between silent atom and living organism as

if they were the material work of some spiritual builder.

78 Thus by electrical forces Nature builds all human and animal life-forms and organisms. 79 The primary atoms of matter have their home in the electro-magnetic forces and are evolved from them into the material organisms of creation. 80 When the electro-magnetic origin of light, heat, physical life and so-called gravitation is fully accepted and their dynamic energy traced to its potential body, 81 we have reached the strength of primary forces and the unending circle of electrical potencies. 82 This brings us to the border land of creative work, to the mysterious sea of all life-giving forces, and the universal basis of all existing creations.

83 Here spirit, matter, and electricity-- the three great basic entities of creation-- work together in full accord in evolving and fashioning all material growth and material structures. 84 In natural growth protoplasm gives the material conditions of life without which there could be no food supplies. 85 They contain grouped elements of oxygen, nitrogen, hydrogen and carbon out of which living structures are reared. 86 Life is dependent upon food supplies of matter, which supplies must be raised to radiant conditions by electric forces to secure its assimilation into living organic forms.

87 Life, therefore, like light, seeks through magnetic action a radiant plane of matter where it can reveal its working presence. 88 Upon such a plane all forms of life come to birth from a common parentage-- from electric force and radiant matter, 89 each form endowed with personality, and powers of reproduction that make them factors of life and growth upon the radiant plane of creative potencies.

90 Prof. G. F. Wright of Oberlin says in a recent article: "Evolution does not solve the mysteries of the Universe. It simply pushes them one step further back. 91 The mystery of the acorn is greater than the mystery of the oak, for it has compressed in it all the 'power and potency' of the oak. 92 It is no explanation of a chick to say it is hatched from an

egg. The wonder and the mystery is simply carried back to that infinitesimal point in the egg 93 which conceals within itself the power of producing the feathered biped with all its marvelous instincts and adapted organism."

94 I hold that the infinitesimal point in the egg and the acorn is its electric center of life-force, or magnetic core, 95 which, under the law of organic affinity, develops by nutrition and respiration, which are electric processes, into the chick and the oak. 96 He says: "So, of all the processes of Nature, human's vision sees only the surface. We do not see causes but only effects. 97 We plant a seed, and all that we see is that under certain conditions it springs up and produces the blade, then the ear, and last the full corn in the ear. 98 No one knows how it comes about that two seeds which look alike under the same conditions produce different coloured flowers and different qualities of fruit. 99 The beginning of everything is a mystery. 100 If one affirms that things have no beginning you but increases the mystery. 101 The difficulty with all theories of evolution is to get a starting point.

102 The time was when philosophers could speak of the Universe as eternal. The geologists fifty years ago could do so, but the demonstration of the conservation of energy has put an end to any such easy-going speculation."

103 All this is well stated and very true, except that by treating all things as electro-magnets, drawing positive and negative atoms or ions from air, food and water, 104 we see how by nutrition and accretion animal and vegetable organism may be evolved by the law of magnetic attraction and organic affinity. 105 This is the only rational solution and is in accord with all the processes of Nature and with the conservation of energy. 106 Elsewhere I have endeavoured to explain how, by the constant renewal of matter and electric energy in the sun and in space, the Universe may be eternal and no waste or deterioration occur and, while always changing, is virtually changeless.

107 Newton in his theory of gravitation discovered one phase of electric energy, and his law of gravitation is in reality simply the law of electrical attraction. 108 But

he never knew the cause of it and never discovered the other and dual phase of electric energy-- the law of electrical repulsion, he never even suspected it. 109 For he held that the balancing force of gravitation of the other planets kept each planet from falling into the sun, which it otherwise would have done under the law of gravitation, which says large bodies attract smaller ones. 110 This position was untenable, as I have shown in "*The Cities of the Sun*."

111 Newton thought that an apple was attracted to the earth because the earth was larger, and that any larger body would attract a smaller one.

112 But I hold that size is not what controls attraction; it is electrical conditions. 113 An amount of substance from the sun would have more attracting power than the same amount from the earth, because the sun has more electrical power. 114 A lodestone has more attracting power than the same amount of ordinary substance. A pound of iron has no attracting force until it is magnetized; then it will lift many times its weight.

115 So size, weight, or gravity is no test of attracting power. I therefore repudiate the law of gravity and adopt electricity, 116 with its dual force of action and reaction, attraction and repulsion, as the supreme cosmic evolving force of the Universe, creating all light, heat and life and producing all the varied and wonderful phenomena of Nature.

117 I hold that by the law of electric energy the sun is not a thermal or heating engine as the astronomers proclaim, but is an electric generator and is not hot, 118 and that the sun's rays, neither where they originate or where they act are hot, but they come to the earth as cool currents of electricity, 119 which generate heat near the earth's surface by coming in contact with an opposite electricity and the resistance and friction of its atmosphere. 120 Proof of this is found in the snow-covered peaks of the tropics and the glaciers of the torrid zone.

121 I have waited six years for objections to the electric theory of creation and have found only one recently stated. This first and only objection is that electricity is a

derivative force. 122 Prof. G. F. Wright, of Oberlin, in an article in the Chicago Record, Dec., 1902, says: "Many of the speculations concerning the unlimited use of electricity overlook the fact of its derivative origin. 123 Electricity is but transformed force. It is not a producer of force but a consumer of force. It merely directs the force to its specific end. 124 The electricity which propels and warms the street cars of Buffalo, and furnishes power to its small factories and illuminates its streets is merely force diverted from the Falls of Niagara; in other words, it is transformed gravitation."

125 True, but gravitation is simply electric attraction, and the electricity that propels, lights and warms the cars is electric attraction diverted from the Falls and used on the cars. 126 It is not derivative force, but the original and only force --electric force transferred from the Falls to the cars.

127 But Prof. Wright himself destroys his own argument when he says: "In other cases the electricity is derived from the heat of consuming coal, while the coal is the product of the sun's rays, chemically sealed up in the coal deposits of the early geological ages. 128 Indeed it is easy to see that all the available force in the world is the product of the sun's rays." 129 In this we fully agree, for I say the heat of the coal and the heat of the sun is electricity. 130 The sun's rays, which he says "is all the available force in the world," is electricity, and the sun is the great electric heart of the solar system.

131 While he whips electricity around the stump, and says it is a new thing every time he turns a corner, 132 I say it is the same electricity, without any change, and proves the oneness of the Universe as a vast electric organism.

133 Thus our great scientists befog themselves. Now that Langley says there is only one radiant matter, and light, heat and chemical changes are all one entity, perhaps he may change his view. 134 I have tried to convince these cross-eyed reasoners that all force is one force and all matter is one matter, and the scientists are now coming to that conclusion steadily.

ORIGIN

135 Prof. Wright says again: "The strength and warmth of all animal bodies is traceable to carbon, and whenever we move a limb or walk, the power to do it is obtained by the consumption of carbon." Well, I say carbon is one form of stored electricity. 136 He says: "The ox feeds upon the grass which is collected or grows through the influence of sunlight," and I say sunlight is electric currents from the great electric dynamo, the sun.

137 He says: "The nebular theory is faulty," and I agree with him. 138 He says: "Gravitation is an utter mystery that has baffled all scientific explanation," and I agree with him, and go a step further and affirm that there is no such thing as gravitation and never was. 139 Newton discovered one of the dual forces of electricity, which I call universal electric attraction, and called it gravitation.

140 He says: "So far as we can see, gravitation acts instantaneously, and Newton gave up the problem of defining it, and said he had no explanation except to say God so made it." 141 This is true, but Newton knew nothing of electricity or his great intellect would likely have discovered the truth and named and explained it as electric attraction.

142 Newton discovered an imaginary force, an idea, a dream, "an occult force," as Leibnitz called it. Newton had an imagination which the scientific plodders who have come after him lacked. 143 They have dug in the dirt, while he sailed through azure seas, and linked suns and worlds together by a mere sweep of the imagination, without any explanation or conceivable cause, and called it gravity.

144 Phillip Akinson, in his work on electricity, 1902, asserts that "energy manifests itself either in masses of matter or in small particles, called molecules, and thus we have two kinds-- mass energy and molecular energy." But have we two kinds of energy? Mass energy and molecular energy is the same.

145 Mass energy is but the aggregation of molecular energy. Large bodies attract small ones because they possess more electric energy. 146 Gravity or weight is but another name for aggregate molecular electric attraction of the

earth for everything upon its surface. 147 The gravity or weight of a man is the pull or force with which the electric attraction of the earth holds him to its surface. 148 In other words, the earth is a vast magnet, and human's body is a smaller magnet, and as the magnetic core of a steel magnet draws all metals towards its magnetic center, so does the earth magnet draw all things toward its center.

149 The same author states that, "the earth is a great thermopile generating electric currents by the difference of potential between its heated and cooled parts." In this I agree with him, but he only states one of a thousand ways to generate electric currents.

150 He says further: "Heat is believed to be a certain mode of molecular motion, and electricity to be another mode; but the nature of the motion of each has never been discovered." And I think never will, as long as the false notion prevails that heat and electricity are modes of motion.

151 A mode of motion is nonsense, for motion is an effect produced by a cause-- it is not a cause. 152 And all cause of motion is electricity, and the mode of operation is the law of electro-magnetism.

153 There is no difference in the law or the mode of operation of electric currents in a volcano, in a cloud, in the earth, in the sun or planets, in an electric light, or in a man's body. 154 The same law exists and the same natural results follow when one lights the gas with a flash of electricity from your finger, as when a meteor blazes, a comet flares out in space, or a sun becomes luminous. 155 The same force that human causes to run along a telegraph wire, or through a telephone circuit, or which runs a street car line, or is taken by the brushes from a revolving dynamo, 156 is the same force and operated under the same law or mode of force as the electric life-giving currents that come from the sun constantly in an omnipotent tide of power.

157 Prof. Thomson says: "The earth is generally found to be negatively electrified, and is insulated in its atmosphere, being in fact a conductor touched only by air--a strong insulator."

158 He says further: "The quality of non-resistance to electric force of the interplanetary ether being considered, the earth, the atmosphere and the surrounding medium may be regarded as constituting respectively, 159 the inner coating, the dielectric and the outer coating of a large Leyden jar charged negatively."

160 Prof. S. P. Thomson in "*Electricity and Magnetism*," says: "Gilbert made the discovery that the compass points north and south because the earth is also a great magnet. 161 Faraday said: 'All matter is in a magnetic condition.' Sir Oliver Lodge says: 'The idea that magnetism is a whirl of electricity is as old as Ampere. 162 Perceiving that a magnet could be initiated by an electric whirl, he made the hypothesis that an electric whirl existed in every magnet.'"

163 Maxwell announced the proposition that electro-magnetic phenomena and light phenomena have their origin in the same medium and are identical in nature. 164 Hertz, by actually producing, detecting and controlling electric waves, caused the discovery of wireless electricity. 165 And it is by the wonderful wireless telegraphy of light that human is put in communication with every considerable body in the Universe, including even the invisible. 166 By it the goings on in Sirius and Algol, Orion and the Pleiades are reported across enormous stretches of millions of millions of miles of space. 167 And by the vibratory motion of the invisibly small, all things are revealed; the infinitely little has enabled us to conquer the inconceivably big. 168 I hold seeing and hearing are the simplest examples of wireless telegraphy.

169 Elihu Thomson, the great electrician, says: "Hertz proved that all luminous phenomena are in essence electrical. 170 Wireless electricity is the outcome of Hertz's experiments on electric waves, and electrical conditions and actions are more fundamental than hitherto regarded."

171 William Ramsey, the distinguished chemist, says: "It is a primary assumption that atoms of elements or in certain cases groups of atoms are themselves electrified, and atoms possess positive and negative poles, and combinations

ensue between such oppositely electrified bodies."

172 Mr. Francis Grierson, a prominent scientist of London, in a recent London periodical, says: "So far as we know electricity is the soul of visible form. What we call brain waves have an analogy to electric waves. 173 The discoveries and inventions of the last ten years have made child's play of every previously known system of philosophy. 174 The simple but amazing facts disclosed during the past five years, render the dreams, speculations and guesswork of the past absurd. 175 The little we know in a practical way is more than all the philosophers of the past knew from Aristotle to Leibnitz."

176 Prof. Langley, in his address at the 1902 session of the American Association of Science, stated that, "up to 1872 it was almost universally believed that there were three different kinds of energy--actinic, luminous and thermal--represented in the spectrum;" 177 but he affirmed: "There is only one radiant energy which appears to us as actinic, luminous or thermal, according to the way we observe it." 178 "Heat and light are not things in themselves, but different sensations in our bodies, or different effects in other bodies. They are merely effects of this mysterious thing we call radiant energy." 179 He thus sustains my position and the electric theory of creation, which is, that there is but one universal and ultimate energy which he calls radiant and I call electric energy, and which are the same thing.

180 It is said that an Italian physicist wrote in 1843: "Light is merely a series of colourific indications, sensible to the organs of light, or vice versa; the radiations of obscure heat are veritable invisible radiations of light." 181 This Langley, by his elaborate researches, more refined and complex than all preceding ones, proved to be true. 182 Since so orthodox a scientist as Langley has proven there is but one energy, the other scientists may stumble over it awhile and then accept it, because he is high authority.

183 Sir Oliver Lodge, in the "*Electrical World*," of February 21st, 1903, sustains the electrical theory strongly. He says: "All matter is electrical in its nature. 184 The difference between one kind of matter and another lies in the

physical and chemical properties of the atoms; but the difference between the atoms is merely due to the difference of the electric grouping of the atoms."

185 He holds that the Thompson corpuscles are all electric. Thomson's theory is that negative electricity is matter. 186 Lodge holds that all matter down to the ultimate corpuscle is electricity or electrical substance. Thus I am sustained by the highest most recent authority.

187 Prof. E. L. Larkin, of the California University, said: "The earth has a permanent charge of negative electricity, and the atmosphere is positive. 188 The surface potential is therefore very near zero. This permits electro-magnetic waves from the sun to act with unabated energy." 189 Prof. Lucien I. Blake of the Kansas University said in a recent lecture: "All atoms of matter are charged with electricity. All vital actions are always connected with electricity."

190 I could fill a volume with recent statements of scientists showing that electricity produces all the phenomena of Nature, 191 all of which they have learned in the last few years, while as a pioneer in this field of thought I have been trying to propagate these electrical theories for many years.

192 Every year new facts are discovered showing that electricity is the cosmic, evolving, ultimate and only force in Nature and the Universe is a vast electric machine or organism moved by electric currents of measureless force and power. 193 The earth revolves around the sun, the sun gravitates around some siderial center in motion like itself, and myriads of suns and planets with their countless population move with many times the velocity of a cannon ball. 194 Stars that seem tranquil and motionless in the heavens are projected through space with a velocity of one hundred to two hundred miles per second. 195 The constituent atoms of our bodies move relatively with as much velocity as the stars in heaven. 196 Motion-- electric energy-- reigns everywhere, forms everything, controls, handles and evolves all suns and planets, all physical life, substance and

organisms in human experience and universal Nature.

197 The electric rays of light from suns and stars of the most distant constellations dart their beams across the Universe, and centuries after, the impulse of electric energy enters the human eye, and gives sense and vision to the soul.

198 Thus the dynamic chains of electric light binds into living unity the realms of matter and mind, "through measureless amplitudes of space and time."

199 These electric currents are not only the source of all natural phenomena, but the sea of electro-magnetism from which they come is the reservoir of life, 200 which stands back of all the myriad manifestations of physical existence, and is the great fountain of vitality from which all life must come.

201 What is electricity? Tesla says it is "invisible light," Atkins says it is "molecular motion," Fleming says it is "a spiral twist of the ether," 202 but the best definition is given in the Scriptures where it says all things were made by the "word of His power." It is the word of creative power.

ELECTRICAL CREATION, BRIEFLY STATED. IT SEEMS TO SOLVE THE RIDDLE OF THE UNIVERSE

George Woodward Warder

6 As the nebular hypothesis and gravitation explain nothing and show neither the primary elements nor the primary energy of the Universe, we should go to the dual forces of electricity which do. 2 As we have learned little more than a name from either, I think it is time to try another hypothesis. 3 Walking single file in dead people's shoes for two hundred years is quite long enough. 4 I am willing to submit the following hypothesis as my conception of electrical creation and the true theory of the Universe.

5 First, creation was wrought out by the agency of electrical forces, operating on invisible elementary matter, and controlled by the intellectual impulse of an infinite power.

6 Second, these creative cosmic forces, by condensing the suns and

planets into vast magnets revolving in a sea of electro-magnetic forces, evolved the marvelous machinery of the Universe.

7 Third, this machinery of the Universe became self-propelling and self-sustaining by reason of the laws of motion, growth and evolution impressed upon it, or by the joint sovereignty of two equal, correlative forces: 8 magnetism, a form of electricity maintains the sovereignty of attraction over matter in body, while electricity, another phase of the same force, maintains the sovereignty of repulsion over matter in space.

9 Fourth, for these reasons electricity is a universal power joining together the two kingdoms of the heavens and the earth-- of matter in body and matter in space. 10 And these forces in their unity of harmonious work can suffer no disturbance equal "to the dust in the balance."

11 Fifth, these floods of electricity and magnetism affect the least and the greatest, "directly as to mass, and inversely to the square of the distance."

12 Sixth, the sun and planets are vast magnets because they are held in charge of electro-magnetic forces in an immense magnetic field. 13 These forces are not from these bodies originally, but these bodies are from these forces; and these forces antedate all forms of visible matter.

14 Seventh, the primary state of matter is the diffused etheric, invisible state, and the building of matter into body is the work of these forces when in charge of matter under organic affinities. 15 Magnetic lines of force fix centres and build around such centres by drawing elemental matter from the radiant sea of space by magnetic energy, into globular forms that become growing worlds, 16 drawing their power and increase of form from the sea of invisible matter in which they are fixed by their axis and orbit lines of motion and force, constituting them working electro-magnets.

17 Eighth, these electro-magnetic forces are the eternal cosmic forces of perpetual motion, ever working by the law of action and reaction, attraction and repulsion,

and evolving world forms and animal and vegetable forms.

18 Ninth, the sun having grown from the sea of invisible etheric and nebulous matter by reason of these wonderful electro-magnetic forces into an immense magnet, larger than all the lesser magnets or planets of the solar system combined, holds them in the magnetic field of its sovereign power, 19 and is, through the flowing currents of electricity, the creating, governing force in the solar system.

20 Tenth, these same electric forces are condensed into smaller magnets and electric organisms or machines, which form electric centres and build up all tangible forms of matter-- human, animal and vegetable. 21 And all visible matter is but the outer shell and visible garment of these invisible forces.

22 Eleventh, without the floods of electric substance or power that come to us in the electric currents of the sun that flow in currents of strength through our bodies as they propel the in-flowing and out-flowing floods of atomic elements of matter, 23 that are laden with incoming supplies of daily life and outgoing wastes, by attraction and repulsion, assimilation of food, respiration and perspiration, our bodily forms would perish or be wholly unfit for the dwelling-place of our spirits.

24 Twelfth, our five senses: seeing, hearing, tasting, smelling, feeling-- that connect us with the world of matter are entirely dependent on electricity 25 and the invisible etheric forms of matter that surround us everywhere and constitute the connecting ties, the invisible ligaments, that pervade and bind all forms of life in Nature's wondrous harmony.

26 Thirteenth, the boundless fountain of infinite energy in atoms in body and atoms through measureless space are superior to any mere sun form or world form of visible expression of such energy. 27 The floods of radiant electric energy that enwrap the sun and planets in orbital lines of omnipotent strength are to these bodies the everlasting fountains from which flow their upholding and evolving power and the conservation of force in their transforming energy.

ORIGIN

28 Fourteenth, as all visible forms of matter are built from invisible elementary atoms, so the most efficient display of electric power finds its expression and source in the same elementary atoms. 29 The electric power working in all atoms of matter gathered in planetary form, saturates such planetary bodies with electric energy, as the steel of the magnet is saturated with such forces, and reveals in the sun currents the source of all terrestrial power and organic life.

30 Fifteenth, the chemists claim to have discovered about seventy different elemental substances in matter, but they are not primary elementary substances; 31 they are secondary, and caused by the marvelous electrical combinations of the two primary elements--atoms and electricity-- and are what Herschel said they looked to be, "manufactured articles."

32 Sixteenth, the laws of magnetic attraction teach us that the positive and negative polar forces, flowing oppositely between sun and earth, establish the bond of union between them, 33 and the transmission of electric energy must be equal between them, and the flow through space at the low level of latent energy.

34 These two oppositely flowing floods of electric energy, under the great law of electro-magnetic attraction, pass through ninety-three million miles of radiant matter in eight minutes of time and enter the resisting atmosphere of sun and earth, 35 their currents thrilling with energy at the high tension of opposite polarities beneath their atmospheric envelope.

36 Thus the attraction known as gravitation, but which is electro-magnetism, pours a constant flood of light and heat upon both sun and planets, 37 and thus the electric light and heat of the sun and planets evolved from their resisting atmosphere, and the contact of their positive and negative electricity, become creative potencies, 38 deriving their vast power from each other, and from their environing space of virgin, imponderable matter, and thereby give life, motion and utility to all visible created things.

39 Thus we find that light, heat and vital force is created by the contact

of the positive and negative electricity in the magnetic atmosphere of suns and worlds. 40 That the electric affinities in matter proclaim an electric origin, and the invisible atom as the material basis of all material life; 41 and by tracing their source to electrical and magnetic energy, we have reached the foundation upon which is built the eternal structures of the Universe, and the bounds of all creation.

ELECTRICAL CREATION MORE FULLY STATED CONFIRMS SCIENTIFIC EVOLUTION

George Woodward Warder

7 I contend that electrical creation confirms scientific evolution. 2 In the beginning the elements assumed form when they came into such a state of electrical balance as enabled them to move in uniform order. 3 The more perfect the order the more perfect the form. 4 The crystal is fine proof of this, for when the elements composing it are all marshaled into perfect uniformity of action the crystal becomes a perfect structure well nigh indestructible. 5 This principle of the crystalline formation of the elements is the basis of world building.

6 In a small volume entitled "*Planetary Evolution*," the learned author, who is too modest to give his name, says: "Atoms are absolute potentialities, creative rather than created conditions of the elements, and have the power of inherent energy or life motion. 7 All tests show the atom remains the inscrutable source of creative power, and the basis of all chemical activity, and must be the basic principle of world building, life motion and life energy."

8 "In all the operations of chemical transmutations no material is lost and no power wasted, and, by the law of the conservation and correlation of force, both energy and material must exist as correlatives. 9 This places the nature of matter upon the same basis as the origin of power. The transformation of force into material is impossible. 10 Force follows the laws of motion, and atoms the law of form obedient to the lines of motion." This is well stated.

ORIGIN

11 This author says further: "The atom has the power to assume form and create form, and matter and force cannot be transformed into each other." 12 Then this power or force must come from electricity, the primary force in Nature; and it has power to assume form and create form by reason of electric energy controlled by spirit intelligence. 13 In planetary construction the first thing that meets our vision is the arrangement of the atoms in crystalline formation, which is the foundation of all planetary structure. 14 The atoms in space continually change their relative positions and construct world forms and organic forms of beauty and power. 15 They settle into globular spheres with all the precision of a trained army or a disciplined mass of life and energy, forming the crystalline masses that compose the primitive foundations of the earth.

16 Polarity has much to do with the phenomena of crystallisation. 17 The same author says: "Polarity is the result of the transverse lines in which the atoms move previous to their comparative arrest. 18 The planet as a globe can have only two poles, but the crystal has as many as the lines of direction in which the moving atoms cross each other's path."

19 In interstellar space he affirms the atomic relations of the elements are undisturbed by any power that would tend to divert the atom from its movement in a straight line; 20 force is transmitted from atom to atom without any effect upon its motion or change of equilibrium. 21 The power of transfer is the basic principle of the electric current, and as long as the direction of the current lies in one of the lines of atomic motion the current passes without resistance and is imperceptible; 22 but if it chances to meet in its pathway a line of force passing from atom to atom in a different direction, there is instantly a neutralisation of motion and the arrest of each atom at the point of crossing which gives polarity, and the molecule is the result. 23 In space the electric current is the first form of creative manifestations the atoms assume.

24 Electricity belongs to the atomic forces, 41 has intimate relations

with organic life, and gives us a key to unlock its mysteries. 25 Electric energy plays such an important part in cosmic construction that without some knowledge of its nature it is impossible to explain the processes which are the basis of world building.

26 The crystal rock under microscopic examination shows the same beautiful figures and marvelous lines of arrangement that in winter the new fallen snow-flakes exhibit, and indicates that the lines of form are essentially the same that gave the planetary rock its forms of crystalline beauty and massive structure. 27 And the beautiful snow that falls so gently upon the wintry lap of earth is one of the best representatives of creative power acting in the primitive states of formative forces. 28 This tends to show that the earth began its formative period in extreme cold and not heat, 29 for the formative lines of shape and force are the same in the crystal ice and crystalline snowflake as they are in the crystalline rocks of earth's primary foundations. 30 And they all indicate the lines of electric energy and magnetic force in atomic activity and molecular formations, which are the beginning of all visible material creations.

31 The shaping of the molecules of the so-called cosmic elements by electric energy into crystalline form is the second great step in world building. 32 While magnetism (the dual force of electricity) serves to hold the form-structure in more or less enduring relations, for the magnet has the power to radiate atomic force in circles and tends to draw the elements into form and hold them there. 33 The electric force keeps the atoms always moving; 34 the magnetic force keeps them or would keep them in atomic balance, or at rest, but electricity keeps magnetism always on the alert, and between the action of the two, or attraction and repulsion, all visible forms are evolved and dissolved.

35 Thus magnetism is the centripetal force, of planetary construction, and electricity the centrifugal power of planetary changes, and upon these two depends all the complex varieties

of inorganic and organic forms that exist. 36 And so long as they exist with their powers of atomic motion so long will world building and form building continue, and must continue through the æons of creative force.

37 The magnetic state of the earth, with the pulsating currents of electric force in the atomic and radiant form, plays a sovereign part in the economy of Nature and makes the planet itself alive with creative force and evolving power.

38 To demonstrate electrical power in world building and the shifting relations of the elements in the planetary combinations, watch the electric plating battery at work. 39 There you will see the atoms in the solution flowing towards the negative pole and depositing themselves in minute crystals upon the metallic surface, if the negative pole is a metal, and adhering with great pertinacity; 40 the metallic crystals penetrate the crystalline surface of the substance to be plated in minute arms filling up the infinitesimal space, 41 and the atoms in this process transfer their atomic motion in line with the electric force, and become arrested as in the primitive state when they formed the crystalline foundations of primitive earth. 42 It will be found that the power or electric force required to plate one metal is just the same as to disintegrate it, and the electric force is a great solvent, while the magnetic force is a concentrating form-moulding world-building power. 43 And these two forces evenly balanced perpetuate the Universe. 44 The fluidic condition of matter arises from molecular activity before the atoms have assumed the crystalline state, and all fluids are easily vapourized to invisible gases.

45 The primitive planet, in coming from nebula to crystalline form, had to pass through the fluidic state, because the electric atomic balance had not yet been acquired sufficient to produce solidity.

46 In this stage there could be no organic life; but the earth was enveloped in dense clouds of vapour, 47 and there was no light for many ages, because the earth's surface was below the electric and atomic rate that produced light, and the dense gases and vapours floating around it and between it

and the sun prevented the light penetrating its atmospheric pall of darkness.

48 But in that darkness and vapour and cosmic convulsions was going forward the processes of organic construction essential to fit it for the coming generations of sentient life. 49 Night and darkness ruled, but chaos had no part, and never ruled in all the cycles of creative power. 50 The direct currents of electric force and the circular currents of magnetic power swept through and through earth's molecular structure, 51 ranging the atoms in all the lines of crystal perfection and spherical form, and laying the rock-ribbed foundations in geological stratas in the heart and center of a growing world.

52 The lines of electro-magnetic force at this period in the planet, with their circular spiral motion, would shape the world into a globular spherical form, 53 and the elements in watery solution would almost come into crystalline firmness, and then an impulse of electrical power would throw them into restless agitation; 54 and again they would respond to the grasp of magnetic strength and return to a state of partial arrest near the crystal condition, and again sway back to the electric primitive molecular state. 55 But they could not get free from the lines of magnetic force which held them with giant grasp until they were incorporated into the foundation rocks of earth's solidifying sphere. 56 And the centre of our planet became a vast solid crystalline magnet, and was never a fiery mist or molten substance.

57 Finally when the crystalline rocks were settled into a crystalline globe the life-cell was born as the basis of a new condition of planetary form. 58 And in the dark waters where no light was, organic life under the law of creative electric energy began its work upon the planet. 59 The life-cell is the resultant of electric-magnetic action.

60 During this period of primeval "darkness upon the face of the earth," the resistless electric waves of the sun were beating upon the cloud-enwrapped surface of the planet, but its light had no power to penetrate its cimmerian gloom. 61 And the earth was sending back its pulsating magnetic currents to

the sun, and both were evolving themselves into giant dynamos of marvelous electric power-- giving and receiving electric currents of positive and negative polarity of wonderful life-giving potency. 62 Gradually the earth solidified into a vast magnet of crystalline rock and metal and like the magnetic core of a steel magnet of vast extent and power, it drew millions of meteors from space.

63 The internal electric forces in volcanic convulsions were up-heaving islands, continents and mountain ranges, rending the rocks and crystalline strata in the contracting crust of the earth, lit up by lightning gleams of electric power. 64 It may be that during this stage of the planet was laid the foundation of all the distinctive types of life-force, 65 including the cell forms that lay at the basis of living structure, the plant forms and the living forms of animalcular life that float in the ocean below and mists above. 66 All of which had their home and birth in the dense darkness that covered the face of the deep.

67 It was the formative period of elementary life, and the descendants and successors of that mighty host of living beings have to this day to lay the foundations of their being in similar conditions of darkness.

68 Creative energy in its first stages of living form operates in dense darkness, and the first life upon the planet began and perfected itself in the age when midnight gloom enveloped the globe. 69 "The Supreme Power," says the author of "*Planetary Evolution*," "wrought out its purpose with no eye to discern its workings and no helpless ignorance to dictate what was needed to make a world." 70 The deep-sea soundings show that life still exists there without the aid of sunlight and that there is no limit to the domain of organic life. 71 And the necessity exists even at this age for darkness during the formative processes of embryonic life.

72 All microscopic life embodies the essential characteristics of activity and form that distinguish many of the distinct types of animal and vegetable life. 73 The mould that gathers upon decaying bread is a great forest when sufficiently magnified. 74 The

wiggling animalculæ in the stagnant water is but a prototype of the writhing serpent of the Brazilian forest. 75 In these two types of minute organic being we see the first stages of life in planetary formation. 76 And the induced electric energy on the animalculine organism compelled it to both growth and activity, and, obedient to that principle, 77 it added cell to cell in any direction that that electric energy in that form sought relief, thus producing different types of organic structure. 78 The influence of the pent-up currents of electric energy was destined to have a moulding power upon the higher types of organic life, 79 for their influence upon the living form soon became manifest in the construction of nerve-tissue, which is the basis of all animal structure, and the beginning of all embryotic form, and is essentially the same in all organic life.

80 All attempts of science to formulate a theory of the source of life end in an abstraction. 81 To teach that life originates in a germ leads to an analysis that shows the germ is a compound form itself, and one of the stages of incipient life. 82 The advocate of the cell as the primitive source of life soon discovers that the cell is the result of chemical forces that have not yet arrived at the germ state, and that both the germ and the cell are but successive stages of life development, 83 and we must go further back into the realm of the invisible electro-magnetic forces for the true source of physical life. 84 Here the untrained intellect is bewildered and is unable to discern any relation of force beyond the physical senses, 85 and science and reasoning causation must explore the invisible realities, and realms of force beyond the physical senses, which requires the highest order of mental training. 86 It is in the mental realm, the realm of spirit and electricity, that we must seek the solution of all the higher problems of life and destiny.

87 In the spermatozoa of the male is the first evolution of the organic life of the planet. It is the electro-chemical combination of elements in which the primitive cell was formed, 88 and in Nature's corresponding environment it goes

steadily forward through all previous stages until perfected in form, and becomes a miniature production of its parent structure. 89 It thus unconsciously followed the forces and elements of the parent organism whereby that parent organism came into being from its parent, and so on backward for generations and ages. 90 And in order to perfect the power of sex to the highest degree and preserve the life of the race, there was a differentiation in the embryonic state, 91 whereby one organism, the male, became the power to preserve the energy, while the other, the female, became the environment to perfect the form.

92 This was no miracle, but a response of the organism to the waves of electric power in the planet, which at times and conditions would be more positive or negative in their electric energy. 93 For all the elements of life and the Universe animate and inanimate are sexual, male or female, positive or negative, in their natural relations.

94 The higher types of life are almost wholly dependent upon the arrangement of the cells on a high electric tension, and the early forms were almost wholly of nerve-tissue structures, 95 and the primitive animalculæ followed the law of differentiation and were able to construct muscular fiber and bone formation, and became the fish and reptiles that inhabited the ancient seas.

96 The processes of planetary formation are resultants of electrical action among the elements that form the planet, 97 and here is the true field of scientific research for the knowledge of causation as expressed through world construction. 98 To the chemist and electrician belong the task of explaining the processes of world building as well as the secrets of life itself, and they must be found in the laws that control the electro-magnetic ether that permeates all atoms and space.

99 In the paleozoic age there were surging tides of electric energy through the planet itself, producing induced currents in all the forming bodies upon its surface. 100 And these primitive currents swept the cell-formations

into lines parallel with their lines of force the same as crystallisations, 101 and as they were floating in circumambient water, the cells took the form of tissue structure, forming organs that followed the crystalline law of self preservation, and, in response to changing electric currents, throwing out new cell-structures.

102 Nerve tissue is the highest form of atomic balance that is visible, and the true basis of form structure that has vitality to meet the shifting electric currents. 103 The tiny cells joined themselves to form new structures to respond to the electric waves, while the lower magnetic induction of the planet sent its power over the new tissue to hold it in form so that the organism could be partially permanent in form in its new environment. 104 In this manner the organism grew and expanded from the primitive animalcular nerve type to the consolidated, firm tissue that enabled it to hold itself from dissolution under adverse conditions and planetary changes. 105 The action of electric force in building secondary forms with a magnetism of their own is one of the most wonderful exhibitions of Nature.

106 And now comes a startling result of this type of energy that has called living organism into being from the lower grades of atomic life. 107 The cells that have formed themselves around a central point, as in the crystalline state, begin to quiver and vibrate with a strong rapidity that defies all power of restraint. 108 In them is to be seen a new relation of the elements that grade still higher in the scale of atomic action.

109 They have risen in the power of sensitiveness above the plane of receptive response to the swaying currents of the earth, and begin to send out currents of their own. 110 Those currents penetrate the whole system with strange energy, and the organism begins to respond with new expressions of power. 111 It moves with reference to the currents that it creates itself, and we have the first type of creation with a brain center governing the whole system.

112 That brain tissue is the result of the action indirect of the electric energy that is sweeping the planet in ceaseless lines of force and

power. 113 It sends its induced currents upon all the forming host of animalcular life floating in the dark waters, and some begin to grow brains.

114 The cellular structure ranges itself in line with the positive and negative polarity that made the crystalline form of the world a globe, 115 and from that living cell-battery go out the currents that control the form by the inward force that ever after is to witness to the power of constructive energy to create living beings with sentient power to regulate and control their own destiny.

116 Meanwhile the surging tides of electric energy are forcing the continents upward, and the fish that swim in the paleozoic seas find the waters receding and itself part of the time on the land or in the mud and shallows, 117 and the growing organism, from generation to generation becomes adapted to each condition of life on land and water. 118 Then comes to pass the raising of the organism from the fish to the reptile by the influence of electrical induction and change of environment. 119 Then also comes the growth of plant life, and the marvelous varieties of vegetation in the form of tree and shrub and grass. 120 Upon the land, half submerged, the vegetation that had its rootlets in the former ocean bed grew from sea weeds into rank grasses and ferns, the types of which are seen to this day in the dense forests and jungles of the tropics.

121 In the early period of the paleozoic age the molusks, polyps, and marine plants were evolved without any reference to light whatever and depended on the sense of feeling to provide for the necessary food supplies to maintain their organism.

122 We have in the night-blooming cereus a flower that belonged in that epoch of the world's evolution when plants flowered and perfected their seed bearing in the dark. 123 And in the salamander, beaver and hippopotamus a type of the amphibious animals of the early ages. 124 We have in the bat a type of animal that flourished in the darkness of earth's formative period, and in the embryonic period of animal and human we find the beginning of the life processes in the darkness of the

womb, 125 and all seed of vegetable and plant must be buried in the darkness of earth before it can bring forth new life.

126 Every living structure on the planet takes form by the laws-of-Nature's creative processes; 127 and the secret unfolding of life structure to-day, however perfect at maturity, is a complete record of all the previous stages of formative growth in animal life, 128 from the vertebra of the fish to the contour of the mammal and the human, condensed as to time during the period of gestation, but following the original lines of formative structure, power and principle.

129 This and all growth and evolution is the result of electrical energy under divine law and spiritual control. 130 Electrical power is the great agent in arranging molecular compounds into all forms of animal and plant life as well as crystalline structures and world forms. 131 The duplicates of plant life with the secondary crystalline forms are found in limestone caverns of the earth. 132 There, in the dense stillness of eternal night, many forms that are seen above ground as plants and flowers are there wrought out in solid stone, 133 as the crystalline limestone rock has arranged its molecular structure obedient to the same lines of form as the electric currents in the upper atmosphere follow in vegetable life.

134 Thus in the eternal nature of the atom and electric energy with their inherent potencies the Creator has abundant resources not only to make this planet, but also the countless worlds of boundless space. 135 And in the wonders of electrical potency in this planet alone it is constantly producing results that excite profound gratitude and reverence.

136 At length when the clouds of darkness faded away and the atmosphere became translucent, and the glorious light of the sun--the great electric heart of our system of worlds-- shone upon the earth, there was a new realm of infinite life and expression to lift the world and all organic life to a higher state of perfection.

137 While the world, like an enormous battery, had in itself enough energy to hold the planet in its spherical form and to

stimulate to activity the secondary forms of life, 138 had not the sun come into more vigorous activity with its electric life-giving energy the earth could not have gone above the primitive forms of life. 139 With this greater influx of power from another sphere of causative energy, the dark age of animality passed and the monstrous types faded out, 140 and in the place of them the world began to bear a class of beings that could reflect the power and principles of light and beauty. 141 And under the pulsations of the sun's electrical and magnetic energy the earth started on its marvelous career of organic growth and development.

142 The sun, as an immense electrical reservoir battery, must radiate in all directions its electric vibratory power over the surging elements in its own environment and from thence through electric atomic transfer to bodies in space. 143 So that whenever a body was in direct line with the magnetic centers of the sun, the arrest of the electric current and atomic motion coming from the sun's center by another magnetic center, 144 as the earth or any other planet, would instantly change the rate of the environment of the planet magnet to a grade of intensity that would give light and heat. 145 In this manner light, heat and greater vital force was born upon the earth, when its dark clouds lifted and its atmosphere became translucent, so that the sun's electric currents could affect the earth through electric transfer. 146 Thus the influx of external light upon planetary life was positive and marvelous, introducing a new power upon the forming organic life in the vegetable and animal world, and working great changes in all organic structures. 147 And in response to this new power the eye began to form and a new and distinct organ of sense was perfected. 148 It was slowly developed at first, for the light radiated from the sun penetrated the mists of earth dimly, for it was almost midnight gloom in some sections and dusky twilight in others.

149 So far I have said nothing of excessive heat, for the earth began in excessive cold. But as the earth

magnet or dynamo increased its electric power it increased its heat.
150 We now come to the dawn of instinct or rationality in the primitive types of life. 151 There we find a basis for the first principles of instinct or animal rationality in the balancing of one sense by the exercise of another, and the combined results of the two. 152 Seeing and feeling gave a higher type of brain power, and raised that organ to a higher grade of perception and a newer type of intelligence.
153 Then another faculty added its powers to the sense of sight and feeling, for the atmosphere in which the reptilian tribes were living half the time or more were sending out sound waves which touched the nervous filaments of the central battery of the brain, 154 and as the eye had formed to respond to the waves of ether caused by the electric currents of the sun, so a new organ began its formation in response to the incoming waves of power the atmosphere brought to the brain-cells, 155 and the ear began to gather in concentric circles around the brain-center, and a new sense-- that of hearing-- was formed. 156 Thus there was an additional increase of the power of perception or instinct. Thus were evolved all types of animal form and animal instinct. 157 They were the result of electric energy, sense perception, and long ages of growth, comparison and environment.
158 Then came human, the highest type of animal organism. Human may have passed the successive changes and transmutations of form that the shifting vibratory rates of the planet responded to in the long period of world building. 159 Human may have attained to the grade of animal activity as a mind of the highest order in bodily form before it received the spiritual powers and intellectual force which it has exhibited all along the ages, 160 after all animal forms had battled with the elements in the struggles to keep in equilibrium between the surging tides of electrical dispersion and magnetic concentration. 161 Certain it is human holds its own by virtue of its steady rise in mental power which has no limit of evolution in the present stage of

physical life and psychic life. 162 And there are no known boundaries of its power to penetrate all mysteries and explore all conditions of existence.

163 "Wherever being has laid foundations, or law is working out the problems of infinite destiny." human came as a spiritual creation.

164 Many scientists discard the religious or Mosaic concept of a special creation of human and a divine revelation, and hold that the revelations of science are the only revelations of God that the world can regard as reliable.

165 I cannot agree with them that human was evolved from the animal creation. I hold human was a special creation, as Moses says he was; 166 but that special creation was not its body-- that may have been evolved from the lowest forms of animal life through many ages, and is no part of the real human.

167 It was woven by electric law and energy as an overcoat of atoms for its earthly habitation. 168 Human's body is not human, but the house in which it lives for a time, the earthly temple of the soul. 169 Moses affirms this when he says "God breathed into man the breath of life, and man became a living soul." It is the breath of God, the atom of Deity, the living soul that constitutes human, and that was a special creation. 170 This I have discussed at length in "*Invisible Light*." I hold no law of evolution could bridge the gulf between human and the animal creation. 171 The fixity of brute instinct, and the boundless expansion of mental and psychic force in human forbid such a conclusion and confirm Moses, who says human was made lord over the earth and all animal creations. 172 Human has three bodies-- a spiritual, an electric and a physical body. Animals have only two-- an electric and physical body. 173 And both the electric and physical bodies of humans and animals came from the same source and are governed by the same laws. 174 Animal instinct is not spirit, is not a part of Deity, it cannot dream of God or heaven, or comprehends the Universe or weigh suns and worlds.

175 It knows only the electric impulses of the material senses

and reasons from these alone, and, by balancing one sense by another, attains an experience which in time becomes an automatic habit or force of Nature under the law of its electric organism. 176 It feels all sensations, like hunger, passion or fear, as an electric impulse on the sensitive tissues of the brain and responds from natural habit. 177 It does not think, reason or soar into the boundless fields of ideality. It cannot feel the spiritual touch of human souls, or the divine impulse of God and love, of music, poetry, language, art and religion, as does the human soul.

178 Human is as much above the animal creation as the animal is above the vegetable and the vegetable above the mineral.

179 We have seen that the mineral is created by aggregations of atoms solidified under the law of magnetic attraction and brought to rest by balanced forces into crystalline form, and thus incorporated into the foundation elements of the earth magnet. 180 They are simply electric and atomic forces and atoms balanced and at rest. They have no organic existence. 181 Vegetable life, which is next above them, have organisms, and are sun engines breathing in nitrogen and giving out carbonic acid or oxygen to sustain animal life. 182 The vegetable organism furnishes food for all animal life.

183 They have no independent existence separate from the sun's rays and the earth's soil except as latent in seed life. 184 Cut off the sun currents from their leaves and the electric earth currents from their roots, and they are at once weakened and destroyed.

185 Animals are a higher order of life which have an independent existence in atmosphere and water-- electric elements-- 186 separate from earth dust, and which evolve and give forth in their own organism the electric instinct and impulse which controls their own actions and habits.

187 They have no psychic or intellectual force, and can never be evolved into human souls or organisms. 188 Human is as far above the animal creation as the heavens are above the earth. 189 Human is not the descendant of a monkey or any other animal

creature except possibly in its bodily organism. 190 Human is a soul and belongs to the Spiritual Kingdom of God.

191 The scientists say there are three kingdoms in Nature-- mineral, vegetable and animal. I say there are four-- mineral, vegetable, animal and human, or the spiritual Kingdom of God. 192 Human is a soul or spiritual body which is from God and a part of God. 193 Human can think, reason, aspire, analyse, and soar into the psychic realms of the spiritual world and commune with angels and Deity, and is a spirit monarch of the Universe.

194 And his longing, heaven-bound nature cries out to Deity: "Thou hast made us for thyself, and our souls are restless till we rest in thee!"

195 The vegetable has the elements of the mineral, with a material organism added; the animal has the elements of the mineral and vegetable with a material organism and an electric body and instinct added. 196 The animal may possibly live hereafter in own electric body or secondary form. 197 Human has the elements of the mineral and vegetable, the material body and the electric body of the animal, 198 and added to all these it has a psychic or spiritual body, which links it to Deity, and makes human the epitome of all creation, the child of God and the Universe, and the sovereign of eternal life, love and destiny.

199 Human history, while complicating, does not alter the real force and nature of evolution. 200 Great people are the images, symbols and instruments taken at random by the constant and mighty forces of their age and times which stood behind them and swept them onward in their great careers. 201 They were the pens of Fate used in her writing, the weather vanes of destiny which turned the way the currents and tides of invisible forces were blowing.

202 Humanity of the past and present is not final but progressive. Human's marvelous discoveries in science, its aesthetic culture and spiritual growth makes the future of the race the most persistently fascinating question of the age.

203 Human is not a mere animal, but is one with Deity, and a part of

that unseen spiritual power which directs the stars in their infinite courses, 204 gives electric brilliancy to the all-dazzling sun, paints the dawn and the aurora, colours the gorgeous wings of the butterfly, and guides insensate matter to do the will of Omnipotence.

HUMAN IS A SOUL CLAD IN AIR, A SPIRIT IN AN ELECTRIC ORGANISM

George Woodward Warder

8 My claim that human is an electric organism is confirmed by Professor Loeb and Dr. Mathews in their recent experiments at the Chicago University. 2 "Electrical charges in the atoms of the bodily tissue are responsible for all the active phenomena of life. In other words, electricity is the basis of life." 3 This is the sweeping conclusion with which Dr. Jacques Loeb amazed the physiologists gathered in their last annual meeting at the Chicago University. 4 Hitherto it has been taken for granted by people of science that the food we eat nourishes us by furnishing the tissues and muscles of the body with thermo or heat energy. This, according to Professor Loeb, is totally wrong. 5 Instead of the food furnishing the muscle with heat energy, it supplies electrical energy, which, after being converted into mechanical energy, is responsible for all the muscular contractions and organic processes of living organisms.

6 He has arrived at this conclusion after many years of intricate and difficult experiments along the line of reproduction of animals, 7 of determining the effect of salt on the heart-beat and its rhythmic motion, and on other muscles, and of the destructive processes at work in the eggs of simple unicellar animals. 8 They have been the means of determining the answer to the one great question, "What is life?" 9 and he regards all his previous discoveries subsidiary to this one. He received his first hint of this new theory of life through the fact that electricity is able to affect protoplasm in a more universal and effective way than any other form of stimulus. 10 And he drew the inference that if

electricity is able to affect protoplasm in the form of currents, it ought to do so in the form of ions, which is an electrically charged atom or group of atoms.

11 In experimenting to determine the toxic and anti-toxic of ions on protoplasm, which is the basic substance of all physical life, 12 he discovered that any one salt will act as a poison on the eggs of a sea urchin, but by adding one or more, or certain other salts, he found it was able to counteract the effects of this toxic effect. 13 From which he concluded that the toxic and anti-toxic effect of the salts were due to the manner in which its atoms are electrically charged.

14 He found that when a salt whose atoms are positively charged come in contact with the eggs of the sea urchin, they interfered with the life processes, while salts whose atoms were negatively charged stimulate contraction; 15 and the presence of both positively and negatively charged atoms were necessary, and the phenomena of life is due to the play between the different charges of electricity in the molecules. 16 The energy of foodstuffs and motions of the heart and other muscles of the body are not due to the production of heat, but to the chemical energy in electrically charged molecules.

17 He says: "A part of the chemical energy of foodstuffs is transformed into electric energy, which gives energy to the body. 18 In one experiment I put a jelly-fish in contact with a solution of electrically charged substances, and it immediately responded by muscular contraction. I then put it in a substance that was a non-conductor and there was no response. 19 In this way I concluded it was the electric charges which effected the muscular contraction, that a pure salt always acts as a poison to the egg, 20 and in order not to have toxic effects it is necessary that the positive and negative electric charges should easily balance. 21 A muscle is stimulated by electro-negatively charged particles, and prevented from contracting by electro-positively charged particles. 22 I have experimented with eggs of different low forms of animal life, with single protoplasmic cells, and with muscles.

23 Professor Mathews has shown that my results hold true for nerves.

ORIGIN

I took the eggs of the fundulus and found that after they were fertilised they will develop in sea water. 24 In a sodium-chloride solution I found they will not develop, but by adding a trace of calcium as many eggs will develop as in the sea water. This is due to the electrically charged atoms of the calcium. 25 Artificial parthenogenesis, or life artificially produced, has been of interest only as it leads me to learn how the electric charges of ions affect life phenomena. 26 You can bring about parthenogenesis only by positive ions. I have come to two conclusions: First, rhythmical contraction occurs only in the presence of electrically charged substances. Second, the efficiency of the charges depends upon the number of the charges or the different ions. 27 Professor Mathews has arrived at a third conclusion, which is, that the negatively charged ions are those which stimulate, and the positively charged ions are those which hinder contraction."

28 Dr. Loeb's paper created a sensation among the assembled scientists, as also did that of Professor A. P. Mathews, on "*The Nature of the Nerve Stimulation and Alteration of Irritability*." 29 "Dr. Loeb's discoveries have revolutionised the basic principles of physiology," declared one of the scientists. "A greater part of the text-books on this subject will have to be rewritten to accord with the results of these new views of life phenomena." 30 And Dr. G. N. Stewart, who presided at the meeting, eulogised Dr. Loeb and said, "He has given us an insight into the mechanics of living tissue which we never before have had. 31 He has brought forward the science of electro-physiology, which has hitherto been despised, but which will now be accorded a respectable position."

32 Professor Garrett P. Serviss says: "This discovery of Dr. Loeb and Prof. Mathews comes closer to the solution of the mystery of life than physiologists have ever before been able to approach, 33 and is so fundamental and far reaching as to warrant the hope that we shall soon know what are the conditions and the limits of human's power to prolong own life."

34 "The whole foundation of physiology and medicine may be reconstructed, and we may find that we possess a control over the phenomena of life more masterful

than anybody has yet dared to dream. 35 Briefly, it has been discovered that our nerves consist of what is called a colloidal solution-- 36 that is, matter resembling gelatin held in solution in water before it is jellied, and these colloidal particles in the nerves carry charges of positive electricity. 37 When the nerve particles pass from the colloidal condition into the state of gelation, or become jellied, the nerve experiences a stimulation or becomes active. 38 This is produced by the action of atoms or ions bearing charges of negative electricity.

39 This explains the action of certain chemical substances when introduced into the human body, some of which tend to quiet the nerves and others to excite them. 40 The nerve-quieting ions are those that bear charges of positive electricity, such as atoms of sodium, potassium, calcium and hydrogen, and tend to keep the colloidal particles of the nerves in a state of solution, so that the nerves remain inactive. 41 The nerve-stimulating ions are atoms of such substances as fluorine and chlorine, which carry charges of negative electricity and cause the nerve particles to coalesce or become jellied, 42 in which condition the nerve is active, the degree of activity depending upon the intensity of the stimulation. 43 Death appears to be the result of the stagnation of the nerves, and this discovery may enable us to oppose the process that ends in death.

44 This throws a flood of light on other obscure problems, and offers an explanation of the effect of anaesthetics upon the human body. 45 Anything that tends to keep the nerve particles in a state of solution quiets the nerves. 46 Now, nerve particles are largely composed of fat, and anaesthetics dissolve fat. 47 Hence anaesthetics produce the effect of positively electrified ions, preventing the nerve particles from coalescing and thus quiets the nerves. 48 The action of whiskey in arresting the progress of snake poison is explained. The alcohol counteracts the coagulating tendency and keeps the nerves in a colloidal condition. 49 It explains many other familiar facts, as why heat

tends to quiet the nerves, and that chemical stimulation is identical with electrical stimulation, and solves the long standing puzzle of muscular contractility.

50 Dr. H. Preston Pratt, an eminent electro-therapeutic expert, says: "Dr. Loeb's experiments have demonstrated that ‘electricity is life’-- 51 that the entire human organism is controlled by electrical forces. The twentieth century will prove electricity and not salt is the real life-giving principle. 52 "If this force is taken away, life ends, and, in the same manner, if this force is supplied the result is the immediate stimulation of the organic life.” 53 "The necessary elements of life are taken into the body through the air and food, and the entrance of the essential elements into the blood sets the human battery into operation, and it continues to operate as long as the electrical forces are supplied to the blood. 54 The human body is of elements the same as a magnet and is built of smaller magnets or molecules."

55 He continued: "To show the connection between human life and electricity, take an ordinary battery of chloride of ammonia or salammoniac and study its workings. 56 You will see that by the introduction of the element zinc the electrical current is found. The zinc is of positive polarity and so is the ammonia, while the chloride is electro-negative.” 57 "The electro-positive zinc has greater electric affinity for the chlorine than the ammonia has, and consequently the ammonia is driven off and combined with chlorine, forming chloride of zinc. The result is the difference of an electric pull between the elements.”

58 "All admit that the force of elements forms a part of the anatomic structure, and there must be electricity. 59 When oxygen is taken into a body it excites the elements in the same manner as the negative chlorine attacks the zinc in the battery. 60 The electrical circuit of the body is the circulating blood, and when the oxygen and the nitrogen are taken in through the lungs the electro-negative ions go in one direction. 61 Sulphur and oxygen are electro-negative and the other elements of the blood are electro-positive; and consequently, when the nitrogen and oxygen of the air attack the blood through the medium of the air cells, we find that oxygen and sulphur pass in one

direction, while the other elements which are electro-positive pass in the opposite direction. 62 This action is electrolytic the same as if we apply a battery to the human body."

63 All this accords with my theory of electrical creation, and proves, as I have contended for many years, that human's body as well as the Universe is an electric organism.

64 In my book "*The New Cosmogony*," published about five years previous to these discoveries, I laid down the broad proposition that Nature or the Creator has never made but one pattern or type of a thing that exists, and that is the electro-magnetic. 65 That suns and worlds, human and all animal and vegetable organisms, are electro-magnets. 66 That electricity was physical life, and digestion and assimilation of food were purely electrical processes; 67 while the five senses-- seeing, hearing, tasting, smelling and feeling-- were all electrical manifestations, seeing and hearing being a form of wireless telegraphy.

68 That the electric combination of positive and negative atoms weaves the visible structure that envelops the soul. 69 The electric elements from the lungs and stomach enter into the blood, and set the human battery in organic operation and create and continue human life.

70 Thus the beginning of life is an electric process, and the source of life is augmented and continued by absorbing electric energy from the air we breathe, from the food we eat and water we drink, 71 and not by the so-called thermal or heat digestive process, but in the same way as we extract electricity from coal and wood-- by a species of electric transformation or combustion, like feeding a flame from the oxygen of the atmosphere.

72 The body is not only an electric machine or organism, but the exercise of every function is an electric process. And the derangement of any function, which we call sickness or disease, is an electric derangement.

73 Prof. Loeb and Dr. Mathews have shown how the body is woven of positive and negative atoms.

74 Prof. Lucian I. Blake, of the Kansas University, in his lecture, "*Atoms and Their Electric Charges*," shows how medicine affects the human body and how life could be started in an unfertilized egg by inserting an electric current. 75 This was done by placing the white of the egg in a vessel containing salt, calcium and water, and turning an electric current into it. Life in this way can be raised to the fourth stage, he says.

76 Another interesting experiment was a comparison of the effect of electrical charges on the ferments of human blood, yeast, plant and platinum. 77 The ferments mixed with water were placed in separate vessels, when the ions of each began to move about, causing bubbles to go to the top of the vessels. 78 Ether was placed in the different vessels, and then a few drops of hydrocyanic acid, a deadly poison, were added. The ether, by having an opposite electrical effect to that of the acid, neutralized its effect.

79 So, in the case of all poisons, if it be known whether the electrical effect is negative or positive to that of the blood ions, an ion producing an opposite electrical effect will counteract the poison.

80 Prof. Blake says: "The reason ether prevents the pain of operations is because it stops the coagulation of the nerves. 81 All atoms of matter are charged with electricity. All vital actions are always connected with electricity. 82 All drug effects are brought about by electrical charges made with the meetings of the ions in the blood and those in the medicine."

83 How strongly does Prof. Blake sustain my theory when shows how medicines affect the human body, how antidotes neutralise poison, why stimulants arouse electrical energy, and how narcotics stupify and deaden it.

84 Electricity, I contend, is the active, energetic and all-pervading ultimate force in Nature, controlled by the still more refined and ultimate spiritual force. 85 It is the medium and ever-active agent in evoking all visible forms and substances; 86 the medium which produces all affinities and repulsions in matter, gyrating from the lowest to the highest elements and from globe to globe, and

constitutes the invisible controlling element whose results are known as laws. 87 Electricity is the guardian and executive of the invisible laws-of-Nature. It is the suspension bridge spanning the darkness and chaos of space between suns and worlds.

88 Human is the product of the perfect unfolding of Nature's invisible electric laws, and aggregate atomic elements; and unites within yourself all the elements and forces of the combined and harmonious Universe. 89 Human is an epitome of the Universe and an atom of deity. 90 Human form, like all visible forms, is only the temporal combination of material substances woven by invisible electric force out of invisible ether.

91 The thoughts of human's mind are the governing force of your organism. The thoughts of the Great Creative Mind constitute the laws-of-Nature and the controlling force in the electric organism of the Universe. 92 Human is a Soul clad in air.

93 The results of these thoughts of deity are the vast expanse of the Universe and varied forms of animate and inanimate nature; 94 just as the result of human's thoughts are the varied structures, temples and works of art, constructed by one upon the surface of the earth. 95 All things human creates are the representatives of own thought, the outward expression of one soul. 96 Human creates nothing but what is a living evidence of one previous thought or concept. 97 All things tangible are the living evidence of a soul-- the invisible soul or spirit of deity and human. 98 All material things are the forms of God's thoughts or human's thoughts, which is the interior cause, producing tangible effects. 99 For the natural world is the spiritual unfoldment made manifest in matter by electric energy. But I must not consume space by a repetition of these things. What the world wants is the truth, and we are discovering it at a very rapid rate. 100 And if these theories are not the truth they are nearer to it than nine-tenths of the accepted truths of science.

101 The ancients knew little about their bodies, or the mysterious operations of physical life. They

looked only at effects and the outside of things, and knew nothing of the invisible forces of Nature. 102 They regarded all the mysteries they could not understand as supernatural, as outside of Nature, and produced by demons, wizards, necromancers, or their imaginary gods.

103 Their knowledge of their bodies was as limited as their knowledge of the Universe, which they regarded as a little span of flat earth and bending sky; 104 and they relied on incantations and prayers to restore the sick, and on the flight of birds and the entrails of beasts to reveal the mysteries of the future. 105 They believed in obsession and deemed all sick, insane and diseased persons as possessed of demon spirits or devils, and their restoration to health or their right minds was called "the casting out of devils."

106 The ancients also believed every evil propensity was the prompting of some demon spirit that possessed the human body, and that there was as many devils as there were evil propensities. 107 Mary Magdalene was possessed of seven devils, and the man who had more evil propensities than they could enumerate was said to possess a "legion of devils."

108 But the world is fast outgrowing the ignorance and superstition of the past and this is a fortunate and happy age in which to live. 109 This is pre-eminently the age of electricity-- of mind and invisible forces-- as the past century was an age of matter. 110 The whole world is feeling the electric thrill of a new life. New voices call us, new inspirations are in the air, new thoughts crowd upon the thinking mind. 111 The reasoning soul catches whispers from the stars and celestial benedictions from the radiance of the sun. 112 Human is a heaven-bound spirit in an electric body woven of dust and air, of infinite ether and eternal atoms, sifted through boundless space, and tossed from suns to worlds; and is climbing to loftier spiritual heights and a diviner atmosphere.

113 The great people of the past had false ideals. They were the ambitious conquerors, who despoiled their own race and deluged the world in blood.

114 Their thrones were built on pyramids of human skulls swimming in a sea of human blood and tears. 115 Their triumphal march was heralded by the clanking chains of miserable captives, and the wailing cries of widows and orphans. 116 For many ages human slavery, grinding poverty and abject misery were the common heritage of the despoiled masses who lived in hovels, were made food for cannon, or were sold into bondage for debt, while a few fortunate rulers reveled in luxury and swayed despotic power. 117 Up to the recent centuries the chief vocations of men were the soldier and the priest-- the one for slaughter and the other to appease the gods.

118 But the evolving ages have changed the ideals of the world, and liberty and justice are no longer a dream; but "Peace hath its victories no less renowned than war." 119 The time is near at hand when the ideals of humans will be so exalted and their consciences so alive to the demands of love and justice 120 that no human of wealth can sleep in own luxurious home or feast on choice viands and know of any human creature or dumb animal suffering from cold and want without first ministering to their needs. 121 This is the law of love written in every enlightened heart, as it is written in the books of the New Testament.

122 Humans are beginning to learn that the greatest thing in this world is not wealth, with its pomp and pride, though it may bring a thousand comforts. 123 It is not religion, with its glorious dreams crowned with the promised beatitudes of heaven, though martyred saints and prophets have given their lives to confirm its faith and hopes. 124 It is not literature, with its gems of thought and flowers of divine fancy, which have charmed and inspired humankind from the days of Homer to those of Shakespeare and Tennyson. 125 It is not science, with "learning's ample page," though she has transformed the earth, and produced a Gallileo and a Newton. 126 It is not the wonders of mechanical genius, though we stand in awe before their marvels of grandeur and utility. 127 It is not the beauty of inspiring art that lifts us to the altitudes of aesthetic joy.

128 These are but the ideals and manifestations of that which is higher and greater, which is written in the soul of human as in a book.

129 Human is the greatest thing in this world-- ah! in the Universe next to Deity. 130 We are the offspring of Omnipotence, the Children of the Sun, the inheritor of the Universe. 131 All suns and worlds, all life and space are the playgrounds of human activities. 132 Human shall dwell in the home of Deity, stroll in the garden of the gods, bask in the radiance of central suns, recline on the daffodil meadows and wander in the elysian fields of paradise. 133 Human is at home in the measureless expanse of all ether and space.

134 Wherever an atom vibrates or an electric current thrills, there human is the monarch of spiritual power, and can command the electric force that tosses suns upon their course and plays football with the stars. 135 Human is no worm of the dust, we are the darling of the skies, the ruler of suns, the cherubim of celestial destiny clad in terrestrial ether and winged with the spiritual power of Omnipotence.

136 Who nobly does must nobly think,
The soul that soars can never sink,
And human's a strange connecting link
Between frail dust and Deity.

ELECTRICAL DERANGEMENT OF THE BODILY ORGANISM PRODUCES SICKNESS AND DEATH

George Woodward Warder

9 I contend that human's body is an electric machine or organism, and electricity is its vital force and governing power, and all sickness is caused by the electrical derangement of the bodily organism. 2 Electricity is the force which organised the body machine, which runs the body machine, and whose loss or deficiency cripples and finally destroys it.

3 Sickness is the impairment of some of the parts or functions of the body by reason of its failure to get its necessary and natural supply of electrical energy. 4 This

may be caused by an injury to some of its parts or by lack of proper air, food and nutrition containing the electric properties required. 5 For air is an electric element from the life-giving sun, and vegetable food is the embalmed rays of the sun, and animal food is vegetable food embalmed in animal organism and brought one step nearer to electrical digestion, and both air and nutriment are necessary to supply vital electricity to the living organism. 6 And while human can live without food forty days, you cannot live without air four minutes.

7 The great force and power which run the human or animal machine is the vitalising air we breathe, the electric atmosphere in which "we live, move and have our being." 8 It is as much a substance as the water in which the fish swim, though it is transparent to light, while water is only partially so.

9 The lungs are the great electric reservoirs of the body and take the electric current of the sun from the atmosphere as constantly and naturally as the electric wire takes the current from the battery or the dynamo.

10 Then it imparts electric energy to the blood and sends it as an electric current and fluid coursing through every part of the body, 11 producing vitalising life and growth, causing the heart valves to beat and pump with marvelous power, the pulse to throb, and the whole machine to pulsate, thrill and whir with electric life and energy.

12 Flammarion says three-fourths of a human's life energy and nourishment comes from the air. 13 And Nicola Tesla says the time may come when human may learn to live on air alone, as do some kinds of vegetable and animal organisms. 14 Human in time may learn to so mix the elements of the atmosphere to supply the needs of the body, that he may, by breathing it into his lungs, obtain all the essential elements to preserve its life and organism.

15 The oxygen of the air keeps alive the fire of physical life, and the body may be compared to a flame fed unceasingly by electric fire from the sun and atmosphere, according to the laws of electric

combustion. 16 The want of oxygen or this electric energy from the air extinguishes the flame of life as it extinguishes the flame of a lamp. 17 The blood could not course through the veins with such marvelous speed if it were not for the electric energy imparted to it in the electric reservoir of the lungs; 18 the heart valves could not throb with such wonderful force or the pulse keep its steady, unceasing beat but for the electric power imparted by the wireless electricity of the air.

19 Besides, the electricity of the air passes through and through the pores of the body at every point, giving additional life and force, 20 and every angle of the body draws electricity like the point of a lightning rod, and the legs, the arms, the toes and the fingers with the space between them, constitute horseshoe magnets of great efficiency.

21 A human's strength and endurance is measured by the electric atmosphere he draws into his lungs and the fuel or food he takes into his stomach or boiler. 22 A human's stomach bears a similar relation to the body that the boiler and furnace does to the machine, and should be treated in very much the same way. 23 It should receive only the fuel necessary to its usefulness, and the ashes and debris should be cleaned out every morning before building a fresh fire, as is done with every well kept furnace.

24 The lungs take in pure electricity from the air, while the stomach takes in compound electric elements, vegetable and animal, and converts them by the electric process of digestion and assimilation into blood and bone, nerves and tissue, and the two functions give vitality and growth to the whole body.

25 But the electric and controlling center of the bodily machine is the electric dynamo of the brain, to which is attached the spinal column with its nerve branches reaching out to all parts of the body, 26 along which, as on connecting wires, the brain telegraphs its wish and will and governs the whole organism. 27 Here the mind or soul dominates the brain and the brain dynamo dominates and controls the body. 28 Through all the vicissitudes of

life, until the final dissolution of the body, the telegrams from the brain running along the wires of the nerves control the muscles, the movements and all the varied utilities of the body. 29 In other words, the mind controls the electricity of the brain, and the electricity of the brain controls the body.

30 If you cut a nerve or obstruct the electric current, you cut off the electric control of the brain, and there is paralysis in the part of the body where the electric wires are disconnected. 31 Consumption is a disease caused by a failure of the lungs to draw sufficient electricity from the air to supply the normal needs of the body. 32 For lack of this electric energy the whole system becomes enfeebled and finally dissolved.

33 Indigestion is a failure of the stomach to supply the necessary electric energy to assimilate the food. 34 And all sickness, aches and pains are Nature crying for electric energy necessary for her to fulfill her natural offices and functions.

35 Dr. Jacques Loeb, of the Chicago University, announced on February-22nd, 1903, that he had discovered that muscular and nervous diseases, such as St. Vitus' dance, paralysis, agitatus, locomotor ataxia and sleeplessness, can be cured by administering calcium salts because of their electrical effects.

36 He says the presence of calcium salts in the muscles prevents their twitching; 37 that practically all nervous disease are caused by the absence of the calcium, and "therefore to restore normal conditions and effect a cure a dose of calcium salts should be administered for its electrical effects upon the parts affected."

38 In recent years many persons have been restored to health and strength by the direct use of electric currents, and many diseases have been cured by electric appliances. 39 The necessity for an ample supply of electricity, both positive and negative, to sustain and preserve the life of the bodily machine is now acknowledged by all thinking scientists.

40 We have seen how different kinds of medicine, by furnishing the positive or negative molecules

needed by the body, restore the natural equilibrium and preserve life and health, 41 and how the failure to obtain these needed electrical supplies of life-giving energy, either by food or medicine, results in disease and death. 42 We have seen how toxic and varied poisons have their antidotes in opposite electrical elements and molecules, and how stimulants excite and opiates quiet the electric energy of the body, and it is unnecessary to dwell longer on this subject. 43 The fact that all sickness and death is caused by the electrical derangement of the body I think is now so clearly proven and so generally accepted, that detail and extended argument is unnecessary.

44 To show that electricity builds up the body. Even at this late period in the world's history there are instances of Nature returning to Her primitive electric crystalline process even to the extent of converting human's body into stone. 45 Four recent cases are reported in the medical records of human's flesh gradually turning to stone. One case is reported from North Judson, Indiana, where Eli Green is turning to stone. 46 His muscles, skin and flesh are gradually becoming as hard as the bones of his framework. To the touch he is dead. 47 Only the feeble action of heart, lungs and stomach and a fertile and active mind give evidence that there is any life in him whatever.

48 The physicians declare he is afflicted with a disease that runs its course in seven years; not a day more or less. Green has already dragged out his existence over four of these years; only three of his short span of life remain.

49 There is a similar case reported of Miss Stella Ewing, the ossified woman of Rome, New York, and one from Sydney, Australia, where Jacques Moritz was afflicted with the same terrible malady. 50 Eight years ago Moritz was seized with sickness that baffled every effort by the physicians to relieve it. 51 From the patient's feet a numbness began to creep upward. That was the first sign of the disease. 52 The numbness steadily ascended, and seven years from the day the malady first displayed itself the sickness had eaten its way into the patient's brain and had hardened it

into stone exactly as it had hardened the muscles, flesh and skin of his body. 53 Then death relieved the sufferer.

54 This shows how easily Nature can go back to Her primitive electric process and in the crystalline formations resume Her first step in world building. 55 And humanity is not entirely free from an occasional freak of Nature in thus returning to Her first processes of electric growth. 56 Electricity teaches there is no death or need of a resurrection. That which lived never dies.

57 Electricity demonstrates the resurrection not of the physical body, but rather the continued existence of the real body, which is the electrical and spiritual body. 58 Electricity proves there is no death. I believe human has three bodies-- first, the physical body, or organic aggregation of atoms; 59 second, the invisible electric body, which weaves and organises the atomic body, sometimes called the astral body; 60 and third, the real human, the spiritual body or soul, which controls the atomic body by means of the electric body. 61 These constitute one perfect organism, and in normal health and condition it is under the almost perfect control of the mind or spiritual body, 62 which sends forth its behest through the electric energy of the brain, which is the seat of power having charge of the electric and atomic body.

63 Death is the separation of the physical and spiritual bodies. 98 The physical body goes into the grave and dissolves back into its natural elements. 64 It fertilises the soil and appears again in grass and tree and shrub, and the cattle eat it, and men eat the cattle, and its molecules enter again into other bodies.

65 But there is no resurrection for the physical body; it never comes out of the grave in organic form. The spiritual and electric bodies never die, never go into the grave. This is the true resurrection-- the life everlasting. 66 It is the invisible and secondary form which does not die, cannot die, and when once formed is as eternal as the stars.

67 The spiritual body and the electric form which surrounds it are incorruptible and start on their journey of endless existence

together, never to be separated or destroyed.

68 Matter in its elemental form is invisible and eternal; electricity and spirit are invisible and eternal. 69 Thus when the real human throws off its overcoat of atoms and steps out of this "mortal coil," one is free from the limitations of matter and can command the electric energy to go where destiny points and draws you, 70 which is to the electric and spiritual center of our planetary system, the self-luminous and perfected world, the all-life-giving sun.

71 The oxygen of the air keeps alive the fire of physical life, and the body may be compared to a flame being fed unceasingly according to the laws of combustion. 72 A want of oxygen extinguishes the flame of life as it extinguishes the flame of a lamp. It is said a human being dies every second. 73 In ten thousand years, two hundred thousand millions of human bodies have been formed by means of respiration and alimentation from the earth and atmosphere, and have returned to them again. 74 They have enriched the earth and entered again into atmospheric circulation.

75 The earth is to-day formed in part of the myriads of brains which have thought and organisms which have lived. 76 We walk over our ancestors as those who come after us will walk over us. 77 It would be difficult to take a step upon the planet without walking over the remains of the dead, or to eat or drink without reabsorbing what has been eaten and drank a thousand times before, or to breathe without using the same air already many times used by the dead.

78 But this is not all there is of humanity. All the souls that have lived still exist. Souls are the seed of terrestrial population. 79 We have no reason to affirm that human is formed solely of material atoms and that the faculty of thinking is only a property of its organisation. 80 This is the mistake of the one-sided physicist. 81 When we analyse matter we find everywhere the invisible atom. Matter disappears like smoke in the atmosphere. Our bodies at death gradually disappear in the same way. 82 If our eyes had

power to see the reality of things they would look through walls formed of separate molecules, through seemingly solid bodies, which are atomic vortices. 83 It is with the eye of the spirit that we must see. We cannot trust to the sole testimony of our senses. 84 There are as many stars above our head in the daytime as at night. 85 Nature knows neither astronomy, physics nor chemistry; these are subjective methods of study. 86 All things are One -- the infinitely great and the infinitely small. Stars and atoms are as one.

87 "To speak with exactness," says Flammarion, "solidity does not exist. A heavy ball of iron is composed of atoms which do not touch each other; its apparent solidity is pure illusion. 88 In scientific analysis it is a cloud of gnats like those that hover in the air at twilight. Heat this ball which seems so solid and it will flow like water; heat it still more, it will evaporate into invisible space without changing its nature. 89 It will always continue to be iron. In a house, its walls, floors, carpets and furniture are composed of molecules which do not touch each other. And these molecules which constitute all matter revolve around each other."

90 It is the same thing with our bodies. They are composed of molecules perpetually rotating around each other, like a flame, constantly consuming and constantly renewing itself. 91 It is like a river on whose banks we sit and fancy we see the same water flowing past, but the current renews each drop perpetually.

92 Each globule of our blood is a miniature world, and we have five million in the fraction of a cubic inch, flowing incessantly through our arteries, flesh and brain, rushing in a vortex of life, as rapid relatively as that of the celestial bodies, 93 and continually renewing the molecules of our heart, brain, eyes, nerves and flesh, and every atom of our bodily organism. And this so rapidly that in a few months our body is entirely reconstructed. 94 Electricity, the right hand of Deity, does all this and sustains the earth, the sun and stars of the Universe in infinite space.

95 That which gives human its organism is not its material part; it

is vital, invisible, electric force, and mental power. 96 The body disintegrates all at once after death, as it disintegrates slowly, renewing itself perpetually, during life.

97 In the future there will be no fearful apprehension that the coal deposits of the world will be exhausted. 98 The waters that now run to waste, the ever moving tides of the restless sea, the swift wings of the unused winds that sweep through the tides of the atmosphere will be harnessed to the car of human progress, and furnish all the energy needed to supply the vast activities of the world.

99 The concentrated heating power, latent in every sunbeam, and the combustible gases hidden in every drop of water will be supplemental sources of boundless energy for all ages on this wonderful magnetic planet. 100 All sickness and ailments of the body are the result of the derangement of the electricity of the body, for which there is a remedy.

101 The art of longevity will be restored to the human race by supplying the electric energy necessary to maintain its growth and vigour, renew its wasted tissue and preserve its organic power. 102 Then the age of Methuselah may come again in longevity, and the centenarian be in the boyhood of its race. 103 Human will eat less, enjoy more, and get a thousand-fold more pleasure out of life, and be better prepared for its swift translation to the celestial cities of the sun.

104 In the future human may not eat eleven hundred meals per annum, but a few mouthfuls of concentrated food daily and an electric supply attachment adjusted to its body during sleeping hours may renew and rejuvenate his electric organism. 105 It may be that in the future every residence will contain a chamber supplied with air and gases containing all the elements of the body so adjusted as to give it continual life and vigour by merely breathing in its life-giving elements a few hours each day. 106 All these things are possible.

107 Then there will be light and refreshing work of a few hours daily-- no real toil or labour-- 108 for the electric devices and pliable

machinery, subject to the will of human and the electric button, will do the work of the world. 109 Then the soul will be paramount and soar above the grosser appetites and passions to gather celestial joys in the spirit realm of earth's diviner life.

110 This is pre-eminently the age of mind and invisible forces, as the past century was the age of matter. 111 Francis Grierson says: "So far as we know, electricity is the soul of form. What we call brain waves have an analogy to electric waves. 112 We are being ruled by the seemingly impossible, and the most successful inventors of the present day would have passed for mad-people twenty years ago. 113 The so-called dreamers are now the persons of action who have proven their power and competence, and thinking people turn to them for more miracles of discovery and invention. 114 The day is not far distant when science of the mind will treat material science as a plaything, and the psychic power of intellect will kill Mammon like the stroke of an electric bolt, and brute power will succumb to soul force. 115 The thinkers of to-day are as far removed from the thinkers of 1870 as electricity is from steam. 116 We know steam is a crude and clumsy thing compared with electricity, and to-morrow we shall awake to the fact that mind is just as superior to the crude electric current."

117 One of the strong desires of humankind is a long life with a cheerful, vigourous old age. 118 This may be obtained by supplying the necessary electrical energy either in proper food, or by a direct supply of electricity. 119 This will prevent the hardening of the cellular tissues which produces the decrepitude of old age, and help to bless and lengthen human life. 120 With the divine powers of mind and electricity working for human the millennium of a long life and happiness will soon arrive.

ALL LIGHT, HEAT AND LIFE IS EVOLVED ONLY IN THE ATMOSPHERE OF SUNS AND PLANETS

George Woodward Warder

10 I contend there is no light, heat or physical life except in the magnetic atmosphere of suns and

planets. 2 That only in this marvelous electric belt which surrounds the earth, sun and planets is light, heat and life evolved, for there alone is it needed for animal and vegetable life.

3 There is neither light, heat nor physical life in space. Physical life cannot exist in the cold, dark ether of space, 4 and without life, light and heat would be not only useless, but as both are sensations of physical organisms they could have no existence whatever. 5 They only exist as sensations caused by electric currents passing either to or through organic bodies. 6 Where those organic bodies do not exist light and heat do not exist, for Nature does no useless, nugatory things.

7 No physical life can be evolved or exist, except in the electric atmosphere of suns and planets where the life-giving electric currents meet and exert their power, and then only by drawing that life as an electric current from the sun constantly into the lungs every minute. 8 In this way only is life and growth generated and all physical organisms created and continued in existence.

9 Thus all life is preserved and renewed by drawing the wireless electricity from the air just as the electric wire takes it from the dynamo. 10 The vital portion of the air we draw into the electric reservoir of our lungs is simply our daily life drawn each day from the life-giving sun. 11 This life and all that exist on earth or planets could not come from a burning globe or a molten sun. It is a superlative absurdity to think so.

12 Light, heat and life are the products of electric energy, which is only called into existence by the contact of positive and negative electricity in Nature's chosen medium-- the atmospheric environment of suns, planets and their satellites. 13 This is Nature's chosen theatre for animal and vegetable life. There is no reason or necessity for light, heat or animal and vegetable life elsewhere in the Universe.

14 Here upon the surface of suns and planets are the mighty and varied currents of electric power and magnetic force, weaving forms and substance from invisible

atoms and molecules, under the laws of electric attraction and organic affinity. 15 In the economy of Nature there are no wasted energies, or useless activities. 16 Light, heat and physical life in space or transparent ether would be useless and nugatory; therefore Nature ignores such folly in all her fruitful processes.

17 There may be reflected light, or a fluorescent glow, as in the tail of a comet or in the nebula of frigid space, but nothing we can truly call either heat or light can be evolved outside of the atmospheric sheet surrounding and penetrating the surface of suns, planets and satellites.

18 We walk on the surface of a revolving magnet and dynamo more perfect in measureless power and efficiency than any human has ever invented or dreamed of, and it generates the power which makes light, heat and life in its own electric environment, where all things "live, move and have their being." 19 It does not get light and heat from the sun; it gets electric currents with which it manufactures light and heat.

20 Prof. Richard Proctor says: "Profs. Bond and Zollner calculated that Jupiter sends forth more light than he receives from the sun," 21 and he concludes that, "if this be true, Jupiter must be partially self-luminous and shines in part by his own light."

22 This sustains my position that there is no such thing as "borrowed light from the sun," any more than borrowed heat from the sun. 23 There are currents of electricity from the sun which burst into light and heat on the earth and planets when they come in contact with their opposite electricity.

24 But each globe in space evolves its own light and heat in its own environing atmosphere. 25 If Jupiter shines by its own light, then the earth and planets all shine by their own light, the sun furnishing the electric power to enable them to do so. 26 I think our moon is no exception. It evolves the mild silvery light it displays in our midnight skies from its own attenuated atmosphere, but displays it, like the planets, only on the side exposed to the direct rays of the sun. 27 The greater and

denser parts of the moon's atmosphere is in the deep and numerous cavities of its torn and rugged volcanic surface. 28 All planets and satellites shine by the light evolved in their own atmosphere.

29 I contend that no reliance can be placed in the spectroscopic evidence of heat in the sun, or any distant globe. 30 This ought to be apparent when all light and heat rays can only be translated into photography as a picture evolved in our own atmosphere. 31 What we see are the electric colours in the atmosphere of a distant sun or planet.

32 The spectroscope simply photographs the colours of the elements in solution composing the atmosphere, just as we photograph the rich colours of a glowing sunset or a gorgeous rainbow. 33 The evidence of the spectroscope as to heat has been greatly exaggerated and overestimated by the scientists, for it can give no evidence of heat. 34 An astronomer standing on the moon and examining our gorgeous, glowing, crimson sunsets or aurora through a spectroscope would declare our earth was a blazing ball of fire. 35 It would seem so to him, and he would have just as strong evidence as our astronomers have that the sun is hot or a ball of fire. Our astronomers look at the brilliant colours of the sun's aurora and make the same mistake.

36 All the astronomers admit the truth of Prof. Proctor's statement--that "the heat-giving power of a star is not proportional to the amount of light it emits." 37 I ask why? And the answer is very plain: Because the stars and suns have no excessive heat and never had. 38 Recent facts prove the sun is not hot. Prof. C. G. Abbott of the Smithsonian Institute, in his observations on the sun's eclipse on May 28th, 1900, says in his report: "My experiments showed the corona of the sun was actually cooler than the gray card which had been used at the room temperature."

39 What our astronomers have taken for fire and evidences of heat is the rich and glowing rainbow colours of the outer atmosphere of the sun, 40 produced by infinitesimal atoms of the different metals and substances of

the sun floating in solution in its brilliant aurora, just as the elements of the earth float in solution in our gorgeous sunsets. 41 The sun having a larger surplus of electricity than the earth is thereby enabled to extend its vast aurora from the equator to the poles, and this gives continuous, varied and beautiful light, with no darkness to its celestial inhabitants. 42 But the earth, lacking a sufficient surplus of electricity to extend its aurora from the equator to the poles, must content itself by displaying its brilliant light and beauty near its poles, only occasionally extending it half way to the equator. 43 The fact that the earth creates its own aurora shows it manufactures its own light. 44 Every flash of lightning in our midnight sky, every blazing meteor in our atmosphere, prove the earth and planets evolve their own light and heat.

45 I agree with Prof. Proctor, when he says: "I adopt the principle of Sir William Herschell that analogy is the chief and the best guide for the student of astronomy. 46 General resemblance of structure indicates a general resemblance in the purpose which the celestial bodies are intended to subserve." 47 And I contend that all or nearly all suns and planets are alike in structure and in substance, and are vast inhabited worlds, governed by the same laws, controlled by the same electric energy, and possessing varied types of vegetable, animal and intellectual creations similar to our earth.

48 It is a universal law-of-Nature that wherever great electric power is conferred there are creations and results commensurate with that power.

49 Prof. Garrett P. Serviss, in the New York Journal, July 24th, 1901, predicted we would have four years of excessive heat on account of the dark spots on the sun, and many other scientists agreed with him. 50 He said: "The earth is a satellite of a variable star. The source of terrible heat is directly in the sun and due to an extraordinary increase in its effective radiation. 51 The periodic sunspot has thrown open the furnace door and sent forth the destroying blast which will continue for four years."

52 I undertook to answer him and contended that the sun is not variable in its heating power, and furnishes no more heating power to the earth at one time than another. That there is no increase in its effective radiation. 53 That the sun does not furnish heat to the earth at all, and is not a thermal or heating engine as claimed by the scientists, but is an electric generator like the earth and does not need to be hot. 54 That the sun furnishes the electric power and the earth heats itself. 55 In other words, the sun furnishes powerful currents of electricity which come in contact with the earth's opposite electricity and the resistance of its atmosphere, and which are converted into light, heat and vital force down near the earth's surface.

56 The electric power furnished by the sun does not vary, but is measured by the attracting power of the earth as a vast magnet. 57 Therefore all excess of heat is due to local causes and the uneven distribution of the sun's electric current on the earth's surface. 58 This unequal distribution of sun currents, causing excessive heat in the west, was produced by light rainfall during the previous year, and the harvesting of large areas in Kansas, Missouri and adjacent territories, thus exposing a dry soil and preventing the accumulation of moisture necessary to form clouds. 59 The succeeding summers justified my position and refuted the predictions of the learned professor and other scientists.

60 In mentioning these things I mean no disparagement to Prof. Serviss, whom I hold in high esteem, and only find fault with the old traditions which he upholds.

61 I am a friend to all scientists and regard them as earnest workers seeking the truth. But they follow accepted and antiquated authority too closely, and thus "the blind lead the blind." 62 They are too often one-sided and impracticable. 63 People who study apes and beetles or atoms and gases all their lives are no judges of angel's faces or of the scope and design of the Universe. 64 Prof. Proctor's testimony that "nine-tenths of the astronomers employ their powers in making observations at great pains

and labour which are not worth the paper on which they are recorded," is a plain statement of their tendency to be cranky and impracticable.

65 Some are so one-sided they think mathematics is everything. Mathematics in its place, like the miser, is good to count gains after they are acquired; 66 but had human relied on mathematics we would have remained as ignorant of the fundamental truths of the Universe as the Blackfoot Indians. 67 Newton owed none of his discoveries to mathematics. When his constructive imagination formulated a theory he tried to bolster it up with mathematics. 68 But it generally proved as delusive as did his calculation that the sun was 1,669,300 degrees hot.

69 The great boast of the mathematicians is that Le Verrier calculated where Neptune was before it was discovered by Galle at Berlin, 70 but the fact is he missed its eight astronomical units or over seven hundred millions of miles, and said Neptune was not the planet he was looking for.

71 These are two average tests of mathematical calculations, and they are on a par with the mis-calculations of how much the sun must burn up annually under the laws of gravity to supply the necessary heat to the earth and planets.

72 Imagination-- constructive ideality-- is the highest gift of Deity to human, and the only faculty that can reason from the known to the unknown and comprehend the wonders and grandeur of the Universe.

73 I am not a practical chemist seeking the mysteries of Nature in the laboratory, nor a professional scientist exploring the fields of original research; 74 but, like La Place, Comte, Herbert Spencer and others, I formulate my theories and scientific hypotheses from the latest and best established facts of science as I see it.

75 Science is only unified or systematic knowledge. Every fact is a scientific fact, and every truth is a scientific truth whether it pertains to so-called science or to religion or philosophy. 76 Nature has no subdivisions of science, religion or philosophy, nor astronomy, chemistry or geology; 77 but all things are a unity,

constituting one harmonious Universe; 78 and anyone who separates science from religion or either from philosophy goes contrary to Nature and divides the Universe into fractions. 79 As I am not a member of any scientific or religious association, I have no prejudices to overcome and seek the truth only, without fear, favour or undue predilections. 80 Old traditions, fossilised theories and antiquated authority have little weight in my mind by the side of recent facts. 81 But I am not an iconoclast, for I am more anxious to build up than to tear down.

82 The professional scientists may deem such students of Nature as myself who trespass upon their chosen domain as amateurs. 83 If so, it is a proud distinction. Amateurs have accomplished nearly all the great things in the world's history. 84 Cromwell was a farmer, Hastings and Clive were clerks, Bismarck twice failed in his examination to become a lawyer, Washington was a surveyor and Franklin a printer, 85 Herschell was a musician, Faraday a bookbinder, Scott a lawyer's clerk, Arkwright, the inventor of the spinning machine, was a barber; Spinoza a glass-blower, Herbert Spencer an engineer, Edison a newsboy, and Stephenson, the inventor of the locomotive, an ordinary workman; 86 Lincoln was a rail-splitter, Grant a tanner, Andrew Johnson a tailor, Andrew Jackson a saddler, Vanderbilt a ferryman, Rothschild a peddler, Krupp a blacksmith, Paul a tent-maker, and Christ a carpenter. 87 The names of distinguished amateurs could be continued indefinitely, but space forbids.

88 As I have discussed this question elsewhere and touched on it in other chapters, extended discussion might cause repetition. 89 Besides, this volume is not intended for detail or abstruse minutiæ, but for the statement of leading facts for the masses of intelligent people, who abhor technical terms and dry details. 90 Many people find scientific books so dry and unpalatable, that, like the weary listener to the dry, dull sermon of the missionary, who said: "If I were a cannibal from Timbuktu, I would eat that missionary and his hymnbook too."

ORIGIN

91 Doubtless he thought the hymnbook would be excellent dessert after such a dry meal; 92 and some readers of scientific works find most any kind of dessert refreshing after partaking of the mental pabulum of dry statistics and technical terms to be found in many scientific works.

93 Our American Indian is never dull or unpoetic in his conception of the Universe. He sees God in the lightning, hears Him in the thunder; and according to him the "Milky Way" is the "Path of souls" leading to the villages in the sun. 94 Along this pathway travel the spirits of the dead, and the brighter stars are "the campfires for the solitary journey to the land of the hereafter."

95 The Japanese term the Milky Way "the silver river of heaven." 96 And the ancient Greeks considered the blue dome of the sky a crystal globe where dwelt the Olympian gods.

97 No science should be dry, and above all astronomy should lift us to empyrean heights where we may tread among the stars

RECENT ELECTRICAL DISCOVERIES AND APPLIANCES, WIRELESS TELEGRAPHY

George Woodward Warder

11 It is said facts are now being discovered and physical theories developed the ultimate result 2 of which may be the explanation of the mysterious phenomena presented by the corona of the sun, the tails of comets, the aurora, terrestrial magnetism and its variations, nebulae and the zodiacal light. 3 First, these facts are being established in connection with the pressure exerted by light which was pointed out by Maxwell and deduced by him from his electro-magnetic theory of light, 4 which is, that when a pencil of light impinges perpendicularly on an opaque object, it produces a pressure on the surface of that object.

5 This pressure is determined by the condition that if the objects were set in motion with the velocity of light and the force against it kept up, the power to keep up the pressure would be

equal to that carried by the ray of light.

6 Second, that particles smaller than atoms, called corpuscles or ions, are thrown off with high velocity from the intensely heated bodies. 7 The sun, they claim, being such a body, it follows that such ions must be shot out from it. 8 On this theory it is held that the explanation of a comet's tail is simple. The comet evaporates on the side next to the sun and, there being no pressure to hinder its expansion; it begins in flying off in all directions. 9 It condenses into very minute particles which, by reason of the impulsion or pressure of the sun's rays, are thrown in the opposite direction from the sun.

10 My explanation has been, without all this detail, that it was the same law of electric repulsion which drove the comet off and prevented it falling into the sun, which also drove the comet's tail in an opposite direction from the sun.

11 This solution of the comet's tail does not solve the greater one of the repulsion of the comet itself. 12 The pressure of the electric ions or corpuscles might force the tail away, but a greater electric force from the sun drives off the comet.

13 Prof. J. J. Thomson and Arrhenius, a Swedish physicist, have by experiments discovered and elaborated the manner and principles on which the ions or corpuscles operate. 14 Arrhenius discovered that these ions were conductors of electricity and why, 15 and Prof. Thomson discovered each corpuscle had the same electric charge as an ion of hydrogen, and that each must be smaller than a hydrogen atom-- in fact only a thousandth part of it.

16 And here for the first time in the world's history, science tells us there are bodies smaller than an atom-- a thousand times smaller than an atom. 17 We are told an atom is a thousand times smaller than the particles of invisible air we breath; now we have an ion a thousand times smaller than the atom. 18 Surely the scientists have at last reached my theory of the fourth state of matter which I call the electro-magnetic. 19 In fact these ions or corpuscles may be electricity itself or the atoms of electricity which science has at last

discovered. 20 And streams of these infinitesimal ions may constitute the swift and invisible currents of electricity which produce all natural phenomena. 21 Prof. Blake, of the Kansas University, says: "Crookes called his cathode streams the fourth form of matter, but first to-day is such a state proven. 22 Now, we must recognise at the beginning of this twentieth century a new form of matter. 23 We have to deal with negatively charged particles so small that they have free paths of motion even among the atoms of substances."

24 As electric currents have free paths of motion even among the atoms of matter, these ions or corpuscles must be one form of electricity and must be both positive and negative, though the negative ions attract the most attention. 25 I am glad to find science coming to my conclusions as to the fourth state of matter. 26 But instead of calling it electric ions, electrons or Thomson corpuscles, it should be named electro-magnetic ether. 27 It may be that science has at last discovered what electricity is, and that it consists of these infinitesimal corpuscles. 28 Prof. Blake says: "These ions or corpuscles shatter into charged gases the molecules of gases and ionize the gases and make them conductors of electricity; 29 they raise gases to incandescence and make them light-giving sources; they form nuclei about which matter will aggregate and condense; 30 they seem to explain some of the most stupendous and perplexing problems in cosmic physics-- such as the cause of the sun's corona, the spread of the comet's tail, the source of the meteors, the fantastic play of the auroras, 31 whence the electric displays of our atmosphere, the after-glow of the setting sun, and the why of the zodiacal light."

32 He says the corpuscles seem to be solving the big problems of the heavens, and adds: "The corpuscles become luminous when impinged upon by electric waves; 33 and waves of light, which are electro-magnetic disturbances, must move them, and light will be produced and be scattered in all directions as if reflected from minute particles of ordinary matter. 34 This may

account for the glow of the nebulae, and the zodiacal light. 35 These corpuscles, being admitted into the moist air of our earth, form nuclei of condensation and drops are formed; and the growth of the high, fleecy clouds finds its beginning around these corpuscles. 36 They also strike our equatorial region; there they are influenced by the earth's magnetic forces and deflected towards the poles, 37 and near the poles they reach gases dense enough to become luminous by their impact and show the fantastic colourings of the aurora.

38 "Our atmosphere lies, then, like a great insulating sheet between conducting layers-- the surface of the ocean and the upper air. 39 In the ether of this intermediate insulating region electric waves may be set up to be propagated as signals in straight lines in all directions. 40 When wireless telegraphy first reached out timidly into space, we all said its currents would leave the earth's surface within a short distance, for they went out from the earth's surface in straight lines; 41 but as they extended farther and farther they seemed to bend around the earth and to follow its curvature. 42 Hertz, who discovered the electric waves which Marconi now so successfully uses in wireless telegraphy, showed us in 1887 that conductors reflected these waves, and the ocean's surface sent them back when they impinged upon it.

43 "Now, with upper air layers proven conductors, the electric waves must be deflected from above as well and bent downward to follow the earth's curvature."

44 And thus electric signals, silent but all pervading, will before long circle our globe by their repeated deflections through this great speaking tube around the earth. 45 The mysterious negative corpuscles, more minute than our smallest atoms, thus are themselves the very basis of the practicability of wireless telegraphy, our latest invention. 46 Nay, more, may not these ions or corpuscles be atoms of electricity, and, being a thousand times smaller than atoms of matter, impregnate them with positive and negative force?

47 Inventors have been endeavouring to send messages over long distances without wires

ever since the first tests were made in 1896. 48 Only recently Marconi has succeeded in sending them across the Atlantic, two thousand miles through the air.

49 The distance to which messages may be transmitted and received depends on the amount of electric energy employed, the frequency of oscillation in the radiating system, the length of the electric waves emitted, the height of the perpendicular wires from the ground, 50 the medium through which the waves are propagated, the sensitiveness of the coherer or receiver, and the precision with which the instruments are adjusted.

51 Long electric waves are radiated to greater distances than shorter ones, and much depends on the syntonic system, or tuning of the instrument, so as to communicate with any selected receiver to the exclusion of all others.

52 An electric generator supplies the source of electricity for operating an induction coil to transform the low pressure into an alternating current of high pressure. 53 This charges the wire suspended from a mast and the wire leading to the earth to a sufficient potential to cause the opposite charges of electricity to rush together, thus forming a spark or disruptive discharge through a small air gap; 54 as a result high potential currents surge to and fro through the wires hundreds of thousands of times per second.

55 These high potential currents radiate electric waves which are propagated as light waves and spread out in every direction. 56 It is said the whole process of transmitting and receiving wireless messages is not unlike to the emission of light and its reception by the retina of the eye.

57 The reception of these waves is by means of a vertical wire similar to that used in transmitting, the difference being the wires at the terminals are connected with metal filings enclosed in a small glass tube called the coherer instead of the spark gap. 58 The electric waves impinge on the elevated wire and are converted into electric oscillations, which act on the filings, and an auxiliary circuit registers the impulses on a ribbon of paper in readable Morse dots and dashes. 59 The higher the

vertical or mast wires and the greater the number of wires, 99 the greater the wave length and the farther the distance transmitted.

60 Marconi in his first Atlantic tests employed kites and balloons to carry the vertical wire so that long electric waves could be obtained. 61 Since then he has carried his wires on high masts, as at Poldhu, Glace Bay, and Wellfleet Station. 62 The Marconi companies have equipped six stations in the United States, five in Hawaii, twenty in Great Britain, one in Belgium and one in France. 63 There are eighteen ocean steamers, thirty-two British-men-of-war and several Italian and American warships which have Marconi installations. 64 Marconi says: "There are thirty-five land stations, twenty-one liners and eighty-five warships equipped with Marconi apparatus. 65 Land stations cost $1,000, and ship equipment, $700. Trans-Atlantic stations cost $100,000 each."

66 Wireless telegraphy is the most recent miracle of electricity, and shows it to be the cosmic energy of the Universe. Science stumbled upon it.

67 And in the same way, Sir Wm. Crookes, in a recent interview, says: "Science may someday stumble upon the soul. People of science believe more than they can express, spiritually as well as physically." 68 They will not prophesy, but said with ominous import: "If you had come to me a hundred years ago do you think I should have dreamed of foretelling the telephone? 69 Why, even now I cannot understand it. I use it every day, but I don't understand it. 70 Think of that little, stretched disk of iron at the end of a wire repeating not only sounds, but words, and with the most delicate and illusive inflections of tone which separate one human voice from another."

71 Mr. Peter Cooper Hewitt, says the Electrical Review, has invented a new apparatus which it is said will make a revolution in the method of sending wireless telegraph messages. 72 The device consists of a glass globe about ten inches in diameter, having two tubes containing mercury sealed in the bottom of the vessel.

73 This apparatus acts, as a powerful and effective interrupter and takes the place of the spark

gap now used in discharging the condensers for setting up electrical waves. 74 It enables powerful, rapid and continuous oscillations to be set up in the antenna, or sending mast, used in transmitting wireless messages, 75 and not only enables messages to be sent over very great distances with ease, but permits secrecy to be maintained, which heretofore has been impossible.

76 The operation of this device depends upon two new phenomena in physics which Mr. Hewitt has discovered in the course of his researches. 77 The first is the resistance of the mercury in the apparatus to a passage of current until a high potential has been applied; the second is the disappearance of this resistance after this high voltage has been reached.

78 The effect of these two phenomena is to permit a condenser to be charged to a high potential and then, by the disappearance of the resistance of the interrupter, to discharge it very rapidly. 79 The result of this action is to set up violent and rapid current impulses in the circuit containing the condenser, and thence in the sending wire. 80 The current impulse, being very powerful, will enable messages to be sent to great distances, and as the number of oscillations per second can be controlled, this permits of selective signaling. 81 The number of impulses can be made very high-- above a million a second. The device is inexpensive and durable. 82 It is considered a great contribution to wireless telegraphy and establishes it on a commercial basis, and selective signaling is solved and trans-Atlantic transmission will be easy.

83 Radium is a rare metal recently discovered, having remarkable qualities and very difficult to obtain. It is a constituent of pitchblende, which is found in many places, but only in a small way. 84 So far all that has been procured has come from a mine in Cornwall. A ton of pitchblende carries about 15½ grains of radium and it is very difficult to extract.

85 A grain is estimated to be worth $200,000 and a kilogram is worth about $2,000,000. There is only about one pound of radium in the

world. It is estimated to be worth $1,000,000.

86 Radium was discovered by M. and Mme. Curie, in France, after they had familiarised themselves with the remarkable properties of uranium and polonium. 87 Radium has many curious and inexplicable qualities. 88 It continually emits heat and light without combustion, without chemical changes of any kind, and without any change in its bulk, appearance or molecular structure, which remains identical after many months. 89 It is so powerful in the energy it constantly hurls forth as to entail many dangers in handling it.

90 Sir Wm. Crookes says in describing it: "Probably if half a kilogram were in a bottle on that table it would kill us all. It would most certainly destroy our sight and burn our skins to such an extent we could not survive. 91 The smallest bit placed on one's arm would produce a blister it would take months to heal."

92 It also emits electrons with a velocity so great that Prof. Crookes estimates "one gram is enough to lift the whole of the British navy to the top of Ben Nevis, and I am not quite certain that we could not throw in the French fleet as well."

93 It has such surprising properties that Lord Kelvin was moved to say of it that, "it threatens to overthrow the correlation of forces," which is the rock-ribbed, foundation postulate of science. 94 It seems already to have unsettled the accepted theory of light, and after the experiments of the Russian scientists who are now investigating it, Profs. Mendelief, Yigooff and Borgruan, the result may give us new scientific theories and a new nomenclature. 95 Radium tends to confirm my electric theory of creation, it also seems to aid the Thomson corpuscles hypothesis, and will open the way to new and important discoveries.

96 My opinion from very brief thought on the subject is that radium is in its nature a form of electric energy solidified, and may be a bundle of Thomson corpuscles or electrons combined and solidified by some process not yet understood. 97 It is in the nature of an electric dynamo, and draws its constant supply of

electricity from the air. 98 It is plain that it is an electric substance and manifestation, for, as Prof. Crookes says, "it memits electrons with a velocity so great one gram would lift the British navy to the top of a mountain, and he is even willing to throw in the French fleet." 99 If he were not a great scientist, I should say he was exaggerating like an amateur. Radium is at present a great scientific puzzle. 100 It seems to destroy the present theory of light and the conservation of energy and the so-called attraction of gravitation by reason of its marvelous energy and wonderful qualities.

101 But I stand with the scientists on the doctrine of the conservation of energy and the correlation of forces, and do not believe radium seriously threatens it, though Lord Kelvin had much reason to say so; 102 and it is a puzzle yet unsolved as to how it maintains its energy without diminution of its force and bulk. 103 I see but one explanation, and that is, that it renews itself constantly by drawing electric energy from the air, as a battery or dynamo draws it, and thus retains its marvelous power unimpaired.

104 I hold that energy, like matter, is a substance and can neither be created nor destroyed. 105 It is impossible to create a molecule out of nothing or to reduce a single particle of energy to nothing. 106 Energy, like matter, can be changed from one form to another or from one place to another, but all matter is one matter in its elemental form, and all energy is from one original energy, which I hold to be electricity. 107 All matter is the aggregate manifestations of the invisible atom, and all energy is the varied manifestations of the one ultimate and only force in nature--electricity.

108 The transformation of energy, such as falling water, expanding steam, heat, light, vital force, and gravitation, are all from the same electric elemental force, and this energy is without increase or decrease and is known as the conservation of energy. 109 The definition given of electricity by Atkins in his work on electricity, which says, "it is a molecular mode of motion," is an absurdity, for motion is an effect produced by a

cause, and all motion is caused by electric energy.

110 And the mode of motion is simply the manner in which the law of electro-magnetism operates. 111 Thus there may be an electric law yet undiscovered by which a substance like radium may draw electric energy from the air and keep its force and bulk unimpaired for many months, or perpetually. 112 But radium raises many other questions affecting the nature of light and heat, such as how such great heat and light can be condensed into so small a compass and evolved with such wonderful power.

113 Prospecting for valuable metals by electricity has been recently introduced in Wales with remarkable success. 114 In the Cwnystwyth mines in Cornwall new and valuable deposits of ore and blende were located. 115 These mines have been worked for over fifteen hundred years, and much of this time the search for additional lodes has been going on; yet this electrical device accomplished in a few hours what fifteen centuries of search failed to discover.

116 By the electric method of prospecting a current of high potential-- 30,000 volts or more-- is employed to energise a piece of ground supposed to contain mineral. 117 The current is taken from the terminals of the generating coil to metal rods or electrodes which are pushed an inch or two into the earth. 118 From these distributers the lines of force spread out in both vertical and horizontal planes and may be made to extend over an area of several miles.

119 Their presence is detected by means of a delicate telephonic receiver connected with a second pair of metallic rods, which are stuck into the earth in any desired position. 120 When the receiver is silent or gives only faint sounds, it indicates that the lines of force are deflected from their normal course. 121 This reveals the presence of metallic masses in the earth, and, by moving the electrodes about, the position and area of an ore deposit may be determined with considerable accuracy. 122 In new and unknown ground the operator would place his distributing electrodes about

200-yards apart, and remove his receiving instrument to a distance of half a mile or more. 123 If his general knowledge of geological formation led him to believe that the metallic veins, if there were any, would run generally north and south, he would place his electrodes east and west, 124 and if he found the electrical distribution normal he might conclude that the ground contained no mineral.

125 This remarkable electrical system for detecting the mineral deposits beneath the surface of the earth will doubtless be tested and perfected until human will be able without digging into the earth to ascertain the mineral deposits at any point beneath its surface. 126 It may not always determine if they may be profitably worked, but in many mining regions it will be a blessing, and save much unprofitable work and sad disappointment.

127 Electrically heated cooking and laundry apparatus is now used in Germany and other countries. And there are farms on large German estates which are run by electricity. 128 The Guednau farm in Eastern Prussia consists of 450-acres, and its dairy handles one thousand gallons of milk daily. 129 It is lighted by electricity, has an electrical churn and feed-cutting machine, water-pumping apparatus, incandescent lamps, threshing and grist mills, saw mill, automatic plough and electrical agricultural machines, 130 all run by charged batteries and a fifty-horse power stationery engine moving two dynamos. 131 Thus farming is made attractive and free from drudgery, and is run like a machine by the electric current. 132 Electricity is used not only to run some farms, but also to hasten and increase the growth of farm products by running wires a few inches beneath the surface to energize the soil.

133 The Commercial Cable Company announce that their ocean cable connections will be complete with Manila, in the Philippines, by the 4th of July of this year, 1903, and that on that day they will telegraph around the world in forty seconds. What a miracle of wonders! 134 Fifty years ago the speediest communication from point to point was by swift horsemen making fifty miles a

day. 135 Now the round earth's antipodes is only forty seconds apart by reason of electric appliances.

136 So wonderful has been the growth of electrical appliances and utilities that Prof. H. B. Shaw, of the Missouri University, in a recent lecture, said: 137 "In twenty years the electric light industry has developed from nothing to the manufacture of over 100,000 incandescent lamps per day. 138 Ninety-five per cent of the street railways in this country are electrically operated. Yet this industry was cradled in Kansas City, Mo., only about twenty years ago."

139 This was when I first had my attention drawn to electricity, for I saw the building of that line on East Fifth street, in that city. 140 That and the lighting of the gas by an electric flash from a human body caused me to investigate electric phenomena and formulate the electric theory of creation.

141 Prof. Shaw said: "The latest development in long distance power is in California, where ten thousand horse-powers is transmitted two hundred miles from where it is generated with a loss of only ten percent of power in the line. 142 Ten thousand horse-power is sufficient to raise a million tons two inches per minute."

143 What a miracle that such power can pass along a wire no larger than a child's finger, and exert such force two hundred miles from where it is generated! 144 Nothing but the invisible creative cosmic force of the Universe could accomplish such a seeming miracle.

145 But some scientists are so irrational as to say this force is merely the pressure, twist or whirl of the ether, when it is plain that if the ether were as rigid as steel it could not exert such force and power. 146 And as to it being a derivative force derived from the coal, wood or sun, it is plain it is the same force and the original, ultimate, creating evolving and only force in the physical Universe.

147 There has been much labour and money expended in endeavouring to perfect a balloon or airship, which would be safe and could be directed through the air at will in any course desired. 148 Electricity has been used as the

steering power and aluminum, because of its light weight, for the frame-work. 149 The French especially have given great attention to what they call the dirigible balloon, but no great amount of success has been achieved and, in my opinion, never will.

150 In the very nature of things, no safe airship can ever be built. It was not intended that human should travel or carry burdens through the upper regions of the air. 151 First, because the law of the earth's electric attraction forbids it. Second, because the sudden and powerful wind and electric currents that pervade the upper regions of the atmosphere are sure to bring ruin and death, sooner or later, and no human power can prevent it.

152 The balloon or airship is only a dangerous toy which can be useful perhaps in times of war to spy out the enemy, but utterly useless otherwise, and which means death in a very short time to all who risk their lives in its treacherous power.

153 There have been two recent and striking examples of this in the case of the two distinguished experts in Paris who thought they had built airships that could overcome the powers of Nature, 154 and while proudly exhibiting them to their family and friends were hurled to a sudden and fearful death.

155 The many deaths and narrow escapes from these useless and dangerous toys make it almost certain that no sane person would risk own life in one of them, though there were a thousand at one command free of expense.

156 Of all the useless follies on which inventive genius and money have been expended, the airship is the worst, 157 because if millions of the most perfect ones the imagination of human can conceive were built and offered free, no prudent person would risk own life or own goods in their treacherous care. 158 The powers of Nature, and what the ancients called the demons of the air, forbid that the airship should ever be anything more than a dangerous toy for reckless persons, who wish to jeopardise their lives.

159 Great efforts have been made, much money expended and many lives lost in futile attempts to find

the North Pole, which when discovered may appear like any other ice field, mountain glacier, or snowdrift of the Arctic Circle. 160 But the thirst for knowledge and the love of adventure and exploration where no financial reward can be expected is creditable to humanity, and shows that the love of knowledge is sometimes above that of sordid gain. 161 The struggle for two centuries has been to reach the North Pole, and it has been approached as near as 700-miles; 162 but recent reports indicate that conditions are more favourable for reaching the South Pole; and a French expedition outfitted this year for the North Pole have changed their destination to the South Pole. One or both poles are likely to be discovered in a few years.

163 There have been many scientific expeditions to various parts of our globe for astronomical observations. 164 One recently sent to Chili from the Lick Observatory should command especial interest since its object is by the study of the southern stars to ascertain where the earth and the solar system is going. 165 We know our sun system is moving swiftly towards the north, in the direction of the stars Vega or Alpha Lyra, at the rate of more than forty-three thousand miles an hour. 166 Each year we are more than three hundred million miles nearer these stars, unless they also are in motion in the same direction. 167 The southern stars have been studied much less than the northern stars, and the testimony of both is desired to determine the direction of the mysterious voyage of the sun and its family of worlds through the unexplored regions of space.

168 We have been watching the stars in front of us for many years, and will now give some attention to the stars in our rear to confirm or disprove many astronomical hypotheses.

169 It is like getting back to anti-Copernican times to have Dr. Alfred Russell Wallace, in his flights of speculative astronomy, 170 say that, "our solar system is central in the Universe and that this earth of ours is probably the only planet on which humanity has been developed." 171 In a recent article

he undertakes to establish this ancient fallacy. It is very doubtful whether the Universe has a general center, 172 but if it has it should be plain to our learned astronomer that as our system is moving through space in a straight line at the rate of 420,000 miles per day it could not occupy a central position very long. 173 The only means we have to judge of the inhabitability of other worlds is by analogy, which is the foundation of all scientific hypotheses. 174 The likeness in form, substance and electric power of suns and planets to our own world leads to the natural conclusion that all suns and worlds are inhabitated. 175 In fact any other assumption is contrary to all cosmological reasoning and all analogy to be found in universal Nature. 176 Nature nowhere bestows vast substance and power without commensurate results of life and growth, and it is reversing all the laws of reason, analogy and cosmic experience to hold to the contrary. 177 We must give up this egotistic assumption that our little world is the only living world in this vast Universe, or that it is only one of a few living worlds.

178 There are no dead worlds or planets or burning suns in this electric Universe, and we are not "the only pebble on the boundless beach" of creative worlds. 179 We have the same electric fire in our bodies that is in the sun, and it neither burns us nor causes us to shrink up annually, as the scientists say the sun does. 180 It is not the consumer of life, but the giver of life, and the continual life energy of the Universe.

181 During a recent eclipse of the moon, Prof. W. H. Pickering, of Harvard Observatory, ascertained that the bright spot around the crater Linne on the surface of the moon grows considerably larger when deprived of the heat of the sun. 182 For many years it has been noticed that the Linne area has been gradually changing and many theories regarding the causes have been advanced.

183 Prof. Pickering is inclined to the belief that it is hoar frost or ice. This tends to confirm my theory that the moon has an atmosphere and some moisture which is mostly hidden in its perforated volcanic surface.

ORIGIN

184 Alexander Young, an astronomer of Laport, Ind., announced on February 20th, 1903, that, "from observations made by him, he is confident that the sun is inhabited; 185 that with his instruments he has seen on the sun's surface mountain sides with great and precipitous rocks which glow with prismatic colours, mingled with the greenness of perennial vegetation."

186 I was not expecting this scientific proof so soon, but I am satisfied that the inhabitants, the mountains and the perennial vegetation are there; 187 and if he has succeeded in magnifying the rays of light from the vast openings in the sun's photosphere sufficiently he can and did see them.

188 I am a firm believer in the inhabitability of the sun, and that it is a perfected, self-luminous world-- a world like our world, only vastly larger and more prolific in life and power. 189 As it is the source of all life and power to the planets, it must be the creator of all life to its celestial inhabitants.

190 Profs. Proctor and Herschell seem to believe that most of the heavenly bodies are inhabited. 191 Sir Wm. Herschell went so far as to contend for a time that the sun was inhabited or inhabitable because, he said, the heat of the sun was in its photosphere, which was far out in space and many miles from the sun's surface, and that there were cool clouds and layers of atmosphere, 192 he thought, between the heat and the sun's surface which made the body of the sun cool enough for animal and vegetable life and human habitation. 193 He changed his mind, however, in a few years and held the heat of the sun was too hot to allow anything in Nature to keep such excessive heat from its surface, and besides, the law of the conservation of forces just coming into scientific prominence then forbid it.

194 Prof. Proctor, says: "I adopt the principle of Sir Wm. Herschell that analogy is the chief and the best guide for the student of astronomy. 195 That general resemblance of structure indicates a general resemblance in the purpose which the celestial bodies

are intended to subserve is evident when we compare the stars with our sun or with each other. 196 Some time or other those worlds have been or will be the abode of intelligent creatures seems to be a fair conclusion from what we know of their structure."

197 Deity does no irrational things, Nature is always logical and consistent, 198 and where there is such vast resource of substance and power bestowed, as in our sun and the eighteen millions of suns of the Universe, it was not for the purpose of making bonfires and blazing furnaces of them. 199 But they were created for vaster, more perfect theatres of intelligent life and activities. 200 Besides, burning them up could bestow no benefit on the planets; the heat could not reach them, and if it could it is only a sensation, and sensation cannot produce vegetable or animal life, or control the earth's motion.

201 One of the greatest of modern discoveries is that heat is not a substance but a sensation, produced by electric currents. 202 So that eighteen millions to one hundred millions of suns do not need to be burning up to furnish electric currents to their planetary worlds. 203 And our sun is not burning up thirty quintillions cubic feet of itself annually, 204 and a hundred millions of suns many a thousand times larger than ours are not burning up a thousand times more of themselves, as the astronomers claim, and the whole thing is a great absurdity and superstition.

AT PRESENT, SCIENCE IS IN A DUBIOUS AND CHAOTIC CONDITION

George Woodward Warder

12 The last few years have been remarkable for the diligence with which scientists have scrutinised every phenomena of Nature, and the abundance of new facts which have rewarded their researches.

2 They have also been remarkable for the changes in scientific opinions, which usually are so gradual as to be imperceptible, 3 but which have recently taken on the speed of the earth's solar

revolution in their transition from the old to new theories.

4 The vast body of scientists is seldom a unit in the acceptance of any theory, even of the most fundamental nature. 5 And where there is such diversity of belief each student of Nature is entitled to form own opinions and beliefs.

6 But the most pitiable and unfortunate of the one-sided scientists are those who would banish logic from the realms of physics, and who regard a deduction or a theory as an enemy of science; 7 who heap scorn on analytic reason-- the highest gift of Deity to human-- and who deem the tabulation of dry facts without causes the only purpose of science.

8 Who want science fenced in with a stone wall and separated from religion and philosophy, and the earth cut up into sections and labelled astronomy, chemistry, geology, and so on ad infinitum; 9 as if Nature knew anything about astronomy, chemistry or geology, or ever considered anything but the unity and harmony of the whole Universe, which includes science, religion and philosophy, one and inseparable, as God and Nature are inseparable.

10 Mr. Cope Whitehouse, a New York scientist, says of present science: "The only fact established beyond doubt regarding suns and planets is their revolution on their axes, and this is all that is needed to generate light and heat. 11 They are arc dynamos, and each in turn transmits what it receives to its neighbour on the circuit."

12 This is well stated and shows that nine-tenths of the accepted facts and theories of science are mere guesswork, founded upon conjectures of some eminent scientist who was accepted as authority a hundred years ago. 13 And the standard scientific works have propagated them as scientific facts.

14 It is a fact apparent to all well informed students that astronomy, physics and chemistry at present are in a chaotic condition-- 15 that nearly all the scientific facts and theories established for two hundred years are now in a state of uncertainty and are virtually overthrown by recent discoveries.

16 The recent discovery of radium seems to overturn the rock-ribbed

scientific theory of the conservation of energy, and raises many new questions in regard to the nature of light and heat. 17 Lord Kelvin, recognised as the highest authority, says: "It threatens to overthrow the doctrine of the correlation of forces." 18 If the scientists would accept the electric theory of creation, its explanation would not be so difficult, for radium seems to be a bundle of electric ions or corpuscles which have the power of drawing electricity from the atmosphere, 19 like a miniature dynamo or a galvanic battery, and thus continually renewing itself, so that there is no loss of power and no shrinkage in size or bulk. 20 The scientists may soon be forced by radium and other natural phenomena to accept the electric theory-- that electricity and not gravity is the one and only fundamental force in Nature.

21 The discovery of the three lines in the spectrum of hydrogen, discovered by Prof. Pickering, of Harvard, may upset the whole theory of the seventy-three elements set forth in our books of chemistry and said to constitute all the elements of the Universe. 22 It may prove they are not elements, or at least not primary elements at all, and finally drive the scientists to my theory that there are only three primary elements in the Universe, and they are spirit, electricity and matter. 23 That the claimed seventy-three elements are only different combinations of two of the original and primary elements-- matter and electricity-- and are what Herschell said they looked to be-- "manufactured articles."

24 Prof. Pickering was the first to analyse lightning with the spectroscope and show that hydrogen is a compound substance made up of lines belonging to at least three chemical elements. 25 This recent discovery was a great surprise to scientific people. And it was confirmed and doubly proven by the spectrum in the new star, in the constellation of Perseus, known as Nova Persei, which also shows in the hydrogen there the same lines consisting of at least three chemical elements.

26 This is new proof by high authority that oxygen, hydrogen and all the claimed elements are--

as I have contended for many years-- 27 only compound substances, and justifies Prof. Serviss' statement in the New York Journal, that these facts "may revolutionise science and reconstruct chemistry." 28 The marvelous increase in brilliancy of the star Nova Persei last year, and its sudden shrinkage, all within a few days, and the same being observable almost instantaneously upon the earth, 29 when that star is 3,400 light years distance from the earth 53 according to the accepted speed of light, which is 186,000 miles a second, unsettles the whole question as to the speed of light. 30 It tends to prove that light is instantaneous, as Prof. Wright says gravitation is.

31 No less an authority than Prof. Simon Newcomb calls the scientific world's attention to this phenomena, and shows it throws doubt on the long-accepted theory as to the speed with which light travels. 32 In his address before the Astronomical Society, December 29th, 1902, he says: "There is an inadequacy in the speed of light to explain the phenomena. We are forced to the conclusion that there exists in the Universe a cause susceptible of transmission with a speed many times that of light."

33 What cause exceeds the speed of light, which is deemed the swiftest thing in the Universe? We know of none. 34 What was it surprised the scientists and came to us with many times the supposed speed of light? It was light, only light. 35 Then this "inadequacy in the speed of light" came on double-quick time, and proves that light can travel many times faster than the scientists for two hundred years have declared it could. 36 And this eminent scientist, with cautious diplomacy, does not directly attack the accepted speed of light, but says "there exists a cause" that produces a greater speed than light. 37 But as only light came, did the "cause" bring it or did it come with its own velocity? 38 If a "cause" or unknown force brought it, then we have a new force in Nature which the scientists must reckon with. 39 So they must accept the alternative and either change the speed of light or deal with a new and unknown force.

ORIGIN

40 In addition to the above complications, Prof. J. J. Thomson, discovered (1901), the electric ions or corpuscles which is considered a new form of matter and force. 41 The discovery of these electric ions or corpuscles a thousand times smaller than atoms has produced utter confusion in the scientific world, and outside of the electric theory of creation they can make no possible explanation of them. 42 The fact is, the scientists are on an island of doubt, in a sea of uncertainty, scanning with telescope, microscope and spectroscope the ocean of foggy knowledge and dubious assumed facts to find a port of safety.

43 Their attempts to fix the specific gravity of the sun, and the sun's burning up and shrinkage as its source of heat, and the heat as the life of the planets; their treatment of heat as an entity and substance, when it is merely a sensation; 44 their reliance on the spectroscope to indicate heat in distant suns, and their accepting gravity without a cause or an explanation, show the blind for centuries have led the blind in extravagant guessing.

45 But since they have seen an electric battery and an arc light, they should be ashamed to ever declare "the sun is hotter than any terrestrial furnace," or that it is hot at all. 46 The arc and incandescent lights are object lessons they ought to study, for they will see almost an exact representation of how all light, heat and vital force are created on suns and planets.

47 They will see two wires, one positive and the other negative, brought together or so near together that in order to complete their electric circuit they must pass through a little space of resisting air, which is a non-conductor, and then they burst into light and moderate heat. 48 In the same manner the positive and negative currents of electricity of the sun and earth, without wires, come together in our atmosphere, which is near the earth's surface a dense resisting non-conductor, 49 and in order to complete the circuit they burst into light, heat and vital force and give life and energy to all animal and vegetable organisms. 50 But the heat must be and is generally moderate, as no vegetable or animal life can exist

in excessive heat. 51 And as excessive heat means ruin and decay, therefore no burning sun can furnish light or give life and growth to any planet.

52 Prof. Simon Newcomb, the learned astronomer, says: "The sun is not a solid body, but must be liquid or gaseous, at least at its surface." 53 He gives this singular reason, therefore, that "the sun's rotation at the equator is completed in less time than at a distance on each side of the equator."

54 I question both the fact and the sufficiency of his reasoning on this point.

55 According to his own statement, the sun revolves at its equator 4,000 miles an hour, or over a mile a second, while it revolves very slowly near its poles and virtually is not in motion at all at its poles. 56 This rapid motion at the equator and slowness of motion near the centre of the sun is calculated to deceive the eye and make it think it completes its rotation at its equator in less time than at a distance from it, looking down along the slope of the sun's vast circumference. 57 This is no evidence, for we see only the moving clouds of light on the outer rim of the sun's atmosphere, ten to twenty thousand miles or more from its surface, and they seem to and do complete their rotation a short time sooner. 58 This they naturally should do. How frail and uncertain is the argument based on such doubtful and assumed facts?

59 Thus these wise astronomers claim from this slim, unreliable evidence and the assumed excessive heat of the sun, that the sun is not a solid body at its surface. 60 Yet the same author rejects this same evidence-- that Jupiter is not a solid body-- in the following language: 61 "The difference in the time of Jupiter's rotation at the equator and in middle latitudes is, so far as we yet know, about five minutes. 62 That is to say, the equatorial regions rotate in nine hours and fifty minutes and those in middle latitudes in nine hours and fifty-five minutes, a difference amounting to 200-miles an hour, a seemingly impossible difference were the surface liquid. 63 We cannot assume this to be the case without more observations than are yet recorded, as no well defined law

of rotation in different latitudes has yet been made out."

64 Thus this learned astronomer will not assume for Jupiter what he assumed for the sun, and weakens and destroys in Jupiter the very same arguments he used to prove the sun was not a solid body at its surface.

65 This same learned astronomer--and I mention him because he is high authority and has written the most recent work on astronomy--66 says that, "under the enormous pressure of the earth, continually increasing to the center, the matter composing the inner portion of the earth is compressed to the density of a metal. 67 If the earth were composed of a fluid or even of a substance which would bend no more than the hardest steel, such a motion as that of the earth upon its axis would be impossible."

68 I accept this as a very reasonable conclusion, and hold the same rule applies to the sun, and that the sun's "enormous pressure, increasing to its center," would compress its inner portion to the density of a metal; 69 and that the sun could not revolve upon its axis and retain its rigidity as it does unless its inner or central portion was as rigid as steel. 70 And this necessarily means that its surface is about as solid as that of our earth.

71 Therefore the sun cannot be molten or liquid at its surface, as the scientific guessers have prognosticated. 72 As they have guessed wrong about nine-tenths of the time, this is one of the nine hundred bad guesses.

73 Lord Kelvin, our wisest scientist, a few years ago estimated that our earth, only fifty miles below its surface, was a molten mass of fiery metal. 74 Now, Simon Newcomb says it has the density of metal, and is as hard as steel, and I think Lord Kelvin has changed his opinion and will agree with him. 75 Thus the hoary-headed superstition that the center of our earth was a molten mass is passing away, and it will be the same as to the heat, and molten condition of the sun-- it will be relegated to the plutonian shades of ignorance and superstition. 76 Because there were numerous volcanoes, geysers and hot springs scattered over the crust of the earth and in some deep mines there were

hot sections, the scientists jumped at the conclusion that the inner portions of the earth were a molten, fiery mass. 77 This was to accord with their false theory of a red-hot molten sun, and their assertion that the earth had its inception as a fire mist, and rolling ball of white-heated gases. 78 But the scientists have changed their theories rapidly in recent years. They are just beginning to discover that there are zones of heat and cold beneath the earth's surface just as there are above its surface. 79 That there are electric currents of heat in volcanic regions and mineral and mining sections, and none in others, and even in the same mines there are warm and cold sections.

80 Take the Cornstalk mines in Nevada. A section 2,300 feet below the surface is very warm; while another section 1,200 deeper-- being 3,500 feet below the surface-- is very cool. 81 Surely Lord Kelvin would now laugh at himself to think he made such a calculation of the heat of the earth and said it was a molten mass of fire fifty miles below its surface. 82 And he even said it was so hot seven miles down in the earth that water could only remain or exist in a state of vapour.

83 Ye gods! When so great a prophet makes such mistakes, surely the little prophets that walk in his footsteps ought to "go 'way back and sit down," and cease talking about the heat of the sun. 84 They should quit telling us the Beneficent Creator is burning up 18,000,000 of its most magnificent and beautiful worlds to heat its little, insignificant planets. 85 They estimate our sun burns up thirty quintillion cubic feet of itself annually, and 18,000,000 of suns are doing the same, making the equivalent of a world destroyed every year and a sun every decade. 86 These statements are so unreasonable and appalling they refute themselves. 87 I mean no disrespect for these learned but misguided scientists who have for two hundred years built all their theories on heat, which Langley now says truthfully is nothing but a sensation. 88 Thus they built the Universe on a sensation, and to sustain the old traditions they want to keep it there. 89 They said the earth began in heat, that it was a

ball of fire a few miles below its surface, and the suns were great flaming furnaces burning up with quenchless fire. 90 They made the Great Creator a fire demon and world destroyer.

91 If Prof. Parker's testimony is to be relied on, nine-tenths of them waste their time on useless calculations and data. They have a wonderful faculty of putting the horse before the cart. 92 For example, Prof. Huston of Princeton, says. "Electricity is being constantly produced during the phenomena of everyday life. 93 It is produced by chemical action, differences of temperature, the motion of conductors and magnets and the various physical and chemical processes that occur during the life and growth of plants and animals."

94 Now, this is misleading, because it states facts backward. It is not true that electricity is being produced in the sense it uses it by these phenomena. 95 These phenomena are being produced by electricity. They are the manifestations of electricity. Electricity is the cause; they are the sequence or results, and he should say electricity is manifested by these things. 96 The same author says: "The earth is to be considered as one huge magnet." This is very true, and as a great magnet does not need to be hot to generate electric life-giving energy, 97 no astronomer ought to look at an electric light or an electric battery without blushing that one ever called the sun hot.

98 Electricity can be generated without burning coal or wood or the use of a furnace. 99 The turbine wheels that are turned by the waters of Niagara Falls, without heat or furnace, can generate a hundred thousand horse-powers. 100 The placing of two or three pieces of metal one above another with a moist substance between them will create a voltaic battery. 101 And mines of two or three kinds of metals or ores, when clay or any soft substance between them become moist, will create a battery that will tear up the earth for miles and produce a geyser or an earthquake.

102 Prof. Proctor agrees with Langley in rejecting the nebular hypothesis, when he says: "Under the continual rain of meteoric matter

the earth, sun and planets are growing. 103 And the formation of the solar system resulted from the aggregations of vast meteoric and cometic systems rotating through space has greater support from what is now going on, and is far more satisfactory than the nebular hypothesis of La Place.

104 The nebular hypothesis affords no explanation of the strange variety of size in the planetary system, variations of inclination among the planets, or the retrograde and almost perpendicular motion of the satellites of Uranus and Neptune. 105 A general explanation of all these matters is at once suggested by their origin from aggregations of meteoric systems." This agrees with the electric theory of creation.

106 All the Newton-La Place theories of gravitation and the nebular hypothesis are now called in question by our wisest astronomers. 107 And one of them has pointed out two hundred instances in which gravitation is set aside and ignored in the motion of the heavenly bodies. 108 Such instances as the runaway stars, the retrograde motion of satellites, the repulsion of comets from the sun, and so on ad infinitum. 109 And as to the outer planets, Uranus, Neptune, Jupiter and Saturn, being older than the inner planets and being thrown off first from the vast whirling sun nebula of La Place's imagination, all modern astronomers either call it in question or reject it, as a fallacy disproved by more recent facts and discoveries. 110 It is reasonable to suppose that there are zones of electric energy in space in each solar system which may help to hold and keep each planet in its orbit, just as there are belts and currents of electricity in the atmosphere and outer crusts of earth and planets. 111 And the sun may send a different kind of electricity to each planet and receive a different kind from each planet.

112 Abbé Moreau, the noted French astronomer, in supporting Col. Du Ligondes, who opposes the La Place theory of the formation of the solar system, 113 in a recent article, April, 1902, undertakes to show that Mars is not older than the earth, as held by the La Place nebular theory, but on the contrary is much younger. 114 His arguments entirely demolish

the nebular theory that the outer planets were thrown off in successive rings of nebula from the sun, and therefore the outer planets are the older. 115 In addition, Flammarion seems to take the same position, for he says: "In Mars two moons revolve rapidly in the heavens in opposite directions, which seems to refute the nebular hypothesis."

116 These all tend to support my electrical theories, and relegate the Newton-La Place theories to the shades of obsolete fancy and mistaken conjecture.

117 Flammarion also says: "The earth in its orbit describes a spiral, and since its creation has never passed twice through the same point in space." 118 This also supports my electrical theory of globular spheres and spiral motion in space to accord with the laws of electro-magnetic energy. 119 This spiral shape of the earth's orbit, I contend, and not the tilting of its poles, creates the changes of seasons. 120 Its poles seem to tilt or change because the earth passes above and below the line of the ecliptic, 121 and in its spiral circuit has the sun above the earth part of the year, when it is summer in the north temperate zone, and below it part of the year when it is summer in the south temperate. 122 And the elliptical shape of the earth's orbit is, I contend, caused by the sun being in motion, which lengthens the circle of the orbit in the direction the sun is traveling 123 and causes the earth to be four million miles nearer it when it turns in front of it, and the same distance farther from it when it turns in the same direction the sun is traveling. 124 It seems strange that no astronomers have thought of these things.

125 Sir Robert Ball said recently: "The most important advance in astronomy was Prof. Keeler's discovery of nebulae in such enormous numbers, and the fact that most of them were in a spiral shape." 126 This spiral shape accords with the law of electro-magnetism and sustains the theory of electrical creation of suns and planets. Matter could not be gathered under any other law.

127 In addition to the contradictions and complications of science already mentioned, scarcely a fundamental principle

or concept remains. 128 One of the eternal indisputable postulates of science was that "two bodies cannot occupy the same space at the same time." 129 But that is exploded, and we know they do and we have proof of it every day. There are numerous instances; I will mention only one: 130 Twenty-eight electric currents can pass over the same wire at the same time, fourteen one way and fourteen the other, and occupy the same space and do not interfere with one another.

131 Scientists used to put great stress on solid matter, and their primary division of matter was into solid, liquid and gaseous. 132 They have recently discovered there is no such thing as solid matter. What they termed solid matter is but the outer and visible shell of invisible forces. 133 That not a single atom of matter touches another atom of matter; but there is a space between them, 134 and the atoms revolve around each other in very much the same way as the earth revolves around the sun, thus showing that the laws of electro-magnetism are the same in atoms as in worlds.

135 The scientists only discovered the non-solidity of matter since the use of the X-rays, and the Crookes tube, and they have been puzzled ever since to know what holds the atoms or molecules together in organised form. 136 They undertake to say it is gravity, but gravity is weight, and atoms have no weight, and they are forced to look to electricity and magnetism to solve the question. 137 And the electric theory gives the only rational explanation, which is, that all things are held together by magnetic attraction or cohesion under the laws of organic affinity. 138 The molecules of iron, stone and marble do not touch each other, but their magnetic attraction is stronger than that of wood or hay; that is why they have more solidity, strength and endurance. 139 Science said we could not look through a grindstone or any solid matter, but we can. 140 We can look through humans, grindstones, iron and brick walls, and if we could turn on sufficient electric power we could look through the earth and take photographs of China-people on the other side of the globe.

ORIGIN

141 Prof. Serviss, in the New York Journal of October 1st, 1902, calls attention to "the remarkable growth of speculation concerning electric or electro-magnetic influences exercised over the earth by the sun and planets," 142 and says: "They have been seized upon by astrological soothsayers to bolster up their pretended science."

143 As I have never taken any interest in astrology, but have taken great interest in the electro-magnetic power of the sun, I am surprised at the obtuseness that would undertake to blend them together when they have no scientific relation.

144 Astrology undertakes to reveal the future by the position and influence of the stars, and is entirely different from any electrical theory of the sun or planets. 145 He says, "The subject of the sun's electric influence is of absorbing interest, but there is no solid scientific basis for a genuine theory."

146 From the lack of knowledge he displays of the well-known laws of electricity I am not surprised at his statement. 147 He says and illustrates it by a diagram: "If we grant the sun does act as a stupendous source of electro-magnetic waves, as the planets circle about the sun in nearly a common plane, 148 and sometimes lie practically in the common plane in a straight line, in such a contingency there may be a stream of electric energy linking them all together."

149 He seems to think this would produce confusion and settle the whole question. 150 He should know that the simplest law of electro-magnetism teaches that the electric attraction of every planet is the measure of its power in drawing the electric currents of the sun. 151 Distance from or nearness to the sun or planets or their being scattered or all on the same plane or in a straight line has nothing to do with the supply of electric power from the sun.

152 Each receives the positive electricity from the sun, which it draws by reason of its negative polarity. 153 He should know that twenty-eight currents of electricity may pass over the same wire at the same time, fourteen one way and fourteen the other way, and do not interfere with one another, and

each go to their separate destinations. 154 The sun may send a different electric current or vibration to each planet and nothing in the Universe could prevent it from reaching that planet. 155 It would pass through or go round any other planet or substance in its way.

156 Wireless electricity is founded on the basic principle that an electric current goes only to the opposite electric polarity and vibration which draws and attracts it or is attuned to it. 157 Prof. Serviss says: "If I examined this subject with a show of interest, it draws upon me sour and suspicious looks from my scientific friends." 158 He should remember that all great truths have had to struggle with "sour and suspicious looks," ever since human began to investigate, and that we must look not to authority for truth, but to truth for authority.

159 He said, in the summer of 1901, the sun was a furnace and the black spots the open door of the furnace, and we would have four years of torrid heat on account of those black spots; but he proved himself a false prophet, like the rest. 160 But he is not to blame; he only followed the old traditions and scientific authority, and they proved to be a broken reed on which he leaned. 161 I mention him because he is an able and recent writer on astronomy. 162 That science is at present unintelligible and almost chaotic to the masses of fairly educated people is too true for superfluous argument. 163 The old farmer's definition of bacilli is a fair sample of the nebulous condition of many minds on scientific subjects. 164 He said they were "little critters from the back cellar that floated in the air, called germs in Germany, parasites in Paris, and microbes in Ireland." 165 Many intelligent people deplore the prolific use of useless technical terms and dry statistics of most scientific works, and their use makes them exclaim with Portia, "My little body is a weary of this great world."

166 I find a very sensible editorial in the New York American of April 18th, 1903, entitled "Science Needs Another Interpreter." 167 It says: "Science is moving too fast for the ordinary layman, who would like to keep pace with its

theories and discoveries.... 168 Chemistry and physics needs a one who will do for them what Huxley did for biology-- someone who has not only a scientific mind but a literary capacity.... 169 Vaguely the layman knows there have been all sorts of discoveries since the X-rays showed him there was a way of seeing through a grindstone.

170 "But he had the idea of X-rays only partially digested when science came on him with the cathode rays and crowned the confusion by discovering radium. 171 With a mind dazzled by light rays that are invisible, and invisible rays that are not light, and bewildered by being told of a substance that gives off terrific energy without loss of bulk or power, 172 he lays away the natural philosophy of his college days and reaches blindly for what the new people have written of these things.

173 "He is then confronted with what reads like a catalogue of fossil insects diversified by stepladder algebraic formulas, the mere parenthesis of which are enough to make a school teacher shudder. 174 The wretched seeker after knowledge is confronted with measurements of light waves until sunbeams are powerless to illuminate the day. 175 Similarly he gathers from the fugitive words he understands among the mass that has no meaning for him, 176 that Prof. Loeb has been putting salt on eggs and creating sea-urchins, to the utter distraction of the rules of Nature's game as he has learned them.

177 "Somewhere there must exist the one whose skill with the pen and whose appreciation of knowledge are equal to the task of acting as interpreter between scientists and the world.... 178 The world is hungrier for knowledge than it is for amusement, and the sales of the books of the person who succeeds in making science readable will make the returns of even the most popular novelist small in comparison."

179 This splendid editorial states facts graphically and truly, and portrays the real condition of things. 180 It shows a scientific chaos, which portends a transition state, and a rapid evolution from the old traditions to a new and more perfect science. 181 Without meaning to be egotistic or to

assume any superior knowledge, or to have any of the qualities suggested in the editorial, 182 I am impelled to suggest that if there are persons befogged scientifically, if they will read *The Cities of the Sun*, I think their minds will be clarified on many points and many of the old scientific traditions will fade into the nothingness from which they came. 183 I am glad to welcome so able a champion of the electrical theory as Mr. Cope Whitehouse, who achieved fame by discovering that the depression in the Egyptian desert could be used for irrigation.

184 This New York scientist says, in an interview in the Kansas City Star of Dec. 2d, 1902: "The English scientists have partially reduced our solar system to a machine, and assigned to Deity little less than the duty of squeezing heat from the sun or stoking it with aerolites. Such theories are made for sale and not for science. 185 When Newton suggested that gravity might swing the moon as well as attract an apple to the ground, he knew nothing of electricity. 186 He might have observed however, that a comet never enters the sun and therefore could not have been attracted by it.

187 "A comet, as it closely approaches its supposed goal, changes its direction and darts away, tail foremost, in a curved path due to a resistance too feeble to obstruct its passage. 188 No allowance is made for the attraction of gravitation in wireless telegraphy, and the most superficial observations in ozology, or the science of smell, show that there is a force in odours which ignores gravitation.

189 "We have reason for supposing that gravitation is a purely local affair, and heat and light do not emanate from the sun. 190 Heat comes from the earth, and the light from the atmosphere, precisely as the film in an incandescent lamp is heated by the resistance it offers to the electric current, and light is produced by the vibration of the motes in the air." 191 "The only fact established beyond doubt regarding the sun and planets is their revolution on their axes, and this is all that is needed to generate light and heat. 192 They are arc dynamos and each in turn transmits what it receives to its neighbors on the circuit." This accord with my

theory published five years previously.

193 He continues: "We do not see the stars, or even the sun". The astronomer who claims that his eye penetrates space billions, trillions and decillions of miles stultifies himself in the next breath by declaring that worlds and solar systems are being formed of cosmic dust. 194 Was the polestar ever obscured by the interposition of a world in formation? Yet the film formed by the breath of the observer on the eyepiece of a telescope would obscure Jupiter. 195 Evidently, therefore, we no more see a star than we see a distant power house that supplies electricity to trolley lines. We only see the end of the stellar or solar ray where it enters the bubble of which the earth is the center.

196 "It is strange that no astronomer has ever heretofore observed that the magnifying power of a lens, two inches in diameter could have no appreciable effect on an object as remote as Saturn. Yet the ring and the satellites of this planet are thus made visible. 197 In short, there is a kind of screen which presents the image of stars, as on a sheet between the observer and the magic lantern at an exhibition. 198 The image can be magnified but their distance is perhaps scarcely fifty inches."

199 In regard to the eruptions of Mont Pelée he says: "Within twenty miles of the earth there is a cold as intense as liquid air. 200 Differences of temperature can be converted into an electric flash, as electricity can be converted into heat. The so-called eruption of Mont Pelée was purely electrical. 201 The sympathetic eruption of La Soufrière was partly due to an interrupted circuit and partly an induced current. 202 There was no flow of lava, but can anyone imagine the crater discharging what was said to have issued from it?... 203 When there is an accurate statement of facts it will be found that neither dust nor gas came from the volcano. Really, only mud, hot water, smoke and stones were ejected. 204 This material descended as a thin covering of uniform thickness. And this blanket was the dust precipitated by the electrical vibration still warm from crystallisation. 205 Had it been otherwise there would have been about one hundred million tons of

frozen mud falling in the neighbourhood.”

206 What Père Mary saw was the cloud of decomposed matter caused by the electric discharges. 207 It is as absurd to speak of all this coming out of the volcano as it would be to say that the smoke and stifling gases in a fire caused by an electric wire came from the power-house. 208 As a fuse burned out in the circuit, Pelée simply sparked. "It set fire to everything between its summit and the sea, and the surface of the water itself was made warm. 209 Now you see how mastodons are found, with hair and flesh intact, imbedded in Siberian ice. 210 If the up-rush of an air current would disturb the cold stratum above a chimney, what would be the effect of the upheaval of a mountain mass with or without a volcano? 211 It is unnecessary to suppose that the axis of the earth has changed. "The ice crop of the Antarctic is much larger than that of the North Pole, but the volcanoes of Erebus and Terror are in violent activity. 212 There are scores of terrestrial and celestial phenomena, from the double tide to the cold moon, that can be explained only by the electrical theory."

213 Thus I could fill a book with the recent proofs and statements of scientists which sustain the electric theory. 214 The dropping of an icicle into a barrel of unslaked lime once caused a great disaster in one of our cities. 215 The slaking of the lime caused a fire. The firemen came and the more water they used the greater was the heat generated, until an explosion wrecked the neighborhood. 216 In like manner, water in the fissures of the earth act chemically upon various minerals and produce similar results. 217 Two or three layers of different metals in the earth produce a galvanic battery and results in the disaster of a volcanic explosion or an earthquake.

218 A silver dollar, a twenty-dollar gold piece, and a piece of copper of similar size, placed one on top of the other, with pieces of moist paper blotter between them, will generate sufficient electricity to send a telegram. 219 Two iron tablespoons tied together with a piece of copper wire and their ends dipped in water will generate an

electric current sufficient to send a cablegram across the Atlantic Ocean. 220 So says Prof. Trobridge of Harvard. If this is true, what a fearful volcano or earthquake may be produced by water moistening the clay or substance between the thousands of acres of different mines or metals one above the other in the outer crust of the earth?

221 These things are marvelous to contemplate and paralyse the imagination.

ELECTRICAL CREATION EXPLAINS NATURAL PHILOSOPHY

George Woodward Warder

13 Herbert Spencer says: "Science is partially unified knowledge; philosophy is completely unified knowledge," 2 and the first knowledge obtained by primitive human was that of sense and inference from such experience. 3 Later there arose a disposition to speculate as to that which lies beyond sense and known only by its effect on sensible things. 4 This speculative propensity is worthy of the highest consideration as a means of knowledge. 5 It has developed all of the numerous systems of philosophy which have flourished in the history of the human race.

6 First in the order of development comes the knowledge of things through the direct experience of physical sense, then comes imagination, reasoning, theoretic science and speculative philosophy.

7 The object of all systems of philosophy is to comprehend and teach the truth about the world around us, especially that part supposed to exist beyond the range of our senses, and to prescribe what is right and good in the life of human. 8 In modern times the attempt to unite all the sciences into a general system has been made by August Comte in France, and Herbert Spencer in England. 9 According to Comte, it was time wasted and labour lost to attempt to explain the cause of gravity, chemical affinity, and electric and magnetic attraction and repulsion. 10 The atomic theory of the constitution of matter, the conception of an interstellar ether,

the undulatory theory of light and heat were all cast aside as useless and unworthy of notice because they were not directly observable and the senses unaided could not apprehend them.

11 According to Comte, the only object of science and philosophy is to observe, record and classify sensible phenomena. 12 What could not be observed by the senses could not be known and did not exist. 13 It is said the only open road to the advance of philosophy was thus forbidden by the human who made the first valuable contribution to its advancement.

14 Herbert Spencer first undertook the great task of discovering the unifying principle of Nature. 15 He recognised all possible phenomena as parts of one great whole, and held that all were united by natural law. 16 He differed from Comte in that he recognised the imperceptible as a reality, but made no attempt to explain it or to bring it into harmony with the phenomena of sense, but designated it the unknowable. 17 He divided his system into two general divisions-- the knowable, which includes all things of sense, experience, and the unknowable, which includes everything else, or the invisible and imperceptible.

18 He held the knowable is the proper sphere of human's knowledge or philosophy, and the unknowable the legitimate domain of God and religion. 19 And while he held that God and religion were imperceptible and unknowable, he held they were none the less a truth of the highest degree of certainty. 20 It is therefore well said that all who fear the downfall of religion as a result of the encroachments of science or philosophy may thank Herbert Spencer for placing it where neither science nor philosophy can touch it. 21 Upon the law of relativity he places the basis of that which can be known, and that which cannot be known. 22 He says: "We think in relations. This is truly the form of all thought.... 23 On analysing the process of thought we found that cognition of the absolute-- the unknowable-- was impossible because it presents neither relations nor its elements-- difference and likeness. 24 Further we found that not only intelligence but life itself consists in the

establishment of internal relations in correspondence with external relations. 25 And lastly, it was shown by the relativity of our thought we are eternally debarred from knowing or conceiving absolute being, 26 yet that this relativity of our thought necessitates that vague consciousness of Absolute Being which no mental effort can suppress."

27 It is apparent that these propositions contradict each other. For, if from the relativity of thought we are eternally debarred from knowing or conceiving Absolute Being, how is it that we have a vague consciousness of this same Absolute Being which cannot be suppressed? 28 Consciousness is one form of knowledge. 29 Spencer, thus recognising the reality of the unknowable, regards that which is or can be known as different manifestations of the unknowable. 30 These manifestations he claims, as they appear in consciousness, pass through a double series. 31 First, a vivid series which includes all sense experience, and second, a faint series which includes thought, as in speculation and deliberation. 32 Force, he contends, is the ultimate and deepest truth of the Universe. All forms of consciousness, he says, are derived as experiences of force. 33 All sense experiences as in the objective series, all subjective feeling or thought, everything known or knowable, is a manifestation of the one universal force or energy. 34 This universal force, I contend, is, first, spirit or mind force; second, electric force controlled by mind force.

35 He says: "Contemplating pure force, we are irresistibly compelled by the relativity of our thought to vaguely conceive some unknown force as the correlative of the known force." 36 This unknown or imperceptible force I contend is electricity and the mental force back of it. 37 All our ideas of matter and motion, he says, are ideas of force. 38 The demonstrated fact of the indestructibility of matter is but another name for the indestructibility of force. 39 The persistency of force means also the persistency of motion. 40 All forms of physical energy-- as light, heat, sound, electricity, magnetism,

chemical action, gravity and sensible motion-- he says, are different manifestations of force. 41 In this I fully agree with him and claim these are all manifestations of the one fundamental force in Nature-- electricity.

42 He says: "Even after all has been said, many will be alarmed by the assertion that the forces we designate as mental come within the same generalisation. 43 Yet there is no alternative but to make this assertion. The facts which justify or rather necessitate it being abundant and conspicuous. 44 All the phenomena of mind belong to the same class-- the phenomena of force." 45 In this I agree, and contend that the mental or spiritual forces are the most potent and supreme forces of the Universe and control all other forces, physical and electric, and are the ultimate of ultimates.

46 He says: "The various forms of force are all changeable into one another." This is shown, he says, by the conservation of energy and the correlation of forces. 47 This accord with my electrical theory of creation, which holds that there is but one physical force in the Universe-- electricity-- 48 and all other forces, such as light, heat, physical life and gravitation, are manifestations of this one fundamental force, and are all changeable or convertible into one another, and all controlled by the dominant force of mind or spirit. 49 In other words, God controls the Universe as human controls own body. 50 Human controls own body by the electric energy that permeates one body and brain, and God controls the Universe by the electric energy that permeates all matter and space, and which is subjected to His Omniscient Spirit and Omnipotent Will.

51 Herbert Spencer says: "An entire history of anything must include its appearance out of the imperceptible and its disappearance into the imperceptible. 52 Be it a single object or a whole Universe, any account which begins with it in a concrete form and leaves off with it in a concrete form is incomplete, since there remains an era of its knowable existence undescribed and unexplained." 53 The simplest statement of this fact, according to my theory, is that all visible things

come from the great invisible sea of electro-magnetism in which all things exist, which he calls the imperceptible, and are woven by magnetic attraction and the aggregation of billions of invisible atoms into visible forms. 54 Then, after they have run their course as visible substances or organic forms, they are again dissolved back into this invisible sea of electro-magnetism. 55 Just as water continually changes from solid and liquid to invisible vapour and back again, so Nature continually renews and purifies her ever-changing molecules but changeless atoms, and builds up organic forms by magnetic attraction and dissolves them by electric repulsion. 56 I contend that matter could be gathered into visible form in no other way than by electric attraction. 57 The life period of all visible things is while magnetic attraction has sway and is paramount; the death or dissolution period is when electric repulsion predominates. 58 The blossoms and fruitage of summer are samples of magnetic life from the sun currents, 85 while the decay of winter is a sample of electric repulsion and dissolution.

59 The law of incessant change, he says, must be the unifying principle which in its simplest form is "the redistribution of matter and motion."

60 Again he says: "The progress from the most diffused and insensible state to that of concentration and definition is called evolution, and is attended by the dissipation of motion and the integration of matter." This I call the law of electric attraction.

61 "The progress from the form of definition to that of diffusion," he says, "is called dissolution and is attended by an absorption of motion and a disintegration of matter." This I call the law of electric repulsion.

62 "This," he says, "is the universal law of evolution and dissolution in its simplest form." And I say that the law of evolution and dissolution in its simplest form is the law of electric attraction and repulsion.

63 Mr. Spencer's definition is complicated, but his process is substantially correct. 64 Yet he offers no explanation of this natural and universal process,

while my electric theory of creation does, and makes his universal evolution and dissolution simply universal electric attraction and repulsion under the well-known laws of electro-magnetism. 65 This is a great advance, a gigantic step toward the explanation of the Universe. 101 The simplest illustration in physics explains both theories. 66 For instance, dry steam, he says, will condense to its liquid form, 103 water by permitting the dissipation of its internal motion in the process of cooling, and a further dissipation of internal motion of the water will reduce it to a solid form, called ice. 67 This he calls evolution, but he does not state what produces it. I say it is produced by electric attraction.

68 Then he says the mass of ice thus evolved from impalpable vapour may be set out in the sun and gradually melt, by the absorption of motion from the sun, into water, and a further absorption of like motion will convert it into invisible vapour. 69 This he calls dissolution, but does not explain it. I say it is the result of the law of electric repulsion.

70 He speaks of the absorption of motion. I contend there can be no absorption of motion, but only an absorption of that which produces motion, which is electric energy, from the sun-- the electric heart of the solar system. 71 Motion, I contend, is not a cause but an effect, and all physical motion is the result of electric energy. 72 And to say with Tindall, that light and heat is a mode of motion is to state an absurdity, for motion is the result of some force operating on matter. It is not a cause but an effect produced by a cause.

73 I explain force and "the redistribution of matter and force" as the product or the result of the universal laws of electric attraction and repulsion, which control atoms, suns and worlds and all matter in body and space. 74 Mr. Spencer offers no explanations and relegates all to the convenient dumping ground of the unknowable. 75 What he calls "The realm of the unknowable" I call the electro-magnetic sea of ether in which all things exist and from which all things are evolved, which is the imperceptible elements of the Universe in

solution. 76 This I claim is the fourth form of matter, the invisible primary essence of all visible creations.

77 I state his law of the redistribution of matter and motion in this way: An increase of electric energy produces an accelerated motion of the molecules of a body or substance, and, if continued, tends to its dissolution by electric repulsion; 78 while an increase of magnetic attraction decreases the activity of its molecules and tends to integration or solidity of form or substance.

79 There is no such thing as heat in reality; heat is accelerated motion, a sensation caused by the increased activity of the molecules; while cold is the absence of motion or heat.

80 Mr. Spencer has described a general indefinite process as "the redistribution of matter and motion," but he has revealed no natural law, or fundamental explanation of natural phenomena. 81 Every important question leads him to a stone wall which he does not try to scale or penetrate, but labels the "Unknowable." 82 A learned philosopher who has spent his life endeavouring to instruct others should not fall back into the convenient ditch of the "unknowable." 83 He says: "What is it that holds together the parts of which this ultimate atom may be imagined to consist? The only answer is a cohesive force." 84 But he does not attempt to explain what that cohesive force is, while I undertake to say it is magnetic cohesion under the law of electro-magnetism, which holds aggregations of atoms in organic affinity, producing visible form and substance. 85 He says: "Force is the ultimate of ultimates. Matter and motion are only different manifestations of this unknowable force."

86 This is making force usurp the place of Deity. Force is a servant, not a master-- a tool and not an ultimate cause. 87 Force without intelligence back of it is anarchy and ruin; it is chaos and not a cosmos. 88 God is a scientific necessity. The ultimate of ultimates is mind or spirit-- the eternal intelligent spirit of Deity and human.

89 I accept the scientific postulate that the conservation of energy and

the correlation of forces affirm, first, that there is but one kind of energy or force in the physical Universe; but I go further and contend electric energy is that force. 90 Second, that, like matter energy cannot be created or destroyed. 91 Third, that energy appears in a variety of forms as motion, heat, light, gravity and chemical action. 92 Fourth, that these forms of energy are interchangeable-- any one form may change into any other form, and all are transformations of the one ultimate force I term electricity. 93 Fifth, that there is nothing in science to show that mind or spirit ever changes into physical energy, or force into mind or matter, or either into the other. 94 This destroys the doctrine of monoecism, or all things from one substance. 95 And Haeckel will have to produce more facts and logic than he has yet set forth to prove that spirit and matter, force and matter are all one and the same thing or substance.

96 The psychic or mental force is the paramount force, and the true realm of evolution belongs to the mental or spiritual Universe and to organic Nature. 97 Physical changes are not evolution in the highest sense except as they are the result of spiritual power and unfolding intellect. 98 The highest sphere of evolution is in biology and behavioural-science. There is matter, mind and force. 99 Materialism is a shallow, one-sided doctrine; and the opposite extreme, that there is no matter, nothing but mind, is also shallow and one-sided. 100 These three separate entities maintain their separate and distinct existence. 101 The electric theory explains and elucidates all natural philosophy and all material phenomena, and is as a scientist has well said, "the best exposition ever offered of the physics and metaphysics of the Universe."

102 In regard to another phase of natural philosophy, Kant proved that in our experience objects can be known only in relation to a subject, and matter only in relation to mind. 103 From this it is evident that mind is at least co-ordinate with matter and cannot be treated as a mere property of matter. 104 From this doctrine Spencer took refuge in the strange notion that

we possess two consciousnesses, the consciousness of ideas within us and the consciousness of motions without us. 105 That neither of these could be resolved into the other, though both were the phenomena of an unknowable absolute. 106 This self-contradiction of a dualistic separation between two aspects of our life, which as a matter of fact can never be divided, proved a citadel of ignorance which could not withstand the attacks of logical criticism.

107 Mr. Spencer's agnostic dualism of objective and subjective mind was due to a fundamental misconception of what is meant by the subjectivity of knowledge. 108 If we have the consciousness of object and subject only in relation to each other, it is not necessary to seek the principle of their unity in any third principle, 109 for his unknowable absolute is "in our mouths and in our hearts," and found in the inseparable unity of experience in which the inward and outward are correlative elements.

110 It seems Mr. Spencer's agnosticism is a sort of spiritual refuge for the destitutes who renounce their heritage like Esau or waste it like the prodigal son, and feed on husks. 111 For those who by their abstractions separate the elements of experience from each other, are forced to go beyond experience for the unity they have lost, and flounder in the miry bogs of agnosticism.

112 The true way is to give up such abstractions as objective and subjective mind, 113 for the mind is a unity, and learn to "think things together" and recognise the organic relation of the inner and the outer life and "explain the parts by the whole, and not the whole by artificially severed parts." 114 This organic unity of mind in human is illustrated by the organic unity of the Universe, which, under the electric theory of creation, is a vast electric organism bound together by invisible electric bands, 115 where every atom has an individuality manifested and explained in the harmonious unity of an ever-changing but indestructible Universe.

116 As human is capable of knowing all things, one cannot be identified with any of them, or if

as an individual one is so identified, one has within own spiritual nature that which carries one beyond the limits of one own individuality. 117 In one inner moral life human is revealed to oneself as a free-will agent, a great and self-determining being, conscious of being subordinated only to the law of duty, which is the law of one own reason. 118 That law, in spite of every outer pressure, one knows one ought to obey, and therefore knows that one can obey it. 119 Thus human is both natural and spiritual; one is limited to a finite personality, yet possesses a universal capacity for knowledge and an absolute power of self-determination. 120 Human reason with one voice seems to depress human to the level of an animal, and with the other voice proceeds to elevate human to the theatre of all life and being, as a "spectator of all time and existence," gifted with absolute freedom of will and conscious individuality. 121 There is an identity which is below or above all distinction; and the Universe is one through all its multiplicity and permanent through all its changes. 122 The unity beneath all differences, the priority of the universal to all particulars, is necessary to the true conception of the organic unity of the world. 123 All opposition of thought and things are relative oppositions which find a solution in the life and movement of the whole. 124 In all the great controversies that have divided the world the combatants have really been co-operators. They developed truth and unity.

125 We do not see anything truly until we comprehend it as a whole, and see it in all its relations to the Universe. 126 Everything so far as it has an independent, individual existence at all is an organism. 127 While conceiving the Universe as organic, Hegel maintained that it "is not a natural but a spiritual organism." 128 For the limited scope of a natural organism and its process cannot be regarded as equal with a Universe which comprehends all existence, whether classed as organic or inorganic. 129 Only the conscious and self-conscious unity of mind can overreach and overcome such extreme antagonisms and reduce

them all to elements in the realisation of its own life. 130 The natural Universe, I contend, is an organism which includes Nature, but manifests its ultimate or highest spiritual force only in the life of human. 131 The Universe as an electric organism obeys the higher supreme spiritual forces. 132 It is said that "Hegel was only working out in the sphere of speculative thought what Christianity had already expressed for the ordinary consciousness." 133 Nearly all great thinkers, I contend, reason forward or backward to the fundamental truths of the Bible, only expressed in a little different way, and which is the old familiar process in human history of "pouring old wine into new bottles." 134 Hegel sought to show how an idealistic view of the Universe and human life could be maintained consistently with the fullest recognition of scientific methods and results. 135 This was an attempt at the reconciliation of science, philosophy and religion proceeding from the growing prevalence of that harmonising spirit which seeks to do justice to the results of scientific investigation and at the same time gives them a new and enlightened interpretation. In this he was right. 136 The main conflict in philosophy as in religion has ceased to lie between materialism and idealism or spiritualism, 137 but rather between Herbert Spencer's "Vague Consciousness of the Absolute," which he bids us worship, and that faith which enables us to pierce the veil of the phenomena and grasp the ultimate reality of things. 138 Philosophy, therefore, is always toiling after the intuitions of faith as "cities of refuge." 139 All philosophy can safely maintain that "what is rational is actual, and what is actual is rational." 140 And all accord with human's highest inspirations of spiritual faith and hope. 141 And the electric theory of creation is the most rational explanation of an organic Universe evolved and controlled by natural law which is the will of Deity, whereby spirit intelligence controls by electric energy all the forces and manifestations of visible creation.

ORIGIN

142 Herbert Spencer has done a great work for science. He has been a great champion and expounder of evolution, and the laws of the material Universe. 143 And while he has been a great agnostic on religious subjects it is because he is a spiritual non-conductor. 144 Human is like a wireless telegraphic receiver; one draws only that which corresponds to own nature and character. 145 Different people have different casts of mind and different natural aptitudes. Some are natural receivers of truths, and others are natural non-conductors of certain truths.

146 There are two eminent illustrations of this fact, for it is said that Newton could not appreciate "Paradise Lost," and Milton could see nothing in "The Principia." 147 This was not to the discredit of either of these books, nor was it a reflection upon the technical learning of either man. 148 Neither was attuned to the message which the other brought to humanity and it proves that in order to apprehend truth in any quarter the person must be sympathetically disposed toward it.

149 Milton had no mind for mathematics, nor Newton for poetry. So the wisest philosophers like Herbert Spencer may go to religion and find nothing there but the abstruce and unknowable. 150 Spencer's mind dwells on the phenomena of matter and material senses only. 151 It is said nearly every great thinker has some central thought fixed firmly in own mind. 152 The central thought of Plato is the theory of ideas-- the assertion of the apparitional character of the seemingly real world. 153 The central thought of Pascal is that of human intelligence confronting the Universe and strangled by its inexorable tragedies. 154 The central thought of Schopenhauer is the absurdity of life, and the central thought of Herbert Spencer is the evolution of the material Universe.

ORIGIN

POETRY
George Woodward Warder

14 Sleep, death and oblivion are things that mock;
Sleep in dreams; death and oblivion in the grave;
And yet we are not mocked. We only walk
Amid realities that bind us like a slave.
2 Sleep soothes and cheers; death grimly reaps and slays.
It makes earth but a tomb--its house of revelry;
It stalks amid life's dark and brightest ways
And takes its victims. All are 'neath its slavery.
3 With chilling frosts it nips life's brightest flowers,
And with pale faces and a gasp they go,
And vaguely trust to bloom 'neath other bowers,
Where death's grim hand will never blast them so.
****
4 All hearts beat to music and measure,
Like songs of the spheres as they roll,
And from dreamland's far mystical treasure
Come songbirds that sing to the soul;
5 Where the glint of the gold in fair tresses
Hide a face that we never have seen,
And the infinite hope that caresses
Kisses joys that we never may glean.
For the wealth of the world is ideal;
6 There is bliss in the beauty of rhyme,
And the thoughts of the soul are the real,
Outlasting the cycles of time.
And the soul is the diamond eternal
Where spirit and power are one,
Brushing dross from its splendor supernal
As dust from the eye of the sun.
****
7 All life is a poem of glory;
Neither reason nor senses can grasp,
Till we read every verse in the story,
And the hand of the author we clasp.
Then sing on sweet souls as of olden,

ORIGIN

With visions of soul-land that shine,
Till the harp of the earthly is golden
From the hand of the Author Divine.

SCIENCE AND PHILOSOPHY SUSTAIN THE RELIGIOUS CONCEPT

George Woodward Warder

15 I contend that science, philosophy and electric evolution sustain the religious concept. 2 The infinite and eternal power that animates the Universe must be psychical in its nature, and any attempt to reduce it to mechanical force must end in absurdity. 3 The only kind of monism which will stand the test of an ultimate analysis, says John Fiske is monotheism. 4 The highest development of psychical life is the end for which the world exists. 5 To the materialist the ultimate power is material power, and psychical life is nothing but fleeting collocations of natural elements in the shape of nervous systems. 6 The psychical nature of God and the immortality of the soul harmonise infinitely better with cosmic philosophy.

7 Prof. John Fiske says: "Evolution brings before us with vividness the conception of an ever-present God, not an absentee God who once manufactured a cosmic machine capable of running itself. 8 It makes God our constant support and Nature His revelation, and when all its religious implications are set forth it will be seen to be the most potent ally Christianity ever had in elevating humankind. 9 The progress of evolution now is to bring out the higher spiritual attributes and to set the whole doctrine of evolution in harmony with religion. 10 Then, the assumption that underlies all religion must be true-- that what we see of the present life is not the whole thing; that there is a spiritual as well as a material side of life; in short, a life eternal.

11 "In the whole history of evolution," he continues, "when we see an internal adjustment reach out towards something, it is in order to adapt itself to something that exists. 12 And if the religious cravings of human constitute an exception they

are the only exception in the whole process of evolution."

13 This is an argument of stupendous and resistless weight. This puts evolution in harmony with religious thought, and the great religious drift of humanity in all ages, and removes the antagonism that used to appear to exist between religion and science.

14 The French materialists of the eighteenth century virtually declared: "We content ourselves with what we can prove by the methods of physical science and we will reject all else." 15 But think how chaotic Nature was to their minds compared to our present conception, and how different the Universe they saw to what we see to-day. 16 And it is not to be wondered at that there was antagonism between science and religion. 17 Anaxagoras maintained that the human race would never have become human if it were not for the hand, and John Fiske says, "human never would have attained own present psychic powers but for religion."

18 This is truth well stated, and the fact that human is the only creature that has a hand, an articulate voice and an aesthetic nature that is never satisfied, is strong proof that human is infinitely more than a mere animal, or a transient animate machine. 19 The higher intellectual powers were dwarfed in the middle ages, when human life was made hideous by famine, pestilence, perennial warfare and bloody superstitions, fear of witchcraft and eternal torments, and people endured it because they had no experience of anything better. 20 But the change wrought in six centuries is amazing, and shows that human genius and human's possibilities are beyond our comprehension. 21 The genius of Aristotle proved that the earth is a globe, that of Copernicus showed that it was one of a system of planets, and that of Newton undertook to explain the laws and dynamics of this marvelous sun and world system.

22 Belief in God, and the immortality of the soul, and the compensations of a future life tend to maintain social order and moral rectitude, by enabling people to endure the trials and injustice of this world in the hope of ample

compensation in the hereafter. 23 Human steps forth on this revolving globe not of own volition, but is sent here by some mysterious power on some inscrutable mission to fulfill some divine purpose. 24 Human comes as a spiritual wayfarer under sentence of death. Not death to the spirit, but to the transient habiliments of earth-dust one gathers round own invisible spiritual form. 25 When one arrives and gathers own reasoning powers to scan the narrow horizon of own life, one is beset by perplexing problems of poverty, disease, sorrow, sin and death. 26 The "slings and arrows of outrageous fortune" often overwhelm human, and one discovers at last that the law of life is the law of growth and development; and all these struggles and trials are intended to evolve character and purify and ennoble the soul. 27 That this is the seed time and nursery of existence preparatory to the harvest of eternal life when one shall drop this overcoat of atoms and be transplanted to the self-luminous bosom and unfading joys of the perfected and celestial sun-worlds. 28 Here one sees incompleteness, fragmentary careers, tragedies, injustice, grieves and farewells, and one hungers for knowledge. 29 One quenchless spirit seeks to penetrate the mysteries of the Universe, and comprehend time and eternity, and in agony of soul one asks the age-old question, "If one die, shall one live again?" 30 Then, if one turn not to the pages of sacred writ for an answer, one will find written on the living pages and animated forms of all nature the promise of another life. 31 One will find it in the returning verdure of spring, in the unfading light of the eternal stars, in the ever-changing beauty of the bending skies, 32 in the mysterious impulse of the untaught birds of the air who start on their vast migrations from the frozen seas of the north to the summer-lands of the sunny south; in the tropic fish, who seek their spawning nests in the clear, cool rivers of the north. 33 The bear and lion, the tiger and elephant, the bees and the insects of a summer day, all have the longings of their natures satisfied. 34 Why should human be an exception? If the Creator of all

keeps faith with all other creatures, why not with human?

35 "As something must have been eternal," says Prof. Wright, "it is easier to suppose it was an intelligent, designing mind which was uncreated from the beginning, and which has brought the Universe into being with all its uniformity of laws and complexity of adaptation 36 than to suppose that the eternal substance was matter out of which has come the orderly Universe as we know it, with its high grades of intelligence in animals and human.

37 "The world, as the creation of a supreme intelligence, is partially comprehensible to finite minds. 38 But to suppose that the thought and purpose and will of human are products of material forces is not only a mystery, but an absurdity which cannot long be entertained by any sane mind. 39 The theory of evolution without a God can lay no claim to scientific support. 40 A theory of evolution, designed, controlled and permeated by divine ideas, may be both scientific and in accord with the highest dictates of religious truth."

41 As to the life hereafter, which the religious concept has always proclaimed, it is a fact demonstrated by history that in all ages, among all people, under all religious forms, the idea of immortality remains fixed and imperishable in the human mind. 42 Every human being in coming into this world brings with you under a form more or less vague this inward belief, desire and hope of immortality. This is God's handwriting on the human soul. 43 And the history of human, the reasoning conscience of human, is God's Bible of life written in human's spiritual nature. 44 And whatever is rational, true and good is of God, and whatever is contrary to the enlightened conscience of human is contrary to the divine purpose of God.

45 Revelation proclaims God is a spirit and human is a spirit, and after death human in its spiritual being shall live on forever. 46 The latest modern scientific thought fully and powerfully sustains the Bible. 47 It says in substance, in dealing with human we must deal with being as a spiritual being; we must go into a realm that brings us within the sphere of the electrical and magnetic relations of the elements, but on a different plane.

ORIGIN

48 First, matter in the invisible world has the same essential basis of formative power so potent in the more tangible relations. 49 Second, the invisible atoms there obey the same essential principles that in a lower grade of activity give visible results. 50 Third, there must be a direct connection between the two conditions of being-- the visible and the spiritual-- as to be axiomatic. 51 Fourth, there must be a secondary form of the invisible elements ere they assume the visible relation, which is a chemical or electric necessity. In all life this law is absolute. 52 Fifth, in applying this principle to the process of the evolution of human's form we have an explanation of how it must be a natural product of evolutionary life, 53 and that human must follow the same law as the evolution of all spirit that pertains to planetary life.

54 Spirit holds visible things in form by its connection with the magnetic life of the planet. It is the controlling power in shaping the form and organism to correspond to changed conditions. 55 The material form can only exist by keeping itself in harmony with the laws of the elements in the planet, 56 and as long as the planet endures the electric form in human and the electric or instinct form in animals within the radius of its magnetic aurora must exist as a secondary satellite, or miniature concrete expression of the forces in the planet. 57 This principle may give the electric form immortality, and, by reason of the eternal nature of the elements composing it, place it beyond the possibility of dissolution as long as the planetary relation of the elements exists.

58 But with human it goes even further, for the spirit form, having the basic principles of eternal existence in its spiritual composition and having once entered upon organic life, has in itself immortality and the power of self-sustenance from the elements in space and cannot become disintegrated, 59 for it has all the necessary material to keep it in eternal existence as an organism, though the planet should revert to its original status and vanish as a distinct form. 60 This explanation of the nature of spirit gives us a logical ground for the rational

consideration of the phenomenon that has been the basis of all the superstitions embalmed in the sacred and curious literature of past ages. 61 That human and probably all types of life have a spiritual or electric counterpart is not a scientific speculation or hypothesis merely, but a logical sequence of the forms that enter into physical organisation.

62 Here in the secondary form, says the author of "Planetary Evolution," is an explanation of the nature of spirit that follows the same principles that construct the physical body and form the same material environments. 63 And the questions of a spiritual life, apart from this principle of a secondary form, cannot be solved by any known formula of a scientific character. 64 On the other hand, the existence of a form holding the powers of thought and action upon the plane of radiant matter gives a satisfactory explanation of the transference of the mental powers that belong to planetary life. 65 The law of correlation and conservation of force prevent their annihilation, and they must exist somewhere. They are a spiritual entity, but should not be regarded as having a supernatural origin.

66 "The spirit is an evolution of planetary life and cannot be destroyed, and it is natural that its mental attachments to the planet should bring it in contact with the mental development generated there. 67 The spirit would have the power of thought and consecutive reasoning as much after its transition from mortal life as before, but it would lack the power of expression through ordinary channels. 68 It would, however, have the power of inductive electric transfer of thought, and, coming in contact with a spirit embodied; 69 this power of induction would excite the elements in the spirit embodied to equilibrium of mentality, which would give rise to a similarity of thought in both." 70 And here lies the foundation of the doctrine of inspiration which is a process of mental action whereby the mind in the body is raised to a perception and expression of ideas beyond its own range of thought as generated by the physical senses. 71 The result is the up-building of the brain organ and the uplifting of the

mentality to the purely spiritual plane, and human has thus, by the aid of the spiritual powers, made another stride forward in the domain of spiritual evolution. 72 And human is a spiritualised being with brain organs adapted to the expression of ideas that respond to the spiritual state of life.

73 It is sometimes assumed that a human cannot be a Christian and a human of science; yet there have been many people of science, from Newton to Lord Kelvin, who were devout Christians. 74 It is also assumed in some quarters that an educated person cannot believe in miracles, or answers to prayer, or special providences. But this is not a fair assumption even from a scientific standpoint. 75 Science affirms the universality of energy and law; Christian theology accepts this fundamental postulate of science and says it is the result of universal spirit and will, or Infinite Mind and volition, which is back of universal energy and law. 76 Energy is spirit and will at work; law is the mode of work. 77 Energy and law are derivative, spirit and will is the primary and ultimate force of the Universe.

78 But says the unbelieving scientist, "I accept energy and law as facts, but do not see that spirit and will are facts." 79 Christianity replies: "You mean by 'see,' mental sight; for in the physical sense you can no more see energy and law than you can see spirit and will, or mind and volition.

80 "The fact is, science is a search for the invisible or supersensible--for that which lies beyond sense and vision. 81 You call it energy and law, which we say is a result and not a cause, and point to spirit and will, which is the primitive, ultimate, first cause of universal energy and law.

82 "Would you feel it a just description of yourself if you were described as nothing but a system of energy and law. 83 Energy is action according to law. But there is psychical energy as well as physical energy, or 'a double faced' unity-- psychical on one side and physical on the other.

84 Thought, feeling, volition are all species of energy subject to laws of their own. 85 And, what is most wonderful; while they are invisible and intangible they control all physical energy in human and all

animal organisms, just as universal spirit and will or volition control all energy and law in the physical Universe. 86 Then, is universal energy and law psychical or physical? 87 If it is intelligent and works according to design and purpose with beneficent uniformity it must be psychical, and all physical energy and law is but a manifestation of spiritual energy and purpose."

88 Then says the scientist, "there may be intelligence without physical organism, and human may be in constant contact with the spiritual world. 89 But I am an organised being and cannot imagine how unorganised beings could communicate with me even if they wished to do so. I cannot imagine it as possible that I could know God, who is a spirit." 90 But Christianity answers, "suppose you are not matter only, but that you are a spirit also, and a spiritual atom of that universal spirit which controls the Universe, then could not spirit communicate with spirit? 91 Thus, you say, all science is founded on energy and law, which necessitates spiritual intelligence and will for its foundation, and consciousness for its evidence. Thought, feeling volition are forms of psychical energy. 92 We are conscious that we think, feel, will; and as consciousness is a mental or spiritual perception, human must be a spiritual being. Then we are not far from Theism-- for God is a spirit.

93 Besides energy and law we have consciousness and spirit, and no force without will. Law is simply the mode in which will works. 94 Law stands for the regular and steadfast operation of will, as opposed to variable or capricious action. 95 The uniformity of Nature is rooted in the faithfulness of God, which sustains the steadfast operation of natural law."

96 Then says the scientist, "there could be no miracles, or answers to prayer, or special providences, for these imply interference with law, which would mean inconsistency on God's part and confusion on ours." 97 But Christianity answers, "Interference with law is of continual occurrence. 98 You cannot stand up or walk, or so much as raise your hand without interfering with the law of gravitation or attraction.

ORIGIN

We can modify or direct the action of forces without violating their laws.

99 Violation of God's laws on God's part would mean inconstancy. 100 Direction of God's own energy to any point He wills-- as in evolution, for example-- is no violation of law; 101 neither are what are termed miracles, special providences and answers to prayer violations of law, but evolutions in accordance with law, as law stands for God's mode of working in the control of the Universe." 102 Then says the scientist, "I cannot reconcile the two ideas of 'infinity' and 'personality.' Personality implies limitation; infinity asserts absence of limitation, a being cannot be at once limited and unlimited." 103 "But why should we suppose personality to involve limitation?" says Christian theology. "Even in human the essential idea of personality is not limitation. 104 Personality in philosophy and theology refers not to the body but to consciousness and will. What difficulty is there in believing that the Infinite God is infinitely conscious and volitional and therefore personal?"

105 There is a mighty force in the material metaphors of the Bible, but these all stand for spiritual realities, and its fundamental postulate is "God is a Spirit," and "God is Love." 106 As human is a spiritual atom of deity. God has spiritual contact and influence with His spiritual children and they are "moved by the Spirit," and "born of the Spirit," as they accept and obey that spiritual influence which leads to righteousness and truth. 107 Religion cannot exist without spirituality and the religious concept. God has so constituted the human soul. 108 Without religion the soul could not dream of heaven or feel the sweet whisperings of faith and hope. Neither could the heart thrill with spiritual joy and truth. 109 Without religion the heaven-bound spirit could not soar to the altitudes of celestial bliss. 110 Without religion and ideality there would have been no gems of art or literature, no beautiful pictures, no living statuary, no lofty temples or inspiring thoughts.

ORIGIN

111 The grandeur of Shakespeare, the sublimity of Milton, the poetry of Byron, Burns, Tennyson and Longfellow, the romances of Scott, Dickens and Hawthorne, the noble architecture of Michael Angelo, the statuary of Phideas, Praxatelles and Canova, and the pictures of Raphael, Murello, and Reuben had never been known. 112 Ideality is the father of beauty and the inspiration of all genius, goodness and nobility and the twin brother of religious hope and faith. 113 Without religion ideality would be a mockery and a dream, hope would be a delusion and a snare, inspiration would wither, like Jonas' gourd, in a night, and the mildew of selfish materialism would convert the verdure of earth into deserts of despair.

114 John Fiske well says, "Human never would have attained own present psychic powers but for religion," 115 and without religion ideality would never have soared to its lofty heights or brought forth its beautiful thoughts, its lofty conceptions, its sublime dreams of joy, or its noble gems of art, poetry, sculpture, architecture and literature. 116 Remove the twin brothers-- religion and ideality-- from the earth, and its glory and worth would shrivel like a withered flower. 117 Its hopes and joys, its dreams of peace and love, of paradise and heaven, would vanish into the desolations of a boundless Sahara, heaped with the burning sands of doubt and scorched by the withering blast of despair. 118 The religious concept is the pilot of the soul to the fair field of heaven, the communion with the Father of the spirit, and ideality is its companion and servant who carries its cloak and staff as they journey along the pathways of earth and the highways of eternity. 119 Science and philosophy, ideality, love and hope and all the aspirations of the human soul sustain the religious concept. 120 It is a scientific postulate embedded in the nature of man and in the basic law of the Universe. 201 Ideality and religion are the most powerful forces in uplifting humanity. 121 The sublimer the ideal the more potent and ennobling its influence on the human soul. 122 Though millions grasp not its sublimity and truth, those receptive souls nearest the

light will catch its divine illuminations and reflect it to those below. 123 And gradually those below will grasp its beauty and truth and step up higher, and each in succession, step by step, will advance to "a higher plane and a broader view," and this is growth and progress toward perfection.

124 The ultimate aim and purpose of creation is ideal perfection. 125 This purpose is written in the fundamental law of evolution--progress from the lower to the higher and the survival of the fittest. 126 The higher, the more sublime, the spiritual truth, though it be ages in advance of the world's comprehension, yet its brightness and power will penetrate the darkness, and scintillate from soul to soul, 127 as the sun gleams from atom to atom, until at last all humanity is illumined and exalted.

128 When we go down into the darkness and poisoned vapours of a dungeon we seek for a ray of sunshine as we seek for life and light, 129 and we are cheered by the smallest sunbeam which enters through a crevice, for in its silvery thread of light little atoms float like miniature stars, dispelling the desolation. 130 There at our feet, left to decay and perish, may be the seed or bulb of an insignificant vine or flower, forgotten by the busy world of conflicts without, 131 where little people become great and great people become little, not dreaming of the eternal law of life and hope that thrills in every throbbing atom and electric germ in this life-evolving magnetic Universe.

132 But there in the darkness of that dungeon a struggle for life and hope goes on as important to the life involved as that of building a throne or destroying an empire. 133 Never did a hero dare or a nation fights more bravely to attain its aspirations than did that little seed or bulb lying in the darkness. 134 A slender beam of light gives it a hope of escape, and, cold and chilled, its prayer for life has slowly evolved a delicate pale vine which creeps toward the sunbeam. 135 Each day it has seen that beam of light fade and pass, and darkness and mildew paralyse it into the stupour of unconsciousness. 136 And again that sunbeam awoke it to consciousness and life. 137 At last

it reached the crevice whence came the light, and, lifting itself as a prisoner escaping from death, it springs forth into the sunshine and opens its blossoms of beauty and perfume to greet and gladden the world of light and life.

138 Thus has humanity struggled for light, and toiled for hope and joy and sunshine through a thousand ages of gloom and chilling mildew of ignorance and darkness. 139 And wherever a gleam of light and truth has pierced the shadows of life's struggles and tragedies, like the tiniest seed or fragile vine, the aspirations of human nature and own longing soul have reached up toward it. 140 What the ray of light is to the flower seed in the dungeon, religion is to human. 141 Wherever human has crept, like the vine, in the darkness, towards the light it was own religious spiritual nature and aspirations which led one. 142 Truth, which comes from the bosom of the eternal Good, streams down into the darkness and lifts human's soul up into the light by the same law that the flower and the vine seek the sunshine, and all true science and philosophy sustain the religious concept.

143 Life seems of little value when people of every nation are armed to the teeth to slay each other like mad-people, as the best way in which they can show their gratitude to Nature for the useless gift of life. 144 But they are not so anxious for war and bloodshed as their preparations would indicate. The fear of death is useless and absurd.

145 As Flammarion has said, there are only two sides to the question. When we go to sleep at night there is always the possibility that we may never awaken. Yet this thought does not prevent us from falling asleep. 146 In one case, suppose death to end all; it is but an unfinished sleep to last forever. 147 In the other case, should the soul survive the body, we shall reawaken in another world to resume the activities of life. 148 In this case the awakening must be rather delightful, as every form of life and every creature finds its happiness in the exercise of its natural energies and faculties. 149 The deep study of this important question and the disgust at the

indifference of humans to this great problem of human destiny impelled a great student of science to attempt suicide. 150 Because one saw everywhere people absorbed in their material interests, accumulating wealth, consecrating their lives to Mammon, folly and passion and neglecting their nobler natures, 151 it made one doubt their fitness for an eternal existence, and one determined to know the truth at once by plunging into the invisible unknown.

152 Prof. Albert H. Walker, in a recent lecture-- May, 1903-- makes a new distinction in philosophy and religion, when he says: "Two systems of philosophy will divide the attention and adherence of the people of the twentieth century. 153 One is the old system of Epicurus which long preceded the rise of Christianity and which underlies the Declaration of Independence; and the other is the philosophy of Christian science." 154 His definition of religion and Atheism is something modern and unique. He says: “I define religion as belief in a God who cares; and Atheism as lack of belief in a God who cares. 155 These two definitions, if correct, divide all people into two classes, and, according to this classification, most of the people in the United States are Atheists."

156 He seems to think all people believe in a God, but a majority believes in a God who does not care, and that is Atheism. 157 An Atheist has always been defined as one who believes there is no God; now they may believe in a God who does not care. This is not a very bad distinction and may be the true one in the future. 158 For modern knowledge and culture forbids any thinking human from denying the existence of a God, and this may compel modern Atheism to modify its creed and accept a don't-care God.

159 He thinks this century may find an answer to the immortality of the soul, and "it may be in the affirmative through actual communication with departed souls; 160 or in the negative by scientific demonstration that the spirit or soul of human is only a name for the electrical and chemical actions and reactions which occur in the body." 161 He also says: "The twentieth century

may show whether there is a great master hand that sweeps over the whole of this deep harp of life, or whether humans are but pipes through whom the breath of ‘Pan doth blow a momentary music.’" 162 Religion has nothing to fear from the future; materialism is vanquished and now Atheism must change its creed.

163 Canon Farrar says: "Let us think noble thoughts of God and break through the brain-spun meshes of impotent negations. 164 God is not vortices of atoms, or streams of tendencies, or earth fermentations. Heaven is not a vacuous eternity, or a future of ceaseless psalmody." 165 The Greek had own Elysian Fields, own daffodil meadows where the Eidola, the shadowy images of the dead, moved in a world of shadows; and own islands of the blest, where Achilles and Tydides unlaced the helmet from their flowing hair.

166 The Scandinavian dreamed of own green sylvan paradise hereafter, amid the barren wastes. 167 The Indian saw God in lightning, heard Him in the thunder's roar, and viewed beyond the cloud-capped hills own hunters' paradise. 168 And in the perennial hereafter in the all-life-giving sun there are green fields, daffodil meadows, golden light, rainbows that never fade, 169 glorified cities, white-robed innocence, the crown and the palm branch, the throne of serene majesty, the golden harp and the song of rejoicing, and all-abounding happiness, innocent, thrilling, intense and unending.

170 The rare and radiant physical beauties of heaven we cannot describe, but it is a place where no guilty step enters the gates of pearl, in the city of God; no polluting presence flings shadows on the golden streets of the New Jerusalem. 171 It is the dwelling place of angels and just humans made perfect, and spirits of saints in celestial glory. 172 There is no darkness, envy, hatred or slander, no gold mixed with dross. 173 No bleared and blighted crowds, degraded out of the semblance of humanity, crawl, like singed moths, around the flaring house of multiplied temptations. 174 Where boyhood shall not so live as to make its own manhood miserable;

where manhood shall not so live as to make old age dishonorable and death ghastly. 175 The apples of Sodom cannot grow on the same soil with the Tree of Life. 176 In other stars and countless worlds there may be work for us to do. 177 What radiant ministrations, what infinite activities, what never-ending progress, what immeasurable happiness, what living ecstasies of unknown raptures may surround us in the beauty and loveliness of the land of the leal, in the life supernal? 178 Heaven is not a reward but a continuity, not a change but a development. It means a place of love and goodness where we are one with God and playfellows with the angels.

179 Present science would change God into a struggle of careless forces or a complexity of impersonal laws. 180 Let us reject the Chinese idea; they believe in God, but worship the devil, because they think the devil's rule predominates. 181 Let us discard the pagan ‘deification of annihilation’, and the modern agnostic's plea for suicide, and the Greek poet's pessimistic postulate: 182 "It were best never to have been born, and next best to depart as soon as possible." 183 Let us grieve at the dark shadows flung by theologians athwart God's light upon those who believe that human reason, conscience, and experience, as well as Scripture, are the books of God. 184 Phrases which belong to metaphor, to imagery, to poetry, to emotion should not be formulated into dogmas, or crystallised into creed. 185 Discard the tyrannous realism of ambiguous metaphors, the asserted infallibility of isolated words. 186 Canon Farrar says: "Erase from our Bible the erroneous disputed renderings of the three words, 'damnation, hell and everlasting.' Not one of these three expressions ought to stand any longer in our English Bible."

187 He says further: "There has never been a human being yet since time began, however beautiful, gifted, bright with genius, or radiant with fascination, who has sinned with impunity." 188 Evil and punishment, as Plato said, walk this world with their heads tied together, and the rivet that links their iron link is of adamant. 189 It

needs no lightning stroke, or divine interposition, no miraculous message to avenge God's violated laws. They avenge themselves. 190 The hell fire of the Bible was a spiritual fire which does not burn the flesh, but purifies the spirit. 191 Not a material fire, but self-kindled fire, an internal fever-- in fact, remorse for remembered sins-- a figurative representation of a moral process by which restoration shall be effected.

192 When earthly life vanishes and we see in the visions of the soul an endless life and being in countless worlds of destiny, death has no terrors. 193 The thought of the pale, cold body enwrapt in its winding sheet, coffined and alone in the narrow grave, its last sad dwelling place, with the grass growing above, where the lonely cricket chirps through the silent night, does not disturb the calm and reasoning soul. 194 A few years hence and we shall all cross the dark river to the shadowy unknown shore and learn the mysteries that lie beyond. 195 But where is that wondrous shore, and where will all of the now living inhabitants of earth be in a century hence? 196 Not floating in the marvelous belt of atmosphere which surrounds the earth. Nor on a changeful planet like our earth. 197 Not floating in the frigid ether of space, but, if my hypothesis is correct, they will be celestial residents in the self-luminous, all-life-giving sun.

198 The only rational scientific theory that satisfies my mind is to regard the suns as self-luminous, perfected worlds, the visible abode of deity, and the future home of the soul. 199 This hypothesis accords with every recently established fact in science, Nature and revelation. 200 It fits human's hopes and aspirations, aesthetic nature, psychic powers and religious concept which have followed us through all the vicissitudes of one history.

201 The question often arises: As justice reigns in the moral world, as equilibrium reigns in the physical world, and the destiny of the soul is the result of its aptitudes and its aspirations, 202 are only those souls alone that truly live and unfold their faculties and aspire to knowledge and truth destined to a conscious

immortality? 203 Many souls pass their lives here in mental sleep, intellectual stupour, and spiritual paralysis. Will they receive the gift of eternal life? Many great scientists think they will not. 204 And all who neglect their mental and moral development seal their own fate and will have no future existence.

205 This is a distressing view held and championed by some of the able minds of modern times. 206 But I do not agree with them, for I believe every soul is a spiritual atom of deity and, however ignorant and depraved, may become wise and good, and enjoy the beatitudes of an immortal existence.

HUMAN REASON
AND THE UNIVERSE ARE BOOKS OF GOD, AS WELL AS THE BIBLE.
George Woodward Warder

16 It is a mistake to consider the Bible as the only book of God and its revelations the only revelations of Deity. 2 The natural Universe and human reason are also books of God. 3 They are books God has been writing all along through the varied history of human and the Universe, from the dawn of creation until now. 4 Human is God's handiwork, His most perfect and finished product, a machine He has been developing and improving through all the ages, a book that He has bound and rebound, and stamped upon it His name and title a million times.

5 The Bible teaches this when it says, "Ye are His epistles known and read of all humans." 6 He has named this book, this living epistle written by His own hands, "The Sons of God," "Children of the Most High," "Heirs of Eternal Life." 7 And human's body, the binding which He has furnished for this book, He has designated “the temple of the living God-- the tabernacle of flesh." 8 The Bible is not only a book of religious and ethical teaching, but also a history of the reason, conscience and experience of humans for a thousand generations.

9 The Bible is the revelation of God's mind and will, and so is human, who was "made in His image." 10 The Bible is God's

book, but so is the physical Universe His book and the revelation of His will. 11 The Scriptures affirm this truth, also, when they say, "The heavens declare the glory of God and the firmament showeth His handiwork. Day unto day uttereth speech and night unto night showeth knowledge." 12 Thus God has three books instead of one. His first book was the physical Universe; His second book was human reason, conscience and experience. 13 And then He added the third, the oracles of Divine truth, to instruct His spiritual atom, human, in the essential truths of life, spiritual being and moral perfection. 14 The theologians should remember this, and the scientists should read and study all these books.

15 Human is a second edition of God epitomised, and in one enlightens spiritual nature one thinks like God, reasons like God, and has the moral conscience, goodness and love that emanate from God. 16 All these books of God should bear the same infallible testimony. 17 The Bible should be in accord with the reason, conscience and experience of human, and both with the constitution and laws of the physical Universe. 18 Wherever they seem to differ or contradict each other it is because we do not understand them, for there is perfect unity and harmony in all creation.

19 Flammarion says: "Science in revealing the plan of the Universe will show that the moral Universe is based upon the same plan, that both worlds form but one world and that spirit governs matter. 20 The same laws rule everywhere and make the vast Universe a unity. 21 All the ages of the past and future are one with the present, and thinking beings will live eternally through successive and progressive transformations. 22 Everything progresses toward supreme perfection. 23 The material world has but an apparent existence, and the reality underlying it is a force imponderable, invisible and intangible." 24 Human is apparently an animal, but ‘being’ is not; that is the visible side of our nature and is deceptive.

ORIGIN

25 All God beholds is apparent. The reality is something altogether different. The sun seems to revolve around the earth, and the earth seems to stand still. 26 The reverse is true. We dwell upon the surface of a body revolving in space and projected with a velocity seventy-five times greater than the speed of a cannon ball. 27 We hear a harmony of sweet sounds which charm our senses. The sound does not exist; it is an impression made upon our sense of hearing by vibrations of the atmosphere which themselves emit no sound. 28 Without the auditory nerve and brain there would be no sound. In reality there is only motion in the ether.

29 The rainbow expands its radiant circle, the rose and lily sparkle in the sunshine; the green fields and golden grain diversify the landscape by their vivid colours. 30 But there are no colours; there is no light; there are only undulations in the air that set the optic nerve vibrating. 31 The sun warms and fertilises, the fire burns, but there is no heat, only the sensation of heat. Heat, like light, is only the result of motion-- invisible, all-potent, supreme. 32 Here is a solid iron joist sustaining tons of enormous weight, yet the joist is composed of molecules which do not touch each other and are in continual motion. 33 What constitutes the solidity of this bar of iron? Not the atoms that compose it; but the cause of its solidity is molecular attraction, the invisible force of magnetic attraction.

34 The present scientific theories have only been apprehended by the brightest intellects within the last half century, and would have been a conglomeration of absurdities to the wisest people of the world a century ago. 35 So, written revelation had to use the language and symbols understood by the ancients. And it seems that scientific evolution is constantly struggling for new terms to express new ideas and discoveries. 36 Some scientists believe it impossible for the terrestrial being to attain a complete knowledge of the truth because human has only five senses, and a multitude of the phenomena of nature remains unknown to human mind because human has no means by which to

reach them. 37 Just as if we should be unable to see if deprived of the optic nerve, or to hear if deprived of the auditory nerve. 38 Our terrestrial harp may be wanting in many chords which prevent us from catching the perfect harmony and truth of the Universe. 39 It is said the smallest magnet can more easily than Newton or Leibnitz discover the magnetic pole, and the swallow has more knowledge of the varieties of latitude than had Columbus or Magellan. 40 But whatever our experience, it is a part of the book of God and Nature.

41 Flammarion says: "No one who is aware of the progress made in the exact sciences of to-day can pretend to be a materialist. 42 The psychic atom, the principle of the human organism would be immortal, like atoms everywhere, if scientists were to admit the fundamental axioms of chemistry. But it would be superior to atoms, and be conscious of its existence. 43 Can the soul partake of the character of electricity? We conceive that it exists as force that survives the dissolution of the body."

44 I conceive the soul controls electricity, which is the right hand of its power, and the tongue of the spirit, 68 and survives in conscious power "the wreck of matter and the crush of worlds." 45 "Whither does the soul go?" asks the same author, and he answers "to other worlds. Yes, living principles of force can transport them from one world to another." 46 I agree with him. I believe they go to other worlds, and the other worlds are perfected sun-worlds. 47 We must not think that the soul belongs to some supernatural world. There is nothing that is not in Nature. Nature is unceasing progress. 48 It is only a few thousand years since terrestrial humanity emerged from its chrysalis state of being. Yet certain spirits have attained transcendent power, and humanity has produced a Shakespeare, a Goethe, a Hugo, a Newton, and a Milton. 49 We live in reality among the stars. We are inhabitants of the skies. 50 Life, light and eternal progress to perfection is the final end and purpose of the Universe. 51 Every thinking human feels in own moral

and psychic nature that one is linked to justice, truth and Deity.

52 Maeterlinck, the Danish philosopher, sustains this thought in his latest work when he says: 53 "Though Nature appears unjust and nothing authorises us to declare that a superior power rewards or punishes here or elsewhere, 54 it is none the less certain that an image of that invisible, incorruptible justice we have vainly sought in the sky or the Universe reposes in the depths of the moral life of every human. 55 It will not add to or take from our wealth, it will bring no immunity from disease or lightning, it will not prolong one hour the life of the being we cherish; 56 but if we have learned to reflect and to love, it will establish in heart and brain a contentment that shall still be inexhaustible and noble. 57 "It will confer a dignity of existence, an intelligence, that shall suffice to sustain our life after the loss of our wealth, after the stroke of disease or lightning has fallen, after the loved one has forever quitted our arms."

58 It is said Jesus was a chosen medium to communicate to the people of the earth the higher sentiment of love which prevails in the sphere of spirit life. 59 His mission was to teach the doctrine of love to humanity, and to afford a striking and never to be forgotten example of its violation. 60 This same Jesus taught that God's law is written in the hearts of humans, and to those who listen to His voice-- the still, small voice of the spirit-- "He moveth in them to will and to do according to His good pleasure." 61 This shows, as Maeterlinck says, "That the invisible justice that reposes in the moral life of every human" comes from God and His epistle, written on the secret tablets of the human soul.

62 Goldwin Smith says: "It will be found that Anarchism and Atheism generally went together. 63 But minds of the finer cast have preserved the religious spirit while they have thrown off the shackles of creed. 64 Yet the Positivist feels the need of a religion, and for the worship of God one substitutes the worship of humanity. 65 Humanity is an abstraction, an imperfect abstraction. It cannot hear prayer or respond in any way to adoration. 66 The adherents of Comte's religion, therefore, are few. Tindall and Huxley would

console us for the loss of religion by substituting the majesty of law. 67 But the idea of law implies an intelligent, authoritative impotent of some kind. There is no majesty in a sequence. 68 "The all-embracing philosophy of Herbert Spencer excludes the supernatural and Theism in its ordinary form, and looks upon them as the Unknowable, which he presents as an object of reverence. 69 But unknownbleness in itself excites no reverence, even though it be supposed infinite and eternal. Nothing excites our reverence but a person, or at least a moral being."

70 Thus does Goldwin Smith, the great Free-thinker of to-day, demolish the Freethinkers of yesterday, the Tindalls, Huxleys and Darwins of Materialism, the Comtes and Voltaires of Atheism, and the Herbert Spencers and Ingersolls of Agnosticism, 71 and contends for the inexorable necessity of a personal deity with intelligent moral or spiritual power. 72 He says the present tendency is "to minimise the supernatural and throw it into the background, bringing the personal character of Christ and his ethical teachings into the foreground," 73 and, "the ledgemen of reason should consider to how great an extent our civilisation has hitherto rested on religion."

74 Abstract humanitarianism and scientific naturalism do not constitute a moral standard, 109 nor can scientific postulates be made a basis for moral culture. 75 Only when acted upon by human does Nature give response to the increasing purpose of the world, and the supreme test is spiritual. 76 Religious truths are fundamental truths. First, the existence and personality of God; second, His creation and government of the Universe; third, human's immortality and freedom of will. 77 These are not contradicted by the solid facts of science nor shattered by "the great eternal iron laws of the Universe." 78 On the contrary all harmonise with these great truths.

79 Emperor William of Germany in his letter to Admiral Holbrun, Feb. 20, 1903, says: "I distinguish between two different kinds of revelation-- progressive and, as it were, historical, the other purely

religious. 80 It does not admit of a doubt that God reveals Himself continuously in the race of humans created by Him. 81 He breathes into human the breath of His life, and follows with fatherly love and interest the development of the human race. 82 In order to lead it forward and develop it, He reveals Himself in this or that great sage, whether priest or king, whether among the heathen, Jews or Christians. 83 Hammurabi was one, so was Moses, Abraham, Homer, Charlemagne, Luther, Shakespeare, Goethe, Kant, and Emperor William the Great. 84 These he sought out and endowed with his grace to accomplish splendid, imperishable results for their people in their intellectual and physical provinces according to His will."

85 Emperor William seems from these statements to be a firm believer in spiritual revelation and personal inspiration. 86 "The second form of revelation, the more religious," he said, "is that which leads to the manifestation of our Lord. 87 It was introduced with Abraham, slow but forward looking and omniscient, for humanity was lost without it. 88 Now begins the most astonishing activity of God's revelation. Abraham's race and the peoples developing from it, regard faiths in one God as their holiest possession, and it follows, hold fast to it with iron-like consistency. 89 It was the direct intervention of God that caused the rejuvenation of His people through centuries, till, the Messiah, heralded by prophets and psalmists, finally appeared, the greatest revelation of God in the world, 90 for He appeared in the Son Himself. Christ in God-- God in human form. He redeemed us, and inspires and entices us to follow Him. 91 We feel His fire burning in us. His sympathy strengthens us. His discontent destroys us. But also His intercession saves us. 92 Conscious of victory, building solely upon His word, we go through labour, ridicule sorrow, misery and death, for we have in Him God's revealed word. 93 That is my view of these matters. It is to me self-evident that the Old Testament contains many sections which are of a purely human and historical nature and are not God's revealed word. 94 These are merely historical

descriptions of incidents of all kinds which happen in the political, religious, moral and intellectual life of these people."
95 This letter of Emperor William was in reply to Prof. Delitzsch, who contended that Moses and the Israelites got their laws and religion from the Babylonians. 96 The discoveries in Asia Minor seem to refute Delitzsch, especially those at Nippur. Nippur is situated between the Euphrates and Tigris in Babylonia. It is one of the oldest towns spoken of in the Scriptures. 97 The famous temple, library and school for priests cover an area of thirteen acres, and are pronounced the most far-reaching archeological discoveries of the century. 98 Only about one-twelfth part of the library has been uncovered, out of which over twenty thousand cuneiform tablets and fragments have been obtained belonging to the era three thousand years before Abraham, or nearly six thousand years before our time. 99 These show strong evidence of civilisation and culture. There have been found evidences that freehand drawing, clay-modeling and sculpture were taught. 100 There were found works of reference, scientific treatises, and various technical volumes on astronomical and religious subjects. 101 These discoveries show the knowledge and culture that existed in the days of Abraham, and are a powerful demonstration of the unshaken truth of Old Testament prophesies. 102 Prof. Hilprecht, who made these excavations and discoveries, says: "As the attempt has recently been made to trace the pure Monotheism of Israel to Babylonian sources, I am bound to declare this an absolute impossibility, on my basis of fourteen years' researches in Babylonian cuneiform inscriptions. 103 The faith of God's chosen people is: 'Hear, O Israel! the Lord our God is one Lord,' and this faith could never proceed from the Babylonian mountain of gods--that charnel-house full of corruption and dead people’s bones." 104 The fact is, as far as I am able to judge, every recent discovery of science tends to sustain the essential truths of the Bible, and confirm the religious concept. 105 Scientists should omit

from their works all spirit of antagonism to religious faith. 106 Such antagonism impairs the usefulness of their works, and is an offence against public morals, public security, and human's aesthetic nature and psychic advancement. 107 Religion has helped to develop the spiritual life of the race, and is the anchor of all good society, good government and exemplary conduct in human. 108 The religious faith and even superstitions which some scientists rail at with such vehemence was a necessary phase of human history and experience to lift the human race to a higher plane of spiritual power. 109 Science has passed through the same phases of credulity and superstition.

108 Whiskey, wines, and intoxicants once had their useful phase 158 in arousing the sluggish brains of our half-civilised ancestors to higher realms of thought and perception. 109 So, what now seem the most absurd superstitions once had their usefulness in deterring people from crime and causing them to lead better lives. 110 The dread of physical punishment hereafter, and the fear of a hell and a devil that never existed, had a salutary effect on countless millions of the past which no moral persuasion or scientific arguments could have reached. 111 But all intoxicants with their blighting curse, and all superstitions with their blinding ignorance have had their day of usefulness and should be relegated to the dark tomb of oblivion. 112 The solemn cathedral, the soft-toned organ, the mellow light from coloured windows, the awe and anxious faith, have added soul development and psychic power to human life. 113 The mother who bowed in prayer, the father who assembled his children around the family altar, have added spiritual power to themselves and their posterity for all generations. 114 And it is the honest, home-loving, God-fearing and praying mothers and fathers of the past three centuries that have made the Anglo-Saxon race and the civilisation of to-day what it is.

115 The Bible says truly, "to be spiritually minded is life," and to be worldly minded is to lead us back to pagan selfishness, when cruelty was a pastime, and

poisoning and assassination were fine arts. 116 This book of God we call human is bound in imperishable atoms that dissolve into viewless ether, and are tied together with electric bands as pliable as silk and as invisible as thought, and the spirit they enwrap is as strong and enduring as omnipotence. 117 The statement is often made to the prejudice of religion that religion has been the cause of most of the wars and cruelties that have desolated the earth since the commencement of human history. This is unjust and misleading. 118 Until the formation of our government, church and state were united among all nations and politics and religion were blended, and a purely religious war was impossible. 119 As to the miracles of the New Testament, if they were all discredited the immaculate teachings of the gospel would remain. 120 The peculiar glory of Christianity is the regeneration it brings to human, putting one under the law of love; and without miracles we would still have vital, uplifting, heaven-inspiring Christianity.

121 As to the infallibility of science, it has nothing to boast of over religion. 122 Science has been groping its devious way from colossal blunder to blunder, and championing as many absurdities and superstitions through all the ages as ever the religious devotee dreamed or the religious concept propagated. 123 She is still teaching some of the grossest superstitions and incredible absurdities. 124 Science has received nearly every fundamental truth from religion, and is at last steadily developing and proving the true religious concept of the Universe, 125 in showing that all visible things are the product of invisible spirit, invisible law and invisible force; that the spiritual and invisible world is the supreme reality; 126 that its Creator and Ruler must be the Father of Spirits, and virtually re-echoes the words of Christ, "God is a Spirit, and they that worship Him must worship Him in spirit and in truth." 127 It teaches universal love, helpfulness and equality, which was demonstrated by Christ when He called for water and washed the feet of those who

worshiped Him. 128 This was His last object lesson, so little understood in Christian philosophy. 129 But ethical and psychic science have lifted it to be the glory of perfected civilisation, and endorsed the exalted truth, "Let him that is greatest among you be the servant of all."

130 All knowledge and truth are in a sense inspired revelation from God, whether written in Nature or the human soul. 131 There is scientific revelation written in physical facts and recognised by the senses; 132 there is God's revelation written in the secret conscience and reasoning power of human, and they naturally sustain and supplement each other and the revealed truths of the Scriptures. 133 It may be that the first chapter of Genesis was not intended so much as an infallible record of the divine order in the creation of the world 134 as to teach the vastly higher spiritual truth that creation is the work of God, thus leading people to His worship and away from the lower worship of sun, moon and heathen deities. 135 The mechanical conception as to the mode of inspiration and revelation tends to give way before a larger conception of the process-- that God speaks to human through the experience of the events of life. 136 Thus revelation becomes a living process, and all later history may become a commentary on sacred history, renewing and confirming the primal utterance of God to the soul of human.

137 The reign of law, which was little understood by the ancients, is now universally accepted and endows the human race with new powers. 138 It also gives new conceptions of the "intelligibility of Nature," which is but a modern scientific term for religion or the reliance on the will and wisdom of Creative Deity. 139 Herbert Spencer's "persistency of matter and force" is but another expression of the reign of law. 140 And as law is the result of an intelligent spiritual concept and impulse, the lawmaker of the Universe must be a supreme, intelligent, spiritual personality. 141 And the reasoning, intelligent soul of human, by discovering the immutable laws-of-Nature, which are the unchanging decrees of Deity, has learned the art of

controlling the great powers of Nature for the use and convenience of human. 142 But in the ultimate analysis it is God's spirit and will that control the Universe, and human's spirit and will which evolve the art of controlling, and masters the great powers of Nature. 143 Therefore, we must look to the powers of the mind to subdue all other powers. 144 This it does by constructive reason and vitalising faith. By constructive reason it builds bridges, tunnels mountains, operates engines, telegraphs and all the appliances of modern commerce. 145 By vitalising faith it renews and strengthens body and soul, and seems to work the miracles of God.

146 Prof. Osler says: "Faith is a most precious commodity. Faith is the great lever of life. Without Faith human can do nothing, with it all things are possible. 147 Galen says: 'Confidence and hope do more good than physic.' 148 Faith in the gods or the saints cures one, faith in little pills another, hypnotic suggestion a third, and faith in a plain, common doctor a fourth. 149 In all ages the prayer of faith has healed the sick, and the mental attitude of the suppliant seems to be of more consequence than the powers to which the prayer is addressed." 150 Miracles, says criticism, belong to an age of ignorance. With the dawn of knowledge they diminish. In its meridian light they disappear.

151 The Jews were eminently addicted to belief in miracles. With them there was satanic miracle as well as divine. 152 They believed in persons being possessed by devils, and all efforts to disentangle them from the demoniac miracles and to resolve them into cures of lunacy by moral influence was vain.

153 Comte totally discards belief in God, but, feeling the need of a religion, substituted the worship of humanity. 154 Humanity is an abstraction by itself, but combined with the Christianity and the monotheism of the New Testament, it is the perfection of ethics and religion. 155 They who preach the religion of humanity, morality and true socialism will find it more perfectly taught in the New Testament, with nobler incentives and higher inspiration

and spirituality, than elsewhere in human history. 156 And it accords more perfectly with the book of truth, written in the reason and conscience of human.

157 Prof. C. F. Kent of Yale, says: "There is no conflict between science and religion. 158 The Bible does not pretend to teach science, but does speak with authority with regard to questions of morality and religion. 159 "The pathetic fact is that the fundamental spiritual truths the Bible narratives seek to teach are lost sight of in the contention for historical accuracy, which was entirely secondary with the authors. 160 The prophets used ancient narratives, the same as Jesus used parables, to illustrate spiritual truths."

161 Dr. Beet, of Wesleyan College, England, denies that either "the endless suffering or the extinction of the wicked is taught in the Scriptures," and says: "Very few Wesleyans now adhere to Wesley's teachings concerning it."

162 The essential truths of the Bible are just as true without miracles as with them. 163 Christ said a wicked and perverse generation seeketh a sign or miracle. 164 Truth is inherently true and needs no miracle to confirm it. 165 And the tendency of all ancient writers, as well as those of the Bible, to exaggerate natural phenomena into wonders and miracles causes many to discard the great truths of revelation. 166 I undertook to show how Joshua might have mistaken a luminous aurora borealis for the sun standing still. 167 And I am inclined to think that a mistranslation is responsible for the story of Jonah and the big fish. 168 Somewhere in ancient history I got the idea that the pirate boats in ancient times were called, "the big fish." 169 If so Jonah might have been captured by the pirates after being thrown overboard, and put in the hole or belly of the boat, and after three days, seeing no prospect of a ransom, was thrown onto the land. 170 God may have prepared the pirates and boat for this purpose and a miracle would be unnecessary. 171 The writers of that day would say Jonah was swallowed by "the big fish," meaning the pirates captured him, and centuries afterwards the translators would make a great

miracle out of it. 172 Take many of our modern expressions, as, "the ship and sailors went to Davy Jones' locker;" if centuries hence our language should become obsolete, the translators would say, "the ship was in a great storm, and it and the sailors were all saved by running into David Jones' big chest." 173 That would be a literal translation, but would not state the facts. 174 Take another illustration. In the war, "a company was lost in the woods and was gobbled up by the enemy." A future translation would read, "a company of soldiers was lost in the woods and a ferocious turkey gobbled and eat them all up." 175 Either of these would make a greater miracle than Jonah and the whale. 176 I mention this to show how easy it is to mistranslate an obsolete language, especially an Oriental language, always so full of figures of speech, hyperbole and parables.

177 There is the wonderful capture of the city of Jericho. When the Israelites, under Joshua, marched round it seven times, and blew seven long blasts on their rams-horns, the walls fell. 178 Now, the spies may have reported to Joshua the weakness of the walls, and, by marching round them seven times, caused the people of the city to crowd onto the walls, and the vibrations of the horns caused them to fall.

179 We know that the vibrations of thunder or cannon or any loud noise has caused many a house to fall, and would endanger any weak building or wall. 180 I believe that if every miracle in the Bible was disapproved or shown to be a natural event it would not destroy or affect a single important truth it teaches. 181 While I believe the brave and honest person will refuse happiness at the expense of truth, I must partly agree with Luckey, the historian, who says we owe more to our illusions than to our knowledge; 182 that superstition appeals to our hopes as well as our fears, and often meets and gratifies the inmost longings of our heart. 183 Imagination, which is altogether constructive, contributes more to our happiness than reason, which is mainly critical and destructive. 184 He says: "The rude charm clasped by the savage, the sacred picture protecting the poor man's

cottage, can bestow a more real consolation in the darkest hour of human suffering than the grandest theories of philosophy." 185 This was more distinctly true in the early history of the human race, when ignorance and superstitious wonder dominated all minds and all important events were deemed supernatural or miraculous.

186 Take the superstitious worship of the Virgin Mary; its beneficence to the human race is beyond all human calculation. 187 It helped to elevate and spiritualise woman and lift her offspring and the generations of humans to a higher spiritual plane. 188 Romantic love between the sexes was never known, so history teaches us, until the worship of the Virgin Mary became universal throughout Christendom. 189 No such sentiment existed in Greece or Rome or any pagan country, and none exists now in any pagan or Mohammedan land. There women are still treated as chattels and denied a soul. 190 We should remember that for human all religions were instituted, all books written, all science formulated, all literature ennobled, all progress inspired, and all art made beautiful.

191 Human reason, the perfection of the Universe and the words of revelation all teach--

192 Human's soul is part of Deity,
and as immortal as its Creative God.
193 Death is but a shadow across its
path of destiny.
194 To the soul there is no grave; the
tomb cannot grasp its viewless form;
195 Earth is but its birthplace--the
cradle of its infancy--
196 Where it drops its cumbrous
wrappings for the wings of
immortality.
197 Time, the vestibule of eternity, is
where it points its course and takes
its leap
198 Into the vast unknown toward
the Infinite and Eternal, and sweeps
199 Out upon its endless progression
in knowledge and perfection
through immensity of worlds.

ORIGIN

LOVE IS THE ELECTRIC LAW OF LIFE: ALL THAT LIVE MUST COME FROM LOVING
George Woodward Warder

17 God is love, and love is the law of life and the creative force of the Universe. 2 The love of God in the soul is the substance and life of all religion. 3 The love of fellow-human in the heart is the foundation of all human kindness and social ethics. 4 As Dante followed his beloved Beatrice from world to world until he found her at the gates of Paradise, 5 so we must follow our loves and ideals through all the tragic incidents of existence until we find them as guardian angels at the gates of celestial glory and creative perfection.

6 A noble character, a worthy and useful life of service to others is the chief purpose and crowning glory of all earthly existence. 7 Wealth and fame are mere incidents in the fleeting drama of human experience. 8 All true greatness is in the beauty and grandeur of the soul. It must come from within; external manifestations may shadow it forth, but cannot produce it. 9 All true gentleness and kindness are a reflex of the inner life of love and willing service. 10 We live in the atmosphere that our thoughts and spirits breathe around us, and by opening the windows and doors of our soul to love we inhale the perfume from other souls, and the breath of life from Deity Himself.

11 Thoughts are forces, and through them we have creative power; but they must be winged with love to manifest divine energy. 12 Every act is preceded and given birth to by a thought, the act repeated forms the habit, the habit determines the character, and character determines the life and destiny.

13 Everything in the material Universe has its origin first in the spiritual concept or thought, and from this it takes its form. 14 The spoken word and the mighty deed spring from the potency of living thought, and life is a tireless swimmer in an ocean of thought. 15 Thought is the conscious energy of the soul, the subtle, invisible force of the reasoning, resistless mind, and, to be potent with life, must be winged with love.

ORIGIN

16 Thought is everywhere and surrounds us like the atmosphere we breathe. 17 When we want a thought we should reach up into the air for it with the caressing hand of love, and it will come like an invisible messenger from spirit land. 18 We should seek thought and wisdom in the intellectual zenith of our own minds, and not from mediums or clairvoyants, for they have never revealed any great truths.

19 Thus our great poets, sages and prophets have reached up into the spiritual altitudes and gathered wisdom and truth as the stars are gathered and sparkle in the glittering mirror of night's far off and measureless spaces. 20 They come with the speed of light from all suns and spheres in the jewelled crown of God's eternal expanse of love and life, 21 they whisper wonderful things to the listening spirit in the silent chambers of the dreaming soul, 22 and they come like angel faces in the visions of night and paint with the flaming finger of anticipated joy the glorious beatitudes of immortality and love. 23 There is the science of thought which brings wisdom and success, and the science of love that brings peace and joy. 24 It is a beautiful thing to live. Life is the fine art of the soul, the literature of the spirit, where it writes its hopes and achievements. 25 It is the theatre of all possibilities here and hereafter, but its atmosphere must be magnetic with love and faith where the spiritual forces may battle and exert their powers. 26 We must first love all the world if we would have the world love us. 27 Only what comes from the heart can reach the heart of the world, for humankind will care little for us unless we show we care for humankind. 28 But what human earnestly desires and persistently wills and strives to accomplish through love will finally be attained. 29 Love and goodness are all-powerful and will eventually conquer.

30 The first cause of all discontent, weariness, bitterness and vanity of life is selfishness. 31 It is the corrosive element that rusts away all the pure gold of energy and aspiration. 32 It is as amazing as sad that we burden ourselves with selfish strivings that are of no

consequence, and miss the gladness and exhilaration of living. 33 For no life is successful unless it is radiant with love and usefulness. 34 Emerson says: "Life is an ecstasy and nothing else is really worth living. 35 Happiness is not determined by a bank account or the flattering incense of praise, but is a mental and spiritual condition."

36 Ye who seek liberty know this; it can only be found in the liberty of your fellow humans. 37 Ye who seek happiness know this; ye can only find it in the happiness of others, and if you desire to be happy you must make others happy. 38 This is God's eternal law of compensation-- of altruism-- love to others; what you do unto others you do unto yourself. 39 Look upon thy fellow human with wisdom and thou shalt have love. 40 Feel for thy fellow human with love and thou shalt have wisdom, and, having wisdom and love, thou hast God and heaven in thy heart. 41 These are the golden rules of the New Testament, written in the reason, conscience and experience of humans, as God's living book of wisdom and truth.

42 Every action has its rebound or echo. Others will return your love or hate as the mountains return an echo, and by the same law. 43 "Whatsoever a human soweth, that shall one also reap." The hate you send forth will return to you, the love you gave will come back to you, for it is an immortal part of you and a part of Omnipotent Deity.

44 If you are sick, love! If you are envied, hated and slandered, love! If age and death steal upon you, love! 45 For God is love, and heaven is love, and love is life eternal. This is God's law, this is the law of human's nature, the law of the New Testament, the law of love and life, the law of the Universe.

46 Whatever may be person's misfortune, if one has a love of humanity, a love of literature, art or Nature, one has resources of happiness that nothing can remove. 47 With these the poor person is rich, and the rich person can never be poor. For each by love has overcome the world. 48 Therefore believe and love, and hold fast to the conviction that the forces of life are divine and

eternal, and their laws written in the reason and consciences of humans, and that death is only a transition from our world to another of greater beauty and perfection. 49 The inadequacy of earth-life to satisfy the soul's capabilities is evidence that its career must continue hereafter in brighter worlds of celestial love and destiny.

50 It is said the common epitaph of humanity is, "They mean well, try a little and fail much." 51 But if love is their guiding star and they obey the dictates of their reason and conscious duty, their lives cannot be failures. 52 Most of our troubles and cares, like echoes, do not exist until we call them forth. 53 But sweet, subdued sorrow, and the tears of love and sympathy that spring from the generous heart to the soulful eyes, are like heavenly dews, and promote the growth of the soul. 54 They should not be classed among the depressing trials. Neither should friendly rivalry, or laudable ambition to excel, be deemed trying aggressions, for they are beneficial phases of growth. 55 Humanity should emancipate itself by hitching its chariot to the star of love, and switching the current of human energy from the circuit of worry and anger, and connecting it with the motors of good thoughts and noble deeds.

56 All humans should realise the fact that anger turns the natural juices of the body into poison 83 as the vibrations of thunder sour the sweetest milk. 57 And every fit of anger is an electric trip-hammer that drives a nail into the coffin of life and shortens human existence. 58 All nature reveals the law of "natural selection and survival of the fittest," and demands in human the highest perfection of love, beauty and self-development. 59 The culture of the divine essence of the soul, love and ideality will eventually emancipate, exalt and ennoble human life. 60 Love is the beginning of life. Love is the creative agency of all human and animal existence. 61 Even the vegetable world, trees, shrubs and flowers have their dual, sexual amities, and their male and female blending in the love of unity and the unity of love, and thereby propagate and continue their

species in the ever changing cycles of life.

62 All that live must come from loving. 63 The positive and negative circles of electric and spiritual forces in man and woman must be broken and reunited in a combined circle of dual vitalising growth and power before God's first command, "be fruitful and multiply and replenish the earth," can be consummated. 64 God has so organised the Universe that love brings life and continues it, while hatred checks all the sweet gushing juices and joys of hope and life, and, brings death and darkness. 65 Love commands the electric creative forces of human life as God commands them in the boundless heavens. 66 Love is the elemental part of God, and the godly part of human. And one whose soul is diffused with love is enwrapt in the effulgent drapery of Divine goodness and joy.

67 Woman by Divine right and the Supreme decrees of destiny is the ministering angel of love and life, and is next to God the Creator and Preserver of the human race.

68 All that live must come from loving
69 In the hallowed name of wife,
God has set the bounds of being
And the joy of giving life.

70 Some very strong writers believe human's body is the product of the thought and mental force of own progenitors. 71 If so, the mental impulse of love, and even its lower form of animal passion, is the begetter of the human race. 72 Mrs. Josephine Barton, in "Mothers of the Living," declares, "The history of flesh has its beginning in the male atom, and exists as an unembodied idea in mental solution. 73 Thinking results in ideas and ideas crystallise into form. Thoughts are the blocks out of which children are made. 74 The physical gets its breath of life from the mental or spiritual. 75 The first avenue of development after its appearance in form in the male parent is the daily and hourly thinking, exercised in the mentality of the parent. 76 These atoms, though microscopic, are the brain and spinal cord of the atom human. 77 The product of the male element is

judgment and will, of the female love and intuition; so the atom man crystallises only the seat, brain and nerve faculties. 78 This structure-- temple of the soul-- like the acorn, has inherent within it growth and fruit possibilities." 79 She arouses useful thought and adds with force and eloquence, "All men are, by their daily thinking, moulding the brain and spinal cords of future men."

80 "O men of earth! what qualities are you weaving in your thread of thought? 81 Of what substance are you moulding the grand army of the future race? Are you endowing them with the intellect of true manhood, or crystallising into atoms all manner of distorted brains?

82 "Our bodies are bulletins of our thoughts, and the male atom is the microscopic beginning of childlife, and when expelled from the loins of their progenitors, become the 'living souls' that people the cities and the plains. 83 The human atom thus formed, when imparted into the custody of the mother, is ready for the breath of life which the mother mind, by love and intuition will breathe into it. 84 The temple for a human soul is thus constructed. The nourishment then given is as pliant to thought as the ocean to a raindrop, and prenatal education is most important.

85 O splendid fact! Be lifted up, thou expectant mother of the living! You are at liberty to take the helm of possibility and steer for the sunlit isles where all sons are gods. 86 The mother should be herself what she would have her child be. She should affirm and reiterate. 'I am the heir of all wisdom, the expression of all beauty, the revelation of love and truth, the life proclamation of the Eternal. 87 I am serene, radiant, valiant, loving, aspiring, knowing.' Then will all conceptions be immaculate and all human life glorious and divine."

88 I maintain that woman is the prototype of the godmother of the Universe, who is the third person of the Trinity, known as the Holy Ghost or Comforter. 89 The Trinity of the theologians-- three persons in one-- is contrary to all human reason and logic. 90 It contradicts every type of being in universal creation, and would be a monstrousity in natural law and

creative experience. It defies all analysis and subverts all law of animate and inanimate nature. 91 God never thus contradicts Himself, His own laws, and His created Universe, or the book of nature and human's reason; and no such doctrine is taught in the New Testament, when analyse by a true construction of language.

92 To deny the Trinity was a crime punished by death long ago in England; and ecclesiastical authority there and elsewhere prescribed what human should believe for centuries, or receive the punishment prescribed by law or the Inquisition. 93 Until recent times people were not allowed to think for themselves. But reason and truth, written in the soul of human by the finger of Deity, will assert its divine right to correct the blunders of ignorance and superstition. 94 And as it was many ages before the fatherhood of God and the brotherhood of human was discovered and recognised, so it required modern intelligence and reason to place woman in her true and God-given position; 95 and recognise in God the Father, God the Son and God the Mother, the same natural trinity in heaven as exists on earth in father, mother and child. 96 The book of Nature, and the book of human's reason asserts there can be no father or son without a mother. 97 They would be an anomaly in Nature, unthinkable and impossible, and if there is a Father and Son in heaven, there is a Divine Mother, who has always been there as the companion and counselor of Deity, and is also the Divine Comforter of all human souls. 98 And if there is sex in all nature, it is reasonable to believe there is sex in the family of Deity. 99 When Christ said, "I and my Father are one," he meant one in purpose and spirit.

100 Up to the recent centuries, woman was the chattel slave of man, kept in ignorance and degradation, and deemed inferior to man, and the past ages would not recognise her divinity, or her equality with man. 101 But now she stands on a level with man, heart to heart, and brain to brain, and every true man offers her the tribute of love and reverence, 102 and recognises that in all the realms of earth and stars there is no being so worthy of love and

worship, next to Deity, as the mothers of men. 103 They are the saviors of humankind, whose vicarious suffering has brought forth and redeemed the generations of humans. 104 They are the trees of life in God's earthly garden, whose branches, ladened with the fruits of love, have called forth the mysterious blossoms of being to bloom in the fields of time and people the land of immortal spirits.

105 The beginning of civilisation was when the mother bid the rude men of the forest and hill to build the needed shelter in grove or cave to protect her and her helpless offspring. 106 And from that simple shelter or thatched-roofed hut has sprung the vine-clad cottage, and the marble palace, and the family roof-tree of every house in every land. 107 It was the mothers of men who filled up the broken ranks of war, and brought peace, and wove garments, and refined and civilised man and taught him the arts and commerce of civilised life. 108 And could the mothers control the destinies of nations, their loving hearts would banish war, and peace would be universal. 109 And the most precious heritage of every nation on the green earth is the nobility of its mothers, for without noble mothers, it can have no worthy and manly men.

110 All nations should recognise this fact, and instead of giving pensions to those who destroy life, they should give them to those who multiply and replenish it, and make a nation worthy of existence and fame. 111 And God will surely bestow on the mothers of men a crown of eternal glory for every life added to His empire and domain of deathless eternities. 112 The momentous question arises in this busy age of travel and pleasure, when so many seek the luxurious ease of opulence and avoid as far as possible all cares and responsibility, 113 Will the emancipated womanhood of our land deny the law of love and life, written in the heart and conscience of all sentient beings, and decline the angelic ministrations of maternity? 114 Will they refuse to join in the economy of God and Nature, or leave this high and holy vocation to the ignorant and superstitious of our foreign

element? 115 If so, the citizenship of our beloved nation will degenerate with each succeeding generation. 116 Will the modern woman seek social pleasures and the flattery of passing admiration in lieu of home life and maternity, and be satisfied to flutter as a gaudy butterfly of fashion? 117 Will her womanly heart find the prattle of a baby voice and the pressure of its chubby hands upon her smiling face, as it crows in her loving arms, a truer, sweeter pleasure than the social triumphs of a few fleeting seasons? 118 A joyous child brings more pleasure to a household than a marble palace with mahogany furniture and an automobile.

119 This is the all-important woman question of the future-- the question of race suicide. 120 For the entrance of woman into all the vocations of business life, the tendency to avoid domestic cares, the laxity of the marriage vows, together with the elimination of homes for boarding houses, and the prevalence of divorces, makes it a serious question for the future. 121 Already this pressing vital question causes the wisest men of France to tremble for the future of their race and nation, for its shrinking population is forcing it from the rank of a first-class power to the humiliation of weakness and decay. 122 Will they listen to France's Macedonian call and the law of love and life written in their womanly natures?

123 Humanity of the past and present is not final. It shall not cease at the present development. 124 Human society was never static. We are at the beginning of the greatest changes in human history. 125 There will be no shock, but the transforming, silent touch of universal evolution, whose voice speaks thus: "We are the creatures of twilight, but out of our minds and the lineage of our minds will spring minds that will reach forward fearlessly. 126 A day will come-- one day in the unending succession of days-- when the beings now latent in our thoughts, hidden in our loins, 127 shall stand on this earth as on a footstool, and they shall laugh and reach out their hands among the stars." 128 It is said that the flower which opens and smiles upon the brink of an abyss is like love,

which lives also between two eternities. 129 It is the most human of the passions and at the same time the most divine. 130 It is the most intimate and the most ethereal; it guides the poet when he scales the skies and lifts the soul to celestial raptures.

131 The gifted and the common mind are alike troubled, agitated and exalted by this divinity who evokes their silent passions and stirs their slumbering fancy. 132 Many animals change their form and colour in the season of love, and human is similarly affected in own psychic nature. 133 Every human and divine element responds to the witchery of the god of love. 134 And new colours in thought and character appear, and the glowing eye glistens with changing smile or tear, like dewdrops on the jewelled face of morn. 135 The first touch of poetry lights up the prosy brain, the first ambitions, brilliant hopes, struggles, flashes of genius, and heroic resolves spring forth like living phantoms at the magic power of this matchless magician of the soul.

136 Woman, far more than man, is reared in the regions of love, and has more leisure to reflect on the secret movements of her heart, and to gather the wisdom and beauty of love and distill it as the rarest perfume of life. 137 Love is woman's crown of divinity. 138 Love lifts human to one highest capabilities, noblest enterprises and loftiest ideals, and makes one monarch of a larger and more beautiful world. 139 The history of man shows how gross and abject natures are transformed by love. 140 How dull and stolid minds have been guided by it to paths of honor and glory. 141 It is said that fame and science should guard themselves from love as from a dangerous enemy, and that to be a great person one must love their art alone and be wed only to their great ambitions.

142 Ah! but for one genius killed by love, a hundred owe to it all their greatness and inspiration and the moving force of life, and bless it as superior to fame and sweeter than all the laurels of victory or the plaudits of success. 143 All the glory of art and science, of thrones and crowns, is inspired by the love

of woman. 144 This was openly proclaimed in the heroic and chivalrous ages and should still be held in grateful remembrance. 145 If love does not always elevate and refine and work the miracles of its magic, it is because men lower their ideals of women and love. 146 Woman has a stronger thirst after the ideal, a more refined sensibility, exquisite fancy and poetic nature and aids man to mount to loftier actions and ideals. 147 In a beautiful picture, Dante is below, Beatrice above; he looks at her and is thus inspired, while her eyes, fixed upon him, seem to say: "Upward, upward; it is thither we must go together!" 148 It is said nothing is so irresistible as the enthusiasm of woman. 149 Without reason for believing, without strength for hope, sustained solely by love, she is always full of faith for the great and beautiful things, and with sublime imprudence cries, "Forward, forward!" and drags man to the most difficult summits of success.

150 A wise man says: "In the great and little things, after having consulted science and art, experience and imagination, after having read history and human hearts, also always consult the woman you love, 151 whether it be a question of a book or a law, or a work of art, or of business, industry or poetry. She will certainly have something new to tell you." 152 Ambition often fails to elevate men, they die without having attained their full measure of power. 153 Only the love of woman could have given them the energy which ambition and self-love were powerless to bestow.

154 In the past ages the world prated much about aristocracy. There have been four kinds of aristocracy in the world's history. 155 There has been the aristocracy of muscle-- the supremacy of brute force. This was followed by the aristocracy of blood or family pedigree, by which one claimed by inheritance superiority over others. 156 Then came the aristocracy of wealth, which prevails in our day, whereby those who obtain fortunes by birth, accident, parsimony, force or fraud, claim superiority over others less sordid or less fortunate. 157 But the true and only aristocracy that ever has or ever will exist in the human race is the

aristocracy of love and goodness. 158 There is nothing so kingly as kindness, nothing so royal as truth, and nothing so godlike as love.

159 The aristocracy of muscle has brought misery and distress and cursed the world with cruelty and oppression; the aristocracies of blood and wealth have often brought sorrow to their possessors, and proved a rope of sand, a broken reed, a Jonas' gourd that faded in a night. 160 But the aristocracy of love and goodness is God's aristocracy, and belongs to the society of heaven. 161 It is a part of the family of Deity, and possesses the wealth of the Universe. 162 It is the pride of celestial hosts, and the joy and blessing of transient mortality. 163 The humblest of earth may join this aristocracy of love and goodness and be a prince and king in his own right, by royal prerogative as eternal and enduring as the earth and stars. 164 Thus we find that love is the spiritual and electric law of life, and the crown-jewel of the Universe; 165 that love gives life and inspires it; that all the creations and forces of Nature are dual and sexual, with love as the supreme sovereign of all life and destiny.

166 Magnificent are the pyramids of Cheops, but while they and the groves of gods and pillars at Karnac were being reared for a tyrannous nobility and priesthood, twenty thousand common people agonised and died in the quarries. 167 Beautiful was Athens, "The City of the Violet Crown," when the sunlight flashed from the Parthenon; but Aristides was banished because he was just, and Socrates was murdered because he taught the oneness of God. 168 Rome sat on her seven hills and ruled the world; but men were butchered in the arena to make a Roman holiday, and at night Christians were burned for torches to light up Nero's golden house. 169 All this was because love had not exalted the ideals and energised the wills of humans.

170 In the middle-ages the sounds of the chisels carving the marble dreams of Michael Angelo was drowned by the shrieks of victims of the Inquisition; 171 and later in England, villains and serfs, even after Magna-Charta, were hanged

for stealing five shillings. 172 In our own land Cotton Mather tells us people were crushed by heavy stones upon their breast, as punishment for petty offences, and witches swung in the breezes of Salem; and sometime ago human slavery was sanctioned by law. 173 All these horrors and the cruelty of the world have been because humans have not let love illumine the soul and energise the heart of humanity. 174 To-day all this is changed. The ægis of the law protects the humblest citizen, and the fate of nations is decided not by a Hannibal or a Charlemagne, but in legislative halls and courts of justice. 175 And all people may work and hope, for fame is waiting with willing laurels for souls aglow with the fires of love and genius, who are destined to be torch bearers along the highways of heavenly harmonies.

176 The heaven of all the heavens above,
The god of all the gods is Love.

177 Carlisle, that rugged old thinker, declared that human should imitate own maker and "Create, create, create." 178 This is the chief object of life. Not alone in the propagation of one race, but to build houses and temples, erect monuments, write books, fertilize deserts, and cause the earth to blossom with new flowers of fragrance, and new thoughts of beauty. 179 In order to thus glorify life and make it a divine ecstasy and a stepping-stone to celestial worlds, love must be the guiding star, and will the creative-impulse. 180 These two are the sovereign forces of the Universe in human and Deity; and uphold and control all others. 181 Therefore human should make love and truth own ideals, and will his sceptre of power, and with each rising sun proclaim:

182 "These two things should no human forget or lose
Or sacrifice: your will and your ideals.
183 These two things are the human. In leaving them
Behind human in the dust of broken dreams
184 Human leaves oneself your nature is usurped.
The lesson of all greatness is to be

ORIGIN

That which we are-- out to our farthest bounds.
185 To lift the high within us higher still--
To delve our depths with a profounder depth--
To push the near horizon of our minds
Out past immediate things to ultimate."

JACOB'S LADDER
IS THE ELECTRIC PATHWAY
BETWEEN SUNS AND PLANETS

George Woodward Warder

18 I contend in my previous books that electricity and not gravity is the one fundamental form of energy from which all other forms, such as light, heat, vital force, physical life and gravitation are derived by transformation. 2 That electric energy is the one evolving creative force in the physical Universe, back of which is the directing, intelligent, spiritual power of Deity, who has made all visible things of one matter-- 3 the invisible atom, controlled by one invisible power, electricity, after one unchanging pattern-- the electro-magnet.

4 This necessarily teaches that the sun is not hot, that all heat, light and vital force is produced by the contact of positive and negative electricity in the dense atmospheric cushion of suns and planets, where alone it is needed for vegetable and animal life. 5 All of which is produced by the positive electric currents of the sun coming in contact with the negative electricity of the planets, 6 just as two wires oppositely electrified and brought together produce the arc and incandescent electric light.

7 I contend that the suns are the self-luminous, perfected worlds of the Universe; worlds like our world, only larger and more prolific in life and power than the planetary worlds. 8 That they are the headquarters of Deity, and the future abode of human. 9 This leads to the reasonable scientific hypothesis that our all-life-giving sun is where Christ ascended to, when the Disciples saw "a cloud receive him out of their sight;" 10 where Elias was translated; where

ORIGIN

Paul was "snatched up to the seventh heaven"; where Saint John in the Apochalyptic journey saw "the new Jerusalem-- the City of God." 11 This wonderful city, from scientific facts and analogy, exists in the sun and could be nowhere else, and seems to be so represented in Revelations, and its description is grandeur than all the romances of earth. 12 This gives the most reasonable scientific explanation of Revelations and the eternal beatitudes of the Christian's life everlasting, while at the same time it recognises the law of evolution, and proclaims there is nothing supernatural in the Universe.

13 I contend that the sun's photosphere is a brilliant, globe-encircling aurora; that the planets are the hatcheries of human souls, and the suns the place of their maturity and perfection; 14 that all things are composed of atoms and electricity, which are as invisible as the soul. 15 That the soul is an invisible atom of Deity, and, like invisible atoms and electricity, may pass to and from the sun.

16 In showing the terraced mountain on which the city in Revelations was built accorded with the proportions of the sun as compared with the earth and moon, a simpler illustration would be this: 17 The sun's diameter is 110-times that of the earth, and as the earth has mountains six miles high, the sun should have them 110-times higher, which would be about 700-miles in perpendicular height, making about 1,200-miles measuring the slope from the base to the apex. 18 Or, if the mountains in the sun are as high in proportion to diameter as those on the moon, the mountains of the moon being three miles high, and the sun's diameter being 400-times greater than the moon; the mountains of the sun should be 1200-miles in perpendicular height.

19 Up to the last few centuries all standards of measurement were indefinite. The cubit, fathom, and foot all depended on the size of the person. A furlong was originally a furrow in an English field, and might be 300 or 800-feet in length. 20 All these measures have been made definite by law or custom since the Bible was written. 21 But the word translated ‘furlong’ was the Greek word ‘stadium’, which

was the length of a Greek foot race which was 520-feet (except in two instances); 22 while a present furlong, the eighth of a mile, is 660-feet, making in 12,000 furlongs a difference of about 320-miles, 38 making John's wonderful city 1,180-miles square. 23 The ancient furlong was about what I put it-- the tenth of a mile. 24 Critics should inform themselves before displaying their colossal lack of information.

25 I contend that over ninety percent of the Universe is invisible matter. This invisible matter floats in all space and permeates all visible matter as water permeates a sponge. 26 All matter in its primary and elementary form is invisible, 44 and, being invisible, it partakes of the characteristics in this respect of invisible force and invisible spirit. 27 These three invisible entities constitute the Universe, its center and circumference, its invisible realities, its eternal foundation and limitless boundaries. 28 Only one of these-- matter-- by a vast aggregation of atoms, is converted from the invisible to the visible. 29 This Universe was made from nothing-- nothing visible, nothing tangible, nothing the human eye could see or the human finger could touch. 30 There was a time when the stars and planets, suns and worlds were transparent ether, as impalpable as the viewless air, and scattered as star dust in the measureless void of space along the forgotten highways of the past eternities. 31 Silence reigned profound in the pulseless regions of the air, where, motionless and dumb, the atoms hung in dark and lifeless space. 32 There was nothing in all this Universe-- nothing but cold, darkness and silence. 33 But these are the home of atoms, the star-dust which Deity had scattered by the breath of His power through the highways of space in the beginning of primeval creation. 34 While these were nothing to human, they were the foundation stones of all created things. 35 This nothingness of space was the fallow ground of the Universe and the formless shadow of suns and worlds. 36 It was a Universe in solution as viewless as ether, and as intangible as mind. 37 The electric energy of space was yet unstirred by the divine fiat or

shook into vibrating force by the word of Creative Power. 38 Other suns and worlds and a Universe of Universes shone forth in the realms of space when the Creative Word was spoken that lit this newer Universe into being.

39 "Let there be light," and from His lips that spoke no word but love and truth and power, the lightning of electric life and glory thrilled every atom with vibrating cosmic energy, and life-evolving force. 40 Then the electric clothing of light and life leaped into power and enwrapt as in swaddling clothes a new born Universe. 41 And wherever the breath of Deity was blown there was the glowing nucleus of a sun, or the revolving center of a world. 42 Then atoms and electricity met in fond and unending embrace, substance and energy clasped hands, and matter and persistent force were woven into each other's arms and saturated with electric, life-giving energy.

43 The first starting point of the Universe was the intellectual volition of Deity. 44 The second was the law-of-Nature impressed upon matter by electricity, the right hand of Deity and the tongue and word of His power. 45 Spirit cannot act directly upon matter; it must have a medium controlled by spirit at one end and working on matter at the other. 46 This medium is electricity. Matter is held together by the electric attraction of the molecules of which it is composed. 47 The molecules are composed of invisible magnets called atoms. This electric attraction acts continuously. 48 Were it to stop its action for a second, solid body would instantly crumble to invisible atoms, our material forms would vanish into thin air, and the Universe disappears in viewless ether. 49 The electro-magnetic force holds firmly the molecules of solid bodies and gives them their strength and solidity. 50 It is more feeble in its cohesive grasp on liquid bodies and is very feeble in gaseous bodies. 51 Molecules are in a ceaseless state of activity and motion, forever vibrating to the touch of electric energy.

52 The ever-restless and varying motions of the invisible molecules constituting all matter is like a cluster of bees at their hive, or of

ants at their nests, hurrying and scrambling over and around each other in constant and curious motions. 53 And if our eyes were powerful enough to see the molecules of which a block of wood or a human body is composed, they would witness such a scene of activity as the crowded bees and ants exhibit, only still more curious and constant. 54 When water is changed into steam it goes into the air as widely separated and invisible particles which disappear entirely, but every particle is still in existence and may be converted again into water. 55 When wood is burned, it changes into ashes, smoke and vapour. Not a single particle is ever destroyed. 56 It is so with our bodies, they dissolve into their natural elements, which pass into tree and shrub and air and water and other bodies; they never return to their organic form. 57 There is no resurrection of the physical body. What goes down into the grave never comes forth again. 58 The spirit-body never enters the grave, but soars to the celestial cities of the sun in a new and endless life. 59 Nature and Deity would not do so nugatory a thing as to resurrect three or four bucketsful of water and a handful of bone-dust. Fresher and better material is at hand in abundance all the time.

60 There are bodies all around us so small that we cannot see them. They are in the air we breathe and in the water we drink. Some of them are alive and some are not. 61 Many of them are so small we need the most powerful microscope to detect their presence. Yet everyone is made up of parts much smaller than itself. 62 The fine dust which clings to our fingers when we hold a butterfly or a moth, scarce visible to the naked eye, is found under the microscope to be made up of a thousand or more still smaller particles. 63 There are living creatures so small it would take a million of them to equal the size of a mustard seed. Millions of them float unseen in the air around us, and swim in the drops of water we drink. 64 Millions more float through the blood in our veins, which to them are vast, surging seas of life. 65 They are so very small, a thousand of them might

fly side by side through the eye of a needle. 66 Yet each little creature must be made of still smaller parts, else they could not move or devour their food; they are too infinitesimal for the grasp of our imagination.

67 If we keep on dividing a body into smaller and smaller pieces, we at last get a piece so very small it cannot be divided again without changing into some other kind of matter. 68 These smaller pieces are called molecules, which are particles of matter which cannot be divided without changing their nature. 69 All bodies are porous and have spaces between their molecules. 70 This was proven of gold a long time ago at Florence, where a hollow globe of gold was filled with water and shut up tight, then put under immense pressure. 71 The water was forced by the pressure through the pores of the gold as a fine dewy moisture or perspiration. 72 The same result would have occurred had it been iron, copper or any other metal, as there is a space between all molecules in all bodies. 73 All molecules in all bodies revolve around each other without touching.

74 You can stand a man before the Crookes tube or Roentgen rays and look through him and take pictures of his bones, and look through his bones and take pictures of objects on the other side of them, and also look through four-foot walls. And photographs are now taken through six-inch brick walls.

75 All spaces between the molecules of all visible substances, all pores and cavities in all organic bodies and inorganic matter, including the earth, and all animal and vegetable life is, I contend, permeated and occupied by invisible electro-magnetic ether. 76 This ether is the life-giving and life-preservative force and essence of the Universe and that from which all things have been evolved. 77 All suns and worlds and all their complex creations and everything that exists floats in this boundless, vibrating sea of magnetic ether. 78 And there are vast and mighty currents of electric force and power reaching from every sun and planet to every other sun and planet in the Universe. 79 These are enduring

bands of strength, invisible ligaments of magnetic power that bind the Universe together as one complete, harmonious electric organism. 80 They constitute the unity and strength of all creation and promulgate and enforce the laws-of-Nature.

81 They are vast highways of space, the boulevards of the Universe. We cannot see them, neither can we see elemental matter, or electricity, or life, but we know they exist, and are the foundations of the Universe. 82 Human spirits, at death, when they drop their visible vesture of atoms, can step onto this electric tide, this current of swift-speeding light and power, and in eight minutes or less time enter the heaven of their dreams in the celestial cities of the sun. 83 They have but to step on this flowing tide of electric power, as they step on a moving stairway or platform in our cities here on earth, to be borne with scarcely a sense of motion to their bright and heavenly abode. 84 It is a swift and continuous band, an endless chain, a mighty ligament of light and life and power constantly passing between heaven and earth, and earth and heaven, between sun and planet and planet and sun. 85 These are the countless pathways between suns and stars, the mighty and everlasting highways of eternity which God hath built to span the silent ether of space between suns and worlds, and bind the Universe in one harmonious whole. 86 On these mighty currents, as on a moving bridge of golden light, angels and humans and ministering spirits may pass and repass to the gateway of eternal life. 87 Moses and Elias, Christ and John, and all the departed saints of earth have trod this Jacob's ladder on which the angels ascend and descend between heaven and earth, and all the departed denizens of earth have trod its golden stairs to their celestial, sun-bright home.

88 Dr. Minot J. Savage, the eminent New York divine, says he objects to my putting eight minutes of time between the earth and the spiritual world. 89 He thinks Christ taught that they were in immediate connection with each other. 90 And so they are, by the coming and going tides of spirits between the two worlds. 91 But

now that the speed of light seems to be discovered to be instantaneous, it may be the communication between them is instantaneous.

92 When the deathless spirit has dropped its "mortal coil," and visited with electric wing the luminous, life-giving sun and the mighty cities on its spacious bosom, and graduated in the universities of heaven, it will discover that eternity is scarcely long enough to study and enjoy the marvelous creations of the Universe. 93 It will find our world is but a floating island in the great solar sea of electro-magnetism, and the solar sea or empire of our sun is but a small province in the boundless ocean of space, hid in the infinite abyss of starry depths; that measureless immensity and countless variety reigns in the Universe. 94 Human souls will then be free as air and untrammeled as ether, and may explore the vast highways of eternity with wonder-seeking minds, and visit Jupiter with its enormous moons, Saturn with its gigantic rings, and traverse the out-lying orbs of distant Uranus and Neptune. 95 They may then pass to other solar realms, and wander over the varied bosom of Andromeda's triple suns of blue and green and sapphire tints that whirl like globes of rainbow beauty in the azure sky, 96 and see the double stars and multiple suns, and fiery comets with their glowing spooms, and blood-red meteors, all following harmonious orbits through the pulsing voids of space, vibrating to the rhythmic cadence of electric law. 97 All moving with tranquil majesty in the trackless seas of immensity obedient to the Omnipotent Will.

98 Here blooms infinite, varied life and ever-changing beauty to thrill and bless the wonder-loving soul and make melodious harmony with every pulsing vibration of their imperishable life. 99 The Universe of myriads of suns is separated by trillions of miles and scattered like lighthouses along the realms of space, as dynamos of heat and light and life, 100 shooting with measureless speed and bound together by mutual ties as delicate and invisible as the ties of love that bind two souls together at the hymeneal altar.

101 Such is God's Universe. She is as a bride to her lover in every floating atom of space, in every circling world and glowing sphere, in every human soul and angel spirit.

102 As light is the great painter of the skies, and photographs all things that occur in the atmosphere of suns and planets, 103 the aspect of the earth and the sun and the events that occurred on their surface thousands of years ago are now winging their flight through space millions of millions of miles distant. 104 To the eye of Deity or an observer on some distant orb these events of centuries past would seem to be actually occurring or in progress. 105 With powers commensurate with the photographic powers of light, a human soul could stand upon a distant star and follow this wonderful vision and gaze on a succession of events from the beginning of time to the present moment, and read the history of every sun and planet in the rays of light from its own atmosphere. 106 And with poised wing in limitless space or on some far-off sun, read the mighty events transpiring on this little earth in the distant rays of light from its own atmosphere. 107 And in the cities of the sun, the denizens of heaven may, by some marvelous appliance, so magnify the picture in each ray of light from earth and sun and planet that they may view with microscopic eye and telescopic vision all the historic scenes of every sphere, and learn the life and history of every rolling orb.

108 They need not visit them to see and know the panoramic history of their glowing life. And thus they may view the varied scenes of earth. 109 Could we transport ourselves to Alpha Lyra, Sirius or some more distant sun and could see, like them, the photographic pictures in the rays of light from earth we could view scenes that transpired on the earth thousands of years ago. 110 Thus human souls may see and thus Deity sees the end from the beginning at all times in all spheres. 111 And a ray of light, a drop of dew, a grain of sand or a blade of grass conveys to him a history of the world of which it is a part. 112 Thus God preserves in every ray of light a constant picture of the changing

panorama of the Universe; 113 and in human's mind, through human's imperishable memory, God keeps a perfect record of human's thoughts and deeds, which He can unravel as a written scroll at any moment.

114 The future is ever present in its germs, precisely as the past is present in its fruits. 115 And God's knowledge of the past and future is as much the subject of His consciousness as the present action of His creatures, or the primary laws He has established. 116 He has assigned to the Universe certain material and spiritual laws, 185 and the whole scheme of the Universe is so perfect it needs no direct intervention. 117 His perfect control of matter under electric law produces the evolutions of Nature that accord with His divine purpose, 118 and God’s spiritual impulse directs the spiritual development of the human soul to the ultimate goal of truth and perfection to be attained in His self-luminous, perfected worlds. 119 Thus we perceive that to the Omnipotent Ruler of the Universe the infinite past and the infinite future would at all times be present, 120 that each atom and event would exhibit to Him at each instant the limitless past and future, giving him perfect and omnipotent consciousness and control of His spiritual and electric Universe.

121 And even on this earth, the time may come when we can so magnify the picture in a ray of light that we may see the cities in the sun, and read the inscriptions on their walls and temples, 122 and view the gates of pearl and the sapphire dome and diamond coronet above the Acropolis of the terraced city of the sun described in Revelations.

123 The soul is an invisible atom of Deity and, like invisible atoms and electricity, may pass to and from the sun in eight minutes and perhaps only a few seconds. 124 I reason scientifically that if invisible matter and electricity go everywhere and pass to and from the sun continually and exert their power and do not lose their natural properties or identity, 125 it is clear and overwhelming proof that human's soul, when it steps out of the body, maintains its power and identity, and can fly with the speed

of light to the throne of light and life in the luminous bosom of the all-life-giving sun.

126 Is it not right, by the eternal law of cause and sequence and unanswerable logic, that life should return to the fountain of life? 127 That life, soul life and material life, which the sun nurtures, builds and vitalises here, when its usefulness here is ended that it should return to the luminous bosom of its great mother-- 128 the source of all life, light and power; and that there it should find the great Spiritual Father, who planned and constructed this mighty machinery of worlds, or His immaculate Son and representative.

129 Then, by all the laws of reason, intelligence, and "the eternal fitness of things," God, the eternal, creative Spirit, should have His abode and center of life and light and power at the central abode of all life and light and power in the physical Universe,-- the all-sustaining, creative sun. 130 Such accords with the eternal laws-of-Nature and the one unchanging mode and pattern of the Universe. 131 For by the universal law of all created things, the center of physical and electric power and life is also the center of spiritual and intellectual power, and there should be the home of Deity and the promised heaven of the human soul.

132 The question may often arise, Does God perfect humanity and then destroy it? 133 Does God make humans of us with all the trouble and care that comes inside of seventy years, and then throw us away? 134 I do not believe He does anything so wasteful and unjust. He has prepared a pathway to the skies and takes us to Himself. This is more rational.

135 Jacob saw the heavenly ladder and angels ascending and descending between heaven and earth, and Stephen saw the heavens open and Christ sitting on the right hand of God. 136 These were not miracles in the supernatural sense; they were simply a larger vision, an expansion of electric and spiritual power under the rapid evolution of natural law. 137 All great seers and prophets have had the same clairvoyant power. 138 At the birth of our planet, the stars sang

together and all the Sons of God shouted for joy. 139 At the birth of Christ the angels sang for the shepherds on the plains of Bethlehem, and they visited Abraham and Lot, and Joseph and Mary, and ministered to Christ when he was weary and famished in the wilderness. 140 They carried John in the spirit to the great and high mountain in the sun which was to him a new heaven and a new earth and showed him the great city of God, and they have borne millions of bright human spirits along the electric highways of the skies to the celestial mansions of the blest. 141 So will they wait and guide us through the dusky borders of mortality, along the shining pathway to the sun, and welcome us to the delights of its celestial cities. 142 And we shall see in the hour of dissolution the ladder Jacob saw reaching from earth to heaven on which the angels ascend and descend, and we shall see the vision martyred Stephen saw when the heavens opened, and the vision St. John saw when he gazed on the New Jerusalem. 143 And this electric stairway between heaven and earth is so real, sure and strong, that the weakest spirit cannot lose its way or stumble or fall. 144 It has the lightness of air and the strength of adamant and is as eternal as the stars. 145 Millions of millions have trod its pathway of viewless power that no steel or adamant could break, and none have failed to reach the heaven that it links to earth.

146 The creature whose intelligence measures the pulsations of molecules and unravels the secret of the whirling nebulæ is no creature of a day, but the child of the Universe, the heir of all the ages, in whose making and perfection is found the consummation of God's creative work. 147 God is a spirit and human is a spirit, and spirit power is the supreme sovereignty of the Universe. 148 And the soul of human can command electric energy to bear it with swift wings and tireless feet along the electric pathway to the luminous bosom of the sun, to the celestial cities of his future heaven. 149 And the angels will be our guides and direct our faltering spirits along the electric pathways to the stars, and light the

shining boulevards of eternity, and lead us to the golden streets and crystal palaces of heaven. 150 And they will escort us into the diamond banqueting hall of the King of Kings, and we shall feast on angels' food, and sip nectar and ambrosia from the table of the God of Gods. 151 And the angel choir shall take down their celestial harps from their panels of amethyst, and with deft fingers and entrancing voices sing us the old, loved melodies of heaven, and put a new song in our mouths, and we shall join the heavenly jubilee of eternal life and glory.

152 "When the daylight trembles into shade,
When falls the silence of mortality,
And all is done, we shall not be afraid
153 But pass from light to light; from what doth seem
248 Into the heart and heaven of our dream."

THIS ELECTRIC UNIVERSE
IS SELF-SUSTAINING AND ETERNAL
George Woodward Warder

19 The natural beauty and utility of the world is vast and varied. 2 The grandeur and strength of the Universe is boundless and enduring. 3 Nature is Deity, thinking in visible thoughts of beauty and power, and speaking in visible tones of life, motion and harmony.

4 All things in Nature combine beauty with utility and while full of change are constant and enduring. 5 The same electric laws, force and substance which gives luminous brilliancy to countless suns, and paints the aurora and the rainbow the rosy hues of dawn and the crimson glories of sunset, 6 give colour to the ruddy cheeks of youth, and red corpuscle to the arterial blood that brings health and strength to human forms. 7 These same electric laws, force and substance hold their sceptre of power through all the Universe. 8 Under electric law atoms and molecules embrace each other and evolve visible forms of life; and suns

glow with warmth and light, and keep their appointed distances in the circling mazes of the sky. 9 And by the grasp of electric energy these life-giving suns carry their family of life-bearing worlds upon their mysterious voyage through the realms of measureless space. 10 All nature is a visible expression of Omnipotent Deity, all the Universe is a symbol of creative power and wisdom which is boundless and enduring, and proclaims that our world, the sun and the Universe are eternal and enduring.

11 The question of the continued existence of our solar system is a fascinating subject to most of our astronomers; 12 they seem never to be weary of looking forward to a time when the light of the sun will expire with age, or it will be destroyed by some great catastrophe. 13 I have no such apprehensions. First, because in the six or eight thousand years of human history on this planet there is no record of any sun or star being blotted out, or any planet being destroyed. 14 The sun, stars and planets are substantially the same as they were when Babylon flourished, when Abraham was a sun worshiper, and when the angels sang on the plains of Bethlehem. 15 As far as human knowledge and science goes, not a single star has faded from the glittering hosts of night's jewelled crown.

16 Second, because the same electric force that started suns and planets on their grand velocities and fixed their orbits is not only an attracting force, but also a repelling force of marvelous power. 17 And while suns and planets attract each other they also repel each other, and make each keep their respective distance under the law of electro-magnetism by which opposite poles attract and like poles repel each other. 18 If you place the opposite poles of a horseshoe magnet together they will attract each other and cling together until a superior force overcomes their mutual attraction; 19 but if you reverse them and put their like poles together, they will not cling together, but will repulse each other.

20 In chemistry molecules of opposite polarity unite, and this is

called chemical affinity; 31 molecules of like polarity will not unite, and this is called chemical repulsion. 21 Magnets attract only when their poles are reversed, or when they are oppositely electrified, and suns and planets do the same. 22 The sun as the great central magnet, or electric generator, has the power both to attract and to repel. 23 The planets are kept in their orbits by both the sun's attraction and its repulsion. 24 In the summer, when the earth gets four millions of miles nearer the sun, there is a repelling force from the sun that sends it off again, or it would continue to approach the sun until it would fall into his spacious bosom. 25 No law of gravitation or balancing force of planets could do this. 26 The centrifugal force of electric repulsion in the sun does for the earth what all the balancing force of the planets could not do if they were all swung in the circling orbit of Mars. 27 The sun, by this electric propelling force, throws off the comets which approach it. This is proven by scientific records in many instances for centuries. 28 By this same propelling force the sun holds off the swift leaden planet Mercury. 29 By this same electric repulsion the planets prevent their moons from falling back onto their surfaces.

30 These moons are the same material and electric composition as the worlds from which they come, and, as like polarity repels, they are thus kept in their orbits. 31 There are estimated to be eighteen to one hundred millions of suns in this Universe. Can anyone believe they are kept in their places by a mere balancing force? They are held by electrical repulsion as well as by electrical attraction. 32 There may also be belts or zones of ether with the proper electrical vibration or condition in the orbit of each planet and satellite which hold them with giant grasp in their allotted places. 33 And every sun system may have its own peculiar electricity, which has a repulsion for all other systems and holds each in its proper place. 34 All these things are possible and probable under the theory of electrical creation. 35 As twenty-eight currents of electricity can pass over the same wire at the same time, fourteen each way,

how many kinds of electric currents may the Universe possess? 36 May not each planet have its own peculiar current, and its own peculiar attracting power, and the sun give each a different electricity?

37 While each sun system, with its revolving planets, is held together by mutual electric attraction, the eighteen millions of sun systems are prevented from coming in collision with each other by the law of electric repulsion. 38 This would prevent any one system from trespassing upon the domain or territory of another, and permit each and all to move freely among themselves and change places without danger of trespass or collision. 39 In case of too near an approach to each other the law of repulsion would drive them off. This would avoid the necessity of a central sun, which probably does not exist or it would be visible. 40 If all these systems were positively magnetised or all negatively magnetised they would repel each other. 41 This law of electrical repulsion would increase the nearer these systems approached each other, and this increasing power would send them further away, and forever prevent discord and collision. 42 This is why there is no discord in the fields of heaven and harmony reigns triumphant.

43 Electric repulsion is all that prevents these almost infinite sun systems from coming into conflict with one another, and ending in aggregate and ruinous collision, and reducing the Universe to a heterogeneous mass of discordant spheres. 44 No law of gravitation could prevent such a wreck and ruin of the Universe. 45 On the contrary, the size and weight of every sun and star that floats in the broad expanse of ether would under the law of gravity tend to bring about just such a universal catastrophe. 46 If the boasted law of gravitation prevailed to-day, or ever did prevail, such would be the disastrous results. The law of gravitation tends to aggregate all bodies into one. 47 If the Universe was under the dominion of gravity there would be but one vast globe in all the Universe, and if there was a human on it there would be but one enormous giant. 48 Newton's law of gravitation is

"large bodies attract small ones." 49 If that is true, then all small bodies would fly into the arms of the larger ones, and the process would continue until the largest body had them all, and there would be no smaller ones to attract. This is a fair analysis of the law of gravitation.

50 As to the rule that matter and worlds "attract each other inversely to the square of the distance," that rule could not exist but for the law of electric repulsion. 51 That rule is very near the law by which matter falls towards the sun by electric attraction. But it is not the law of orbital energy by which planets are kept out of the sun. 52 Neither is it the law by which satellites is kept from falling into the planets around which they revolve. 53 The weight that falls to the earth by attraction may be lifted by dynamic repulsion. Therefore the law of repulsion is as necessary as the law of attraction. 54 Gravitation ignores the laws of repulsion. With gravity only all spheres would fall together in a common ruin; with repulsion only they would dissolve into ether; and both of these forces, normally active and balanced, are necessary to preserve the Universe. 55 Therefore, I contend that our earth, the solar system and the Universe is self-sustaining and eternal in duration, because of the ever-active omnipotent force of electrical repulsion in sun systems, in suns and planets and their satellites.

56 Our wise astronomers for two centuries have bestowed upon gravitation all the divine attributes, and thrown around it the halo of a worshiped divinity; and ignored its twin brother and dual force, repulsion. 57 This was excusable before the discovery of electricity and its marvelous forces as a new causation. 58 But since then it seems the blind folly of stupid conservativism that would cling to old traditions and antiquated authority. 59 They recognised the law of repulsion in matter, in gases, in gunpowder, in volcanoes, in steam, in dynamite, in perfumery, in everything in the earth, but denied its operation in the sun and planets, and sidereal space. 60 This ever-active omnipotent force of electric

repulsion keeps all sun systems from coming together or trespassing upon each other's vast domains. 61 There is electrical repulsion as a great barrier between them to hold them apart. Why? Because they have like polarities or become alike electrified as they approach each other. 62 This without any other reason is sufficient to forever prevent collisions between the sun systems of the Universe. 63 Electrical repulsion keeps our earth and the planets from falling into the sun. 64 Why? Because our earth and the planets, when they approach within a certain distance of the sun, may become similarly electrified to the sun, and are thrown back to their proper and balanced orbit. 65 Electrical repulsion keeps all satellites from falling into their primary planets. Why? Because they have like polarities, and are positive or negative like their primaries, and repulse each other. 66 Thus each and all the suns, planets and satellites continue in their orbits of balanced forces, and will always continue and are as eternal as the laws of electro-magnetism that created and upholds the Universe. 67 The same law applies to comets. Why does the comet, when it approaches just so near to the sun, dart away so quickly? 68 Because it becomes alike electrified as the sun, 106 and the law of repulsion strikes it like the blow of a mammoth trip-hammer and hurls it in the opposite direction. 69 This is one reason; there may be others, for the laws of repulsion are as many and various as the laws of attraction.

70 The scientists in all ages have been fascinated with fearful, grim and dismal pictures of the end of the world. 71 Like the theologians who delighted to paint the tortures of the fiery prophet of their imagination, the scientists have exhausted their wildest fancy in picturing the sun consumed with fire, the earth melting with fervent heat and the final "wreck of matter and the crush of worlds." 72 The latest display of dismal and excessive fancy on this subject is from the prolific pen of our most eminent and worthy astronomer, Prof. Simon Newcomb. 73 It is to be found in McClure's Magazine of May, 1903, which I have just

read, entitled "The End of the World." 74 It is a well written, imaginative story or article, embracing his theory or hypothesis of the cause and manner of the world's destruction.

75 I admire his scholarly style, his great learning, and splendid fancy, and if I believed in the scientific theories and traditions which he champions with such an able pen, I should say it was a masterly presentation of what would occur in sun and earth at some indefinite future time. 76 But as I have discarded the old scientific traditions I cannot accept his theories or his fancy picture. It is too dismal for my optimistic conception of what has occurred or what will occur in this vast and mighty Universe. 77 He is a worthy successor of Newton and La Place, for he has a vigourous imagination, which easily scans the future and presents what I deem antiquated theories, sustained by traditional facts. 78 Each person lives in a different world and sees a different Universe, according to one own knowledge and imagination.

79 The Universe Ptolemy saw was different from that of Copernicus, and Newton's different from both, so my conception of the Universe is different from that of Prof. Newcomb's. 80 Imagination is a creature of education and converts knowledge into utility, and reasons from the known to the unknown, and is the telescope of futurity and the microscope of past centuries. 81 I am a great believer in imagination or ideality as the highest gift of Deity, and accept Napoleon's statement that "imagination rules the world." 82 I believe no person can be a great astronomer without it, and the tallest and broadest enlightened imagination will naturally have the best conception of the complicated motion and grandeur of the Universe. 83 Tyndall in an address at Liverpool in 1870, said, "There are tories even in science who regard imagination as a faculty to be feared and avoided rather than to be employed. 84 In fact, without this power our knowledge of Nature would be a mere tabulation of coexistence and sequences; the soul of force would be dislodged from our Universe; casual

relations would disappear, and with them that science which binds the facts of Nature to an organic whole." 85 This is nobly and truly said, for all progress is heralded by theorisation; which is an intelligible explanation of things, and serves to relate cause and effect. 86 It distinguishes the human being from the animal, the civilised from the savage, the wise and learned from the ignorant and foolish. 87 Herbert Spencer said, "In the formation of a theory we have the highest condition of the human mind." 88 And Holder, in his life of Darwin, says, "Darwin was greater than others, because he had the genius of scientific hypothesis." 89 Therefore I am proud of Prof. Newcomb's hypothesis of the cause and manner of the death of the solar system, though I do not accept his theory or his conclusions. 90 I am glad he is not one of those scientists, who said in the New York Journal not long ago, that the only thing of value to science was the tabulation of facts. 91 The mere tabulation of facts would be of as little value to the world without causation, theory and hypothesis, as the Egyptian hieroglyphics before the discovery of the Rosetta Stone.

92 Let us see what the learned astronomer, Prof. Newcomb, says. He projects himself into the future and starts out by imagining that from the central observatory in the Himalayas, "Mars is signalling a dark star." This, he says, was after "the world had long been dull and stagnant." 93 Now, I protest that this world will never become dull and stagnant, nor any part of this electric Universe, but all will go on steadily progressing to more perfect conditions. Here is where our theories clash on the first sentence. 94 Then he proceeds to tell the kind of dullness and stagnation that existed. 95 He says almost every scientific discovery had been made thousands of years before, and all inventions had been perfected, and everything went on as by machinery. 96 The peace of the world was settled and the time when people fought and killed each other in war lay far back in the mists of antiquity, and the newspapers chronicled little but births, marriages, deaths and the weather reports. 97 "Only one

language was spoken the world over, and all gentlemen dined in blue coats with gilt buttons and wore white neckties with red borders."

98 Now I cannot accept this as a true picture of our earth at any time in its future, or the hypothesis of human stagnation as possible or probable. 99 I do not regard the world's peace, and perfected machinery, and "blue coats with gilt buttons and white neckties with red borders," as evidence of dullness and stagnation. 100 And I cannot believe the newspapers, whose proverbial energy is perennial, will ever get to the low ebb of stagnation he describes. 101 But to the more important points. Three thousand years before this time messages had been successfully interchanged with the inhabitants of Mars, 102 and now this message of "a dark star" arrives from Mars, which excites the astronomers, and later the people, until the whole world is in a frenzy of terror, apprehension and despair, watching this terrible star, which continued to increase. 103 The people of Mars are also "in a state of extraordinary excitement," and our astronomers are much puzzled about the orbit of this dark star, many times the size of our earth. 104 Then the Himalaya observatory sends out the startling announcement that, "the dark star has no orbit; but is falling toward the sun with great speed."

105 Then a professor in physics sees the dangerous possibility of its collision with the sun, and has an immense vault, which had been previously built for scientific experiments, a hundred feet underground, stored with provisions, etc. 106 In this safe retreat he hides himself and his assistants when the dark star strikes the sun, and the fearful conflagration of the sun and earth occurs. 107 And when the sun and earth were burned up by the collision of the dark star with the sun, they, like Noah and his family, were saved from the general destruction.

108 The description of the melting of the houses, stones and all combustible material on the surface of the earth, the anguish and despair of the thronging multitudes, and the destruction of

the great city of Hatten, built on the ruins of the old city of Neeork, would duplicate the horrors of Dante's "Inferno." 109 The illustrations are equally horrible and terrific, and both are calculated to shock the mind of the reader and retard mental composure and æsthetic culture. 110 He states, in the words of the professor, his theory, thus: "My theory is that if one of these dark objects chances to strike a star it bursts through its outer envelope and sets free the enormous fires pent up within." 111 These pent-up fires within the sun, he claims, are going to blaze up more furious and be the cause of this dread catastrophe of ruin and death to the sun and planets. 112 With all respect to this eminent astronomer, I insist, first, there are no pent-up fires in the sun. 113 Second, no dark or light star, planet or globe can ever fall into the sun, because the law of electric repulsion in the sun will send it off, as it does the comets, in an opposite direction; 114 besides this same law of electric repulsion will forbid any such object from coming into the solar system. 115 He says this dark star, many times the size of our earth, striking the sun, would destroy it and our earth and planetary system by fire. 116 All life and combustible material, including stones and the surface of the sun and planets, he insists, would be utterly consumed by the heat engendered by such a collision. 117 Now, I contend, in the first place, that such an event is virtually impossible; 118 and if it were possible, a star of many times the size of our earth, coming in collision with the sun, would make little more impression on it than a dozen hogsheads of dynamite thrown against the surface of the moon. 119 Both would do great local damage to the spot and vicinity where they struck, but neither would produce any great general disturbance and injury to these orbs.

120 Many times the size of the earth would mean naturally something like a dozen times the size of the earth. 121 Let us estimate the general result by comparison. The sun is one million three hundred thousand times larger than the earth. 122 It is so large that if we could drop our

earth into the center of the sun, our moon, which is two hundred and forty thousand miles from us, would only be about half way to the circumference or outer rim of the sun. 123 Now, a star many times the size of our earth, striking the surface of the sun, would create great heat by the compact, and great distraction in the locality where it struck; 124 and would likely imbed itself in the sun, like large meteors do on the earth, and become a good sized mountain on the sun's surface. 125 It would not increase the electric currents or radiation, of the sun sufficient to melt the snow on the mountains of the tropics or set fire to a haystack on the earth. 126 Its effect on the earth would not be excessive in temperature, and would be very temporary. 127 For my theory is that the sun sends only such currents of electricity to the earth as the earth draws and demands by its opposite polarity. 128 Only a great sun a thousand or a million times larger than our earth would make any great impression on the sun in case of a collision; and then it would not result in its destruction, or that of the earth and planets. 129 Its size and power would be increased, but that would not necessarily increase the heat of the planets, if, as I contend, the sun could only send them the electric currents the planets draw by reason of their opposite polarity; 130 just as a receiving station of wireless telegraphy receives only the electric currents intended for it because of the peculiar attracting power it possesses.

131 I am aware that the recent flaring out in light, and increase in size of the star Nova Persei in the constellation of Perseus, has given plausibility to the conjecture of some astronomers that it was caused by a collision between two suns. 132 But I think the better opinion is that this star is a new sun, partly nebulous and in its formative state; 133 and that it was visited by a great cloud or swarm of meteors, which produced the great illumination which flared out into space for a few days and then subsided. 134 Its former small size, to which it has returned, and its present nebulous condition, or the nebulæ that surrounds it, seems to fully justify this conclusion. 135 I do not believe there ever has been

or ever will be a collision among the suns or planets. The wisdom of the Creator, as manifested in the great universal laws of electro-magnetism, forbid it. 136 If such a catastrophe was likely ever to occur, it would have happened many times since the history of the race began, 137 and we would have had many undoubted demonstrations of the direful uncertainty of the life of the suns and planets and the varying chances and unstable condition of the Universe.

138 Let us hear the conclusion of Prof. Newcomb's hypothesis in the last words of the last human on the earth, in the person of the professor of physics: "Such is the course of evolution. 139 The sun, which for millions of years gave light and heat to our system and supported life on the earth, was about to sink into exhaustion and become a cold and inert mass. 140 Its energy could not be revived except by such a catastrophe as has occurred. 141 The sun is restored to what it was before there was any earth on which it could shed its rays, and will in time be ready to run its course anew. 142 In order that a race may be renewed, it must die like an individual. Untold ages must once more elapse while life is reappearing on earth and developing in higher forms." 143 This is the present accepted scientific theory. But is it right?

144 According to my conception, it is not. The sun is not growing old, or cold, or feeble, nor can it "sink into exhaustion." Nature, on this earth, under electric law and process, is ever renewing Herself. 145 And it is the same in all suns and planets. Nature's curriculum of eternal processes is continuous change and evolution. 146 Her processes of renewal and purification are so perfect here on earth, that our most luscious fruits and vegetables, and our most beautiful and fragrant flowers come from the rank manure of the farmer's stable. 147 The fertilisers of our soil are the decayed excrement of bird and beast and the most loathsome decaying elements; 148 yet, through Nature's evolving and purifying process they become wheat and corn, plant, vegetable and flower, and our most wholesome, acceptable

and nutritious food; 149 and if we live many years in the same neighborhood we eat the same food over and over many times, and the cattle and all living creatures do the same thing. 150 The atoms that compose our bodies have been used over and over again many times. 151 They have been in the bodies of millions of humans and animals, plants and vegetables before we used them, and will be in millions of bodies yet uncreated. 152 They have been tossed by winds, hurled and threshed about by tornadoes and cyclones, drowned in the sea, and buried in the earth and often digested by other animals before they came to rest under balanced electric forces in our bodies.

153 Every atom in our bodies have been to the sun and back billions of times and will be again. 154 They have been renewed by the electric currents of the sun, by the energy of the soil, by the electro-magnetic ether of space, and are as eternal as law and destiny. 155 In like manner, the elements of the sun are constantly being renewed and invigorated, and it has an area of six billions of miles in diameter from which to draw virgin atoms, 156 and like a great sea of inexhaustible force, it is the fountain from which it receives its measureless power and indestructible life and energy. 157 For it is the central dynamo and electric heart of the solar system, and with its family of planets is floating in a boundless sea of electro-magnetism that has no limit of life and energy. 158 The sun may send a different kind of wireless electricity to each of the planets, and each of the planets may return a different kind of electricity to the sun. 159 Thus these electric currents may pass and repass between sun and planets and be re-energised and used over and over again, just as the atoms of our bodies and all earthly molecules are used over and over again. 160 Thus the sun constantly renews and invigorates itself and all the elements of the solar system, and can never come into "a state of exhaustion," as so graphically described. 161 But this vast electric Universe is stable, enduring, self-sustaining and eternal; 162 and no law or act of conflict among its millions of suns

and planets has ever been discovered, or is likely ever to be, the conjectures and sophisticated prognostications of pessimistic scientists to the contrary notwithstanding. 163 Can any reasoning, common thinker, aside from the scientists, after viewing our moon swinging around our earth, as it has done for thousands of years, only 240,000-miles from us, without approaching a mile nearer the earth in all that time, believe there is any danger of a collision between them? 164 The law that holds them apart thousands and millions of years will continue to do so; and their collision is virtually a matter of impossibility until the electric laws of the Universe are abrogated. 165 Can anyone believe that the little leaden planet Mercury that has been swinging so close around our enormous sun-- only thirty millions of miles from it-- for millions of years could keep its constant orbit unless there was an irresistible law, 166 as omnipotent and changeless as Deity, that has and will forever keep it from falling into the sun.

167 Look at the planet of Mars with two satellites, of Jupiter with six, and Saturn with eight, flying swiftly around their primaries, all only a few thousand miles from their surface, and some of them going in different directions-- 168 could any balancing force, any law of gravitation, keep them from falling into their primaries? 169 Every one of them is a contradiction of the law of gravity, and puts the stamp of falsity on all its claims. 170 But they all show there is a law which defies gravity and is a correlative force, and that is the law of electric repulsion; 171 and it is the cosmic force which, with electric attraction, has built the Universe as a vast electric machine, and they will forever preserve its integrity and existence, and the sun, earth and Universe are eternal.

172 The world moves; knowledge increases, and science is gradually broadening its conception of the harmony and endurance of the Universe. 173 The theory of dead matter and blind force has been relegated to the obsolete and discarded past, and been replaced by the recognition of ever-present

life and infinite grades of consciousness. 174 The vast and varied factors in Nature's problems of eternal destiny point to our sun and earth as a present existing and unending reality. 175 Nature builds up, tears down, and reproduces Her organic forms on the surface of planetary globes, but She does not destroy Her great sun magnets and world magnets in the same manner, as many of our scientists think. 176 There is a great difference in the powers and functions of suns and planets and the creeping things on their surfaces. 177 Suns and planets, after they have attained their matured and balanced powers, are immortal, and creating, enduring and perfected organisms; 178 and, like human in own immortal spirit, they have attained to eternal life, and neither death nor ruin can ever come near them. 179 Suns and worlds in their electric energy have the powers of creation, and as the creator is always superior to the created, they should not be judged alike.

180 Therefore the changing and transitory nature of many things on the earth's surface is no proof that such will be the earth's destiny. 181 On the contrary, every ligament of force and power in this electric Universe is pledged to secure the continued and endless duration of our sun and solar system, including our earth. 182 And timorous humanity should no longer shrink in horror at its prospective wreck and ruin. 183 May the truth prevail and human's mind be freed from the horrors, of an anticipated destruction of the sun and earth, and the optimistic joy of imperishable life and love here, and in the all-glorious sun hereafter brighten the terrestrial existence of humanity.

184 All hail! Thou life-giving sun!
Sweep on and ever while the cycles roll
Thou wandering orb of luminous sod!
Thou blazing banner of the mighty God!
185 From Creation's center to its farthest pole,
Speed on and on in thy unknown track;
But the hand that sends thee can draw thee back,
And teach thee the way when thy footsteps stray,
As He doth the wanderer.

ORIGIN

****

186 Like a silent thought from Creation wrought,
Thou speakest a language weird and strange
Of the breadth of space and the speed of change,
And the wondrous dream that the ages taught;
That from star to star and from sun to sun
187 The soul shall pass while the cycles run
Renewed in its youth, gleaning wisdom and truth,
God's wisest wanderer.

****

188 The living shall die, and the dead shall live,
And the mystery deepens on every hand,
And the worlds shall stay, and the soul shall stand,
And a lesson of truth shall all things give.
189 And a mystic touch hath a world to a world
And the banners of God are ever unfurled
In creation's face teaching truth and grace
To the wanderer

ARE ALL SUNS AND WORLDS INHABITED?
George Woodward Warder

20 Are all suns and worlds inhabited? 2 This has been a puzzling question to the astronomers, who have had various opinions on the subject. 3 From the laws of electric creation, as I understand them, the affirmative answer seems reasonable and natural. 4 But as we cannot visit these suns and worlds in the flesh, my answer must be formed from the operations of the laws of electricity as applied to this planet. 5 Prof. Newcomb says astronomers have no means of knowing as to the inhabitability of distant orbs any more than other persons, and that we can only reason cosmologically on the subject, and, reasoning thus, he thinks only the earth and possibly Mars are inhabited.

6 Prof. H. H. Turner, professor of astronomy at Oxford, England, in the Fortnightly Review of April, 1903, in combating Alfred Russell Wallace's theory that our earth is in the center of the Universe, and

the only inhabited world, says: 7 "Why should not any one of the suns possess planets as well adapted as we are to develop high forms of organic life?" 8 He seems to think no valid reason can be given why there are not many inhabited worlds as favorably situated as ours to produce and maintain organic life. 9 And I fully agree with him, and go a step further and say there are many reasons why nearly all suns and worlds are inhabited. 10 Reasoning from electric law and cosmological facts, our world, and its laws, forces and creations, should be a fair sample of the laws, forces, and creations of all worlds and planets. 11 This is in accord with universal chemistry, which teaches that the same laws and substances exist throughout all the realms of space. 12 In reasoning on the formative period of our world, we found the electric current to be the first form of matter and force, or the first form of creative manifestations in space. 13 These currents antedate all suns, worlds and visible objects. 14 We also found that all visible forms of matter were the aggregation of billions of invisible atoms, and all visible matter and forms were simply the outer garment and scaffolding of these invisible electric forces; 15 that force follows the law of motion, and atoms the law of form obedient to the lines of motion. 16 The second step in planetary construction was the arrangement of the atoms into crystalline formation, due to opposite currents of electrical motion, and to atomic balance. 17 This produced the rock-ribbed foundations of the earth and solidified it into a vast magnet of marvelous force and power. 18 Then when the crystalline rocks and metals were settled into a crystalline globe throbbing with electric power, vegetation came and the electric life-cell was formed as the first step towards organic life. 19 Then came the formation of nerve tissue as the basis of form structure and the evolution of microscopic life which developed under electric energy into all forms of animal existence which now inhabit the earth. 20 These were all formed and perfected through ages of response to the varying electric currents of life-giving power.

ORIGIN

21 Then the animal form evolved a brain, and acquired the sense of feeling and sight and hearing by reason of the electric currents that impinged on the sensitive tissues of the brain, 22 and animal instinct was slowly and gradually developed and the animal organism raised to the highest grade of the perfected mammal. All this was done under electric law by magnetic energy. 23 Then the Creative Deity said, "Let us make human." 24 And it is likely He took a perfected mammal, enlarged its brain-pan, stood it erect to front the stars, and breathed into it an atom of its own spirit, "and human became a living soul." 25 The psychic power of glowing thought and reasoning mind, inspiring hope and heaven-bound love, and truth, and language, music, poetry, and dreams of heaven, were implanted as a celestial fire in his deathless spirit. 26 This is human,-- the soul, the spirit, the divine, eternal spark of Deity itself-- not the body; that is merely the overcoat of atoms for the spirit, the temple for the soul, the house in which it dwells.

27 It will be seen from the foregoing that electricity is the creative, evolving force of the Universe, the word of omnipotent power, the creative machinery of suns and worlds. 28 That electricity creates suns and worlds and all animal and vegetable organisms, that it can evolve all forms, and give animal instinct as the result of balancing the experience of one sense with another through long ages of experience. 29 But it cannot create mind, soul or the spirit of Deity. It could not create human as a psychic being. It could organise human body, but it could not confer on human a soul. 30 Electricity does not rob God of power; it is God’s creative machinery, and the right hand of His power, 31 and, guided by His omnipotent will as the law-of-Nature, it can and does evolve suns and worlds and all organic life. But not spirit-life-- not human.

32 Moses and the Bible were inspired or they could never have shown so clearly the nobler creation of human, and His inherent sovereignty over the world, and dominion over all the

animal creation. 33 I like that statement, "And God said let us make human." Electricity was the word of His power, the creative agent of His will, which is the law-of-Nature. 34 It could create a sun, a world, a Universe; it could give sense and feeling to insensate dust, and evolve and fashion human's body as a house suited for his earthly habitation, but it could not furnish a tenant or evolve a soul. 35 The God-father and the God-mother alone could do this, and make human a spiritual and eternal being.

36 Now, I argue that if electricity created this earth with all its complex elements and organic forms, it also created all suns and worlds and all the machinery of the Universe by the same process, 37 and has endowed every rolling sphere in space of sufficient size and power with vegetation, and all the varied forms of animal organism. 38 Is not this a rational conclusion, since it has been demonstrated by universal chemistry and spectroscopic analysis that all laws, force and substance are the same in all suns and worlds and throughout the Universe? 39 Is it reasonable to believe that the electric currents and magnetic energy of our earth could evolve billions of billions of little living creatures which float in the air thicker than motes in a sunbeam, 40 that swim in the waters so abundant that there are millions in a raindrop, that penetrate all vegetable and animal substance and organisms, 41 that course through the veins of our bodies by the billion, and eat our food for us that we may digest it better; yet in other suns and worlds produce no such results? I cannot think so.

42 The animalculæ are so small that Ehrenburg estimates that five hundred million of them exist in one drop of water one twelfth of an inch in diameter; 43 that not only the blood, but the flesh and muscles are also composed of infinitesimal lives, each cell possessing a distinct life of its own. 44 Binet describes human as a colony of protozoans; and according to these two biologists human is a walking Chinese Empire, when you consider the microscopic beings in human body. 45 Besides our bodies and

those of vegetable and animal organism that are thus honeycombed and flooded with animalculine life, there are countless millions floating in the air, swimming in the water, and buried in the dust of the earth. 46 So that organic life is everywhere present on the earth, in invisible or visible form. 47 And the invisible forms of life of the earth everywhere surpass the visible forms millions of millions of times. 48 Just as the invisible matter in the world and the Universe surpass the visible countless billions of times. 49 Thus the natural, spontaneous production of life and life forms in myriads everywhere on this earth emphasises the reasonable hypothesis that they are evolved on all suns and planets. 50 This shows the unity of matter and life. Wherever there is matter there is electric energy and life-force, which evolves infinite grades of life-forms. 51 Prof. Buchner asserts that "spectrum analysis has brought about the highly important conviction of the unity of what is to us the visible Universe." 52 And Prof. Shaler of Harvard declares, "the unity of life is the greatest discovery of the nineteenth century." 53 The infinite diversity in Nature first fixed the attention of investigators; now its infinite unity is the marvel which excites their wonder and admiration.

54 Now the unity of matter, force and physical life are accepted by the ablest thinkers. This all tends to prove the inhabitability of all suns and worlds. 55 Prof. Huxley put himself on record as believing in intelligent organic life in other worlds, in the following vigorous language: 56 "Looking at the matter from the most rigidly scientific point of view, the assumption that amid the myriads of worlds scattered through endless space there can be no intelligence as much greater than human's as is greater than a black beetle's, is not merely baseless but impertinent. 57 Without stepping beyond the analogy of that which is known, it is easy to people the cosmos with entities in ascending scale, until we reach something practicably indistinguishable from omnipotence, omnipresence, omniscience.

58 "If our intelligence can in some matters surely reproduce the past of thousands of years ago, and

anticipate the future thousands of years hence, 59 it is clearly within the limit of possibility that some greater intellect even of the same order may be able to mirror the whole of the past and future." 60 This is a masterly statement that demolishes Alfred Russell Wallace's little arguments like a trip-hammer would an eggshell. 61 Ruskin also saw much good in the idea of life in other worlds above us, "in creatures as much nobler than ours as ours is nobler than that of the dust."

62 When once the unity and universality of force and electric life are made clear, and spirit and psychic life in their immortal destiny are made manifest, 63 as thinking creatures we are led upward to a larger development of life and power, dominated by a supreme intelligence we call Deity, Infinite Goodness and Spiritual Father. 64 Then we remember that he has assured us in the sacred oracles, that "we shall be with Him and shall be like Him," and that there are many mansions in the skies. 65 Our scientists tell us there are living creatures so small and so numerous that it would take millions of worlds like ours to support a human population equal to the number of these creatures that can live and move in one cubic inch of space. 66 Some of these multiply at the rate of one hundred and seventy thousand millions in a hundred hours. And I say every one is a tiny electric machine.

67 The electric currents that built our world from invisible atoms and evolved the complex substances of which it is composed, and the myriad forms of organic life that exist on its surface will fill other worlds with countless forms of organic life. 68 For in the great electro-magnetic sea we call ether and space, in which all things float or exist, and which permeates all form and substance, 69 there is a boundless reservoir of electric life which will blossom into infinite grades of physical organisms wherever the surface of suns, planets and satellites have living environments of soil, light and electric currents. 70 Even the soil of our earth maintains life because it is living matter itself. And some forms of

life will exist without light or soil. 71 This is the electric Universe in solution, the life-giving sea of all form and substance.

72 Oh, what a miracle of wonders! From this marvelous reservoir of life, force and substance each created thing draws the elements of its growth and existence. And each draws from the same source that which its nature requires. 73 The oak draws from the same soil and air as the hickory, the rose, the apple tree and the poison ivy. 74 But the oak converts all the substance it gathers into the natural fibre of the oak, the hickory into the natural fibre of the hickory, 75 the apple tree converts it into the luscious fruit of the apple, the rose into the delightful perfume which regales our senses, and the poison ivy converts the same air and soil into deadly poison. 76 This is the marvel of electric law and energy. How does it do it? It does it, I contend, by the law of magnetic currents under the control of organic affinity. 77 The Bible states this law in a little different form when it says God caused every tree and shrub and created thing to bring forth seed of its kind. 78 Human, like all nature, also draws from one common intellectual and moral reservoir. 79 And while some draw inspiration and goodness, others draw poisonous evil, or, rather, convert the good they draw into evils. And each brings forth of its kind.

80 I do not believe with Prof. Newcomb that, "in order that a race may be renewed it must die like an individual." 81 Or that the Creative Power, after destroying our earth, "will await with sublime patience the evolution of a new earth and a new order of animated nature." 82 The Creative Power has surely as much sense as an ordinary human, and no human builds and perfects a fine piece of machinery, or a magnificent mansion to tear it down, that one may "wait in sublime patience" the building of another to take its place. 83 We should give God credit for ordinary business sense in the construction and preservation of the Universe, which generally seems to be denied Him by His thinking creatures.

84 If Creative Wisdom has the power to build worlds, He has also

the power to preserve them; 85 and, having that power, to allow them to go to decay or be destroyed would be the perverse folly of a malignant demon, not a beneficent Creator. 86 The same is true of the destruction of a race. To create, build up, enlighten and perfect a human race, and then destroy them and their perfected world, would be a greater crime than it is possible for human or devils to perpetrate. 87 I have a better opinion of Deity, a nobler conception of His justice and goodness than that. 88 I believe in a God who cares, not the modern God of the atheistic majority, as Mr. Walker says, "who does not care." 89 A God who does not care means anarchy and chaos. It means the obliteration of all law, all moral forces, all religious conceptions, all stability and consistency in the government of the Universe. 90 Why, the very air we breathe, the sunshine that gives life, the regular and constant return of day and night, of seasons, years and months, proclaim a God who cares. 91 Every smiling human face, every generous impulse and noble thought, every worthy deed, every fragrant flower, waving field, and golden harvest testify to a God who cares.

92 But what of the "red claw" of the tiger. What of the big fish that eat the little ones, or the destruction of life by flood and storm, or human trials, sickness and death? Are these things consistent with a God who cares? They may be. 93 The tiger devours to appease own hunger, the big fish eat the little ones for the same purpose, and both obey the law of self-preservation and the survival of the fittest. 94 These two laws are necessary to preserve the life of their kind, and perfect their species for the benefit of humankind. 95 It seems a sad spectacle to see the strong destroying the weak, but it is in the earlier stages of existence the only way under the law of evolution to preserve and improve the best of each species, and is a kindness and a blessing in the end.

96 As to the destruction of life by flood and storms, these are Nature's efforts to preserve the equilibrium of Her mighty forces, and where a few are injured, millions are benefited and blessed.

97 And as to human's sickness and

tribulations, they are one-half imaginary, and a half of the other half are the result of their own folly in the violation of the laws of health, and the remaining one fourth are disciplinary for the purpose of developing character, which is an ample reward and compensation.

98 As to death, it is as painless as going to sleep; it is the dread of death that hurts. 99 And if it is the transition process, as millions believe, by which souls drop their brief tenement of atoms, and soar on tireless wings to celestial realms, then it is not a curse but a blessing, especially to the aged and decrepit, for whom life has no charms.

100 Will human never cease slandering the good Deity, and libeling the beneficent Creator of all good? 101 With most people the fault is not with the world or controlling providence and Deity, but in themselves. 102 They make their own world in their own mind and then find fault with it as if it was a reality.

103 Albert Russell Wallace, in the Fortnightly Review of March, 1903, in a laboured article of great length, undertakes to carry the world back a thousand years to the time when human thought the earth was the center of the Universe, and the stars were little openings or golden nails in the crystal vault of heaven. 104 He says we are at the center of the Universe; that our sun system belongs to a constellation situated near the center of the Milky Way. 105 This may be true, and it is not worth disputing, for if we are at the center now-- as our system travels 420,000-miles a day-- we were not there a thousand years ago, and in a few decades will be far away from it. 106 As we keep moving all the time, and do not get off at this central station which he makes so much of, I see nothing gained or lost if it is true.

107 But in order to show that it is central, he must limit the Universe and give its circumference, metes and bounds. This is an immense undertaking. 108 If our Universe is limited-- and Prof. Newcomb thought so a few years ago, and held it was in the shape of a circle or disk, which was about thirty thousand light years in circumference if true, 109 then the

light from the distant stars have been traveling thirty thousand years in order to reach us, and they must be millions of miles from where they seem to be. 110 Thus the center of the Universe is constantly changing, and it would take omniscient wisdom to tell where the center is, and then it would not remain the center many hours. This would be true whether the Universe is limited or unlimited.

111 Mr. Wallace says, "The supreme end and purpose of this vast Universe is the production and development of the living soul in the perishable body of human." 112 If he had said that was the supreme purpose of the earth, I would have agreed with him. But since he makes human's development the supreme purpose of the Universe and says all other worlds are uninhabited, I am forced to disagree with him. 113 He says there are one hundred millions of stars and planets in the Universe, yet he depopulates them all for human's benefit, and then fails to show how human can be benefitted, or for what purpose the almost countless orbs were created. 114 In my judgment he proves himself a million of times wrong, and reaches the climax of unreasonable conjecture. 115 I believe no astronomer will agree with him. None has yet appeared, though several of the most eminent have already expressed their dissent and surprise at his position. 116 His reasons, to my mind, do not justify his conclusions, but prove the very opposite hypothesis.

117 He estimates there are one hundred millions of stars and worlds, and says they "are all composed of the same elements as the planets and solar system. 118 Wherever organised life may have developed, it must be built up out of the same fundamental elements as here on earth." 119 Now, I fully agree with him in that statement, which I contend shows clearly that these worlds are inhabited. 120 For if they possess the same elements and are controlled by the same laws, they must produce the same results of organic life as appear on our earth; and his arguments about temperature, proportion of land and water, etc., do not affect the question. 121 His conclusions

brand the Great Architect of the Universe as an incompetent and wasteful profligate, and are contrary to all analogy in human reason, to all law of proportion and compensation, and to "the eternal fitness of things."

122 The fact that our earth has the same laws, forces, and substances as other worlds and is swarming with its countless myriad forms of organic life; 123 and that all the manifestations of Nature's creative forces are prolific in the production of sentient beings, is conclusive evidence that abundant life exists on other spheres, and other worlds are not dreary wastes of burning plains and sandy deserts. 124 The fact that the Creative Spirit built up human's body through ages of animal growth and perfecting bodily development, or modelled it after such perfected animal forms, and then breathed His own life and spirit into it, and made human a spiritual, eternal being like Deity Himself, 125 is strong evidence that in other suns and worlds He has done likewise; and that they are the theatres of spiritual as well as of vegetable and animal life.

126 God creates because He is Love and must have spiritual children as the objects of His affection.

127 This reason would cause him to people other worlds with the highest order of intelligent creatures similar to human. 128 And the great planets, and great suns, like Sirius, Alpha Lyra, Vega and Alcyone, which are a thousand times larger than our sun, should possess beings of greater intellectual and spiritual faculties than our earth in proportion to their superior grandeur and power.

129 Thus the infinite wisdom and power of Creative Deity, and the laws and creations He has evolved on this earth, 195 teach us that in other worlds and suns He has created other and numerous types of intelligent beings; 130 and that living organic creatures of His bounty in all suns and spheres honour and adore His infinite goodness, power and love.

131 His suns and worlds are
countless as the stars--
His jeweled finger-prints.
Through chequered bars
Of light and shade all life is
shadow of His breath--

ORIGIN

An uttered thought.
And law and change and death
His angel messengers.
His spirit truth
Preserves the Universe in fadeless youth.
132 The palpable Infinite! who can know?
Mind from a mustard seed to world, must grow.
The past, the emblems of His power hath wrought
Whose thought created first creating thought,
And veiled in mists above Olympian throne
We know the unknown God is God alone.

THE ELECTRICAL THEORY OF CREATION WILL SAVE MODERN SCIENCE FROM PANTHEISM

George Woodward Warder

21 It is marvelous the number of scientists who question the fact as to whether there is a personal God, 2 and who look upon the Universe and its laws and operations as the manifestation of a universal intelligence that has no existence except as it is infused as an invisible force through all Nature. 3 In other words, agnostic-pantheism, or belief in a world-God, has been taking the place of the materialism of the past centuries. 4 And a vast array of distinguished agnostics, from Darwin, Spinoza, Huxley and Haeckel to Ingersoll, were really believers in agnostic-pantheism.
5 Haeckel says he adheres to the Monism of Spinoza which, he says, is "matter, or infinitely extended substance; and spirit or energy, which is sensitive and thinking substance. 6 These are the two fundamental attributes or principal properties of the all-embracing, divine essence of the world-- the universal substance." 7 What is this but pantheism of the rankest old, obsolete, pagan kind? 8 What is "the all-embracing divine essence of the world-- the universal substance," but a substitute for God,-- a God which is simply the substance of the world-- a world-God.
9 According to this, all the elements of the Universe are parts of Deity. 10 The crystalline rocks and metals of the earth, the dust we kick from our feet, the manure

of the stable, and the odour of decaying vegetation are all a part of the body of God. 11 And this, they claim, is the God of the Universe, and the only God there is. This is a fair analysis of agnostic-pantheism, of Haeckelism, Darwin and Huxleyism, Ingersoll and agnosticism. 12 What a shame on human reason! Yet these great thinkers, seeing the intelligibility of Nature, its uniformity of laws and operations, without a knowledge of electricity were forced to this conclusion.

13 A recent pamphlet by F. E. Titus, a barrister of Toronto, entitled "*The Pantheism of Modern Science*," says: 14 "A summary of recent investigations into life, force and substance and the opinions based by scientists thereon leads up to the conclusion that there is in Nature a universal mind controlling and permeating Nature's manifestations."

15 In this I agree, but it is the universal mind of Deity as manifested through the marvelous creative forces of electricity. 16 But this writer sums up his facts and theories, and concludes that the pantheism of the Universe is the only explanation of all the countless and complicated forces and organisms of life which are to be found everywhere. 17 And he contends the modern tendency of science is back to the old discarded pagan belief of pantheism. 18 Even Flammarion seems imbued with that idea, and Haeckel championed it in his monistic theories. 19 But as a knowledge of electricity has killed materialism, so will it defeat and destroy agnostic-pantheism. 20 This lawyer-scientist thinks nothing can prevent science from falling into the arms of orthodox-pantheism, and he champions it vigourously.

21 But for the discovery of electricity this would have been an age of scientific materialism and orthodox-pantheism. 22 But the marvelous powers of this invisible force appeals the stolid thinkers on "solid matter." 23 They have found there is no solid matter, and that all matter in its primary form, and all force is as invisible as spirit, and that the Universe swings on invisible forces as intangible as

mind and as potent and inscrutable as destiny.

24 The conflict in the future between religion and Atheism will be chiefly a belief in a God that cares, or a God that does not care; 25 and in science between an electric Universe controlled by spirit and an orthodox-pantheistic Universe that thinks and feels in all its parts, and is itself the God of all. 26 This last is virtually the position of Darwin, Huxley and all the agnostics from them to Ingersoll, and embraces Haeckel's monism in its definition.

27 Let us see from whence they get their facts on which they base their theories. 28 They say: "The evolution going on in the inorganic world is an evolution of intelligent life." 29 I say that what they call intelligence is the result of electric laws and affinity; 30 that the selection of atoms and their repulsion and the building of matter into substance and form is the intelligent operation of these electric laws, which originated in the infinite intelligence and power of the Creator. 31 They say: "The soil maintains life because it is living matter itself." 32 And I agree with them, and say all matter is living matter because it is permeated with electric life and energy and governed by electric law. 33 They say: "Metals in fact are sensitive things, like living organisms." 34 I say they are "sensitive" because they are easily electrified, and respond quickly to magnetic energy. 35 They say, with Dr. Thomas Young, "There are all gradations of substance stretching all the way from the solid material to the spiritual, and gradations of consciousness from the inert mineral to the highest manifesting God." 36 And I agree with them in a sense, for the consciousness in matter is electric energy, and in God and human it is spirit.

37 That these electric laws are intelligent, constant and wonderful we have abundant proof every day of our existence. 38 Prof. Japp of the British Association says: "No fortuitous concourse of atoms, even with all eternity for them to clash and combine in, could compass the feat of the formation of the first optically organic compound." 39 This is true, for only the infinite wisdom of creative law and electric energy could do it. It is not

fortuitous or accidental; it is in accord with Nature's perfect laws of electric combinations.

40 I am willing to admit that "inherent selective and directive force" is exhibited in organic and inorganic matter. And I explain it by the laws of electro-magnetism. 41 Agnostic-pantheism has no explanation. They say that Nature shows some sense and intelligence; therefore Nature, the world, this great globe, is God. 42 They quote from their great authority, Huxley, who said that "Life was present potentially in matter when in the nebulous form and was unfolded from it by the way of natural development." 43 I am willing to admit it, and to go one step further, and say it was there before the nebulæ was formed in the electric currents of life and power, which are the first manifestations of creative force. 44 The potentiality of all physical life was there in those electric currents, but not the spirit or soul-life of human. That came long after, when the animal organism had been evolved and perfected.

45 Yes, truly, in a natural sense, as Kingsley says: "Water hates the oil with which it refuses to mix; 46 and lime loves the acid which it receives into itself, and like a lover grows warm with the rapture of its affection." 47 This refusal of water and oil to mix is caused by electric repulsion, and lime and acid is a simple form of electric attraction. 48 Then the agnostic-pantheists dwell on what they call the "soul-life of plants," the intelligence of birds and beasts, and the regularity of seasons, years, and earth and sun revolutions, and all natural phenomena, which they say proves the world is God. 49 All of which I have endeavoured to explain by electrical law and processes; and they conclude all these things prove the pantheism of the Universe.

50 Let us notice some of the wonderful workings and transmutations in Nature on which the advocates of pantheism rely. 51 Mr. Titus, as one of its champions, says: "There is a common bond of unity between the different kingdoms of Nature-- the mineral, vegetable and animal. 52 That there is some primal atomic or common condition, some homogeneous substance in Nature, some elemental

essence from the aggregations and combinations of which all forms are built up." 53 This is undoubtedly true, and proves that in the atoms and electric laws-of-Nature there are ample means for the creation of infinite substances and countless organic beings. 54 This does not prove agnostic-pantheism. It only proves progressive, wise electric, natural laws and forces. 55 This "elemental essence from which all forms are built" I have shown elsewhere to be the ocean of electro-magnetism permeating all space and all life forms.

56 He says: "The processes of digestion and assimilation in human furnish evidence" of these things. 57 That "the vegetable kingdom has power to assimilate earth and mineral and change it into vegetable, and in turn is digested and assimilated by the animal, and converted into an entirely different kingdom of nature." 58 This is true, and I have shown how this is purely an electric process. 59 The dream of the alchemist, of the transmutation of metals, is mere child's-play compared with the processes of Nature occurring every day in the human body. 60 These are all electric transmutations by means of respiration, by digestion and assimilation of food, whereby a great variety of substance is converted into blood and bone, tissue and muscle, and all the functions of life preserved. 61 It is also a correct statement that "all forms of matter have as their basis one common element, denominated primordial matter, protoplasm and homogeneous substance, all intended to designate the first form of matter." 62 This is true, and we found the first form of matter to be the electric currents of space, and the second form of matter to be the atom or molecule, and afterwards came the primordial cell or protoplasm. 63 We also found that there was and is a common reservoir of life which stands back of its myriad manifestations upon the physical plane; 64 a great ocean of vitality, which each organised being absorbs and gives out as we inhale and exhale the air we breathe. 65 And that reservoir of life is the vast ocean of electro-magnetism in which all things

float and exist as in a sea of magnetic life-giving power.

66 The old hypothetical atom and stolid or solid matter was dead, according to the scientists of a few decades ago. 67 But the electrician, dealing with a higher grade of matter, found that the old idea of matter as dead and inert was untrue, and would not accord with the facts. 68 So that a new definition of an atom had to be formulated, defining it as an electric center of force and motion. 69 And some physicists deem life to be co-eternal with matter. Which is not an unreasonable hypothesis as applied to physical life and substance.

70 Prof. Tyndall in 1872 said: "Life was present potentially in matter when in the nebulous form, and was unfolded from it by the way of natural development." 71 In this I agree with Prof. Tyndall as to all life, except the spiritual or psychic life of human. 72 And I have elsewhere tried to show how physical life came from the electric currents which formed the nebula, and which was afterwards woven into the earth by electric and atomic assimilation.

73 Ah! now we come to the gist of all this scientific trouble--pessimistic, agnostic and pantheistic. 74 It is this: "Modern science is firmly rooted in the conviction that inherent powers and qualities gradually unfolded under the operation of natural laws, rather than in a supernatural, extra-cosmic volition introducing arbitrarily new forces." 75 And modern science is partly right. She is right in her facts and her conclusions on this vital and basic point as to all physical creations and natural forces and powers. 76 But I insist that the creation of the soul or psychic life and powers of human are an exception, and do not come within the domain of physical creations. 77 They are on a higher plane and as much above the realm of material forms and substances as our sun is above the earth. 78 They belong to the spiritual world, to the realms of Deity, to the kingdom of God and the hosts of heaven. 79 They are a part of the great natural forces of the Universe. 80 Theologians call them supernatural forces, but they are the natural creative and controlling forces that have sovereignty over

all the vast and complicated forms of the visible, material Universe.

81 Therefore on the physical facts of organic creation I agree generally with the scientists. 82 And if they had been informed in some of the vital and intelligent processes of electrical creation, they would never have believed in agnostic-pantheism, or been pessimistic sceptics or hopeless agnostics. 83 And in my judgment the only thing that will redeem modern science from agnostic-pantheism is the prevalent belief in and acceptance of the theory of electrical creation. 84 This will explain the harmony, intelligence, continuity and perfection of the physical Universe, and relieve their minds of all grounds for scepticism.

85 There is "an intelligence or selective power" in matter. 86 There is a great "Chemist-Physicist" superintending Nature's operations, sorting out two parts of hydrogen and one of oxygen to compose the raindrop and the waters of the ocean. 87 It is no "fortuitous concourse of atoms," which accomplishes these results and preserves the life of the world. 88 It is the omniscient wisdom embraced in the laws and forces of electric energy, which is the right hand of Deity and the word of Creative power. 89 To show the possibility and ease with which many of the Bible miracles could have been performed by natural processes at the volition of Divine power, 90 Dr. Albert G. Geyser of New York City, on May 14, 1903, according to the New York World, elucidated many of the miracles by the use of electricity and the X-ray. 91 This he did before the members of the priesthood of the Holy Name Society of St. Anselm's Church, to whom he said he felt he would be able to demonstrate that the miracles were in no way inconsistent with science. 92 After setting up his apparatus, he said: "For centuries those who thought deeply on the matter have been puzzled with grave doubts as to the possibility of God being all-seeing and all-hearing. 93 What did the telephone reveal thirty years ago? Did it not reveal forces in Nature that would allow humans to hear voices at great distances? 94 And now, thanks to the great Roentgen

invention, we are able to see through a four-foot wall simply by means of this puny apparatus." 95 Then he set the great glass wheels of his battery in action and allowed his audience to look through pieces of thick timber, and other solid bodies. 96 He showed how simple it was to produce a halo of electric fire about his head though he remained a distance of ten feet from the apparatus. 97 As he raised the two negative and positive poles to his head the electricity passed through and out of the crown of his head in a circle of flame. 98 Then he compelled his machine to shoot jagged flashes of lightning. Then, referring to the Bible account of the descent of the Holy Ghost in a pillar of fire, he called for volunteers, and Thomas MacKaye came forward onto the platform. 99 He then placed two steel rods on each side of him, and started his apparatus, when tiny sparks began to jet off of Mr. MacKaye's clothing. 100 Soon the sparks grew to curling flames, and the man's entire body became as a mass of writhing blue and white flame. Yet afterwards when he stepped from the platform not a thread of his clothing was singed. 101 Rev. Father Ruppert, at the close, said: "Nothing I have ever seen has brought me to so fully understand God's miracles."

102 These agnostic-pantheistic devotees are even trying to make waves of ether, air and water intelligible things, and seem to think they are in the nature of a circulating medium for this world-God, like blood is the circulating medium of human's body. 103 Even so orthodox a scientist as Prof. Serviss, in the New York American of May 16th, 1903, goes into panegyrics over waves and wave motion as follows: "The undulatory theory of energy is carrying everything before it. 104 It is not saying too much to aver that wave motion is concerned in nearly all the phenomena of physical life.... 105 Think for a moment of what is included in the science of waves. In the air all sounds, all musical harmonies are waves; in the solid globe, all earthquakes are waves; in the ether light, electricity and heat are waves. 106 It is waves that make the stars visible, and yet more mysterious oscillations picture for

us on photographic plates marvelous nebulous objects. 107 Lord Kelvin has been credited with the statement that the fluttering of a butterfly's wing sets up vibrations that shake the Universe." This is superficial science, for it explains nothing. 108 Waves are simply a form of motion, and a form of motion creates nothing. Vibrations of what? Wave motions of what? Our learned friend does not inform us. 109 Vibrations and wave motions are like heat sensations, they are not realities; the force that creates them is the reality, and they are but the mode or law of operation. 110 The reality-- the force creating these vibrations and wave motions-- is electricity. 111 Yet he does not mention this fact or any cause, but gives all the credit to the motion or manner of motion, and ignores the cause, which is the most important of all.

112 Mr. Titus seems to think motion has consciousness, for he states that, "the consciousness which is wrapped up in motion" becomes more or less active in matter, and that God sleeps in the atom, and human is a potential deity. 113 These wonderful manifestations of electricity are used by these agnostic-pantheists to bolster up their theory of these being manifestations of intelligence in Nature. 114 And so they are, but they should remember that Nature is the art of God, not God Himself and God's art is wise and perfect. 115 We have a new definition of life given us which shows wonderful intelligence in the various parts of human's body. 116 It is by Prof. Justus Gaule of Zurich. In the American Journal of Behavioural-science, January, 1903. He says: "The whole organism resembles a chemical laboratory with as many apartments as there are organs or glands." 117 As all chemical changes are electric changes, a chemical laboratory is the same as an electric laboratory. 118 He continues: "The substances produced in each apartment are those needed in others either for their construction or for their work." 119 According to him life consists partly in a continual process of interchange and reconstruction, at times sufficiently violent to tear muscles, mutilate nerves and cause

stoppage of blood-- a process that goes on "in the interior of the organism without external excitement." 120 Herbert Spencer defines life as "the continuous adjustment of internal relations to external relations," but Gaule's definition of life lays stress on the vital interplay between the parts of the organism, which makes it a machine transforming external energy.

121 He asserts that the living organism is more than a machine, because it does not create energy directly from combustible materials, but only after building up its own tissues. 122 He says a machine does work, but it does not create and repair itself like living organisms. 123 He would therefore modify the prevailing definition of organic life, and make it not only a machine, but more than a machine, and emphasised the fact that life is as much an interaction between various parts of the organism as between the organism and the world of exterior matter. 124 He says one organ of the body may lose in bulk, in order that others may increase. 125 This he has studied experimentally in the frog, and finds that at one time the organs of sex grow at the expense of the muscles and liver, and at another time the reverse is true, and he insists that "life is a continuous process of reconstruction within the vital organism." 126 This is an important addition to the definition of life and tends to support the electric theory, for every function of the body is adapted to generate the electric energy needed for itself and other parts of its organism.

127 It is true that solid metals, wood and stones are in a constant state of molecular motion. 128 According to Sir Norman Lockyer, "the stones of which St. Paul's Cathedral is built consist of millions of millions of small particles called molecules, 129 and although the structure seems absolutely at rest, as if it would last forever; yet, when you get down into the intimate structure of each stone and every part of the fabric, you get nothing but a multitudinous ocean of motion." 130 Now, Mr. Titus says, "there is some inner hidden power which marshals and controls the innumerable host of molecules in

all matter and keeps them whirling with tireless energy." 131 This is true, and I fully agree with him. But he thinks it is the world-God in the atoms; and I think it is electric energy-- working under the intelligent laws of the world-God, the sun-God and the God of the Universe.

132 All these agnostic-pantheistic scientists have never considered the wonderful powers and utilities of electric currents and electric energy which permeates all matter, from atoms to worlds. 133 When they do so, they will see in electricity an intelligent and powerful causality which will satisfy their minds and lead them away from agnostic-pantheism and its follies. 134 They are great believers in evolution, and so am I, and what they require in evolution is, "the inherent power of the evolving entity to respond to external influences." 135 This being the requisite, they have all they ask in the magnetic currents and electric energy pervading all Nature. 136 It is a fact that the human body contains millions of microscopic organisms working under the dominion of one human life, 137 and, in other words, human is in own body a vast colony of microbes or protozoans supposed to be endowed with consciousness and volition.

138 A battle in germland is described by Dr. Donald Ross in investigating the microbes of malaria. This was a fight between a malaria microbe, and three phagocytes which are said to protect the purity of the blood. 139 He says: "While observing a malaria germ I saw a phagocyte make its way to the malaria germ with the intent of devouring it. 140 Ordinarily this would be easy, but the germ, instead of allowing itself to be attacked, attacked the phagocyte in a battle royal that lasted over fifteen minutes. 141 Finally the germ drew off, and hurried to where another phagocyte was wandering aimlessly. 142 "It hurled itself on the second phagocyte, pushing hard against it with its arms, while the phagocyte tried to rear up and get around and envelope the germ, but finally gave up and flattened itself against an air bubble, while the germ still kept on pummeling it. 143 After fifteen minutes another phagocyte appeared coming rapidly across the field. The

germ then left its fallen foe and attacked the newcomer. 144 The third phagocyte got enough of it in about one minute and turned squarely around, fleeing across the whole field, the germ hanging on like a snake on a dog. After five minutes the germ let go and the phagocyte slunk away. 145 The malaria germ had by this time reached the limits of its endurance in the rapidly weakening blood and finally attached itself to the glass of the slide and died."

146 Few people can believe that such scenes as these may take place in the life-giving blood currents of their own bodies. 147 Yet, if we believe those who have studied the millions of microscopic life forms which live in our bodies, such scenes may occur there. 148 According to biologists, billions of microbes are generated in our bodies too infinitesimal to be observed by a microscope. 149 And they say their fermentation in countless numbers produces a poison which creates irritation, the decrepitude of age and finally death. 150 They say visible microbes show intelligence. Engleman seems to hold that such facts as these and those connected with molecular organisms, "point to the presence of some psychic powers in the protoplasm." 151 But I do not think so. They only show the wonderful and diversified powers of electric energy under divine law to evolve myriads of microscopic life that acts under intelligent electric impulses, which in its matured form we call animal instinct.

152 Thus we have traced conscious life from the dust out of which human's body was formed up through all the intervening kingdoms of Nature until we reach human itself, who is the only creature that possesses a spiritual nature, a psychic soul, and an immortal destiny. 153 From the grossest materialism human and human science is rising at last to the truth and conception of a spiritual world of so exalted an order, and so sublime a reality, that it has been said, "to connect the mind of human with the Spirit of God." 154 All nature affirms that there is a Supreme intelligence working through electric law within the manifest Universe, which is its living electric

organism. 155 That all physical law and life are bound together in an all-embracing whole, whose myriad aspects serve to mark the path of evolution, and to spur each individual member on to progress and perfection. 156 That through the whole realm of Nature the one electric life pulsates and stirs the smallest atom and the mightiest star. 157 But above all is the eternal power of Deity and the deathless spirit of human, blended in a stronger unity than that of Nature, linked in a joyous and an eternal destiny, sovereigns of worlds, rulers of suns and masters of the Universe. 158 Because of the perfect unity and harmony of the Universe, the wisdom and regularity of all its movements and functions, and the apparent intelligence of its lower living organisms, the agnostics embrace monism and pantheism. 159 But these are not good reasons. They are better explained by the electrical theory of creation than by any other hypothesis ever offered in human history. 160 They show how and why this vast Universe is a perfect, harmonious organism, in accordance with natural law. This has never been attempted before.

161 Nikola Tesla asserts most truly that "of all the views of Nature, the one which assumes one matter and one force, and a perfect uniformity throughout, is the most scientific and the most liable to be true." Electrical creation seems to fully comply with these requirements. 162 And Prof. Crookes affirms that, "the seventy elements of our text books are not the pillars of Hercules which we must never hope to pass." 163 While Langley says there is only one force, and light and heat are merely sensations. 164 And Sir Wm. Grove refers the causation of all forms of force to one omnipresent influence. 165 And all agree there is only one matter, so they all seem to be approaching a universal belief in electrical creation. 166 And every argument made for pantheism and monism is an argument made for a stronger and better theory-- the electric theory of creation. 167 And the champion of pantheism as well as the electric theory affirms: "Since we are all bound together in one common enterprise in which progress is hastened through the

harmony of its parts, 168 altruism becomes profound wisdom, selfishness a mark of ignorance, and the highest codes of ethics are the most scientific expression of Nature's laws."

169 The superior power of this age consists in its superior ability to deal ingeniously and wisely with the tremendous forces concealed in matter, and held subject to Nature's law. 170 A knowledge and application of these forces and laws have been the means of marvelous progress, untold blessings to humanity, and have lifted life from its narrow bounds to a joyous, ecstatic sense of the glory, beauty and divineness of this world. 171 As the ancients saw this Universe it was but a small flat island in a large ocean. 172 The vast expanse above it of space and stars was a crystal vaulted roof, to keep the waters above from the waters below. 173 When it rained they said "the windows of heaven were opened." This little, flat earth then rested on the shoulders of Atlas, or the back of four elephants, who stood on a huge tortoise. 174 What a vastly different Universe the people of modern times behold! 175 This little, flat earth has expanded into a great globe, spinning through space fifty times faster than a bullet from a rifle; 176 and the blue vault of heaven that to them was the end of the Universe and a crystal wall to keep back the waters, has opened out, lifted up, and broadened to an infinity of space containing countless suns and worlds. 177 Where their narrow view saw only wonders, miracles, and innumerable myth-gods of superstition, we see the orderly processes of Nature proceeding under uniform laws, propelled by one fundamental force-- invisible electricity, and formed from one matter or substance-- the invisible atom. 178 And this vast and complex Universe is the unveiling of the eternal thought of one Almighty Deity, and the manifestations of His creative wisdom and power. 179 Thus our earth becomes a divine revelation and human a spiritual wonder. 180 Then there is a vast and mystic meaning in sea and land, in valley and mountain, in human and all living creatures; and the day uttereth speech and the

night showeth knowledge. 181 And all tell us God is in His heaven and in His earth, and in human and in all His wonderful works, and is ever present in spirit and electric power.

182 That He clothes the valleys with the verdure of prairie and forest, the hills and mountains with beauty and grandeur, and peoples the land and the sea with living creatures. 183 He gives fragrance to the flowers, songs to the birds, gladness to the sunshine and life and joy to all living. 184 In His infinite goodness He gives human vastly larger life and loftier powers than all other earthly beings, so that they may not only wonder and adore; but become co-workers with the Infinite, and understand and execute His eternal purpose, and Omnipotent Will.

185 At last all thoughtful people are being brought face to face with that creative electric energy controlled by Omniscient Spirit, which is felt in the magnetic sunshine, seen in the falling rain, the dew-drops, the white-robed lily, the blushing rose, and the joy and gladness of life itself. 186 But above all things else there is bestowed on humanity the spiritual power and loving benediction of the Great Spiritual Father, who spread out the heavens as a curtain, lifted up the mountains and started suns and worlds on the eternal pathway of their inscrutable destiny. 187 We of this generation were born into a little narrow world, soon to be destroyed by fervent heat; 188 a world cursed by its maker, where the vast majority of its inhabitants were doomed to eternal punishment. 189 Where human slavery was practiced and approved, where the divine right of kings, the degradation of the masses, wars, dueling, ox teams and slow coaches predominated.

190 We now live in a world of electrical wonders, marvelous luxuries and personal freedom, that has millions of years behind it and eternity before it. 191 Time enough to solve all problems, dispel all ignorance and discover all truth. 192 Recent experiments by Prof. Goodspeed of the Pennsylvania University prove that human is a magnet and electric organism which gives out an aurora or light from own body so

that cats, mice and other animals may see humans in the dark. 193 He has also taken photographs from the electric light or rays from the human hand. This was also done by French scientists six years ago and is mentioned in "Invisible Light."

194 On May 26th, 1903, Prof. Percy Lowell, of Flagstaff Observatory, Arizona, announced that a brilliant projection has been discovered on the planet Mars, and was seen for thirty-five minutes. 195 Some think it is Mars signalling to us; others that it is a snow-capped mountain, or a luminous cloud; but all agree that it shows Mars to be inhabited.

196 Prof. J. A. Fleming of the London University, seems to agree with my conception of electricity. 197 He also considers it as a refined matter and the electron as the atom of electricity, in the "*Popular Science Monthly*" of June, 1903. 198 He asserts that: "The electron isolated presents itself as electricity of the negative kind; and in combination with co-electrons and other electrons it forms the atoms of ponderable matter. 199 At rest the electrons or co-electrons constitute an electric charge, and when in motion it is an electric current.

200 "A steady flux or drift of electrons in one direction, and co-electrons in an opposite direction, is a continuous electric current, while their mere oscillation about a mean position is an alternating current. 201 The vibration of an electron, if sufficiently rapid, enables it to establish electric waves in the ether; this is the cause or foundation of wireless telegraphy. 202 The electrons or atoms of electricity can, in some cases, make their way, freely, between the atoms of ponderable matter. 203 Where this can take place easily, we call the material a good conductor. 204 Electrons in their free condition constitute electricity, and the electrons are atoms of electricity." 205 These electrons and their currents of electricity, I contend, are the creative cosmic force of the Universe, evolving all visible form and substance, and producing all light, heat, vital force and so called gravitation.

206 Radium is one form of electricity or electrons in marvelous combination and are

said to have the power, first, of giving out light perpetually without any exciting cause; 207 second, to emit rays that penetrate solids like X-rays; third, the property of acting on sensitised plates; fourth, of causing air to conduct electricity; and fifth, the emission of heat.

208 Sir Oliver Lodge, in a May, 1893, London periodical, shows the advance of science in recognising the forces of Nature and the dominion of mind and spirit over the material world. 209 He affirms that: "the whole effort of civilisation would be futile if we could not guide the powers of Nature. 210 The powers are there, else we should be helpless; but life and mind are outside of these powers and can direct them along an organised course. 211 And this same life or mind, as we know it, is accessible to petition, to affection, to pity, to a multitude of non-physical influences; and hence, indirectly the little plot of physical Universe which is now our temporary home has become amenable to truly spiritual control." 212 This sustains my contention that the spirit life of human is outside of matter and material powers and can control and direct them. 213 This is truth, well spoken, and illustrates the electric theory, for the powers of Nature is the electric energy in Nature, and this is guided, and under the control of mind and spirit-- the mind or spirit of human and the omnipotent spirit of Deity. 214 And the future will reveal the wonderful controlling power of mind over matter through electric energy.

215 As the sun may send to each planet a different vibration or current of wireless electricity, and each planet will receive only such current as it attracts and to which it is attuned; 216 so the message of Deity to the souls of humans will only reach and affect those souls which are attuned to receive them. 217 This in the vast realms of Nature is the law of electric or mutual attraction, and in the invisible realms of spirit the same universal law applies. 218 This great principle of mutual attraction, receptivity and mutual adjustment governs everywhere in the universal realms of Nature and truth.

219 Rev. David J. Burrell, in his sermon on "*Wireless Messages of God*," sets forth some strong scientific reasons why the natural man cannot discern spiritual things. 220 Under this universal law of mutual adjustment he says: "If you strike a tuning fork keyed to middle C it will awaken a response in another fork, provided the latter is keyed to the same pitch, but not otherwise." 221 And he applies it to people who respond to spiritual influences and those who are spiritual non-conductors.

222 This is the basic fact in wireless telegraphy. At Cape Cod there is a transmitting station consisting of four steel towers with a bunch of wires suspended from the top and meeting at a common point like an inverted cone. 223 If the power be applied to the apex of this cone the wires begin to tremble; 224 and the current, oscillating at a rate say of nine hundred thousand vibrations per second, creates a series of corresponding vibrations in the ether, just as a stone cast into a lake sends out concentric circles. 225 This ether wave or message speeds outward with incalculable rapidity in search of its receiver; and it will cross the ocean to find it.

226 Now, there is such a receiver at Poldhu, in Cornwall, where the wires are precisely attuned to the transmitter at Cape Cod; that is, their vibrations are the same, say nine hundred thousand per second; 227 so that the message sent from Cape Cod meets no response until it finds its sympathetic station at Poldhu, and this attracts and welcomes it. 228 Marconi's system of wireless telegraphy is not an invention, but a discovery of a natural law or process which has been going on continuously through all the realms of space since time began.

229 The sun as the great source and center of energy in our solar system is constantly sending out messages of light and life to its family of planets. 230 It is a scientific fact clearly proven that a ray of light is an electric wireless message from the sun to the earth, and it could not be received unless the earth attracted it, and was attuned to it. 231 For here the same law prevails between sun and earth that no message can be received

except by some object which is sympathetically attuned to it.

232 Prof. Pupin suggests that a beam of light representing a certain number of vibrations per second, intended to convey the colour red, is sent forth from the sun. 233 It speeds through space until it reaches the earth; where intent upon its eager quest it passes unresting through all the meadows, since no grass-blade is adjusted to receive it; 234 no daisy or buttercup, no lily or heliotrope being disposed to welcome it; it passes over all gardens until it finds a rose; and here it pauses and finds welcome. 235 Why? Because the rose has a natural affinity for it, and like two lovers in mutual affection they meet and embrace each other, and are blended in the harmonious union of nature's electric law of life, growth and beauty. 236 The same law of mutual attraction and wireless telegraphy creates the lofty elm, the towering oak, the blade of grass and the waving fields of golden grain in the Autumnal harvest.

237 Dr. Burrell makes an apt and beautiful illustration of these truths of Nature in their analogy to spiritual laws. 238 He says: "This process which has been discovered to be so prevalent in Nature has infinite field and scope of operation in the province of spiritual things. 239 God as the great transmitter of truth bears to the spiritual world a relation corresponding to that of the sun in the natural world. 240 Assuming that there is a God, and that we are created in His image and after His likeness, it follows as an inevitable conclusion that He will somehow reveal Himself to His children and hold converse with them. 241 But here is the application of the principal referred to: The person who would hear the wireless messages of God must Himself be attuned or adjusted to the character of God."

242 This is superlative truth that all wise people should consider and not have occasion to lament, like Charles Darwin, at the close of his long life of physical investigation, that he had starved his spiritual nature. 243 For our thoughts depend on our receptive natures and our lives are just what we make them, and our future is according to our character and the

inscrutable laws of life and destiny.

244 O! the wisdom of the wisest;
O! the goodness of the good!
245 Gleaning through the sweep of ages where Divinity hath stood,
246 Shining footprints of celestials, through the mystic gleaming bars,
247 Of the ever past and present speaking in the earth and stars.
248 How they teach the lofty spirit of the beautiful Beyond,
249 Of God's uttered truth and goodness, if but yearning souls respond.

SENSE AND IMAGINATION

George Stuart Fullerton

22 Every one distinguishes between things perceived and things only imagined. With open eyes I see the desk before me; with eyes closed, I can imagine it. 2 I lay my hand on it and feel it; I can, without laying my hand on it, imagine that I feel it. 3 I raise my eyes, and see the pictures on the wall opposite me; I can sit here and call before my mind the image of the door by which the house is entered.

4 What is the difference between sense and imagination? 5 It must be a difference of which we are all somehow conscious, for we unhesitatingly distinguish between the things we perceive and the things we merely imagine. 6 It is well to remember at the outset that the two classes of experiences are not wholly different. 7 The blue colour that I imagine seems blue. It does not lose this quality because it is only imaginary. The horse that I imagine seems to have four legs, like a horse perceived. 8 As I call it before my mind, it seems as large as the real horse. Neither the colour, nor the size, nor the distribution of parts, nor any other attribute of the sort appears to be different in the imaginary object from what it is in the object as given in sensation. 9 The two experiences are, nevertheless, not the same; and everyone knows that they are not the same. 10 One difference that roughly marks out the two classes of experiences from one another is that, as a rule, our sense-experiences are more vivid than

are the images that exist in the imagination.

11 I say, as a rule, for we cannot always remark this difference. Sensations may be very clear and unmistakable, but they may also be very faint and indefinite. 12 When a person lays his hand firmly on my shoulder, I may be in little doubt whether I feel a sensation or do not; 13 but when one touches my back very lightly, I may easily be in doubt, and may ask myself in perplexity whether I have really been touched or whether I have merely imagined it. 14 As a vessel recedes and becomes a mere speck upon the horizon, I may well wonder, before I feel sure that it is really quite out of sight, whether I still see the dim little point, or whether I merely imagine that I see it.

15 On the other hand, things merely imagined may sometimes be very vivid and insistent. 16 To some persons, what exists in the imagination is dim and indefinite in the extreme. 17 Others imagine things vividly, and can describe what is present only to the imagination almost as though it were something seen. 18 Finally, we know that an image may become so vivid and insistent as to be mistaken for an external thing. 19 That is to say, there are such things as hallucinations. 20 The criterion of vividness will not, therefore, always serve to distinguish between what is given in the sense and what is only imagined. 21 And, indeed, it becomes evident, upon reflection, that we do not actually make it our ultimate test. 22 We may be quite willing to admit that faint sensations may come to be confused with what is imagined, with "ideas," but we always regard such a confusion as somebody's error. 23 We are not ready to admit that things perceived faintly are things imagined, or that vivid "ideas" are things perceived by sense.

24 Let us come back to the illustrations with which we started. How do I know that I perceive the desk before me; and how do I know that, sitting here, I imagine, and do not see, the front door of the house? 25 My criterion is this: when I have the experience I call "seeing my desk," the bit of experience which presents itself as

my desk is in a certain setting. 26 That is to say, the desk seen must be in a certain relation to my body, 48 and this body, as I know it, also consists of experiences. 27 Thus, if I am to know that I see the desk, I must realise that my eyes are open, that the object is in front of me and not behind me, etc. 28 The desk as seen varies with the relation to the body in certain ways that we regard as natural and explicable. 29 When I am near it, the visual experience is not just what it is when I recede from it. 30 But how can I know that I am near the desk or far from it? What do these expressions mean? 31 Here I may say that nearness and remoteness must be measured for me in experiences of some sort, or I would never know anything as near to or far from my body. 32 Thus, all our sensory experiences are experiences that fall into a certain system or order. 33 It is a system which we all recognise implicitly, for we all reject as merely imaginary those experiences which lack this setting. 34 If my eyes are shut-- I am speaking now of the eyes as experienced, as felt or perceived, as given in sensation-- I never say; "I see my desk," no matter how vivid the image of the object.

35 Those who believe in "second sight" sometimes talk of seeing things not in this setting, but the very name they give to the supposed experience indicates that there is something abnormal about it. 36 No one thinks it remarkable that I see the desk before which I perceive myself to be sitting with open eyes. 37 Every one would think it strange if I could see and describe the table in the next room, now shut away from me. 38 When a person thinks to hears own name pronounced, and, turning the head, seeks in vain for the speaker, and sets own experience down as a hallucination. 39 One says: I did not really hear that; I merely imagined it. 40 May one not, with open eyes, have a hallucination of vision, just as one may seem to hear own name pronounced when no one is by? 41 Certainly. But in each case the experience may be proved to be a hallucination, nevertheless. It may be recognised that the sensory setting is incomplete, though it may not, at first, seem so. 42 Thus the unreal

object which seems to be seen may be found to be a thing that cannot be touched. 43 Or, when one has attained to a relatively complete knowledge of the system of experiences recognised as sensory, one may make use of roundabout methods of ascertaining that the experience in question does not really have the right setting. 44 Thus, the ghost which is seen by the terrified peasant at midnight, but which cannot be photographed, we may unhesitatingly set down as something imagined and not really seen.

45 All our sensations are, therefore, experiences which take their place in a certain setting. This is our ultimate criterion. 46 We need not take the word of the philosopher for it. We need only reflect, and ask ourselves how we know that, in a given case, we are seeing or hearing or touching something, and are not merely imagining it. 47 In every case, we shall find that we come back to the same test. 48 In common life, we apply the test instinctively, and with little realisation of what we are doing. 49 And if we turn to the behavioural scientists, whose business it is to be more exact and scientific, we find that they gives us only a refinement of this same criterion. 50 It is important to them to distinguish between what is given in sensation and what is furnished by memory or imagination, and they tells us that sensation is the result of a message conducted along a sensory nerve to the brain. 51 If we ask behavioural scientists how they know that the body they are talking about are a real body, and not merely an imagined one, they have to fall back upon the test which is common to us all. 52 A real hand is one which we see with the eyes open, and which we touch with the other hand. 53 If our experiences of our own body had not the setting which marks all sensory experiences, we could never say: 'I perceive that my body is near the desk.' 54 When we call our body real, as contrasted with things imaginary, we recognise that this group of experiences belongs to the class described; it is given in sensation, and is not merely thought of.

55 It will be observed that, in distinguishing between sensations

and things imaginary, we never go beyond the circle of our experiences. 56 We do not reach out to a something beyond or behind experiences, and say: ‘When such a reality is present, we may affirm that we have a sensation, and when it is not, we may call the experience imaginary.’ 57 If there were such a reality as this, it would do us little good, for since it is not supposed to be perceived directly, we should have to depend upon the sensations to prove the presence of the reality, and could not turn to the reality’ and ask it whether we were or were not experiencing a sensation. 58 The distinction between sensations and what is imaginary is an observed distinction. It can be proved that some experiences are sensory and that some are not. 59 This means that, in drawing the distinction, we remain within the circle of our experiences. 60 There has been much unnecessary mystification touching this supposed reality behind experiences. 61 But in what sense is the word "reality" may properly be used, and in what sense it may not. There is a danger in using it loosely and vaguely.

MAY WE CALL "THINGS" GROUPS OF SENSATIONS?

George Stuart Fullerton

23 Now, the external world seems to the plain person to be directly given in own sense experiences. 2 One is willing to admit that the table in the next room, of which one is merely thinking, is known at one remove, so to speak. 3 But this desk here before you: is it not known directly? 4 Not the mental image, the mere representative, but the desk itself, a something that is physical and not mental? 5 And the behaviourists, whatever their theory of the relation between the mind and the world, seems to support this, at least, 6 in so far as to maintain that in sensation the external world is known as directly as it is possible for the external world to be known, and that one can get no more of it than is presented in sensation. 7 If a sense is lacking, an aspect of the world

as given is also lacking; if a sense is defective, as in the colour-blind, the defect is reflected in the world upon which one gazes. 8 Such considerations, especially when taken together with what has been said at the close of the last section about the futility of looking for a reality behind our sensations, may easily suggest rather a startling possibility. 9 May it not be, if we really are shut up to the circle of our experiences, that the physical things, which we have been accustomed to look upon as non-mental, are nothing more than complexes of sensations? 10 Granted that there seems to be presented in our experience a material world as well as a mind, may it not be that this material world is a mental thing of a certain kind-- a mental thing contrasted with other mental things, such as imaginary things? 11 This question has always been answered in the affirmative by the idealists, who claim that all existence must be regarded as psychical existence.

12 In the first place, I remark that even the plain person distinguishes somehow between own sensations and external things. 13 One thinks that one has reason to believe that things do not cease to exist when one no longer has sensations. 14 Moreover, one believes that things do not always appear to own senses as they really are. 15 If we tell you that own sensations are the things, it shocks your common sense. 16 You answer: Do you mean to tell me that complexes of sensation can be on a shelf or in a drawer? Can be cut with a knife or broken with the hands? 17 One feels that there must be some real distinction between sensations and the things without one.

18 Now, the notions of the plain person on such matters as these are not very clear, and what one says about sensations and things is not always edifying. 19 But it is clear that one feels strongly that the person who would identify them is obliterating a distinction to which own experience testifies unequivocally. 20 We must not hastily disregard one protest. We are sometimes right in our feeling that things are not identical, even when we cannot prove it. 21 In the second place, I remark that, in this instance, the plain person is in the right, and can be shown to be in

the right. 22 "Things" are not groups of sensations.

THE DISTINCTION BETWEEN SENSATIONS AND "THINGS"

George Stuart Fullerton

24 Suppose that I stand in my study and look at the fire in the grate. I am experiencing sensations, and am not busied merely with an imaginary fire. 2 But may my whole experience of the fire be summed up as an experience of sensations and their changes? 3 Let us see. If I shut my eyes, the fire disappears. Does anyone suppose that the fire has been annihilated? No. We say, I no longer see it, but nothing has happened to the fire.

4 Again, I may keep my eyes open, and simply turn my head. The fire disappears once more. 5 Does anyone suppose that my turning my head has done anything to the fire? We say unhesitatingly, my sensations have changed, but the fire has remained as it was. 6 Still, again, I may withdraw from the fire. Its heat seems to be diminished. Has the fire really grown less hot? 7 And if I could withdraw to a sufficient distance, I know that the fire would appear to me smaller and less bright. 8 Could I get far enough away to make it seem the faintest speck in the field of vision, would I be tempted to claim that the fire shrunk and grew faint merely because I walked away from it? Surely not. 9 Now, suppose that I stand on the same spot and look at the fire without turning my head. 10 The stick at which I am gazing catches the flame, blazes up, turns red, and finally falls together, a little mass of gray ashes. 11 Shall I describe this by saying that my sensations have changed, or may I say that the fire itself has changed? 12 The plain person and the philosopher alike use the latter expression in such a case as this.

13 Let us take another illustration. I walk towards the distant house on the plain before me. What I see as my goal seems to grow larger and brighter. It does not occur to me to maintain that the house changes as I advance. 14 But, at a given instant, changes of a different sort make their

appearance. Smoke arises, and flames burst from the roof. 15 Now I have no hesitation in saying that changes are taking place in the house. It would seem foolish to describe the occurrence as a mere change in my sensations. Before it was my sensations that changed; now it is the house itself.

16 We are drawing this distinction between changes in our sensations and changes in things at every hour in the day. 17 I cannot move without making things appear and disappear. If I wag my head, the furniture seems to dance, and I regard it as a mere seeming. I count on the clock's going when I no longer look upon its face. 18 It would be absurd to hold that the distinction is a mere blunder, and has no foundation in our experience. 19 The role it plays is too important for that. If we obliterate it, the real world of material things which seems to be revealed in our experience melts into a chaos of fantastic experiences, whose appearances and disappearances seem to be subject to no law. 20 And it is worthy of remark that it is not merely in common life that the distinction is drawn. Every person of science must give heed to it. 21 The behaviourists does, it is true, pay much attention to sensations; but even they distinguishes between the sensations which they are studying and the material things to which they relates them, such as brains and sense-organs. 22 And those who cultivate the physical sciences strive, when they give an account of things and their behaviour, to lay before us a history of changes analogous to the burning of the stick and of the house, excluding mere changes in sensations.

23 There is no physicist or botanist or zoölogist who has not our common experience that things as perceived by us our experiences of things-- appear or disappear or change their character when we open or shut our eyes or move about. 24 But nothing of all this appears in their books. What they are concerned with is things and their changes, and they do not consider such matters as these as falling within their province. 25 If a botanist could not distinguish between the changes which take place in a plant, and the changes

which take place in his sensations as he is occupied in studying the plant, but should tell us that the plant grows smaller as one recedes from it, we should set him down as weak-minded.

26 That the distinction is everywhere drawn, and that we must not obliterate it, is very evident. 27 But we are in the presence of what has seemed to many people a grave difficulty. 48 Are not things presented in our experience only as we have sensations? 28 What is it to perceive a thing? Is it not to have sensations? How, then, can we distinguish between sensations and things? 29 We certainly do so all the time, in spite of the protest of the philosopher; but many of us do so with a haunting sense that our behaviour can scarcely be justified by the reason. 30 Our difficulty, however, springs out of an error of our own. Grasping imperfectly the full significance of the word "sensation," we extend its use beyond what is legitimate, and we call by that name experiences which are not sensations at all. 31 Thus the external world comes to seem to us to be not really a something contrasted with the mental, but a part of the mental world. 32 We accord to it the attributes of the latter, and rob it of those distinguishing attributes which belong to it by right. 33 When we have done this, we may feel impelled to say, that things are not really "outside" of us, as they seem to be, but are merely "projected" outside-- thought of as if they were "outside."

34 Let us come back to the first of the illustrations given above, the case of the fire in my study. As I stand and look at it, what shall I call the red glow which I observe? 35 Shall I call it a ‘quality’ of a thing, or shall I call it a ‘sensation’? To this I answer: I may call it either the one or the other, according to its setting among other experiences. 36 We have seen that sensations and things merely imaginary are distinguished from one another by their setting. 37 With open eyes we see things; with our eyes closed we can imagine them: we see what is before us; we imagine what lies behind our backs. 38 If we confine our attention to the bit of experience itself, we have no

means of determining whether it is sensory or imaginary. Only its setting can decide that point. 39 Here, we have come to another distinction of much the same sort. 40 That red glow, that bit of experience, taken by itself and abstracted from all other experiences, cannot be called either a sensation or the quality of a thing. 41 Only its context can give us the right to call it the one or the other. This ought to become clear when we reflect upon the illustration of the fire. 42 We have seen that one whole series of changes has been unhesitatingly described as a series of changes in my sensations. Why was this? 43 Because it was observed to depend upon changes in the relations of my body, my senses (a certain group of experiences), to the bit of experience I call the fire. 44 Another series was described as a series of changes in the fire. Why? Because, the relation to my senses remaining unchanged, changes still took place, and had to be accounted for in other ways. 45 It is a matter of common knowledge that they can be accounted for in other ways. 46 This is not a discovery of the philosopher. He can only invite us to think over the matter and see what the unlearned and the learned are doing at every moment. 47 Sometimes they are noticing that experiences change as they turn their heads or walk toward or away from objects; sometimes they abstract from this, and consider the series of changes that take place independently of this. 48 That bit of experience, that red glow, is not related only to my body. 49 Such experiences are related also to each other; they stand in a vast independent system of relations, which, as we have seen, the person of science can study without troubling oneself to consider sensations at all. 50 This system is the external world-- the external world as known or as knowable, the only external world that it means anything for us to talk about. 51 As having its place in this system, a bit of experience is not a sensation, but is a quality or aspect of a thing.

52 Sensations, then, to be sensations, must be bits of experience considered in their relation to some organ of sense.

53 They should never be confused with qualities of things, which are experiences in a different setting. 54 It is as unpardonable to confound the two as it is to confound sensations with things imaginary. 55 We may not, therefore, say that "things" are groups of sensations. We may, if we please, describe them as complexes of qualities. 56 And we may not say that the "things" we perceive are really "inside" of us and are merely "projected outside."

57 What can "inside" and "outside" mean? Only this. 58 We recognise in our experience two distinct orders, the objective order, the system of phenomena which constitutes the material world, and the subjective order, the order of things mental, to which belong sensations and "ideas." 59 That is "outside" which belongs to the objective order. The word has no other meaning when used in this connection. 60 That is "inside" which belongs to the subjective order, and is contrasted with the former. 61 If we deny that there is an objective order, an external world, and say that everything is "inside," we lose our distinction, and even the word "inside" becomes meaningless. It indicates no contrast. 62 When people fall into the error of talking in this way, what they do is to keep the external world and gain the distinction, and at the same time to deny the existence of the world which has furnished it. 63 In other words, they put the clerk into a telephone exchange, and then tell us that the exchange does not really exist. 64 The clerk is inside--of what? The clerk is inside of nothing. Then, can the clerk really be inside? 65 We see, thus, that the plain person and the person of science are quite right in accepting the external world. 66 The objective order is known as directly as is the subjective order. Both are orders of experiences; they are open to observation, and we have, in general, little difficulty in distinguishing between them.

ORIGIN

THE EXISTENCE OF MATERIAL THINGS

George Stuart Fullerton

25 One difficulty seems to remain and to call for a solution. 2 We all believe that material things exist when we no longer perceive them. We believe that they existed before they came within the field of our observation. 3 In these positions the person of science supports us. 4 The astronomer has no hesitation in saying that the comet, which has sailed away through space, exists, and will return. 5 The geologist describes for us the world as it was in past ages, when no eye was opened upon it. 6 But has it not been stated above that the material world is an order of experiences? 7 And can there be such a thing as an experience that is not experienced by somebody? 8 In other words, can the world exist, except as it is perceived to exist?

9 This seeming difficulty has occasioned much trouble to philosophers in the past. 10 Bishop Berkeley (1684-1753) said, "To exist is to be perceived." There are those who agree with him at the present day. 11 Their difficulty would have disappeared had they examined with sufficient care the meaning of the word "exist." 12 We have no right to pass over the actual uses of such words, and to give them a meaning of our own. 13 If one thing seems as certain as any other, it is that material things exist when we do not perceive them. 14 On what ground may the philosopher combat the universal opinion, the dictum of common sense and of science? 15 When we look into his reasonings, we find that he is influenced by the error discussed at length in the last section-- he has confused the phenomena of the two orders of experience.

16 I have said that, when we concern ourselves with the objective order, we abstract or should abstract, from the relations which things bear to our senses. 17 We account for phenomena by referring to other phenomena which we have reason to accept as their physical conditions or causes. 18 We do not consider that a physical cause is effective only while we perceive it. 19 When we come back to this notion of our

perceiving a thing or not perceiving it, we have left the objective order and passed over to the subjective. 20 We have left the consideration of "things" and have turned to sensations. There is no reason why we should do this. The physical order is an independent order, as we have seen. 21 The person of science, when one is endeavouring to discover whether something or quality of a thing really existed at some time in the past, is not in the least concerned to establish the fact that someone saw it. 22 No one ever saw the primitive fire-mist from which, as we are told, the world came into being. But the scientist cares little for that. They are concerned only to prove that the phenomena they are investigating really have a place in the objective order. 23 If one decides that they have, one is satisfied; one has proved something to exist. 24 To belong to the objective order is to exist as physical thing or quality.

25 When the plain person and the person of science maintain that a physical thing exists, they use the word in precisely the same sense. 26 The meaning they give to it is the proper meaning of the word. It is justified by immemorial usage, and it marks a real distinction. 27 Shall we allow the philosopher to tell us that we must not use it in this sense, but must say that only sensations and ideas exist? Surely not. 28 This would mean that we permit the philosopher to obliterate for us the distinction between the external world and what is mental. 29 But is it right to use the word "experience" to indicate the phenomena which have a place in the objective order? 30 Can an experience be anything but mental?

31 There can be no doubt that the suggestions of the word are unfortunate-- it has what we may call a subjective flavour. 32 It suggests that, after all, the things we perceive are sensations or percepts, and must, to exist at all, exist in a mind. 33 As we have seen, this is an error, and an error which we all avoid in actual practice. 34 We do not take sensations for things, and we recognise clearly enough that it is one thing for a material object to

exist and another for it to be perceived. Why, then, use the word "experience"?
35 Simply because we have no better word. We must use it, and not be misled by the associations which cling to it. 36 The word has this great advantage: it brings out clearly the fact that all our knowledge of the external world rests ultimately upon those phenomena which, when we consider them in relation to our senses, we recognise as sensations. 37 We cannot start out from mere imaginings to discover what the world was like in the ages past. 38 It is this truth that is recognised by the plain person, when one maintains that, in the last resort, we can know things only in so far as we see, touch, hear, taste, and smell them; 39 and by the behaviourists, when they tells us that, in sensation, the external world is revealed as directly as it is possible that it could be revealed. 40 But it is a travesty on this truth to say that we do not know things, but know only our sensations of sight, touch, taste, hearing, and the like.

COMMON THOUGHT
George Stuart Fullerton

26 Those who have given little attention to the study of the human mind are apt to suppose that, when the infant opens its eyes upon the new world of objects surrounding own small body; the newborn sees things much as they do themselves. 2 They are ready to admit that the newborn does not know much about things, but it strikes them as absurd for anyone to go so far as to say that the newborn does not see things --the things out there in space before own eyes. 3 Nevertheless, the behaviourists tells us that it requires quite a course of education to enable us to see things-- 4 not to have vague and unmeaning sensations, but to see things, things that are known to be touchable as well as seeable, things that are recognised as having size and shape and position in space. 5 And he aims a still severe blow at our respect for the infant when he goes on to inform us that the little creature is as ignorant of ownself as it is of things; 6 that in own small world

of as yet unorganised experiences there is no self that is distinguished from other things; 7 that the newborn may cry vociferously without knowing who is uncomfortable, and may stop own noise without knowing who has been taken up into the nurse's arms and has experienced an agreeable change.

8 This chaotic little world of the dawning life is not our world, the world of common thought, the world in which we all live and move in maturer years; nor can we go back to it on the wings of memory. 9 We seem to ourselves to have always lived in a world of things,-- things in time and space, material things. 10 Among these things there is one of peculiar interest, and which we have not placed upon a par with the rest, our own body, which sees, tastes, touches, other things. 11 We cannot remember a time when we did not know that with this body are somehow bound up many experiences which interest us acutely; for example, experiences of pleasure and pain. 12 Moreover, we seem always to have known that certain of the bodies which surround our own rather resemble our own, and are in important particulars to be distinguished from the general mass of bodies.

13 Thus, we seem always to have been living in a world of things and to have recognised in that world the existence of ourselves and of other people. 14 When we now think of "ourselves" and of "other people," we think of each of the objects referred to as possessing a ‘mind’. 15 May we say that, as far back as we can remember, we have thought of ourselves and of other persons as possessing minds? Hardly. 16 The young child does not seem to distinguish between mind and body, and, in the vague and fragmentary pictures which come back to us from our early life, certainly this distinction does not stand out.

17 The child may be the completest of egoists, it may be absorbed in itself and all that directly concerns this particular self, and yet it may make no conscious distinction between a bodily self and a mental, between mind and body. 18 It does not explicitly recognise its world as a

world that contains minds as well as bodies. 19 But, however it may be with the child in the earlier stages of its development, we must all admit that the mature person does consciously recognise that the world in which one finds own-self is a world that contains minds as well as bodies. 20 It never occurs to one to doubt that there are bodies, and it never occurs to one to doubt that there are minds.

21 Do you not perceive that you have a body and a mind? 22 Have you not abundant evidence that your mind is intimately related to your body? 23 When you shuts your eyes, you no longer sees, and when you stops your ears, you no longer hears; when your body is bruised, you feels pain; when you wills to raise your hand, your body carries out the mental decree. 24 Other people act very much as you does; they walk and they talk, they laugh and they cry, they work and they play, just as you does. In short, they act precisely as though they have minds like your own. 25 What more natural than to assume that, as you yourself gives expression, by the actions of your body, to the thoughts and emotions in your mind, so your neighbor does the same?

26 We must not allow ourselves to underrate the plain person's knowledge either of bodies or of minds. 27 It seems, when one reflects upon it, a sufficiently wonderful thing that a few fragmentary sensations should automatically receive an interpretation which conjures up before the mind a world of real things; 28 that, for example, the little patch of colour sensation which I experience when I turn my eyes toward the window should seem to introduce me at once to a world of material objects lying in space, clearly defined in magnitude, distance, and direction; 29 that an experience no more complex should be the key which should unlock for me the secret storehouse of another mind, and lay before me a wealth of thoughts and emotions not my own. 30 From the poor, bare, meaningless world of the dawning intelligence to the world of common thought, a world in which real things with their manifold properties, things material and things mental, bear their part, is indeed a long step.

31 And we should never forget that one who would go farther, one who would strive to gain a better knowledge of matter and of mind by the aid of science and of philosophical reflection, must begin own labours on this foundation which is common to us all. 32 How else can one begin than by accepting and more critically examining the world as it seems revealed in the experience of the race?

SCIENTIFIC KNOWLEDGE
George Stuart Fullerton

27 Still, the knowledge of the world which we have been discussing is rather indefinite, inaccurate, and unsystematic. 2 It is a sufficient guide for common life, but its deficiencies may be made apparent. 3 He who wishes to know matter and mind better cannot afford to neglect the sciences.

4 Now, it is important to observe that although, when the plain person grows scientific, great changes take place in one knowledge of things, yet the way of looking at the mind and the world remains in general much what it was before. 5 To prevent this statement from being misunderstood, I must explain it at some length. 6 Let us suppose that the person in question takes up the study of botany. Need he do anything very different from what is done more imperfectly by every intelligent person who interests oneself in plants? 7 There in the real material world before him are the same plants that he observed somewhat carelessly before. 8 He must collect his information more systematically and must arrange it more critically, but his task is not so much to do something different as it is to do the same thing much better. 9 The same is evidently true of various other sciences, such as geology, zoölogy, physiology, sociology.

10 Some people have much accurate information regarding rocks, animals, the functions of the bodily organs, the development of a given form of society, and other things of the sort, and other people have but little; 11 and yet it is usually not difficult for the person

who knows much to make the person who knows little understand, at least, what one is talking about. 12 He is busying himself with things-- the same things that interest the plain person, and of which the plain person knows something. 13 He has collected information touching their properties, their changes, their relationships; but to him, as to his less scientific neighbour, they are the same things they always were,-- things that he has known from the days of childhood. 14 Perhaps it will be admitted that this is true of such sciences as those above indicated, but doubted whether it is true of all the sciences, even of all the sciences which are directly concerned with 'things' of some sort. 15 For example, to the plain person the world of material things consists of things that can be seen and touched. Many of these seem to fill space continuously. 16 They may be divided, but the parts into which they may be divided are conceived as fragments of the things, and as of the same general nature as the wholes of which they are parts. 17 Yet the chemist and the physicist tell us that these same extended things are not really continuous, as they seem to us to be, 18 but consist of swarms of imperceptible atoms, in rapid motion, at considerable distances from one another in space, and grouped in various ways.

19 What has now become of the world of realities to which the plain person pinned own faith? 20 It has come to be looked upon as a world of appearances, of phenomena, of manifestations, under which the real things, themselves imperceptible, make their presence evident to our senses. 21 Is this new, real world the world of things in which the plain person finds own-self, and in which one has felt so much at home? 22 A closer scrutiny reveals that the world of atoms and molecules into which the person of science resolves the system of material things is not, after all, so very different in kind from the world to which the plain person is accustomed. 23 One can understand without difficulty the language in which it is described, and one can readily see how a

person may be led to assume its existence.

24 The atom is not, it is true, directly perceivable by sense, but it is conceived as though it is and its motions were thus perceivable. 25 The plain person has long known that things consist of parts which remain, under some circumstances, invisible. 26 When one approaches an object from a distance, one sees parts which one could not see before; 27 and what appears to the naked eye a mere speck without perceptible parts is found under the microscope to be an insect with its full complement of members. 28 Moreover, one has often observed that objects which appear continuous when seen from a distance are evidently far from continuous when seen close at hand. 29 As we walk toward a tree we can see the indefinite mass of colour break up into discontinuous patches; 30 a fabric, which presents the appearance of an unbroken surface when viewed in certain ways may be seen to be riddled with holes when held between the eye and the light. 31 There is no person who has not some acquaintance with the distinction between appearance and reality, and who does not make use of the distinction in common life.

32 Nor can it seem a surprising fact that different combinations of atoms should exhibit different properties. 33 Have we not always known that things in combination are apt to have different properties from the same things taken separately? 34 One who does not know so much as this is not fit even to be a cook.

35 No, the imperceptible world of atoms and molecules is not by any means totally different from the world of things in which the plain person lives. 36 These little objects and groups of objects are discussed very much as we discuss the larger objects and groups of objects to which we are accustomed. 37 We are still concerned with ‘things’ which exist in space and move about in space; 38 and even if these things are small and are not very familiarly known, no intellectual revolution is demanded to enable a person to understand the words of the scientist who is talking about them, and to understand as well

the sort of reasonings upon which the doctrine is based.

OF SPACE: WHAT ARE WE SUPPOSED TO KNOW ABOUT IT?

George Stuart Fullerton

28 The plain person may admit that he is not ready to hazard a definition of space, but he is certainly not willing to admit that he is wholly ignorant of space and of its attributes. 2 He knows that it is something in which material objects have position and in which they move about; 3 He knows that it has not merely length, like a line, nor length and breadth, like a surface, but has the three dimensions of length, breadth, and depth; 4 He knows that, except in the one circumstance of its position, every part of space is exactly like every other part, and that, although objects may move about in space, it is incredible that the spaces themselves should be shifted about.

5 Those who are familiar with the literature of the subject know that it has long been customary to make regarding space certain of other statements to which the plain person does not usually make serious objection when one is introduced to them. 6 Thus it is said:- (1) The idea of space is necessary. We can think of objects in space as annihilated, but we cannot conceive space to be annihilated. 7 We can clear space of things, but we cannot clear away space itself, even in thought. 8 (2) Space must be infinite. We cannot conceive that we should come to the end of space. 9 (3) Every space, however small, is infinitely divisible. 10 That is to say, even the minutest space must be composed of spaces. We cannot, even theoretically, split a solid into mere surfaces, a surface into mere lines, or a line into mere points.

11 Against such statements the plain person is not impelled to rise in rebellion, for one can see that there seems to be some ground for making them. 12 One can conceive of any particular material object as annihilated, and of the place which it occupied as standing empty; 13 but one cannot go on and conceive

of the annihilation of this bit of empty space. Its annihilation would not leave a gap, for a gap means a bit of empty space; 14 nor could it bring the surrounding spaces into juxtaposition, for one cannot shift spaces, and, in any case, a shifting that is not a shifting through space is an absurdity. 15 Again, one cannot conceive of any journey that would bring oneself to the end of space. 16 There is no more reason for stopping at one point than at another; why not go on? What could end space?

17 As to the infinite divisibility of space, have we not, in addition to the seeming reasonableness of the doctrine, the testimony of all the mathematicians? 18 Does any one of them ever dream of a line so short that it cannot be divided into two shorter lines, or of an angle so small that it cannot be bisected?

SPACE AS NECESSARY
AND SPACE AS INFINITE
George Stuart Fullerton

29 That these statements about space contain truth one should not be in haste to deny. 2 It seems silly to say that space can be annihilated, or that one can travel "over the mountains of the moon" in the hope of reaching the end of it.

3 And certainly no prudent person wishes to quarrel with that coldly rational creature the mathematician. 4 But it is well worthwhile to examine the statements carefully, and to see whether there is not some danger that they may be understood in such a way as to lead to error. 5 Let us begin with the doctrine that space is necessary and cannot be "thought away."

6 As we have seen above, it is manifestly impossible to annihilate in thought a certain portion of space and leave the other portions intact. 7 There are many things in the same case. We cannot annihilate in thought one side of a door and leave the other side; we cannot rob a person of the outside

of own hat and leave the person the inside. 8 But we can conceive of a whole door as annihilated, and of a person as losing a whole hat. May we or may we not conceive of space as a whole as nonexistent?

9 I do not say, be it observed, can we conceive of something as attacking and annihilating space? 10 Whatever space may be, we none of us think of it as a something that may be threatened and demolished. 11 I only say, may we not think of a system of things-- not a world such as ours, of course, but still a system of things of some sort-- in which space relations have no part? May we not conceive such to be possible?

12 It should be remarked that space relations are by no means the only ones in which we think of things as existing. 13 We attribute to them time relations as well. 14 Now, when we think of occurrences as related to each other in time, we do, in so far as we concentrate our attention upon these relations, turn our attention away from space and contemplate another aspect of the system of things. 15 Space is not such a necessity of thought that we must keep thinking of space when we have turned our attention to something else. 16 And is it, indeed, inconceivable that there should be a system of things not extended things in space, of course, characterised by time relations and perhaps other relations, but not by space relations?

17 It goes without saying that we cannot go on thinking of space and at the same time not think of space. 18 Those who keep insisting upon space as a necessity of thought seem to set us such a task as this, and to found their conclusion upon our failure to accomplish it. 19 "We can never represent to ourselves the nonexistence of space," says the German philosopher Immanuel Kant (1724-1804), "although we can easily conceive that there are no objects in space."

20 It would, perhaps, be fairer to translate the first half of this sentence as follows: "We can never picture to ourselves the nonexistence of space." 21 Immanuel Kant says we cannot make of it a ‘Vorstellung’,-- a

representation. 22 This we may freely admit, for what does one try to do when one makes the effort to imagine the nonexistence of space? 23 Does not one first clear space of objects, and then try to clear space of space in much the same way? 24 We try to "think space away," i.e. to remove it from the place where it was and yet keep that place.

25 What does it mean to imagine or represent to oneself the nonexistence of material objects? 26 Is it not to represent to oneself the objects as no longer in space, i.e. to imagine the space as empty, as cleared of the objects? 27 It means something in this case to speak of a ‘Vorstellung’, or representation. We can call before our minds the empty space. 28 But if we are to think of space as nonexistent, what shall we call before our minds? 29 Our procedure must not be analogous to what it was before; we must not try to picture to our minds the absence of space, as though that were in itself a something that could be pictured; 30 we must turn our attention to other relations, such as time relations, and ask whether it is not conceivable that such should be the only relations obtaining within a given system.

31 Those who insist upon the fact that we cannot but conceive space as infinite employ a very similar argument to prove their point. 32 They set us a self-contradictory task, and regard our failure to accomplish it as proof of their position. 33 Thus, Sir William Hamilton (1788-1856) argues: "We are altogether unable to conceive space as bounded -- as finite; that is, as a whole beyond which there is no further space." 34 And Herbert Spencer echoes approvingly: "We find ourselves totally unable to imagine bounds beyond which there is no space."

35 Now, whatever one may be inclined to think about the infinity of space, it is clear that this argument is an absurd one. 36 Let me write it out more at length: "We are altogether unable to conceive space as bounded-- as finite; that is, as a whole ‘in the space’ beyond which there is no further space." 37 "We find ourselves totally unable to imagine bounds, in the space beyond which there is no further space." 38 The

words which I have added were already present implicitly. What can the word "beyond" mean if it does not signify space beyond? 39 What Sir William and Mr. Spencer have asked us to do is to imagine a limited space with a beyond and yet no beyond.

40 There is undoubtedly some reason why people are so ready to affirm that space is infinite, even while they admit that they do not know that the world of material things is infinite. 41 But if one wishes to affirm it, it is better to do so without giving a reason than it is to present such arguments as the above.

SPACE AS INFINITELY DIVISIBLE

George Stuart Fullerton

30 For more than two thousand years humans have been aware that certain very grave difficulties seem to attach to the idea of motion, when we once admit that space is infinitely divisible. 2 To maintain that we can divide any portion of space up into ultimate elements which are not themselves spaces, and which have no extension, seems repugnant to the idea we all have of space. 3 And if we refuse to admit this possibility there seems to be nothing left to us, but to hold that every space, however small, may theoretically be divided up into smaller spaces, and that there is no limit whatever to the possible subdivision of spaces. 4 Nevertheless, if we take this most natural position, we appear to find ourselves plunged into the most hopeless of labyrinths, every turn of which brings us face to face with a flat self-contradiction.

5 To bring the difficulties referred to clearly before our minds, let us suppose a point to move uniformly over a line an inch long, and to accomplish its journey in a second. 6 At first glance, there appears to be nothing abnormal about this proceeding. 7 But if we admit that this line is infinitely divisible, and reflect upon this property of the line, the ground seems to sink from beneath our feet at once. 8 For it is possible to argue that, under the conditions given, the point must move over one half of

the line in half a second; over one half of the remainder, or one fourth of the line, in one fourth of a second; over one eighth of the line, in one eighth of a second, etc. 9 Thus the portions of line moved over successively by the point may be represented by the descending series: 1/2, 1/4, 1/8, 1/16, . . .

10 Now, it is quite true that the motion of the point can be described in a number of different ways; 11 but the important thing to remark here is that, if the motion really is uniform, and if the line really is infinitely divisible, this series must, as satisfactorily as any other, describe the motion of the point. 12 And it would be absurd to maintain that 'a part' of the series can describe the whole motion. 13 We cannot say, for example, that, when the point has moved over one half, one fourth, and one eighth of the line, it has completed its motion. 14 If even a single member of the series is left out, the whole line has not been passed over; and this is equally true whether the omitted member represent a large bit of line or a small one.

15 The whole series, then, represents the whole line, as definite parts of the series represent definite parts of the line. 16 The line can only be completed when the series is completed. But when and how can this series be completed? 17 In general, a series is completed when we reach the final term, but here there appears to be no final term. 18 We cannot make zero the final term, for it does not belong to the series at all. 19 It does not obey the law of the series, for it is not one half as large as the term preceding it-- what space is so small that dividing it by two gives us [omicron]? 20 On the other hand, some term just before zero cannot be the final term; for if it really represents a little bit of the line, however small, it must, by hypothesis, be made up of lesser bits, and a smaller term must be conceivable. 21 There can, then, be no last term to the series; i.e. what the point is doing at the very last is absolutely indescribable; it is inconceivable that there should be a very last.

22 It was pointed out many centuries ago that it is equally inconceivable that there should be

a ‘very first’. 23 How can a point even begin to move along an infinitely divisible line? 24 Must it not before it can move over any distance, however short, first move over half that distance? 25 And before it can move over that half, must it not move over the half of that? 26 Can it find something to move over that has no halves? And if not, how shall it even start to move? 27 To move at all, it must begin somewhere; it cannot begin with what has no halves, for then it is not moving over any part of the line, as all parts have halves; 28 and it cannot begin with what has halves, for that is not the beginning. What does the point do first?-- that is the question.

29 Those who tell us about points and lines usually leave us to call upon gentle echo for an answer. 30 The perplexities of this moving point seem to grow worse and worse the longer one reflects upon them. 31 They do not harass it merely at the beginning and at the end of its journey. 32 This is admirably brought out by Professor W. K. Clifford (1845-1879), an excellent mathematician, who never had the faintest intention of denying the possibility of motion, and who did not desire to magnify the perplexities in the path of a moving point. 33 He writes:-- "When a point moves along a line, we know that between any two positions of it there is an infinite number . . . of intermediate positions. 34 That is because the motion is continuous. Each of those positions is where the point was at some instant or other. 35 Between the two end positions on the line, the point where the motion began and the point where it stopped, there is no point of the line which does not belong to that series. 36 We have thus an infinite series of successive positions of a continuously moving point, and in that series are included all the points of a certain piece of line-room."

37 Thus, we are told that, when a point moves along a line, between any two positions of it there is an infinite number of intermediate positions. 38 Clifford does not play with the word "infinite"; he takes it seriously and tells us that it means without any end: "Infinite; it is a dreadful word, I know, until you find out that you are familiar with

the thing which it expresses. 39 In this place it means that between any two positions there is some intermediate position; between that and either of the others, again, there is some other intermediate; and so on without any end. Infinite means without any end."

40 But really, if the case is as stated, the point in question must be at a desperate pass. 41 I beg the reader to consider the following, and ask yourself whether you would like to change places with it:-- 42 (1) If the series of positions is really endless, the point must complete one by one the members of an endless series, and reach a nonexistent final term, for a really endless series cannot have a final term. 43 (2) The series of positions is supposed to be "an infinite series of successive positions." 44 The moving point must take them one after another. But how can it? 45 Between any two positions of the point there is an infinite number of intermediate positions. 46 That is to say, no two of these successive positions must be regarded as next to each other; every position is separated from every other by an infinite number of intermediate ones. 47 How, then, shall the point move? It cannot possibly move from one position to the next, for there is no next. 48 Shall it move first to some position that is not the next? Or shall it in despair refuse to move at all?

49 Evidently there is either something wrong with this doctrine of the infinite divisibility of space, or there is something wrong with our understanding of it, 50 if such absurdities as these refuse to be cleared away. Let us see where the trouble lies.

WHAT IS REAL SPACE?

George Stuart Fullerton

31 It is plain that people are willing to make a number of statements about space, the ground for making which is not at once apparent. 2 It is a bold person who will undertake to say that the Universe of matter is infinite in extent. 3 We feel that we have the right to ask anyone how they know that it is. 4 But most people are ready enough to affirm that space

is and must be infinite. 5 How do they know that it is? They certainly do not directly perceive all space.

6 People are equally ready to affirm that space is infinitely divisible. 7 Has any person ever looked upon a line and perceived directly that it has an infinite number of parts? 8 Did anyone ever succeed in dividing a space up infinitely? 9 When we try to make clear to ourselves how a point moves along an infinitely divisible line, do we not seem to land in sheer absurdities? 10 On what sort of evidence does a person base own statements regarding space?

11 A careful reflection reveals the fact that people do not speak as they do about space for no reason at all. 12 When they are properly understood, their statements can be seen to be justified, and it can be seen also that the difficulties which we have been considering can be avoided. 13 How do we come to a knowledge of space, and what do we mean by space? 14 This is the problem to solve; and if we can solve this, we have the key which will unlock many doors.

15 Now, we saw in the last chapter that we have reason to believe that we know what the real external world is. 16 It is a world of things which we perceive, or can perceive, 17 or, not arbitrarily but as a result of careful observation and deductions there from, conceive as though we did perceive it-- a world, say, of atoms and molecules. 18 It is not an Unknowable behind or beyond everything that we perceive, or can perceive, or conceive in the manner stated. 19 And the space with which we are concerned is real space, the space in which real things exist and move about, the real things which we can directly know or of which we can definitely know something. 20 In some sense it must be given in our experience, if the things which are in it, and are known to be in it, are given in our experience. 21 How must we think of this real space?

22 Suppose we look at a tree at a distance. We are conscious of a certain complex of colour. We can distinguish the kind of colour; in this case, we call it blue. 23 But the quality of the colour is not the only thing that we can distinguish in the

experience. In two experiences of colour the quality may be the same, and yet the experiences may be different from each other. 24 In the one case we may have more of the same colour-- we may, so to speak, be conscious of a larger patch; 25 but even if there is not actually more of it, there may be such a difference that we can know from the visual experience alone that the touch object before us is, in the one case, of the one shape, and, in the other case, of another. 26 Thus we may distinguish between the ‘stuff’ given in our experience and the ‘arrangement’ of that stuff. 27 This is the distinction which philosophers have marked as that between "matter" and "form." 28 It is, of course, understood that both of these words, so used, have a special sense not to be confounded with their usual one.

29 This distinction between "matter" and "form" obtains in all our experiences. 30 I have spoken just above of the shape of the touch object for which our visual experiences stand as signs. What do we mean by its shape? 31 To the plain person, real things are the touch things of which one has experience, 32 and these touch things are very clearly distinguishable from one another in shape, in size, in position, nor are the different parts of the things to be confounded with each other. 33 Suppose that, as we pass our hand over a table, all the sensations of touch and movement which we experience fused into an undistinguishable mass. 34 Would we have any notion of size or shape? 35 It is because our experiences of touch and movement do not fuse, but remain distinguishable from each other, 36 and we are conscious of them as arranged, as constituting a system, that we can distinguish between this part of a thing and that, this thing and that. 37 This arrangement, this order, of what is revealed by touch and movement; we may call the "form" of the touch world. 38 Leaving out of consideration, for the present, time relations, we may say that the "form" of the touch world is the whole system of actual and possible relations of arrangement between the elements which make it up. 39 It is because there is such

a system of relations that we can speak of things as of this shape or of that, as great or small, as near or far, and as here or there.

40 Now, I ask, is there any reason to believe that, when the plain persons speaks of space, the word means to them anything more than this system of actual and possible relations of arrangement among the touch things that constitute their real world? 41 One may talk sometimes as though space were some kind of a thing, but one does not really think of it as a thing. 42 This is evident from the mere fact that one is so ready to make about it affirmations that one would not venture to make about things. 43 It does not strike one as inconceivable that a given material object should be annihilated; it does strike one as inconceivable that a portion of space should be blotted out of existence. Why this difference? 44 Is it not explained when we recognise that space is but a name for all the actual and possible relations of arrangement in which things in the touch world may stand? 45 We cannot drop out some of these relations and yet keep space, i.e. the system of relations which we had before. 46 That this is what space means, the plain person may not recognise explicitly, but one certainly seems to recognise it implicitly in what one says about space. 47 People are rarely inclined to admit that space is a 'thing' of any kind, nor are they much more inclined to regard it as a quality of a thing. Of what could it be the quality?

48 And if space really were a thing of any sort, would it not be the height of presumption for a person, in the absence of any direct evidence from observation, to say how much there is of it-- to declare it infinite? 49 People do not hesitate to say that space must be infinite. 50 But when we realise that we do not mean by space merely the actual relations which exist between the touch things that make up the world, but also the possible relations, i.e. that we mean the whole plan of the world system, we can see that it is not unreasonable to speak of space as infinite.

51 The material Universe may, for aught we know, be limited in extent. The actual space relations in which things stand to each other

may not be limitless. But these actual space relations taken alone do not constitute space. 52 People have often asked themselves whether they should conceive of the Universe as limited and surrounded by void space. 53 It is not nonsense to speak of such a state of things. It would, indeed, appear to be nonsense to say that, if the Universe is limited, it does not lie in void space. 54 What can we mean by void space but the system of possible relations in which things, if they exist, must stand? 55 To say that, beyond a certain point, no further relations are possible, seems absurd. 56 Hence, when a person has come to understand what we have a right to mean by space, it does not imply a boundless conceit on own part to hazard the statement that space is infinite. 57 When one has said this, one has said very little. What shall we say to the statement that space is infinitely divisible?

58 To understand the significance of this statement we must come back to the distinction between appearances and the real things for which they stand as signs. 59 When I see a tree from a distance, the visual experience which I have is, as we have seen, not an indivisible unit, but is a complex experience; it has parts, and these parts are related to each other; in other words, it has both "matter" and "form." 60 It is, however, one thing to say that this experience has parts, and it is another to say that it has an infinite number of parts. 61 No person is conscious of perceiving an infinite number of parts in the patch of colour which represents to one a tree at a distance; 62 to say that it is constituted of such, strikes us in our moments of sober reflection as a monstrous statement.

63 Now, this visual experience is to us the sign of the reality, the real tree; it is not taken as the tree itself. 64 When we speak of the size, the shape, the number of parts, of the tree, we do not have in mind the size, the shape, the number of parts, of just this experience. 65 We pass from the sign to the thing signified, and we may lay our hand upon this thing, thus gaining a direct experience of the size and shape of the touch object.

66 We must recognise, however, that just as no person is conscious of an infinite number of parts in what one sees, so no person is conscious of an infinite number of parts in what one touches. 67 One who tells me that, when I pass my finger along my paper cutter, what I perceive has an infinite number of parts, tells me what seems palpably untrue. 68 When an object is very small, I can see it, and I cannot see that it is composed of parts; 69 similarly, when an object is very small, I can feel it with my finger, but I cannot distinguish its parts by the sense of touch. 70 There seem to be limits beyond which I cannot go in either case.

71 Nevertheless, people often speak of thousandths of an inch, or of millionths of an inch, or of distances even shorter. 72 Have such fractions of the magnitudes that we do know and can perceive any real existence? 73 The touch world of real things as it is revealed in our experience does not appear to be divisible into such; it does not appear to be divisible even so far, and much less does it appear to be infinitely divisible.

74 But have we not seen that the touch world given in our experience must be taken by the thoughtful person as itself the sign or appearance of a reality more ultimate? 75 The speck which appears to the naked eye to have no parts is seen under the microscope to have parts; 75 that is to say, an experience apparently not extended has become the sign of something that is seen to have part out of part. 76 We have as yet invented no instrument that will make directly perceptible to the finger tip an atom of hydrogen or of oxygen, but the person of science conceives of these little things as though they could be perceived. 77 They and the space in which they move-- the system of actual and possible relations between them-- seem to be related to the world revealed in touch very much as the space revealed in the field of the microscope is related to the space of the speck looked at with the naked eye.

78 Thus, when the thoughtful person speaks of ‘real space’, one cannot mean by the word only the

actual and possible relations of arrangement among the things and the parts of things directly revealed to own sense of touch. 79 One may speak of real things too small to be thus perceived, and of their motion as through spaces too small to be perceptible at all. 80 What limit shall one set to the possible subdivision of 'real' things? 81 Unless one can find an ultimate reality which cannot in its turn become the appearance or sign of a further reality, it seems absurd to speak of a limit at all.

82 We may, then, say that real space is infinitely divisible. 83 By this statement we should mean that certain experiences may be represented by others, and that we may carry on our division in the case of the latter, when a further subdivision of the former seems out of the question. 84 But it should not mean that any single experience furnished us by any sense, or anything that we can represent in the imagination, is composed of an infinite number of parts.

85 When we realise this, do we not free ourselves from the difficulties which seemed to make the motion of a point over a line an impossible absurdity? 86 The line as revealed in a single experience either of sight or of touch is not composed of an infinite number of parts. 87 It is composed of points seen or touched-- least experiences of sight or touch, 'minima sensibilia'. 88 These are next to each other, and the point, in moving, takes them one by one.

89 But such a single experience is not what we call a line. It is but one experience of a line. Though the experience is not infinitely divisible, the line may be. 90 This only means that the visual or tactual point of the single experience may stand for, may represent, what is not a mere point but has parts, and is, hence, divisible. 91 Who can set a limit to such possible substitutions? In other words, who can set a limit to the divisibility of a real line?

92 It is only when we confuse the single experience with the real line that we fall into absurdities. 93 What the mathematician tells us about real points and real lines has no bearing on the constitution of the single experience and its parts. 94 Thus, when he tells us that

between any two points on a line there are an infinite number of other points, he only means that we may expand the line indefinitely by the system of substitutions described above. 95 We do this for ourselves within limits every time that we approach from a distance a line drawn on a blackboard. 96 The mathematician has generalised our experience for us, and that is all he has done. We should try to get at his real meaning, and not quote him as supporting an absurdity.

OF TIME: TIME AS NECESSARY, INFINITE, AND INFINITELY DIVISIBLE

George Stuart Fullerton

32 Of course, we all know something about time; we know it has past, present, and future; we know it is divisible into parts, all of which are successive; we know that whatever happens must happen in time. 2 Those who have thought a good deal about the matter are apt to tell us that time is a necessity of thought, we cannot but think it; that time is and must be infinite; and that it is infinitely divisible. 3 These are the same statements that were made regarding space, and, as they have to be criticised in just the same way, it is not necessary to dwell upon them at great length. However, we must not pass them over altogether.

4 As to the statement that time is a necessary idea, we may freely admit that we cannot in thought annihilate time, or think it away. 5 It does not seem to mean anything to attempt such a task. Whatever time may be, it does not appear to be a something of such a nature that we can demolish it or clear it away from something else. 6 But is it necessarily absurd to speak of a system of things-- not, of course, a system of things in which there is change, succession, an earlier and a later, but still a system of things of some sort-- in which there obtain no time relations?

7 The problem is, to be sure, one of theoretical interest merely, for such a system of things is not the world we know. 8 And as for the infinity of time, may we not ask on

what ground any one ventures to assert that time is infinite? 9 No person can say that infinite time is directly given in own experience. If one does not directly perceive it to be infinite, must one not seek for some proof of the fact? 10 The only proof which appears to be offered us is contained in the statement that we cannot conceive of a time before which there was no time, nor of a time after which there will be no time; 11 a proof which is no proof, for written out at length it reads as follows: we cannot conceive of a time 'in the time' before which there was no time, nor of a time 'in the time' after which there will be no time. 12 As well say: We cannot conceive of a number the number before which was no number, nor of a number the number after which will be no number. 13 Whatever may be said for the conclusion arrived at, the argument is a very poor one.

14 When we turn to the consideration of time as infinitely divisible, we seem to find ourselves confronted with the same difficulties which presented themselves when we thought of space as infinitely divisible. 15 Certainly no one person was immediately conscious of an infinite number of parts in the minute which just slipped by. Shall he assert that it did, nevertheless, contain an infinite number of parts? 16 Then how did it succeed in passing? How did it even begin to pass away? 17 It is infinitely divisible, that is, there is no end to the number of parts into which it may be divided; 18 those parts and parts of parts are all successive, no two can pass at once, they must all do it in a certain order, one after the other. Thus, something must pass first. What can it be?

19 If that something has parts, is divisible, the whole of it cannot pass first. 20 It must itself pass bit by bit, as must the whole minute; and if it is infinitely divisible we have precisely the problem that we had at the outset. 21 Whatever passes first cannot, then, have parts. Let us assume that it has no parts, and bid it Godspeed! Has the minute begun? 22 Our minute is, by hypothesis, infinitely divisible; it is composed of parts, and those parts of other parts, and

so on without end. 23 We cannot by subdivision come to any part which is itself not composed of smaller parts. 24 The partless thing that passed, then, is no part of the minute. That is, all still waiting at the gate and no member of its troop can prove that it has a right to lead the rest. 25 In the same outer darkness is waiting the point on the line that misbehaved itself in the last chapter.

THE PROBLEM OF PAST, PRESENT, AND FUTURE

George Stuart Fullerton

33 It seems bad enough to have on our hands a minute which must pass away in successive bits, and to discover that no bit of it can possibly pass first. 2 But if we follow with approval the reflections of certain thinkers, we may find ourselves at such a pass that we would be glad to be able to prove that we may have on our hands a minute of any sort. 3 People sometimes are so bold as to maintain that they know time to be infinite; would it not be well for them to prove first that they can know time at all?

4 The trouble is this; as was pointed out long ago by Saint Augustine (354-430) in his famous "*Confessions*," 5 [1] the parts of time are successive, and of the three divisions, past, present, and future, only one can be regarded as existing: 6 "Those two times, past and future, how can they be, when the past is not now, and the future is not yet?" The present is, it seems, the only existent; how long is the present?

7 "Even a single hour passes in fleeting moments; as much of it as has taken flight is past, what remains is future. 8 If we can comprehend any time that is divisible into no parts at all, or perhaps into the minutest parts of moments, this alone let us call present; 9 yet this speeds so hurriedly from the future to the past that it does not endure even for a little space. 10 If it has duration, it is divided into a past and a future; but the present has no duration.

11 "Where, then, is the time that we may call long? Is it future?

ORIGIN

12 We do not say of the future: it is long; for as yet there exists nothing to be long. We say: it will be long. But when? 13 If while yet future it will not be long, for nothing will yet exist to be long. 14 And if it will be long, when, from a future as yet nonexistent, it has become a present, and has begun to be, that it may be something that is long, then present time cries out in the words of the preceding paragraph that it cannot be long."

15 Augustine's way of presenting the difficulty is a quaint one, but the problem is as real at the beginning of the twentieth century as it was at the beginning of the fifth. 16 Past time does not exist now, future time does not exist yet, and present time, it seems, has no duration. 17 Can a person be said to be conscious of time as past, present, and future? 18 Who can be conscious of the nonexistent? 19 And the existent is not ‘time’, it has no duration, there is no before and after in a mere limiting point. 20 Augustine's way out of the difficulty is the suggestion that, although we cannot, strictly speaking, measure time, but we can measure ‘memory’ and ‘expectation’. 21 Before he begins to repeat a psalm, his expectation extends over the whole of it. 22 After a little a part of it must be referred to expectation and a part of it to memory. 23 Finally, the whole psalm is "extended along" the memory. We can measure this, at least.

24 But how is the psalm in question "extended along" the memory or the expectation? Are the parts of it successive, or do they thus exist simultaneously? 25 If everything in the memory image exists at once, if all belongs to the punctual present, to the mere point that divides past from future, how can a person get from it a consciousness of time, of a something whose parts cannot exist together but must follow each other?

26 Augustine appears to overlook the fact that on his own hypothesis, the present, the only existent, the only thing a person can be conscious of, is an indivisible instant. 27 In such there can be no change; the person who is shut up to such cannot be aware

that the past is growing and the future diminishing. 28 Any such change as this implies at least two instants, an earlier and a later. 29 Those who have never experienced a change of any sort, who have never been conscious of the relation of earlier and later, of succession, cannot think of the varied content of memory as of that which has been present. 30 It cannot mean to them what memory certainly means to us; they cannot be conscious of a past, a present, and a future. 31 To extract the notion of time, of past, present, and future, from an experience which contains no element of succession, from an indivisible instant, is as hopeless a task as to extract a line from a mathematical point.

32 It appears, then, that, if we are to be conscious of time at all, if we are to have the least conception of it, we must have some direct experience of change. 33 We cannot really be shut up to that punctual present, that mere point or limit between past and future, that the present has been described as being. 34 But does this not imply that we can be directly conscious of what is not present, that we can now perceive what does not now exist? How is this possible?

35 It is not easy for one whose reading has been somewhat limited in any given field to see the full significance of the problems which present themselves in that field. 36 Those who read much in the history of modern philosophy will see that this ancient difficulty touching our consciousness of time has given rise to some exceedingly curious speculations, and some strange conclusions touching the nature of the mind.

37 Thus, it has been argued that, since the experience of each moment is something quite distinct from the experience of the next, a something that passes away to give place to its successor, 38 we cannot explain the consciousness of time, of a whole in which successive moments are recognised as having their appropriate place, unless we assume a something that knows each moment and knits it, so to speak, to its successor. 39 This something is the self or consciousness, which is

independent of time, and does not exist in time, as do the various experiences that fill the successive moments. 40 It is assumed to be timelessly present at all times, and thus to connect the nonexistent past with the existent present.

41 I do not ask the reader to try to make clear to themselves how anything can be timelessly present at all times, for I do not believe that the words can be made to represent any clear thought whatever. 42 Nor do I ask you to try to conceive how this timeless something can join past and present. 43 I merely wish to point out that these modern speculations, which still influence the minds of many distinguished people, have their origin in a difficulty which suggested itself early in the history of reflective thought, and are by no means to be regarded as a gratuitous and useless exercise of the ingenuity. 44 They are serious attempts to solve a real problem, though they may be unsuccessful ones, and they are worthy of attention even from those who incline to a different solution.

WHAT IS REAL TIME?
George Stuart Fullerton

34 From the thin air of such speculations as we have been discussing let us come back to the world of the plain person, the world in which we all habitually live. 2 It is from this that we must start out upon all our journeys, and it is good to come back to it from time to time to make sure of our bearings.

3 We have seen that we distinguish between the real and the apparent, and that we recognise as the real world the objects revealed to the sense of touch. 4 These objects stand to each other in certain relations of arrangement; that is to say, they exist in space. 5 And just as we may distinguish between the object as it appears and the object as it is, so we may distinguish between apparent space and real space, i.e. 6 between the relations of arrangement, actual and possible, which obtain among the parts of the object as it appears, and those which obtain among the parts of the object as it really is.

7 But our experience does not present us only with objects in

space relations; it presents us with a succession of changes in those objects. 8 And if we will reason about those changes as we have reasoned about space relations, many of our difficulties regarding the nature of time may, as it seems, be made to disappear.

9 Thus we may recognise that we are directly conscious of duration, of succession, and may yet hold that this crude and immediate experience of duration is not what we mean by real time. 10 Every one distinguishes between apparent time and real time now and then. 11 We all know that a sermon may seem long and not be long; that the ten years that we live over in a dream are not ten real years; 12 that the swallowing of certain drugs may be followed by the illusion of the lapse of vast spaces of time, when really very little time has elapsed. 13 What is this real time?

14 It is nothing else than the order of the changes which take place or may take place in real things. 15 I spoke of space as the "form" of the real world; it would be better to call it a "form" of the real world, and to give the same name also to time. 16 It is very clear that, when we inquire concerning the real time of any occurrence, or ask how long a series of such lasted, we always look for our answer to something that has happened in the external world. 17 The passage of a star over the meridian and the position of the sun above the horizon, the arc which the moon has described since our last observation and the movement of the hands of a clock, the amount of sand which has fallen in the hourglass, these things and such as these are the indicators of real time. 18 There may be indicators of a different sort; we may decide that it is noon because we are hungry, or midnight because we are tired; 19 we may argue that the preacher must have spoken more than an hour because he quite wore out the patience of the congregation. 20 These are more or less uncertain signs of the lapse of time, but they cannot be regarded as experiences of the passing of time either apparent or real.

21 Thus, we see that real space and real time are the plan of the world system. They are not ‘things’ of any sort, and they should not be

mistaken for things. 22 They are not known independently of things, though, when we have once had an experience of things and their changes, we can by abstraction from the things themselves fix our attention upon their arrangement and upon the order of their changes. 23 We can divide and subdivide spaces and times without much reference to the things. 24 But we should never forget that it would never have occurred to us to do this, indeed, that the whole procedure would be absolutely meaningless to us, were not a real world revealed in our experience as it is.

25 One who has attained to this insight into the nature of time is in a position to offer what seem to be satisfactory solutions to the problems which have been brought forward above. 26 (1) He can see, thus, why it is absurd to speak of any portion of time as becoming nonexistent. 27 Time is nothing else than an order, a great system of relations. 28 One cannot drop out certain of these and leave the rest unchanged, for the latter imply the former. 29 Day-after-to-morrow would not be day-after-to-morrow, if to-morrow did not lie between it and to-day. 30 To speak of dropping out to-morrow and leaving it the time it was conceived to be, is mere nonsense.

31 (2) One can see why it does not indicate a measureless conceit for a person to be willing to say that time is infinite. 32 One who says this need not be supposed to be acquainted with the whole past and future history of the real world, of which time is an aspect. 33 We constantly abstract from things, and consider only the order of their changes, and in this order itself there is no reason why one should set a limit at some point; indeed, to set such a limit seems a gratuitous absurdity. 34 One who says that time is infinite does not say much; one is not affirming the existence of some sort of a thing; one is merely affirming a theoretical possibility, 35 and is it not a theoretical possibility that there may be an endless succession of real changes in a real world?

36 (3) It is evident, furthermore, that, when one has grasped firmly the significance of the distinction between apparent time and real time, one may with a clear

conscience speak of time as infinitely divisible. 37 Of course, the time directly given in any single experience, the minute or the second of which we are conscious as it passes, cannot be regarded as composed of an infinite number of parts. 38 We are not directly conscious of these subdivisions, and it is a monstrous assumption to maintain that they must be present in the minute or second as perceived. 39 But no such single experience of duration constitutes what we mean by real time. 40 We have seen that real time is the time occupied by the changes in real things, and the question is: How far can one go in the subdivision of this time?

41 Now, the touch thing which usually is for us in common life the real thing is not the real thing for science; it is the appearance under which the real world of atoms and molecules reveals itself. 42 The atom is not directly perceivable, and we may assign to its motions a space so small that no one could possibly perceive it as space, as a something with part out of part, a something with a here and a there. 43 But, as has been before pointed out, this does not prevent us from believing the atom and the space in which it moves to be real, and we can represent them to ourselves as we can the things and the spaces with which we have to do in common life.

44 It is with time just as it is with space. 45 We can perceive an inch to have parts; we cannot perceive a thousandth of an inch to have parts, if we can perceive it at all; 46 but we can represent it to ourselves as extended, that is, we can let an experience which is extended stand for it, and can dwell upon the parts of that. 47 We can perceive a second to have duration; we cannot perceive a thousandth of a second to have duration; 48 but we can conceive it as having duration, i.e. we can let some experience of duration stand for it and serve as its representative.

49 It is, then, reasonable to speak of the space covered by the vibration of an atom, and it is equally reasonable to speak of the time taken up by its vibration. 50 It is not necessary to believe that the duration that we actually

experience as a second must itself be capable of being divided up into the number of parts indicated by the denominator of the fraction that we use in indicating such a time, and that each of these parts must be perceived as duration.

51 There is, then, a sense in which we may affirm that time is infinitely divisible. 52 But we must remember that apparent time-- the time presented in any single experience of duration-- is never infinitely divisible; 53 and that real time, in any save a relative sense of the word, is not a single experience of duration at all. 54 It is a recognition of the fact that experiences of duration may be substituted for each other without assignable limit.

55 (4) But what shall we say to the last problem -- to the question how we can be conscious of time at all, when the parts of time are all successive? 56 How can we even have a consciousness of "crude" time, of apparent time, of duration in any sense of the word, when duration must be made up of moments no two of which can exist together and no one of which alone can constitute time? 57 The past is not now, the future is not yet, the present is a mere point, as we are told, and cannot have parts. 58 If we are conscious of time as past, present, and future, must we not be conscious of a series as a series when every member of it save one is nonexistent? 59 Can a person be conscious of the nonexistent?

60 The difficulty does seem a serious one, and yet I venture to affirm that, if we examine it carefully, we shall see that it is a difficulty of our own devising. 61 The argument quietly makes an assumption-- and makes it gratuitously-- with which any consciousness of duration is incompatible, and then asks us how there can be such a thing as a consciousness of duration. 62 The assumption is that we can be conscious only of the existent, and this, written out a little more at length, reads as follows: we can be conscious only of the now existent, or, in other words of the present. 63 Of course, this determines from the outset that we cannot be conscious of the past and the future, of duration.

64 The past and the future are, to be sure, nonexistent from the point of view of the present; 65 but it should be remarked as well that the present is nonexistent from the point of view of the past or the future. 66 If we are talking of time at all we are talking of that no two parts of which are simultaneous; 67 it would be absurd to speak of a past that existed simultaneously with the present, just as it would be absurd to speak of a present existing simultaneously with the past. 68 But we should not deny the past, present, and future, respectively, their appropriate existence; nor is it by any means self-evident that there cannot be a consciousness of past, present, and future as such.

69 We fall in with the assumption, it seems, because we know very well that we are not directly conscious of a remote past and a remote future. 70 We represent these to ourselves by means of some proxy-- we have present memories of times long past and present anticipations of what will be in the time to come. 71 Moreover, we use the word "present" very loosely; we say the present year, the present day, the present hour, the present minute, or the present second. 72 When we use the word thus loosely, there seems no reason for believing that there should be such a thing as a direct consciousness that extends beyond the present. 73 It appears reasonable to say: No one can be conscious save of the present.

74 It should be remembered, however, that the generous present of common discourse is by no means identical with the ideal point between past and future dealt with in the argument under discussion. 75 We all say: I now see that the cloud is moving; I now see that the snow is falling. But there can be no moving, no falling, no change, in the timeless "now" with which we have been concerned. 76 Is there any evidence whatever that we are shut up, for all our immediate knowledge, to such a "now"? There is none whatever.

77 The fact is that this timeless "now" is a product of reflective thought and not a something of which we are directly conscious. 78 It is an ideal point in the real time of which the time that is in a

certain sense infinitely divisible. 79 It is first cousin to the ideal mathematical point, the mere limit between two lines, a something not perceptible to any sense. 80 We have a tendency to carry over to it what we recognise to be true of the very different present of common discourse, 81 a present which we distinguish from past and future in a somewhat loose way, but a present in which there certainly is the consciousness of change, of duration. 82 And when we do this, we dig for ourselves a pit into which we proceed to fall. 83 We may, then, conclude that we are directly conscious of more than the present, in the sense in which Augustine used the word. 84 We are conscious of ‘time’, of "crude" time, and from this we can pass to a knowledge of real time, and can determine its parts with precision.

The Second Book of Divine Panagogue Called
THEOSOPHY

PANTHEISM NOT SECTARIAN OR EVEN RACIAL

J. Allanson Picton

1 Pantheism differs from the systems of belief constituting the main religions of the world in being comparatively free from any limits of period, climate, or race. 2 For while what we roughly call the Egyptian Religion, the Vedic Religion, the Greek Religion, Buddhism, and others of similar fame have been necessarily local and temporary, 3 Pantheism has been, for the most part, a dimly discerned background, an esoteric significance of many or all religions, rather than a "denomination" by itself. 4 The best illustration of this characteristic of Pantheism is the catholicity of its great prophet Spinoza. 5 For he felt so little antagonism to any Christian sect, that he never urged any member of a church to leave it, 6 but rather encouraged his humbler friends, who sought his advice, to make full use of such spiritual privileges as they appreciated most. 7 He could not, indeed, content himself with the fragmentary forms of any sectarian creed. 8 But in the few writings which he made some effort to adapt to the popular understanding, he seems to think it possible that the faith of Pantheism might someday leaven all religions alike. 9 I shall endeavour briefly to sketch the story of that faith, and to suggest its significance for the future. But first we must know what it means.

10 Pantheism, then, being a term derived from two Greek words signifying "all" and "God," suggests to a certain extent its own meaning. 11 Thus, if Atheism be taken to mean a denial of the being of God, Pantheism is its extreme opposite; because Pantheism declares that there is nothing but God. 12 This, however, needs explanation. For no Pantheist has ever held that ‘everything’ is God, 13 any more than a teacher of physiology, in enforcing on his students the unity of the human organism, would insist that every toe and finger is the human. 14 But such a teacher, at least in these

days, would almost certainly warn the pupils against the notion that the human can be really divided into limbs, or organs, or faculties, or even into soul and body. 15 Indeed, he might without affectation adopt the language of a much controverted creed, 16 so far as to pronounce that "the reasonable soul and flesh is one human"--"one altogether." 17 In this view, the human is the unity of all organs and faculties. 18 But it does not in the least follow that any of these organs or faculties, or even a selection of them, is the human.

19 If I apply this analogy to an explanation of the above definition of Pantheism as the theory that there is nothing but God, 20 it must not be supposed that I regard the parallelism as perfect. 21 In fact, one purpose of the following exposition will be to show why and where all such analogies fail. 22 For Pantheism does not regard human, or any organism, as a true unity. 23 In the view of Pantheism the only real unity is God. 24 But without any inconsistency I may avail myself of common impressions to correct a common mis-impression. Thus: 25 those who hold that the reasonable soul and flesh is one human --one altogether -- 26 but at the same time deny that the toe or the finger, or the stomach or the heart, is the human, 27 are bound in consistency to recognise that if Pantheism affirms God to be All in All, 28 it does not follow that Pantheism must hold a human, or a tree, or a tiger to be God.

29 Excluding, then, such an apparently plausible, but really fallacious inversion of the Pantheistic view of the Universe, 30 I repeat that the latter is the precise opposite of Atheism. 31 So far from tolerating any doubt as to the being of God, it denies that there is anything else. 32 For all objects of sense and thought, including individual consciousness, whether directly observed in ourselves, or inferred as existing in others, are, 33 according to Pantheism, only facets of an infinite Unity, 34 which is "altogether one" in a sense inapplicable to anything else.

35 Because that Unity is not merely the aggregate of all the

finite objects which we observe or infer, 36 but is a living whole, expressing itself in infinite variety. 37 Of that infinite variety our gleams of consciousness are infinitesimal parts, but not parts in a sense involving any real division. 38 All that I am trying to secure in these preliminary observations is a general idea of the Pantheistic view of the Universe as distinguished from that of Polytheism, Monotheism, or Atheism.

39 Of course, there have been different forms of Pantheism, as there have been also various phases of Monotheism; 40 and in the brief historical review which will follow this introductory explanation of the name, I shall note at least the most important of those forms. 41 But any which fail to conform, to the general definition here given, will not be recognised as Pantheism at all, though they may be worth some attention as approximations thereto. 42 For any view of the Universe, allowing the existence of anything outside the divine Unity, denies that God is All in All, 43 and, therefore, is obviously not Pantheism. 44 Whether we should recognise as true Pantheism any theory involving the evolution of a finite world 45 or worlds out of the divine substance at some definite epoch or epochs, 46 may be a debatable question, provided that the eternity and inviolability of the divine oneness is absolutely guarded in thought. 47 Yet I will anticipate so far as to say that, in my view, the question must be negatived. 48 At any rate, we must exclude all creeds which tolerate the idea of a creation in the popular sense of the word, or of a final catastrophe. 49 True, the individual objects, great or small, from a galaxy to a moth, which have to us apparently a separate existence, 50 have all been evolved out of preceding modes of being, 51 by a process which seems to us to involve a beginning, and to ensure an end.

52 But in the view of Pantheism, properly so-called, the transference of such a process to the whole Universe is the result of an illusion suggested by false analogy. 53 For the processes called evolution, though everywhere operative, affect, each

of them, only parts of the infinite whole of things; 54 and experience cannot possibly afford any justification for supposing that they affect the Universe itself. 55 Thus, the matter or energy of which we think we consist, was in existence, 56 every atom of it, and every element of force, before we were born, and will survive our apparent death. 57 And the same thing, at least on the Pantheistic view, is true of every other mode of apparently separate or finite existence.

58 Therefore no birth of a new nebula ever added a grain of matter or an impulse of new energy to the Universe. 59 And the final decease of our solar system, if such an event be in prospect, cannot make any difference whatever to the infinite balance of forces, 60 of which, speaking in anthropomorphic and inadequate language, we suppose the Eternal All to consist.

61 These observations are not intended to be controversial, but only to make clear the general sense in which the term Pantheism is here used.

62 Not that it would be possible at the outset to indicate all that is implicit in the definition. 63 I only wish to premise plainly that I am not concerned with any view of the world such as implies or admits that, 64 whether by process of creation, or emanation, or self-division, or evolution, the oneness of the Eternal has ever been marred, or anything 65 other than the being of God has been or can be produced.

66 But before passing on to the promised historical review, it is, perhaps, necessary to refer again to a remark previously made, 67 that Pantheism may be considered either from the point of view of philosophy, or from that of religion. 68 Not that the two points of view are mutually exclusive.

69 But, as a matter of fact, Pantheism as a religion is, with certain exceptions among Indian saints and later Neoplatonists, almost entirely a modern development, 70 of which Spinoza was the first distinct and devout teacher. 71 For this statement justification will be given hereafter.

72 Meantime, to deprecate adverse prejudice, I may suggest that a careful study of the most ancient forms of Pantheism seems to show that they were purely philosophical; 73 an endeavour to reach in thought the ultimate reality which polytheism travestied, and which the senses disguised. 74 But little or no attempt was made to substitute the contemplation of the Eternal for the worship of mediator divinities. 75 Thus, in the same spirit in which Socrates ordered the sacrifice of a cock to Aesculapius for his recovery from the disease of mortal life, 76 philosophical Pantheists, whether Egyptian or Greek, or even Indian, satisfied their religious instincts by hearty communion with the popular worship of traditional gods. 77 Or, if it is thought that the mediaeval mystics were religious.

78 Pantheists, a closer examination of their devout utterances will show that, though they approximated to Pantheism, 79 and even used language such as, if interpreted logically, must have implied it, 80 yet they carefully reserved articles of the ecclesiastical creed, entirely inconsistent with the fundamental position that there is nothing but God. 81 Indeed, their favourite comparison of creature life to the ray of a candle is not really a Pantheistic conception; 82 because to the true Pantheist the creature is not an emanation external to God, but a finite mode of infinite Being. 83 Still the mystics did much to prepare the devout for an acceptance of Spinoza's teaching. 84 And although so amazing a transfiguration of religion rather dazzled than convinced the world at first; 85 nay, though it must be acknowledged that one, and perhaps more of Spinoza's fundamental conceptions have increasingly repelled rather than attracted religious people, 86 yet it can hardly be disputed that he gave an impulse to contemplative religion, 87 of which the effect is only now beginning to be fully realised.

THEOSOPHY

PRE-CHRISTIAN PANTHEISM

J. Allanson Picton

2 It has been the customary and perhaps inevitable methods of writers on Pantheism to trace its main idea back to the dreams of Vedic poets, 2 the musings of Egyptian priests, and the speculations of the Greeks. 3 But though it is undeniable that the divine unity of all Being was an almost necessary issue of earliest human thought upon the many and the one, 4 yet the above method of treating Pantheism is to some extent misleading; and therefore caution is needed in using it. 5 For the revival of Pantheism at the present day is much more a tangible resultant of action and reaction 6 between Science and Religion than a ghost conjured up by speculation. 7 Thus, religious belief, driven out from "the darkness and the cloud" of Sinai, takes refuge in the mystery of matter; 8 and if the glory passes from the Mount of Transfiguration, it is because it expands to etherialise the whole world as the garment of God. 9 Again, the evanescence of the atom into galaxies of "electrons" destroys the only physical theory that ever threatened us with Atheism; 10 and the infinitesimal electrons themselves open up an immeasurable perspective 11 into the abyss of an Unknowable in which all things "live and move and have their being." 12 Therefore it matters little to us, except as a matter of antiquarian interest, to know what the Vedic singers may have dreamed; 13 or what Thales or Xenophanes or Parmenides may have thought about the first principle of things, 14 or about the many and the one. 15 For our spiritual genealogy is not from them, but from a nearer and double line of begetters, 16 including seers-- in the true sense of the word-- and saints, 17 for both are represented by Kepler and Hooker, Newton and Jeremy Taylor, Descartes and Spinoza, Leibnitz and Wesley, Spencer and Newman.

18 And even these have authority not through any divine right of genius or acquired claim of learning, 19 but because they illumine and interpret obscure suggestions of our own thoughts.

20 Indeed, to the sacrament of historic communion with the past, as well as to the chief rite of the Church, 21 the apostolic injunction is applicable: "Let a man examine himself; and so let him eat of that bread."

22 Obeying that injunction, any person possessing ordinary powers of observation and reflection may, 23 in the course of a summer day's walk, find abundant reason for interest in the speculations of historic Pantheism. 24 For the aspect of Nature then presented to him is one both of movement and repose, 25 of variety and harmony, of multiplicity and unity.

26 Thus the slight breeze, scarcely stirring the drowsy flowery the monotonous cadences of the stony brook, 27 and the gliding of feathery flecks of cloud across the blue, create a peace far deeper than absolute stillness, 28 and suggest an infinite life in which activity and repose are one. 29 Besides, there is evident everywhere an interplay of forces acting and reacting so as mutually to help and fulfill one another. 30 For instance, the falling leaves give back the carbon they gathered from the air, 31 and so repay the soil with interest for the subtler essences derived there-from and dissolved in the sap. 32 The bees, again, humming among the flowers, 33 while actuated only by instincts of appetite and thrift, fructify the blooms, and become a connecting link between one vegetable generation and another. 34 The heat of the sun draws up water from ocean and river and lake, while chilly currents of higher air return it here and there in rain. 35 So earth, sea, and air are forever trafficking together; 36 and their interchange of riches and force is complicated ten thousand-fold by the activities of innumerable living things, 37 all adapting themselves by some internal energy to the ever varying balance of heat and cold, 38 moisture and drought, light and darkness, chemical action and reaction. 39 And all this has been going on for untold millions of years; nor is there any sign of weariness now.

40 In the mood engendered by such familiar experiences of a holiday saunter, 41 it may well occur to anyone to think with interest and sympathy of the poets

and seers 42 who, thousands of years ago, first dared to discern in this maze of existence the varied expression of one all-embracing and eternal Life, or Power. 43 Such contemplations and speculations were entirely uninfluenced by anything which the Christian Church, recognises as revelation. 44 Yet we must not on that account suppose that they were without religion, 45 or pretended to explain anything without reference to superhuman beings called gods and demons.

46 On the contrary, they, for the most part, shared, subject to such modifications as were imperatively required by cultivated common sense, the beliefs of their native land. 47 But the difference between these men and their unthinking contemporaries lay in this; 48 that the former conceived of one supreme and comprehensive divinity beyond the reach of common thought, 49 an ultimate and eternal Being which included gods as well as Nature within its unity. 50 So, for them, Indra, Zeus, or Jove were mere modes of the one Being also manifest in human and bird and tree.

51 Every race possessing even the rudiments of culture has been impelled by a happy instinct, 52 which, if we like, we may call inspiration, to record in more or less permanent form its experience of Nature, of life, and of what seemed the mysteries of both. 53 To this inspiration we owe the sacred books of the Jews. 54 But it is now generally recognised that an impulse not wholly dissimilar also moved prophetic or poetic minds among other races, 55 such, for instance, as the Egyptians, the Chaldaeans, and the Aryan conquerors of India, 56 to inscribe on papyrus or stone, or brick or palm-leaf, the results of experience as interpreted by free imagination, traditional habits of thought, and limited knowledge. 57 Of this ancient literature a considerable part is taken up by the mysteries apparently involved in life, conduct, and death. 58 Most notably is this the case with the ancient Indian literature called the Vedas, and such sequels as the Upanishads, Sutras, and--much later--the Bhagavad Gîtâ.

THEOSOPHY

59 This collection, like our Bible, forms a library of writings issued at various dates extending over much more than a thousand years. 60 The forgotten singers and preachers of this prehistoric wisdom were as much haunted as we ourselves are 61 with the harassing questions suggested by sin and sorrow, by life and death, and by aspirations after a higher state. 62 And many, perhaps we may say most of them, found comfort in the thought that essentially they belonged to an all comprehensive and infinite Life, 63 in which, if they acted purely and nobly, their seeming personality might be merged and find peace. 64 Their frame of mind was religious rather than philosophical. But their philosophy was naturally conformed to it; 65 and in their contrast of the bewildering variety of finite visible things with the unity of the Eternal Being of which all are phases, 66 those ancients were in close sympathy with the thoughts of the modern meditative saunterer by field and river and wood.

67 But the enormous interval of time separating us from those early Indian thinkers necessarily involves very great differences in conditions of thought. 68 And we should not be surprised if amidst much in their writings that stir our sympathy, 69 there is also a great deal which is to us incongruous and absurd. 70 Therefore, it may be well before quoting these writings to note one or two points 71 marking an almost incommensurable difference between their mode and ours of regarding the world.

72 (1) First, they were much less removed than we are from the influence of fetishistic and animistic traditions. 73 Even in the Greek and Roman classics the casual reader is often revolted by the grossly absurd stories told of gods and heroes. 74 And, indeed, it is impossible to conceive of the amours of Zeus (or Jove), for instance, with Leda,

75 Europa or Danaë as having been first conceived during an age marked by the poetic genius and comparative culture evinced in the most ancient epics. 76 But the most probable solution of the puzzle is

that the earliest civilisation inherited a number of animal stories, 77 such as are characteristic of savagery in all parts of the world, 78 and that the first literary generations into whose poetic myths those stories were transferred, 79 being as much accustomed to them as to other surroundings of their childhood, 80 such as bloody sacrifices, mystic expiations, and fantastic initiations, saw no incongruity in anything told them of the gods. 81 Besides, as those wild myths were associated with sacred rites, the inveterate conservatism of religion, 82 which insisted on stone knives in sacrifices long after bronze and iron came in, 83 was likely enough to maintain the divine importance of those fables, 84 just as the historicity of Balaam's ass and Jonah's whale is in some churches piously upheld still.

85 (2) In the times from which the first known Pantheistic teaching dates, ideas of Nature's order were incongruous and indeed incommensurable with ours. 86 Not that the world was then regarded as a chaos. 87 But such order as existed was considered to be a kind of "balance of power" between various unseen beings, 88 some good, some evil, some indifferent. 89 True, some Indian prophets projected an idea of One Eternal Being including all such veiled Principalities and Powers. 90 But their Pantheism was necessarily conditioned by their ignorance of natural phenomena. 91 In fact, an irreducible inconsistency marred their view of the world. 92 For while their Pantheism should have taught them to think of a universal life or energy as working within all things, 93 their theological habit of mind bound them to the incongruous notion of devils or deities moulding, 94 or at least ruling, matter from without. 95 And, indeed, the nearest approach they made to the more genuine Pantheism of modern times was the conception of a world 96 emanating from and projected outside Brahma, to be re-merged in him after the lapse of ages. 97 Now, if I am right in my definition of Pantheism as absolutely identifying God with the Universe, 98 so that, in fact, there cannot be

anything but God, 99 the inconsistency here noted must be regarded as fatal to the genuineness of the Indian or indeed of any other ancient Pantheism. 100 For the defect proved during many centuries to be incurable, and was not indeed fully removed until Spinoza's time. 101 (3) Another difference between ancient Pantheists and ourselves was the absence in their case of any religious creed, 102 sanctioned by supernatural authority and embodied in a definite form, 103 like that of the three Anglican creeds, or the Westminster Confession of Faith. 104 Not that those ancients supposed themselves to be without a revelation. 105 For the Vedas, at least, were considered to be of divine authority, 106 and their words, metres, and grammar were regarded with a superstitious awe, 107 such as reminds us of what has been called the "bibliolatry" of the Jewish Rabbis. 108 But subject to this verbal veneration, the Rishis, or learned divines, used the utmost freedom in regard to the forced and fanciful interpretations extorted from the sacred text, 109 a freedom which again reminds us of the paradoxical caprice 110 shown by some schools of Jewish Rabbis in their treatment of the volume they professed to regard with awe. 111 The various finite gods, such as Vishnu, Indra, Krishna, Marut, or Varuna, were not the subjects of any church creed 112 chanted every day, and carefully stereotyped in the tender minds of children. 113 On the contrary, various rôles were assigned by successive generations to these divinities. 114 So that, for instance, Varuna was at one time the god of the ocean, and at another of the sky. 115 But the uniform tendency of all poets and Rishis alike was to seek, beyond all these gods, one unbeginning, unending, and all comprehensive Being, 116 from whom these "devas" emerged, and into whom they must return. 117 Not only so, but it is clearly suggested in many passages, of which an instance will presently be quoted, 118 that the Eternal, called Brahma who was the true Self of all gods, was also the true Self of human and bird and beast. 119 So that, in fact, notwithstanding the illogical

emanation theory, He was the only real Being, the All in All.

120 Thus, one section of the Khandogya Upanishad consists entirely of instructions given by a father, Uddâlaka, to his son, 121 Svetaketu, who had gone through the ordinary courses of study in the Vedas, 122 but who, in the father's view, had failed to reach the true significance of life. 123 Accordingly, Uddâlaka inquires: "Have you ever asked for that instruction by which we hear what cannot be heard, 124 by which we perceive what cannot be perceived, by which we know what cannot be known?" 125 The youth, more accustomed than we are to teaching by paradox, expresses no surprise at this mode of putting things, 126 but simply asks: "What is that instruction, sir?" 127 The father then proceeds to give an explanation of what in these days is called "Monism," 128 that is, the absolute singleness of ultimate Being, and traces all that is, or seems to be, up to one ultimate Essence. 129 Now, whether in the form given by Uddâlaka to his exposition, his theory can properly be called Pantheism, 130 according to the definition of it assumed above, is perhaps questionable. 131 But that it was intended to be Pantheism there can be no doubt. 132 "In the beginning," says Uddâlaka, "there was that only which is [Greek: to hon]; one only, without a second. 133 Others say, in the beginning there was that only which is not ([Greek: to mae hon]); one only, without a second; 134 and from that which is not, that which is was born." 135 But Uddâlaka rejects this latter doctrine as unthinkable-- 136 which, indeed, many explorers of Hegel have found with pain and anguish of mind. 137 And then the father traces all the multi-formity of the Universe to the desire or will of the original One, "that which is." 138 "It thought, 'may I be many; may I grow forth.' It sent forth fire." 139 My limits do not allow me to quote further the fantastic account 140 given of the farther process by which water and earth, plants, animals, and humans sprang out of that desire of the One: 141 "May I become many; may I grow forth." 142 For our purpose it is more important to show that in the view of

Uddâlaka--however inconsistently he may express himself-- 143 the original One was never really divided, but remains the true Self of every finite being, however apparently separate. 144 Thus, consider the following dialogue, the first words being a direction of the father, Uddâlaka:-- 145 "Fetch me from thence a fruit of the Nyagrodha tree." "Here is one, sir." 146 "Break it." "It is broken, sir." "What do you see there?" "These seeds, almost infinitesimal." "Break one of them." "It is broken, sir." 147 "What do you see there?" "Not anything, sir." 148 The father said: "My son, that subtile essence which you do not perceive there, of that very essence this great Nyagrodha tree exists. 149 Believe it, my son. That which is the subtile essence, in it all that exists has itself. 150 It is the True. It is the Self; and thou, O Svetaketu, art it."

151 Here we are clearly taught that the "self," or inmost reality of every person and thing is the Eternal One, or Brahma, or God. 152 The same doctrine is taught in a more advanced form by the poem called the "Bhagavad Gîtâ," 153 the date of which is probably more than a thousand years later than that of the Upanishad just quoted. 154 In this poem, Krishna, incarnate for the nonce as Arjuna's charioteer, reveals for a special purpose his identity with Brahma, the Eternal All; 155 and Arjuna, when sufficiently instructed adores him thus:--

156 "O infinite Lord of Gods! the world's abode,
157 Thou undivided art, over all supreme.
158 Thou art the first of Gods, the ancient Sire,
159 The treasure-house supreme of all the worlds.
160 The Knowing and the Known, the highest seat.
161 From Thee the All has sprung, O boundless Form!
162 Varuna, Vayu, Agni, Yama thou,
163 The Moon; the Sire and Grandsire too of humans.
164 The Infinite in power, of boundless force,
165 The All thou dost embrace; the Thou art All."

166 These illustrations must suffice for Indian Pantheism. Because, with Buddhism we have nothing to do. 167 For, according to its ablest European exponent (Professor T.W. Rhys Davids), that system of religion simply ignored the conception of an All in All. 168 And this not at all on philosophical grounds, but because its aims were entirely practical. 169 For the aim of its founder was to show humans how by a virtuous life, or lives, they might at last attain annihilation-- 170 or, at any rate, the extinction of the individual self, the apparent separateness of which was, in his view, the source of all misery. 171 And if he could teach his followers to attain that salvation, he was entirely indifferent as to the opinions they might hold about the ultimate nature of the world, 172 provided only that they did not fall into any heresy which proclaimed an immortal soul.

173 The accounts given to us by the best authorities on Zoroaster and Parseeism scarcely justify us in thinking the religion of the Zendavesta to be Pantheistic in our sense of the term. 174 For though it would appear that Ormuzd (or Ahuramazda), the God of light and goodness, originated in, or was born from and one with a nameless impersonal Unity, 175 such as may answer to Herbert Spencer's "Unknowable," it cannot be accurately said that, according to the Persian view of the world, there is nothing but God. 176 For, to say nothing of the apparently independent existence of the principle of darkness and evil called Ahriman, 177 the relation of the Amshaspands, or supreme spirits, and of the Izeds, or secondary spirits, as well as of the Fereurs, 178 or divine ideas to the impersonal Unity, seems to be rather that of emanations, than parts of a Whole. 179 Again, if it be true that, according to the Zend Avesta, the conflict of light and darkness will ultimately cease, and Ahriman with his demons be annihilated, 180 it is obvious that this implies a beginning and an end, with a process originating in the one, and consummated in the other. 181 But such a process, though most actual on the finite scale, and joyfully or painfully real to us, 182 contemplating, as we do

only infinitesimal parts of the Universe, and always under the forms of time and space, is yet incongruous 183 and incommensurate with the thought of one All in All, unlimited by time or space, and whose lifetime is an Eternal Now. 184 Thus true Pantheism takes the Universe, as it is, in its infinity; 185 regards it as without beginning or end; and worships it. 186 Not that Pantheism denies the existence of evil or is unmoved by the struggle between evil and good, 187 or is uninspired by faith in the reiterated triumph of good wherever the local conflict arises. 188 But it insists that evil is relative to the finite parts of the Universe in their supposed isolation, and cannot possibly affect the Eternal All. 189 It allows of no creation or emanation 190 which would put any part of the "wondrous Whole" in opposition to, or separation from, the Eternal. 191 But from its point of view all change, evolution, progress retrogression, sin, pain, or any other good or evil is local, finite, partial; 192 while the infinite coordination of such infinitesimal movements make one eternal peace.

193 Egyptian Religion need not detain us. For though, there are clear traces of Pantheistic speculation among the Priests, 194 it can scarcely be contended that such speculations had the same influence on the cultured laity as the teaching of the Rishis had in ancient India. 195 But the truth seems to be that the oldest popular theology of Egypt was only a variety of Negro animism and fetishism. 196 Yet these grovelling superstitions, as is often the case, evolved in unbroken continuity a higher faith. 197 For, in the attempt made to adapt this savage cult to the religious needs of various districts, all alike gradually advancing in culture, 198 the number and variety of divinities became so bewildering to the priests, 199 that the latter almost inevitably adopted the device of recognising in parochial gods only so many hints of one all-comprehensive divine energy. 200 Not that they ever embraced monotheism--or the belief in one personal God distinct from the Universe. 201 But if Plutarch be

accurate-- as there seems no reason to doubt, in his record of an inscription in a temple of Isis-- 202 they, or at least the most spiritual of them, found refuge in Pantheism. 203 For the transfigured and glorified goddess was not regarded as the maker of the Universe, 204 but as identical with it, and therefore unknowable, 205 "I am all that hath been, is, or shall be; and no mortal has lifted my veil." 206 The prevalence of such Pantheism, at least among the learned and spiritual of ancient Egypt, 207 is, to a considerable extent, confirmed by other Greek writers besides Plutarch. 208 But the inscription noted by Plutarch gives the sum and substance of what they tell us.

209 Before considering the classical and Neo-platonic Greek speculations commonly regarded as Pantheistic, 210 we may do well to recall to mind the immense difference between the established habit of theological thought in our day, 211 and the vague, or at best, poetically vivid ideas of the ancients. 212 For the long tradition of nearly two thousand years, 213 which has made monotheism to us almost as fixed an assumption as that of our own individuality, was entirely wanting in this case. 214 Not that the idea of one supreme God had never been suggested. 215 But it was not the Hebrew or Christian idea that was occasionally propounded; 216 for in the ethnic mind it was rarely, if ever, regarded as inconsistent with polytheism; and consequently it verged on Pantheism. 217 "Consequently," I say, because such monotheism as existed had necessarily to explain the innumerable minor deities 218 as emanations from, or manifestations of the supreme God. 219 And though such conscious attempts at reconciliation of beliefs in many gods and in one Supreme were confined to a small minority of meditative priests and speculative philosophers, 220 yet really, the combination was implicit in the sort of polytheistic religion which possessed the family affections and patriotic associations of the early Greek world.

221 For though we may find a difficulty in ridding ourselves of a prejudice wrought into the tissue

of our early faith [222] by the nursery lessons of childhood, it was not the graven or molten image which was really worshipped by the devout, [223] but that form of superhuman power which, by local accident, had been identified with the "idol." [224] If, indeed, we supposed every "idolator" to have received definite religious teaching, [225] analogous to that with which we ourselves were imbued in youth, we might well find his attitude inconceivable. [226] But he had nothing of the kind. He only knew that in war, in hunting, in fishing, in farming, [227] he was confronted with powers which passed his comprehension; [228] and tradition permeated him with the expectation that such powers would be propitiated by his worship of the images set up in their names. [229] There was therefore no reasoned creed, such as those of the Catholic and Reformed Churches, [230] but only a vague sentiment brought to a focus by the associations of the shrine. [231] From such a view of polytheism it is easy to understand how most, if not all, of the old speculative philosophers could allow the existence of the traditional gods, [232] even while in reasoned contemplation they saw that all deities were subordinate to and merged in one universal God. [233] How far this unstable religious position was subject to the influence of the oriental mysticism [234] at which we have glanced already, is, at any rate, so far as concerns the classical age of Greek philosophy, a matter of conjecture. [235] But the resurrection of a prehistoric and almost forgotten civilisation from the buried cities of Crete [236] has brought to light many evidences of frequent intercourse, two or three thousand years before the Christian era, [237] between European and Egyptian, or Asiatic, centres of life. [238] Therefore, we may well believe that during the earliest stages of the evolution of thought in East and West, [239] it was as impossible as at the present time for any local school of thinkers to be absolutely original or independent. [240] Thus, later Greek philosophers, whether themselves within sound of the echoes of Hindu teaching or not, [241] may very well have grown up

in an atmosphere impregnated with mythic germs, whose origin they did not know. 242 But however that may be, Greek Pantheism, while it had many points of contact with Eastern speculation, was more purely intellectual 243 and less essentially religious than the Pantheism of the Vedas, or the solemn dream that haunted Egyptian temples. 244 For while the aspiration of Hindu Pantheists was to find and assume the right attitude toward "the glory of the sum of things," 245 the Greeks, as St. Paul long afterward said, "sought after wisdom," 246 and were fascinated by the idea of tracing all the bewildering variety of Nature up to some one "principle" ([Greek: archê]), beginning, origin.

247 Thus Thales of Miletus, during the late seventh and early sixth century B.C., is said to have been satisfied when he found in water-- or moisture-- the ultimate principle 248 out of which all things and all life, including gods and humans, were evolved. 249 With such a speculation of infant philosophy we are here not concerned, 250 except to say that it was not Pantheism as understood in modern times. 251 For while his ablest exponents admit that no sufficient evidence is left to show very clearly what he meant, 252 there seems no reason for supposing that to him the Universe was a Living God.

253 It would be fruitless to relate how successors of Thales varied his theory of an ultimate "principle," by substituting air or fire for water. 254 But it is worthwhile to note that another citizen of Miletus, Anaximander, 255 after an interval of some forty years, pronounced that the beginning, the first principle, the origin of all things, was neither water, nor air, nor fire, but the Infinite [Greek: to apeae on]. 256 And though the best authorities confess that they cannot be sure of his meaning, 257 this may very well be because he anticipated Herbert Spencer by two and a half millenniums, 258 in acknowledging that all things merge in one and the same Unknowable. 259 But, so far as our evidence goes, he made no such attempt as the modern philosopher did, 260 to persuade the religious instinct that this

Unknowable could supply the place of all the gods.

261 The position of Xenophanes, who, toward the latter part of the sixth century B.C. migrated, 262 apparently for political reasons, in fear of Persian imperialism, from Colophon in Asia Minor to Elea in Italy, was a little different, and, for our purpose, more interesting. 263 For the few fragments which are unfortunately all that is left to us of his philosophical poetry, are strongly suggestive of Pantheism, 264 and the interpretation put upon them by later classical and sub-classical writers, who had his works before them, would appear decisive. 265 True, the distinguished and enlightened scholar, Simon Karsten, 266 who, in the first quarter of the nineteenth century, found a labour of love in collecting and editing the remains of early Greek philosophers, deprecated such a judgment. 267 Yet, while the motives for his special pleading were honourable, 268 seeing the odious misrepresentations of Pantheism still prevalent in the Dutch scholar's native land,-- 269 misrepresentations undissipated even by the splendour of Spinoza,-- his protest remains special pleading still. 270 And he himself candidly quotes at large from an alleged work of Aristotle-- 271 possibly, only a student's notes of the latter's lectures-- 272 and also from Simplicius, as reported by Theophrastus in a comment on Aristotle's Physics, 273 sentences which describe the system of Xenophanos as unquestionably Pantheistic. 274 From, which description I gather that the devout philosopher regarded God as the only real Being, 275 including all that in human language has been, is, and will be, without beginning or end, 276 living and perceiving equally everywhere throughout His infinite essence. 277 And if that essence is compared by Xenophanes to a sphere, neither bounded nor boundless, neither moving nor immovable, 278 this is only because few, if any, in that age of the world, could content themselves with loyally accepting the limits imposed on human by the very nature of things, 279 limits which now compel us to own that, while the Eternal is more real than ourselves, yet, in the strict sense of

knowing, 280 He is, from an intellectual standpoint, the Unknowable.

281 This Pantheism did not generate in Xenophanes any arrogant disdain for the religion of his time. 282 For, though he condemned, in words often quoted, the folly which supposed the gods to have the human form, senses, passions and appetites, 283 he was yet glad to worship the divine All as partially manifested in finite beings-- 284 perhaps personified powers of Nature. 285 Thus among the fragments of his poetry fortunately preserved, is one exquisite gem, a description of a festive repast in the open air.

286 There purity comes first, symbolised by clear floor, clean hands, and spotless dishes. 287 Upon purity waits beauty, not in the forms desired by sensuous passion, but in garlands of flowers and in delicate scents. 288 The wine is unstinted, yet tempered with sparkling water. 289 But, lest the plentifulness of bread and honey and cheese upon the lordly table should eclipse the highest sanctions of human joy, 290 an altar prominent in the festive scene is heaped with offerings of flowers. 291 Then the first note of music is the praise of God, a praise taking form in blameless poetic myths and holy thoughts. 292 In such a feast the minds of the guests are kindled with a desire to be capable of doing right. 293 "There is no harm in drinking with reasonable moderation; 294 and we may honour the guest who, warmed by wine, talks of such noble deeds and instances of virtue as his memory may suggest. 295 But let him not tell of Titan battles, or those of the giants or centaurs, the fictions of bygone days, 296 nor yet of factious quarrels, nor gossip, that can serve no good end. 297 Rather let us ever keep a good conscience towards the gods."

298 Having given so much space to an ancient who seems to me specially interesting as a prophet of the ultimate apotheosis of earthly religions, 299 I must be content to indicate, in a very few lines, the course of the Pantheistic tradition among the Greeks after his day. 300 The arithmetical mysticism of Pythagoras has no bearing upon our subject.

THEOSOPHY

301 Empedocles of Agrigentum, living about the middle of the fifth century B.C., 302 and thus, perhaps, in the second generation after Xenophanes, was, in many respects, a much more imposing figure-- 303 clothed in purple, wielding political power, possessing medical skill, and even working miraculous cures, 304 such as are apparently easy to men of personal impressiveness, sympathy, and "magnetism." 305 But he does not appear to have so nearly anticipated modern Pantheism as did his humbler predecessor. 306 For though the fragments of Empedocles, much larger in volume than those of Xenophanes, 307 certainly hint at some kind of everlasting oneness in things, 308 and expressly tell us that there is no creation nor annihilation, but only perpetual changes of arrangement, 309 yet they present other phases of thought, apparently irreconcilable with the doctrine that there is nothing other than God. 310 Thus he teaches that there are four elements-- earth, air, water and fire-- out of which all things are generated. 311 He also anticipates Lucretius in his pessimistic view of humanity's lot; 312 and insists on the apparently independent existence of a principle of discord or strife in the Universe. 313 It would be a forced interpretation to suppose him to have set forth precociously the Darwinian theory of the struggle for life. 314 For his notion seems much more akin to the Zoroastrian imagination of Ahriman. 315 Again, he sings melodiously, but most unphilosophically, of a former golden-age, 316 in which the lion and the lamb would seem to have lain down together in peace; and trees yielded fruit all the year round.

317 At that time the only deity was Venus, who was worshipped with bloodless offerings alone. 318 Still, it must be remembered that, whether consistently or not, Empedocles produced an elaborate work on the Nature of Things, 319 to which Lucretius makes eloquent and earnest acknowledgments. 320 But that very approval of Lucretius forbids us to regard the older poet as a Pantheist in our sense of the term. 321 For certainly to him the

Universe cannot have been a living God.

322 Between this philosophical idea of a Oneness, not thought of as God, 323 and the spiritual contemplation of a universal Life of which all things are modes, 324 the highest thoughts of humans hovered during the process by which, in some measure under extraneous influences, Greek speculation finally produced Neo-platonism-- 325 or, as we might say in the current phraseology of our time-- a restatement of Plato's teaching. 326 Of this school, arising in the early Christian centuries, some leaders were undoubtedly Pantheists. 327 But we cannot say this of Plato himself, nor of his master Socrates. 328 For though these great men were more profoundly interested in the moral order of the world 329 than in any questions of physical Nature, or even of metaphysical subtleties, 330 they were never given to the kind of contemplation suggested above in extracts from the Classical Books of the East, 331 the contemplation which reduces the moral ideal from unreserved subordination of self to the Universe as of the part to the Whole. 332 Doubtless the inspiration imparted by Socrates to a disciple in mere intellect his superior, 333 and the resulting moral and religious suggestions abounding in the Dialogues, 334 did much to impel the current of religious evolution toward that spiritual aspect of the Infinite All 335 which fascinated some of the Neo-Platonists, and received its most splendid exposition from Spinoza. 336 But the conditions imposed by necessary brevity compel me to pass by those classic names with this acknowledgment, 337 and to hasten toward the fuller revelation of Pantheism as a religion.

POST-CHRISTIAN PANTHEISM

J. Allanson Picton

3 In speaking of Neo-Platonism I incidentally mentioned its apparent subjection to "extraneous influences." 2 These, of course, included the rising power of Christianity and its Jewish traditions. 3 Even before the advent of the new revelation, the

THEOSOPHY

Jewish settlements existing in all great cities of the Graeco-Roman world excited interest at any rate 4 among sentimentalists touched by the fascination at that time beginning to be exerted by oriental religions. 5 And this influence of Jewish traditions was much facilitated by the existence of a Greek translation of the Hebrew scriptures.

6 Now, what the Hebrew tradition did for Greek philosophy was, of course, not to favour its Pantheistic trend, where that existed, 7 but much more to convert such semi-Pantheism from a mere intellectual speculation to contemplative devotion. 8 For Hebraism itself had become almost as intensely monotheistic as the later Islam. 9 And, though monotheism may be a stage in the progress of religion from Animism to Pantheism, 10 it may, also, by the peculiar intensity of the personal devotion it sometimes inspires, 11 cause the very idea of any farther expansion of faith to be counted a sin.

12 Perhaps the influence of Hebraism on Hellenism may be illustrated by the Alexandrian Philo's pathetic endeavour 13 not only to trace the wisdom of the Greeks to Moses, but to show that this derived lore is much mightier for good 14 when re-invested with the spiritual power and ardent devotion of the Jewish faith. 15 "If anyone will speak plainly," he writes, "he might say that the intelligible world is nothing other than the word [Greek: logos], reason of the world-making God. 16 For neither is the intelligible city anything other than the thought [Greek: logismos] of the architect already intending to build the city. 17 This is the teaching of Moses, not mine. 18 At any rate in what follows, when he records the origin of human, he declares outright that human was made in the image of God. 19 But if a part (of creation) reflects the type, so also must the entire manifestation, this intelligible ordered world, 20 which is a reproduction of the divine image on a larger scale than that of human."

21 How Philo managed to extort this out of the Pentateuch is a question of interest, but one on which I cannot delay. 22 Suffice it, that while he thus showed his

reverence for the traditions of his race, his whole aim is to fire philosophy with religious devotion. 23 But he was not, in any strict sense of the word, a Pantheist, 24 though he regarded the Logos as an emanation from the Eternal, and the kosmos, the ordered world, as in some way emanating from the Logos. 25 Perhaps, indeed, if we could exclude from emanation the idea of time, as Christians are supposed to do 26 when they speak of the "eternal generation" of the Divine Son or the "procession" of the Holy Ghost, 27 we might regard Philo, with the succeeding Neo-Platonists and some of the Gnostics, as approximately Pantheistic. 28 But his vagueness and uncertainty about matter forbid such a conclusion. 29 For whether he regarded matter as eternally existing apart from the divine substance, 30 or whether he looked upon it as the opposite of Being, as a sort of positive nothing, 31 in either case, it cannot be said that for him the whole Universe was God, and nothing but God.

32 If I have given more space to the great Alexandrian Jew than my narrow limits ought to afford, 33 it is because I think I may thus avoid the necessity of saying much about the philosophic schemes of the Neo-Platonists, 34 the phantasies of the Gnostics, or the occasionally daring speculations of the Christian Fathers. 35 For whether the works of Philo were much studied by the Greeks or not, they certainly described the spiritual resultant-- so to speak-- 36 emerging from the mutual impact of Western and Oriental, especially Jewish, ideas. 37 Which resultant was "in the air" from the first century of the Christian age; 38 and the later epistles ascribed to St. Paul, as well as the Fourth Gospel, show clear traces of it.

39 But the inspiration of the time-spirit was not confined to the Christian Church. 40 For the city of Alexandria, where that spirit seems to have been peculiarly potent 41 as shown in the transfigured Judaism of Philo, was the birthplace of the Neo-Platonic school already mentioned above. 42 And among its greatest members, such as Plotinus,

Porphyry, Proclus, the religious influence of the East was distinctly apparent. 43 True, they followed Socrates and Plato in reverence for knowledge as the unfailing begetter of virtue. 44 But their speculations about the divine Being were touched by Oriental emotion. 45 And we may with some confidence believe that their development of the Platonic Trinity owed a good deal to the rapid spread of Christianity. 46 Thus the sentiment, the fervour, the yearning for "salvation," the worship and devotion taught by the best of the Neo-Platonists were not so much, from Athens as from Sinai and Galilee.

47 Yet, though there were in their world-conception many anticipations of the gospel of the "God-intoxicated human," 48 whom the counsels of the Eternal reserved for the fullness of times, 49 it would scarcely be accurate to describe the system of any of them as strictly Pantheistic. 50 For they were always troubled about "matter" as an anomalous thing in a divine Universe, 51 and in treating of it they hesitated between the notion of an eternal nuisance which the Demiurges, or acting God, could only modify, not destroy, 52 and, on the other hand, a strained theory of an evil nothing, which is yet something.

53 Again, so far from realising Spinoza's faith in God as so literally All in All that there is nothing else but He, 54 they would not tolerate the contact of the Infinite with the finite, of God with the world. 55 Consistently with such prepossessions, they held obstinately to the notion of some beginning, and therefore some ending of the ordered world. 56 And this beginning was effected by emanations such as the Logos, 57 or, as others had it, the world-soul and other divine energies, between the Eternal and creation; 58 a phantasy which, however poetically wrought out, is not really consistent with Pantheism. 59 Such ideas of a hierarchy of subordinate emanations to fill the supposed abyss between the Infinite and the Finite were eagerly adopted 60 and developed by the pseudo-philosophers called Gnostics, on both sides of the boundary between the Church and the World. 61 Suffice it that, like

most, though by no means all of their predecessors, they regarded the world of earth, sun, planet, stars, and animated nature with human at its head, as the whole Universe; 62 and, assuming that it must have had a beginning, they vexed their souls with futile attempts to frame some gradual transition 63 from the uncreated to the created, from the eternal to the mortal. 64 The grotesque chimaeras engendered thus are remembered now 65 only as illustrations of the facile transition from the sublime to the ridiculous and from philosophy to folly.

66 The orthodox Christian fathers were not less conscious than the Neo-Platonists or Gnostics of the perennial problem of the Many and the One. 67 But they were restrained, perhaps, by the "faith that comes of self-control," 68 perhaps by mere common sense, from indulging in attempts to connect the Infinite with the Finite by "vain genealogies." 69 Indeed, for the most part they confessed that whatever light the Gospel might shed on moral issues, it left untouched the ultimate question of the relation of the Infinite to the Finite. 70 And the only aspect of their most venturesome speculations which I need recall is their insistence, 71 even when apparently verging toward Pantheism, on a transcendent as well as an immanent God, 72 that is on a Creator existing, so to speak, outside the Universe and apart from it as well as permeating every part. 73 Thus, for example, Augustine would seem to deny to the world any separate creature existence 74 when he says, that but for the divinity everywhere in it, creation would cease to be. 75 But in his insistence on the creation of the world from nothing, he directly contradicts Pantheism, 76 because he must necessarily be taken to mean that there is now something other than God.

77 That there have been devout Christians whose mystic speculations on the relations of the soul to the Eternal logically involved Pantheism-- 78 if logic in such a case had any function--there can be no doubt. 79 But for most of them "God's word written" seemed to confirm God's word in heaven and earth as known to them, 80 proclaiming that there had

been a beginning and there must be an end. 81 Therefore, whatever might be the immanence of the Creator in His works, 82 God could not, in their minds, be identified with "the fashion of this world" which "passeth away." 83 Yet the time was coming when the Divine word both in Scripture and in Nature was to be otherwise read. 84 For humans began to learn that the Bible was other than they had supposed and the Universe immeasurably greater than they had conceived.

MODERN PANTHEISM

J. Allanson Picton

4 Modern Pantheism as a religion begins with Spinoza. Whether it ended with him is a question which the future will have to decide. 2 But the signs of the times are, at least in my view, very clearly against such a conclusion. 3 And amongst the omens which portend immortality, not necessarily for the philosophical scheme, but for the "God-intoxicated" devoutness of his Pantheism, 4 is the desire, or rather the imperious need increasingly realised, for a religion emancipated from theories of creation or teleology, intolerant of any miracle, 5 save indeed the wonders of the spiritual life, and satisfying the heart with an ever present God. 6 For it is to be remembered that Spinoza was the first Pantheist who was also a prophet, 7 in the sense of speaking out the divine voice of the infinite Universe to its human constituent parts.

8 Not that I would minimise the religious fervour of the Neo-Platonists: it is their Pantheism that seems to have been imperfect. 9 But in Spinoza we have a man who, inheriting by birth the tradition--I might even say the apostolic succession-- 10 of the Jewish prophets, and gifted with an insight into the consummation of that tradition in Jesus Christ, 11 was driven by a commanding intellect to divorce the spiritual life he prized from creeds that had become to him Impossible, 12 and to enshrine it in the worthier temple of an eternal Universe identical with God. 13 It is not, then, with his philosophy that I am

so much concerned as with his religion.

14 It is given to no human to be absolutely original in the sense of creating ideas of which no germs existed before his day. 15 But short of such an impossible independence of the past, Benedict de Spinoza had perhaps as much originality as any man who ever lived. 16 Yet with a modesty ever characteristic of moral greatness, he himself was disposed, 17 at any rate during his earlier philosophical development, to exaggerate his indebtedness to the philosopher Descartes, 18 whose system he labouriously abridged in the inappropriate form of a series of propositions supposed to be demonstrated after the fashion of Euclid.

19 But whatever may have been the esoteric belief of Descartes about creation out of nothing and the theological dogmas connected therewith, 20 he attached too much importance to the social and political functions of established ecclesiastical institutions to declare himself independent of them. 21 And though his submission, signalised on his death-bed, did not interfere with the freest working of his brilliant intellect within limits permitted to the former ecclesiastical "schoolmen," 22 it did prevent his frank realisation of the eternal oneness of all being. 23 For it compelled him to retain belief in a Creator distinct in essence from Creation. 24 Such a belief Spinoza entirely rejected. For though his "Natura Naturans," or Nature Active, may in a manner be called the Creator of his "Natura Naturata," or Nature Passive, 25 these are consubstantial and co-eternal, neither being before or after the other.

26 Thus for him there was no beginning of the Universe and there could be no end. 27 There was no creation out of nothing, nor any omen of weariness, decay, or death in the eternal order. 28 He teaches us in effect to take the Universe as it is, and to pry into no supposed secrets of origin or end, 29 an entirely gratuitous labour, imposed by illusions arising out of the continuous redistribution of parts of the Whole. 30 Instead of thus spending our mental energy for nought, he would have us

regard the whole of Being as one Substance characterized by innumerable attributes, 31 of which Extension and Thought alone come within our human cognisance; while each Attribute is subject to infinite Modes or modifications, 32 which, in their effect on the two attributes known to us--extension and thought--constitute the Universe of our experience. 33 That infinite and eternal Substance revealed by Attributes and their Modes is God, 34 absolute in His perfections if He could be fully conceived and known in all His activities. 35 And even to our ignorance He is entrancing in His gradual self-revelation, 36 as with our inadequate ideas we pursue the unattainable from glory to glory.

37 This, then, is the first note we make of the gospel of Spinoza. 38 But if anyone thinks that the sacred word "gospel" is here misused, and that such teaching is fatal to piety, 39 let him turn to the 104th Psalm and read, from Spinoza's point of view, the cosmic vision of the Hebrew seer. 40 True, we can think no longer of the supernatural carpenter who works on "the beams of his chambers" above, 41 or of the mythical engineer who digs deep in the darkness to "lay the foundations of the earth." 42 For that is poetry, appealing by concrete images to the emotions. 43 But it does not bind the intellect to a literal interpretation; 44 and we are no longer tormented by vain efforts to reconcile with infinite impossibilities the half-human personality presented in poetic guise. 45 So that the vision of the seer is now the suggestion to us of an infinite and eternal Being, 46 whose attributes by modification take the innumerable shapes of sun, moon, and stars, 47 and mountains and river, and tree and flower, and bird and beast, and human. 48 And the winds that sweep and the floods that roll, and the rocky barriers that stand fast, 49 and the rivers that wind among the hills, and the trees that flourish and the living societies that gather in fruitful places, 50 the labourer in his vineyard, the sailor in his ship, all are in and of the one Eternal Being. 51 Yet we echo not with less, but perhaps with more reverence, than the believers in a

divine artisan, 52 the words of the Psalmist: "O Lord, how manifold are Thy works! 53 in wisdom hast Thou made them all: the earth is full of Thy riches." 54 But if the thunder and the flaming fire and the sweeping flood seem discordant, 55 they existed for the Psalmist as well as for us, and they do not seem to have troubled him. 56 At this point, therefore, we need only say that Spinoza's religion of one divine Substance, whose unity in variety is holy, 57 ought to stir within us with not less fervour, 58 at least the spirit of the Psalmist's concluding prayer: "Let the sinners be consumed out of the earth and let the wicked be no more."

59 Spinoza's maintenance of extension as one of the two infinite divine attributes cognisable by us has, with a certain amount of plausibility, been urged as a note of materialism. 60 And this reproach has been supported by reference to his insistence that in human the body and the soul are only two different aspects of the same thing; 61 for to him the body is a finite Mode of God's infinite attribute of extension 62 and the soul a finite Mode of God's infinite attribute of thought, 63 while both are manifestations of the one eternal divine Substance. 64 Still, if in any way we are to regard God as extended, it seems impossible to avoid the inference that we regard Him as identified with matter, or at least the possibility of matter. 65 Sir Frederick Pollock has admitted that this is a weak point in Spinoza's philosophy, and mars its symmetry. 66 But, being more concerned with, his religion, I am content to point out that such an objection was much more effective in Spinoza's time than it is to-day. 67 For the whole trend of philosophy during the nineteenth century was towards a view of Extension itself as a mode of Thought, 68 and therefore toward the absorption of one of Spinoza's theoretical divine attributes in the other.

69 Now if this should prove to be the permanent tendency of the most influential thinkers--as indeed seems most likely-- 70 it will probably be held that Spinoza was wrong in attributing extension to the Eternal as one of the qualities of His substance, 71 except in so far as extension is, if

not a necessary, at any rate an actual, and so far as we know, a universal mode of thought. 72 But though, as Sir Frederick Pollock has pointed out, Spinoza has in a manner "counted thought twice over" 73 while treating of the only two infinite attributes cognisable to us, we need not, on that account, surrender his luminous idea of God as a Being absolutely infinite, 74 that is, "Substance consisting of infinite Attributes, whereof each one expresses eternal and infinite being." 75 Nor need we abandon his supplementary but essential idea of "Modes" 76 or "modifications" which mould the attributes into the varieties of finite worlds, known and unknown. 77 Thus it may be that, in Spinoza's sense of the word "Attribute," we shall have to confess that only one comes within our human ken, 78 that of Thought in a sense which includes feeling.

79 But if the late Herbert Spencer, apart from his synthetic philosophy of phenomena, has left any permanent mark on the religions consciousness, 80 it has been by a consecration of the mystery of the ultimate Unknowable. 81 And in the spirit of reverence thus taught by him we may still hold with Spinoza 82 that the Eternal has an infinity of other attributes with their infinite modifications not within our cognisance. 83 This would only be an enlarged application of Hamlet's words: "There are more things in Heaven and Earth, Horatio, Than are dreamt of in your philosophy." 84 Or, to put it in another way, the Universe perceptible to us is only one of an infinity of Universes. 85 By which is not meant an infinite extension of galaxies in space, but the co-existence 86 and, so to speak, inter-penetration of an infinity of modes of existence imperceptible to us.

87 To Spinoza, then, God is the totality of Being. 88 But it is not to be inferred that he identified God with the visible, or with any conceivable Universe. 89 For either of these must fall far short of infinity, and the Being of God is infinite. 90 All I mean, when I say that Spinoza identifies God with the totality of existence, 91 is that he regards the deity as that Perfect Being without beginning or end, 92 whose essence it is to be, and of

whom all that exists, 93 whether known to us or not, is separately a partial, and comprehensively a perfect expression.

94 Of more practical interest to us perhaps is Spinoza's doctrine of human, 95 though it would have been impossible to explain that without first indicating his idea of God. 96 In his view, then, human is a finite mode of the two divine attributes, extension and thought. 97 Thus both the extended body and the conscious mind have their substance and reality in God. 98 But the essence of human does not necessarily involve his separate existence as the essence of God implies Being. 99 Of course the substance of human is imperishable because it is of God's substance. 100 Nay, there is a sense in which each human, being an eternal thought of God, has an aspect towards eternity or exists "sub specie eternitatis." 101 But that is a truth transcending the finite practical world with which we have to do.

102 According to Spinoza, what constitutes the real essence of the human mind is the (divine) idea of a certain individual creature actually existing. 103 Here, perhaps, modern speculations about the constitution of matter may help us-- 104 if we use them with due reserve-- to grasp Spinoza's notion of a "res singularis in actu"-- 105 or as it might be rendered freely, "a creature of individual functions," for what is called the "vortex theory," 106 though as old as Cartesian philosophy, has recently flashed into sudden prominence. 107 And whether or not the speculation be only a passing phase of human thought about the Unknowable, it equally answers the purpose of illustration. 108 Thus the "ether" is supposed to fill all space; 109 and within it there are imagined or inferred innumerable "tourbillons" or "vortices," 110 which, though parts of the indefinitely extended ether, form by their self-contained motion little worlds in themselves. 111 These little worlds are by some regarded as the atoms which, by composition, and differentiation, build up our palpable Universe. 112 With the possibilities of such a theory I have nothing to do. But the notion of the vortex in the

ether may perhaps help us to a glimpse of Spinoza's notion 113 when he speaks of a "res singularis in actu" a creature of individual functions.

114 For to him human was, as it were, an infinitesimal vortex in a phase or attribute of the divine Substance. 115 The analogy, like all other analogies, would not bear being pressed. 116 But it does suggest to us a picture of finite individuality in action or function, subordinated to unity with infinite Substance. 117 If it be said that such an explanation would necessarily include the conscious life of beasts and birds, 118 the answer would seem to be, that admitting this to be the case, yet in human the divine idea of individuality is more fully expressed and has more of reality than in any lower creature.

119 Human, then, according to Spinoza, is in God and of God. 120 But what are we to say of bad people, the vile, the base, the liar, the murderer? Are they also in God and of God? 121 Spinoza does not blench. Yes, they are. 122 But here comes in his doctrine of "adequate" and "inadequate ideas." Thus, if you see the colour red it completely expresses itself. 123 It cannot be defined and needs no explanation. As it is in the Infinite Thought so it is in ours. 124 We have an "adequate idea" of it. But now if you see on an artist's canvas a splotch of red and blue and yellow, part of a work only begun, it gives you no adequate idea. 125 True, you have an adequate idea of each several colour, but not of their relations to the work conceived. 126 To get that you would have to enter into the mind of the artist and see as he sees. 127 Then the splotch of colour would take its place as part of a harmonious whole; 128 and would give you an adequate idea just as it does to the artist.

129 Now, according to Spinoza, when we see things as they appear in Infinite Thought we have an adequate idea. 130 But if we see only a component element in an idea-- let us say-- of the divine Artist, then our idea is inadequate. 131 Hence we misjudge things. And of the part played by bad people in the divine Whole we certainly have no adequate idea. 132 But here again we must be on

our guard against the abuse of illustrations. 133 For it is not to be inferred that Spinoza regards the Universe as an unfinished picture, of which, the completion will justify the beginning. 134 On the contrary, the Universe is to him eternal, the necessary expression of the infinite attributes of eternal Being. Still the analogy may help us.

135 For the concentration of attention on a single part of an ordered whole may, quite as certainly as a glance at an unfinished work, be the occasion of an inadequate idea. 136 In effect, the suggestion is that if we, like God, could contemplate the infinite Universe all at once, 137 and have an adequate idea thereof, in other words if we could ascend to the self contemplation of the Eternal, 138 we should have the bliss associated by long habit with the words of the Psalmist: 139 "I shall be satisfied when I awake, with thy likeness." 140 Such bliss, however, is only approximately attainable in moments of mystic transport. 141 And when, as in so many experiences, we see only in part, 142 and have inadequate ideas, faith in the Eternal Whole is needed to keep us from blasphemy.

143 With such necessarily brief hints as to Spinoza's attitude towards evil, I resume his doctrine of human-- the individual creature as a centre of action. 144 Of final causes Spinoza will not hear. But if instead of asking "what is the chief end of human," we ask what is the idea of human, 145 Spinoza answers that it is the realisation of a mode of the divine attributes, extension and thought. 146 And if this should seem unsatisfying, let it be remembered that to this devout Pantheist the divine attributes and their modes were the expression of the very substance and life of God.

147 Now with "extension," for reasons already given, we need not trouble ourselves 148 except to say that at least Spinoza's teaching would suggest the idea of ‘mens sana in corpore sano’. 149 Because to him the mind was the "idea" of the body, and the body the "object"-- 150 not quite in the modern sense-- of the mind. 151 But as regards the human mode of the divine attribute of thought, 152

Spinoza makes its ideal to be a life absorbed in such contemplation of "the Blessed God," the infinite Whole, 153 as shall react on the creature in inspirations of freedom, purity and love.

154 And first as to freedom, Spinoza means by this not caprice, nor the monstrous miracle of causeless action, 155 but independence of external force or of any disproportionate and illegitimate passion. 156 The freedom to which he aspires is the freedom of God, 157 who eternally acts in accordance with the mutual harmony of the whole attributes of His nature, not one of which clashes with another. 158 So Spinoza's free human is one in whom all aspirations and energies, converging in one resultant, the expression of the divine idea, move him in harmony with the Universe. 159 From such a point of view the quibbles about "free will," in the sense of causeless action, cease to have any meaning. 160 For if the good human says "I could have done otherwise if I had liked," the obvious reply is, "Yes, but you would not have liked." 161 Because the will is not a separate faculty, but the expression of the whole nature, as that exists at the moment of "willing." 162 And the only real freedom is the unimpeded conglomerate impulse to do right. 163 But should it be asked what if the resultant impulse of the whole nature is toward wrong? 164 The answer is, in that case there is no freedom, but a slavery to some external influence or to a disturbed balance of the passions. 165 Or if it be asked what is right? 166 That is a far reaching question to the solution of which Spinoza bends all his splendid powers. 167 But limits of space preclude me from saying more than, 168 that his ideal of right will be found conformable to the highest standards of the most spiritual religions.

169 This ideal I ventured to symbolise rather than define as "purity." 170 For after all the philosophic reasoning with which it is no less lucidly than labouriously worked out in the final book of his Ethica, "Concerning Human. 171 Freedom"-- the moral result of all this intellectual effort is that same cleansing of the soul 172 from vain

desire and that subordination of the earthly self to its divine idea which we are taught in the Sermon on the Mount. 173 And while surely everyone but a fanatical anti-Christian must allow the greater prophetic worth of the Galilean, 174 who could teach these sublime lessons so that "the common people heard him gladly," 175 it seems difficult to deny to the heretic Jew of the Hague the second rank among the teachers given to the world by that strangely gifted race. 176 For though he could not speak to "the common people," he left as his legacy to humankind, 177 not so much a system of philosophy, as an impregnable foundation for morals and religion, 178 available for the time now coming upon us--such a time as that suggested by the writer of the Epistle to the Hebrews, 179 when he spoke of "the removing of those things that are shaken, as of things that are made, that those things which cannot be shaken may remain." 180 No doubt Sir Frederic Pollock is quite right in declaring that Spinoza would have been the very last man to desire any one to become a Spinozist. 181 But that is quite consistent with the inspired Pantheist's infinite longing to see all humans blessed by that inward peace which he proved, by his own heroic experience, 182 to be identical with the self-control conferred and maintained by devout contemplation of God's all-comprehensive Being and our place therein. 183 If, then, I regard purity as the best symbol of such a moral ideal, it is because the word connotes, 184 together with freedom from discordant passion, a frankly unconstrained recognition of the simplicity of our relation to God. 185 For surely when once the self has made the great surrender, and becomes content to be nothing, 186 that in St. Paul's words, "God may be All in All," the whole problem of life is infinitely simplified, in the sense that no farther degree of simplification is possible. 187 Because all contradictions of pain and evil and sorrow are dissolved in that act of surrender. 188 We must, indeed, recognise that to our "inadequate ideas" the time often seems "out of joint." 189 But we need not, with Hamlet, cry out on

an impossible "spite." 190 For when once it is heartily and loyally realised that not our partial likings, but the eternal harmony of the Whole, is the glory of God, 191 we already anticipate the peace of absorption in the Infinite.

192 Nor is this moral ideal without a sacred passion; at least to ordinary people; 193 though it must be confessed that Spinoza, in the stillness of his sacred peace, ignored the word. 194 But he still held that the larger our view of the Universe and of our communion therewith, 195 the more we have of God in us and the more do we realise an "intellectual love" towards Him. 196 That this in his case was no barren sentiment, but a genuine moral inspiration, was proved by his life; 197 for truly "he endured as seeing Him who is invisible." 198 And it was not by faculties wholly wanting to smaller people that he did this. 199 For though his intellect was in some respects almost beyond compare, 200 it was rather by his self-subordinating contemplation that he was kept at peace. 201 Indeed, he knew far less of the extended Universe than our people of science do, 202 and his doctrines of mind and thought are, by indisputable authorities, regarded as imperfect. 203 But imagining what God must be, could we have an adequate idea not only of His Being-- which Spinoza thought he had-- 204 but of His infinite attributes and their modes-- which Spinoza recognised that he had not-- 205 he declared that love toward God was the very highest good. 206 And it was supremely blessed in this, that it could engender no jealousy nor selfishness, nor sectarian zeal, 207 but rather a large-hearted charity which would gather all humankind into the present heaven of that love.

LIFE OF SPINOZA

J. Allanson Picton

5 It is not within the scope of the present essay to give a life of Baruch (or Benedict) de Spinoza. 2 But for the sake of those to whom the work of Sir Frederick Pollock is not easily accessible, the following particulars may be given. 3 Spinoza was born in

THEOSOPHY

Amsterdam, November, 1632, of a fairly prosperous Jewish family, originally from Portugal. 4 He received thorough instruction in the language and literature of the Hebrews, 5 and in addition became a good Latin scholar, so far as to write and correspond in that language. 6 He was early interested in philosophy, and especially attracted for a time by the writings of Descartes. 7 By the time he was twenty-three years old he was suspected of heresy, 8 and in his twenty-fourth year (1655) was cut off from the Synagogue with a frightful curse. 9 His family disowned him, and for his maintenance he turned to the polishing of lenses, 10 a trade already learned in accordance with the Jewish custom that every boy must have a handicraft. 11 What he earned would hardly be considered a "living wage" in these days. 12 But according to Colerus, his first biographer, who enquired of the householders with whom Spinoza lodged, his day's maintenance of often cost no more than 4-1/2d. 13 Various incidents proved his total indifference to money, except as far as needed to "provide things honest in the sight of all people." 14 Though of an amiable and sociable disposition he lived a solitary life, while not indisposed to kindly talk with his humbler neighbours. 15 He had some of the greatest scholars of the day among his correspondents. 16 He published but little during his life, leaving his greatest work as a legacy to the world on his early death, at the Hague, from consumption, in 1677.

17 "It is to be observed that, inasmuch as Attribute is defined by reference to intellect, 18 and Thought itself is an attribute, Thought appears to be in a manner, counted twice over."-- 19 Spinoza: His Life and Philosophy, by Sir Frederick Pollock. Second edition, 1899, p. 153.

20 It is of course true that Spinoza considered himself to have a clear and adequate conception of God. 21 But by this he meant only that, as a philosopher, he had an intuitive certainty of eternal and infinite Being. 22 So have all of us humbler mortals, though we should not have been able to express it for ourselves. 23 No one supposes that for an indefinite

space of time or eternity there was nothing, and then suddenly there was something. 24 But, if not, then everyone recognises with Spinoza the fact of eternal Being, 25 though, of course, he saw what this recognition meant, as the many do not. 26 But when it comes to the facts of mortal imperfections and ignorance, 27 Spinoza, with his theory of "inadequate ideas," is as ready as Spencer to acknowledge the Unknowable.

28 I do not think it necessary in an essay of this kind to discuss Spinoza's theory of the body as object of the mind, 29 and the mind as "idea" of the body, both being different aspects of the same thing.

30 "Rei alicujus singularis actu existentis." The word "divine" does not occur in *Proposition xi. Ethices II.*, from which I quote. 31 But it is implied; because the mind is only a mode or modification of the infinite attribute of thought, 32 which again expresses the eternal Substance in God. 33 I venture a doubt whether "actually existing," though adopted by such authorities as Sir F. Pollock gives, with any distinctness, Spinoza's meaning. 34 I may be wrong, but I suspect that one of the later uses of "actus," as quoted in Ducange, affected Spinoza's Latinity. 35 Thus several ecclesiastical writers are quoted as using the word in the sense of office, or function. 36 Surely this would suit Spinoza's definition of the mind. 37 For he treats it as a centre of phenomenal activity amidst the infinite modes of the divine attribute. 38 Its apparent individuality is a consequence of its spontaneity as a centre of action-- 39 always understood that the spontaneity is consistent with the absolute eternal order assumed throughout the work.

40 Of course the professor of optics can tell us how many vibrations in a second go to produce the particular shade of colour. 41 But these cannot by any means be identified with conscious perception; and it is with this only that we are concerned.

42 Ethices *Pars II., Prop. xi. Corollarium*. "Hence it follows that the human mind is part of the infinite intellect (thought) of God; 43 and accordingly, when we say that the human mind perceives this or that, 44 we only say that God-- not in His infinity, but so far as He

is expressed by the nature of the human mind, 45 or, so far as He constitutes the essence of the human mind-- has this or that idea. 46 And when, we say that God has this or that idea, not only so far as He constitutes the nature of the human mind, 47 but so far as He has the idea also of some other thing together with the human mind, 48 then we say that the human mind perceives the thing in part, or inadequately." 49 E.G. all races have naturally supposed earthquakes and storm, battle, murder and sudden death to present ideas identical in the minds of their gods and of themselves. 50 But Spinoza's suggestion, as I interpret it, is that the true God has the idea of such things, 51 not only so far as He constitutes the human mind, but as He includes the ideas of some correlated things to us inconceivable. 52 Our idea is therefore "inadequate."

SPINOZA AND HIS WORK
J. Allanson Picton

6 Notwithstanding the admiration, and even reverence, with, which Spinoza was regarded by a few scholars during his life-time, 2 it cannot be said that during the century following his death, in 1677, there was any wide acceptance of his ideas. 3 The times were not favourable. For the political and social power of ecclesiasticism, whether established, or un-established, 4 compelled people of science and philosophers to treat dominant creeds as consecrated ground, 5 on which ordinary methods of research, reasoning or criticism could not be pursued. 6 In saying this, I am far from accusing those illustrious people of insincerity. 7 Some few of them, indeed, used a sort of cryptic satire to excuse to themselves an unwilling conformity. 8 But, for the most part, the moral pressure of tradition and education compelled enlightened people to identify the doctrines of a personal God, 9 Creation, Fall, Redemption and Immortality with moral interests

vitally essential to human welfare. 10 Under such circumstances a prudent conservatism was inevitable.

11 Yet, notwithstanding these restraining influences, the thoughts breathed forth by the lonely thinker were as living seed wafted abroad, 12 and falling here and there on good ground, germinated and brought forth fruit. 13 Sometimes his influence was acknowledged, sometimes it was repudiated; but it was there, nevertheless. 14 It is doubtful whether Fichte's idealism could have taken the form it did had not Spinoza preceded him. 15 Hegel, setting out on his great intellectual career with a resolve to defend the faith once delivered to the saints, 16 yet traces its roots to a philosophy of Being which, at any rate, looks very like Pantheism. 17 This is perhaps delicate ground to tread. For if one is asked whether one understands Hegel, 18 one is tempted to answer, like the pious Scotch lady when her friends enquired whether she had understood the minister's sermon, "Hech, sirs, d'ye think I'd presume?" 19 Still, not my own reading of him only, but Mr. Haldane's profoundly interesting interpretations given in his Gifford Lectures, 20 make the impression that Hegel's eternal process is always a projection of subject as object and re-integration of the two. 21 And this goes on, not only on the infinite, but on the finite scale, 22 amidst the infinite number of processes which constitute the Whole of Being. 23 But this seems to leave no room for creation out of nothing, and it is to that extent pantheistic. 24 There are doubtless saving interpretations, but it is difficult to follow them; 25 and they cannot cancel the initial postulate of one eternal process, consisting in the relations of infinite subject, object and reunion. 26 On such a system I do not see how there can be anything but God, 27 and, therefore, notwithstanding his aversion to the name, count Hegel a Pantheist.

28 Goethe and Wordsworth, in many inspired passages of their poetry, echo the faith of Spinoza. 29 Wordsworth, of course, in the reaction from his first expectations of the new order that he hoped to

see arise out of the French Revolution, 30 was Inclined to magnify the Importance of established religious ceremonies and creeds. 31 But we cannot suppose that he ever repented of his reverence for Nature as a divine revelation. 32 And we may believe that he continued to regard his practically pantheistic visions as an insight into the eternal reality 33 from which the detailed schemes of orthodox theology were projected.

34 That Schleiermacher was much indebted to Spinoza is abundantly evident from his own words. 35 He spoke of "the holy repudiated Spinoza." 36 He declared that "the high world-spirit penetrated him; the Infinite was his beginning and his end; 37 the Universe his only and eternal love. 38 In holy innocence and lowliness, he mirrored himself in the eternal world, and saw himself as its most love-worthy image. 39 He was full of religion and of the Holy Spirit; and therefore he stands alone and unreachable, 40 master in his art above the profane multitude, without disciples and without citizenship."

41 Coming down to Anglican Broad Churchmen, it would scarcely be fair to quote isolated utterances as proofs of their Pantheism. 42 And yet when Frederick Robertson asked, "What is this world itself but the form of Deity whereby the manifoldness and beauty of His mind manifests itself?" 43 and still farther, when he quotes with approval Channing's word, that "perhaps matter is but a mode of thought," 44 the most earnest Pantheist would hardly desire more. 45 For the conception of the Universe involved must surely exclude the real being, or even the real existence, of anything but God. 46 Matthew Arnold never committed himself to Pantheism, nor, indeed, to any other theory of the Universe. 47 For his delicate humour and lambent satire always had in view simply the practical object of clearing a plain way for the good life through the "Aberglaube" of theology. 48 His description of God as "the Power not ourselves which makes for righteousness," might seem, in fact, the negation of Pantheism, 49 because, if God is not ourselves,

there is something other than God. 50 But the person who deliberately justified the loose phraseology of the Bible about infinite Being, 51 by the plea that it was language "thrown out" at an object infinitely transcending linguistic expression, 52 ought not himself to be pinned to the implications logically deducible from his own words "thrown out" at the same transcendent object. 53 And, though Matthew Arnold was too literary to be a Pantheist, 54 that is, though he thought more of forms of expression than of ultimate reality, 55 his satirical disintegration of the creeds, wherever it is effective, makes Pantheism the only religious alternative. 56 "Secular" and godless alternatives may be offered; but their incongruity with the whole evolution of humanity from prehistoric animism to the higher Pantheism will make their doom short and sure.

57 In the earlier part of this essay I made the remark that Pantheism as a religion is almost entirely modern. 58 The context, however, clearly showed what was meant; for several pages have been occupied with indications 59 of the ideas and teaching of individual Pantheists from Xenophanes to Spinoza. 60 But we do not usually take much note of a religion that is confined to one or two people in an age. 61 If it dies out we treat it merely as a curiosity, or an intellectual puzzle, 62 like the dreams of Jacob Boehme, or the atheistic ecclesiasticism of Comte. 63 But, if it afterwards shows symptoms of unexpected adaptation to the mental and moral conditions of a newer world, 64 and if, on account of this adaptation, it gains a hold on people who are neither philosophers nor metaphysicians, but only religious, 65 it demands our consideration on far other grounds than those of intellectual curiosity.

66 Now it has only been during the second half of the last century that Pantheism has been able to claim attention as a religion in such a sense as this. 67 As to the fact there can hardly be any dispute. 68 For not only has it become ever a more prominent motive in the music of the poets, 69 and not only are all rationalisations of Christianity

more or less transparent disguises of Pantheism, 70 but I may safely appeal to those ordinary members of intelligent society who are neither poets, nor divines, nor philosophers, 71 whether the freest and most confidential interchange of religious thought does not continually verge on a faith which merges everything in God.

72 Nor are the reasons of this tendency far to seek. Indeed, they are palpable and conspicuous in the mutual pressure of science and faith. 73 For, on the one hand science has made unthinkable the old-world conception of a three-storeyed Universe, constructed by an artificer God, 74 who suddenly awoke from an eternity of idleness to make Heaven, Earth, and Hell-- 75 a conception involving a King of kings, enthroned like an eastern monarch, 76 and sending forth His ministering spirits, or appointing His angel deputies to direct and govern at His beck. 77 Or if it be said that never, except in the ages of primeval simplicity, or amongst later generations living under primeval conditions? 78 Has such a conception been entertained, it would be difficult for the "broadest" Church-person to say what has been, put in its place. 79 It is vain to remind us how later Christianity has patronised nebular hypotheses and the doctrine of evolution. 80 For these give no definite substitute whatever for the old story, that Elohim "spoke, and it was done-- he commanded, and it stood fast." 81 Whence the fiery mists by the rotation and cooling of which the worlds were slowly evolved? 82 We are told that the same process is going on now within the ken of astronomers. 83 But does anyone suppose that in those realms of space God is evoking something out of nothing, or saying "be," and "there is"? 84 No; we are assured that these fiery mists are formed by the collision of misguided orbs; 85 and we are even asked-- or, at least we were asked-- to believe that this process must go on until all systems are agglomerated in one orb, to be ultimately congealed into stone. 86 What, then, is the office of the Creator according to this scheme, as repulsive as it is absurd? 87 It would appear that, at some moment in a vacuous eternity, He calls matter out of nothing, 88

whirls it into fiery vortices, and then lets it cool down to the absolute zero wherein death reigns forever.

89 But, after all, "there is a spirit in human," and "the inspiration of the Almighty," 90 of the Eternal, of the glorious Whole to which we belong, stirs in us a protest against this blasphemy of ignorance. 91 Ignorance, I say, for it was not the knowledge of our wise people that whispered such things, 92 but their sense of the vacuity beyond their knowledge. 93 Up to certain bounds, their grasp of facts, their insight into physical order, their mathematical skill, were beyond all praise. 94 But beyond that bound, aye, and within it, in every inconceivable mode of the action of force, as, for example, in gravitation, brooded the Unknowable. 95 And it was not their knowledge, but their ignorance that entailed absurd issues. 96 Already there are signs that even celestial physics and mathematics will refuse to endorse as final so revolting a scheme of material evolution and devolution, ending only in universal death. 97 And when once the re-birth of new order out of the old is seen to be everywhere and eternally taking place, 98 then all the hints given us by science of the ultimate oneness of all things, converge in the faith that All is God, and God is All. 99 For certainly, the latest observations on Matter suggest that all forms of it are variations of one ultimate Substance. 100 And the convertibility of forces, as well as the conservation of force, point to one eternal energy. 101 Nor is the duality thus suggested any final conclusion. 102 For few, I imagine, would now contend that, in the last result Matter and Force are fundamentally different things. 103 In fact, Monism holds the field; and though the evolution of human opinion is very slow, 104 it appears safe to predict that the triumph of that world theory is assured.

105 This result Is additionally secured by the increasing incongruity felt between the immeasurable vastness of the Universe, 106 even as known, and the idea of creation out of nothing. 107 When the Almighty could be seriously pictured as constructing chambers for Himself and His

heavenly host above, 108 the middle floor of earth for the children of humans, and the abyss for ghosts and devils, 109 the notion that His word evoked that puny structure from nothing might be invested by poets and prophets with a certain grandeur. 110 Each part of the work had an object as conceivable as that of each floor in a house; 111 and, according to petty human notions of utility, nothing was wasted. 112 But now, when our astronomers confront us with countless millions of orbs, to whose extension in space no bound can be proved, 113 while some of them tell us that the whole immensity is a desert of alternate fire and darkness, with no spark of finite intellect except in our tiny earth, 114 some of us, at least, cannot help feeling that the notion of a personal divine worker calling this huge enigma out of blank eternal nothing, 115 is enormously and utterly incongruous both with reverence and common sense.

116 And if the Pantheist in these days be asked, "What interpretation then do you propose?" the answer is, "I propose none. 117 I take things as they are. 118 In their totality they are unknowable, as, indeed, even science finds they are in their infinitesimal parts." 119 But we need not on this account lose "the divinity that shapes our ends."

120 For, between the infinite and the infinitesimal the human experience realises itself in surroundings which, 121 when observed and reflected on, make the impression of ordered relations of parts. 122 By a necessity of our finite and individual existence as centres of action-- a necessity of which we can give no account-- 123 we present those relations to ourselves in forms of time and space. 124 Then, when our experience is large enough and ripe enough, 125 being enriched and stimulated by the stored-up experience of humanity, as recorded in tradition, custom, Bibles, and Epics, 126 we attain to the moral sense, and realise that we are bound to be loyal to something greater than self. 127 That "greater" may be the tribe, the nation, humanity or God. 128 But in far the larger number of cases in which this sense of willing loyalty is aroused, 129 its

cause is the appeal to us of some whole of which we form a part. 130 Certainly this is so with the patriot and the philanthropist. 131 Indeed, it would be difficult, or impossible, to find any human relationship, from the family upwards, through the wider circles of school, club, municipality, nationality, 132 in which this sense of loyalty or devotion to the law of the whole is not the best incentive to devotion.

133 Yet, when we come to contemplate the final and supreme object of devotion, the Eternal Himself, 134 it has been almost the universal custom to make a surprising exception, 135 and to regard religion as maintainable only by recognition of a tremendous outward authority, 136 to which only such loyalty is possible as in barbarous times was fostered towards a personal chieftain, or feudal king. 137 Now Pantheism holds this to be an error, and regards obedience and devotion to God as the ultimate 138 and most inspiring application of that principle of the loyalty of the part to the whole which runs through all morality.

139 Why should we be supposed to be without God because we acknowledge Him to be super-personal, and "past finding out"? 140 Or why should we be suspected of denying the divinity of evolution because we do not believe the Eternal All to be subject to it? 141 This instinct of loyalty, in the sense of self-subordination to any greater Whole of which we are part, 142 the distinction of right and wrong thence arising, and the aspiration after a moral ideal, are not of human's invention. 143 Speaking, as we cannot help doing, in terms of time, I hold that the germs of this higher creature-life were always in the divine unity out of which human is evolved. 144 And in pursuing the inspirations of that higher life, as experience suggests them, humanity has always had a guide and a saviour in the Living God, 145 of whom the race life-time of human is an infinitesimal phase. 146 In such an interpretation of human's relations to God there is nothing necessarily hostile to any form of genuine religion. 147 True, there are in the creeds many statements which we cannot accept

in the letter. 148 But there are few which have not some spiritual suggestion for us. 149 And if we can attain to that intellectual love of God in which Spinoza was absorbed, we have no quarrel with any mode of sincere devotion. 150 Pious Catholic, Protestant, Vedantist, Mohammedan-- all, by the implicit, though unrecognised necessities of their faith, worship the same God as ourselves. 151 But the wrangles of sectarian zeal no longer concern us: for we have passed "To where beyond those voices there is peace."

THEOLOGY IS SHOWN NOT TO BE SUBSERVIENT TO REASON, NOR REASON TO THEOLOGY: A DEFINITION OF THE REASON WHICH ENABLES US TO ACCEPT THE AUTHORITY OF THE BIBLE

Benedict of Spinoza

7 Those who know not that philosophy and reason are distinct, dispute whether Scripture should be made subservient to reason, or reason to Scripture: 2 that is, whether the meaning of Scripture should be made to agreed with reason; or whether reason should be made to agree with Scripture: 3 the latter position is assumed by the sceptics who deny the certitude of reason, the former by the dogmatists.

4 Both parties are, as I have shown, utterly in the wrong, for either doctrine would require us to tamper with reason or with Scripture. 5 We have shown that Scripture does not teach philosophy, but merely obedience, 6 and that all it contains has been adapted to the understanding and established opinions of the multitude. 7 Those, therefore, who wish to adapt it to philosophy, must needs ascribe to the prophets many ideas which they never even dreamed of, 8 and give an extremely forced interpretation to their words: 9 those on the other hand, who would make reason and philosophy subservient to theology, 10 will be forced to accept as Divine utterances the prejudices of the ancient Jews, and to fill and confuse their mind therewith.

11 In short, one party will run wild with the aid of reason, and the other will run wild without the aid

of reason. 12 The first among the Pharisees who openly maintained that Scripture should be made to agree with reason, was Maimonides, 13 whose opinion we reviewed, and abundantly refuted,: now, although this writer had much authority among his contemporaries, 14 he was deserted on this question by almost all, and the majority went straight over to the opinion of a certain R. Jehuda Alpakhar, 15 who, in his anxiety to avoid the error of Maimonides, fell into another, which was its exact contrary. 16 He held that reason should be made subservient, and entirely give way to Scripture. 17 He thought that a passage should not be interpreted metaphorically, simply because it was repugnant to reason, 18 but only in the cases when it is inconsistent with Scripture itself - that is, with its clear doctrines. 19 Therefore he laid down the universal rule, that whatsoever Scripture teaches dogmatically, and affirms expressly, must on its own sole authority be admitted as absolutely true: 20 that there is no doctrine in the Bible which directly contradicts the general tenour of the whole: 21 but only some which appear to involve a difference, for the phrases of Scripture often seem to imply something contrary to what has been expressly taught. 22 Such phrases, and such phrases only, we may interpret metaphorically.

23 Scripture clearly teaches the unity of God (see Deuteronomv, chapter-1, verse:4), nor is there any text distinctly asserting a plurality of gods; 24 but in several passages God speaks of Himself, and the prophets speak of Him, in the plural number; 25 such phrases are simply a manner of speaking, and do not mean that there actually are several gods: 26 they are to be explained metaphorically, not because a plurality of gods is repugnant to reason, but because Scripture distinctly asserts that there is only one. 27 So, again, as Scripture asserts (as Alpakhar thinks) in Deuteronomy. Chapter-4, verse:15, that God is incorporeal, 28 we are bound, solely by the authority of this text, and not by reason, to believe that God has no body: 29 consequently we must explain metaphorically, on the sole authority of Scripture,

all those passages which attribute to God's hands, feet, and take them merely as figures of speech. 30 Such is the opinion of Alpakhar. In so far as he seeks to explain Scripture by Scripture, I praise him, 31 but I marvel that a man gifted with reason should wish to debase that faculty. 32 It is true that Scripture should be explained by Scripture, so long as we are in difficulties about the meaning and intention of the prophets, 33 but when we have elicited the true meaning, we must of necessity make use of our judgment and reason in order to assent thereto. 34 If reason, however, much as she rebels, is to be entirely subjected to Scripture, I ask, are we to effect her submission by her own aid, or without her, and blindly? 35 If the latter, we shall surely act foolishly and injudiciously; if the former, we assent to Scripture under the dominion of reason, and should not assent to it without her. 36 Moreover, I may ask now, is a person to assent to anything against his reason? 37 What is denial if it be not reason's refusal to assent? 38 In short, I am astonished that anyone should wish to subject reason, the greatest of gifts and a light from on high, to the dead letter which may have been corrupted by human malice; 39 that it should be thought no crime to speak with contempt of mind, the true handwriting of God's Word, calling it corrupt, blind, and lost, 40 while it is considered the greatest of crimes to say the same of the letter, which is merely the reflection and image of God's Word. 41 People think it pious to trust nothing to reason and their own judgment, and impious to doubt the faith of those who have transmitted to us the sacred books. 42 Such conduct is not piety, but mere folly. 43 And, after all, why are they so anxious? What are they afraid of? 44 Do they think that faith and religion cannot be upheld unless people purposely keep themselves in ignorance, and turn their backs on reason? 45 If this be so, they have but a timid trust in Scripture. 46 However, be it far from me to say that religion should seek to enslave reason, or reason religion, 47 or that both should not be able to keep their sovereignity in perfect harmony. 48 I will revert to this

question presently, for I wish now to discuss Alpakhar's rule.

49 He requires, as we have stated, that we should accept as true, or reject as false, everything asserted or denied by Scripture, 50 and he further states that Scripture never expressly asserts or denies anything which contradicts its assertions or negations elsewhere. 51 The rashness of such a requirement and statement can escape no one. 52 For-- passing over the fact that he does not notice that Scripture consists of different books, written at different times, for different people, by different authors: 53 and also that his requirement is made on his own authority without any corroboration from reason or Scripture-- 54 he would be bound to show that all passages which are indirectly contradictory of the rest, can be satisfactorily explained metaphorically through the nature of the language and the context: 55 further, that Scripture has come down to us untampered with.

56 Firstly, I ask what shall we do if reason prove recalcitrant? 57 Shall we still be bound to affirm whatever Scripture affirms, and to deny whatever Scripture denies? 58 Perhaps it will be answered that Scripture contains nothing repugnant to reason. 59 But I insist that it expressly affirms and teaches that God is jealous 60 (namely, in the decalogue itself, and in Exodus, chapter-34, verse:14, and in Deuteronomy, chapter-4, verse:24, and in many other places), 61 and I assert that such a doctrine is repugnant to reason. 62 It must, I suppose, in spite of all, be accepted as true. 63 If there are any passages in Scripture which imply that God is not jealous, they must be taken metaphorically as meaning nothing of the kind. 64 So, also, Scripture expressly states (Exodus, chapter-19, verse:20) that God came down to Mount Sinai, and it attributes to Him other movements from place to place, 65 nowhere directly stating that God does not so move. 66 Wherefore, we must take the passage literally, and Solomon's words (I Kings, chapter-8, verse:27), "But will God dwell on the earth? 67 Behold the heavens and earth cannot contain thee," 68 inasmuch as they do not expressly state that God does not move from place to

place, but only imply it, 69 must be explained away till they have no further semblance of denying locomotion to the Deity.

70 So also we must believe that the sky is the habitation and throne of God, for Scripture expressly says so; 71 and similarly many passages expressing the opinions of the prophets or the multitude, which reason and philosophy, but not Scripture, tell us to be false, 72 must be taken as true if we are to follow the guidance of our author, for according to him, reason has nothing to do with the matter. 73 Further, it is untrue that Scripture never contradicts itself directly, but only by implication. 74 For Moses says, in so many words (Deuteronomy, chapter-4, verse:24), "The Lord thy God is a consuming fire," and elsewhere expressly denies that God has any likeness to visible things. (Deuteronomy, chapter-4, verse:12.) 75 If it be decided that the latter passage only contradicts the former by implication, and must be adapted thereto, lest it seem to negative it, 76 let us grant that God is a fire; or rather, lest we should seem to have taken leave of our senses, 77 let us pass the matter over and take another example.

78 Samuel expressly denies that God ever repents, "for He is not a human that He should repent" (I Samuel, chapter-15, verse:29). 79 Jeremiah, on the other hand, asserts that God does repent, both of the evil and of the good which He had intended to do (Jeremiah, chapter-18, verse:8-10). 80 What? Are not these two texts directly contradictory? Which of the two, then, would our author want to explain metaphorically? 81 Both statements are general, and each is the opposite of the other - what one flatly affirms, the other flatly, denies. 82 So, by his own rule, he would be obliged at once to reject them as false, and to accept them as true. 83 Again, what is the point of one passage, not being contradicted by another directly, but only by implication, 84 if the implication is clear, and the nature and context of the passage preclude metaphorical interpretation?

85 There are many such instances in the Bible, where we pointed out that the prophets held different and contradictory opinions, and where

we drew attention to the contradictions in the historical narratives. 86 There is no need for me to go through them all again, for what I have said sufficiently exposes the absurdities 87 which would follow from an opinion and rule such as we are discussing, and shows the hastiness of its propounder.

88 We may, therefore, put this theory, as well as that of Maimonides, entirely out of court; 89 and we may take it for indisputable that theology is not bound to serve reason, nor reason theology, but that each has its own domain. 90 The sphere of reason is, as we have said, truth and wisdom; the sphere of theology, is piety and obedience. 91 The power of reason does not extend so far as to determine for us that people may be blessed through simple obedience, without understanding. 92 Theology, tells us nothing else, enjoins on us no command save obedience, and has neither the will nor the power to oppose reason: 93 Theology defines the dogmas of faith only in so far as they may be necessary for obedience, and leaves reason to determine their precise truth: 94 for reason is the light of the mind, and without reason all things are dreams and phantoms.

95 By theology, I here mean, strictly speaking, revelation, 96 in so far as it indicates the object aimed at by Scripture namely, the scheme and manner of obedience, or the true dogmas of piety and faith. 97 This may truly be called the Word of God, which does not consist in a certain number of books. 98 Theology thus understood, if we regard its precepts or rules of life, will be found in accordance with reason; 99 and, if we look to its aim and object, will be seen to be in nowise repugnant thereto, wherefore it is universal to all people. 100 As for its bearing on Scripture, we have shown that the meaning of Scripture should be gathered from its own history, 101 and not from the history of Nature in general, which is the basis of philosophy. 102 We ought not to be hindered if we find that our investigation of the meaning of Scripture thus conducted shows us that it is here and there repugnant to reason; 103 for whatever we may find of this

sort in the Bible, which people may be in ignorance of, without injury to their charity, 104 has, we may be sure, no bearing on theology or the Word of God, 105 and may, therefore, without blame, be viewed by everyone as he pleases. 106 To sum up, we may draw the absolute conclusion that the Bible must not be accommodated to reason, nor reason to the Bible.

107 Now, inasmuch as the basis of theology - the doctrine that human may be saved by obedience alone - cannot be proved by reason whether it be true or false, 108 we may be asked, Why, then, should we believe it? 109 If we do so without the aid of reason, we accept it blindly, and act foolishly and injudiciously; 110 if, on the other hand, we settle that it can be proved by reason, theology becomes a part of philosophy, and inseparable there from. 111 But I make answer that I have absolutely established that this basis of theology cannot be investigated by the natural light of reason, 112 or, at any rate, that no one ever has proved it by such means, and, therefore, revelation was necessary. 113 We should, however, make use of our reason, in order to grasp with moral certainty what is revealed-- 114 I say, with moral certainty, for we cannot hope to attain greater certainty than the prophets: yet their certainty was only, moral. 115 Those, therefore, who attempt to set forth the authority of Scripture with mathematical demonstrations are wholly in error: 116 for the authority of the Bible is dependent on the authority of the prophets, 117 and can be supported by no stronger arguments than those employed in old time by the prophets for convincing the people of their own authority. 118 Our certainty on the same subject can be founded on no other basis than that which served as foundation for the certainty of the prophets. 119 Now the certainty of the prophets consisted-- as we pointed out-- in these elements:- (I.) A distinct and vivid imagination; (II.) A sign; (III.) Lastly, and chiefly, a mind turned to what is just and good. 120 It was based on no other reasons than these, and consequently they cannot prove their authority by any other

reasons, 121 either to the multitude whom they addressed orally, nor to us whom they address in writing.

122 The first of these reasons, namely, the vivid imagination, could be valid only for the prophets; 123 therefore, our certainty concerning revelation must, and ought to be, based on the remaining two - namely, the sign and the teaching. 124 Such is the express doctrine of Moses, for (in Deuteronomy, chapter-18) he bids the people obey the prophet who should give a true sign in the name of the Lord, 125 but if he should predict falsely, even though it were in the name of the Lord, he should be put to death, 126 as should also he who strives to lead away the people from the true religion, 127 though he confirm his authority with signs and portents. We may compare with the above Deuteronomy. Chapter-13. 128 Whence it follows that a true prophet could be distinguished from a false one, both by their doctrine and by the miracles they wrought, 129 for Moses declares such an one to be a true prophet, and bids the people trust him without fear of deceit. 130 He condemns as false, and worthy of death, those who predict anything falsely even in the name of the Lord, 131 or who preach false gods, even though their miracles be real.

132 The only reason, then, which we have for belief in Scripture or the writings of the prophets, is the doctrine we find therein, and the signs by which it is confirmed. 133 For as we see that the prophets extol charity and justice above all things, and have no other object, we conclude that they did not write from unworthy motives, 134 but because they really thought that people might become blessed through obedience and faith: 135 further, as we see that they confirmed their teaching with signs and wonders, we become persuaded that they did not speak at random, nor run riot in their prophecies. 136 We are further strengthened in our conclusion by the fact that the morality they teach is in evident agreement with reason, 137 for it is no accidental coincidence that the Word of God which we find in the prophets coincides with the Word of God

written in our hearts. 138 We may, I say, conclude this from the sacred books as certainly as did the Jews of old from the living voice of the prophets: 139 that Scripture has come down to us intact in respect to its doctrine and main narratives.

140 Therefore this whole basis of theology and Scripture, though it does not admit of mathematical proof, may yet be accepted with the approval of our judgment. 141 It would be folly to refuse to accept what is confirmed by such ample prophetic testimony, 142 and what has proved such a comfort to those whose reason is comparatively weak, 143 and such a benefit to the state; a doctrine, moreover, which we may believe in without the slightest peril or hurt, 144 and should reject simply because it cannot be mathematically proved: 145 it is as though we should admit nothing as true, or as a wise rule of life, which could ever, in any possible way, be called in question; 146 or as though most of our actions were not full of uncertainty and hazards. 147 I admit that those who believe that theology and philosophy are mutually contradictory, 148 and that therefore either one or the other must be thrust from its throne-- 149 I admit, I say, that such persons are not unreasonable in attempting to put theology on a firm basis, and to demonstrate its truth mathematically.

150 Who, unless he were desperate or mad, would wish to bid an incontinent farewell to reason, or to despise the arts and sciences, or to deny reason's certitude? 151 But, in the meanwhile, we cannot wholly absolve them from blame, inasmuch as they invoke the aid of reason for her own defeat, and attempt infallibly to prove her fallible. 152 While they are trying to prove mathematically the authority and truth of theology, and to take away the authority of natural reason, they are in reality only bringing theology under reason's dominion, 153 and proving that her authority has no weight unless natural reason be at the back of it. 154 If they boast that they themselves assent because of the inward testimony of the Holy Spirit, 155 and that they only invoke the aid of reason because of unbelievers, in order to

convince them, 156 not even so can this meet with our approval, for we can easily show that they have spoken either from emotion or vain-glory. 157 It most clearly follows from the last chapter that the Holy Spirit only gives its testimony in favour of works, 158 called by Paul (in Galatians, chapter-5, verse:22) the fruits of the Spirit, and is in itself really nothing but the mental acquiescence which follows a good action in our souls. 159 No spirit gives testimony concerning the certitude of matters within the sphere of speculation, 160 save only reason, who is mistress, as we have shown, of the whole realm of truth. 161 If then they assert that they possess this Spirit which makes them certain of truth, they speak falsely, and according to the prejudices of the emotions, 162 or else they are in great dread lest they should be vanquished by philosophers and exposed to public ridicule, 163 and therefore they flee, as it were, to the altar; but their refuge is vain, for what altar will shelter a person who has outraged reason? 164 However, I pass such persons over, for I think I have fulfilled my purpose, and shown how philosophy should be separated from theology, 165 and wherein each consists; that neither should be subservient to the other, but that each should keep her unopposed dominion.

166 Lastly, as occasion offered, I have pointed out the absurdities, the inconveniences, and the evils following from the extraordinary confusion, 167 which has hitherto prevailed between the two subjects, owing to their not being properly distinguished and separated. 168 Before I go further I would expressly state that I consider the utility and the need for Holy Scripture or Revelation to be very great. 169 For as we cannot perceive by the natural light of reason that simple obedience is the path of salvation, 170 and are taught by revelation only that it is so by the special grace of God, which our reason cannot attain, 171 it follows that the Bible has brought a very great consolation to humankind. 172 All are able to obey, whereas there are but very few, compared with the aggregate of humanity, who can acquire the habit of virtue under the unaided

guidance of reason. 173 Thus if we had not the testimony of Scripture, we should doubt of the salvation of nearly all people.

RELIGION AND REFLECTION

George Stuart Fullerton

8 A person may be through and through ethical in his thought and feeling, and yet know nothing of the science of ethics. 2 He may be possessed of the finest aesthetic taste, and yet may know nothing of the science of aesthetics. 3 It is one thing to be good, and another to know clearly what goodness means; 4 it is one thing to love the beautiful, and another to know how to define it.

5 Just so a person may be thoroughly religious, and may, nevertheless, have reflected very little upon own religious belief and the foundations upon which it rests. 6 This does not mean that a person's belief is without foundation. It may have a firm basis or it may not. 7 But whatever the case may be, one is not in a position to say much about it. One feels that one is right, but one cannot prove it. 8 The person is, I think we must admit, rather blind as to the full significance of own position, and one is, in consequence, rather helpless. 9 Such a person is menaced by certain dangers. 10 We have seen in the chapter on ethics that people are by no means at one in their judgments as to the rightness or wrongness of given actions. 11 And it requires a very little reflection to teach us that people are not at one in their religious notions. 12 God and His nature, the relation of God to human, what the religious life should be, these things are the subject of much dispute; 13 and some people hold opinions regarded by others as not merely erroneous but highly pernicious in their influence.

14 Shall a person simply assume that the opinions which one happens to hold are correct, and that all who differ with them are in error? 15 One has not framed own opinions quite independently for oneself. We are all influenced by what we have inherited from the past, 16 and what we inherit may be partly erroneous, even if we be right in the main. 17 Moreover, we

are all liable to prejudices, and those who has no means of distinguishing such from sober truths may admit into own creed many errors. 18 The lesson of history is very instructive upon this point. 19 The fact is that a human's religious notions reflect the position which one occupies in the development of civilisation very much as do one ethical notions.

20 Again. Even supposing that a person has enlightened notions and is living a religious life that the most instructed must approve; 21 if a person has never reflected, and has never tried to make clear to oneself just what one really does believe and upon what grounds one believes it, 22 how will it be with such a person when their position is attacked by another? 23 People are, as I have said, not at one in these matters, 24 and there are few or none of the doctrines put forward as religions that have not been attacked again and again.

25 Now, those who depend only upon an instinctive feeling may be placed in the very painful position of seeing no answer to the objections brought against them. 26 What is said may seem plausible; it may even seem true, and is it right for a person to oppose what appears to be the truth? 27 One may be shocked and pained, and may feel that one who makes the assault cannot be right, 28 and yet may be forced to admit that a relentless logic, or what presents itself as such, has every appearance of establishing the repellent truth that robs one of one's dearest possession. 29 The situation is an unendurable one; it is that of the person who guards a treasure and recognises that there is no lock on the door.

30 Surely, if there is error mixed with truth in our religious beliefs, it is desirable that we should have some way of distinguishing between the truth and the error. 31 And if our beliefs really have a foundation, it is desirable that we should know what that foundation is, 32 and should not be at the mercy of every passer-by who takes the notion to throw a stone at us. 33 But these desirable ends, it seems clear, cannot be attained without reflection.

THEOSOPHY

THE PHILOSOPHY OF RELIGION
George Stuart Fullerton

9 The reflection that busies itself with these things results in what is called the philosophy of religion. 2 To show that the name is an appropriate one and that we are concerned with a philosophical discipline, 3 I shall take up for a moment the idea of God, which most people will admit has a very important place in our conception of religion.

4 Does God exist? 5 We may feel very sure that He does, and yet be forced to admit that the evidence of His existence is not so clear and undeniable as to compel the assent of everyone. 6 We do not try to prove the existence of the people we meet and who talk to us. No one thinks of denying their existence; it is taken for granted. 7 Even the metaphysician, when he takes up and discusses the question whether we can prove the existence of any mind beyond our own, 8 does not seriously doubt whether there are other minds or not. 9 It is not so much what we know, as how we know it, that interests him.

10 But with the existence of God it is different. 11 That people do not think that an examination of the evidence can be dispensed with is evident from the books that are written and lectures that are delivered year after year. 12 There seem to be honest differences of opinion, and we feel compelled to offer people proofs-- to show that belief is reasonable.

13 How shall we determine whether this world in which we live is such a world that we may take it as a revelation of God? 14 And of what sort of a Being are we speaking when we use the word "God"? 15 The question is not an idle one, for people's conceptions have differed widely. 16 There is the savage, with a conception that strikes the modern civilised person as altogether inadequate; 17 there is the thoughtful person of our day, who has inherited the reflections of those who have lived in the ages gone by. 18 And there is the philosopher, or, perhaps, I should rather say, there are the philosophers. 19 Have they not conceived of God as a group of abstract notions, 20 or as a something that may best be

described as the Unknowable, 21 or as the Substance which is the identity of thought and extension, or as the external world itself? 22 All have not sinned in this way, but some have, and they are not people whom we can ignore.

23 If we turn from all such notions and, in harmony with the faith of the great body of religious people in the ages past, 24 some of whom were philosophers but most of whom were not, cling close to the notion that God is a mind or spirit, 25 and must be conceived according to the analogy, atleast, of the human mind, the mind we most directly know-- 26 if we do this, we are still confronted by problems to which the thoughtful person cannot refuse attention.

27 What do we mean by a mind? 28 This is a question to which one can scarcely give an intelligent answer unless one has exercised one's faculty of philosophic reflection. 29 And upon what sort of evidence does one depend in establishing the existence of minds other than one's own? 30 This has been discussed at length and the problem is certainly a metaphysical one. 31 And if we believe that the Divine Mind is not subject to the limitations which confine the human, how shall we conceive it? 32 The question is an important one. 33 Some of the philosophers and theologians who have tried to free the Divine Mind from such limitations have taken away every positive mark by which we recognise a mind to be such, 34 and have left us a naked "Absolute" which is no better than a labeled vacuum. 35 Moreover, we cannot refuse to consider the question of God's relation to the world. 36 This seems to lead back to the broader question: How are we to conceive of any mind as related to the world?

37 What is the relation between mind and matter? 38 If any subject of inquiry may properly be called metaphysical, surely this may be. 39 We see, then, that there is little wonder that the thoughtful consideration of the facts and doctrines of religion has taken its place among the philosophical sciences. 40 Aesthetics has been called applied behavioural-science; and I think it is scarcely too much to say that we are here concerned with applied

metaphysics, 41 with the attempt to obtain a clear understanding of the significance of the facts of religion 42 in the light of those ultimate analyses which reveal to us the real nature of the world of matter and of minds.

PHILOSOPHY AS A GUIDE TO LIFE

George Stuart Fullerton

10 At the close of the fourth century before Christ there arose the schools of the Stoics, the Epicureans, and the Sceptics. 2 In them we seem to find a somewhat new conception of philosophy--philosophy appears as chiefly a guide to life. 3 The Stoic emphasises the necessity of living "according to Nature," and dwells upon the character of the wise people; 4 the Epicurean furnishes certain selfish maxims for getting through life as pleasantly as possible; the Sceptic counsels apathy, an indifference to all things,-- 5 blessed are those who expects nothing, for they shall not be disappointed. 6 And yet, when we examine more closely these systems, we find a conception of philosophy not really so very different from that which had obtained before. 7 We do not find, it is true, that disinterested passion for the attainment of truth which is the glory of science. 8 Humankind seems quite too much concerned with the problem of one own happiness or unhappiness; one has grown morbid.

9 Nevertheless, the practical maxims which obtain in each of these systems are based upon a certain view of the system of things as a whole. 10 The Stoic tells us of what the world consists; what was the beginning and what will be the end of things; what is the relation of the system of things to God. 11 They develops a physics and a logic as well as a system of ethics. 12 The Epicurean informs us that the world originated in a rain of atoms through space; 13 they examines into the foundations of human knowledge; and they proceeds to make oneself comfortable in a world from which one has removed those disturbing elements, the gods. 14 The Sceptic

decides that there is no such thing as truth, before one enunciates the dogma that it is not worthwhile to worry about anything. 15 The philosophy of each school includes a view of the system of things as a whole. 16 The philosophers still regarded the Universe of knowledge as their province.

PHILOSOPHY
IN THE MIDDLE AGES
George Stuart Fullerton

11 I cannot do more than mention Neo-Platonism, that half Greek and half Oriental system of doctrine 2 which arose in the third century after Christ, the first system of importance after the schools mentioned above. 3 But I must not pass it by without pointing out that the Neo-Platonic philosopher undertook to give an account of the origin, development, and end of the whole system of things.

4 In the Middle-Ages there gradually grew up rather a sharp distinction between those things that can be known through the unaided reason, 5 and those things that can only be known through a supernatural revelation. 6 The term "philosophy" came to be synonymous with knowledge attained by the natural light of reason. 7 This seems to imply some sort of a limitation to the task of the philosopher. Philosophy is not synonymous with all knowledge.

8 But we must not forget to take note of the fact that philosophy, even with this limitation, constitutes a pretty wide field. 9 It covers both the physical and the moral sciences. 10 Nor should we omit to notice that the scholastic philosopher was at the same time a theologian. 11 Albert the Great and St. Thomas Aquinas, the famous scholastics of the 13th-century, had to write a "Summa Theologiae," or system of theology, 12 as well as to treat of the other departments of human knowledge.

13 Why were these people not overwhelmed with the task set them by the tradition of their time? 14 It was because the task was not, after all, so great as a modern person might conceive it to be. 15 Gil Blas, in Le Sage's famous

romance, finds it possible to become a skilled physician in the twinkling of an eye, 16 when Dr. Sangrado has imparted to him the secret that the remedy for all diseases is to be found in bleeding the patient and in making them drink copiously of hot water. 17 When little is known about things, it does not seem impossible for one person to learn that little. 18 During the Middle-Ages and the centuries preceding, the physical sciences had a long sleep. 19 People were much more concerned in the 13th-century to find out what Aristotle had said than they were to address questions to Nature. 20 The special sciences, as we now know them, had not been called into existence.

THE MODERN PHILOSOPHY
George Stuart Fullerton

12 The submission of people's minds to the authority of Aristotle and of the church gradually gave way. 2 A revival of learning set in. People turned first of all to a more independent choice of authorities, 3 and then rose to the conception of a philosophy independent of authority, of a science based upon an observation of Nature, 4 of a science at first hand. The special sciences came into being. 5 But the old tradition of philosophy as universal knowledge remained. 6 If we pass over the people of the transition period and turn our attention to Francis Bacon (1561-1626) and Rene Descartes (1596-1650), 7 the two who are commonly regarded as heading the list of the modern philosophers, we find both of them assigning to the philosopher an almost unlimited field.

8 Bacon holds that philosophy has for its objects God, human, and Nature, 9 and he regards it as within his province to treat of "philosophia prima" --a sort of metaphysics, though he does not call it by this name--, 10 of logic, of physics and astronomy, of anthropology, in which he includes behavioural-science, of ethics, and of politics. 11 In short, he attempts to map out the whole field of human knowledge, and to tell those who work in this corner of it or in that how they should set about their task. 12 As for

Descartes, he writes of the trustworthiness of human knowledge, 13 of the existence of God, of the existence of an external world, of the human soul and its nature, of mathematics, physics, cosmology, physiology, and, in short, of nearly everything discussed by the people of his day. 14 No person can accuse this extraordinary Frenchman of a lack of appreciation of the special sciences which were growing up. 15 No one in his time had a better right to be called a scientist in the modern sense of the term. 16 But it was not enough for him to be a mere mathematician, or even a worker in the physical sciences generally. 17 He must be all that has been mentioned above.

18 The conception of philosophy as of a something that embraces all departments of human knowledge has not wholly passed away even in our day. 19 I shall not dwell upon Spinoza (1632-1677), who believed it possible to deduce a world a-priori with mathematical precision; 20 upon Christian Wolff (1679-1754), who defined philosophy as the knowledge of the causes of what is or comes into being; 21 upon Fichte (1762-1814), who believed that the philosopher, by mere thinking, could lay down the laws of all possible future experience; 22 upon Schelling (1775-1854), who, without knowing anything worth mentioning about natural science, had the courage to develop a system of natural philosophy, and to condemn such investigators as Boyle and Newton; 23 upon Hegel (1770-1831), who undertakes to construct the whole system of reality out of concepts, 24 and who, with his immediate predecessors, brought philosophy for a while into more or less disrepute with people of a scientific turn of mind. 25 I shall come down quite to our own times, and consider a person whose conception of philosophy has had and still has a good deal of influence, 26 especially with the general public-- with those to whom philosophy is a thing to be taken up in moments of leisure, 27 and cannot be the serious pursuit of a life.

28 "Knowledge of the lowest kind," says Herbert Spencer, "is un-unified knowledge; 29 Science is partially-unified knowledge;

Philosophy is completely unified knowledge." 30 Science, he argues, means merely the family of the Sciences-- stands for nothing more than the sum of knowledge formed of their contributions. 31 Philosophy is the fusion of these contributions into a whole; it is knowledge of the greatest generality. 32 In harmony with this notion Spencer produced a system of philosophy which includes the following: A volume entitled "First Principles," 33 which undertakes to show what human can and what human cannot know; 34 a treatise on the principles of biology; another on the principles of behavioural-science; still another on the principles of sociology; and finally one on the principles of morality. 35 To complete the scheme it would have been necessary to give an account of inorganic Nature before going on to the phenomena of life, 36 but our philosopher found the task too great and left this out.

37 Now, Spencer was a man of genius, and one finds in his works many illuminating thoughts. 38 But it is worthy of remark that those who praise his work in this or in that field are almost always people who have themselves worked in some other field 39 and have an imperfect acquaintance with the particular field that they happen to be praising. 40 The metaphysician finds the reasonings of the "First Principles" rather loose and inconclusive; 41 the biologist pays little heed to the "Principles of Biology"; 42 the sociologist finds Spencer not particularly accurate or careful in the field of his predilection. 43 He has tried to be a professor of all the sciences, and it is too late in the world's history for him or for any person to cope with such a task. 44 In the days of Plato a person might have hoped to accomplish it.

WHAT PHILOSOPHY MEANS IN OUR TIME

George Stuart Fullerton

13 It savours of temerity to write down such a title as that which heads the present section. 2 There are people philosophy means little else than the doctrine of Kant, or of Hegel, or of the brothers Caird,

or of Herbert Spencer, or even of St. Thomas Aquinas, 3 for we must not forget that many of the seminaries of learning in Europe and some in America still hold to the mediaeval church philosophy.

4 But let me gather up in a few words the purport of what has been said above. 5 Philosophy once meant the whole body of scientific knowledge. 6 Afterward it came to mean the whole body of knowledge which could be attained by the mere light of human reason, unaided by revelation. 7 The several special sciences sprang up, and a multitude of people have for a long time past devoted themselves to definite limited fields of investigation with little attention to what has been done in other fields. 8 Nevertheless, there has persisted the notion of a discipline which somehow concerns itself with the whole system of things, 9 rather than with any limited division of that broad field. 10 It is a notion not peculiar to the disciples of Spencer. 11 There are many to whom philosophy is a "Weltweisheit," a world-wisdom. 12 Shall we say that this is the meaning of the word philosophy now? 13 And if we do, how shall we draw a line between philosophy and the body of the special sciences?

14 Perhaps the most just way to get a preliminary idea of what philosophy means to the people of our time is to turn away for the time being from the definition of any one person or group of people, 15 and to ask ourselves what a professor of philosophy in an American or European university or any other place is actually supposed to teach. 16 It is quite clear that professor of philosophy is not supposed to be an Aristotle. 17 Philosophers does not represent all the sciences, 18 and no one expects philosophers to lecture on mathematics, mechanics, physics, chemistry, zoölogy, botany, economics, politics, and various other disciplines. 19 There was a time when philosopher might have been expected to teach all that people could know, but that time is long past.

20 Nevertheless, there is quite a group of sciences which are regarded as belonging especially to philosophical province; 21 and

although a person may devote a large part of own attention to some one portion of the field, 22 and would certainly be thought remiss if wholly neglected the rest. 23 This group of sciences includes logic, behavioural-science, ethics and aesthetics, metaphysics, and the history of philosophy. 24 I have not included epistemology or the "theory of knowledge" as a separate discipline, for reasons which will appear later; 25 and I have included the history of philosophy, because, whether we care to call this a special science or not, it constitutes a very important part of the work of the teacher of philosophy in our day.

26 Of this group of subjects the student who goes to the university to study philosophy is supposed to know something before leaving its walls, 27 whatever else one may or may not know. 28 It should be remarked, again, that there is commonly supposed to be a peculiarly close relation between philosophy and religion. 29 Certainly, if anyone about a university undertakes to give a course of lectures on theism, it is much more apt to be the professor of philosophy than the professor of mathematics or of chemistry. 30 The person who has written an "Introduction to Philosophy," a "Behavioural-science," a "Logic," and an "Outlines of Metaphysics" is very apt to regard it as own duty to add to the list a "Philosophy of Religion." 31 The students in the theological seminaries of Europe and America are usually encouraged, if not compelled, to attend courses in philosophy.

32 Finally, it appears to be definitely accepted that even the disciplines that we never think of classing among the philosophical sciences are not wholly cut off from a connection with philosophy. 33 When we are occupied, not with adding to the stock of knowledge embraced within the sphere of any special science, 34 but with an examination of the methods of the science, with, so to speak, a criticism of the foundations upon which the science rests, 35 our work is generally recognised as philosophical. 36 It strikes no one as odd in our day that there should be established a "Journal of Philosophy, Behavioural-science,

and Scientific Methods," 37 but we should think it strange if someone announced the intention to publish a "Journal of Philosophy and Comparative Anatomy."

38 It is not without its significance that, when Mach, who had been professor of physics at Prague, was called (in 1895) to the University of Vienna 39 to lecture on the history and theory of the inductive sciences, 40 he was made, not professor of physics, but professor of philosophy.

41 The case, then, stands thus: a certain group of disciplines is regarded as falling peculiarly within the province of the professor of philosophy, 42 and the sciences which constitute it are frequently called the philosophical sciences; 43 moreover, it is regarded as quite proper that the teacher of philosophy should concern oneself with the problems of religion, 44 and should pry into the methods and fundamental assumptions of special sciences in all of which it is impossible that one should be an adept. 45 The question naturally arises: Why has one task come to be circumscribed as it is? Why should one teach just these things and no others?

46 To this question certain persons are at once ready to give an answer. 47 There was a time, they argue, when it seemed possible for one person to embrace the whole field of human knowledge. 48 But human knowledge grew; the special sciences were born; each concerned itself with a definite class of facts and developed its own methods. 49 It became possible and necessary for a person to be, not a scientist at large, but a chemist, a physicist, a biologist, an economist. 50 But in certain portions of the great field people have met with peculiar difficulties; 51 here it cannot be said that we have sciences, but rather that we have attempts at science. 52 The philosopher is the person to whom is committed what is left when we have taken away what has been definitely established 53 or is undergoing investigation according to approved scientific methods. 54 The philosopher is Lord of the Uncleared Ground, and may wander through it in own compassless, irresponsible way, 55

never feeling that one is lost, for one has never had any definite bearings to lose.

56 Those who argue in this way support their case by pointing to the lack of a general consensus of opinion 57 which obtains in many parts of the field which the philosopher regards as one own; 58 and also by pointing out that, even within this field, there is a growing tendency on the part of certain sciences to separate themselves from philosophy and become independent. 59 Thus the psychologist and the logician are sometimes very anxious to have it understood that they belong among the scientists and not among the philosophers. 60 Now, this answer to the question that we have raised undoubtedly contains some truth. 61 As we have seen from the sketch contained in the preceding pages, 62 the word philosophy was once a synonym for the whole sum of the sciences or what stood for such; 63 gradually the several sciences have become independent and the field of the philosopher has been circumscribed. 64 We must admit, moreover, that there is to be found in a number of the special sciences a body of accepted facts which is without its analogue in philosophy.

65 In much of their work the philosophers certainly seems to be walking upon more uncertain ground than their neighbors; 66 and if one is unaware of that fact, it must be either because one has not a very nice sense of what constitutes scientific evidence, 67 or because one is carried away by own enthusiasm for some particular form of doctrine.

68 Nevertheless, it is just to maintain that the answer we are discussing is not a satisfactory one. 69 For one thing, we find in it no indication of the reason why the particular group of disciplines with which the philosopher occupies themselves has been left to them, 70 when so many sciences have announced their independence. 71 Why have not these, also, separated off and set up for themselves? 72 Is it more difficult to work in these fields than in others? 73 And, if so, what reason can be assigned for the fact?

74 Take behavioural-science as an instance. How does it happen that

the physicist calmly develops own doctrine without finding it necessary to make own bow to philosophy at all, 75 while the psychologist is at pains to explain that own book is to treat behavioural-science as "a natural science," 76 and will avoid metaphysics as much as possible? 77 For centuries people have been interested in the phenomena of the human mind. 78 Can anything be more open to observation than what passes in a human's own consciousness? 79 Why, then, should the science of behavioural-science lag behind? 80 And why these endless disputes as to whether it can really be treated as a "natural science" at all?

81 Again. May we assume that, because certain disciplines have taken a position of relative independence, 82 therefore all the rest of the field will surely come to be divided up in the same way, 83 and that there will be many special sciences, but no such thing as philosophy? 84 It is hasty to assume this on no better evidence than that which has so far been presented. 85 Before making up one's mind upon this point, one should take a careful look at the problems with which the philosopher occupies themselves. 86 A complete answer to the questions raised above can only be given in the course of the book, where the main problems of philosophy are discussed, 87 and the several philosophical sciences are taken up and examined. But I may say, in anticipation, as much as this:-- 88 (1) Philosophy is reflective knowledge. What is meant by reflective knowledge will be explained at length in the next chapter. 89 (2) The sciences which are grouped together as philosophical are those in which we are forced back upon the problems of reflective thought, and cannot simply put them aside. 90 (3) The peculiar difficulties of reflective thought may account for the fact that these sciences are, more than others, a field in which we may expect to find disputes and differences of opinion. 91 (4) We need not be afraid that the whole field of human knowledge will come to be so divided up into special sciences that philosophy will disappear. 92 The problems with which the philosophers

occupies themselves are real problems, 93 which present themselves unavoidably to the thoughtful mind, and it is not convenient to divide these up among the several sciences. This will become clearer as we proceed.

HOW THE PLAIN HUMAN THINKS THEY KNOWS THE WORLD

George Stuart Fullerton

14 As schoolboys we enjoyed Cicero's joke at the expense of the "minute philosophers." 2 They denied the immortality of the soul; he affirmed it; 3 and he congratulated himself upon the fact that, if they were right, they would not survive to discover it and to triumph over him.

4 At the close of the seventeenth century the philosopher John Locke was guilty of a joke of somewhat the same kind. 5 "I think," said he, “nobody can, in earnest, be so sceptical as to be uncertain of the existence of those things which he sees and feels. 6 At least, those that can doubt so far-- whatever they may have with their own thoughts-- will never have any controversy with me; 7 since they can never be sure I say anything contrary to their own opinion."

8 Now, in this chapter and in certain chapters to follow, I am going to take up and turn over, so that we may get a good look at them, 9 some of the problems that have presented themselves to those who have reflected upon the world and the mind as they seem given in our experience. 10 I shall begin by asking whether it is not possible to doubt that there is an external world at all.

11 The question cannot best be answered by a jest. 12 It may, of course, be absurd to maintain that there is no external world; 13 but surely they, too, is in an absurd position who maintains dogmatically that there is one, 14 and is yet quite unable to find any flaw in the reasonings of the person who seems to be able to show that this belief has no solid foundation. 15 And we must not forget that the people who have thought it worthwhile to raise just such questions as this, 16 during the last twenty centuries, have been among the most brilliant

intellects of the race. 17 We must not assume too hastily that they have occupied themselves with mere trivialities. 18 Since, therefore, so many thoughtful people have found it worthwhile to ask themselves seriously whether there is an external world, 19 or, at least, how we can know that there is an external world, 20 it is not unreasonable to expect that, by looking for it, we may find in our common experience or in science some difficulty 21 sufficient to suggest the doubt which at first strikes the average person as preposterous. 22 In what can such a doubt take its rise? Let us see.

23 I think it is scarcely too much to say that the plain person believes that one does not directly perceive an external world, 24 and that they, at the same time, believes that one does directly perceive one. 25 It is quite possible to believe contradictory things, when one's thought of them is somewhat vague, and when one does not consciously bring them together.

26 As to the first-mentioned belief. Does not the plain person distinguish between own ideas of things and the things themselves? 27 Does one not believe that own ideas come to oneself through the avenues of the senses? 28 Is one not aware of the fact that, when a sense is disordered, the thing as one perceives it is not like the thing "as it is"? 29 A blind person does not see things when they are there; a colour-blind person sees them as others do not see them; a person suffering under certain abnormal conditions of the nervous system sees things when they are not there at all, 30 one has hallucinations. 31 The thing itself, as it seems, is not in the person's mind; it is the idea that is in the person's mind, and that represents the thing. 32 Sometimes it appears to give a true account of it; sometimes it seems to give a garbled account; sometimes it is a false representative throughout--there is no reality behind it. 33 It is, then, the idea that is immediately known, and not the thing; the thing is merely inferred to exist.

34 I do not mean to say that the plain person is conscious of drawing this conclusion. 35 I only maintain that it seems a natural conclusion to draw from the facts

which one recognises, 36 and that sometimes one seems to draw the conclusion half-consciously. 37 On the other hand, we must all admit that when the plain person is not thinking about the distinction between ideas and things, 38 but is looking at some material object before own eyes, is touching it with own fingers and turning it about to get a good look at it, 39 it never occurs to a person that one is not directly conscious of the thing itself. 40 One seems to oneself to perceive the thing immediately; to perceive it as it is and where it is; 41 to perceive it as a really extended thing, out there in space before own body. 42 One does not think of oneself as occupied with mere images, representations of the object. 43 One may be willing to admit that own mind is in own head, but one cannot think that what one sees is in own head. 44 Is not the object there? Does one not see and feel it? Why doubt such evidence as this? 45 Anyone who tells you that the external world does not exist seems to be denying what is immediately given in own experience.

46 The person who looks at things in this way assumes, of course, that the external object is known directly, 47 and is not a something merely inferred to exist from the presence of a representative image. 48 May one embrace this belief and abandon the other one? 49 If we elect to do this, we appear to be in difficulties at once. 50 All the considerations which made us distinguish so carefully between our ideas of things and the things themselves crowd in upon us. 51 Can it be that we know things independently of the avenues of the senses? 52 Would a person with different senses know things just as we do? 53 How can any person suffer from an hallucination, if things are not inferred from images, but are known independently?

54 The difficulties encountered appear sufficiently serious even if we keep to that knowledge of things which seems to be given in common experience. 55 But even the plain person has heard of atoms and molecules; 56 and if one accepts the extension of knowledge offered by the person of science, 57 one must admit that,

whatever this apparently immediately perceived external thing may be, 58 it cannot be the external thing that science assures us is out there in space beyond own body, 59 and which must be a very different sort of thing from the thing one seems to perceive. 60 The things we perceive must, then, be appearance; and where can that appearance be if not in our own mind?

61 The person who has made no study of philosophy at all does not usually think these things out; 62 but surely there are interrogation marks written up all over our experiences, and one misses them only because one does not see clearly. 63 By judiciously asking questions one may often lead another either to affirm or to deny that they have an immediate knowledge of the external world, pretty much as one pleases. 64 If one affirms it, one position does not seem to be a wholly satisfactory one, as we have seen; 65 and if one denies it, one makes the existence of the external world wholly a matter of inference from the presence of ideas in the mind, and one must stand ready to justify this inference.

66 To many people it has seemed that the inference is not an easy one to justify. 67 One may say: We could have no ideas of things, 68 no sensations, if real things did not exist and make an impression upon our senses. 69 But to this it may be answered: How is that statement to be proved? 70 Is it to be proved by observing that, when things are present and affect the senses, there come into being ideas which represent the things? 71 Evidently such a proof as this is out of the question, 72 for, if it is true that we know external things only by inference and never immediately, then we can never prove by observation that ideas and things are thus connected. 73 And if it is not to be proved by observation, how shall it be proved? Shall we just assume it dogmatically and pass on to something else? 74 Surely there is enough in the experience of the plain person to justify one in raising the question whether one can certainly know that there is an external world.

THE BEHAVIOURIST
AND THE EXTERNAL WORLD
George Stuart Fullerton

15 We have seen just above that the doubt regarding the existence of the world seems to have its root in the familiar distinction between ideas and things, 2 appearances and the realities which they are supposed to represent. 3 The psychologist has much to say about ideas; and if sharpening and making clear this distinction has anything to do with stirring up doubts, 4 it is natural to suppose that they should become more insistent when one has exchanged the ignorance of everyday life for the knowledge of the psychologist. 5 Now, when the psychologist asks how a given mind comes to have a knowledge of any external thing, 6 they finds their answer in the messages which have been brought to the mind by means of the bodily senses. 7 They describes the sense-organs and the nervous connections between these and the brain, 8 and tells us that when certain nervous impulses have travelled, let us say, from the eye or the ear to the brain, one has sensations of sight or sound. 9 They describes for us in detail how, out of such sensations and the memories of such sensations, we frame mental images of external things. 10 Between the mental image and the thing that it represents they distinguishes sharply, 11 and they informs us that the mind knows no more about the external thing than is contained in such images. 12 That a thing is present can be known only by the fact that a message from the thing is sent along the nerves, 13 and what the thing is must be determined from the character of the message. 14 Given the image in the absence of the thing,-- that is to say, an hallucination,-- the mind will naturally suppose that the thing is present. 15 This false supposition cannot be corrected by a direct inspection of the thing, for such a direct inspection of things is out of the question. 16 The only way in which the mind concerned can discover that the thing is absent is by referring to its other experiences. 17 This image is compared with other images and is discovered to be in some way

abnormal. 18 We decide that it is a false representative and has no corresponding reality behind it.

19 This doctrine taken as it stands seems to cut the mind off from the external world very completely; 20 and the most curious thing about it is that it seems to be built up on the assumption that it is not really true. 21 How can one know certainly that there is a world of material things, 22 including human bodies with their sense-organs and nerves, if no mind has ever been able to inspect directly anything of the sort? 23 How can we tell that a sensation arises when a nervous impulse has been carried along a sensory nerve 24 and has reached the brain, if every mind is shut up to the charmed circle of its own ideas? 25 The anatomist and the behavioural-scientists give us very detailed accounts of the sense-organs and of the brain; 26 the behaviourists even undertakes to measure the speed with which the impulse passes along a nerve; 27 the psychologists accepts and uses the results of their labours. 28 But can all this be done in the absence of any first-hand knowledge of the things of which one is talking?

29 Remember that, if the psychologist is right, any external object, eye, ear, nerve, or brain, which we can perceive directly, is a mental complex, a something in the mind and not external at all. 30 How shall we prove that there are objects, ears, eyes, nerves, and brains,--in short, all the requisite mechanism for the calling into existence of sensations,-- 31 in an outer world which is not immediately perceived but is only inferred to exist?

32 I do not wish to be regarded as impugning the right of the psychologist to make the assumptions which they do, and to work as they do. 33 They have a right to assume, with the plain person, that there is an external world and that we know it. 34 But a very little reflection must make it manifest that they seems, at least, to be guilty of an inconsistency, 35 and that anyone who wishes to think clearly should strive to see just where the trouble lies.

36 So much, at least, is evident: the person who is inclined to doubt whether there is, after all, any real

external world, 37 appears to find in the psychologist's distinction between ideas and things something like an excuse for own doubt. 38 To get to the bottom of the matter and to dissipate their doubt one has to go rather deeply into metaphysics. 39 I merely wish to show just here that the doubt is not a gratuitous one, 40 but is really suggested to the thoughtful mind by a reflection upon our experience of things. 41 And, as we are all apt to think that the person of science is less given to busying themselves with useless subtleties than is the philosopher, 42 I shall, before closing this chapter, present some paragraphs upon the subject from the pen of a professor of mathematics and mechanics.

THE "TELEPHONE EXCHANGE
George Stuart Fullerton

16 “We are accustomed to talk," writes Professor Karl Pearson, "of the 'external world,' of the 'reality' outside us. 2 We speak of individual objects having an existence independent of our own. 3 The store of past sense-impressions, our thoughts and memories, although most probably they have beside their psychical element a close correspondence 4 with some physical change or impress in the brain, are yet spoken of as inside ourselves. 5 On the other hand, although if a sensory nerve be divided anywhere short of the brain, we lose the corresponding class of sense impression, 6 we yet speak of many sense-impressions, such as form and texture, as existing outside ourselves. 7 How close then can we actually get to this supposed world outside ourselves? 8 Just as near but no nearer than the brain terminals of the sensory nerves. 9 We are like the clerk in the central telephone exchange who cannot get nearer to own customers than own end of the telephone wires. 10 We are indeed worse off than the clerk, for to carry out the analogy properly we must suppose the clerk - never to have been outside the telephone exchange, 11 never to have seen a customer or any one like a customer-- in short, never, except through the telephone wire, to

have come in contact with the outside Universe -. 12 Of that 'real' Universe outside ownself one would be able to form no direct impression; 13 the real Universe for one would be the aggregate of one's constructs from the messages which were caused by the telephone wires in own office. 14 About those messages and the ideas raised in own mind by them one might reason and draw own inferences; 15 and own conclusions would be correct-- for what? For the world of telephonic messages, for the type of messages that go through the telephone. 16 Something definite and valuable one might know with regard to the spheres of action and of thought of own telephonic subscribers, 17 but outside those spheres one could have no experience. 18 Pent up in own office one could never have seen or touched even a telephonic subscriber in ownself. 19 Very much in the position of such a telephone clerk is the conscious ego of each one of us seated at the brain terminals of the sensory nerves. 20 Not a step nearer than those terminals can the ego get to the 'outer world,' 21 and what in and for themselves are the subscribers to its nerve exchange it has no means of ascertaining. 22 Messages in the form of sense-impressions come flowing in from that 'outside world,' and these we analyse, classify, store up, and reason about. 23 But of the nature of 'things-in-themselves,' of what may exist at the other end of our system of telephone wires, we know nothing at all.

24 "But the reader, perhaps, remarks, 'I not only see an object, but I can touch it. I can trace the nerve from the tip of my finger to the brain. 25 I am not like the telephone clerk, I can follow my network of wires to their terminals and find what is at the other end of them.' 26 Can you, reader? Think for a moment whether your ego has for one moment got away from your brain exchange. 27 The sense-impression that you call touch was just as much as sight felt only at the brain end of a sensory nerve. 28 What has told you also of the nerve from the tip of your finger to your brain? 29 Why, sense-impressions also, messages conveyed along optic or tactile sensory nerves. 30 In truth, all you

have been doing is to employ one subscriber to your telephone exchange to tell you about the wire that goes to a second, 31 but you are just as far as ever from tracing out for yourself the telephone wires to the individual subscriber and ascertaining what your nature is in and for yourself. 32 The immediate sense-impression is just as far removed from what you term the 'outside world' as the store of impresses. 33 If our telephone clerk had recorded by aid of a phonograph certain of the messages from the outside world on past occasions, 34 then if any telephonic message on its receipt set several phonographs repeating past messages, we have an image analogous to what goes on in the brain. 35 Both telephone and phonograph are equally removed from what the clerk might call the 'real outside world,' 36 but they enable one through their sounds to construct a Universe; to projects those sounds, which are really inside own office, outside own office, and speaks of them as the external Universe. 37 This outside world is constructed by one from the contents of the inside sounds, 38 which differ as widely from things-in-themselves as language, the symbol, must always differ from the thing it symbolises. 39 For our telephone clerk sounds would be the real world, 40 and yet we can see how conditioned and limited it would be by the range of own particular telephone subscribers and by the contents of their messages.

41 "So it is with our brain; the sounds from telephone and phonograph correspond to immediate and stored sense-impressions. 42 These sense-impressions we project as it were outwards and term the real world outside ourselves. 43 But the things-in-themselves which the sense-impressions symbolise, the 'reality,' as the metaphysicians wish to call it, at the other end of the nerve, remain unknown and is unknowable. 44 Reality of the external world lies for science and for us in combinations of form and colour and touch-- 45 sense-impressions as widely divergent from the thing 'at the other end of the nerve' as the sound of the telephone from the subscriber at the other end of the wire. 46 We

are cribbed and confined in this world of sense-impressions like the exchange clerk in own world of sounds, and not a step beyond can we get. 47 As a person's world is conditioned and limited by their particular network of wires, so ours is conditioned by our nervous system, by our organs of sense. 48 Their peculiarities determine what is the nature of the outside world which we construct. 49 It is the similarity in the organs of sense and in the perceptive faculty of all normal human beings which makes the outside world the same, or practically the same, for them all. 50 To return to the old analogy, it is as if two telephone exchanges had very nearly identical groups of subscribers. 51 In this case a wire between the two exchanges would soon convince the imprisoned clerks that they had something in common and peculiar to themselves. 52 That conviction corresponds in our comparison to the recognition of other consciousness." 53 I suggest that this extract be read over carefully, not once but several times, and that the reader try to make quite clear to themselves the position of the clerk in the telephone exchange, 54 the position of the mind in the body, as depicted by Professor Pearson, before recourse is had to the criticisms of anyone else. 55 One cannot find anywhere better material for critical philosophical reflection.

56 As has been seen, our author accepts without question, the psychological doctrine that the mind is shut up within the circle of the messages that are conducted to it along the sensory nerves, 57 and that it cannot directly perceive anything truly external. 58 He carries own doctrine out to the bitter end in the conclusion that, since we have never had experience of anything beyond sense-impressions, and have no ground for an inference to anything beyond, 59 we must recognise that the only external world of which we know anything is an external world built up out of sense-impressions. 60 It is, thus, in the mind, and is not external at all; it is only "projected outwards," thought of as though it were beyond us. 61 Shall we leave the inconsistent position of the plain

person and of the psychologists and take our refuge in this world of projected mental constructs?

62 Before the reader makes up own mind to do this, I beg you to consider the following:-- 63 (1) If the only external world of which we have a right to speak at all is a construct in the mind or ego, 64 we may certainly affirm that the world is in the ego, but does it sound sensible to say that the ego is somewhere in the world? 65 (2) If all external things are really inside the mind, and are only "projected" outwards, of course our own bodies, sense-organs, nerves, and brains, are really inside and are merely projected outwards. 66 Now, do the sense-impressions of which everything is to be constructed "come flowing in" along these nerves that are really inside? 67 (3) Can we say, when a nerve lies entirely within the mind or ego, that this same mind or ego is nearer to one end of the nerve than it is to the other? 68 How shall we picture to ourselves "the conscious ego of each one of us seated at the brain terminals of the sensory nerves"? 69 How can the ego place the whole of itself at the end of a nerve which it has constructed within itself? 70 And why is it more difficult for it to get to one end of a nerve like this than it is to get to the other? 71 (4) Why should the thing "at the other end of the nerve" remain unknown and unknowable? 72 Since the nerve is entirely in the mind, is purely a mental construct, can anything whatever be at the end of it without being in the mind? 73 And if the thing in question is not in the mind, how are we going to prove that it is any nearer to one end of a nerve which is inside the mind than it is to the other? 74 If it may really be said to be at the end of the nerve, why may we not know it quite as well as we do the end of the nerve, or any other mental construct?

75 It must be clear to the careful reader of Professor Pearson's paragraphs, that he does not confine himself strictly to the world of mere "projections," to an outer world which is really inner. 76 If he did this, the distinction between inner and outer would disappear. 77 Let us consider for a moment the imprisoned clerk. He is in a telephone exchange, about

him are wires and subscribers. 78 He gets only sounds and must build up his whole Universe of things out of sounds. 79 Now we are supposing him to be in a telephone exchange, to be receiving messages, to be building up a world out of these messages. 80 Do we for a moment think of him as building up, out of the messages which came along the wires, 81 those identical wires which carried the messages and the subscribers which sent them? Never! 82 We distinguish between the exchange, with its wires and subscribers, and the messages received and worked up into a world. 83 In picturing to ourselves the telephone exchange, we are doing what the plain person and the psychologists do when they distinguish between mind and body,-- 84 they never suppose that the messages which come through the senses are identical with the senses through which they come.

85 But suppose we maintain that there is no such thing as a telephone exchange, with its wires and subscribers, which is not to be found within some clerk. 86 Suppose the real external world is something inner and only "projected" without, mistakenly supposed by the unthinking to be without. 87 Suppose it is nonsense to speak of a wire which is not in the mind of a clerk. 88 May we under such circumstances describe any clerk as in a telephone exchange? as receiving messages? as no nearer to own subscribers than own end of the wire? 89 May we say that sense-impressions come flowing in to the clerk? 90 The whole figure of the telephone exchange becomes an absurdity when we have once placed the exchange within the clerk. 91 Nor can we think of two clerks as connected by a wire, when it is affirmed that every wire must "really" be in some clerk.

92 The truth is, that, in the extracts which I have given above and in many other passages in the same volume, 93 the real external world, the world which does not exist in the mind but without it, is much discredited, and is yet not actually discarded. 94 The ego is placed at the brain terminals of the sensory nerves, 95 and it receives messages which flow in; i.e. the clerk is actually placed in an exchange. 96

That the existence of the exchange is afterward denied in so many words does not mean that it has not played 97 and does not continue to play an unimportant part in the thought of the author.

98 It is interesting to see how a person of science, whose reflections compel them to deny the existence of the external world that we all seem to perceive 99 and that we somehow recognise as distinct from anything in our minds, is nevertheless compelled to admit the existence of this world at every turn. 100 But if we do admit it, what shall we make of it? 101 Shall we deny the truth of what the psychologist has to tell us about a knowledge of things only through the sensations to which they give rise? 102 We cannot, surely, do that. 103 Shall we affirm that we know the external world directly, and at the same time that we do not know it directly, but only indirectly, and through the images which arise in our minds? 104 That seems inconsistent. Certainly there is material for reflection here.

105 Nevertheless the more we reflect on that material, the more evident does it become that the plain person cannot be wrong in believing in the external world which seems revealed in one experiences. 106 We find that all attempts to discredit it rest upon the implicit assumption of its existence, 107 and fall to the ground when that existence is honestly denied. 108 So our problem changes its form. We no longer ask: Is there an external world? 109 but rather: What is the external world, and how does it differ from the world of mere ideas?

THE POSSIBILITY OF DEFINING RELIGION

Ralph Barton Perry

17 The least religious experience is so mysterious and so complex that a moderate degree of reflection upon it tends to a sense of intellectual impotence. 2 "If I speak," says Emerson, "I define and confine, and am less." 3 One would gladly set down religion among the unspeakable things and

avoid the imputation of degrading it. 4 It is certain that the enterprise of defining religion is at present in disrepute. 5 It has been undertaken so often and so unsuccessfully that contemporary students for the most part prefer to supply a list of historical definitions of religion, 6 and let their variety demonstrate their futility. 7 Metaphysicians and psychologists agree that in view of the differences of creed, ritual, organisation, conduct, and temperament that have been true of different religions in different times and places, 8 one may as well abandon the idea that there is a constant element.

9 But on the other hand we have the testimony afforded by the name religion; 10 and the ordinary judgments of people to the effect that it signifies something to be religious, and to be more or less religious. 11 There is an elementary logical principle to the effect that a group name implies certain common group characters. 12 Impatience with abstract or euphemistic definitions should not blind us to the truth. 13 Even the psychologists tends in their description of religious phenomena to single out and emphasise what they calls a typical religious experience. 14 And the same applies to the idealist's treatment of the matter. 15 Religion, they reasons, is essentially a development of which the true meaning can be seen only in the higher stages. 16 The primitive religion is therefore only implicit religion. 17 But lower stages cannot be regarded as belonging to a single development with higher stages, 18 if there be not some actual promise of the later in the earlier, or some element which endures throughout. 19 It is unavoidable, then, to assume that in dealing with religion we are dealing with a specific and definable experience.

THE PROFITABLENESS OF DEFINING RELIGION

Ralph Barton Perry

18 The profitableness of undertaking such a definition is another matter. 2 It may well be that in so human and practical an affair as religion, definition is peculiarly inappropriate. 3 But is

there not a human and practical value in the very defining of religion? 4 Is there not a demand for it in the peculiar relation that exists between religion and the progress of enlightenment? 5 Religion associates itself with the habits of society. 6 The progress of enlightenment means that more or less all the time, and very profoundly at certain critical times, society must change its habits. 7 The consequence is that religion is likely to be abandoned with the old habits. The need of a new religion is therefore a chronic one. 8 The reformer in religion, or the person who wishes to be both enlightened and religious, 9 is chiefly occupied with the problem of disentangling religion pure and undefiled from definite discredited practices and opinions. 10 And the solution of the problem turns upon some apprehension of the essence of religion. 11 There is a large amount of necessary and unnecessary tragedy due to the extrinsic connection between ideas and certain modes of their expression. 12 There can be no more serious and urgent duty than that of expressing as directly, and so as truly as possible, the great permanent human concerns. 13 The people to whom educational reform has been largely due have been the people who have remembered for their fellows what this whole business of education is after all for. 14 Comenius and Pestalozzi served society by stripping educational activity of its historical and institutional accessories, 15 and laying bare the genuine human need that these are designed to satisfy. 16 There is a similar virtue in the insistent attempt to distinguish between the essential and the accessory in religion.

THE TRUE METHOD OF DEFINING RELIGION

Ralph Barton Perry

19 Although declining to be discouraged by the conspicuousness of past failures in this connection, one may well profit by them. 2 The amazing complexity of religious phenomena must somehow be seen to be consistent with their common nature. 3 The religious

experience must not only be found, but must also be reconciled with "the varieties of religious experience." 4 The inadequacy of the well-known definitions of religion may be attributed to several causes. 5 The commonest fallacy is to define religion in terms of a religion. 6 My definition of religion must include my brother's religion, even though he live on the other side of the globe, 7 and my ancestors' religion, in spite of their prehistoric remoteness. 8 Error may easily arise through the attempt to define religion in terms of my own religion, or what I conceive to be the true religion. 9 Whatever the relation between ideal religion and actual religion, the field of religion contains by common consent cults that must on their own grounds condemn one another; 10 religions that are bad religions, and yet religions.

11 A more enlightened fallacy, and a more dangerous one, is due to the supposition that religion can be defined exclusively in terms of some department of human nature. 12 There have been descriptions of religion in terms of feeling, intellect, and conduct respectively. 13 But it is always easy to overthrow such a description, 14 by raising the question of its application to evidently religious experiences that belong to some other aspect of life. 15 Religion is not feeling, because there are many phlegmatic, God-fearing people whose religion consists in good works. 16 Religion is not conduct, for there are many mystics whose very religion is withdrawal from the field of action. 17 Religion is not intellection, for no one has ever been able to formulate a creed that is common to all religions. 18 Yet without a doubt one must look for the essence of religion in human nature. 19 The present psychological interest in religion has emphasised this truth. 20 How, then, may we describe it in terms of certain constant conditions of human life, and yet escape the abstractness of the facultative method? 21 Modern behavioural-science suggests an answer in demonstrating the interdependence of knowledge, feeling, and volition. 22 The perfect case of this unity is belief. 23 The believing

experience is cognitive in intent, but practical and emotional as well in content. 24 I believe what I take for granted; and the object of my belief is not merely known, but also felt and acted upon. 25 What I believe expresses itself in my total experience.

26 There is some hope, then, of an adequate definition of the religious experience, if it be regarded as belonging to the psychological type of belief. 27 Belief, however, is a broader category than religion. 28 There must be some religious type of believing. An account of religion in terms of believing, 29 and the particular type of it here in question, would, then, constitute the central stem of a psychology of religion, 30 and affords the proper conceptions for a description of the religious experience. 31 Even here the reservation must be made that belief is always more than the believing state, in that it means to be true.

32 Hence to complete an account of religion one should consider its object, or its cognitive implications. 33 But this direct treatment of the relation between religion and philosophy must be deferred until in the present chapter 34 we shall come to appreciate the inwardness of the religious consciousness. 35 To this end we must permit ourselves to be enlightened by the experience of religious people as viewed from within. 36 It is not our opinion of a person's religion that is here in question, but the content and meaning which it has for the person.

37 "I would have you," says Fielding, in his "Hearts of people," 38 "go and kneel beside the Mahommedan as he prays at the sunset hour, and put your heart to his and wait for the echo that will surely come. . . . 39 I would have you go to the Hillman smearing the stone with butter that his god may be pleased, 40 to the woman crying to the forest god for her sick child, to the boy before his monks learning to be good. 41 No matter where you go, no matter what the faith is called, if you have the hearing ear, if your heart is in unison with the heart of the world, you will hear always the same song."

42 The general identification of religion with belief is made

without serious difficulty. 43 The essential factor in belief, is, as we have seen, the reaction of the whole personality to a fixed object or accepted situation. 44 A similar principle underlies common judgments about a person's religion. 45 A person is accounted most religious whose religion penetrates own life most intimately. 46 In the person whose religion consists in the outer exercise of attendance upon church, we recognise the sham. 47 They appear to be religious. They do one of the things which a religious person would do; but an object of religious faith is not the constant environment of their life. 48 A person may or may not feel sure of God from own pew, but God is not among the things that count in own daily life. 49 God does not enter into one’s calculations or determine one’s scale of values. 50 Again, discursive thinking is regarded as an interruption of religion. 51 When I am at pains to justify my religion, I am already doubting; and for common opinion doubt is identical with irreligion. 52 In so far as I am religious, my religion stands in no need of justification, even though I regard it as justifiable. 53 In my religious experience I am taking something for granted; in other words I act about it and feel about it in a manner that is going to be determined by the special conditions of my mood and temperament. 54 The mechanical and prosaic person acknowledges God in own mechanical and prosaic way. 55 They believes in divine retribution as one believes in commercial or social retribution. 56 They are as careful to prepare for the next world as one is to be respectable in this. 57 The poets, on the other hand, believe in God after the manner of their genius. 58 Though they worship God in spirit they may conduct their life in an irregular manner peculiar to themselves. 59 Difference of mood in the same individual may be judged by the same measure. 60 When God is most real to them, brought home to them most vividly, or consciously obeyed, in these moments they are most religious. 61 When, on the other hand, God is merely a name to them, and church a routine, or

when both are forgotten in the daily occupations, they are least religious. 62 Their life on the whole is said to be religious in so far as periods of the second type are subordinated to periods of the first type. 63 Further well-known elements of belief, corollaries of the above, are evidently present in religion. 64 A certain imagery remains constant throughout an individual's experience. One comes back to it as to a physical object in space. 65 And although religion is sporadically an exclusive and isolated affair, it tends strongly to be social. 66 The religious object, or God, is a social object, common to me and to my neighbour, and presupposed in our collective undertakings. 67 This reduction of religion to the type of the believing state should thus provide us with an answer to that old and fundamental question concerning the relative priority of faith and works. 68 The test of the faith is in the works, and the works are religious in so far as they are the expression of the faith. 69 Religion is neither the doing of anything nor the feeling of anything nor the thinking of anything, 70 but the reacting as a whole, in terms of all possible activities of human life, to some accepted situation.

71 We may now face the more interesting but difficult question of the special character of religious belief. 72 In spite of the fact that in these days the personality of God is often regarded as a transient feature of religion, 73 that type of belief which throws most light upon the religious experience is the belief in persons. 74 Our belief in persons consists in the practical recognition of a more or less persistent disposition toward ourselves. 75 The outward behaviour of our fellow-people is construed in terms of the practical bearing of the attitude which it implies. 76 The extraordinary feature of such belief is the disproportion between its vividness and the direct evidence for it. 77 Of this we are most aware in connection with those personalities which we regard as distinctly friendly or hostile to ourselves. 78 We are always more or less clearly in the presence of our friends and enemies. 79 Their well-wishing or their ill-wishing

haunts the scene of our living. 80 There is no more important constituent of what the psychologists call our "general feeling tone." 81 There are times when we are entirely possessed by a state that is either exuberance in the presence of those who love us, 82 or awkwardness and stupidity in the presence of those whom we believe to suspect and dislike us. 83 The latter state may easily become chronic. 84 Many people live permanently in the presence of an accusing audience. 85 The inner life which expresses itself in the words, "Everybody hates me!" is perhaps the most common form of morbid self-consciousness. 86 On the other hand, buoyancy of spirits springs largely from a constant faith in the good-will of one's fellows. 87 In this case one is filled with a sense of security, 88 and is conscious of a sympathetic reinforcement that adds to private joys and compensates for private sorrows. 89 And this sense of attitude is wonderfully discriminating. 90 We can feel the presence of a "great individual," a "formidable person," a superior or inferior, 91 one who is interested or indifferent to our talk, and all the subtlest degrees of approval and disapproval.

92 A similar sensibility may quicken us even in situations where no direct individual attitude to ourselves is implied. 93 We regard places and communities as congenial when we are in sympathy with the prevailing purposes or standards of value. 94 We may feel ill at ease or thoroughly at home in cities where we know no single human soul. 95 Indeed, in a misanthrope like Rousseau-- and who has not his Rousseau moods!-- the mere absence of social repression arouses a most intoxicating sense of tunefulness and security. 96 Nature plays the part of an indulgent parent who permits all sorts of personal liberties.

97 "The view of a fine country, a succession of agreeable prospects, a free air, a good appetite, and the health I gain by walking; 98 the freedom of inns, and the distance from everything that can make me recollect the dependence of my situation, conspire to free my soul, 99 and give boldness to my thoughts, throwing me, in a

manner, into the immensity of things, where I combine, choose, and appropriate them to my fancy, 100 without restraint or fear. I dispose of all nature as I please."

101 In such confidence or distrust, inspired originally by the social environment, and similarly suggested by other surroundings of life, we have the key to the religious consciousness. 102 But it is now time to add that in the case of religion 103 these attitudes are concerned with the universal or supernatural rather than with present and normal human relationships. 104 Religious reactions are "total reactions."

105 "To get at them," says William James, "you must go behind the foreground of existence and reach down to that curious sense of the whole residual cosmos as an everlasting presence, 106 intimate or alien, terrible or amusing, lovable or odious, which in some degree everyone possesses. 107 This sense of the world's presence, appealing as it does to our peculiar individual temperament, makes us either strenuous or careless, devout or blasphemous, gloomy or exultant about life at large; 108 and our reaction, involuntary and inarticulate and often half unconscious as it is, is the completest of all our answers to the question, 109 'What is the character of this Universe in which we dwell?'"

110 This residual environment, or profounder realm of tradition and Nature, may have any degree of unity from chaos to cosmos. 111 For religion its significance lies in the idea of original and far-reaching power rather than in the idea of totality. 112 But that which is at first only "beyond," is practically the same object as that which comes in the development of thought to be conceived as the "world" or the "Universe." 113 We may therefore use these latter terms to indicate the object of religion, until the treatment of special instances shall define it more precisely. 114 Religion is, then, human's sense of the disposition of the Universe to oneself. 115 We shall expect to find, as in the social phenomena with which we have just dealt, that the manifestation of this sense consists in a general reaction appropriate to the disposition so

attributed. 116 A person will be fundamentally ill at ease, profoundly confident, or will habitually take precautions to be safe. 117 The ultimate nature of the world is here no speculative problem. 118 The savage who could feel some joy at living in the Universe would be more religious than the sublimest dialectician. 119 It is in the vividness of the sense of this presence that the acuteness of religion consists. 120 I am religious in so far as the whole tone and temper of my living reflects a belief as to what the Universe thinks of such as me.

EXAMPLES OF RELIGIOUS BELIEF

Ralph Barton Perry

20 The examples that follow are selected because their differences in personal flavor serve to throw into relief their common religious character. 2 Theodore Parker, in describing his own boyhood, writes as follows: 3 "I can hardly think without a shudder of the terrible effect the doctrine of eternal damnation had on me. 4 How many, many hours have I wept with terror as I lay on my bed, till, between praying and weeping, sleep gave me repose. 5 But before I was nine years old this fear went away, and I saw clearer light in the goodness of God. 6 But for years, say from seven till ten, I said my prayers with much devotion, I think, and then continued to repeat, 'Lord, forgive my sins,' till sleep came on me."

7 Compare with this Stevenson's Christmas letter to his mother, in which he says: 8 "The whole necessary morality is kindness; and it should spring, of itself, from the one fundamental doctrine, Faith. 9 If you are sure that God, in the long run, means kindness by you, you should be happy; and if happy, surely you should be kind."

10 Here is destiny frowning and destiny smiling, but in each case so real, so present, as to be immediately responded to with helpless terror and with grateful warm-heartedness.

11 The author of the "Imitatio Christi" speaks thus of the daily living of the Christian: 12 "The life of a Christian who has dedicated

oneself to the service of God should abound with eminent virtues of all kinds, 13 that one may be really the same person which one is by outward appearance and profession. 14 Indeed, a person ought not only to be the same, but much more, in own inward disposition of soul; 15 because one professes to serve a God who sees the inward parts, a searcher of the heart and reins, a God and Father of spirits: 16 and therefore, since we are always in His sight, we should be exceedingly careful to avoid all impurity, all that may give offence to Him whose eyes cannot behold iniquity. 17 We should, in a word, so far as mortal and frail nature can, imitate the blessed angels in all manner of holiness, 18 since we, as well as they, are always in His presence. . . . 19 And good people have always this notion of the thing. 20 For they depend upon God for the success of all they do, even of their best and wisest undertakings."

21 Such is to be the practical acknowledgment of God in the routine of life. 22 The more direct response to this presence appears abundantly in St. Augustine's conversation and reminiscence with God.

23 "How evil have not my deeds been; or if not my deeds my words; or if not my words my will? 24 But Thou, O Lord, art good and merciful, 25 and Thy right hand had respect unto the profoundness of my death, and removed from the bottom of my heart that abyss of corruption. 26 And this was the result, that I willed not to do what I willed, and willed to do what thou willedst. 27 How sweet did it suddenly become to me to be without the delights of trifles! 28 And what at one time I feared to lose, it was now a joy to me to put away. 29 For Thou didst cast them away from me, Thou true and highest sweetness. 30 Thou didst cast them away, and instead of them didst enter in Thyself-- 31 sweeter than all pleasure, though not to flesh and blood; 32 brighter than all light, but more veiled than all mysteries; 33 more exalted than all honor, but not to the exalted in their own conceits. 34 Now was my soul free from the gnawing cares of seeking and getting. 35 And I babbled unto

Thee my brightness, my riches, and my health, the Lord my God." 36 In these two passages we meet with religious conduct and with the supreme religious experience, the direct worship of God. 37 In each case the heart of the matter is an individual's indubitable conviction of the world's favourable concern for oneself. 38 The deeper order of things constitutes the real and the profoundly congenial community in which one lives.

TYPICAL RELIGIOUS PHENOMENA: CONVERSION

Ralph Barton Perry

21 Let us now apply this general account of the religious experience to certain typical religious phenomena: conversion; piety; and religious instruments, symbolisms, and modes of conveyance. 2 Although recent study of the phenomenon of conversion has brought to light a considerable amount of interesting material, 3 there is some danger of misconceiving its importance. 4 The psychology of conversion is primarily the psychology of crisis or radical alteration, rather than the psychology of religion. 5 For the majority of religious men and women conversion is an insignificant event, and in very many cases it never occurs at all. 6 Religion is more purely present where it is normal and monotonous. 7 But this phenomenon is nevertheless highly significant in that religion and irreligion are placed in close juxtaposition, 8 and the contribution of religion at its inception thereby emphasised. 9 In general it is found that conversion takes place during the period of adolescence. 10 But this is the time of the most sudden expansion of the environment of life; 11 a time when there is the awakening consciousness of many a new presence. 12 This is sometimes expressed by saying that it is a period of acute self-consciousness. 13 Life is conscious of itself as over against its inheritance; the whole setting of life sweeps into view. 14 Some solution of the life problem, some coming to terms with the Universe, is the normal issue of it. 15 Religious

conversions signify, then, that in this fundamental adjustment a person defines and accepts for own life a certain attitude on the part of the Universe. 16 The examples cited by the psychologists, as well as the generalisations which they derive, bear out this interpretation. 17 "General Booth, the founder of the Salvation Army, considers that the first vital step in saving outcasts 18 consists in making them feel that some decent human being cares enough for them to take an interest in the question whether they are to rise or sink." 19 The new state is here one of courage and hope stimulated by the glow of friendly interest. 20 The converts are no longer "out in the cold." They are told that the world wishes them well, 21 and this is brought home to them through representations of the tenderness of Christ, and through the direct ministering of those who mediate it. 22 But somehow the converts must be persuaded to realise all this. 23 They must believe it before it can mean anything to them. 24 They are therefore urged to pray-- a proceeding that is at first ridiculous to them, since it involves taking for granted what one disbelieves. 25 But therein lies the critical point. It is peculiar to the object in this case that it can exist only for one who already believes in it. 26 The psychologists call this the element of "self-surrender." 27 To be converted a person must somehow suffer own surroundings to put into one a new heart, which may thereupon confirm its object. 28 Such belief is tremendously tenacious because it so largely creates its own evidence. 29 Once believe that "God, in the long run, means kindness by you," and you are likely to stand by it to the end-- 30 the more so in this case because the external evidence either way is to the average person so insufficient. 31 Such a belief as this is inspired in the convert, 32 not by reasoning, but by all the powers of suggestion that personality and social contagion can afford.

THEOSOPHY

PIETY

Ralph Barton Perry

22 The psychologists describe piety as a sense of unity. One feels after reading their accounts that they are too abstract. 2 For there are many kinds of unity, characteristic of widely varying moods and states. 3 Any state of rapt attention is a state of unity, and this occurs in the most secular and humdrum moments of life. 4 Nor does it help matters to say that in the case of religion this unity must have been preceded by a state of division; 5 for we cannot properly characterise any state of mind in terms of another state unless the latter be retained in the former. 6 And that which is characteristic of the religious sense of unity would seem to be just such an overcoming of difference. 7 There is recognition of two distinct attitudes, which may be more or less in sympathy with one another, 8 but which are both present even in their fullest harmony. 9 Were I to be taken out of myself so completely as to forget myself, I should inevitably lose that sense 10 of sympathy from which arises the peculiar exultation of religious faith, 11 a heightened experience of the same type with the freedom and spontaneity that I experience in the presence of those with whom I feel most in accord. 12 The further graces and powers of religion readily submit to a similar description. 13 My sense of positive sympathy expresses itself in an attitude of well-wishing; 14 living in an atmosphere of kindness I instinctively endeavour to propagate it. 15 My buoyancy is distinctly of that quality which to a lesser degree is due to any sense of social security; 16 my power is that of one who works in an environment that reinforces oneself. 17 I experience the objective or even cosmical character of my enterprises. 18 They have a momentum which makes me their instrument rather than their perpetrator. 19 A paradoxical relation between religion and morality has always interested observers of custom and history. 20 Religion is apparently as capable of the most fiendish malevolence as of the most saintly gentleness.

21 Fielding writes that, "When religion is brought out or into daily life and used as a guide or a weapon in the world it has no effect either for good or evil. 22 Its effect is simply in strengthening the heart, in blinding the eyes, in deafening the ears. 23 It is an intensive force, an intoxicant. It doubles or trebles a human's powers. 24 It is an impulsive force sending one headlong down the path of emotion, whether that path leads to glory or to infamy. 25 It is a tremendous stimulant, that is all."

26 Religion does not originate life purposes or define their meaning, but stimulates them by the same means that works in all corporate and social activity. 27 To work with the Universe is the most tremendous incentive that can appeal to the individual will. 28 Hence in highly ethical religions the power for good exceeds that of any other social and spiritual agency. 29 Such religion makes present, actual, and real, that good on the whole which the individual otherwise tends to distinguish from that which is good for oneself. 30 In daily life the morally valid and the practically urgent are commonly arrayed against one another; 31 but the ethical religion makes the valid urgent.

RELIGIOUS INSTRUMENTS, SYMBOLISM, AND MODES OF CONVEYANCE

Ralph Barton Perry

23 The instruments of religion are legion, 2 and it is in order here only to mention certain prominent cases in which their selection would seem to have direct reference to the provocation and perpetuation of such a sense of attitude as we have been describing. 3 This is true in a general way of all symbolism. 4 There is no essential difference between the religious symbol and such symbols as serve to remind us of human relationships. 5 In both cases the perceptual absence of will is compensated for by the presence of some object associated with that will. 6 The function of this object is due to its power to revive and perpetuate a certain special social atmosphere. 7 But the most important vehicle of

religion has always been personality. 8 It is, after all, to priests, prophets, and believers that religious cults have owed their long life. 9 The traits that mark the prophet are both curious and sublime. 10 They are most remarkable for the confidence with which they speak for the Universe. 11 Whether it be due to lack of a sense of humour or to a profound conviction of truth, is indifferent to our purpose. 12 The power of such people is undoubtedly in their suggestion of a force greater than they, 13 whose designs they bring directly and socially to the attention of people. 14 The prophets in their prophesying are indeed not altogether distinguished from God, 15 and it is through the mediation of a directly perceptible human attitude that a divine attitude gets itself fixed in the imagination of the believer. 16 What is true of the prophet is equally true of the preacher whose function it is not to represent God in their own person, but to depict Him with their tongues. 17 It is generally recognised that the preacher is neither a moraliser nor a theologian. 18 But it is less perfectly understood that it is their function to suggest the presence of God. 19 Their proper language is that of the imagination, 20 and the picture which they portray is that of a reciprocal social relationship between human and the Supreme Master of the situation of life. 21 The preacher will not define God or prove God, but introduce Him and talk about Him. 22 And at the same time the association of prayer and worship with their sermon, and the atmosphere created by the meeting together of a body of disciples, will act 23 as the confirmation of their suggestions of such a living presence.

24 The conveyance of any single religious cult from generation to generation affords a signal illustration of the importance in religion of the recognition of attitude. 25 Religions manage somehow to survive any amount of transformation of creed and ritual. 26 It is not what is done, or what is thought, that identifies the faith of the first Christians with that of the last, but a certain reckoning with the disposition of God. 27 The successive generations of

THEOSOPHY

Christians are introduced into the spiritual world of their fathers, 28 with its furnishing of hopes and fears remaining substantially the same; 29 and their Christianity consist in their continuing to live in it with only a slight and gradual renovation. 30 To any given individual, God is more or less completely represented by one's elders in the faith in their exhortations and ministering; 31 and through them one fixes as the centre of own system an image of God's own accuser or redeemer. 32 The complete verification of this interpretation of the religious experience would require the application of it to the different historical cults. 33 In general the examination of such instances is entirely beyond the scope of this chapter; 34 but a brief consideration may be given to those which seem to afford reasonable grounds for objection.

35 First, it may be said that in primitive religions, notably in fetichism, tabooism, and totemism, there is no recognition of a cosmical unity. 36 It is quite evident that there is no conception of a Universe. 37 But it is equally evident that the natural and historical environment in its generality has a very specific practical significance for the primitive believer. 38 It is often said with truth that these earliest religions are more profoundly pantheistic than polytheistic. 39 People recognises an all-pervading interest that is capable of being directed to oneself. 40 The selection of a deity is not due to any special qualification for deification possessed by the individual object itself, 41 but to the tacit presumption that, as Thales said, "all things are full of gods." 42 The disposition of residual reality manifests to the believer no consistency or unity, 43 but it is nevertheless the most constant object of one's will. 44 We live in the midst of a capriciousness which we must appease if we are to establish ourselves at all.

45 Secondly, in the case of Buddhism we are said to meet with a religion that is essentially atheistic. 46 "Whether Buddhas arise, O priests, or whether Buddhas do not arise, it remains a fact 47 and the fixed and necessary

constitution of being, that all its constituents are transitory."

48 The secret of life lies in the application of this truth:

49 "O builder! I've discovered thee!
50 This fabric thou shalt ne'er rebuild!
51 Thy rafters all are broken now,
52 And pointed roof demolished lies!
53 This mind has demolition reached,
54 And seen the last of all desire!"

55 The case of Buddha itself and of the exponents of its purely esoteric doctrine, belong to the reflective type which will presently be given special consideration. 56 But with the ordinary believer, even where an extraneous but almost inevitable polytheism is least in evidence, 57 the religious experience consists in substantially the same elements that appear in theistic religions. 58 The individual is here living appropriately to the ultimate nature of things, with the ceaseless periods of time in full view. 59 That which is brought home to oneself is the illusoriness and hollowness of things when taken in the spirit of active endeavour. 60 The only profound and abiding good is nothingness. 61 While Nature and society conspire to mock the individual, Nirvana invites us to its peace. 62 The religious course of our life consists in the use of such means as can win us this end. 63 From the stand-point of the Universe one has the sympathy only of that wisdom whose essence is self-destruction. 64 And this truth is mediated by the imagination of divine sympathy, 65 for the Blessed One remains as the perpetual incarnation of one own blessedness.

66 Finally there remains the consideration of the bearing of this interpretation upon the more refined and disciplined religions. 67 The religion of the critically enlightened person is less naive and credulous in its imagery. 68 God tends to vanish into an ideal or a universal, into some object of theoretical definition. 69 Here we are on that borderland where an assignment of individual cases can never be made with any certainty of correctness. 70 We can generalise only by describing the conditions that such cases must

fulfill if they are properly to be denominated religious. 71 And there can be no question of the justice of deriving such a description from the reports of historical and institutional religions. 72 An idealistic philosophy will, then, be a religion just in so far as it is rendered practically vivid by the imagination. 73 Such imagination must create and sustain a social relationship.

74 The question of the legitimacy of this imagination is another matter. 75 It raises the issue concerning the judgment of truth implied in religion, and this is the topic of the next chapter. 76 At any rate the religious experience may be realised by virtue of the metaphorical or poetical representation of a situation as one of intercommunication between persons, 77 where reflective definition at the same time denies it. 78 The human worshipper may supply the personality of God from oneself, viewing oneself as from the divine stand-point. 79 But whatever faculty supplies this indispensable social quality of religion, one who defines God as the ultimate goodness or the ultimate truth, has certainly not yet worshipped Him. 80 A person begins to be religious only when such an ideal determines the atmosphere of own daily living; 81 when one regards the immanence of such an ideal in Nature and history as the object of one's will; 82 and when one responds to its presence in the spirit of own conduct and own contemplation.

THE PHILOSOPHICAL IMPLICATIONS OF RELIGION

Ralph Barton Perry

24 It has been maintained that religion is closely analogous to one's belief in the disposition toward one's self of humans or communities. 2 In the case of religion this disposition is attributed to the more or less vaguely conceived residual environment 3 that is recognised as lying outside of the more familiar natural and social relations. 4 After the rise of science this residual environment tends to be conceived as a unity which is ultimate or fundamental, 5 but for the religious

consciousness it is more commonly regarded as a general source of influence practically worthy of consideration. 6 Such a belief, like all belief, is vitally manifested, with such emphasis upon action, feeling, or intellection as temperament and mood may determine.

7 But if the psychology of belief is the proper starting-point for a description of the religious experience, 8 it is none the less suggestive of the fact that religion, just because it is belief, is not wholly a matter for behavioural-science. 9 For religion means to be true, and thus submits itself to valuation as a case of knowledge. 10 The psychological study of religion is misleading when accepted as a substitute for philosophical criticism. 11 The religious person takes own religion not as a narcotic, but as an enlightenment. 12 Its subjective worth is due at any rate in part to the supposition of its objective worth. 13 As in any case of insight, that which warms the heart must have satisfied the mind. 14 The religious experience purports to be the part of wisdom, and to afford only such happiness as increasing wisdom would confirm. 15 And the charm of truth cannot survive its truthfulness. 16 Hence, though religion may be described, it cannot be justified, from the stand-point of therapeutics. 17 Were such the case it would be the real problem of religious leaders to find a drug capable of giving a constantly pleasant tone to their patient's experience. 18 There would be no difference between priests and physicians who make a specialty of nervous diseases, 19 except that the former would aim at a more fundamental and perpetual suggestion of serenity. 20 Now no person wants to be even a blessed fool. 21 Person does not want to dwell constantly in a fictitious world, even if it be after one’s own heart. 22 A person may from the cynical point of view actually do so, but if one be religious one thinks it is reality, and is satisfied only in so far as one thinks so. 23 He regards the person who has said in own’s heart that there is no God as the fool, 24 and not because one may have to suffer for it, but because one is cognitively blind to the real nature

of things. 25 Piety, on the other hand, one regards as the standard experience, the most veracious life. 26 Hence, it is not an accident that religion has had its creeds and its controversies, its wars with science and its appeals to philosophy. 27 The history of these affairs shows that religion commonly fails to understand the scope of its own demand for truth; 28 but they have issued from the deep conviction that one's religion is, implicitly, at least, in the field of truth; 29 that there are theoretical judgments whose truth would justify or contradict it.

30 This general fact being admitted, there remains the task to which the present discussion addresses itself, 31 that of defining the kind of theoretical judgment implied in religion, and the relation to this central cognitive stem of its efflorescences of myth, theology, and ritual. 32 It is impossible to separate the stem and the efflorescence, or to determine the precise spot at which destruction of the tissue would prove fatal to the plant, 33 but it is possible to obtain some idea of the relative vitality of the parts.

34 The difficulty of reaching a definite statement in this matter is due to the fact that the truth in which any religious experience centres is a practical and not a scientific truth. 35 A practical truth does not commit itself to any single scientific statement, 36 and can often survive the overthrow of that scientific statement in which at any given time it has found expression. 37 In other words, an indefinite number of scientific truths are compatible with a single practical truth. 38 An instance of this is the consistency with my expectation of the alternation of day and night, 39 of either the Ptolemaic or Copernican formulation of the solar system. 40 Now expectation that the sun will rise to-morrow is an excellent analogue of my religious belief. 41 Celestial mechanics is as relevant to the one as metaphysics to the other. 42 Neither is overthrown until a central practical judgment is discredited, 43 and either could remain true through a very considerable alteration of logical definition; 44 but neither is on this

account exempt from theoretical responsibility.

45 In so far as religion deliberately enters the field of science, and defines its formularies with the historical or metaphysical method, this difficulty does not, of course, exist. 46 Grant that the years of Methuselah's life, or the precise place and manner of the temptation of Jesus, or the definition of Christ in the terms of the Athanasian Creed, are constitutive of Christianity, 47 and the survival of that religion will be determined by the solution of ordinary problems of historical or metaphysical research. 48 But the Christian will very properly claim that their religion is only externally and accidentally related to such propositions, 49 since they are never or very rarely intended in their experience. 50 As religious they are occupied with Christ as their saviour or with God as their protector and judge. 51 The history of Jesus or the metaphysics of God essentially concern them only in so far as they may or may not invalidate this relationship. 52 They cares only for the power and disposition of the divine, 53 and these are affected by history and metaphysics only in so far as they have definitely put them to such proof.

54 For my religion is my sense of a practical situation, and only when that has been proved to be folly has my religion become untrue. 55 My God is my practical faith, my plan of salvation. 56 My religion is overthrown if I am convinced that I have misconceived the situation and mistaken what I should do to be saved. 57 The conception of God is very simple practically, and very complex theoretically, a fact that confirms its practical genesis. 58 My conception of God contains an idea of my own interests, an idea of the disposition of the Universe toward my interests, and some working plan for the reconciliation of these two terms. 59 These three elements form a practical unity, but each is capable of emphasis, and a religion may be transformed through the modification of any one of them. 60 It appears, then, as has always been somewhat vaguely recognised, that the truth of religion is ethical as well as metaphysical or scientific. 61 My

religion will be altered by a change in my conception of what constitutes my real interest, 62 a change in my conception of the fundamental causes of reality, or a change in my conception of the manner in which my will may or may not affect these causes. 63 God is neither an entity nor an ideal, but always a relation of entity to ideal: 64 reality regarded from the stand-point of its favourableness or unfavourableness to human life, and prescribing for the latter the propriety of a certain attitude.

65 The range of historical examples is limitless, but certain of these are especially calculated to emphasise the application of a criterion to religion. 66 Such is the case with Elijah's encounter with the prophets of Baal, as narrated in the Old Testament. 67 "And Elijah came near unto all the people, and said, How long halt ye between two opinions? 68 If Yahweh be God, follow him: but if Baal, then follow him. . . . 69 And call ye on the name of your god, and I will call on the name of Yahweh: and the God that answereth by fire, let him be God. . . . 70 And Elijah said unto the prophets of Baal, Choose you one bullock for yourselves, and dress it first; for ye are many; 71 and call on the name of your god, but put no fire under. 72 And they took the bullock which was given them, and they dressed it, and called on the name of Baal from morning even until noon, saying, O Baal, hear us. 73 But there was no voice, nor any that answered. . . . 74 And it came to pass at noon, that Elijah mocked them, and said, Cry aloud: for he is a god; 75 either he is musing, or he is gone aside, or he is in a journey, or peradventure he sleepeth, and must be awaked. 76 And they cried aloud, and cut themselves after their manner with knives and lances, till the blood gushed out upon them. . . . 77 But there was neither voice, nor any to answer, nor any that regarded."

78 The religion of the followers of Baal here consists in a belief in the practical virtue of a mode of address 79 and form of ritual associated with the traditions and customs of a certain social group. 80 The prophets of this cult agree to regard the experiment proposed by Elijah as a crucial test, and that

which is disproved from its failure is a plan of action. 81 These prophets relied upon the presence of a certain motivity, 82 from which a definite response could be evoked by an appeal which they were peculiarly able to make; 83 but though "they prophesied until the time of the offering of the evening oblation," there was none that regarded.

84 An equally familiar and more instructive example is the refutation of the Greek national religion by Lucretius. 85 The conception of life which Lucretius finds unwarranted is best depicted in Homer. 86 There we hear of a society composed of gods and people. 87 Though the gods, on the one hand, have their own history, their affairs are never sharply sundered from those of people, 88 who, on the other hand, must constantly reckon with them, gauge their attitude, and seek their favour by paying tribute to their individual humours and preferences. 89 In the Ninth Book of the "Iliad," Phoenix addresses himself to the recalcitrant Achilles as follows:

90 "It fits not one that moves
The hearts of all, to live unmoved,
and succor hates for loves.
91 The Gods themselves are
flexible; whose virtues, honours,
pow'rs,
92 Are more than thine, yet they will
bend their breasts as we bend ours.
93 Perfumes, benign devotions,
savours of offerings burn'd,
94 And holy rites, the engines are
with which their hearts are turn'd,
95 By people that pray to them."

96 Here is a general recognition of that which makes sacrifice rational. 97 It is because he conceives this presupposition to be mistaken, that Lucretius declares the practices and fears which are founded upon it to be folly. 98 It is the same with all that is practically based upon the expectation of a life beyond the grave. 99 The correction of the popular religion is due in his opinion to that true view of the world taught by Epicurus, 100 whose memory Lucretius thus invokes at the opening of the Third Book of the "De Rerum Natura":

101 "Thee, who first wast able amid such thick darkness to raise

on high so bright a beacon and shed a light on the true interests of life, 101 thee I follow, glory of the Greek race, and plant now my footsteps firmly fixed in thy imprinted marks. . . . 102 For soon as thy philosophy issuing from a godlike intellect has begun with loud voice, 103 to proclaim the nature of things, the terrors of the mind are dispelled, the walls of the world part asunder, 104 I see things in operation throughout the whole void: the divinity of the gods is revealed and their tranquil abodes 105 which neither winds do shake nor clouds drench with rains nor snow congealed by sharp frost harms with hoary fall: 106 an ever cloudless ether o'ercanopies them, and they laugh with light shed largely round. 107 Nature too supplies all their wants and nothing ever impairs their peace of mind. 108 But on the other hand the Acherusian quarters are nowhere to be seen, though earth is no bar to all things being descried, 109 which are in operation underneath our feet throughout the void."

110 In another passage, after describing the Phrygian worship of Cybele, he comments as follows:

111 "All which, well and beautifully as it is set forth and told, is yet widely removed from true reason. 112 For the nature of gods must ever in itself of necessity enjoy immortality together with supreme repose, 113 far removed and withdrawn from our concerns; 114 since exempt from every pain, exempt from all dangers, strong in its own resources, not wanting aught of us, 115 it is neither gained by favours nor moved by anger. . . . 116 The earth however is at all time without feeling, 117 and because it receives into it the first-beginnings of many things, 118 it brings them forth in many ways into the light of the sun."

119 If the teaching of Epicurus be true it is evident that those who offered hecatombs with the idea that they were thereby mitigating anger, or securing special dispensation, were playing the fool. 120 They were appealing to a fictitious motivity, one not grounded in "the nature of things."

121 To one for whom the walls of

the world had parted asunder, such a procedure was no longer possible; 122 though he might choose to "call the sea Neptune" and reverence the earth as "mother of the gods."

123 The history of religion contains no more impressive and dramatic chapter than that which records the development of the religion of the Jews. 124 Passing over its obscure beginnings in the primitive Semitic cult, we find this religion first clearly defined as tribal self-interest sanctioned by Yahweh. 125 God's interest in his chosen people determines the prosperity of him who practices the social virtues.

126 "The name of Yahweh is a strong tower: the righteous runneth into it, and is safe."

127 "He that is steadfast in righteousness shall attain unto ife."

128 "To do justice and judgment is more acceptable to Yahweh than sacrifice."

129 But in time it is evident to the believer that own experience does not bear out this expectation. 130 Neither as a Jew nor as a righteous person does one prosper more than own neighbor. 131 One comes, therefore, to distrust the virtue of own wisdom. 132 "Then I saw that wisdom excelleth folly, as far as light excelleth darkness. 133 The wise man's eyes are in his head, and the fool walketh in darkness: and yet I perceived that one event happeneth to them all. 134 Then said I in my heart, As it happeneth to the fool, so will it happen even to me; and why was I then more wise? 135 Then I said in my heart, that this also was vanity. 136 For of the wise man, even as of the fool, there is no remembrance forever; seeing that in the days to come all will have been already forgotten. 137 And how doth the wise man die even as the fool! 138 So I hated life; because the work that is wrought under the sun was grievous unto me: 139 for all is vanity and a striving after wind."

140 It is evident that people who expects the favour of fortune in return for their observance of precept is mistaken. 141 The "work that is wrought under the sun" makes no special provision for them during their lifetime. 142 Unless the cry of vanity is to be the last word there must be a reinterpretation of the promise of

God. 143 This appears in the new ideal of patient submission, and the chastened faith that expects only the love of God. 144 And those whom God loves He will not forsake. 145 They will come to their own, if not here, then beyond, according to His inscrutable but unswerving plan. 146 "The sacrifices of God are a broken spirit: a broken and a contrite heart, O God, thou wilt not despise." 147 "For thus saith the high and lofty One that inhabiteth eternity, whose name is Holy: 148 I dwell in the high and holy place, with him also that is of a contrite and humble spirit, 149 to revive the spirit of the humble, and to revive the heart of the contrite ones."

150 In this faith Judaism merges into Christianity. 151 In the whole course of this evolution God is regarded as the friend of His people, but His people learn to find a new significance in his friendship. 152 That which is altered is the conduct which that friendship requires and the expectation which it determines. 153 The practical ideal which the relationship sanctions, changes gradually from that of prudence to that of goodness for its own sake. 154 God, once an instrument relevant to human temporal welfare, has come to be an object of disinterested service.

155 No such transformation as this was absolutely realised during the period covered by the writings of the Old Testament, 156 nor has it even yet been realised in the development of Christianity. 157 But the evolution of both Judaism and Christianity has taken this direction. 158 The criterion of this evolution is manifestly both ethical and metaphysical. 159 The Christians avows that they rates purity of character above worldly prosperity, 160 so that the former cannot properly be prized for the sake of the latter. 161 Furthermore, they shares more or less unconsciously such philosophical and scientific opinions as deny truth to the conception of special interferences and dispensations from a supernatural agency. 162 Therefore they look for no fire from heaven to consume their sacrifices. 163 But their religion is nevertheless a practical expectation. 164 They believe that God is good, and that God loves

them and sustains them. 165 They believe that there obtains between oneself, in so far as good, 166 and the Universe sub-specie aeternitatis, a real sympathy and reciprocal re-enforcement. 167 They believes that they secures through the profoundly potent forces of the Universe that which they regards as of most worth; 168 and that somewhat is added to these forces by virtue of their consecration. 169 The God of the Christians cannot be defined short of some such account as this, inclusive of an ideal, an attitude, and an expectation.

170 The God of the Christians is to be known only in terms of the Christlike outlook upon life, in which the disciple is taught to emulate the master. 171 When moral and intellectual development shall have discredited its scale of values, 172 or its conviction that cosmical events are in the end determined in accordance with that scale of values, 173 then Christianity must either be transformed, or be untenable for the wise person. 174 If we have conceived the essence of Christianity too broadly or vaguely, it does not much matter for our present purposes. 175 Its essence is, at any rate, some such inwardness of life resolving ideality and reality into one, 176 and drawing upon objective truth only to the extent required for the confirming of that relation.

177 We conclude, then, our attempt to emphasise the cognitive factor in religion, with the thesis that every religion centres in a practical secret of the Universe. 178 To be religious is to believe that a certain correlation of forces, moral and factual, is in reality operative, 179 and that it determines the propriety and effectiveness of a certain type of living. 180 Whatever demonstrates the futility, vanity, or self-deception of this living, discredits the religion. 181 And, per contra, except as they define or refute such practical truth, religion is not essentially concerned with theoretical judgments.

182 But neither religion nor any other human interest consists in essentials. 183 Such a practical conviction as that which has been defined inevitably flowers into a marvelous complexity, 184 and taps for its nourishment every

spontaneity of human nature. 185 If it be said that only the practical conviction is essential, this is not the same as to say that all else is superfluous. 186 There may be no single utterance that my religion could not have spared 187 and yet were I to be altogether dumb my religion would, indeed, be as nothing. 188 For if I believe, I accept a presence in my world, which as I live will figure in my dreams, or in my thoughts, or in my habits. 189 And each of these expressions of myself will have a truth if it do but bear out my practical acceptance of that presence. 190 The language of religion, like that of daily life, is not the language of science except it takes it upon itself to be so. 191 There is scarcely a sentence which I utter in my daily intercourse with people which is not guilty of transgressions against the canons of accurate and definite thinking. 192 Yet if I deceive neither myself nor another, I am held to be truthful, 193 even though my language deal with chance and accident, material purposes and spiritual causes, 194 and though I vow that the sun smiles or the moon lets down her hair into the sea. 195 Science is a special interest in the discovery of unequivocal and fixed conceptions, and employs its terms with an unalterable connotation. 196 But no such algebra of thought is indispensable to life or conversation, and its lack is no proof of error. 197 Such is the case also with that eminently living affair, religion. 198 I may if I choose, and I will if my reasoning powers be at all awakened, be a theologian. 199 But theology, like science, is a special intellectual spontaneity. 200 St. Thomas, the master theologian, did not glide unwittingly from prayer into the quæstiones of the "Summa Theologiæ," but turned to them as to a fresh adventure.

201 Theology is inevitable, because humanly speaking adventure is inevitable. 202 For human, with our intellectual spontaneity, every object is a problem; 203 and did we not seek sooner or later to define salvation, there would be good reason to believe that one did not practically reckon with any. 204 But this is similarly and independently true of the

imagination, the most familiar means with which human clothes and vivifies own convictions, 205 the exuberance with which one plays about them and delights to confess them. 206 The imagination of religion, contributing what Matthew Arnold called its "poetry and eloquence," 207 does not submit itself to such canons as are binding upon theology or science, but exists and flourishes in its own right.

208 The indispensableness to religion of the imagination is due to that faculty's power of realising what is not perceptually present. 209 Religion is not interested in the apparent, but in the secret essence or the transcendent universal. 210 And yet this interest is a practical one. 211 Imagination may introduce one into the vivid presence of the secret or the transcendent. 212 It is evident that the religious imagination here coincides with poetry. 213 For it is at least one of the interests of poetry to cultivate and satisfy a sense for the universal; 214 to obtain an immediate experience or appreciation that shall have the vividness without the particularism of ordinary perception. 215 And where poets elect so to view the world, we allow them as poets the privilege, and judge them by the standards to which they submits themselves. 216 That upon which we pass judgment is the fitness of one expression. 217 This expression is not, except in the case of the theoretical mystic, regarded as constituting the most valid form of the idea, 218 but is appreciated expressly for its fulfillment of the condition of immediacy. 219 The same sort of critical attitude is in order with the fruits of the religious imagination. 220 These may or may not fulfill enough of the requirements of that art to be properly denominated poetry; 221 but like poetry they are the translation of ideas into a specific language. 222 They must not, therefore, be judged as though they claimed to excel in point of validity, but only in point of consistency with the context of that language. 223 And the language of religion is the language of the practical life. 224 Such translation is as essential to an idea that is to enter into the religious experience, 225 as

translation into terms of immediacy is essential to an idea that is to enter into the appreciative consciousness of the poet. 226 No object can find a place in my religion until it is conjoined with my purposes and hopes; until it is taken for granted and acted upon, 227 like the love of my friends, or the courses of the stars, or the stretches of the sea.

228 The religious imagination, then, is to be understood and justified as that which brings the objects of religion within the range of living. 229 The central religious object, as has been seen, is an attitude of the residuum or totality of things. 230 To be religious one must have a sense for the presence of an attitude, like one sense for the presence of one’s human fellows, 231 with all the added appreciation that is proper in the case of an object that is unique in its mystery or in its majesty. 232 It follows that the religious imagination fulfils its function in so far as it provides the object of religion with properties similar to those which lend vividness and reality to the normal social relations.

233 The presence of one's fellows is in part the perceptual experience of their bodies. 234 To this there corresponds in religion some extraordinary or subtle appearance. 235 The gods may in visions or dreams be met with in their own proper embodiments; 236 or, as is more common, they may be regarded as present for practical purposes: 237 in some inanimate object, as in the case of the fetish; in some animal species, as in the case of the totem; in some place, as in the case of the shrine; or even in some human being, as in the case of the inspired prophet and miracle worker. 238 In more refined and highly developed religions the medium of God's presence is less specific. 239 He is perceived with "-- a sense sublime. Of something far more deeply interfused, Whose dwelling is the light of setting suns, And the round ocean and the living air, And the blue sky, and in the mind of human." 240 God is here found in an interpretation of the common and the natural, rather than in any individual and peculiar embodiment. 241 And here the

poet's appreciation, if not their art, is peculiarly indispensable.

242 But, furthermore, a person's fellows are inmates of "the household of human" in that one knows their history. 243 They belong to the temporal context of actions and events. 244 Similarly, the gods must be historical. The sacred traditions or books of religion are largely occupied with this history. 245 The more individual and anthropomorphic the gods, the more local and episodic will be the account of their affairs. 246 In the higher religions the acts of God are few and momentous, such as creation or special providence; 247 or they are identical with the events of Nature and human history when these are construed as divine. 248 To find God in this latter way requires an interpretation of the course of events in terms of some moral consistency, 249 a faith that sees some purpose in their evident destination.

250 There is still another and a more significant way in which people recognise one another: the way of address and conversation. 251 And people have invariably held a similar intercourse with their gods. To this category belong communion and prayer, with all their varieties of expression. 252 I have no god until I address him. This will be the most direct evidence of what is at least from my point of view a social relation. 253 There can be no general definition of the form which this address will take. 254 There may be as many special languages, as many attitudes, and as much playfulness and subtlety of symbolism as in human intercourse. 255 But, on the other hand, there are certain utterances that are peculiarly appropriate to religion. 256 In so far as one regards own object as endowed with both power and goodness the worshipper will use the language of adoration; 257 and the sense of one's dependence will speak in terms of consecration and thanksgiving. 258 "O God, thou art my God; early will I seek thee: 259 My soul thirsteth for thee, my flesh longeth for thee, 260 In a dry and weary land, where no water is. 261 So have I looked upon thee in the sanctuary,

262 To see thy power and thy glory. 263 For thy loving-kindness is better than life; 264 My lips shall praise thee."

265 These are expressions of a hopeful faith; 266 but, on the other hand, God may be addressed in terms of hatred and distrust. 267 "Who is most wretched in this dolorous place? 268 I think myself; yet I would rather be 269 My miserable self than He, than He. 270 Who formed such creatures to own disgrace. 271 "The vilest thing must be less vile than Thou 272 From whom it had its being, God and Lord! 273 Creator of all woe and sin! abhorred, Malignant and implacable."

274 In either case there may be an indefinite degree of hyperbole. 275 The language of love and hate, of confidence and despair, is not the language of description. 276 In this train of the religious consciousness there is occasion for whatever eloquence human can feel, and whatever rhetorical luxuriance one can utter.

277 Such considerations as these serve to account for the exercise and certain of the fruits of the religious imagination, 278 and to designate the general criterion governing its propriety. 279 But how is one to determine the boundary between the imaginative and the cognitive? 280 It is commonly agreed that what religion says and does is not all intended literally. 281 But when is expression of religion only poetry and eloquence, and when is it matter of conviction? 282 If we revert again to the cognitive aspect of religion, it is evident that there is but one test to apply: 283 whatever either fortifies or misleads the will is literal conviction. 284 This test cannot be applied absolutely, because it can properly be applied only to the intention of an individual experience. 285 However I may express my religion, that which I express, is, we have seen, an expectation. 286 The degree to which I literally mean what I say is then the degree to which it determines my expectations. 287 Whatever adds no item to these expectations, but only recognises and vitalises them, is pure imagination. 288 But it follows that it is entirely impossible from direct inspection to define any given

expression of religious experience as myth, or to define the degree to which it is myth. 289 It submits to such distinctions only when viewed from the stand-point of the concrete religious experience which it expresses. 290 Any such given expression could easily be all imagination to oneself, and all conviction to another person. 291 Consider the passage which follows: 292 "And I saw the heaven opened; and behold, a white horse, 293 and he that sat thereon, called Faithful and True; and in righteousness he doth judge and make war. 294 And his eyes are a flame of fire, and upon his head are many diadems; 295 and he hath a name written, which no one knoweth but he himself. 296 And he is arrayed in a garment sprinkled with blood: and his name is called The Word of God."

297 Is this all rhapsody, or is it in part true report? There is evidently no answer to the question so conceived. 298 But if it were to express my own religious feeling it would have some specific proportion of literal and metaphorical significance, 299 according to the degree to which its detail contributes different practical values to me. 300 It might then be my guide-book to the heavens, or only my testimony to the dignity and mystery of the function of Christ.

301 The development of religion bears in a very important way upon this last problem. 302 The factor of imagination has undoubtedly come to have a more clearly recognised role in religion. 303 There can be no doubt that what we now call myths were once beliefs, and that what we now call poetry was once history. 304 If we go back sufficiently far we come to a time when the literal and the metaphorical were scarcely distinguishable, 305 and this because science had not emerged from the early animistic extension of social relations. 306 People meant to address their gods as they addressed their fellows, 307 and expected them to hear and respond, as they looked for such reactions within the narrower circle of ordinary intercourse. 308 The advance of science has brought into vogue a description of Nature that inhibits such expectations. 309 The result has

been that people, continuing to use the same terms, essentially expressive as they are of a practical relationship, 310 have come to regard them as only a general expression of their attitude. 311 The differences of content that are in excess of factors of expectation remain as poetry and myth. 312 On the other hand, it is equally possible, if not equally common, for that which was once imagined to come to be believed. 313 Such a transformation is, perhaps, normally the case when the inspired utterance passes from its author to the cult. 314 The prophets and sweet singers are likely to possess an exuberance of imagination not appreciated by their followers; and for this reason almost certainly misunderstood. 315 For these reasons it is manifestly absurd to fasten the name of myth or the name of creed upon any religious utterance whatsoever, 316 unless it be so regarded from the stand-point of the personal religion which it originally expressed, 317 or unless one means by so doing to define it as an expression of one own religion. 318 Those who define "the myth of creation," or "the poetical story of Samson," as parts of the pre-Christian Judaic religion, exhibit a total loss of historical sense. 319 The distinction between cognition and fancy does not exist among objects, but only in the intending experience; 320 hence, for me to attach my own distinction to any individual case of belief, viewed apart from the believer, is an utterly confusing projection of my own personality into the field of my study.

321 Only after such considerations as these are we qualified to attack that much-vexed question as to whether religion deals invariably with a personal god. 322 It is often assumed in discussion of this question that "personal god," as well as "god," is a distinct and familiar kind of entity, 323 like a dragon or centaur; its existence alone being problematical. 324 This is doubly false to the religious employment of such an object. 325 If it be true that in religion we mean by God a practical interpretation of the world, 326 whatsoever be its

nature, then the personality of God must be a derivative of the attitude, and not of the nature of the world. 327 Given the practical outlook upon life, there is no definable world that cannot be construed under the form of God. 328 My god is my world practically recognised in respect of its fundamental or ultimate attitude to my ideals. 329 In the sense, then, conveyed by this term attitude my god will invariably possess the characters of personality. 330 But the degree to which these characters will coincide with the characters which I assign to human persons, or the terms of any logical conception of personality, cannot be absolutely defined. 331 Anthropomorphisms may be imagination or they may be literal conviction. 332 This will depend, as above maintained, upon the degree to which they determine my expectations. 333 Suppose the world to be theoretically conceived as governed by laws that are indifferent to all human interests. 334 The practical expression of this conception appears in the naturalism of Lucretius, or Diogenes, or Omar Khayyam. 335 Living in the vivid presence of an indifferent world, I may picture my gods as leading their own lives in some remote realm which is inaccessible to my petitions, 336 or as regarding me with sinister and contemptuous cruelty. 337 In the latter case I may shrink and cower, or return them contempt for contempt. 338 I mean this literally only if I look for consequences following directly from the emotional colouring which I have bestowed upon them. 339 It may well be that I mean merely to regard myself sub specie aeternitatis, 340 in which case I am personifying in the sense of free imagination. 341 In the religion of enlightenment the divine attitude tends to belong to the poetry and eloquence of religion rather than to its cognitive intent. 342 This is true even of optimistic and idealistic religion. 343 The love and providence of God are less commonly supposed to warrant an expectation of special and arbitrary favours, 344 and have come more and more to mean the play of my own feeling about the general central conviction of the favourableness of the cosmos to

my deeper or moral concerns. 345 But the factor of personality cannot possibly be entirely eliminated, for the religious consciousness creates a social relationship between human and the Universe. 346 Such an interpretation of life is not a case of the pathetic fallacy, unless it incorrectly reckons with the inner feeling which it attributes to the Universe. 347 It is an obvious practical truth that the total or residual environment is significant for life. 348 Grant this and you make rational a recognition of that significance, or a more or less constant sense of coincidence or conflict with cosmical forces. 349 Permit this consciousness to stand, and you make some expression of it inevitable. 350 Such an expression may, furthermore, with perfect propriety and in fulfillment of human nature, set forth and transfigure this central belief until it may enter into the context of immediacy.

351 Thus any conception of the Universe whatsoever may afford a basis for religion. 352 But there is no religion that does not virtually make a more definite claim upon the nature of things, 353 and this entirely independently of its theology, or explicit attempt to define itself. 354 Every religion, even in the very living of it, is naturalistic, or dualistic, or pluralistic, or optimistic, or idealistic, or pessimistic. 355 And there is in the realm of truth that which justifies or refutes these definite practical ways of construing the Universe. 356 But no historical religion is ever so vague even as this in its philosophical implications. 357 Indeed, we shall always be brought eventually to the inner meaning of some individual religious experience, where no general criticism can be certainly valid.

358 There is, then, a place in religion for that which is not directly answerable to philosophical or scientific standards. 359 But there is always, on the other hand, an element of hope which conceives the nature of the world, and means to be grounded in reality. 360 In respect of that element, philosophy is indispensable to religion. 361 The meaning of religion is, in fact, the

central problem of philosophy. 362 There is a virtue in religion like that which Emerson ascribes to poetry. 363 "The poet is in the right attitude; he is believing; the philosopher, after some struggle, having only reasons for believing." 364 But whatever may be said to the disparagement of its dialectic, philosophy is the justification of religion, and the criticism of religions. 365 To it must be assigned the task of so refining positive religion as to contribute to the perpetual establishment of true religion. 366 And to philosophy, with religion, belongs the task of holding fast to the idea of the Universe. 367 There is no religion except before you begin, or after you have rested from, your philosophical speculation. 368 But in the Universe these interests have a common object. 369 As philosophy is the articulation and vindication of religion, so is religion the realisation of philosophy. 370 In philosophy thought is brought up to the elevation of life, 371 and in religion philosophy, as the sum of wisdom, enters into life.

THE PROBLEMS OF RELIGION
THE SPECIAL INTERESTS OF FAITH
Ralph Barton Perry

25 In that part of his philosophy in which he deals with faith, the great German philosopher Kant mentions God, Freedom, and Immortality as the three pre-eminent religious interests. 2 Religion, as we have seen, sets up a social relationship between human and that massive drift of things which determines human destiny. 3 Of the two terms of this relation, God signifies the latter, while freedom and immortality are prerogatives which religion bestows upon the former. 4 Human, viewed from the stand-point of religion as an object of special interest to the Universe, is said to have a soul; 5 and by virtue of this soul human is said to be free and immortal, 6 when thought of as having a life in certain senses independent of its immediate natural environment. 7 The attempt to make this faith theoretically intelligible has led to the philosophical disciplines known as 'theology' and 'psychology'.

THEOSOPHY

THEOLOGY DEALS WITH THE NATURE AND PROOF OF GOD

Ralph Barton Perry

26 Theology, as a branch of philosophy, deals with the proof and the nature of God. 2 Since "God" is not primarily a theoretical conception, the proof of God is not properly a philosophical problem. 3 Historically, this task has been assumed as a legacy from Christian apologetics; 4 and it has involved, at any rate so far as European philosophy is concerned, the definition of ultimate being in such spiritual terms as make possible the relation with human postulated in Christianity. 5 For this it has been regarded as sufficient to ascribe to the world an underlying unity capable of bearing the predicates of perfection, omnipotence, and omniscience. 6 Each proof of God has defined Him pre-eminently in terms of some one of these His attributes.

THE ONTOLOGICAL PROOF OF GOD

Ralph Barton Perry

27 The ontological proof of God held the foremost place in philosophy's contribution to Christianity up to the eighteenth century. 2 This proof infers the existence from the ideal of God, and so approaches the nature of God through the attribute of perfection. 3 It owes the form in which it was accepted in the Middle Ages and Renaissance to St. Anselm, Archbishop of Canterbury at the close of the eleventh century. 4 He argued from the idea of a most perfect being to its existence, on the ground that non-existence, or existence only in idea, would contradict its perfection. 5 It is evident that the force of this argument depends upon the necessity of the idea of God. 6 The argument was accepted in Scholastic Philosophy largely because of the virtual acceptance of this necessity. 7 Mediæval thought was under the dominance of the philosophical ideas of Plato and Aristotle, and through them

rationalism had come to be the unquestioned starting-point for all thought. 8 For Plato reality and rationality meant one and the same thing, 9 so that the ultimate reality was the highest principle of rationality, which he conceived to be the idea of the good. 10 In the case of Aristotle the ideal of rationality was conceived to determine the course of the cosmical evolution as its immanent final cause. 11 But in itself it was beyond the world, or transcendent. 12 For Plato perfection itself is reality, whereas for Aristotle perfection determines the hierarchical order of natural substances. 13 The latter theory, more suitable to the uses of Christianity, because it distinguished between God and the world, was incorporated into the great school systems. 14 But both theories contain the essence of the ontological proof of God. 15 In thought one seeks the perfect truth, and posits it as at once the culmination of insight and the meaning of life. 16 The ideal of God is therefore a necessary idea, because implied in all the effort of thought as the object capable of finally satisfying it. 17 St. Anselm adds little to the force of this argument, and does much to obscure its real significance.

18 In stating the ontological argument the term perfection has been expressly emphasised, because it may be taken to embrace both truth and goodness. 19 Owing to a habit of thought, due in the main to Plato, it was long customary to regard degrees of truth and goodness as interchangeable, and as equivalent to degrees of reality. 20 The ens realissimum was in its completeness the highest object both of the faculty of cognition and of the moral will. 21 But even in the scholastic period these two different aspects of the ideal were clearly recognised, and led to sharply divergent tendencies. 22 More recently they have been divided and embodied in separate arguments. 23 The epistemological argument defines God in terms of that absolute truth which is referred to in every judgment. 24 Under the influence of idealism this absolute truth has taken the form of a universal mind, or all-embracing standard experience,

called more briefly the absolute. 25 The ethical argument, on the other hand, conceives God as the perfect goodness implied in the moral struggle, 26 or the power through which goodness is made to triumph in the Universe to the justification of moral faith. 27 While the former of these arguments identifies God with being, the latter defines God in terms of the intent or outcome of being. 28 Thus, while the epistemological argument does not distinguish God and the world, the latter does so, 29 assuming that independent reality can be attributed to the stages of a process and to the purpose that dominates it.

THE COSMOLOGICAL PROOF OF GOD
Ralph Barton Perry

28 The cosmological proof of God approaches Him through the attribute of creative omnipotence. 2 The common principle of causal explanation refers the origin of natural events to similar antecedent events. 3 But there must be some first cause from which the whole series is derived, 4 a cause which is ultimate, sufficient to itself, and the responsible author of the world. 5 Because God's function as creator was a part of the Christian teaching, and because explanation by causes is habitual with common sense, this argument has had great vogue. 6 But in philosophy it has declined in importance, 7 chiefly because it has been absorbed in arguments which deal with the kind of causality proper to a first cause or world-ground. 8 The argument that follows is a case in point.

THE TELEOLOGICAL PROOF OF GOD
Ralph Barton Perry

29 The teleological proof argues that the world can owe its origin only to an intelligent first cause. 2 The evidence for this is furnished by the cunning contrivances and beneficent adaptations of Nature. 3 These could not have come about through chance or the working of mechanical forces, but only

through the foresight of a rational will. 4 This argument originally infers God from the character of Nature and history; 5 and the extension of mechanical principles to organic and social phenomena, 6 especially as stimulated by Darwin's principle of natural selection, has tended greatly to diminish its importance. 7 When, on the other hand, for Nature and history there are substituted the intellectual and moral activities themselves, 8 and the inference is made to the ideal which they imply, the teleological argument merges into the ontological. 9 But the old-fashioned statement of it remains in the form of religious faith, 10 and in this capacity it has had the approval even of Hume and Kant, the philosophers who have contributed most forcibly to its overthrow as a demonstration of God. 11 They agree that the acknowledgment of God in Nature and history is the sequel to a theistic belief, 12 and an inevitable attitude on the part of the religious consciousness.

GOD AND THE WORLD.
THEISM AND PANTHEISM
Ralph Barton Perry

30 Another group of ideas belonging to philosophical theology consists of three generalisations respecting God's relation to the world, known as theism, pantheism, and deism. 2 Although, theoretically, these are corollaries of the different arguments for God, 3 two of them, theism and pantheism, owe their importance to their rivalry as religious tendencies.

4 Theism emphasises that attitude to God which recognises in him an historical personage, 5 in some sense distinct from both the world and humankind, which are His works and yet stand in an external relationship to Him. 6 It expresses the spirit of ethical and monotheistic religion, and is therefore the natural belief of the Christian.

7 Pantheism appears in primitive religion as an animistic or polytheistic sense of the presence of a divine principle diffused throughout *N*ature. 8 But it figures most notably in the history of

religions, in the highly reflective Brahmanism of India. 9 In sharp opposition to Christianity, this religion preaches the indivisible unity of the world 10 and the illusoriness of the individual's sense of one's own independent reality. 11 In spite of the fact that such a doctrine is alien to the spirit of Christianity, it enters into Christian theology through the influence of philosophy. 12 The theoretical idea of God tends, as we have seen, to the identification of Him with the world as its most real principle. 13 Or it bestows upon Him a nature so logical and formal, and so far removed from the characters of humanity, 14 as to forbid His entering into personal or social relations. 15 Such reflections concerning God find their religious expression in a mystical sense of unity, 16 which has in many cases either entirely replaced or profoundly modified the theistic strain in Christianity. 17 In current philosophy pantheism appears in the epistemological argument which identifies God with being; 18 while the chief bulwark of theism is the ethical argument, 19 with its provision for a distinction between the actual world and ideal principle of evolution.

DEISM

Ralph Barton Perry

31 While theism and pantheism appear to be permanent phases in the philosophy of religion, deism is the peculiar product of the eighteenth century. 2 It is based upon a repudiation of supernaturalism and "enthusiasm," on the one hand, and a literal acceptance of the cosmological and teleological proofs on the other. 3 Religions, like all else, were required, in this epoch of clear thinking, 4 to submit to the canons of experimental observation and practical common sense. 5 These authorise only a natural religion, the acknowledgment in pious living of a God 6 who, having contrived this natural world, has given it over to the rule, not of priests and prophets, but of natural law. 7 The artificiality of its conception of God, and the calculating spirit of its piety, make deism a much less

genuine expression of the religious experience 8 than either the moral chivalry of theism or the intellectual and mystical exaltation of pantheism.

METAPHYSICS AND THEOLOGY
Ralph Barton Perry

32 The systematic development of philosophy leads to the inclusion of conceptions of God within the problem of metaphysics, 2 and the subordination of the proof of God to the determination of the fundamental principle of reality. 3 There will always remain, however, an outstanding theological discipline, whose function it is to interpret worship, 4 or the living religious attitude, in terms of the theoretical principles of philosophy.

PSYCHOLOGY
IS THE THEORY OF THE SOUL
Ralph Barton Perry

33 Psychology is the theory of the soul. 2 As we have already seen, the rise of scepticism directs attention from the object of thought to the thinker, 3 and so emphasises the self as a field for theoretical investigation. 4 But the original and the dominating interest in the self is a practical one. 5 The precept, γνῶθι σεαυτόν, has its deepest justification in the concern for the salvation of one's soul. 6 In primitive and half-instinctive belief the self is recognised in practical relations. 7 In its animistic phase this belief admitted of such relations with all living creatures, 8 and extended the conception of life very generally to natural processes. 9 Thus in the beginning the self was doubtless indistinguishable from the vital principle. 10 In the first treatise on Psychology, the "περὶ Ψυχῆς" of Aristotle, this interpretation finds a place in theoretical philosophy. 11 For Aristotle the soul is the entelechy of the body-- that function or

activity which makes a person of it. 12 He recognised, furthermore, three stages in this activity: the nutritive, sensitive, and rational souls, or the vegetable, animal, and distinctively human natures, respectively. 13 The rational soul, in its own proper activity, is human's highest prerogative, the soul to be saved. 14 By virtue of it human rises above bodily conditions, and lays hold on the divine and eternal. 15 But Plato, who, as we have seen, was ever ready to grant reality to the ideal apart from the circumstances of its particular embodiment, 16 had already undertaken to demonstrate the immortality of the soul on the ground of its distinctive nature. 17 According to his way of thinking, the soul's essentially moral nature made it incapable of destruction through the operation of natural causes. 18 It is evident, then, that there were already ideas in vogue capable of interpreting the Christian teaching concerning the existence of a soul, 19 or of an inner essence of human capable of being made an object of divine interest.

20 The immediate effect of Christianity was to introduce into philosophy as one of its cardinal doctrines the theory of a spiritual being, 21 constituting the true self of the individual, and separable from the body. 22 The difference recognised in Plato and Aristotle between the divine spark and the appetitive and perceptual parts of human nature was now emphasised. 23 The former--frequently called the "spirit," to distinguish it from the lower soul --was defined as a substance having the attributes of thought and will. 24 The fundamental argument for its existence was the immediate appeal to self-consciousness; 25 and it was further defined as indestructible on the ground of its being utterly discontinuous and incommensurable with its material environment. 26 This theory survives at the present day in the conception of pure activity, 27 but on the whole the attributes of the soul have superseded its substance. 28 Intellectualism and voluntarism are the two rival possibilities of emphasis when the soul is defined in terms of its known activities.

THEOSOPHY

29 Wherever the essence of personality is in question, as also occurs in the case of theology, thought and will present their respective claims to the place of first importance. 30 Intellectualism would make will merely the concluding phase of thought, while voluntarism would reduce thought to one of the interests of a general appetency. 31 It is evident that idealistic theories will be much concerned with this question of priority. 32 It is also true, though less evident, that intellectualism, since it emphasises the general and objective features of the mind, tends to subordinate the individual to the universal; 33 while voluntarism, emphasising desire and action, is relatively individualistic, 34 and so, since there are many individuals, also pluralistic.

35 The question of the freedom of the will furnishes a favourite controversial topic in philosophy. 36 For the interest at stake is no less than the individual's responsibility before human and God for his good or bad works. 37 It bears alike upon science, religion, and philosophy, and is at the same time a question of most fundamental practical importance. 38 But this diffusion of the problem has led to so considerable a complication of it that it becomes necessary in outlining it to define two issues. 39 In the first place, the concept of freedom is designed to express generally the distinction between human and the rest of Nature. 40 To make human in all respects the product and creature of human natural environment would be to deny freedom and accept the radically necessitarian doctrine. 41 The question still remains, however, as to the causes which dominate human. 42 Human may be free from Nature, and yet be ruled by God, or by distinctively spiritual causes, such as ideas or character. 43 Where in general the will is regarded as submitting only to a spiritual causation proper to its own realm, the conception is best named determinism; 44 though in the tradition of philosophy it is held to be a doctrine of freedom, because contrasted with the necessitarianism above defined. 45 There remains indeterminism, which attributes to the will a

spontaneity that makes possible the direct presence to it of genuine alternatives. 46 The issue may here coincide with that between intellectualism and voluntarism. 47 If, e.g., in God's act of creation, His ideals and standards are prior to His fiat, His conduct is determined; 48 whereas it is free in the radical or indeterministic sense if His ideals themselves are due to His sheer will. 49 This theory involves at a certain point in action the absence of cause. 50 On this account the free-will is often identified with chance, 51 in which case it loses its distinction from Nature, and we have swung round the circle.

52 There is similar complexity in the problem concerning immortality. 53 Were the extreme claims of naturalism to be established, there would be no ground whatsoever upon which to maintain the immortality of human, mere dust returning unto dust. 54 The philosophical concept of immortality is due to the supposition that the quintessence of the individual's nature is divine. 55 But several possibilities are at this point open to us. The first would maintain the survival after death of a recognisable and discrete personality. 56 Another would suppose preservation after death, through being taken up into the life of God. 57 Still another, the theory commonly maintained on the ground of rationalistic and idealistic metaphysics, would deny that immortality has to do with life after death, 58 and affirm that it signifies the perpetual membership of the human individual in a realm of eternity through the truth or virtue that is in oneself. 59 But this interpretation evidently leaves open the question of the immortality of that which is distinctive and personal in human nature.

60 So far we have followed the fortunes only of the "spirit" of human. What of that lower soul through which one is identified with the fortunes of own body? 61 When philosophy gradually ceased, in the sixteenth and seventeenth centuries, to be "the handmaid of religion," 62 there arose a renewed interest in that part of human nature lying between the strictly physiological functions, on the one hand, and

thought and will on the other. 63 Descartes and Spinoza analysed what they called the "passions," meaning such states of mind as are conditioned by a concern for the interests of the body. 64 At a later period, certain English philosophers, following Locke, traced the dependence of ideas upon the senses. 65 Their method was that of introspection, or the direct examination by the individual of one own ideas, 66 and for the sake of noting their origin and composition from simple factors. 67 The lineal descendants of these same English philosophers defined more carefully the process of association, 68 whereby the complexity and sequence of ideas are brought about, 69 and made certain conjectures as to its dependence upon properties and transactions in the physical brain. 70 These are the three main philosophical sources of what has now grown to be the separate behavioural science of psychology. 71 It will be noted that there are two characteristics which all of these studies have in common. 72 They deal with the experience of the individual as composing one own private history, and tend to attribute the specific course which this private history takes to bodily conditions. 73 It is only recently that these investigations have acquired sufficient unity and exclusiveness of aim to warrant their being regarded as a special science. 74 But such is now so far the case that the psychologist of this type pursues their way quite independently of philosophy. 75 It is true their research has advanced considerably beyond their understanding of its province. 76 But it is generally recognised that they must examine those very factors of subjectivity which the natural scientists otherwise seeks to evade, 77 and, furthermore, that they must seek to provide for them in Nature. 78 The psychologists treats the inner life in what Locke called "the plain historical method," 79 that is to say, instead of interpreting and defining its ideas, they analyses and reports upon its content. 80 They would not seek to justify a moral judgment, as would ethics, or to criticise the cogency of thought, as

would logic; but only to describe the actual state as they found it. 81 In order to make their data commensurable with the phenomena of Nature, they discover or define bodily conditions for the subjective content which they analyses. 82 Their fundamental principle of method is the postulate of psycho-physical parallelism, 83 according to which they assumes a state of brain or nervous system for every state of mind. 84 But in adopting a province and a method the psychologist foregoes finality of truth after the manner of all natural science. 85 They deals admittedly with an aspect of experience, and their conclusions are no more adequate to the nature of the self than they are to the nature of outer objects. 86 An admirable reference to this abstract division of experience occurs in Külpe's

BEHAVIOURAL-SCIENCE
AND PHILOSOPHY
Ralph Barton Perry

34 "For the developed consciousness, as for the naive, every experience is an unitary whole; 2 and it is only the habit of abstract reflection upon experience that makes the objective and subjective worlds seem to fall apart as originally different forms of existence. 3 Just as a plane curve can be represented in analytical geometry as the function of two variables, 4 the abscissæ and the ordinates, without prejudice to the unitary course of the curve itself, 5 so the world of human experience may be reduced to a subjective and an objective factor, without prejudice to its real coherence."

6 The problems of psychology, like those of theology, tend to disappear as independent philosophical topics. 7 The ultimate nature of the-self will continue to interest philosophers-- 8 more deeply, perhaps, than any aspect of experience-- 9 but their conception of it will be a corollary of their metaphysics and epistemology. 10 The remainder of the field of the old philosophical behavioural-science, the introspective and experimental analysis of special states of mind, 11 is already the province of a

natural science which is becoming more and more free from the stand-point and method of philosophy.

TRANSITION FROM CLASSIFICATION BY PROBLEMS TO CLASSIFICATION BY DOCTRINES.

NATURALISM SUBJECTIVISM. ABSOLUTE IDEALISM. ABSOLUTE REALISM

Ralph Barton Perry

35 Reminding ourselves anew that philosophical problem cannot be treated in isolation from one another; 2 we shall hereinafter seek to become acquainted with general stand-points that give systematic unity to the issues which have been enumerated. 3 Such stand-points are not clearly defined by those who occupy them, and they afford no clear-cut classification of all historical philosophical philosophies. 4 But system-making in philosophy is commonly due to the moving in an individual mind of some most significant idea; 5 and certain of these ideas have reappeared so frequently as to define more or less clearly marked tendencies, 6 or continuous strands, out of which the history of thought is forever weaving itself. 7 Such is clearly the case with naturalism. 8 From the beginning until now there have been people whose philosophy is a summation of the natural sciences, 9 whose entire thought is based upon an acceptance of the methods and the fundamental conceptions of these disciplines. 10 This tendency stands in the history of thought for the conviction that the visible and tangible world which interacts with the body is veritable reality. 11 This philosophy is realistic and empirical to an extent entirely determined by its belief concerning being. 12 But while naturalism is only secondarily epistemological, subjectivism and absolute idealism have their very source in the self-examination and the self-criticism of thought. 13 Subjectivism signifies the conviction that the knower cannot escape oneself. 14 If reality is to be kept within the range of possible knowledge, it must be defined in terms of the processes or states of

selves. 15 Absolute idealism arises from a union of this epistemological motive with a recognition of what are regarded as the logical necessities to which reality must submit. 16 Reality must be both knowledge and rational knowledge; 17 the object, in short, of an absolute mind, which shall be at once all containing and systematic. 18 This rationalistic motive was, however, not originally associated with an idealistic epistemology, 19 but with the common-sense principle that being is discovered and not constituted by thought. 20 Such an absolute realism is, like naturalism, that seeks to define reality as a logical or ethical necessity.

The Third Book of Divine Panagogue Called

NATURE

THE GENERAL MEANING OF MATERIALISM

Ralph Barton Perry

1 The meaning conveyed by any philosophical term consists largely of the distinctions which it suggests. 2 Its peculiar quality, like the physiognomy of the battle-scarred veteran, is a composite of the controversies which it has survived. 3 There is, therefore, an almost unavoidable confusion attendant upon the denomination of any early phase of philosophy as materialism. 4 But in the historical beginnings of thought, as also in the common-sense of all ages, there is at any rate present a very essential strand of this theory. 5 The naive habit of mind which, in the sixth century before Christ, prompted successive Greek thinkers to define reality in terms of water, air, and fire, 6 is in this respect one with that exhibited in Dr. Samuel Johnson's smiting the ground with his stick in curt refutation of Bishop Berkeley's idea-philosophy. 7 There is a theoretical instinct, not accidental or perverse, but springing from the very life-preserving equipment of the organism, 8 which attributes reality to tangible space-filling things encountered by the body. 9 For obvious reasons of self-interest the organism is first of all endowed with a sense of contact, 10 and the more delicate senses enter into its practical economy as means of anticipating or avoiding contact. 11 From such practical expectations concerning the proximity of that which may press upon, injure, or displace the body, arise the first crude judgments of reality. 12 And these are at the same time the nucleus of naive philosophy and the germinal phase of materialism.

CORPOREAL BEING

Ralph Barton Perry

2 The first philosophical movement among the Greeks was a series of attempts to reduce the tangible world

to unity, 2 and of these the conception offered by Anaximander is of marked interest in its bearing upon the development of materialism. 3 This philosopher is remarkable for having defined his first principle, 4 instead of having chosen it from among the different elements already distinguished by common-sense. 5 He thought the unity of Nature to consist in its periodic evolution from and return into one infinite sum of material (τὸ ἄπειρον), 6 which, much in the manner of the "nebula" of modern science, is conceived as both indeterminate in its actual state and infinitely rich in its potentiality. 7 The conception of matter, the most familiar commonplace of science, begins to be recognisable. 8 It has here reached the point of signifying a common substance for all tangible things, 9 a substance that in its own general and omnipresent nature is without the special marks that distinguish these tangible things from one another. 10 And in so far the philosophy of Anaximander is materialistic.

CORPOREAL PROCESSES. HYLOZOISM AND MECHANISM

Ralph Barton Perry

3 But the earliest thinkers are said to be hylozoists, rather than strict materialists, 2 because of their failure to make certain distinctions in connection with the processes of matter. 3 The term hylozoism unites with the conception of the formless material of the world (ὕλη), 4 that of an animating power to which its formations and transformations are due. 5 Hylozoism itself was not a deliberate synthesis of these two conceptions, but a primitive practical tendency to universalise the conception, of life. 6 Such "animism" instinctively associates with an object's bulk and hardness a capacity for locomotion and general initiative. 7 And the material principles defined by the philosophers retain this vague and comprehensive attribute as a matter of course, 8 until it is distinguished and separated through attempts to understand it.

9 That aspect of natural process which was most impressive to Greek minds of the reflective type was the alternation of "generation and decay." 10 In full accord with his more ancient master, Epicurus, the Latin poet Lucretius writes: 11 "Thus neither can death-dealing motions keep the mastery always, nor entomb existence forevermore; 12 nor, on the other hand, can the birth and increase giving motions of things preserve them always after they are born. 13 Thus the war of first beginnings waged from eternity is carried on with dubious issue: 14 now here, now there, the life-bringing elements of things get the mastery and are o'ermastered in turn: 15 with the funeral wail blends the cry which babies raise when they enter the borders of light; 16 and no night ever followed day, nor morning night, that heard not, mingling with the sickly infant's cries, wailings of the attendants on death and black funeral."

17 In a similar vein, the earliest conceptions of natural evolution attributed it to the co-working of two principles, that of Love or union and that of Hate or dissolution. 18 The process is here distinguished from the material of Nature, but is still described in the language of practical life. 19 A distinction between two aspects of vital phenomena is the next step. These may be regarded in respect either of the motion and change which attend them, or the rationality which informs them. 20 Life is both effective and significant. 21 Although neither of these ideas ever wholly ceases to be animistic, they may nevertheless be applied quite independently of one another. 22 The one reduces the primitive animistic world to the lower end of its scale, 23 the other construes it in terms of a purposive utility commensurable with that of human action. 24 Now it is with mechanism, the former of these diverging ways, that the development of materialism is identified. 25 For this philosophy a thing need have no value to justify its existence, nor any acting intelligence to which it may owe its origin. 26 Its bulk and position are sufficient for its being, 27 and the operation of

forces capable of integrating, dividing, or moving it is sufficient for its derivation and history. 28 In short, there is no rhyme or reason at the heart of things, but only actual matter distributed by sheer force. 29 With this elimination of the element of purposiveness from the hylozoistic world, the content and process of Nature are fitted to one another. 30 Matter is that which is moved by force, and force is the determining principle of the motions of matter. 31 Materialism is now definitely equipped with its fundamental conceptions.

MATERIALISM AND PHYSICAL SCIENCE

Ralph Barton Perry

4 The central conceptions of materialism as a philosophical theory differ from those employed in the physical sciences only in what is demanded of them. 2 The scientist reports upon physical phenomena without accepting any further responsibility, while those who like Lucretius maintain a physical metaphysics, 3 must, like him, prove that "the minute bodies of matter from everlasting continually uphold the sum of things." 4 But, though they employ them in their own way, materialists and all other exponents of naturalism derive their central conceptions from the physical sciences, 5 and so reflect the historical development through which these sciences have passed. 6 To certain historical phases of physical science, in so far as these bear directly upon the meaning of naturalism, we now turn.

THE DEVELOPMENT OF THE CONCEPTIONS OF PHYSICAL SCIENCE. SPACE AND MATTER

Ralph Barton Perry

5 From the earliest times down to the present day the groundwork of materialism has most commonly been cast in the form of an atomic theory. 2 Democritus, the first system-builder of this school, adopted the conception of indivisible

particles (ἄτομοι), 3 impenetrable in their occupancy of space, and varying among themselves only in form, order, and position. 4 To provide for the motion that distributes them he conceived them as separated from one another by empty space. 5 From this it follows that the void is as real as matter, or, as Democritus himself is reputed to have said, "thing is not more real than no-thing."

6 But atomism has not been by any means universally regarded as the most satisfactory conception of the relation between space and matter. 7 Not only does it require two kinds of being, with the different attributes of extension and hardness, respectively, 8 but it would also seem to be experimentally inadequate in the case of the more subtle physical processes, such as light. 9 The former of these is a speculative consideration, and as such had no little weight with the French philosopher Descartes, 10 whose divisions and definitions so profoundly affected the course of thought in these matters after the sixteenth century. 11 Holding also "that a vacuum or space in which there is absolutely no body is repugnant to reason," 12 and that an indivisible space-filling particle is self-contradictory, he was led to identify space and matter; 13 that is, to make matter as indispensable to space as space to matter. 14 There is, then, but one kind of corporeal being, whose attribute is extension, and whose modes are motion and rest. 15 The most famous application of the mechanical conceptions which he bases upon this first principle, is his theory of the planets, 16 which are conceived to be embedded in a transparent medium, and to move with it, vortex fashion, about the sun. 17 But the conception of the space-filling continuity of material substance owes its prominence at the present time to the experimental hypothesis of ether. 18 This substance, originally conceived to occupy the intermolecular spaces and to serve as a medium for the propagation of undulations, is now regarded by many physicists as replacing matter. 19 "It is the great

hope of science at the present day," says a contemporary exponent of naturalism, "that hard and heavy matter will be shown to be ether in motion." 20 Such a theory would reduce bodies to the relative displacements of parts of a continuous substance, which would be first of all defined as spatial, 21 and would possess such further properties as special scientific hypotheses might require.

22 Two broadly contrasting theories thus appear: that which defines matter as a continuous substance coextensive with space; 23 and that which defines it as a discrete substance divided by empty space. 24 But both theories are seriously affected by the peculiarly significant development of the conception of force.

MOTION AND ITS CAUSE. DEVELOPMENT AND EXTENSION OF THE CONCEPTION OF FORCE

Ralph Barton Perry

6 In the Cartesian system the cause of motion was pressure within a plenum. 2 But in the seventeenth century this notion encountered the system of Newton, a system which seemed to involve action at a distance. 3 In the year 1728 Voltaire wrote from London: "When a Frenchman arrives in London, he finds a very great change, in philosophy as well as in most other things. 4 In Paris he left the world all full of matter; here he finds absolute vacua. 5 At Paris the universe is seen filled up with ethereal vortices, while here the same space is occupied with the play of the invisible forces of gravitation. 6 In Paris the earth is painted for us longish like an egg, and in London it is oblate like a melon. 7 At Paris the pressure of the moon causes the ebb and flow of tides; 8 in England, on the other hand, the sea gravitates toward the moon, 9 so that at the same time

when the Parisians demand high water of the moon, the gentlemen of London require an ebb."

10 But these differences are not matters of taste, nor even rival hypotheses upon an equal footing. 11 The Newtonian system of mechanics, the consummation of a development initiated by Galileo, differed from the vortex theory of Descartes 12 as exact science differs from speculation and unverified conjecture. 13 And this difference of method carried with it eventually certain profound differences of content, 14 distinguishing the Newtonian theory even from that of Democritus, with which it had so much in common. 15 Although Democritus had sought to avoid the element of purposiveness in the older hylozoism 16 by referring the motions of bodies as far as possible to the impact of other bodies, he nevertheless attributed these motions ultimately to weight, 17 signifying thereby a certain downward disposition. 18 Now it is true that in his general belief Newton himself is not free from hylozoism. 19 He thought of the motions of the planets themselves as initiated and quickened by a power emanating ultimately from God. 20 They are "impressed by an intelligent Agent," and "can be the effect of nothing else than the wisdom and skill of a powerful ever-living Agent 21 who, being in all places, is more able by His will to move the bodies within His boundless uniform sensorium, 22 and thereby to form and reform the parts of the universe, than we are by our will to move the parts of our own bodies."

23 But by the side of these statements must be set his famous disclaimer, "hypotheses non fingo." 24 In his capacity of natural philosopher he did not seek to explain motions, but only to describe them. 25 Disbelieving as he did in action at a distance, he saw no possibility of explanation short of a reference of them to God; 26 but such "hypotheses" he thought to be no proper concern of science. 27 As a consequence, the mathematical formulation of motions came, through him, to be regarded as the

entire content of mechanics. 28 The notion of an efficient cause of motion is still suggested by the term force, 29 but even this term within the system of mechanics refers always to a definite amount of motion, or measurement of relative motion. 30 And the same is true of attraction, action, reaction, and the like. 31 The further explanation of motion, the definition of a virtue or potency that produces it, first a neglected problem, 32 then an irrelevant problem, is finally, for a naturalistic philosophy in which this progression is completed, an insoluble problem. 33 For the sequel to this purely descriptive procedure on the part of science is the disavowal of "metaphysics" by those who will have no philosophy but science. 34 Thus the scientific conservatism of Newton has led to the positivistic and agnostic phase of naturalism. 35 But a further treatment of this development must be reserved until the issue of epistemology shall have been definitely raised.

36 A different emphasis within the general mechanical scheme, attaching especial importance to the conceptions of force and energy, has led to a rival tendency in science and a contrasting type of naturalism. 37 The mechanical hypotheses hitherto described are all of a simple and readily depicted type. 38 They suggest an imagery quite in accord with common-sense and with observation of the motions of great masses like the planets. 39 Material particles are conceived to move within a containing space; the motions of corpuscles, atoms, or the minute parts of ether, differing only in degree from those of visible bodies. 40 The whole physical universe may be represented in the imagination as an aggregate of bodies participating in motions of extraordinary complexity, but of one type. 41 But now let the emphasis be placed upon the determining causes rather than upon the moving bodies themselves. 42 In other words, let the bodies be regarded as attributive and the forces as substantive. 43 The result is a radical alteration of the

mechanical scheme and the transcendence of common-sense imagery. 44 This was one direction of outgrowth from the work of Newton. 45 His force of gravitation prevailed between bodies separated by spaces of great magnitude. 46 Certain of the followers of Newton, notably Cotes, accepting the formulas of the master but neglecting his allusions to the agency of God, accepted the principle of action at a distance. 47 Force, in short, was conceived to pervade space of itself.

48 But if force be granted this substantial and self-dependent character, what further need is there of matter as a separate form of entity? 49 For does not the presence of matter consist essentially in resistance, itself a case of force? 50 Such reflections as these led Boscovich and others to the radical departure of defining material particles as centres of force.

THE DEVELOPMENT AND EXTENSION OF THE CONCEPTION OF ENERGY

Ralph Barton Perry

7 But a more fruitful hypothesis of the same general order is due to the attention directed to the conception of energy, or capacity for work, 2 by experimental discoveries of the possibility of reciprocal transformations without loss, of motion, heat, electricity, and other processes. 3 The principle of the conservation of energy affirms the quantitative constancy of that which is so transformed, measured, 4 for example, in terms of capacity to move units of mass against gravity. 5 The exponents of what is called "energetics" have in many cases come to regard that the quantity of which is so conserved, as a substantial reality whose forms and distributions compose Nature. 6 A contemporary scientist, whose synthetic and dogmatic habit of mind has made him eminent in the ranks of popular philosophy, writes as follows: 7 "Mechanical and chemical

energy, sound and heat, light and electricity, are mutually convertible; 8 they seem to be but different modes of one and the same fundamental force or energy. 9 Thence follows the important thesis of the unity of all natural forces, or, as it may also be expressed, the 'monism of energy.'" 10 The conception of energy seems, indeed, to afford an exceptional opportunity to naturalism. 11 We have seen that the matter-motion theory was satisfied to ignore, or regard as insoluble, problems concerning the ultimate causes of things. 12 Furthermore, as we shall presently see to better advantage, the more strictly materialistic type of naturalism must regard thought as an anomaly, and has no little difficulty with life. 13 But the conception of energy is more adaptable, and hence better qualified to serve as a common denominator for various aspects of experience. 14 The very readiness with which we can picture the corpuscular scheme is a source of embarrassment to the seeker after unity. 15 That which is so distinct is bristling with incompatibilities. 16 The most aggressive materialist hesitates to describe thought as a motion of bodies in space. 17 Energy, on the other hand, exacts little if anything beyond the character of measurable power. 18 Thought is at any rate in some sense a power, and to some degree measurable. 19 Recent discoveries of the dependence of capacity for mental exertion upon physical vitality 20 and measurements of chemical energy received into the system as food, and somehow exhausted by the activities of thought, 21 have lent plausibility to the hypothesis of a universal energy of which physical and "psychical" processes are alike manifestations. 22 And the conception of energy seems capable not only of unifying Nature, but also of satisfying the metaphysical demand for an efficient and moving cause. 23 This term, like "force" and "power," is endowed with such a significance by common sense. 24 Indeed, naturalism would seem here to have swung round toward its hylozoistic starting-point. 25 The exponent of energetics, like the naïve

animistic thinker, attributes to Nature a power like that which he feels welling up within himself. 26 When he acts upon the environment, like meets like. 27 Energetics, it is true, may obtain a definite meaning for its central conception from the measurable behaviour of external bodies, 28 and a meaning that may be quite free from vitalism or teleology. 29 But in his extension of the conception the author of a philosophical energetics abandons this strict meaning, 30 and blends his thought even with a phase of subjectivism, known as panpsychism. 31 This theory regards the inward life of all nature as homogeneous with an immediately felt activity or appetency, 32 as energetics finds the inner life to be homogeneous with the forces of Nature. 33 Both owe their philosophical appeal to their apparent success in unifying the world upon a direct empirical basis, 34 and to their provision for the practical sense of reality. 35 Such, in brief, are the main alternatives available for a naturalistic theory of being, 36 in consequence of the historical development of the fundamental conceptions of natural science.

THE CLAIMS OF NATURALISM

Ralph Barton Perry

8 We turn now to an examination of the manner in which naturalism, equipped with working principles, seeks to meet the special requirements of philosophy. 2 The conception of the unity of Nature is directly in the line of a purely scientific development, 3 but naturalism takes the bold and radical step of regarding Nature so unified as coextensive with the real, or at any rate knowable, universe. 4 It will be remembered that among the early Greeks Anaxagoras had referred the creative and formative processes of Nature to a non-natural or rational agency, which he called the Nous. 5 The adventitious character of this principle, the external and almost purely nominal part which it played in the actual cosmology of Anaxagoras, 6 betrayed it into the

hands of the atomists, with their more consistently naturalistic creed. 7 Better, these maintain, the somewhat dogmatic extension of conceptions proved to be successful in the description of Nature, 8 than a vague dualism which can serve only to distract the scientific attention and people the world with obscurities. 9 There is a remarkable passage in Lucretius in which atomism is thus written large and inspired with cosmical eloquence:

10 "For verily not by design did the first-beginnings of things station themselves each in its right place guided by keen intelligence, 11 nor did they bargain sooth to say what motions each should assume, 12 but because many in number and shifting about in many ways throughout the universe, 13 they are driven and tormented by blows during infinite time past, 14 after trying motions and unions of every kind at length they fall into arrangements such as those out of which our sum of things has been formed, 15 and by which too it is preserved through many great years, when once it has been thrown into the appropriate motions, 16 and causes the streams to replenish the greedy sea with copious river waters, 17 and the earth, fostered by the heat of the sun, to renew its produce, 18 and the race of living things to come up and flourish, and the gliding fires of ether to live: 19 all which these several things could in no wise bring to pass, unless a store of matter could rise up from infinite space, 20 out of which store they are to make up in due season whatever has been lost."

21 The prophecy of La Place, the great French mathematician, voices the similar faith of the eighteenth century in a mechanical understanding of the universe: 22 "The human mind, in the perfection it has been able to give to astronomy, affords a feeble outline of such an intelligence. 23 Its discoveries in mechanics and in geometry, joined to that of universal gravitation, 24 have brought it within reach of comprehending in the same analytical expressions the past and future states of the system of the world." 25 As for God, the creative and presiding intelligence, La Place

had "no need of any such hypothesis."

THE TASK OF NATURALISM
Ralph Barton Perry

9 But these are the boasts of Homeric heroes before going into battle. 2 The moment such a general position is assumed there arise sundry difficulties in the application of naturalistic principles to special interests and groups of facts. 3 It is one thing to project a mechanical scheme in the large, but quite another to make explicit provision within it for the origin of Nature, 4 for life, for the human self with its ideals, and for society with its institutions. 5 The naturalistic method of meeting these problems involves a reduction all along the line in the direction of such categories as are derived from the infra-organic world. 6 That which is not like the planetary system must be construed as mechanical by indirection and subtlety.

THE ORIGIN OF THE COSMOS
Ralph Barton Perry

10 The origin of the present known natural world was the first philosophical question to be definitely met by science. 2 The general form of solution which naturalism offers is anticipated in the most ancient theories of Nature. 3 These already suppose that the observed mechanical processes of the circular or periodic type, like the revolutions and rotations of the stars, are incidents in a historical mechanical process of a larger scale. 4 Prior to the present fixed motions of the celestial bodies, the whole mass of cosmic matter participated in irregular motions analogous to present terrestrial redistributions. 5 Such motions may be understood to have resulted in the integration of separate bodies, to which they at the same time imparted a rotary motion. 6 It is such a hypothesis that Lucretius paints in his bold, impressionistic colours.

7 But the development of mechanics paved the way for a definite scientific theory, the named "nebular

hypothesis," 8 announced by La Place in 1796, and by the philosopher Kant at a still earlier date. 9 Largely through the Newtonian principle of the parallelogram of forces, the present masses, orbits, and velocities were analysed 10 into a more primitive process of concentration within a nebulous or highly diffused aggregate of matter. 11 And with the aid of the principle of the conservation of energy this theory appears to make possible the derivation of heat, light, and other apparently non-mechanical processes from the same original energy of motion.

12 But a persistently philosophical mind at once raises the question of the origin of this primeval nebula itself, 13 with a definite organisation and a vast potential energy that must, after all, be regarded as a part of Nature rather than its source. 14 Several courses are here open to naturalism. It may maintain that the question of ultimate origin is unanswerable; 15 it may regard such a process of concentration as extending back through an infinitely long past; 16 or, and this is the favourite alternative for more constructive minds, the historical cosmical process may be included within a still higher type of periodic process, which is regarded as eternal. 17 This last course has been followed in the well-known synthetic naturalism of Herbert Spencer. 18 "Evolution," he says, "is the progressive integration of matter and dissipation of motion." 19 But such a process eventually runs down, and may be conceived as giving place to a counter-process of devolution which scatters the parts of matter and gathers another store of potential motion. 20 The two processes in alternation will then constitute a cosmical system without beginning or end.

21 In such wise a sweeping survey of the physical universe may be thought in the terms of natural science. 22 The uniformitarian method in geology, resolving the history of the crust of the earth into known processes, such as erosion and igneous fusion; 23 and spectral

analysis, with its discoveries concerning the chemical constituents of distant bodies through the study of their light, 24 have powerfully reënforced this effort of thought, and apparently completed an outline sketch of the universe in terms of infra-organic processes.

LIFE. NATURAL SELECTION

Ralph Barton Perry

11 But the cosmos must be made internally homogeneous in these same terms. 2 There awaits solution, in the first place, the serious problem of the genesis and maintenance of life within a Nature that is originally and ultimately inorganic. 3 The assimilation of the field of biology and physiology to the mechanical cosmos had made little real progress prior to the nineteenth century. 4 Mechanical theories had, indeed, been projected in the earliest age of philosophy, and proposed anew in the seventeenth century. 5 Nevertheless, the structural and functional teleology of the organism remained as apparently irrefutable testimony to the in working of some principle other than that of mechanical necessity. 6 Indeed, the only fruitful method applicable to organic phenomena was that which explained them in terms of purposive adaptation. 7 And it was its provision for a mechanical interpretation of this very principle that gave to the Darwinian law of natural selection, 8 promulgated in 1859 in the "Origin of Species," so profound a significance for naturalism. It threatened to reduce the last stronghold of teleology, 9 and completely to dispense with the intelligent Author of Nature. 10 Darwin's hypothesis sought to explain the origin of animal species by survival under competitive conditions of existence through the possession of a structure suited to the environment. 11 Only the most elementary organism need be presupposed, together with slight variations in the course of subsequent generations, and both may be conceived to arise mechanically. 12 There will then result in surviving organisms a

gradual accumulation of such variations as promote survival under the special conditions of the environment. 13 Such a principle had been suggested as early as the time of Empedocles, 14 but it remained for Darwin to establish it with an unanswerable array of observation and experimentation. 15 If any organism whatsoever endowed with the power of generation be allowed to have somehow come to be, 16 naturalism now promises to account for the whole subsequent history of organic phenomena and the origin of any known species.

MECHANICAL PHYSIOLOGY
Ralph Barton Perry

12 But what of life itself? 2 The question of the derivation of organic from inorganic matter has proved insoluble by direct means, 3 and the case of naturalism must here rest upon such facts as the chemical homogeneity of these two kinds of matter, 4 and the conformity of physiological processes to more general physical laws. 5 Organic matter differs from inorganic only through the presence of protein, a peculiar product of known elements, 6 which cannot be artificially produced, but which is by natural means perpetually dissolved into these elements without any discoverable residuum. 7 Respiration may be studied as a case of aerodynamics, the circulation of the blood as a case of hydrodynamics, 8 and the heat given off in the course of work done by the body as a case of thermodynamics. 9 And although vitalistic theories still retain a place in physiology, as do teleological theories in biology, 10 on the whole the naturalistic programme of a reduction of organic processes to the type of the inorganic tends to prevail.

MIND. THE REDUCTION TO SENSATION
Ralph Barton Perry

13 The history of naturalism shows that, as in the case of life, so also in the case of mind, 2 its hypotheses were projected by the Greeks, but precisely formulated and verified

only in the modern period of science. 3 In the philosophy of Democritus the soul was itself an atom, finer, rounder, and smoother than the ordinary, but thoroughly a part of the mechanism of Nature. 4 The processes of the soul are construed as interactions between the soul and surrounding objects. 5 In sensation, the thing perceived produces images by means of effluxes which impinge upon the soul-atom. 6 These images are not true reports of the outer world, but must be revised by thought before its real atomic structure emerges.

7 For this higher critical exercise of thought Democritus devised no special atomic genesis. 8 The result may be expressed either as the invalidity of such operations of mind as he could provide for in his universe, 9 or the irreducibility to his chosen first principles of the very thought which defined them. 10 Later naturalism has generally sacrificed epistemology to cosmology, and reduced thought to sensation.

11 Similarly, will has been regarded as a highly developed case of instinct. 12 Knowledge and will, construed as sensation and instinct, may thus be interpreted in the naturalistic manner within the field of biology.

AUTOMATISM

Ralph Barton Perry

14 But the actual content of sensation, and the actual feelings which attend upon the promptings of instinct, still stubbornly testify to the presence in the universe 2 of something belonging to a wholly different category from matter and motion. 3 The attitude of naturalism in this crucial issue has never been fixed and unwavering, 4 but there has gradually come to predominate a method of denying to the inner life all efficacy and real significance in the cosmos, while admitting its presence on the scene. 5 It is a strange fact of history that Descartes, the French philosopher who prided himself on having rid the soul of all dependence on Nature, should have greatly contributed to this method. 6

But it is perhaps not so strange when we consider that every dualism is, after all, symmetrical, 7 and that consequently whatever rids the soul of Nature at the same time rids Nature of the soul. 8 It was Descartes who first conceived the body and soul to be utterly distinct substances. 9 The corollary to this doctrine was his automatism, applied in his own system to animals other than human, 10 but which those less concerned with religious tradition and less firmly convinced of the soul's originating activity were not slow to apply universally. 11 This theory conceived the vital processes to take place quite regardless of any inner consciousness, or even without its attendance. 12 To this radical theory the French materialists of the eighteenth century were especially attracted. 13 With them the active soul of Descartes, the distinct spiritual entity, disappeared. 14 This latter author had himself admitted a department of the self, which he called the "passions," 15 in which the course and content of mind is determined by bodily conditions. 16 Extending this conception to the whole province of mind, they employed it to demonstrate the thorough-going subordination of mind to body.

17 La Mettrie, a physician and the author of a book entitled "L'Homme Machine," was first interested in this thesis by a fever delirium, and afterward adduced anatomical and pathological data in support of it. 18 The angle from which he views human life is well illustrated in the following: 19 "What would have sufficed in the case of Julius Cæsar, of Seneca, of Petronius, to turn their fearlessness into timidity or braggartry? 20 An obstruction in the spleen, the liver, or the vena portae. For the imagination is intimately connected with these viscera, 21 and from them arise all the curious phenomena of hypochondria and hysteria. . . . 22 'A mere nothing, a little fibre, some trifling thing that the most subtle anatomy cannot discover, would have made two idiots out of Erasmus and Fontenelle.'"

RADICAL MATERIALISM. MIND AS AN EPIPHENOMENON

Ralph Barton Perry

15 The extreme claim that the soul is a physical organ of the body, identical with the brain, marked the culmination of this militant materialism, 2 so good an instance of that over-simplification and whole-hearted conviction characteristic of the doctrinaire propagandism of France. 3 Locke, the Englishman, had admitted that possibly the substance which thinks is corporeal. 4 In the letters of Voltaire this thought has already found a more positive expression: 5 "I am body, and I think; more I do not know. 6 Shall I then attribute to an unknown cause what I can so easily attribute to the only fruitful cause I am acquainted with? 7 In fact, where is the person who, without an absurd godlessness, dare assert that it is impossible for the Creator to endow matter with thought and feeling?"

8 Finally, Holbach, the great systematiser of this movement, takes the affair out of the hands of the Creator 9 and definitively announces that "a sensitive soul is nothing but a human brain 10 so constituted that it easily receives the motions communicated to it."

11 This theory has been considerably tempered since the age of Holbach. 12 Naturalism has latterly been less interested in identifying the soul with the body, 13 and more interested in demonstrating its dependence upon specific bodily conditions, after the manner of La Mettrie. 14 The so-called higher faculties, such as thought and will, have been related to central or cortical processes of the nervous system, 15 processes of connection and complication which within the brain itself supplement the impulses and sensations congenitally and externally stimulated. 16 The term "epiphenomenon" has been adopted to express the distinctness but entire dependence of the mind. 17 Human is "a conscious automaton." 18 The real course of Nature passes through human nervous system, while consciousness attends upon its functions like a shadow, present but not efficient.

KNOWLEDGE, POSITIVISM AND AGNOSTICISM

Ralph Barton Perry

16 Holbach's "Système de la Nature," published in 1770, marks the culmination of the unequivocally materialistic form of naturalism. 2 Its epistemological difficulties, always more or less in evidence, have since that day sufficed to discredit materialism, 3 and to foster the growth of a critical and apologetic form of naturalism known as positivism or agnosticism. 4 The modesty of this doctrine does not, it is true, strike very deep. 5 For, although it disclaims knowledge of ultimate reality, it also forbids anyone else to have any. 6 Knowledge, it affirms, can be of but one type, that which comprises the verifiable laws governing Nature. 7 All questions concerning first causes are futile, a stimulus only to excursions of fancy popularly mistaken for knowledge. 8 The superior certainty and stability which attaches to natural science is to be permanently secured 9 by the savant's steadfast refusal to be led away after the false gods of metaphysics.

10 But though this is sufficient ground for an agnostic policy, it does prove an agnostic theory. 11 The latter has sprung from a closer analysis of knowledge, though it fails to make a very brave showing for thoroughness and consistency. 12 The crucial point has already been brought within our view. 13 The general principles of naturalism require that knowledge shall be reduced to sensations, or impressions of the environment upon the organism. 14 But the environment and the sensations do not correspond. 15 The environment is matter and motion, force and energy; the sensations are of motions, to be sure, but much more conspicuously of colours, sounds, odours, pleasures, and pains. 16 Critically, this may be expressed by saying that since the larger part of sense-perception is so unmistakably subjective, 17 and since all knowledge alike must be derived from this source, knowledge as a whole must be regarded as dealing only with appearances. 18 There are

at least three agnostic methods progressing from this point. 19 All agree that the inner or essential reality is unfathomable. 20 But, in the first place, those most close to the tradition of materialism maintain that the most significant appearances, the primary qualities, are those which compose a purely quantitative and corporeal world. 21 The inner essence of things may at any rate be approached by a monism of matter or of energy.

22 This theory is epistemological only to the extent of moderating its claims in the hope of lessening its responsibility. 23 Another agnosticism places all sense qualities on a par, 24 but would regard physics and psychology as complementary reports upon the two distinct series of phenomena in which the underlying reality expresses itself. 25 This theory is epistemological to the extent of granting knowledge, viewed as perception, as good a standing in the universe as that which is accorded to its object. 26 But such a dualism tends almost irresistibly to relapse into materialistic monism, because of the fundamental place of physical conceptions in the system of the sciences. 27 Finally, in another and a more radical phase of agnosticism, we find an attempt to make full provision for the legitimate problems of epistemology. 28 The only datum, the only existent accessible to knowledge, is said to be the sensation, or state of consciousness. 29 In the words of Huxley: "What, after all, do we know of this terrible 'matter' except as a name for the unknown and hypothetical cause of states of our own consciousness? 30 And what do we know of that 'spirit' over whose threatened extinction by matter a great lamentation is arising . . . 31 except that it is also a name for an unknown and hypothetical cause, or condition, of states of consciousness?"

32 The physical world is now to be regarded as a construction which does not assimilate to itself the content of sensations, but enables you to anticipate them. 33 The sensation signifies a contact to which

science can provide a key for practical guidance.

EXPERIMENTALISM

Ralph Barton Perry

17 This last phase of naturalism is an attempt to state a pure and consistent experimentalism, a workable theory of the routine of sensations. 2 But it commonly falls into the error of the vicious circle. The hypothetical cause of sensations is said to be matter. 3 From this point of view the sensation is a complex, comprising elaborate physical and physiological processes. 4 But these processes themselves, on the other hand, are said to be analysable into sensations. 5 Now two such methods of analysis cannot be equally ultimate. 6 If all of reality is finally reducible to sensations, then the term sensation must be used in a new sense to connote a self-subsistent being, 7 and can no longer refer merely to a function of certain physiological processes. 8 The issue of this would be some form of idealism or of the experience-philosophy that is now coming so rapidly to the front. 9 But while it is true that idealism has sometimes been intended, and that a radically new philosophy of experience has sometimes been closely approached, 10 those, nevertheless, who have developed experimentalism from the naturalistic stand-point have in reality achieved only a thinly disguised materialism. 11 For the very ground of their agnosticism is Materialistic Knowledge of reality itself is said to be unattainable, 12 because knowledge, in order to come within the order of Nature, must be regarded as reducible to sensation; 13 and because sensation itself, when regarded as a part of Nature, is only a physiological process, 14 a special phenomenon, in no way qualified to be knowledge that is true of reality.

NATURALISTIC EPISTEMOLOGY NOT SYSTEMATIC

Ralph Barton Perry

18 Perhaps, after all, it would be as fair to the spirit of naturalism to relieve it of responsibility for an epistemology. 2 It has never thoroughly reckoned with this problem. It has deliberately selected from among the elements of experience, 3 and been so highly constructive in its method as to forfeit its claim to pure empiricism; 4 and, on the other hand, has, in this same selection of categories and in its insistence upon the test of experiment, fallen short of a thorough-going rationalism. 5 While, on the one hand, it defines and constructs, it does so, on the other hand, within the field of perception and with constant reference to the test of perception. 6 The explanation and justification of this procedure is to be found in the aim of natural science rather than in that of philosophy. 7 It is this special interest, rather than the general problem of being, that determines the order of its categories. 8 Naturalism as an account of reality is acceptable only so far as its success in satisfying specific demands obtains for it a certain logical immunity. 9 These demands are unquestionably valid and fundamental, but they are not coextensive with the demand for truth. 10 They coincide rather with the immediate practical need of a formulation of the spatial and temporal changes that confront the will. 11 Hence naturalism is acceptable to common-sense as an account of what the every-day attitude to the environment treats as its object. 12 Naturalism is common-sense about the "outer world," revised and brought up to date with the aid of the results of science. 13 Its deepest spring is the organic instinct for the reality of the tangible, 14 the vital recognition of the significance of that which is on the plane of interaction with the body.

NATURE

GENERAL ETHICAL STAND-POINT

Ralph Barton Perry

19 Oddly enough, although common-sense is ready to entrust to naturalism the description of the situation of life, it prefers to deal otherwise with its ideals. 2 Indeed, common-sense is not without a certain suspicion that naturalism is the advocate of moral reversion. 3 It is recognised as the prophecy of the brute majority of life, 4 of those considerations of expediency and pleasure that are the warrant for its secular moods rather than for its sustaining ideals. 5 And that strand of life is indeed its special province. 6 For the naturalistic method of reduction must find the key to human action 7 among those practical conditions that are common to human and own inferiors in the scale of being. 8 In short, human life, like all life, must be construed as the adjustment of the organism to its natural environment 9 for the sake of preservation and economic advancement.

CYNICISM AND CYRENAICISM

Ralph Barton Perry

20 Early in Greek philosophy this general idea of life was picturesquely interpreted in two contrasting ways, those of the Cynic and the Cyrenaic. 2 Both of these wise men postulated the spiritual indifference of the universe at large, 3 and looked only to the contact of life with its immediate environment. 4 But while the one hoped only to hedge himself about, the other sought confidently the gratification of his sensibilities. 5 The figure of the Cynic is the more familiar. Diogenes of the tub practised self-mortification until his dermal and spiritual callousness were alike impervious. 6 From behind his protective sheath he could without affectation despise both Nature and society. 7 He could reckon himself more blessed than Alexander, 8 because, with demand reduced to the minimum, he could be sure of a surplus of supply. 9 Having renounced all goods save the bare necessities of life, he could neglect both promises and threats and be

played upon by no one. 10 He was securely entrenched within himself, an unfurnished habitation, but the citadel of a king. 11 The Cyrenaic, on the other hand, did not seek to make impervious the surface of contact with Nature and society, 12 but sought to heighten its sensibility, that it might become a medium of pleasurable feeling. 13 For the inspiration with which it may be pursued this ideal has nowhere been more eloquently set forth than in the pages of Walter Pater, who styles himself "the new Cyrenaic." 14 "Not the fruit of experience, but experience itself, is the end. 15 A counted number of pulses only is given to us of a variegated, dramatic life. 16 How may we see in them all that is to be seen in them by the finest senses? 17 How shall we pass most swiftly from point to point, and be present always at the focus where the greatest number of vital forces unite in their purest energy?

18 To burn always with this hard, gemlike flame, to maintain this ecstacy, is success in life. . . . 19 While all melts under our feet, we may well catch at any exquisite passion, 20 or any contribution to knowledge that seems by a lifted horizon to set the spirit free for a moment, 21 or any stirring of the senses, strange dyes, strange colours, and curious odours, or work of the artist's hands, or the face of one's friend. 22 Not to discriminate every moment some passionate attitude in those about us, 23 and in the brilliancy of their gifts some tragic dividing of forces on their ways, is, on this short day of frost and sun, to sleep before evening."

DEVELOPMENT OF UTILITARIANISM. EVOLUTIONARY CONCEPTION OF SOCIAL RELATIONS

Ralph Barton Perry

21 In the course of modern philosophy the ethics of naturalism has undergone a transformation 2 and development that equip it much more formidably for its competition with rival theories. 3 If the Cynic and Cyrenaic philosophies of life seem too egoistic and narrow in outlook,

this inadequacy has been largely overcome through the modern conception of the relation of the individual to society. 4 Human is regarded as so dependent upon social relations that it is both natural and rational for human to govern own actions with a concern for the community. 5 There was a time when this relation of dependence was viewed as external, a barter of goods between the individual and society, sanctioned by an implied contract. 6 Thomas Hobbes, whose unblushing materialism and egoism stimulated by opposition the whole development of English ethics, 7 conceived morality to consist in rules of action which condition the stability of the state, 8 and so secure for the individual that "peace" which self-interest teaches us is essential to our welfare. 9 "And therefore so long a human is in the condition of mere nature, which is a condition of war, as private appetite is the measure of good and evil: 10 and consequently all people agree on this, that peace is good, 11 and therefore also the ways or means of peace, which, as I have showed before, are 'justice,' 'gratitude,' 'modesty,' 'equity,' 'mercy,' 12 and the rest of the laws of Nature, are good; that is to say, 'moral virtues'; and their contrary 'vices,' evil."

13 Jeremy Bentham, the apostle of utilitarianism in the eighteenth century, defined political and social sanctions 14 through which the individual could purchase security and good repute with action conducive to the common welfare. 15 But the nineteenth century has understood the matter better-- and the idea of an evolution under conditions that select and reject, is here again the illuminating thought. 16 No individual, evolutionary naturalism maintains, has survived the perils of life without possessing as an inalienable part of own nature, 17 congenital like human’s egoism, certain impulses and instinctive desires in the interest of the community as a whole. 18 The latest generation of a race whose perpetuation has been conditioned by a capacity to sustain social relations and make common cause against a

more external environment, is moral, 19 and does not adopt morality in the course of a calculating egoism. 20 Conscience is the racial instinct of self-preservation uttering itself in the individual member, who draws your own very life-blood from the greater organism.

NATURALISTIC ETHICS NOT SYSTEMATIC
Ralph Barton Perry

22 This latest word of naturalistic ethics has not won acceptance as the last word in ethics, and this in spite of its indubitable truth within its scope. 2 For the deeper ethical interest seeks not so much to account for the moral nature as to construe and justify its promptings. 3 The evolutionary theory reveals the genesis of conscience, and demonstrates its continuity with Nature, 4 but this falls as far short of realising the purpose of ethical study as a history of the natural genesis of thought would fall short of logic. 5 Indeed, naturalism shows here, as in the realm of epistemology, a persistent failure to appreciate the central problem. 6 Its acceptance as a philosophy, we are again reminded, can be accounted for only on the score of its genuinely rudimentary character. 7 As a rudimentary phase of thought it is both indispensable and inadequate. 8 It is the philosophy of instinct, which should in normal development precede a philosophy of reason, in which it is eventually assimilated and supplemented.

NATURALISM AS ANTAGONISTIC TO RELIGION
Ralph Barton Perry

23 There is, finally, an inspiration for life which this philosophy of naturalism may convey -- 2 atheism, its detractors would call it, but none the less a faith and a spiritual exaltation that spring from its summing up of truth. 3 It is well first to realise that which is dispiriting in it, 4 its failure to provide for the freedom, immortality, and moral

providence of the more sanguine faith.

5 "For what is human looked at from this point of view? . . . 6 Human, so far as natural science by itself is able to teach us, is no longer the final cause of the universe, the Heaven-descended heir of all the ages. 7 Human very existence is an accident, its story a brief and transitory episode in the life of one of the meanest of the planets. 8 Of the combination of causes which first converted a dead organic compound into the living progenitors of humanity, science, indeed, as yet knows nothing. 9 It is enough that from such beginnings famine, disease, and mutual slaughter, fit nurses of the future lords of creation, have gradually evolved, 10 after infinite travail, a race with conscience enough to feel that it is vile, and intelligence enough to know that it is insignificant. . . . 11 We sound the future, and learn that after a period, long compared with the individual life, but short indeed compared with the divisions of time open to our investigation, 12 the energies of our system will decay, the glory of the sun will be dimmed, and the earth, tideless and inert, will no longer tolerate the race which has for a moment disturbed its solitude. 13 Human will go down into the pit, and all our thoughts will perish. 14 The uneasy consciousness, which in this obscure corner has for a brief space broken the contented silence of the universe, will be at rest. 15 Matter will know itself no longer. 'Imperishable monuments' and 'immortal deeds,' death itself, and love stronger than death, will be as though they had never been. 16 Nor will anything that is be better or be worse for all that the labour, genius, devotion, and suffering of human have striven through countless generations to effect."

NATURALISM AS THE BASIS FOR A RELIGION OF SERVICE, WONDER, AND RENUNCIATION

Ralph Barton Perry

24 But though our philosopher must accept the truth of this terrible

picture, he is not left without spiritual resources. 2 The abstract religion provided for the agnostic faithful by Herbert Spencer does not, it is true, afford any nourishment to the religious nature. 3 He would have people look for a deep spring of life in the negative idea of mystery, the apotheosis of ignorance, 4 while religious faith to live at all must lay hold upon reality. 5 But there does spring from naturalism a positive religion, whose fundamental motives are those of service, wonder, and renunciation: 6 service of humanity in the present, wonder at the natural truth, and renunciation of a universe keyed to vibrate with human ideals.

7 "Have you," writes Charles Ferguson, "had dreams of Nirvana and sickly visions and raptures? 8 Have you imagined that the end of your life is to be absorbed back into the life of God, and to flee the earth and forget all? 9 Or do you want to walk on air, or fly on wings, or build a heavenly city in the clouds? 10 Come, let us take our kit on our shoulders, and go out and build the city here."

11 For Haeckel "natural religion" is such as "the astonishment with which we gaze upon the starry heavens and the microscopic life in a drop of water, 12 the awe with which we trace the marvellous working of energy in the motion of matter, 13 the reverence with which we grasp the universal dominance of the law of substance throughout the universe."

14 There is a deeper and a sincerer note in the stout, forlorn humanism of Huxley: 15 "That which lies before the human race is a constant struggle to maintain and improve, 16 in opposition to the State of Nature, the State of Art of an organised polity; 17 in which, and by which, human may develop a worthy civilisation, capable of maintaining and constantly improving itself, 18 until the evolution of our globe shall have entered so far upon its downward course that the cosmic process resumes its sway; 19 and, once more, the State of Nature prevails over the surface of our planet."

MIRABAUD'S
SYSTEM OF NATURE
Paul Henri Thiery
(Baron D'Holbach)

25 The source of human's unhappiness *is* own ignorance of Nature. 2 The pertinacity with which human clings t*o* blind opinions imbibed in our infancy, which interweave themselves with human existence, 3 the consequent prejudice that warps human's mind, that prevents its expansion, that renders human the slave of fiction, appears to doom human to continual error. 4 Human resembles a child destitute of experience, full of ideal notions: 5 a dangerous leaven mixes itself with all own knowledge: it is of necessity obscure, it is vacillating and false:-- 6 Human takes the tone of own ideas on the authority of others, who are themselves in error, or else have an interest in deceiving others. 7 To remove this Cimmerian darkness, these barriers to the improvement of human's condition; 8 to disentangle human from the clouds of error that envelope human's mind; 9 to guide human out of this Cretan labyrinth, requires the clue of Ariadne, with all the love she could bestow on Theseus. 10 It exacts more than common exertion; it needs a most determined, a most undaunted courage-- 11 it is never effected but by a persevering resolution to act, to think for yourself; to examine with rigour and impartiality the opinions you have adopted. 12 Human will find that the most noxious weeds have sprung up beside beautiful flowers; 13 entwined themselves around their stems, overshadowed them with an exuberance of foliage, cloaked the ground, enfeebled their growth, diminished their petals; dimmed the brilliancy of their colours; 14 that deceived by their apparent freshness of their verdure, by the rapidity of their exfoliation, human have given them cultivation, 15 watered them, nurtured them, when human ought to have plucked out their very roots.

16 Human seeks to range out of own sphere: notwithstanding the reiterated checks of your ambitious folly experiences, you still attempts

the impossible; 17 strives to carry human researches beyond the visible world; and hunts out misery in imaginary regions. 18 Human would be a metaphysician before human has become a practical philosopher. 19 Human quits the contemplation of realities to meditate on chimeras. 20 Human neglects experience to feed on conjecture, to indulge in hypothesis. 21 Human dares not cultivate own reason, because from human's earliest days human has been taught to consider it criminal. 22 Human pretends to know own date in the indistinct abodes of another life, 23 before human has considered of the means by which human is to render itself happy in the world human inhabits: 24 in short, human disdains the study of Nature, except it be partially: 25 human pursues phantoms that resemble an 'ignis-fatuus', which at once dazzle, bewilders, and affright: 26 like the benighted traveller led astray by these deceptive exhalations of a swampy soil, 27 human frequently quits the plain, the simple road of truth, by pursuing of which, human can alone ever reasonably hope to reach the goal of happiness.

28 The most important of our duties, then, is to seek means by which we may destroy delusions that can never do more than mislead us. 29 The remedies for these evils must be sought for in Nature Herself; 30 it is only in the abundance of Her resources, that we can rationally expect to find antidotes to the mischiefs brought upon us by an ill directed, by an overpowering enthusiasm. 31 It is time these remedies were sought; it is time to look the evil boldly in the face, to examine its foundations, to scrutinise its superstructure: reason, with its faithful guide experience, 32 must attack in their entrenchments those prejudices, to which the human race has but too long been the victim. 33 For this purpose reason must be restored to its proper rank,-- it must be rescued from the evil company with which it is associated. 34 It has been too long degraded-- too long neglected-- cowardice has rendered it subservient to delirium, the slave to falsehood. 35 It must no longer be

held down by the massive claims of ignorant prejudice.

36 Truth is invariable-- it is requisite to human-- it can never harm you-- your very necessities, sooner or later, make you sensible of this; oblige you to acknowledge it. 37 Let us then discover it to mortals-- let us exhibit its charms-- let us shed it effulgence over the darkened road; 38 it is the only mode by which human can become disgusted with that disgraceful superstition which leads you into error, 39 and which but too often usurps your homage by treacherously covering itself with the mask of truth-- 40 its lustre can wound none but those enemies to the human race whose power is bottomed solely on the ignorance, 41 on the darkness in which they have in almost every claimed contrived to involve the mind of human.

42 Truth speaks not to those perverse beings:-- her voice can only be heard by generous souls accustomed to reflection, 43 whose sensibilities make them lament the numberless calamities showered on the earth by political and religious tyranny-- 44 whose enlightened minds contemplate with horror the immensity, the ponderousity of that series of misfortunes which error has in all ages overwhelmed humankind.

45 To error must be attributed those insupportable chains which tyrants, which priests have forged for most nations. 46 To error must be equally attributed that abject slavery into which the people of almost every country have fallen. 47 Nature designed they should pursue their happiness by the most perfect freedom.-- 48 To error must be attributed those religious terrors which, in almost every climate, have either petrified human with fear, or caused human to destroy themselves for coarse or fanciful beings. 49 To error must be attributed those inveterate hatreds, those barbarous persecutions, those numerous massacres, those dreadful tragedies, 50 of which, under pretext of serving the interests of heaven, the earth has been but too frequently made the theatre. 51 It is error consecrated by religious enthusiasm, which produces that ignorance, 52 that

uncertainty in which human ever finds themselves with regard to your most evident duties, your clearest rights, the most demonstrable truths. 53 In short, human is almost everywhere a poor degraded captive, devoid of greatness of soul, of reason, or of virtue, 54 whom human's inhuman gaolers have never permitted to see the light of day.

55 Let us then endeavour to disperse those clouds of ignorance, those mists of darkness, which impede human on your journey, 56 which obscure your progress, which prevent your marching through life with a firm, with a steady grip. 57 Let us try to inspire human with courage-- with respect for your reason-- with an inextinguishable love for truth-- 58 with a remembrance of Gallileo--to the end that you may learn to know yourself-- to know your legitimate rights-- 59 that you may learn to consult your own experience, and no longer be the dupe of an imagination led astray by authority-- 60 that you may renounce the prejudices of your childhood-- that you may learn to found your morals on your nature, on your wants, on the real advantage of society-- 61 that you may dare to love yourself-- that you may learn to pursue your true happiness by promoting that of others-- 62 in short, that you may no longer occupy yourself with reveries either useless or dangerous-- 63 that you may become a virtuous, a rational being, in which case you cannot fail to become happy.

64 If human must have own chimeras, let you at least learn to permit others to form theirs after their own fashion; 65 since nothing can be more immaterial than the manner of people's thinking on subjects not accessible to reason, 66 provided those thoughts be not suffered to embody themselves into actions injurious to others: 67 above all, let human be fully persuaded that it is of the utmost importance to the inhabitants of this world to be JUST, KIND, and PEACEABLE.

68 Far from injuring the cause of virtue, an impartial examination of the principles of this work will show that its object is to restore truth to its

proper temple, 69 to build up an altar whose foundations shall be consolidated by morality, reason, and justice: 70 from this sacred pane, virtue guarded by truth, clothed with experience, shall shed forth her radiance on delighted mortals; 71 whose homage flowing consecutively shall open to the world a new aera, 72 by rendering general the belief that happiness, the true end of human's existence, can never be attained but BY PROMOTING THAT OF ONE FELLOW CREATURE .

73 In short, human should learn to know, that happiness is simply an emanative quality formed by reflection; 74 that each individual ought to be the sun of one's own system, continually shedding around one's own genial rays; 75 that these, re-acting, will keep your own existence constantly supplied with the requisite heat to enable you to put forth kindly fruit.

NATURE AND HER LAWS
Paul Henri Thiery
(Baron D'Holbach)

26 Human has always deceived oneself when you abandoned experience to follow imaginary systems. 2 Human is the work of Nature. Human exists in Nature. Human is submitted to the laws of Nature. 3 Human cannot deliver oneself from them:-- cannot step beyond them even in thought. 4 It is in vain your mind would spring forward beyond the visible world: direful and imperious necessity ever compels you return-- 5 being formed by Nature, human is circumscribed by Her laws; 6 there exists nothing beyond the great whole of which human forms a part, of which human experiences the influence. 7 The beings human fancy pictures as above Nature, or distinguished from Her, are always chimeras formed after that which you have already seen, 8 but of which it is utterly impossible human should ever form any finished idea, either as to the place they occupy, or their manner of

acting-- 9 for human there is not, there can be nothing out of that Nature which includes all beings.

10 Therefore, instead of seeking out of the world you inhabits for beings who can procure yourself a happiness denied to human by Nature, 11 let you study this Nature, learn Her laws, contemplate Her energies, observe the immutable rules by which She acts. 12 Let you apply these discoveries to your own felicity, and submit in silence to Her precepts, which nothing can alter. 13 Let you cheerfully consent to be ignorant of causes hid from human under the most impenetrable veil. 14 Let you yield to the decrees of a universal power, which can never be brought within your own comprehension, 15 nor ever emancipate you from those laws imposed on yourself by human's essence.

16 The distinction which has been so often made between the physical and the moral being, is evidently an abuse of terms. 17 Human is a being purely physical: the moral human is nothing more than this physical being considered under a certain point of view; 18 that is to say, with relation to some of human's modes of action, arising out of your individual organisation. 19 But is not this organisation itself the work of Nature?

20 The motion or impulse to action, of which human is susceptible, is that not physical? 21 Human visible actions, as well as the invisible motion interiorly excited by your will or your thoughts, are equally the natural effects, 22 the necessary consequencesyou're your peculiar construction, and the impulse you receives from those beings by whom you are always surrounded. 23 All that the human mind has successively invented, with a view to change or perfect your being, to render yourself happy, 24 was never more than the necessary consequence of human's peculiar essence, and that of the beings who act upon yourself.

25 The object of all human's institutions, all human's reflections, all human's knowledge, is only to procure that happiness toward which you is continually impelled by the

peculiarity of your nature. 26 All that you does, all that you thinks, all that you are, all that you will be, is nothing more than what Universal Nature has made human. 27 Human's ideas, human's actions, human's will, are the necessary effects of those properties infused into human by Nature, 28 and of those circumstances in which She has placed human. 29 In short, art is nothing but Nature acting with the tools She has furnished.

30 Nature sends human naked and destitute into this world which is to be human's abode: 31 human quickly learns to cover own nakedness-- to shelter oneself from the inclemencies of the weather, 32 first with artlessly constructed huts, and the skins of the beasts of the forest; by degrees human mends their appearance, renders them more convenient: 33 human establishes manufactories to supply own immediate wants; 34 human digs clay, gold, and other fossils from the bowels of the earth; converts them into bricks for own house, into vessels for own use, gradually improves their shape, and augments their beauty. 35 To a being exalted above our terrestrial globe, human would not appear less subjected to the laws of Nature when naked in the forest painfully seeking own sustenance, 36 than when living in civilised society surrounded with ease, or enriched with greater experience, plunged in luxury, 37 where human everyday invents a thousand new wants and discovers a thousand new modes of supplying them. 38 All the steps taken by human to regulate own existence, ought only to be considered as a long succession of causes and effects, 39 which are nothing more than the development of the first impulse given human by Nature.

40 The same animal, by virtue of their organisation, passes successively from the most simple to the most complicated wants; it is nevertheless the consequence of their nature. 41 The butterfly whose beauty we admire, whose colours are so rich, whose appearance is so brilliant, commences as an inanimate unattractive egg; 42 from this, heat produces a worm, this

becomes a chrysalis, then changes into that beautiful insect adorned with the most vivid tints: 43 arrived at this stage it reproduces, it generates; at last despoiled of its ornaments, it is obliged to disappear, having fulfilled the task imposed on it by Nature, 44 having performed the circle of transformation marked out for beings of its order.

45 The same course, the same change takes place in the vegetable world. 46 It is by a series of combinations originally interwoven with the energies of the aloe, 47 that this plant is insensibly regulated, gradually expanded, and at the end of a number of years produces those flowers which announce its dissolution.

48 It is equally so with human, who in all your motion, all the changes you undergoes, never acts but according to the laws peculiar to your organisation, and to the matter of which you are composed. 49 The physical human, is one who acts by the causes our faculties make us understand. 50 The moral person, is one who acts by physical causes, with which our prejudices preclude us from becoming perfectly acquainted. 51 The wild person is a child destitute of experience, incapable of proceeding in own happiness, 52 because human has not learnt how to oppose resistance to the impulses you receives from those beings by whom you are surrounded. 53 The civilised person, is one whom experience and sociality have enabled to draw from Nature the means of your own happiness, 54 because you have learned to oppose resistance to those impulses you receives from exterior beings, 55 when experience has taught you they would be destructive to your welfare. 56 The enlightened person is one in own maturity, in own perfection; who is capable of advancing one's own felicity, 57 because you have learned to examine, to think for yourself, and not to take that for truth upon the authority of others, 58 which experience has taught you a critical disquisition will frequently prove erroneous. 59 The happy person is one who knows how to enjoy the benefits bestowed upon human by Nature: 60 in other words,

one who thinks for oneself; who is thankful for the good human possesses; 61 who does not envy the welfare of others, nor sigh after imaginary benefits always beyond one's grasp. 62 The unhappy person is one who is incapacitated to enjoy the benefits of Nature; 63 that is, one who suffers others to think for themselves; who neglects the absolute good human possesses, in a fruitless search after ideal benefits; 64 who vainly sighs after that whichever eludes your pursuit.

65 It necessarily results, that human in own enquiry ought always to contemplate experience, and natural philosophy: 66 These are what you should consult in your religion,-- in your morals,-- in your legislation,-- in your state-government,-- in the arts,-- in the sciences,-- in your pleasures,-- above all, in your misfortunes. 67 Experience teaches that Nature acts by simple, regular, and invariable laws. 68 It is by human own senses, human is bound to this universal Nature; 69 it is by human's own perception human must penetrate Nature's secrets; 70 it is from human's own senses human must draw experience of Nature's laws. 71 Therefore, whenever you neglects to acquire experience or quits Her path, you stumbles into an abyss; your own imagination leads you astray.

72 All the errors of human are physical: a person never deceives oneself 73 but when human neglects to return back to Nature, to consult Her laws, to call practical knowledge to one's aid. 74 It is for want of practical knowledge a person forms such imperfect ideas of matter, 75 of its properties, of its combinations, of its power, of its mode of action, and of the energies which spring from its essence. 76 Wanting this experience, the whole universe, to human, is but one vast scene of error. 77 The most ordinary results appear to human the most astonishing phenomena; human wonders at everything, understands nothing, 78 and yields the guidance of your actions to those interested in betraying your interests. 79 Human is ignorant of Nature, and human has mistaken Nature's laws; 80 human has not contemplated the necessary

routine which Nature has marked out for everything She holds.

81 Mistaken the laws of Nature, did I say? Human has mistaken themselves: 82 the consequence is, that all human systems, all human conjectures, all human reasonings, from which you have banished experience, are nothing more than a tissue of errors, a long chain of inconsistencies. 83 Error is always prejudicial to human: it is by deceiving yourself the human race is plunged into misery. 84 Human neglected Nature; human did not comprehend Her laws; human formed gods of the most preposterous and ridiculous kinds: 85 these became the sole objects of your hope, and the creatures of your fear: human was unhappy, human trembled under these visionary deities; 86 under the supposed influence of visionary beings created by human; under the terror inspired by blocks of stone; 87 by logs of wood; by flying fish; or the frowns of people, mortal as yourself, 88 whom your disturbed fancy had elevated above that Nature of which alone you are capable of forming any idea. 89 Human's very posterity laughs at own folly, because experience has convinced them of the absurdity of own groundless fears-- of human misplaced worship. 90 Thus has passed away the ancient mythology, with all the trifling and nonsensical attributes attached to it by ignorance.

91 Not understanding that Nature, equal in Her distributions, entirely destitute of malice, follows only necessary and immutable laws, 92 when Nature either produces beings or destroys them, when She causes those to suffer, whose construction creates sensibility; 93 when She scatters among them good and evil; when She subjects them to incessant change-- 94 human did not perceive it was in the breast of Nature Herself, that it was in Her exuberance you ought to seek to satisfy your own deficiencies; 95 for remedies against your pains; for the means of rendering yourself happy: you expected to derive these benefits from fantastic beings, whom you supposed to be above Nature; 96

whom you mistakenly imagined to be the authors of your pleasures, and the cause of your misfortunes. 97 From hence it appears that to human ignorance of Nature, you owes the creation of those illusive powers; under which you has so long trembled with fear; 98 that superstitious worship, which has been the source of all human misery, and the evils entailed upon posterity.

99 For want of clearly comprehending your own peculiar nature, your proper course, your wants, and your rights, human has fallen in society, from FREEDOM INTO SLAVERY 100 Human had forgotten the purpose of own existence, or else you believed yourself obliged to suppress the natural desires of your own heart, 101 to sacrifice your own welfare to the caprice of chiefs, either elected by yourself, or submitted to without examination. 102 Human was ignorant of the true policy of association-- of the object of government; 103 you disdained to listen to the voice of Nature, which loudly proclaimed the price of all submission to be protection and happiness: 104 the end of all government is the benefit of the governed, not the exclusive advantage of the governors. 105 You gave yourself up without enquiry to people like yourself, whom your prejudices induced you to contemplate as beings of a superior order, 106 as God upon earth, they profited by your own ignorance, took advantage of your own prejudices, corrupted you, rendered you vicious, enslaved you, and made you miserable. 107 Thus human, intended by Nature for the full enjoyment of liberty, to patiently search out Her laws, to investigate Her secrets, to cling to your own experience; 108 has, from a neglect of Her salutary admonitions, from an inexcusable ignorance of your own peculiar essence, fallen into servility: has been wickedly governed.

109 Having mistaken yourself, human has remained ignorant of the indispensable affinity that subsists between yourself, and the beings of your own species: 110 having mistaken your duty to yourself, it consequently follows, human has

mistaken own duty to others. 111 Human made a calculation in error of what your happiness required; 112 you did not perceive, what you owed to yourself, the excesses you ought to avoid, the desires you ought to resist, the impulses you ought to follow, 113 in order to consolidate your felicity, to promote your comfort, and to further your advantage. 114 In short, human was ignorant of own true interests; hence your irregularities, your excesses, your shameful extravagance, 115 with that long train of vices, to which you have abandoned yourself, at the expense of your preservation, at the hazard of your permanent prosperity.

116 It is, therefore, ignorance of yourself that has hindered human from enlightening own morals. 117 The corrupt authorities to which you had submitted, felt an interest in obstructing the practice of your duties, even when you knew them. 118 Time, with the influence of ignorance, aided by your own corruption, gave them a strength not to be resisted by your enfeebled voice. 119 Human's duties continued unperformed, and you fell into contempt both with yourself and with others.

120 The ignorance of human has endured so long, human has taken such slow, such irresolute steps to ameliorate human condition, 121 only because human has neglected to study Nature, to scrutinise Her laws, to search out Her expedients, to discover Her properties, 122 that your sluggishness finds its account, in permitting yourself to be guided by example, rather than to follow experience, which demands activity; 123 to be led by routine, rather than by your reason, which enjoins reflection; 124 to take that for truth upon the authority of others, which would require a diligent and patient investigation. 125 From hence may be traced the hatred human betrays for everything that deviates from those rules to which you have been accustomed; 126 hence you stupid, your scrupulous respect for antiquity, for the most silly, the most absurd and ridiculous institutions of your fathers: 127 hence those fears that seize you, when the most beneficial

changes are proposed to you, or the most likely attempts are made to better your condition. 128 Human dreads to examine, because you have been taught to hold it irreverent of something immediately connected with your welfare; 129 human's credulity suffers you to believe the interested advice, and spurns at those who wish to show you the danger of the road you are travelling.

130 This is the reason why nations linger on in the most shameful lethargy, suffering under abuses handed down from century to century, 131 trembling at the very idea of that which alone can repair their calamities. 132 It is for want of energy, for want of consulting experience, that medicine, natural philosophy, agriculture, painting, in fact, all the useful sciences, have so long remained under the fetters of authority, have progressed so little: 133 those who profess these sciences, prefer treading the beaten paths, however imperfect, rather than strike out new ones,-- 134 they prefer the phrensy of their imagination, their voluntary conjectures, to that laboured experience which alone can extract Her secrets from Nature.

135 Human, in short, whether from sloth or from terror, having abnegated the evidence of own senses, has been guided in all own actions, in all own enterprises, 136 by imagination, by enthusiasm, by habit, by preconceived opinions, but above all, by the influence of authority, 137 which knew well how to deceive human, to turn human ignorance to esteem, human sloth to advantage. 138 Thus imaginary, unsubstantial systems, have supplied the place of experience-- of mature reflection-- of reason. 139 Human, petrified with own fears, intoxicated with the marvellous, stupefied with sloth, surrendered own experience: 140 guided by human credulity, you was unable to fall back upon it; you became consequently inexperienced; 141 from thence you gave birth to the most ridiculous opinions, 142 or else adopted all those vague chimeras, all those idle notions offered to you by people whose interest it was to continue human in that lamentable state of ignorance.

143 Thus the human race has continued so long in a state of infancy, because human has been inattentive to Nature; has neglected Her ways, 144 because you have disdained experience--because you have thrown by your reason--because you have been enraptured with the marvellous and the supernatural,-- because you have unnecessarily TREMBLED. 145 These are the reasons there is so much trouble in conducting yourself from this state of childhood to that of humanhood. 146 Human has had nothing but the most trifling hypotheses, of which you have never dared to examine either the principles or the proofs, 147 because you have been accustomed to hold them sacred, to consider them as the most perfect truths, and which you are not permitted to doubt, even for an instant. 148 Human's ignorance made you credulous; human's curiosity made you swallow the wonderful: time confirmed you in your own opinions, 149 and you passed your conjectures from race to race for realities; 150 a tyrannical power maintained human in your own notions, because by those alone could society be enslaved. 151 It was in vain that some faint glimmerings of Nature occasionally attempted the recall of your own reason, 152 that slight coruscations of experience sometimes threw human darkness into light, 153 the interest of the few was founded on one person's enthusiasm; their pre-eminence depended on the person's love of the marvellous; 154 their very existence rested on the firmness of the person's ignorance; 155 they consequently suffered no opportunity to escape, of smothering even the transient flame of intelligence. 156 The many were thus first deceived into credulity, then forced into submission. 157 At length the whole science of human became a confused mass of darkness, falsehood, and contradictions, 158 with here and there a feeble ray of truth, furnished by that Nature, of which you can never entirely divest yourself; 159 because, without human perception, human necessities are continually bringing you back to Nature's resources.

160 Let us then, if possible, raise ourselves above these clouds of prepossession! 161 Let us quit the heavy atmosphere in which we are enucleated; 162 let us in a more unsullied medium-- in a more elastic current, contemplate the opinions of people, and observe their various systems. 163 Let us learn to distrust a disordered conception; let us take that faithful monitor, experience, for our guide; 164 let us consult Nature, examine Her laws, dive into Her stores; let us draw from Herself, our ideas of the beings She contains; 165 let us recover our senses, which interested error has taught us to suspect; 166 let us consult that reason, which, for the vilest purposes has been so infamously calumniated, so cruelly dishonoured; 167 let us examine with attention the visible world; 168 let us try, if it will not enable us to form a supportable judgment of the invisible territory of the intellectual world: 169 perhaps it may be found there has been no sufficient reason for distinguishing them-- 170 that it is not without motives, well worthy our enquiry, that two empires have been separated, which are equally the inheritance of Nature.

171 The universe, that vast assemblage of everything that exists, presents only matter and motion: 172 the whole offers to our contemplation, nothing but an immense, an uninterrupted succession of causes and effects; 173 some of these causes are known to us, because they either strike immediately on our senses, or have been brought under their cognisance, by the examination of long experience; 174 others are unknown to us, because they act upon us by effects, frequently very remote from their primary cause. 175 An immense variety of matter, combined under an infinity of forms, incessantly communicates, unceasingly receives a diversity of impulses. 176 The different qualities of this matter, its innumerable combinations, its various methods of action, 177 which are the necessary consequence of these associations, constitute for human what we calls the ESSENCE of beings: 178 it is from these varied

essences that spring the orders, the classes, or the systems, which these beings respectively possess, 179 of which the sum total makes up that which is known by the term Nature.

180 Nature, therefore, in its most significant meaning, is the great whole that results from the collection of matter, 181 under its various combinations, with that contrariety of motion, which the universe presents to our view. 182 Nature, in a less extended sense, or considered in each individual, is the whole that results from its essence; 183 that is to say, the peculiar qualities, the combination, the impulse, and the various modes of action, by which it is discriminated from other beings. 184 It is thus that HUMAN is, as a whole, or in own nature, the result of a certain combination of matter, 185 endowed with peculiar properties, competent to give, capable of receiving, certain impulses, the arrangement of which is called organisation; 186 of which the essence is, to feel, to think, to act, to move, after a manner distinguished from other beings, with which you can be compared. 187 Human, therefore, ranks in an order, in a system, in a class by oneself, 188 which differs from that of other animals, in whom we do not perceive those properties of which human is possessed. 189 The different systems of beings, or if they will, their particular natures, depend on the general system of the great whole, 190 or that Universal Nature, of which they form a part; to which everything that exists is necessarily submitted and attached.

191 Having described the proper definition that should be applied to the word NATURE, I must advise the reader, once for all, 192 that whenever in the course of this work the expression occurs, that "Nature produces such or such an effect," 193 there is no intention of personifying that Nature which is purely an abstract being; 194 it merely indicates that the effect spoken of necessarily springs from the peculiar properties of those beings which compose the mighty macrocosm. 195 When, therefore, it is said, Nature demands that human should pursue one’s own

happiness, it is to prevent circumlocution -- to avoid tautology; 196 it is to be understood, that it is the property of a being that feels, that thinks, that acts, to labour to its own happiness; 197 in short, that is called natural, which is conformable to the essence of things, or to the laws, which Nature prescribes to the beings She contains, 198 in the different orders they occupy, under the various circumstances through which they are obliged to pass. 199 Thus health is natural to human in a certain state; disease is natural to human under other circumstances; dissolution, 200 or if they will, death, is a natural state for a body, deprived of some of those things, necessary to maintain the existence of the animal. 201 By ESSENCE is to be understood, that which constitutes a being, such as it is; the whole of the properties or qualities by which it acts as it does. 202 Thus, when it is said, it is the essence of a stone to fall, it is the same as saying that its descent is the necessary effect of its gravity-- 203 of its density-- of the cohesion of its parts-- of the elements of which it is composed. 204 In short, the essence of a being is its particular, its individual nature.

OF MOTION, AND ITS ORIGIN

Paul Henri Thiery (Baron D'Holbach)

27 Motion is an effect by which a body either changes, or has a tendency to change, its position: 2 that is to say, by which it successively corresponds with different parts of space, or changes its relative distance to other bodies. 3 It is motion alone that establishes the relation between our senses and exterior or interior beings: 4 it is only by motion that these beings are impressed upon us-- that we know their existence-- that we judge of their properties-- 5 that we distinguish the one from the other-- that we distribute them into classes. 6 The beings, the substances, or the various bodies of which Nature is the assemblage, 7 are themselves effects of certain combinations or causes which become causes in their turn. 8

NATURE

A CAUSE is a being which puts another in motion, or which produces some change in it. 9 The EFFECT is the change produced in one body, by the motion or presence of another. 10 Each being, by its essence, by its peculiar nature, has the faculty of producing, is capable of receiving, has the power of communicating, a variety of motion. 11 Thus some beings are proper to strike our organs; 12 these organs are competent to receiving the impression, are adequate to undergoing changes by their presence. 13 Those which cannot act on any of our organs, either immediately and by themselves, or immediately by the intervention of other bodies, exist not for us; 14 since they can neither move us, nor consequently furnish us with ideas: 15 they can neither be known to us, nor of course be judged of by us. 16 To know an object, is to have felt it; to feel it, it is requisite to have been moved by it. 17 To see, is to have been moved, by something acting on the visual organs; 18 to hear, is to have been struck, by something on our auditory nerves. 19 In short, in whatever mode a body may act upon us, whatever impulse we may receive from it, we can have no other knowledge of it than by the change it produces in us.

20 Nature, as we have already said, is the assemblage of all the beings, 21 consequently of all the motion of which we have a knowledge, as well as of many others of which we know nothing, because they have not yet become accessible to our senses. 22 From the continual action and re-action of these beings, result a series of causes and effects; 23 or a chain of motion guided by the constant and invariable laws peculiar to each being; 24 which are necessary or inherent to its particular nature--which make it always act or move after a determinate manner. 25 The different principles of this motion are unknown to us, because we are in many instances, if not in all, ignorant of what constitutes the essence of beings. 26 The elements of bodies escape our senses; we know them only in the mass: 27 we are neither acquainted with their intimate

combination, nor the proportion of these combinations; 28 from whence must necessarily result their mode of action, their impulse, or their different effects.

29 Our senses bring us generally acquainted with two sorts of motion in the beings that surround us: 30 the one is the motion of the mass, by which an entire body is transferred from one place to another. 31 Of the motion of this genus we are perfectly sensible. 32 Thus, we see a stone fall, a ball roll, an arm move, or change its position. 33 The other is an internal or concealed motion, which always depends on the peculiar energies of a body: that is to say, on its essence, 34 or the combination, the action, and re-action of the minute-- of the insensible particles of matter, of which that body is composed. 35 This motion we do not see; we know it only by the alteration or change, which after some time we discover in these bodies or mixtures. 36 Of this genus is that concealed motion which fermentation produces in the particles that compose flour, 37 which, however scattered, however separated, unite, and form that mass which we call BREAD. 38 Such also is the imperceptible motion by which we see a plant or animal enlarge, strengthen, undergo changes, and acquire new qualities, 39 without our eyes being competent to follow its progression, or to perceive the causes which have produced these effects. 40 Such also is the internal motion that takes place in human, which is called your INTELLECTUAL FACULTIES, your THOUGHTS, your PASSIONS, your will. 41 Of these we have no other mode of judging, than by their action; that is, by those sensible effects which either accompany or follow them. 42 Thus, when we see a person run away, we judge the person to be interiorly actuated by the passion of fear.

43 Motion, whether visible or concealed, is styled ACQUIRED, when it is impressed on one body by another; 44 either by a cause to which we are a stranger, or by an exterior agent which our senses enable us to discover. 45 Thus we call that acquired motion, which the wind

gives to the sails of a ship. 46 That motion which is excited in a body, that contains within itself the causes of those changes we see it undergo, is called SPONTANEOUS. 47 Then it is said, this body acts or moves by its own peculiar energies. Of this kind is the motion of the person who walks, who talks, who thinks. 48 Nevertheless, if we examine the matter a little closer, we shall be convinced, that, strictly speaking, there is no such thing as spontaneous motion in any of the various bodies of Nature; 49 seeing they are perpetually acting one upon the other; that all their changes are to be attributed to the causes, either visible or concealed, by which they are moved. 50 The will of human is secretly moved or determined by some exterior cause that produces a change in human: 51 we believe human moves of oneself, because we neither see the cause that determined human, the mode in which it acted, nor the organ that it put in motion.

52 That is called SIMPLE MOTION, which is excited in a body by a single cause. 53 COMPOUND MOTION, that which is produced by two or more different causes; 54 whether these causes are equal or unequal, conspiring differently, acting together or in succession, known or unknown.

55 Let the motion of beings be of whatsoever nature it may, it is always the necessary consequence of their essence, 56 or of the properties which compose them, and of those causes of which they experience the action. 57 Each being can only move and act after a particular manner; 58 that is to say, conformably to those laws which result from its peculiar essence, its particular combination, its individual nature: 59 in short, from its specific energies, and those of the bodies from which it receives an impulse. 60 It is this that constitutes the invariable laws of motion:

61 I say invariable, because they can never change, without producing confusion in the essence of things. 62 It is thus that a heavy body must necessarily fall, if it meets with no obstacle sufficient to arrest its descent; 63 that a sensible body must naturally seek pleasure, and avoid

pain; 64 that fire must necessarily burn, and diffuse light. 65 Each being, then, has laws of motion, that are adapted to itself, 66 and constantly acts or moves according to these laws; at least when no superior cause interrupts its action. 67 Thus, fire ceases to burn combustible matter, as soon as sufficient water is thrown into it, to arrest its progress. 68 Thus, a sensible being ceases to seek pleasure, as soon as the person fears that pain will be the result. 69 The communication of motion, or the medium of action, from one body to another, also follows certain and necessary laws; 70 one being can only communicate motion to another, by the affinity, by the resemblance, by the conformity, by the analogy, 71 or by the point of contact, which it has with that other being. 72 Fire can only propagate when it finds matter analogous to itself: it extinguishes when it encounters bodies which it cannot embrace; 73 that is to say, that do not bear towards it a certain degree of relation or affinity.

74 Everything in the universe is in motion: the essence of matter is to act: 75 if we consider its parts, attentively, we shall discover there is not a particle that enjoys absolute repose. 76 Those which appear to us to be without motion, are, in fact, only in relative or apparent rest; 77 they experience such an imperceptible motion, and expose it so little on their surfaces, that we cannot perceive the changes they undergo. 78 All that appears to us to be at rest, does not, however, remain one instant in the same state. 79 All beings are continually breeding, increasing, decreasing, or dispersing, with more or less dullness or rapidity. 80 The insect called EPHEMERON, is produced and perishes in the same day; of consequence, it experiences the greatest changes of its being very rapidly, in our eyes. 81 Those combinations which form the most solid bodies, which appear to enjoy the most perfect repose, are nevertheless decomposed, and dissolved in the course of time. 82 The hardest stones, by degrees, give way to the contact of air. 83 A mass

of iron, which time, and the action of the atmosphere, has gnawed into rust, 84 must have been in motion, from the moment of its formation, in the bowels of the earth, until the instant we behold it in this state of dissolution.

85 Natural philosophers, for the most part, seem not to have sufficiently reflected on what they call the nisus; 86 that is to say, the incessant efforts one body is making on another, but which, notwithstanding appear, to our superficial observation, to enjoy the most perfect repose. 87 A stone of five hundred weight seems to rest quiet on the earth, nevertheless, it never ceases for an instant, to press with force upon the earth, which resists or repulses it in its turn. 88 Will the assertion be ventured, that the stone and earth do not act? Do they wish to be undeceived? 89 They have nothing to do but interpose their hand betwixt the earth and the stone; 90 it will then be discovered, that notwithstanding its seeming repose, the stone has power adequate to bruise it; 91 because the hand has not energies sufficient, within itself, to resist effectually both the stone and earth. 92 Action cannot exist in bodies without re-action. 93 A body that experiences an impulse, an attraction, or a pressure of any kind, if it resists, clearly demonstrates by such resistance that it re-acts; 94 from whence it follows, there is a concealed force, called by these philosophers ‘vis inertia’, that displays itself against another force; 95 and this clearly demonstrates, that this inert force is capable of both acting and re-acting. 96 In short, it will be found, on close investigation, that those powers which are called dead, and those which are termed live or moving, are powers of the same kind; which only display themselves after a different manner.

97 Permit us to go a greater distance yet. May we not say, that in those bodies, or masses, of which their whole become evident from appearances to us to be at rest, 98 there is notwithstanding, a continual action, and counter-action, constant efforts, uninterrupted or communicated force, and continued opposition? 99 In short, a nisus, by

which the constituting portions of these bodies press one upon another, mutually resisting each other, acting and re-acting incessantly? 100 That this reciprocity of action, this simultaneous re-action, keeps them united, 101 causes their particles to form a mass, a body, and a combination, which, viewed in its whole, has the appearance of complete rest, 102 notwithstanding not one of its particles really ceases to be in motion for a single instant? 103 These collective masses appear to be at rest, simply by the equality of the motion-- 104 by the responsorial impulse of the powers acting in them.

105 Thus it appears that bodies enjoying perfect repose, really receive, whether upon their surface, or in their interior, a continual communicated force, 106 from those bodies by which they are either surrounded or penetrated, dilated or contracted, rarified or condensed: in fact, from those which compose them; 107 whereby their particles are incessantly acting and re-acting, or in continual motion, the effects of which are displayed by extraordinary changes. 108 Thus heat rarifies and dilates metals, which is evidence deducible that a bar of iron, from the change of the atmosphere alone, must be in continual motion; 109 that there is not a single particle in it that can be said to enjoy rest even for a single moment. 110 In those hard bodies, indeed, the particles of which are in actual contact, and which are closely united, 111 how is it possible to conceive, that air, cold, or heat, can act upon one of these particles, even exteriorly, 112 without the motion being communicated to those which are most intimate and minute in their union? 113 Without motion, how should we be able to comprehend the manner in which our sense of smelling is affected, by emanations escaping from the most solid bodies, 114 of which all the particles appear to be at perfect rest? 115 How could we, even by the assistance of a telescope, see the most distant stars, if there was not a progressive motion of light from these stars to the retina of our eye?

116 Observation and reflection ought to convince us, that everything in Nature is in continual motion-- 117 that there is not a single part, however small, that enjoys repose-- that Nature acts in all-- that She would cease to be Nature if She did not act. 118 Practical knowledge teaches us, that without unceasing motion, nothing could be preserved-- nothing could be produced-- nothing could act in this Nature. 119 Thus the idea of Nature necessarily includes that of motion. 120 But it will be asked, and not a little triumphantly, from whence did Nature derive Her motion? 121 Our reply is, we know not, neither do they-- that we never shall, that they never will. 122 It is a secret hidden from us, concealed from them, by the most impenetrable veil. 123 We also reply, that it is fair to infer, unless they can logically prove to the contrary, that it is in Herself, since She is the great whole, out of which nothing can exist. 124 We say this motion is a manner of existence, that flows, necessarily, out of the nature of matter; 125 that matter moves by its own peculiar energies; that its motion is to be attributed to the force which is inherent in itself; 126 that the variety of motion, and the phenomena which result, proceed from the diversity of the properties-- 127 of the qualities-- of the combinations, which are originally found in the primitive matter, of which Nature is the assemblage.

128 Natural philosophers, for the most part, have regarded as inanimate, or as deprived of the faculty of motion, those bodies which are only moved by the intervention of some agent or exterior cause; 129 they have considered themselves justified in concluding, that the matter which forms these bodies is perfectly inert in its nature. 130 They have not forsaken this error, 131 although they must have observed, that whenever a body is left to itself, or disengaged from those obstructions which oppose themselves to its descent, it has a tendency to fall 132 or to approach the centre of the earth, by a motion uniformly accelerated; 133 they have rather chosen to suppose a

visionary exterior cause, of which they themselves had but an imperfect idea, 134 than admit that these bodies held their motion from their own peculiar nature. 135 These philosophers, also, notwithstanding they saw above them an infinite number of globes 136 that moved with great rapidity round a common centre, still adhered to their favourite opinions; 137 and never ceased to suppose some whimsical causes for these movements, until the immortal 138 NEWTON clearly demonstrated that it was the effect of the gravitation of these celestial bodies towards each other. 139 Experimental philosophers, however, and amongst them the great Newton himself, have held the cause of gravitation as inexplicable. 140 Notwithstanding the great weight of this authority, it appears manifest that it may be deduced from the motion of matter, by which bodies are diversely determined. 141 Gravitation is nothing more than a mode of moving-- a tendency towards a centre: 142 to speak strictly, all motion is relative gravitation; since that which falls relatively to us, rises, with relation to other bodies. 143 From this it follows, that every motion in our microcosm is the effect of gravitation; 144 seeing that there is not in the universe either top or bottom, nor any absolute centre. 145 It should appear, that the weight of bodies depends on their configuration, 146 as well external as internal, which gives them that form of action which is called gravitation. 147 Thus, for instance, a piece of lead, spherically formed, falls quickly and direct: 148 reduce this ball into very thin plates, it will be sustained in the air for a much longer time: 149 apply to it the action of fire, this lead will rise in the atmosphere: 150 here, then, the same metal, variously modified, has very different modes of action.

151 A very simple observation would have sufficed to make the philosophers, antecedent to Newton, feel the inadequateness of the causes they admitted to operate with such powerful effect. 152 They had a sufficiency to convince themselves, in the collision of two bodies, which

they could contemplate, 153 and in the known laws of that motion, which these always communicate by reason of their greater or less compactness; 154 from whence they ought to have inferred, that the density of subtle or ethereal matter, being considerably less than that of the planets, 155 it could only communicate to them a very feeble motion, quite insufficient to produce that velocity of action, of which they could not possibly avoid being the witnesses.

156 If Nature had been viewed uninfluenced by prejudice, they must have been long since convinced that matter acts by its own peculiar activity; 157 that it needs no exterior communicative force to set it in motion. 158 They might have perceived that whenever mixed bodies were placed in a situation to act on each other, motion was instantly excited; 159 and that these mixtures acted with a force capable of producing the most surprising results. 160 If particles of iron, sulphur, and water be mixed together, these bodies thus capacitated to act on each other, are heated by degrees, and ultimately produce a violent combustion. 161 If flour be wetted with water, and the mixture closed up, it will be found, after some lapse of time, (by the aid of a microscope) to have produced organised beings that enjoy life, 162 of which the water and the flour were believed incapable: 163 it is thus that inanimate matter can pass into life, or animate matter, which is in itself only an assemblage of motion.

164 Reasoning from analogy, which the philosophers of the present day do not hold incompatible: 165 the production of a human, independent of the ordinary means, would not be more astonishing than that of an insect with flour and water. 166 Fermentation and putrid substances, evidently produce living animals. 167 We have here the principle; with proper materials, principles can always be brought into action. 168 That generation which is styled uncertain is only so for those who do not reflect, 169 or who do not permit themselves, attentively, to observe the operations of Nature.

NATURE

170 The generative of motion, and its development, as well as the energy of matter, may be seen everywhere; 171 more particularly in those unitions in which fire, air, and water, find themselves combined. 172 These elements, or rather these mixed bodies, are the most volatile, the most fugitive of beings; 173 nevertheless in the hands of Nature, they are the essential agents employed to produce the most striking phenomena. 174 To these we must ascribe the effects of thunder, the eruption of volcanoes, earthquakes. 175 Science offers to our consideration an agent of astonishing force, in gunpowder, the instant it comes in contact with fire. 176 In short, the most terrible effects result from the combination of matter, which is generally believed to be dead and inert.

177 These facts prove, beyond a doubt, that motion is produced, is augmented, is accelerated in matter, without the help of any exterior agent: 178 therefore it is reasonable to conclude that motion is the necessary consequence of immutable laws, 179 resulting from the essence, from the properties existing in the different elements, and the various combinations of these elements. 180 Are we not justified, then, in concluding, from these precedents, that there may be an infinity of other combinations, 181 with which we are unacquainted, competent to produce a great variety of motion in matter, 182 without being under the necessity of having recourse, for the explanation, to agents who are more difficult to comprehend than even the effects which are attributed to them?

183 Had human but paid proper attention to what passed under one's review, human would not have sought out of Nature, a power distinguished from Herself, 184 to set Her in action, and without which human believes She cannot move. 185 If, indeed, by Nature is meant a heap of dead matter, destitute of peculiar qualities purely passive, we must unquestionably seek out of this Nature the principle of Her motion. 186 But if by Nature be understood, what it really is, a whole, of which the numerous parts are endowed with

various properties, 187 which oblige them to act according to these properties; 188 which are in a perpetual ternateness of action and reaction; 189 which press, which gravitate towards a common center, whilst others depart from and fly off towards the periphery, or circumference; 190 which attract and repel; 191 which by continual approximation and constant collision, produce and decompose all the bodies we behold; 192 then, I say, there is no necessity to have recourse to supernatural powers, 193 to account for the formation of things, and those extraordinary appearances which are the result of motion.

194 Those who admit a cause exterior to matter, are obliged to believe that this cause produced all the motion by which matter is agitated in giving it existence. 195 This belief rests on another, namely, that matter could begin to exist; 196 an hypothesis that, until this moment, has never been satisfactorily demonstrated. 197 To produce from nothing, or the CREATION, is a term that cannot give us the least idea of the formation of the universe; 198 it presents no sense, upon which the mind can rely. 199 In fact, the human mind is not adequate to conceive a moment of non-existence, or when all shall have passed away; 200 even admitting this to be a truth, it is no truth for us, because by the very nature of our organisation, we cannot admit positions as facts, of which no evidence can be adduced that has relation to our senses; 201 we may, indeed, consent to believe it, because others say it; but will any rational being be satisfied with such an admission? 202 Can any moral good spring from such blind assurance? 203 Is it consistent with sound doctrine, with philosophy, or with reason?

204 Do we, in fact, pay any respect to the intellectual powers of another, 205 when we say to human, "I will believe this, because in all the attempts you have ventured, for the purpose of proving what you say, you have entirely failed; 206 and have been at last obliged to acknowledge you know nothing about the matter?" 207 What moral reliance ought we to

have on such people? 208 Hypothesis may succeed hypothesis; system may destroy system: a new set of ideas may overturn the ideas of a former day. 209 Other Gallileos may be condemned to death-- other Newtons may arise-- we may reason-- argue-- dispute-- quarrel-- punish and destroy: 210 nay, we may even exterminate those who differ from us in opinion; but when we have done all this, we shall be obliged to fall back upon our original darkness-- 211 to confess, that that which has no relation with our senses, that which cannot manifest itself to us by some of the ordinary modes by which other things are manifested, has no existence for us-- 212 is not comprehensible by us-- can never entirely remove our doubt-- can never seize on our steadfast belief; 213 seeing it is that of which we cannot form even a notion; 214 in short, that it is that, which as long as we remain what we are, must be hidden from us by a veil, which no power, no faculty, no energy we possess, is able to remove.

215 All who are not enslaved by prejudice agree to the truth of the position, that nothing can be made of nothing. 216 Many theologians have acknowledged Nature to be an active whole. 217 Almost all the ancient philosophers were agreed to regard the world as eternal. 218 OCELLUS LUCANUS, speaking of the universe, says, "it has always been, and it always will be." 219 VATABLE and GROTIUS assure us, that to render the Hebrew phrase in the first chapter of the Bible, GENESIS correctly, we must say, 220 "when God made heaven and earth, matter was without form." 221 If this be true, and every Hebraist can judge for oneself, then the word which has been rendered ‘created’, means only to fashion, form, arrange. 222 We know that the Greek words create and form, have always indicated the same thing. 223 According to ST. JEROME, ‘creare’ has the same meaning as ‘condere’, to found, to build. 224 The Bible does not anywhere say in a clear manner, that the world was made of nothing. 225 TERTULLIAN and the father PETAU both admit, that "this is a truth

established more by reason than by authority." 226 ST. JUSTIN seems to have contemplated matter as eternal, since he commends PLATO for having said, that 227 "God, in the creation of the world, only gave impulse to matter, and fashioned it." 228 BURNET and PYTHAGORAS were entirely of this opinion, and even our Church Service may be adduced in support; 229 for although it admits by implication a beginning, it expressly denies an end: 230 "As it was in the beginning, is now, and ever shall be, world without end." 231 It is easy to perceive that that which cannot cease to exist, must have always been.

232 Motion becomes still more obscure, when creation, or the formation of matter, is attributed to a SPIRITUAL being; 233 that is to say, to a being which has no analogy, no point of contact, with it--to a being which has neither extent or parts, 234 and cannot, therefore, be susceptible of motion, as we understand the term; 235 this being only the change of one body, relatively to another body, in which the body moved presents successively different parts to different points of space. 236 Moreover, as all the world are nearly agreed that matter can never be totally annihilated, or cease to exist; 237 by what reasoning, I would ask, do they comprehend-- how understand-- that that which cannot cease to be, could ever have had a beginning?

238 If, therefore, it be asked, whence came matter? it is very reasonable to say it has always existed. 239 If it be inquired, whence proceeds the motion that agitates matter? the same reasoning furnishes the answer; 240 namely, that as motion is coeval with matter, it must have existed from all eternity, seeing that motion is the necessary consequence of its existence-- 241 of its essence-- of its primitive properties, such as its extent, its gravity, its impenetrability, its figure. 242 By virtue of these essential constituent properties, inherent in all matter, and without which it is impossible to form an idea of it, 243 the various matter of which the universe is composed must from all eternity have pressed against, each other-- 244 have

gravitated towards a center-- have clashed-- have come in contact-- have been attracted-- have been repelled-- have been combined-- have been separated: 245 in short, must have acted and moved according to the essence and energy peculiar to each genus, and to each of its combinations.

246 Existence supposes properties in the thing that exists: whenever it has properties, its mode of action must necessarily flow from those properties which constitute its mode of being. 247 Thus, when a body is ponderous, it must fall; when it falls, it must come in collision with the bodies it meets in its descent; 248 when it is dense, when it is solid, it must, by reason of this density, communicate motion to the bodies with which it clashes; 249 when it has analogy, when it has affinity with these bodies, it must be attracted, must be united with them; 250 when it has no point of analogy with them, it must be repulsed.

251 From which it may be fairly inferred, that in supposing, as we are under the necessity of doing, the existence of matter, 252 we must suppose it to have some kind of properties; from which its motion, or modes of action, must necessarily flow. 253 To form the universe, DESCARTES asked but matter and motion: a diversity of matter sufficed for him; 254 variety of motion was the consequence of its existence, of its essence, of its properties: 255 its different modes of action would be the necessary consequence of its different modes of being. 256 Matter without properties would be a mere nothing; therefore, as soon as matter exists, it must act; 257 as soon as it is various, it must act variously; 258 if it cannot commence to exist, it must have existed from all eternity; 259 if it has always existed, it can never cease to be: 260 if it can never cease to be, it can never cease to act by its own energy. 261 Motion is a manner of being, which matter derives from its peculiar existence.

262 The existence of matter is a fact: the existence of motion is another fact. 263 Our visual organs point out to us matter with different essences, forming a variety of combinations,

endowed with various properties that discriminate them. 264 Indeed, it is a palpable error to believe that matter is a homogeneous body, of which the parts differ from each other only by their various modifications. 265 Among the individuals of the same species that come under our notice, no two resemble exactly; 266 and it is therefore evident that the difference of situation alone will, necessarily, carry a diversity more or less sensible, 267 not only in the modifications, but also in the essence, in the properties, in the entire system of beings. 268 This truth was well understood by the profound and subtle LEIBNITZ.

269 If this principle be properly digested, and experience seems always to produce evidence of its truth, 270 we must be convinced that the matter or primitive elements which enter into the composition of bodies, are not of the same nature, 271 and consequently, can neither have the same properties, nor the same modifications; 272 and if so, they cannot have the same mode of moving and acting. 273 Their activity or motion, already different, can be diversified to infinity, augmented or diminished, accelerated or retarded, 274 according to the combinations, the proportions, the pressure, the density, the volume of the matter, that enters their composition. 275 The endless variety to be produced, will need no further illustration than the commonest book of arithmetic furnishes us, 276 where it will be found, that to ring all the changes that can be produced on twelve bells only, would occupy a space of more than ninety-one years.

277 The element of fire is visibly more active and more inconstant than that of earth. 278 This is more solid and ponderous than fire, air, or water. 279 According to the quantity of these elements, which enter the composition of bodies, these must act diversely, 280 and their motion must in some measure partake the motion peculiar to each of their constituent parts. 281 Elementary fire appears to be in Nature the principle of activity; 282 it may be compared to a fruitful leaven, that puts the mass into fermentation and gives it life.

NATURE

283 Earth appears to be the principle of solidity in bodies, from its impenetrability, and by the firm coherence of its parts. 284 Water is a medium, to facilitate the combination of bodies, into which it enters itself, as a constituent part. 285 Air is a fluid whose business it seems to be, to furnish the other elements with the space requisite to expand, to exercise their motion, and which is, moreover, found proper to combine with them. 286 These elements, which our senses never discover in a pure state-- which are continually and reciprocally set in motion by each other-- 287 which are always acting and re-acting, combining and separating, attracting and repelling-- 288 are sufficient to explain to us the formation of all the beings we behold.

289 Their motion is uninterruptedly and reciprocally produced from each other; they are alternately causes and effects. 290 Thus, they form a vast circle of generation and destruction-- of combination and decomposition, 291 which, it is quite reasonable to suppose, could never have had a beginning, and which, consequently can never have an end. 292 In short, Nature is but an immense chain of causes and effects, which unceasingly flow from each other. 293 The motion of particular beings depends on the general motion, which is itself maintained by individual motion. 294 This is strengthened or weakened, accelerated or retarded, simplified or complicated, procreated or destroyed, by a variety of combinations and circumstances, 295 which every moment change the directions, the tendency, the modes of existing, and of acting, of the different beings that receive its impulse.

296 If it were true, as has been asserted by some philosophers, that everything has a tendency to form one unique or single mass, 297 and in that unique mass the instant should arrive when all was in ‘nisus’, all would eternally remain in this state; 298 to all eternity there would be no more than one Being and one effort: this would be eternal and universal death. 299 If we desire to go beyond

this, to find the principle of action in matter, to trace the origin of things, it is forever to fall back upon difficulties; 300 it is absolutely to abridge the evidence of our senses; by which only we can understand, by which alone we can judge of the causes acting upon them, or the impulse by which they are set in action.

301 Let us, therefore, content ourselves with saying WHAT is supported by our experience, and by all the evidence we are capable of understanding; 302 against the truth of which not a shadow of proof, such as our reason can admit, has ever been adduced-- 303 which has been maintained by philosophers in every age-- which theologians themselves have not denied, but which many of them have upheld; 304 namely, that matter always existed; that it moves by virtue of its essence; 305 that all the phenomena of Nature is ascribable to the diversified motion of the variety of matter She contains; 306 and which, like the phoenix, is continually regenerating out of its own ashes.

OF MATTER;
OF THE COURSE OF NATURE
Paul Henri Thiery (Baron D'Holbach)

28 We know nothing of the elements of bodies, but we know some of their properties or qualities; 2 and we distinguish their various matter by the effect or change produced on our senses; that is to say, by the variety of motion their presence excites in us. 3 In consequence, we discover in them, extent, mobility, divisibility, solidity, gravity, and inert force. 4 From these general and primitive properties flow a number of others, such as density, figure, colour, ponderousity. 5 Thus, relatively to us, matter is all that affects our senses in any manner whatever; 6 the various properties we attribute to matter, by which we discriminate its diversity, are founded on the different impressions we receive on the changes they produce in us.

7 A satisfactory definition of matter has not yet been given. Human, deceived and led astray by its prejudices, 8 formed but vague,

superficial, and imperfect notions concerning it. 9 Human looked upon it as an unique being, gross and passive, incapable of either moving by itself, of forming combinations, or of producing anything by its own energies. 10 Instead of this unintelligible jargon, human ought to have contemplated it as a genus of beings, 11 of which the individuals, although they might possess some common properties, such as extent, divisibility, figure, 12 should not, however, be all ranked in the same class, nor comprised under the same general denomination. 13 An example will serve more fully to explain what we have asserted, throw its correctness into light, and facilitate the application. 14 The properties common to all matter, are extent, divisibility, impenetrability, figure, mobility, or the property of being moved in mass. 15 FIRE, beside these general properties, common to all matter, enjoys also the peculiar property of being put into activity by a motion that produces on our organs of feeling the sensation of heat; 16 and by another, that communicates to our visual organs the sensation of light.

17 Iron, in common with matter in general, has extent and figure; is divisible, and moveable in mass: 18 if fire be combined with it in a certain proportion, the iron acquires two new properties; 19 namely, those of exciting in us similar sensations of heat and light, which were excited by the element of fire, 20 but which the iron had not, before its combination with the igneous matter. 21 These distinguishing properties are inseparable from matter, and the phenomena that result, may, in the strictest sense of the word, be said to result necessarily.

22 If we contemplate a little the paths of Nature-- if, for a time, we trace the beings in this Nature, under the different states through which, by reason of their properties, they are compelled to pass; 23 we shall discover, that it is to motion, and motion only, that is to be ascribed all the changes, all the combinations, all the forms, in short, all the various modifications of matter. 24 That it is by motion everything that exists is

produced, experiences change, expands, and is destroyed. 25 It is motion that alters the aspect of beings; that adds to, or takes away from their properties; which obliges each of them, by a consequence of its nature, after having occupied a certain rank or order, 26 to quit it, to occupy another, and to contribute to the generation, maintenance, and decomposition of other beings, totally different in their bulk, rank, and essence.

27 In what experimental philosophers have styled the THREE ORDERS OF NATURE, 28 that is to say, the mineral, the vegetable, and animal worlds, they have established, by the aid of motion, a transmigration, an exchange, a continual circulation in the particles of matter. 29 Nature has occasion in one place, for those particles which, for a time, She has placed in another. 30 These particles, after having, by particular combinations, constituted beings endued with peculiar essences, 31 with specific properties, with determinate modes of action, dissolve and separate with more or less facility; and combining in a new manner, they form new beings. 32 The attentive observer sees this law execute itself, in a manner more or less prominent, through all the beings by which one is surrounded. 33 Human sees Nature full of ‘erratic germe’, some of which expand themselves, whilst others wait until motion has placed them in their proper situation, 34 in suitable wombs or matrices, in the necessary circumstances, to unfold, to increase, to render them more perceptible by the addition of other substances of matter analogous to their primitive being. 35 In all this we see nothing but the effect of motion, necessarily guided, modified, accelerated or slackened, strengthened or weakened, 36 by reason of the various properties that beings successively acquire and lose; which, every moment, infallibly produces alterations in bodies more or less marked. 37 Indeed, these bodies cannot be, strictly speaking, the same in any two successive moments of their existence; 38 they must, every instant, either acquire or lose: 39 in

short, they are obliged to undergo continual variations in their essences, in their properties, in their energies, in their masses, in their qualities, in their mode of existence.

40 Animals, after they have been expanded in, and brought out of, the wombs that are suitable to the elements of their machine, enlarge, strengthen, acquire new properties, new energies, new faculties; 41 either by deriving nourishment from plants analogous to their being, or by devouring other animals whose substance is suitable to their preservation; 42 that is to say, to repair the continual depredation or loss of some portion of their own substance, that is disengaging itself every instant. 43 These same animals are nourished, preserved, strengthened, and enlarged, by the aid of air, water, earth, and fire. 44 Deprived of air, or of the fluid that surrounds them, that presses on them, that penetrates them, that gives them their elasticity, they presently cease to live. 45 Water, combined with this air, enters into their whole mechanism of which it facilitates the motion. 46 Earth serves them for a basis, by giving solidity to their texture: it is conveyed by air and water, which carry it to those parts of the body with which it can combine. 47 Fire itself, disguised and enveloped under an infinity of forms, continually received into the animal, 48 procures it heat, continues it in life, renders it capable of exercising its functions. 49 The aliments, charged with these various principles, entering into the stomach, re-establish the nervous system, and restore, by their activity, and the elements which compose them, the machine which begins to languish, to be depressed, by the loss it has sustained. 50 Forthwith the animal experiences a change in its whole system; it has more energy, more activity; 51 it feels more courage; displays more gaiety; it acts, it moves, it thinks, after a different manner; all its faculties are exercised with more ease. 52 This igneous matter, so congenial to generation--so restorative in its effect-- so necessary to life, was the JUPITER of the ancients: 53 from all that has

preceded, it is clear, that what are called the elements, or primitive parts of matter, variously combined, are, by the agency of motion, continually united to, and assimilated with, the substance of animals-- 54 that they visibly modify their being-- have an evident influence over their actions, that is to say, upon the motion they undergo, whether visible or concealed.

55 The same elements, which under certain circumstances serve to nourish, to strengthen, to maintain the animal, become, under others, the principles of its weakness, the instruments of its dissolution-- of its death: 56 they work its destruction, whenever they are not in that just proportion which renders them proper to maintain its existence: 57 thus, when water becomes too abundant in the body of the animal, it enervates it, it relaxes the fibres, and impedes the necessary action of the other elements: 58 thus, fire admitted in excess, excites in it disorderly motion destructive of its machine: 59 thus, air, charged with principles not analogous to its mechanism, brings upon its dangerous diseases and contagion. 60 In fine, the aliments modified after certain modes, in the room of nourishing, destroy the animal, and conduce to its ruin: 61 the animal is preserved no longer than these substances are analogous to its system. 62 They ruin it when they want that just equilibrium that renders them suitable to maintain its existence.

63 Plants that serve to nourish and restore animals are themselves nourished by earth; 64 they expand on its bosom, enlarge and strengthen at its expense, continually receiving into their texture, by their roots and their pores, water, air, and igneous matter: 65 water visibly reanimates them whenever their vegetation or genus of life languishes; it conveys to them those analogous principles by which they are enabled to reach perfection: 66 air is requisite to their expansion, and furnishes them with water, earth, and the igneous matter with which it is charged. 67 By these means they receive more or less of the inflammable matter; the different proportions of these principles, their

numerous combinations, 68 from whence result an infinity of properties, a variety of forms, constitute the various families and classes into which botanists have distributed plants: 69 it is thus we see the cedar and the hyssop develop their growth; the one rises to the clouds, the other creep humbly on the earth. 70 Thus, by degrees, from an acorn springs the majestic oak, accumulating, with time, its numerous branches, and overshadowing us with its foliage. 71 Thus, a grain of corn, after having drawn its own nourishment from the juices of the earth, serves, in its turn, for the nourishment of human, 72 into whose system it conveys the elements or principles by which it has been itself expanded, combined, and modified 73 in such a manner, as to render this vegetable proper to assimilate and unite with the human frame; that is to say, with the fluids and solids of which it is composed.

74 The same elements, the same principles, are found in the formation of minerals, as well as in their decomposition, whether natural or artificial. 75 We find that earth, diversely modified, wrought, and combined, serves to increase their bulk, and give them more or less density and gravity. 76 Air and water contribute to make their particles cohere; the igneous matter, or inflammable principle, tinges them with colour, 77 and sometimes plainly indicates its presence, by the brilliant scintillation which motion elicits from them. 78 These stones and metals, these bodies, so compact and solid, are disunited, are destroyed, by the agency of air, water, and fire; 79 which the most ordinary analysis is sufficient to prove, as well as a multitude of experience, to which our eyes are the daily evidence.

80 Animals, plants, and minerals, after a lapse of time, give back to Nature; 81 that is to say, to the general mass of things, to the universal magazine, the elements, or principles, which they have borrowed: 82 The earth retakes that portion of the body of which it formed the basis and the solidity; 83 the air charges itself with these parts,

that are, analogous to it, and with those particles which are light and subtle; 84 water carries off that which is suitable to liquescency; 85 fire, bursting its chains, disengages itself, and rushes into new combinations with other bodies. 86 The elementary particles of the animal, being thus dissolved, disunited, and dispersed; assume new activity, and form new combinations: 87 thus, they serve to nourish, to preserve, or destroy new beings; 88 among others, plants, which arrived at their maturity, nourish and preserve new animals; these in their turn yielding to the same fate as the first.

89 Such is the constant, the invariable course, of Nature; such is the eternal circle of mutation, which all that exists is obliged to describe. 90 It is thus motion generates, preserves for a time, and successively, destroys, one part of the universe by the other; whilst the sum of existence remains eternally the same. 91 Nature, by its combinations, produces suns, which place themselves in the centre of so many systems: 92 she forms planets, which, by their peculiar essence, gravitate and describe their revolutions round these suns: 93 by degrees the motion is changed altogether, and becomes eccentric: 94 perhaps the day may arrive when these wondrous masses will disperse, of which human, in the short space of its existence, can only have a faint and transient glimpse.

95 It is clear, then, that the continual motion inherent in matter, changes and destroys all beings; 96 every instant depriving them of some of their properties, to substitute others: 97 it is motion, which, in thus changing their actual essence, changes also their order, their direction, their tendency, and the laws which regulate their mode of acting and being: 98 from the stone formed in the bowels of the earth, by the intimate combination and close coherence of similar and analogous particles, 99 to the sun, that vast reservoir of igneous particles, which sheds torrents of light over the firmament; 100 from the benumbed oyster, to the thoughtful and active human; we see an uninterrupted progression, a perpetual chain of

motion and combination; 101 from which is produced, beings that only differ from each other by the variety of their elementary matter-- 102 by the numerous combinations of these elements, from whence springs modes of action and existence, diversified to infinity. 103 In generation, in nutrition, in preservation, we see nothing more than matter, variously combined, 104 of which each has its peculiar motion, regulated by fixed and determinate laws, which oblige them to submit to necessary changes. 105 We shall find, in the formation, in the growth, in the instantaneous life, of animals, vegetables, and minerals, nothing but matter; 106 which combining, accumulating, aggregating, and expanding by degrees, forms beings, who are either feeling, living, vegetating, or else destitute of these faculties; 107 which, having existed some time under one particular form, are obliged to contribute by their ruin to the production of other forms.

108 Thus, to speak strictly, nothing in Nature is either born, or dies, according to the common acceptation of those terms. 109 This truth was felt by many of the ancient philosophers. 110 PLATO says, that according to tradition, "the living were born of the dead, the same as the dead did come of the living; and that this is the constant routine of Nature." 111 He adds from himself, "who knows, if to live, be not to die; and if to die, be not to live?" 112 This was the doctrine of PYTHAGORAS, a man of great talent and no less note. 113 EMPEDOCLES asserts, "there is neither birth nor death, for any mortal; but only a combination, and a separation of that which was combined, and that this is what amongst people they call birth, and death." 114 Again he remarks, "those are infants, or short-sighted people, with very contracted understandings, who imagine anything is born, which did not exist before, or that anything can die or perish totally."

LAWS OF MOTION

Paul Henri Thiery (Baron D'Holbach)

29 Human is never surprised at those effects, of which you thinks you knows the cause; 2 you believes you does know the cause, as soon as you sees them act in an uniform and determinate manner, 3 or when the motion excited is simple: the descent of a stone, that falls by its own peculiar weight, is an object of contemplation to the philosopher only; 4 to whom the mode by which the most immediate causes act, 5 and the most simple motion, are no less impenetrable mysteries than the most complex motion, 6 and the manner by which the most complicated causes give impulse. 7 The uninformed are seldom tempted either to examine the effects which are familiar to them, or to recur to first principles. 8 They think they see nothing in the descent of a stone, which ought to elicit their surprise, or become the object of their research: 9 it requires a NEWTON to feel that the descent of heavy bodies is a phenomenon, worthy his whole, his most serious attention; 10 it requires the sagacity of a profound experimental philosopher, to discover the laws by which heavy bodies fall, by which they communicate to others their peculiar motion. 11 In short, the mind that is most practised in philosophical observation, has frequently the chagrin to find, 12 that the most simple and most common effects escape all his researches, and remains inexplicable to him. 13 When any extraordinary, any unusual, effect is produced, to which our eyes have not been accustomed; 14 or when we are ignorant of the energies of the cause, the action of which so forcibly strikes our senses, we are tempted to meditate upon it, and take it into our consideration.

15 The European, accustomed to the use of GUNPOWDER, passes it by, without thinking much of its extraordinary energies; 16 the workman, who labours to manufacture it, finds nothing marvellous in its properties, because he daily handles the matter that forms its composition. 17 The

American, to whom this powder was a stranger, who had never beheld its operation, looked upon it as a divine power, and its energies as supernatural. 18 The uninformed, who are ignorant of the true cause of THUNDER, contemplate it as the instrument of divine vengeance. 19 The experimental philosopher considers it as the effect of the electric matter, which, nevertheless, is itself a cause which he is very far from perfectly understanding. 20 It required the keen, the penetrating mind of a FRANKLIN, to throw light on the nature of this subtle fluid-- 21 to develop the means by which its effects might be rendered harmless-- 22 to turn to useful purposes, a phenomenon that made the ignorant tremble--that filled their minds with terror, their hearts with dismay, as indicating the anger of the gods: 23 impressed with this idea, they prostrated themselves, they sacrificed to JUPITER, to deprecate its wrath.

24 Be this as it may, whenever we see a cause act, we look upon its effect as natural: 25 when this cause becomes familiar to the sight, when we are accustomed to it, we think we understand it, and its effects surprise us no longer. 26 Whenever any unusual effect is perceived, without our discovering the cause, the mind sets to work, becomes uneasy; 27 this uneasiness increases in proportion to its extent: 28 as soon as it is believed to threaten our preservation, we become completely agitated; 29 we seek after the cause with an earnestness proportioned to our alarm; our perplexity augments in a ratio equivalent to the persuasion we are under: 30 how essentially requisite it is, we should become acquainted with the cause that has affected us in so lively a manner. 31 As it frequently happens that our senses can teach us nothing respecting this cause which so deeply interests us-- 32 which we seek with so much ardour, we have recourse to our imagination; this, disturbed with alarm, enervated by fear, becomes a suspicious, a fallacious guide: 33 we create chimeras, fictitious causes, to whom we give the credit, to whom we ascribe the honour of those

phenomena by which we have been so much alarmed. 34 It is to this disposition of the human mind that must be attributed, as will be seen in the sequel, the religious errors of human, 35 who, despairing of the capacity to trace the natural causes of those perplexing phenomena to which human was the witness, 36 and sometimes the victim, created in human's brain (heated with terror) imaginary causes, which have become to human a source of the most extravagant folly.

37 In Nature, however, there can be only natural causes and effects; 38 all motion excited in this Nature, follows constant and necessary laws: the natural operations, 39 to the knowledge of which we are competent, of which we are in a capacity to judge, 40 are of themselves sufficient to enable us to discover those which elude our sight; we can at least judge of them by analogy. 41 If we study Nature with attention, the modes of action which She displays to our senses will teach us not to be disconcerted by those which She refuses to discover. 42 Those causes which are the most remote from their effects, unquestionably act by intermediate causes; by the aid of these, we can frequently trace out the first. 43 If in the chain of these causes we sometimes meet with obstacles that oppose themselves to our research, we ought to endeavour by patience and diligence to overcome them; 44 when it so happens we cannot surmount the difficulties that occur, we still are never justified in concluding the chain to be broken, 45 or that the cause which acts is SUPER-NATURAL. 46 Let us, then, be content with an honest avowal, that Nature contains resources of which we are ignorant; 47 but never let us substitute phantoms, fictions, or imaginary causes, senseless terms, for those causes which escape our research; 48 because, by such means we only confirm ourselves in ignorance, impede our enquiries, and obstinately remain in error.

49 In spite of our ignorance with respect to the meanderings of Nature, 50 for of the essence of being, of their properties, their elements, their

combinations, their proportions, we yet know the simple and general laws, according to which bodies move; 51 we see clearly, that some of these laws, common to all beings, never contradict themselves; 52 although, on some occasions, they appear to vary, we are frequently competent to discover that the cause becoming complex, from combination with other causes, 53 either impedes or prevents its mode of action being such as in its primitive state we had a right to expect. 54 We know that active, igneous matter, applied to gunpowder, must necessarily cause it to explode: 55 whenever this effect does not follow the combination of the igneous matter with the gunpowder-- whenever our senses do not give us evidence of the fact, 56 we are justified in concluding, either that the powder is damp, or that it is united with some other substance that counteracts its explosion. 57 We know that all the actions of human have a tendency to render you happy: 58 whenever, therefore, we see human labouring to injure or destroy oneself, it is just to infer that human is moved by some cause opposed to own natural tendency; 59 that human is deceived by some prejudice; that, for want of experience, human is blind to consequences: that human does not see whither own actions will lead oneself.

60 If the motion excited in beings was always simple; if their actions did not blend and combine with each other, it would be easy to know, and we should be assured, in the first instance, of the effect a cause would produce. 61 I know that a stone, when descending, ought to describe a perpendicular: 62 I also know, that if it encounters any other body which changes its course, it is obliged to take an oblique direction, 63 but if its fall be interrupted by several contrary powers, which act upon it alternately, I am no longer competent to determine what line it will describe. 64 It may be a parabola, an ellipsis, spiral, circular, this will depend on the impulse, it receives, and the powers by which it is impelled.

65 The most complex motion, however, is never more than the result of simple motion combined: 66 therefore as soon as we know the general laws of beings and their action, we have only to decompose, to analyse them, in order to discover those of which they are combined; 67 experience teaches us the effects we are to expect. 68 Thus it is clear, the simplest motion causes that necessary junction of different matter, of which all bodies are composed: 69 that matter, varied in its essence, in its properties, in its combinations, has each its several modes of action or motion, peculiar to itself; 70 the whole motion of a body is consequently the sum total of each particular motion that is combined.

71 Amongst the matter we behold, some is constantly disposed to unite, whilst other is incapable of union; 72 that which is suitable to unite, forms combinations, more or less intimate, possessing more or less durability: 73 that is to say, with more or less capacity to preserve their union, to resist dissolution. 74 Those bodies which are called SOLIDS, receive into their composition a great number of homogeneous, similar, and analogous particles, disposed to unite themselves with energies conspiring or tending to the same point. 75 The primitive beings, or elements of bodies, have need of supports, of props; 76 that is to say, of the presence of each other, for the purpose of preserving themselves; of acquiring consistence or solidity: 77 a truth, which applies with equal uniformity to what is called ‘physical’, as to what is termed ‘moral’.

78 It is upon this disposition in matter and bodies, with relation to each other, that is founded those modes of action 79 which natural philosophers designate by the terms attraction, repulsion, sympathy, antipathy, affinities, relations; 80 that moralists describe under the names of love, hatred, friendship, aversion. 81 Human, like all the beings in Nature, experiences the impulse of attraction and repulsion; 82 the motion excited in human differing from that of other beings, only, because it is more

concealed, and frequently so hidden, that neither the causes which excite it, nor their mode of action are known. 83 This system of attraction and repulsion is very ancient, although it required a NEWTON to develop it. 84 That love, to which the ancients attributed the unfolding, or disentanglement of chaos, appears to have been nothing more than a personification of the principle of attraction. 85 All their allegories and fables upon chaos, evidently indicate nothing more than the accord or union that exists between analogous and homogeneous substances; 86 from whence resulted the existence of the universe: 87 whilst discord or repulsion, which they called SOIS, was the cause of dissolution, confusion, and disorder; 88 there can scarcely remain a doubt, but this was the origin of the doctrines of the TWO PRINCIPLES. 89 According to DIOGENES LAERTIUS, the philosopher, EMPEDOCLES, asserted, that "there is a kind of affection by which the elements unite themselves; 90 and a sort of discord, by which they separate or remove themselves."

91 However it may be, it is sufficient for us to know that by an invariable law, certain bodies are disposed to unite with more or less facility; whilst others cannot combine or unite themselves: 92 water combines itself readily with salt, but will not blend with oil. 93 Some combinations are very strong, cohering with great force, as metals; others are extremely feeble, their cohesion slight and easily decomposed, as in fugitive colours. 94 Some bodies, incapable of uniting by themselves, become susceptible of union by the agency of other bodies, which serve for common bonds or MEDIUMS. 95 Thus, oil and water, naturally heterogeneous, combine and make soap, by the intervention of alkaline salt. 96 From matter diversely combined, in proportions varied almost to infinity, result all physical and moral bodies; 97 the properties and qualities of which are essentially different, with modes of action more or less complex: 98 which are either understood with facility, or difficult of comprehension, according to the elements or matter that has entered

into their composition, and the various modifications this matter has undergone.

99 It is thus, from the reciprocity of their attraction, the primitive imperceptible particles of matter, which constitute bodies, become perceptible, 100 form compound substances, aggregate masses; by the union of similar and analogous matter, whose essences fit them to cohere. 101 The same bodies are dissolved, their union broken, whenever they undergo the action of matter inimical to their junction. 102 Thus by degrees are formed, plants, metals, animals, humans; each grows, expands, and increases in its own system or order; 103 sustaining itself in its respective existence, by the continual attraction of analogous matter; to which it becomes united, and by which it is preserved and strengthened. 104 Thus, certain aliments become fit for the sustenance of human, whilst others destroy human existence: 105 some are pleasant to human, strengthen human habit; others are repugnant to human, weaken its system: 106 in short, never to separate physical from moral laws, it is thus that human, mutually attracted to each other by their reciprocal wants, form those unions which we designate by the terms, MARRIAGE, FAMILIES, SOCIETIES, FRIENDSHIPS, CONNEXIONS: 107 it is thus that virtue strengthens and consolidates them; that vice relaxes or totally dissolves them.

108 Of whatever Nature may be the combination of beings, their motion has always one direction or tendency: 109 without direction we could not have any idea of motion: this direction is regulated by the properties of each being; 110 as soon as they have any given properties, they necessarily act in obedience to them: 111 that is to say, they follow the law invariably determined by these same properties; 112 which, of themselves, constitute the being such as human is found, and settle human's mode of action, which is always the consequence of human's manner of existence. 113 But what is the general direction, or common tendency, we see in all beings? What is the visible and known end of all

their motion? 114 It is to conserve their actual existence-- to preserve themselves-- to strengthen their several bodies-- to attract that which is favourable to them-- to repel that which is injurious them-- 115 to avoid that which can harm them-- to resist impulsions contrary to their manner of existence, and to their natural tendency.

116 To exist, is to experience the motion peculiar to a determinate essence: 117 to conserve this existence, is to give and receive that motion from which results its maintenance:-- 118 it is to attract matter suitable to corroborate its being-- to avoid that by which it may be either endangered or enfeebled. 119 Thus, all beings of which we have any knowledge have a tendency to conserve themselves, each after its peculiar manner: 120 the stone, by the firm adhesion of its particles, opposes resistance to its destruction. 121 Organised beings conserve themselves by more complicated means, but which are, nevertheless, calculated to maintain their existence against that by which it may be injured. 122 Human, both in its physical and in its moral capacity, is a living, feeling, thinking, active being; 123 who, every instant of human duration, strives equally to avoid that which may be injurious, 124 and to procure that which is pleasing to yourself, or that which is suitable to your mode of existence; 125 all human actions tending solely to conserve oneself. ST. AUGUSTINE admits this tendency in all whether organised or not.

126 Conservation, then, is the common point to which all the energies, all the powers, all the faculties of beings, seem continually directed. 127 Natural philosophers call this direction or tendency, SELF-GRAVITATION: NEWTON calls it INERT FORCE: moralists denominate it in human, SELF-LOVE 128 which is nothing more than the tendency human has to preserve oneself-- 129 a desire of happiness--a love of your own welfare-- a wish for pleasure-- a promptitude in seizing on everything that appears favourable to your conservation-- 130 a marked aversion to all that either disturbs your

happiness, or menaces your existence-- 131 primitive sentiments, that are common to all beings of the human species; which all their faculties are continually striving to satisfy; 132 which all their passions, their wills, their actions, have eternally for their object and their end. 133 This self-gravitation, then, is clearly a necessary disposition in human, and in all other beings; 134 which, by a variety means, contribute to the preservation of the existence they have received, 135 as long as nothing deranges the order of their machine, or its primitive tendency.

136 Cause always produces effect; there can be no effect without cause. 137 Impulse is always followed by some motion, more or less sensible; by some change, more or less remarkable in the body which receives it. 138 But motion, and its various modes of displaying itself, is, as has been already shown, determined by the nature, the essence, the properties, the combinations of the beings acting. 139 It must, then, be concluded that motion, or the modes by which beings act, arises from some cause; 140 that as this cause is not able to move or act, but in conformity with the manner of its being or its essential properties, 141 it must equally be concluded, that all the phenomena we perceive are necessary; 142 that every being in Nature, under the circumstances in which it is placed, and with the given properties it possesses, cannot act otherwise than it does.

143 Necessity is the constant and infallible relation of causes with their effects. 144 Fire consumes, of necessity, combustible matter plated within its circuit of action: 145 human, by fatality, desires either that which really is, or appears to be serviceable to own welfare. 146 Nature, in all the extraordinary appearances She exhibits, necessarily acts after Her own peculiar essence: 147 all the beings She contains, necessarily act each after its own a individual nature: 148 it is by motion that the whole has relation with its parts; and these parts with the whole: 149 it is thus that in the general

system everything is connected: 150 it is itself but an immense chain of causes and effects, which flow without ceasing, one from the other. 151 If we reflect, we shall be obliged to acknowledge that everything we see is necessary; 152 that it cannot be otherwise than it is that all the beings we behold, as well as those which escape our sight, act by invariable laws. 153 According to these laws, heavy bodies fall-- light bodies ascend-- analogous substances attract each other-- beings tend to preserve themselves-- human cherishes oneself; 154 loves that which human thinks advantageous--detests that which human has an idea may prove unfavourable to oneself. 155 In fine, we are obliged to admit, there can be no perfectly independent energy-- no separated cause-- no detached action, in a Nature where all the beings are in a reciprocity of action-- 156 who, without interruption, mutually impel and resist each other-- 157 who is Herself nothing more than an eternal circle of motion, given and received according to necessary laws; 158 which under the same given incidents, invariably produce the same effect. 159 Two examples will serve to throw the principle here laid down, into light-- 160 one shall be taken from physics, the other from morals.

161 In a whirlwind of dust, raised by elemental force, confused as it appears to our eyes, in the most frightful tempest excited by contrary winds, when the waves roll high as mountains, 162 there is not a single particle of dust, or drop of water, that has been placed by CHANCE, 163 that has not a cause for occupying the place where it is found; 164 that does not, in the most rigorous sense of the word, act after the manner in which it ought to act; 165 that is, according to its own peculiar essence, and that of the beings from whom it receives this communicated force.

166 A geometrician exactly knew the different energies acting in each case, 167 with the properties of the particles moved, could demonstrate that after the causes given, each particle acted precisely as it ought to act, 168 and that it could not have acted otherwise than it did. 169 In

those terrible convulsions that sometimes agitate political societies, shake their foundations, and frequently produce the overthrow of an empire; 170 there is not a single action, a single word, a single thought, a single will, a single passion in the agents, 171 whether they act as destroyers, or as victims, that is not the necessary result of the causes operating; 172 that does not act, as, of necessity, it must act, from the peculiar essence of the beings who give the impulse, 173 and that of the agents who receive it, according to the situation these agents fill in the moral whirlwind. 174 This could be evidently proved by an understanding capacitated to rate all the action and re-action, of the minds and bodies of those who contributed to the revolution.

175 In fact, if all be connected in Nature, if all motion be produced, the one from the other, notwithstanding their secret communications frequently elude our sight; 176 we ought to feel convinced of this truth, that there is no cause, however minute, however remote, that does not sometimes produce the greatest and most immediate effects on human. 177 It may, perhaps, be in the parched plains of Libya, that are amassed the first elements of a storm or tempest, which, borne by the winds, approach our climate, 178 render our atmosphere dense, and thus operating on the temperament, may influence the passions of a human, 179 whose circumstances shall have capacitated this person to influence many others, who shall decide after own will the fate of many nations.

180 Human, in fact, finds oneself in Nature, and makes a part of it: 181 human acts according to laws, which are appropriate to oneself; 182 you receives in a manner more or less distinct, the action and impulse of the beings who surrounds you; 183 who themselves act after laws that are peculiar to their essence. 184 Thus human is variously modified; but your actions are always the result of your own energy, 185 and that of the beings who act upon yourself, and by whom you are modified. 186 This is what gives such variety to human's

determinations-- what generally produces such contradiction in human's thoughts, human's opinions, human's will, human's actions; 187 in short, in that motion, whether concealed or visible, by which human is agitated. 188 We shall have occasion, in the sequel, to place this truth, at present so much contested, in a clearer light: 189 it will be sufficient for our purpose at present to prove, generally, that everything in Nature is necessary-- 190 that nothing to be found in it can act otherwise than it does. 191 Motion, alternately communicated and received, establishes the connection or relation between the different orders of beings: 192 when they are in the sphere of reciprocal action, attraction approximates them; repulsion dissolves and separates them; 193 the one strengthens and preserves them; the other enfeebles and destroys them. 194 Once combined, they have a tendency to conserve themselves in that mode of existence, by virtue of their inert force; 195 in this they cannot succeed, because they are exposed to the continual influence of all other beings, who perpetually and successively act upon them; 196 their change of form, their dissolution, is requisite to the preservation of Nature Herself: 197 this is the sole end we are able to assign Her-- to which we see Her tend without intermission-- 198 which she follows without interruption, by the destruction and reproduction of all subordinate beings, who are obliged to submit to Her laws-- 199 to concur, by their mode of action, to the maintenance of Her active existence, so essentially requisite to the GREAT WHOLE.

200 It is thus each being is an individual, who, in the great family, performs own necessary portion of the general labour-- 201 who executes the unavoidable task assigned to oneself. 202 All bodies act according to laws, inherent in their peculiar essence, without the capability to swerve, even for a single instant, from those according to which Nature Herself acts. 203 This is the central power, to which all other powers, essences, and energies, are

submitted: 204 She regulates the motions of beings, by the necessity of Her own peculiar essence: 205 She makes them concur by various modes to the general plan: this appears to be nothing more than the life, action, and maintenance of the whole, by the continual change of its parts. 206 This object She obtains, in removing them, one by the other; by that which establishes, and by that which destroys, the relation subsisting between them; 207 by that which gives them, and that which deprives them of, their forms, combinations, proportions, and qualities, 208 according to which they act for a time, after a given mode; these are afterwards taken from them, to make them act after a different manner.

209 It is thus that Nature makes them expand and change, grow and decline, augment and diminish, approximate and remove, forms and destroys them, according as She finds it requisite to maintain the whole; 210 towards the conservation which this Nature is Herself essentially necessitated to have a tendency. 211 This irresistible power, this universal necessity, this general energy, then, is only a consequence of the nature of things; 212 by virtue of which everything acts, without intermission, after constant and immutable laws: 213 these laws not varying more for the whole than for the beings of which it is composed. 214 Nature is an active living whole, to which all its parts necessarily concur; of which, without their own knowledge, they maintain the activity, the life, and the existence. 215 Nature acts and exists necessarily: all that She contains, necessarily conspires to perpetuate Her active existence. 216 This is the decided opinion of PLATO, when he says, "matter and necessity are the same thing; this necessity is the mother of the world." 217 In point of fact, we cannot go beyond this aphorism, MATTER ACTS, BECAUSE IT EXISTS; AND EXISTS, TO ACT.

218 If it be enquired how, or for why, matter exists? We answer, we know not: 219 but reasoning by analogy, of what we do not know by that which we do, we should be of opinion it

exists necessarily, 220 or because it contains within itself a sufficient reason for its existence. 221 In supposing it to be created or produced by a being distinguished from it, or less known than itself, 222 which it may be, for anything we know to the contrary, 223 we must still admit, that this being is necessary, and includes a sufficient reason for own existence. 224 We have not then removed any of the difficulty, we have not thrown a clearer light upon the subject, we have not advanced a single step; 225 we have simply laid aside a being, of which we know some few of the properties, 226but of which we are still extremely ignorant, to have recourse to a power, of which it is utterly impossible we can, as long as we are humans, form any distinct idea; 227 of which, notwithstanding it may be a truth, we cannot, by any means we possess, demonstrate the existence. 228 As, therefore, these must be at best but speculative points of belief, which each individual, by reason of its obscurity, may contemplate with different optics, under various aspects, 229 they surely ought to be left free for each to judge after one's own fashion: 230 the Hindu can have no just cause of enmity against the Christian for their faith: this has no moral right to question the Muslims upon theirs; 231 the numerous sects of each of the various persuasions spread over the face of the earth, ought to make it a creed to look with an eye of complacency on the deviation of the others; 232 and rest upon that great moral axiom, which is strictly conformable to Nature, which contains the whole of human's happiness-- 233 "Do not unto another, that which do you not wish another should do unto you;" 234 for it is evident, according to their own doctrines, out of all the variety of systems, you only can be right.

235 We shall see in the sequel, how much human's imagination labours to form an idea, 236 of the energies of that Nature human has personified, and distinguished from Herself: 237 in short, we shall examine some of the ridiculous and pernicious inventions, 238 which, for want of

understanding Nature, have been imagined to impede Her course, to suspend Her eternal laws, to place obstacles to the necessity of things.

ORDER AND CONFUSION--INTELLIGENCE--CHANCE

Paul Henri Thiery (Baron D'Holbach)

30 The observation of the necessary, regular, and periodical motion in the universe, generated in the mind of human the idea of ORDER; 2 this term, in its original signification, represents nothing more than a mode of considering, 3 a facility of perceiving, together and separately, the different relations of a whole; 4 in which is discovered, by its manner of existing and acting, a certain affinity or conformity with its own. 5 Human, in extending this idea to the universe, carried with you those methods of considering things which are peculiar to yourself: 6 human has consequently supposed there really existed in Nature affinities and relations, which we classed under the name of ORDER; 7 and others which appeared to you not to conform to those, which you have ranked under the term of CONFUSION.

8 It is easy to comprehend, that this idea of order and confusion can have no absolute existence in Nature, where everything is necessary; 9 where the whole follows constant and invariable laws, which oblige each being, in every moment of its duration, to submit to other laws, which flow from its own peculiar mode of existence. 10 Therefore it is in human imagination, only, you finds a model of that which you terms order or confusion; 11 which, like all human abstract, metaphysical ideas, supposes nothing beyond your reach. 12 Order, however, is never more than the faculty of conforming itself with the beings by whom you are environed, or with the whole of which you forms a part.

13 Nevertheless, if the idea of order be applied to Nature, it will be found to be nothing but a series of action or motion, which you judges to conspire to your common end. 14 Thus, in a body that moves, order is the chain of action, the series of

motion, proper to constitute it what it is, and to maintain it in its actual state. 15 Order, relatively to the whole of Nature, is the concatenation of causes and effects, necessary to Her active existence-- to maintaining Her constantly together; 16 but, as it has been proved in the chapter preceding, every individual being is obliged to concur to this end, in the different ranks they occupy; 17 from whence it is a necessary deduction, that what is called the ORDER OF NATURE, can never be more than a certain manner of considering the necessity of things, 18 to which all, of which human has any knowledge, is submitted. 19 That which is styled CONFUSION, is only a relative term, used to designate that series of necessary action, that chain of requisite motion, 20 by which an individual being is necessarily changed or disturbed in its mode of existence-- by which it is instantaneously obliged to alter its manner of action; 21 but no one of these actions, no part of this motion is capable, even for a single instant, of contradicting or deranging the general order of Nature; 22 from which all beings derive their existence, their properties, the motion appropriate to each.

23 What is termed confusion in a being, is nothing more than its passage into a new class, a new mode of existence; 24 which necessarily carries with it a new series of action, a new chain of motion, different from that of which this being found itself susceptible in the preceding rank it occupied. 25 That which is called order, in Nature, is a mode of existence, or a disposition of its particles, strictly necessary. 26 In every other assemblage of causes and effects, of worlds, as well as in that which we inhabit, some sort of arrangement, some kind of order would necessarily be established. 27 Suppose the most incongruous, the most heterogeneous substances were put into activity, and assembled by a concatenation of extraordinary circumstances; 28 they would form amongst themselves, a complete order, a perfect arrangement. 29 This is the true notion of a property, which may be

defined, an aptitude to constitute a being, 30 such as it is actually found, such as it is with respect to the whole of which it makes a part.

31 Order, then, is nothing but necessity, considered relatively to the series of actions, or the connected chain of causes and effects, that it produces in the universe. 32 What is the motion in our planetary system; but a series of phenomena, operated upon according to necessary laws, that regulate the bodies of which it is composed? 33 In conformity to these laws, the sun occupies the centre; the planets gravitate towards it, and revolve round it, in regulated periods: 34 the satellites of these planets gravitate towards those which are in the centre of their sphere of action, and describe round them their periodical route. 35 One of these planets, the earth which human inhabits, turns on its own axis; 36 and by the various aspects which its revolution obliges it to present to the sun, experiences those regular variations which are called SEASONS. 37 By a sequence of the sun's action upon different parts of this globe, all its productions undergo vicissitudes: 38 plants, animals, humans, are in a sort of morbid drowsiness during Winter: in Spring, these beings re-animate, to come as it were out of a long lethargy. 39 In short, the mode in which the earth receives the sun's beams, has an influence on all its productions; 40 these rays, when darted obliquely, do not act in the same manner as when they fall perpendicularly; 41 their periodical absence, caused by the revolution of this sphere on itself, produces night and day. 42 However, in all this, human never witnesses more than necessary effects, flowing from the nature of things, which, whilst that remains the same, can never be opposed with propriety. 43 These effects are owing to gravitation, attraction, centrifugal power, and more.

44 On the other hand, this order, which human admires as a supernatural effect, is sometimes disturbed, or changed into what you calls confusion: 45 this confusion is, however, always a necessary

consequence of the laws of Nature; 46 in which it is requisite to the support of the whole that some of Her parts should be deranged and thrown out of the ordinary course. 47 It is thus, COMETS present themselves so unexpectedly to human's wondering eyes; 48 their eccentric motion disturbs the tranquillity of human's planetary system; 49 they excite the terror of the mis-instructed to whom everything unusual is marvellous. 50 The natural philosopher, himself, conjectures that in former ages, these comets have overthrown the surface of this mundane ball, and caused great revolutions on the earth. 51 Independent of this extraordinary confusion, you are exposed to others more familiar to yourself: 52 sometimes, the seasons appear to have usurped each other's place; to have quitted their regular order: 53 sometimes the opposing elements seem to dispute among themselves the dominion of the world; 54 the sea bursts its limits; the solid earth is shaken and rent asunder; 55 mountains are in a state of conflagration; pestilential diseases destroy both humans and animals; sterility desolates a country: 56 then affrighted human utters piercing cries, offers up own prayers to recall order; 57 tremblingly raises your hands towards the Being you supposes to be the author of all these calamities; 58 nevertheless, the whole of this afflicting confusion are necessary effects, produced by natural causes; 59 which act according to fixed laws, determined by their own peculiar essence, and the universal essence of Nature: 60 in which everything must necessarily be changed, moved, and dissolved; 61 where that which is called ORDER, must sometimes be disturbed and altered into a new mode of existence; 62 which to your deluded mind, to your imagination, led astray by ignorance and want of reflection, appears CONFUSION.

63 There cannot possibly exist what is generally termed a confusion of Nature: 64 human finds order in everything that is conformable to one's own mode of being; confusion in everything by which it is opposed:

65 nevertheless, in Nature, all is in order; because none of Her parts are ever able to emancipate themselves from those invariable rules which flow from their respective essences: 66 there is not, there cannot be confusion in a whole, to the maintenance of which what is called confusion is absolutely requisite; 67 of which the general course can never be discomposed, although individuals may be, and necessarily are; 68 where all the effects produced are the consequence of natural causes, that under the circumstances in which they are placed, act only as they infallibly are obliged to act.

69 It therefore follows, there can be neither monsters nor prodigies; wonders nor miracles in Nature: 70 those which are designated MONSTERS, are certain combinations, with which the eyes of human are not familiarised; but which, therefore, are not less the necessary effects of natural causes. 71 Those which human terms PRODIGIES, WONDERS, or SUPERNATURAL effects, are phenomena of Nature, with whose mode of action you are unacquainted; 72 of which your ignorance does not permit you to ascertain the principles; whose causes you cannot trace; 73 but which your impatience, your heated imagination, aided by a desire to explain, makes you foolishly attribute to imaginary causes; 74 which, like the idea of order, have no existence but in yourself; 75 and which, that you may conceal your own ignorance, that you may obtain more respect with the uninformed, you places beyond Nature, 76 out of which your experience is every instant demonstrably proving that none of these things can have existence.

77 As for those effects which are called MIRACLES, that is to say, contrary to the unalterable laws of Nature, it must be felt such things are impossible; 78 because, nothing can, for an instant, suspend the necessary course of beings, without the whole of Nature was arrested; without She was disturbed in Her tendency. 79 There have neither been wonders nor miracles in Nature; except for those, who have not sufficiently studied the

laws, 80 who consequently do not feel, that those laws can never be contradicted, even in the most minute parts, without the whole being destroyed, 81 or at least without changing Her essence, Her mode of action; that it is the height of folly to recur to supernatural causes to explain the phenomena human beholds, 82 before you becomes fully acquainted with natural causes-- with the powers and capabilities which Nature herself contains. 83 Order and Confusion, then, are only relative terms, by which human designates the state in which particular beings find themselves. 84 It says, a being is in order, when all the motion it undergoes conspires to favour its tendency to its own preservation; 85 when it is conducive to the maintenance of its actual existence: 86 that it is in confusion when the causes which move it disturb the harmony of its existence, 87 or have a tendency to destroy the equilibrium necessary to the conservation of its actual state. 88 Nevertheless, confusion, as we have shown, is nothing but the passage of a being into a new order; 89 the more rapid the progress, the greater the confusion for the being that is submitted to it: 90 that which conducts human to what is called death, is, for human, the greatest of all possible confusion. 91 Yet this death is nothing more than a passage into a new mode of existence: 92 it is the eternal, the invariable, the unconquerable law of Nature, to which the individuals of own order, each in own turn, is obliged to submit.

93 The human body is said to be in order, when its various component parts act in that mode, from which results the conservation of the whole; 94 from which emanates that which is the tendency of your actual existence; 95 in other words, when all the impulse you receives, all the motion you communicates, tends to preserve your health, to render you happy, by promoting the happiness of your fellow humans. 96 You is said to be in health when the fluids and solids of your body concur to render you robust, to keep your mind

in vigour; when each lends mutual aid towards this end. 97 You is said to be in confusion, or in ill health, whenever this tendency is disturbed; 98 when any of the essential parts of your body cease to concur to your preservation, or to fulfil its peculiar functions. 99 This it is that happens in a state of sickness, in which, however, the motion excited in the human machine is as necessary, 100 is regulated by laws as certain, as natural, as invariable, as that which concurs to produce health. 101 Sickness merely produces in him a new order of motion, a new series of action, a new chain of things. 102 Human dies: to human, this appears the greatest confusion you can experience; 103 your body is no longer what it was-- its parts no longer concur to the same end-- the blood has lost its circulation-- the body is deprived of feeling-- your ideas have vanished-- the brain thinks no more-- your desires have fled-- death is the epoch, the cessation of your human existence. 104 Human frame becomes an inanimate mass, by the subtraction of those principles by which it was animated; that is, which made it act after a determinate manner: 105 its tendency has received a new direction; its action is changed; the motion excited in its ruins conspires to a new end. 106 To that motion, the harmony of which you calls order, which produced life, sentiment, thought, passions, health, succeeds a series of motion of another species; 107 that, nevertheless, follows laws as necessary as the first; 108 all the parts of the dead human conspire to produce what is called dissolution, fermentation, putrefaction: 109 these new modes of being, of acting, are just as natural to human, reduced to this state, as sensibility, thought, the periodical motion of the blood, etc, 110 were to the living human: your essence having changed, your mode of action can no longer be the same. 111 To that regulated motion, to that necessary action, which conspired to the production of life, succeeds that determinate motion, that series of action which concurs to produce the dissolution of the dead carcass; 112 the dispersion of its parts; the

formation of new combinations, from which result new beings; and which, as we have before seen, is the immutable order of active Nature.

113 How then can it be too often repeated, that relatively to the great whole, all the motion of beings, all their modes of action, can never be but in order, that is to say, are always conformable to Nature; 114 that in all the stages through which beings are obliged to pass, they invariably act after a mode necessarily subordinate to the universal whole? 115 To say more, each individual being always acts in order; 116 all its actions, the whole system of its motion, are the necessary consequence of its peculiar mode of existence; whether that be momentary or durable. 117 Order, in state-governmental society, is the effect of a necessary series of ideas, of wills, of actions, in those who compose it; 118 whose movements are regulated in a manner, either calculated to maintain its indivisibility, or to hasten its dissolution. 119 Human constituted, or modified, in the manner we term virtuous, acts necessarily in that mode, from whence results the welfare of your associates: 120 the human we stile wicked, acts necessarily in that mode, from whence springs the misery of own fellows: 121 the nature, being essentially different, it must necessarily act after a different mode: its individual order is at variance, but its relative order is complete: 122 it is equally the essence of the one, to promote happiness, as it is of the other to induce misery.

123 Thus, order and confusion in individual beings, is nothing more than the manner of human's considering the natural and necessary effects, which they produce relatively to yourself. 124 Human fears the wicked person; one says that the wicked will carry confusion into society, because they disturbs its tendency and places obstacles to its happiness. 125 Human avoids a falling stone, because it will derange in you the order necessary to your conservation. 126 Nevertheless, order and confusion, are always, as we have shown, consequences, equally

necessary to either the transient or durable state of beings. 127 It is in order that fire burns, because it is of its essence to burn; 128 on the other hand, it is in order, that an intelligent being should remove oneself from whatever can disturb one's mode of existence. 129 A being, whose organisation renders you sensible, must in virtue of your essence, fly from everything that can injure your organs, or that can place your existence in danger.

130 Human calls those beings intelligent, who are organised after your own manner; 131 in whom you sees faculties proper for their preservation; suitable to maintain their existence in the order that is convenient to them; 132 that can enable them to take the necessary measures towards this end, with a consciousness of the motion they undergo. 133 From hence, it will be perceived, that the faculty called intelligence, consists in a possessing capacity to act comformably to a known end, in the being to which it is attributed. 134 Human looks upon these beings as deprived of intelligence, in which you finds no conformity with yourself; 135 in whom you discovers neither the same construction, nor the same faculties: 136 of which you knows neither the essence, the end to which they tend, the energies by which they act, nor the order that is necessary to them. 137 The whole cannot have a distinct name, or end, because there is nothing out of itself, to which it can have a tendency. 138 If it be in yourself, that you arrange the idea of 'order', it is also in yourself that you draws up that of 'intelligence'. 139 Human refuses to ascribe it to those beings, who do not act after one's own manner: you accords it to all those whom you supposes to act like yourself: 140 the latter one calls intelligent agents: the former blind causes; that is to say, intelligent agents who act by chance: 141 thus chance is an empty word without sense, but which is always opposed to that of intelligence, without attaching any determinate, or any certain idea.

142 Human, in fact, attributes to chance all those effects, of which the

connection they have with their causes is not seen. 143 Thus you uses the word chance, to cover your own ignorance of those natural causes, which produce visible effects, by means which you cannot form an idea of; 144 or that act by a mode of which you does not perceive the order; or whose system is not followed by actions conformable to your own. 145 As soon as you sees, or believes you sees, the order of action, or the manner of motion, you attributes this order to an intelligence; 146 which is nothing more than a quality borrowed from yourself-- from your own peculiar mode of action-- from the manner in which you is yourself affected.

147 Thus an intelligent being is one who thinks, who wills, and who acts, to compass an end. 148 If so, you must have organs, an aim conformable to those of human: 149 therefore, to say Nature is governed by an intelligence, is to affirm that She is governed by a being, furnished with organs; 150 seeing that without this organic construction, you can neither have sensations, perceptions, ideas, thought, will, plan, nor action which you understands.

151 Human always makes oneself the center of the universe: it is to yourself that you relates all you beholds. 152 As soon as you believes you discovers a mode of action that has a conformity with your own, or some phenomenon that interests your feelings, you attributes it to a cause that resembles yourself-- 153 that acts after your manner-- that has faculties similar to those you possesses-- whose interests are like your own-- whose projects are in unison with and have the same tendency as those one's yourself indulges: 154 in short, it is from yourself, or the properties which actuate you, that you forms the model of this cause. 155 It is thus that human beholds, out of your own species, nothing but beings who act differently from yourself; 156 yet believes that you remarks in Nature an order similar to your own ideas-- views conformable to those which one's yourself possesses. 157 Human imagines that Nature is governed by a cause whose intelligence is

conformable to your own, 158 to whom you ascribes the honour of the order which you believes you witnesses-- of those views that fall in with those that are peculiar to yourself-- 159 of an aim which quadrates with that which is the great end of all your own actions. 160 It is true that human, feeling your incapability of producing the vast, the multiplied effects of which you witnesses the operation, when contemplating the universe, 161 was under the necessity of making a distinction between yourself and the cause which you supposed to be the author of such stupendous effects; 162 you believed you removed every difficulty, by amplifying in this cause all those faculties of which you was yourself in possession; 163 adding others of which your own self-love made you desirous, or which you thought would render your being more perfect: 164 thus, human gave JUPITER wings, with the faculty of assuming any form you might deem convenient: 165 it was thus, by degrees, you arrived at forming an idea of that intelligent cause, which you has placed above Nature, 166 to preside over action-- to give Her that motion of which you have chosen to believe She was in Herself incapable. 167 Human obstinately persists in regarding this Nature as a heap of dead, inert matter, without form, 168 which has not within itself the power of producing any of those great effects, those regular phenomena, from which emanates what you styles the order of the Universe. 169 ANAXAGORAS is said to have been the first who supposed the universe created and governed by an intelligence: 170 ARISTOTLE reproaches him with having made an automaton of this intelligence; or in other words, with ascribing to it the production of things, only when he was at a loss to account for their appearance. 171 From whence it may be deduced, that it is for want of being acquainted with the powers of Nature, or the properties of matter, that human has multiplied beings without necessity-- 172 that you has supposed the universe under the government of an intelligent cause,

which you is, and perhaps always will be, yourself the model: 173 in fine, this cause has been personified under such a variety of shapes, sexes, and names, that a list of the deities human has at various times supposed to guide this.

174 Nature, or to whom you has submitted Her, makes a large volume that occupies some years of your youthful education to understand. 175 Human only rendered this cause more inconceivable, when you extended in it your own faculties too much. 176 Human either annihilates, or renders it altogether impossible, when you would attach to it incompatible qualities, 177 which you are obliged to do, to enable you to account for the contradictory and disorderly effects you beholds in the world. 178 In fact, you sees confusion in the world; 179 yet, notwithstanding your confusion contradicts the plan, the power, the wisdom, the bounty of this intelligence, and the miraculous order which you ascribes to it; 180 human says, the extreme beautiful arrangement of the whole, obliges you to suppose it to be the work of a sovereign intelligence: 182 unable, however, to reconcile this seeming confusion with the benevolence you attaches to this cause, you had recourse to another effort of your imagination; 183 human made a new cause, to whom you ascribed all the evil, all the misery, resulting from this confusion: 184 still, your own person served for the model; to which you added those deformities which you had learned to hold in disrespect: 185 in multiplying these counter or destroying causes, one peopled Pandemonium.

186 It will no doubt be argued, that as Nature contains and produces intelligent beings, either She must be Herself intelligent, or else She must be governed by an intelligent cause. 187 We reply, intelligence is a faculty peculiar to organised beings, that it is to say, to beings constituted and combined after a determinate manner; 188 from whence results certain modes of action, which are designated under various names; 189 according to the different effects which these beings produce: wine has not the properties called ‘wit’

and ‘courage’; 190 nevertheless, it is sometimes seen that it communicates those qualities to people, who are supposed to be in themselves entirely devoid of them. 191 It cannot be said Nature is intelligent after the manner of any of the beings She contains; 192 but She can produce intelligent beings by assembling matter suitable to their particular organisation, 193 from whose peculiar modes of action will result the faculty called intelligence; 194 who shall be capable of producing certain effects which are the necessary consequence of this property. 195 I therefore repeat, that to have intelligence, designs and views, it is requisite to have ideas; to the production of ideas, organs or senses are necessary: 196 this is what is neither said of Nature nor of the causes human has supposed to preside over Her actions. 197 In short experience warrants the assertion, it does more, it proves beyond a doubt, that matter, which is regarded as inert and dead, assumes sensible action, intelligence, and life, when it is combined and organised after particular modes.

198 From what has been said, it must rationally be concluded that order is never more than the necessary or uniform connection of causes with their effects; 199 or that series of action which flows from the peculiar properties of beings, so long as they remain in a given state; 200 that confusion is nothing more than the change of this state; that in the universe, all is necessarily in order, because everything acts and moves according to the various properties of the different beings it contains; 201 that in Nature there cannot be either confusion or real evil, since everything follows the laws of its natural existence; 202 that there is neither chance nor any thing fortuitous in this Nature, where no effect is produced without a sufficient, without a substantial cause; 203 where all causes act necessarily according to fixed and certain laws, which are themselves dependant on the essential properties of these causes or beings, 204 as well as on the combination, which constitutes either their transitory or permanent state; 205 that intelligence

is a mode of acting, a method of existence natural to some particular beings; 206 that if this intelligence should be attributed to Nature, it would then be nothing more than the faculty of conserving Herself in active existence by necessary means. 207 In refusing to Nature the intelligence human enjoys-- in rejecting the intelligent cause which is supposed to be the contriver of this Nature, or the principle of that order human discovers in Her course, nothing is given to chance, 208 nothing to a blind cause, nothing to a power which is indistinguishable; 209 but everything human beholds is attributed to real, to known causes; or to those which by analogy are easy of comprehension. 210 All that exists is acknowledged to be a consequence of the inherent properties of eternal matter, 211 which by contact, by blending, by combination, by change of form, produces order and confusion; 212 with all those varieties which assail your sight, it is yourself who is blind, when you imagines blind causes:-- 213 human only manifested own ignorance of the powers of motion, of the laws of Nature, when you attributed, any of its effects to 'chance'. 214 Human did not show a more enlightened feeling when you ascribed them to an intelligence, 215 the idea of which you borrowed from yourself, but which is never in conformity with the effects which you attributes to its intervention-- 216 human only imagined words to supply the place of things-- human made JUPITER, SATURN, JUNO, and a thousand others, operate that which you found yourself inadequate to perform; 217 human distinguished them from Nature, gave them an amplification of your own properties, 218 and believed they understood them by thus obscuring ideas, which they never dared either define or analyse.

NATURE

MORAL AND PHYSICAL DISTINCTIONS OF HUMAN-- HUMAN ORIGIN

Paul Henri Thiery (Baron D'Holbach)

31 Let us now apply the general laws we have scrutinised, to those beings of Nature who interest us the most. 2 Let us see in what human differs from the other beings by which you are surrounded. 3 Let us examine if human has not certain points in conformity with them, that oblige human, notwithstanding the different properties they respectively possess, 4 to act in certain respects according to the universal laws to which everything is submitted. 5 Finally, let us enquire if the ideas human has formed of itself in meditating on your own peculiar mode of existence, be chimerical, or founded in reason.

6 Human occupies a place amidst that crowd, that multitude of beings, of which Nature is the assemblage. 7 Human's essence, that is to say, the peculiar manner of existence, by which human is distinguished from other beings, 8 renders you susceptible of various modes of action, of a variety of motion, some of which are simple and visible, others concealed and complicated. 9 Human's life itself is nothing more than a long series, a succession of necessary and connected motion; which operates perpetual changes in your machine; 10 which has for its principle either causes contained within yourself, such as blood, nerves, fibres, flesh, bones; 11 in short, the matter, as well solid as fluid, of which your body is composed-- or those exterior causes, which, by acting upon human, modify you diversely; 12 such as the air with which human is encompassed, the aliments by which you are nourished, 13 and all those objects from which human receives any impulse whatever, by the impression they make on your own senses.

14 Human, like all other beings in Nature, tends to own destruction-- 15 human experiences inert force-- and gravitates upon oneself-- 16 human is attracted by objects that are contrary or repugnant to own existence-- and

seeks after some-- 17 human flies, or endeavours to remove itself from others. 18 It is this variety of action, this diversity of modification of which the human being is susceptible, that has been designated under such different names, by such varied nomenclature. 19 It will be necessary, presently, to examine these closely and go more into detail. 20 However marvellous, however hidden, however secret, however complicated may be the modes of action, which the human frame undergoes, whether interiorly or exteriorly; 21 whatever may be, or appear to be the impulse you either receives or communicates, examined closely, it will be found that all human's motion, all human's operations, all human's changes, all human's various states, all human's revolutions, are constantly regulated by the same laws, 22 which Nature has prescribed to all the beings She brings forth-- which She develops-- which She enriches with faculties-- 23 of which She increases the bulk-- which She conserves for a season-- which She ends by decomposing, by destroying: obliging them to change their form.

24 Human, in one's origin, is an imperceptible point, a speck, of which the parts are without form; of which the mobility, the life, escapes own senses; 25 in short, in which you does not perceive any sign of those qualities, called SENTIMENT, FEELING, THOUGHT, INTELLIGENCE, FORCE, REASON, etc. 26 Placed in the womb suitable to own expansion, this point unfolds, extends, increases, by the continual addition of matter human attracts, 27 that is analogous to human being, which consequently assimilates itself with you. 28 Having quitted this womb, so appropriate to conserve your existence, to unfold your qualities, to strengthen your habits; 29 so competent to give, for a season, consistence to the weak rudiments of human frame; 30 human travels through the stage of infancy; human becomes adult: human's body has then acquired a considerable extension of bulk, 31 human's motion is marked, human's action is visible, human is sensible in all own parts; 32 human is a living, an active mass;

that is to say, a combination that feels and thinks; that fulfils the functions peculiar to beings of own species.

33 But how has human become sensible? 34 Because human has been by degrees nourished, enlarged, repaired by the continual attraction that takes place within yourself, 35 of that kind of matter which is pronounced inert, insensible, inanimate; which is, nevertheless, continually combining itself with human's machine; 36 of which it forms an active whole, that is living, that feels, judges, reasons, wills, deliberates, chooses, elects; 37 that has the capability of labouring, more or less efficaciously, to human's own individual preservation; that is to say, to the maintenance of the harmony of human existence.

38 All the motion and changes that human experiences in the course of one's life, whether it be from exterior objects or from those substances contained within oneself, are either favourable or prejudicial to your existence; 39 either maintain its order, or throw it into confusion; are either in conformity with, or repugnant to, the essential tendency of human's peculiar mode of being. 40 Human is compelled by Nature to approve of some, to disapprove of others; some of necessity render you happy, others contribute to your misery; 41 some become the objects of your most ardent desire, others of your determined aversion: some elicit your confidence, others make you tremble with fear.

42 In all the phenomena human presents, from the moment you quits the womb of your mother, to that wherein you becomes the inhabitant of the silent tomb, you perceives nothing but a succession of necessary causes and effects, 43 which are strictly conformable to those laws that are common to all the beings in Nature. 44 All your modes of action-- all your sensations-- all your ideas-- all your passions-- every act of your will-- every impulse which you either gives or receives, are the necessary consequences of your own peculiar properties, 45 and those which human finds in the various beings by whom you are moved. 46

NATURE

Everything you does-- everything that passes within yourself-- your concealed motion-- your visible action, are the effects of inert force-- of self-gravitation-- 47 the attractive or repulsive powers contained in human's machine-- of the tendency you have, in common with other beings, to your own individual preservation; 48 in short, of that energy which is the common property of every being you beholds. 49 Nature, in human, does nothing more than show, in a decided manner, what belongs to the peculiar nature by which you are distinguished from the beings of a different system or order. 50 The source of those errors into which human has fallen, when you have contemplated yourself, has its rise, as will presently be shown, in the opinion you have entertained, 51 that you moved by yourself-- that you always acts by your own natural energy-- that in your actions, in the will that gave you impulse, you were independent of the general laws of Nature; 52 and of those objects which, frequently, without your knowledge, always in spite of yourself, in obedience to these laws, are continually acting upon yourself. 53 If you had examined yourself attentively, you must have acknowledged, that none of the motion you underwent was spontaneous-- 54 you must have discovered, that even your birth depended on causes, wholly out of the reach of your own powers-- 55 that, it was without your own consent you entered into the system in which you occupies a place-- 56 that, from the moment in which you were born, until that in which you dies, you are continually impelled by causes, 57 which, in spite of yourself, influence your frame, modify your existence, dispose of your conduct. 58 Would not the slightest reflection have sufficed to prove to yourself, that the fluids, the solids, of which your own body is composed, as well as that concealed mechanism, which you believes to be independent of exterior causes, 59 are, in fact, perpetually under the influence of these causes; that without them you finds yourself in a total incapacity to

act? 60 Would you not have seen, that your temperament, your constitution, did in no wise depend on yourself-- 61 that your passions are the necessary consequence of this temperament-- that your will is influenced, your actions determined by these passions; consequently by opinions, which you have not given to yourself, of which you are not the master? 62 Human's blood, more or less heated or abundant; human's nerves more or less braced, human's fibres more or less relaxed, you're your dispositions either transitory or durable-- 63 are not these, at every moment decisive of your ideas; of your thoughts: of your desires: of your fears: of your motion, whether visible or concealed? 64 The state in which you finds yourself, does it not necessarily depend on the air which surrounds you diversely modified; 65 on the various properties of the aliments which nourish yourself; on the secret combinations that form themselves in your machine, which either preserve its order, or throw it into confusion? 66 In short, had human fairly studied itself, everything must have convinced you, that in every moment of your duration, you were nothing more than a passive instrument in the hands of necessity.

67 Thus it must appear, that where all is connected, where all the causes are linked one to the other, where the whole forms but one immense chain, there cannot be any independent, any isolated energy; any detached power. 68 It follows then, that Nature, always in action, marks out to human each point of the line you are bound to describe; establishes the route, by which you must travel. 69 It is Nature that elaborates, that combines the elements of which you must be composed; 70 It is Nature that gives human its being, your tendency, your peculiar mode of action. 71 It is Nature that develops humans, expands yourself, strengthens yourself, increases your bulk-- preserves you for a season, during which you are obliged to fulfil the task imposed on yourself. 72 It is Nature, that in human's journey through life, strews on the road those objects, those events; those

adventures, that modify you in a variety of ways, 73 that give you impulses which are sometimes agreeable and beneficial, at others prejudicial and disagreeable. 74 It is Nature, that in giving human feeling, in supplying human with sentiment, has endowed you with capacity to choose, 75 the means to elect those objects, to take those methods that are most conducive, most suitable, most natural, to your conservation. 76 It is Nature, who when you have run your race, when you have finished your career, when you have described the circle marked out for yourself, conducts you in its turn to your own destruction; 77 dissolves the union of your elementary particles, and obliges you to undergo the constant, the universal law; from the operation of which nothing is exempted. 78 It is thus, motion places human in the matrix of its mother; brings human forth out of Her womb; sustains human for a season; at length destroys human; 79 obliges human to return into the bosom of Nature; who speedily reproduces human, scattered under an infinity of forms; 80 in which each of human's particles run over again, in the same manner, the different stages, as necessary as the whole had before run over those of your preceding existence.

81 The beings of the human species, as well as all other beings, are susceptible of two sorts of motion: 82 the one, that of the mass, by which an entire body, or some of its parts, are visibly transferred from one place to another; the other, internal and concealed, of some of which human is sensible, 83 while some takes place without your knowledge, and is not even to be guessed at, but by the effect it outwardly produces. 84 In a machine so extremely complex as human, formed by the combination of such a multiplicity of matter, 85 so diversified in its properties, so different in its proportions, so varied in its modes of action, the motion necessarily becomes of the most complicated kind; 86 its dullness, as well as its rapidity, frequently escapes the observation of those themselves, in whom it takes place.

87 Let us not, then, be surprised, if, when human would account to oneself for your own existence, for your own manner of acting, 88 finding so many obstacles to encounter, you invented such strange hypotheses to explain the concealed spring of your machine-- 89 if then this motion appeared to yourself, to be different from that of other bodies, you conceived an idea, that you moved and acted in a manner altogether distinct from the other beings in Nature. 90 Human clearly perceived that your own body, as well as different parts of it, did act; but, frequently, you were unable to discover what brought them into action: 91 from whence you received the impulse: you then conjectured it contained within yourself a moving principle distinguished from your machine, which secretly gave an impulse to the springs which set this machine in motion; 92 that moved human by its own natural energy; that consequently human acted according to laws totally distinct from those which regulated the motion of other beings: 93 human was conscious of certain internal motion, which you could not help feeling; 94 but how could you conceive, that this invisible motion was so frequently competent to produce such striking effects? 95 How could you comprehend, that a fugitive idea, an imperceptible act of thought, was so frequently capacitated to bring your whole being into trouble and confusion? 96 Human fell into the belief, that you perceived within yourself a substance distinguished from that self, endowed with a secret force; 97 in which human supposed existed qualities distinctly differing from those, of either the visible causes that acted on your own organs, or those organs themselves. 98 Human did not sufficiently understand, that the primitive cause which makes a stone fall, or your own arm move, are perhaps as difficult of comprehension, 99 as arduous to be explained, as those internal impulses, of which your thought or your will are the effects. 100 Thus, for want of meditating Nature-- of considering Her under Her true point of view--

101 of remarking the conformity-- of noticing the simultaneity, the unity of the motion of this fancied motive-power with that of human body-- of your material organs-- 102 you conjectured you were not only a distinct being, but that you were set apart, with different energies, from all the other beings in Nature; 103 that you was of a more simple essence having nothing in common with anything by which you were surrounded; nothing that connected human with all that you beheld.

104 It is from thence has successively sprung your notions of SPIRITUALITY, IMMATERIALITY, IMMORTALITY; 105 in short, all those vague unmeaning words you have invented by degrees, in order to subtilise and designate the attributes of the unknown power, 106 which you believes you contains within yourself; which you conjectures to be the concealed principle of all your visible actions when human once imbibes an idea that you cannot comprehend, 107 you meditates upon it until you have given it a complete personification:

108 Thus human saw, or fancied human saw, the igneous matter pervade everything; 109 human conjectured that it was the only principle of life and activity; human proceeded to embody it; human gave it its own form; called it JUPITER, 110 and ended by worshipping this image of human's own creation, as the power from whom human derived every good human experienced, every evil human sustained.

111 To crown the bold conjectures human ventured to make on this internal motive-power, human supposed, that different from all other beings, even from the body that served to envelope it, it was not bound to undergo dissolution; 112 that such was its perfect simplicity, that it could not be decomposed, nor even change its form; 113 in short, that it was by its essence exempted from those revolutions to which you saw the body subjected, as well as all the compound beings with which Nature is filled.

114 Thus human, in your own ideas, became double; human looked upon oneself as a whole, composed by the

inconceivable assemblage of two different, two distinct natures, which have no point of analogy between themselves: 115 human distinguished two substances in oneself; you evidently submitted to the influence of gross beings, composed of coarse inert matter: this human called BODY;-- 116 the other, which human supposed to be simple, of a purer essence, was contemplated as acting from itself: 117 giving motion to the body, with which it found itself so miraculously united: this human called SOUL, or SPIRIT; 118 the functions of the One, human denominated physical, corporeal, material; the functions of the other human styled spiritual, intellectual. 119 Human, considered relatively to the first, was termed the PHYSICAL HUMAN; viewed with relation to the last, human was designated the MORAL HUMAN. 120 These distinctions, although adopted by the greater number of the philosophers of the present day, are, nevertheless, only founded on gratuitous suppositions. 121 Human has always believed you remedied your ignorance of things, by inventing words to which you could never attach any true sense or meaning. 122 Human imagined one understood matter, its properties, its faculties, its resources, its different combinations, because you had a superficial glimpse of some of its qualities: 123 human has, however, in reality, done nothing more than obscure the faint ideas you have been capacitated to form of this matter, by associating it with a substance much less intelligible than itself. 124 It is thus, speculative human, in forming words, in multiplying beings, has only plunged you into greater difficulties than those you endeavoured to avoid; 125 and thereby placed obstacles to the progress of your own knowledge: whenever you have been deficient of facts, you have had recourse to conjecture, which you quickly changed into fancied realities. 126 Thus, your imagination, no longer guided by experience, hurried on by your new ideas, was lost, without hope of return, in the labyrinth of an ideal, of an intellectual world, to which you had yourself given birth;

127 it was next to impossible to withdraw human from this delusion, to place human in the right road, of which nothing but experience can furnish you the clue. 128 Nature points out to human, that in you, as well as in all those objects which act upon human, there is never more than matter endowed with various properties, diversely modified, that acts by reason of these properties: 129 that human is an organised whole, composed of a variety of matter; 130 that like all the other productions of Nature, human follows general and known laws, as well as those laws or modes of action which are peculiar to yourself and unknown.

131 Thus, when it shall be inquired, what is human? 132 We say, human is a material being, organised after a peculiar manner conformed to a certain mode of thinking-- of feeling; 133 capable of modification in certain modes peculiar to oneself-- to one's organisation-- to that particular combination of matter which is found assembled in yourself.

134 If, again, it be asked, what origin we give to beings of the human species? 135 We reply, that, like all other beings, human is a production of Nature, who resembles them in some respects, and finds yourself submitted to the same laws; 136 who differs from them in other respects, and follows particular laws, determined by the diversity of your conformation.

137 If, then, it be demanded, whence came human? 138 We answer, our experience on this head does not capacitate us to resolve the question: but that it cannot interest us, as it suffices for us to know that human exists; 139 that human is so constituted, as to be competent to the effects we witness.

140 But it will be urged, has human always existed? 141 Has the human species existed from all eternity; or is it only an instantaneous production of Nature? 142 Have there been always human like ourselves? Will there always be such? 143 Have there been, in all times, males and females? Was there a first human, from whom all others are descended?

144 Was the animal anterior to the egg, or did the egg precede the animal? 145 Is this species without beginning? Will it also be without end? 146 The species itself, is it indestructible, or does it pass away like its individuals? 147 Has human always been what human now is; or has human, before human arrived at the state in which we see human, been obliged to pass under an infinity of successive developments? 148 Can human at last flatter itself with having arrived at a fixed being, or must the human species again change? 149 If human is the production of Nature, it will perhaps be asked, Is this Nature competent to the production of new beings, to make the old species disappear?

150 Adopting this supposition, it may be inquired, why Nature does not produce under our own eyes new beings-- new species? 151 It would appear on reviewing these questions, to be perfectly indifferent, as to the stability of the argument we have used, which side was taken; 152 that, for want of experience, hypothesis must settle a curiosity that always endeavours to spring forward beyond the boundaries prescribed to our mind. 153 This granted, the contemplators of Nature will say, that they sees no contradiction, in supposing the human species, such as it is at the present day, was either produced in the course of time, or from all eternity: 154 they will not perceive any advantage that can arise from supposing that it has arrived by different stages, 155 or successive developments, to that state in which it is actually found. 156 Matter is eternal, it is necessary, but its forms are evanescent and contingent.

157 It may be asked of human, is human anything more than matter combined, of which the former varies every instant? 158 Notwithstanding, some reflections seem to favour the supposition, to render more probable the hypothesis, that human is a production formed in the course of time; 159 who is peculiar to the globe human inhabits, who is the result of the peculiar laws by which it is directed; 160 who, consequently, can only date own formation as coeval with that of own

planet. 161 Existence is essential to the universe, or the total assemblage of matter essentially varied that presents itself to our contemplation; 162 the combinations, the forms, however, are not essential. 163 This granted, although the matter of which the earth is composed has always existed, this earth may not always have had its present form--its actual properties; 164 perhaps it may be a mass detached in the course of time from some other celestial body;-- 165 perhaps it is the result of the spots, or those encrustations which astronomers discover in the sun's disk, which have had the faculty to diffuse themselves over our planetary system;-- 166 perhaps the sphere we inhabit may be an extinguished or a displaced comet, which heretofore occupied some other place in the regions of space;-- 167 which, consequently, was then competent to produce beings very different from those we now behold spread over its surface; 168 seeing that its then position, its nature, must have rendered its productions different from those which at this day it offers to our view.

169 Whatever may be the supposition adopted, plants, animals, humans, can only be regarded as productions inherent in and natural to our globe, 170 in the position and in the circumstances in which it is actually found: 171 these productions it would be reasonable to infer would be changed, if this globe by any revolution should happen to shift its situation. 172 What appears to strengthen this hypothesis, is, that on our ball itself, all the productions vary, by reason of its different climates: 173 humans, animals, vegetables, minerals, are not the same on every part of it: they vary sometimes in a very sensible manner, at very inconsiderable distances.

174 The elephant is indigenous to, or native of the torrid zone: the rein deer is peculiar to the frozen climates of the North; 175 Indostan is the womb that matures the diamond; we do not find it produced in some countries: 176 the pine-apple grows in the common atmosphere of America; in some climate it is never

produced in the open ground, never until art has furnished a sun analogous to that which it requires-- 177 the Europeans in their own climate finds not this delicious fruit. 178 Human in different climates varies in own skin colour, in own size, in own conformation, in own human-powers, in own industry, in own courage, and in the faculties of own mind. 179 But, what is it that constitutes climate? 180 It is the different position of parts of the same globe, relatively to the sun; positions that suffice to make a sensible variety in its productions.

181 There is, then, sufficient foundation to conjecture that if by any accident our globe should become displaced, all its productions would of necessity be changed; 182 seeing that causes being no longer the same, or no longer acting after the same manner, the effects would necessarily no longer be what they now are, 183 all productions, that they may be able to conserve themselves, or maintain their actual existence, have occasion to co-order themselves with the whole from which they have emanated. 184 Without this they would no longer be in a capacity to subsist: 185 it is this faculty of co-ordering themselves,-- this relative adaption, which is called the ORDER OF THE UNIVERSE: the want of it is called CONFUSION.

186 Those productions which are treated as MONSTROUS, are such as are unable to co-order themselves with the general or particular laws of the beings who surround them, 187 or with the whole in which they find themselves placed: they have had the faculty in their formation to accommodate themselves to these laws; 188 but these very laws are opposed to their perfection: for this reason they are unable to subsist. 189 It is thus that by a certain analogy of conformation, which exists between animals of different species, mules are easily produced; 190 but these mules, unable to co-order themselves with the beings that surround them, are not able to reach perfection, consequently cannot propagate their species. 191 Human can live only in air, fish only in water: put the human into the water, the fish into the air,

not being able to co-order themselves with the fluids which surround them, these animals will quickly be destroyed. 192 Transport by imagination, a human from our planet into SATURN, human lungs will presently be rent by an atmosphere too rarified for own mode of being, 193 human members will be frozen with the intensity of the cold; human will perish for want of finding elements analogous to own actual existence: 194 transport another into MERCURY, the excess of heat, beyond what own mode of existence can bear, will quickly destroy it.

195 Thus, everything seems to authorise the conjecture, that the human species is a production peculiar to our sphere, in the position in which it is found: 196 that when this position may happen to change, the human species will, of consequence, either be changed or will be obliged to disappear; 197 seeing that there would not then be that with which human could co-order itself with the whole, or connect itself with that which can enable it to subsist. 198 It is this aptitude in human to co-order itself with the whole, that not only furnishes human with the idea of order, but also makes human exclaim "whatever is, is right;" 199 whilst everything is only that which it can be, as long as the whole is necessarily what it is; whilst it is positively neither good nor bad, as we understand those terms: 200 it is only requisite to displace a human, to make human accuse the universe of confusion. 201 These reflections would appear to contradict the ideas of those, who are willing to conjecture that the other planets, like our own, are inhabited by beings resembling ourselves. 202 But if the LAPLANDER differs in so marked a manner from the HOTTENTOT, 203 what difference ought we not rationally to suppose between an inhabitant of our planet and one of SATURN or of VENUS?

204 However it may be, if we are obliged to recur by imagination to the origin of things, to the infancy of the human species, 205 we may say that it is probable that human was a necessary consequence of the

disentangling of our globe; 206 or one of the results of the qualities, of the properties, of the energies, of which it is susceptible in its present position-- 207 that human was born male and female-- that human's existence is co-ordinate with that of the globe, under its present position-- 208 that as long as this co-ordination shall subsist, the human species will conserve itself, will propagate itself, 209 according to the impulse, after the primitive laws, which human has originally received-- 210 that if this co-ordination should happen to cease; if the earth, displaced, should cease to receive the same impulse, the same influence, on the part of those causes which actually act upon it, or which give it energy; 211 that then the human species would change, to make place for new beings, 212 suitable to co-order themselves with the state that should succeed to that which we now see subsist. 213 In thus supposing the changes in the position of our globe, the primitive human did, perhaps, differ more from the modern human, than the quadruped differs from the insect. 214 Thus human, the same as everything else that exists on our planet, as well as in all the others, may be regarded as in a state of continual vicissitude: 215 thus the last term of the existence of human is to us as unknown and as indistinct as the first: 216 there is, therefore, no contradiction in the belief that the species vary incessantly-- 217 that to us it is as impossible to know what you will become, as to know what you have been.

218 With respect to those who may ask why Nature does not produce new beings? 219 We may enquire of them in turn, upon what foundation they suppose this fact? What it is that authorises them to believe this sterility in Nature? 220 Know that if, in the various combinations which She is every instant forming, Nature be not occupied in producing new beings, without the cognisance of these observers? 221 Who has informed them that this Nature is not actually assembling, 222 in Her immense elaboratory, the elements suitable to bring to light, generations entirely new, that will have nothing

in common with those of the species at present existing? 223 What absurdity then, or what want of just inference would there be, to imagine that the human, the horse, the fish, the bird, will be no more? 224 Are these animals so indispensably requisite to Nature, that without them She cannot continue her eternal course? 225 Does not all change around us? Do we not ourselves change? 226 Is it not evident that the whole universe has not been, in its anterior eternal duration, rigorously the same that it now is? 227 That it is impossible, in its posterior eternal duration, it can be rigidly in the same state that it now is for a single instant? 228 How, then, pretend to define that, to which the infinite succession of destruction, of reproduction, of combination, of dissolution, of metamorphosis, of change, of transposition, may be able eventually to conduct it by their consequence? 229 Suns encrust themselves, and are extinguished; planets perish and disperse themselves in the vast plains of air; 230 other suns are kindled, and illumine their systems; new planets form themselves, either to make revolutions round these suns, or to describe new routes; 231 and human, an infinitely small portion of the globe, which is itself but an imperceptible point in the immensity of space, vainly believes it is for itself this universe is made; 232 foolishly imagines human ought to be the confident of Nature; confidently flatters itself human is eternal: and calls itself KING OF THE UNIVERSE!!!

233 O human! wilt thou never conceive, that thou art but an ephemeron? 234 All changes in the great macrocosm: nothing remains the same an instant, in the planet thou inhabitest: 235 Nature contains no one constant form, yet thou pretendest thy species can never disappear; 236 that thou shalt be exempted from the universal law, that wills all shall experience change! 237 Alas! In thy actual being, art not thou submitted to continual alterations? 238 Thou, who in thy folly, arrogantly assumest to thyself the title of KING OF NATURE! 239 Thou,

who measurest the earth and the heavens!

240 Thou, who in thy vanity imaginest, that the whole was made, because thou art intelligent! 241 There requires but a very slight accident, a single atom to be displaced, to make thee perish; 242 to degrade thee; to ravish from thee this intelligence of which thou appearest so proud.

243 If all the preceding conjectures be refused by those opposed to us; 244 if it be pretended that Nature acts by a certain quantum of immutable and general laws; 245 if it be believed that humans, quadrupeds, fish, insects, plants, are from all eternity, and will remain eternally, what they now are: 246 if I say it be contended, that from all eternity the stars have shone, in the immense regions of space, have illuminated the firmament; 247 if it be insisted, we must no more demand why human is such as human appears, 248 then ask why Nature is such as we behold Her, or why the world exists?

249 We are no longer opposed to such arguments. 250 Whatever may be the system adopted, it will perhaps reply equally well to the difficulties with which our opponents endeavour to embarrass the way: 251 examined closely, it will be perceived they make nothing against those truths, which we have gathered from experience. 252 It is not given to human to know everything-- it is not given human to know own origin-- it is not given human to penetrate into the essence of things, nor to recur to first principles-- 253 but it is given human, to have reason, to have honesty, to ingenuously allow you are ignorant of that which you cannot know, 254 and not to substitute unintelligible words, absurd suppositions, for own uncertainty. 255 Thus, we say to those, who to solve difficulties far above their reach, pretend that the human species descended from a first man and a first woman, created diversely according to different creeds;-- 256 that we have some ideas of Nature, but that we have none of creation;-- 257 that the human mind is incapable of comprehending the period when all was nothing;-- 258 that to use

words we cannot understand, is only in other terms to acknowledge our ignorance of the powers of Nature;-- 259 that we are unable to fathom the means by which She has been capacitated to produce the phenomena we behold.

260 Let us then conclude, that human has no just, no solid reason to believe itself a privileged being in Nature; 261 because human is subject to the same vicissitudes, as all Her other productions. 262 Human pretended prerogatives have their foundation in error, arising from mistaken opinions concerning own existence. 263 Let human but elevate itself by own thoughts above the globe human inhabits, human will look upon one's own species with the same eyes it does all other beings in Nature: 264 Human will then clearly perceive that in the same manner that each tree produces its fruit, by reason of its energies, 265 in consequence of its species: so each human acts by reason of one's own particular energy; 266 that human produces fruit, actions, works, equally necessary: 267 human will feel that the illusion which human anticipates in favour of itself, arises from own being, at one and the same time, a spectator and a part of the universe. 268 Human will acknowledge, that the idea of excellence which human attaches to your being, has no other foundation than your own peculiar interest; than the predilection you have in favour of yourself-- 269 that the doctrine human has broached with such seeming confidence, bottoms itself on a very suspicious foundation, namely IGNORANCE and SELF-LOVE.

THE SOUL
AND THE SPIRITUAL SYSTEM
Paul Henri Thiery (Baron D'Holbach)

32 Human, after having gratuitously supposed yourself composed of two distinct independent substances, that have no common properties, relatively with each other; 2 has pretended, as we have seen, that that which actuated human interiorly, 3 that motion which is invisible, that impulse

which is placed within yourself, is essentially different from those which act exteriorly. 4 The first human designated, as we have already said, by the name of a SPIRIT or a SOUL.

5 If however it be asked, what is a spirit? 6 The moderns will reply, that the whole fruit of their metaphysical researches is limited to learning that this motive-power, which they state to be the spring of human's action, is a substance of an unknown nature; 7 so simple, so indivisible, so deprived of extent, so invisible, so impossible to be discovered by the senses, 8 that its parts cannot be separated, even by abstraction or thought. 9 The question then arises, how can we conceive such a substance, which is only the negation of everything of which we have a knowledge? 10 How form to ourselves an idea of a substance, void of extent, yet acting on our senses; 11 that is to say, on those organs which are material, which have extent? 12 How can a being without extent be moveable; how put matter in action? 13 How can a substance devoid of parts, correspond successively with different parts of space? 14 But a very cogent question presents itself on this occasion: if this distinct substance that is said to form you of the component parts of human, be really what it is reported, and if it be not, it is not what it is described; 15 if it be unknown, if it be not pervious to the senses; if it be invisible, by what means did the metaphysicians themselves become acquainted with it? 16 How did they form ideas of a substance, that taking their own account of it, is not, under any of its circumstances, either directly or by analogy, cognisable to the mind of human? 17 If they could positively achieve this, there would no longer be any mystery in Nature: 18 it would be as easy to conceive the time when all was nothing, when all shall have passed away, to account for the production of everything we behold, as to dig in a garden or read a lecture. 19 Doubt would vanish from the human species; there could no longer be any difference of opinion, since all must necessarily be of your

mind on a subject so accessible to every enquirer.

20 But it will be replied, the materialists themselves admits, the natural philosophers of all ages have admitted, elements and atoms, beings simple and indivisible, of which bodies are composed:--granted; they have no more: 21 they have also admitted that many of these atoms, many of these elements, if not all, are unknown to them: 22 nevertheless, these simple beings, these atoms of the materialists, are not the same thing with the spirit, or the soul of the metaphysician. 23 When the natural philosophers talks of atoms-- when they describes them as simple beings, they indicates nothing more than that they are homogeneous, pure, without mixture: 24 but then they allows that they have extent, consequently parts, are separable by thought, although no other natural agent with which they are acquainted is capable of dividing them: 25 that the simple beings of this genus are susceptible of motion-- can impart action-- receive impulse-- are material-- are placed in Nature-- are indestructible;-- 26 that consequently, if they cannot know them from themselves, they can form some idea of them by analogy: 27 thus they has done that intelligibly, which the metaphysician would do unintelligibly: 28 the latter, with a view to render human immortal, finding difficulties to your own wish, from seeing that the body decayed-- 29 that it has submitted to the great, the universal law-- has, to solve the difficulty, to remove the impediment, given human a soul, distinct from the body, which they says is exempted from the action of the general law: 30 to account for this, they has called it a spiritual being, whose properties are the negation of all known properties, consequently inconceivable: 31 had they, however, had recourse to the atoms of the former-- had they made this substance the last possible term of the division of matter-- it would at least have been intelligible; 32 it would also have been immortal, since, according to the reasonings of all human, whether metaphysicians, theologians, or natural philosophers,

an atom is an indestructible element, that must exist to all eternity.

33 All people are agreed in this position, that motion is the successive change of the relations of your body with other bodies, or with the different parts of space. 34 If that which is called spirit be susceptible of communicating or receiving motion-- if it acts --if it gives play to the organs of body-- to produce these effects, 35 it necessarily follows that this being changes successively its relation, its tendency, its correspondence, the position of its parts, 36 either relatively to the different points of space, or to the different organs of the body which it puts in action: 37 but to change its relation with space, with the organs to which it gives impulse, it follows of necessity that this spirit must have extent, solidity, consequently distinct parts: 38 whenever a substance possesses these qualities, it is what we call MATTER, 39 it can no longer be regarded as a simple pure being, in the sense attached to it by the moderns, or by theologians.

40 Thus it will be seen, that those who, to conquer insurmountable difficulties, have supposed in human an immaterial substance, distinguished from human body, have not thoroughly understood themselves; 41 indeed they have done nothing more than imagined a negative quality, of which they cannot have any correct idea: 42 matter alone is capable of acting on our senses; without this action nothing would be capable of making itself known to us. 43 They have not seen that a being without extent is neither in a capacity to move itself, nor has the capability of communicating motion to the body; 44 since such a being, having no parts, has not the faculty of changing its relation, or its distance, relatively to other bodies, 45 nor of exciting motion in the human body, which is itself material. 46 That which is called our soul moves itself with us; now motion is a property of matter-- this soul gives impulse to the arm; 47 the arm, moved by it, makes an impression, a blow, that follows the general law of motion: 48 in this

case, the force remaining the same, if the mass was two-fold, the blow should be double. 49 This soul again evinces its materiality in the invincible obstacles it encounters on the part of the body. 50 If the arm be moved by its impulse when nothing opposes it, yet this arm can no longer move, when it is charged with a weight beyond its strength. 51 Here then is a mass of matter that annihilates the impulse given by a spiritual cause, 52 which spiritual cause having no analogy with matter, ought not to find more difficulty in moving the whole world, than in moving a single atom, nor an atom, than the universe. 53 From this, it is fair to conclude, such a substance is a chimera-- a being of the imagination. 54 That it required a being differently endowed, differently constituted, to set matter in motion-- to create all the phenomena we behold: 55 nevertheless, it is a being the metaphysicians have made the contriver, the Author of Nature.

56 As human, in all own speculations, takes yourself for the model, you no sooner imagined a spirit within yourself, than giving it extent, human made it universal; 57 then ascribed to it all those causes with which your ignorance prevents you from becoming acquainted, 58 thus you identified human with the Author of Nature-- then availed yourself of the supposition to explain the connection of the soul with the body: 59 your self-complacency prevented you perceiving that you was only enlarging the circle of your own errors, 60 by pretending to understand that which it is more than possible you will never be permitted to know; 61 your self-love prevented you from feeling, that whenever you punished another for not thinking as you did, that you committed the greatest injustice, 62 unless you were satisfactorily able to prove that other wrong, and yourself right: 63 that if you were obliged to have recourse to hypothesis-- to gratuitous suppositions, whereon to found your doctrine, that from the very fallibility of your nature, these might be erroneous: 64 thus GALLILEO was persecuted, because the

metaphysicians, the theologians of his day, chose to make others believe what it was evident they did not themselves understand.

65 As soon as I feel an impulse, or experience motion, I am under the necessity to acknowledge extent, solidity, density, impenetrability in the substance I see move, or from which I receive impulse: 66 thus, when action is attributed to any cause whatever, I am obliged to consider it MATERIAL. 67 I may be ignorant of its individual nature, of its mode of action, or of its generic properties; but I cannot deceive myself in general properties, which are common to all matter: 68 this ignorance will only be increased, when I shall take that for granted of a being, of which from that moment I am precluded by what I admit from forming any idea, 69 which moreover deprives it completely either of the faculty of moving itself, giving an impulse, or acting. 70 Thus, according to the received idea of the term, a spiritual substance that moves itself, that gives motion to matter, and that acts, implies a contradiction, that necessarily infers a total impossibility.

71 The partisans of spirituality believe they answer the difficulties they have accumulated, by asserting that "the soul is entire-- is whole under each point of its extent." 72 If an absurd answer will solve difficulties, they certainly have done it. But let us examine this reply:-- 73 it will be found that this indivisible part which is called soul, however insensible or however minute, must yet remain something: 74 then an infinity of unextended substances, or the same substance having no dimensions, repeated an infinity of times, would constitute a substance that has extent: 75 this cannot be what they mean, because according to this principle, the human soul would then be as infinite as the Author of Nature; 76 seeing that they have stated this to be a being without extent, who is an infinity of times whole in each part of the universe.

77 But when there shall appear as much solidity in the answer as there is a want of it, it must be acknowledged that in whatever

manner the spirit or the soul finds itself in its extent, 78 when the body moves forward the soul does not remain behind; if so, it has a quality in common with the body, peculiar to matter; since it is conveyed from place to place jointly with the body. 79 Thus, when even the soul should be admitted to be immaterial, what conclusion must be drawn? 80 Entirely submitted to the motion of the body, without this body it would remain dead and inert.

81 This soul would only be part of a two-fold machine, necessarily impelled forward by a concatenation, or connection with the whole. 82 It would resemble a bird, which a child conducts at its pleasure, by the string with which it is bound. 83 Thus, it is for want of consulting experience, by not attending to reason, that human has darkened own ideas upon the concealed principle of own motion. 84 If, disentangled from prejudice--if, destitute of gratuitous suppositions--if, throwing aside error, you would contemplate your own soul, or the moving principle that acts within yourself, 85 you would be convinced that it forms a part of its body, that it cannot be distinguished from it, but by abstraction; 86 that it is only the body itself, considered relatively with some of its functions, or with those faculties of which its nature, or its peculiar organisation, renders it susceptible:-- 87 human will perceive that this soul is obliged to undergo the same changes as the body; 88 that it is born with it; that it expands itself with it; that like the body, it passes through a state of infancy, a period of weakness, a season of inexperience; 89 that it enlarges itself, that it strengthens itself, in the same progression; that like the body, it arrives at an adult age or reaches maturity; 90 that it is then, and not till then, it obtains the faculty of fulfilling certain functions; that it is in this stage, and in no other, that it enjoys reason; 91 that it displays more or less wit, judgment, and humanly activity; that like the body, it is subject to those vicissitudes which exterior causes obliges it to undergo by their influence; 92 that, conjointly with the body, it suffers,

enjoys, partakes of its pleasures, shares its pains, is sound when the body is healthy, and diseased when the body is oppressed with sickness; 93 that like the body, it is continually modified by the different degrees of density in the atmosphere; by the variety of the seasons, and by the various properties of the aliments received into the stomach: 94 in short, human would be obliged to acknowledge that at some periods it manifests visible signs of torpor, stupefaction, decrepitude, and death.

95 In despite of this analogy, or rather this continual identity, of the soul with the body, human has been desirous of distinguishing their essence; 96 human has therefore made the soul an inconceivable being: 97 but in order that human might form to oneself some idea of it, you was, notwithstanding, obliged to have recourse to material beings, and to their manner of acting. 98 The word spirit, therefore, presents to the mind no other ideas than those of breathing, of respiration, of wind.

99 Thus, when it is said the soul is a spirit, it really means nothing more than that its mode of action is like that of breathing: 100 which though invisible in itself, or acting without being seen, nevertheless produces very visible effects. 101 But breath, it is acknowledged, is a material cause; it is allowed to be air modified; it is not, therefore, a simple or pure substance, such as the moderns designate under the name of SPIRIT.

102 It is rather singular that in the Hebrew, the Greek, and the Latin, the synonymy, or corresponding term for spirit should signify breath. 103 The metaphysicians themselves can best say why they have adopted such a word, to designate the substance they have distinguished from matter: 104 some of them, fearful they should not have distinct beings enough, have gone farther, and compounded human of three substances, BODY, SOUL, and INTELLECT.

105 Although the word spirit is so very ancient among people, the sense attached to it by the moderns is quite new: 106 the idea of spirituality, as admitted at this day, is a recent production of the imagination. 107 Neither PYTHAGORAS nor PLATO,

however heated their brain, however decided their taste for the marvellous, appear to have understood by spirit an immaterial substance, 108 or one without extent, devoid of parts; such as that of which the moderns have formed the human soul, the concealed author of motion. 109 The ancients, by the word spirit, were desirous to define matter of an extreme subtilty, of a purer quality than that which acted grossly on our senses. 110 In consequence, some have regarded the soul as an ethereal substance; others as igneous matter; others again have compared it to light. 111 DEMOCRITUS made it consist in motion, consequently gave it a manner of existence. 112 ARISTOXENES, who was himself a musician, made it harmony. 113 ARISTOTLE regarded the soul as the moving faculty, upon which depended the motion of living bodies.

114 The earliest doctors of Christianity had no other idea of the soul, than that it was material. 115 TERTULLIAN, ARNOBIUS, CLEMENT of ALEXANDRIA, ORIGEN, SAINT JUSTIN, IRENAEUS, have all of them discoursed upon it; but have never spoken of it other than as a corporeal substance-- as matter.

116 It was reserved for their successors at a great distance of time, to make the human soul and the soul of the world pure spirits; 117 that is to say, immaterial substances, of which it is impossible they could form any accurate idea: 118 by degrees this incomprehensible doctrine of spirituality, conformable without doubt to the views of those who make it a principle to annihilate reason, prevailed over the others: 119 But it might be fairly asked, if the pretended proofs of this doctrine owe themselves to a human, who on a much more comprehensible point has been proved in error; 120 if, on that which time has shown was accessible to human's reason, the great champion in support of this dogma was deceived; 121 are we not bound to examine, with the most rigorous investigation, the reasonings, the evidence, of one who was the decided, the proven child of enthusiasm and error? 122 Yet

DESCARTES, to whose sublime errors the world is indebted for the Newtonian system, although before him the soul had been considered spiritual, 123 was the first who established that, "that which thinks ought to be distinguished from matter;" 124 from whence he concludes rather hastily, that the soul, or that which thinks in human, is a spirit; or a simple indivisible substance. 125 Perhaps it would have been more logical, more consistent with reason, to have said, since human, who is matter, who has no idea but of matter, enjoys the faculty of thought, matter can think; 126 that is, it is susceptible of that particular modification called thought.

127 However this may be, this doctrine was believed divine, supernatural, because it was inconceivable to human. 128 Those who dared believe even that which was believed before; namely, that the soul was material, were held as rash inconsiderate mad-people, 129 or else treated as enemies to the welfare and happiness of the human race. 130 When human had once renounced experience; when human had abjured own reason; when human had joined the banner of this enthusiastic novelty; human did nothing more, day after day, than subtilise the delirium, the ravings of your own imagination: 131 you pleased yourself by continually sinking deeper into the most unfathomable depths of error: 132 you felicitated yourself on your discoveries; on your pretended knowledge; in an exact ratio as your own understanding became enveloped in the mists of darkness, environed with the clouds of ignorance. 133 Thus, in consequence of human's reasoning upon false principles; of having relinquished the evidence of own senses; the moving principle within yourself, the concealed author of motion, has been made a mere chimera, a mere being of the imagination, 134 because human has divested it of all known properties; because human has attached to it nothing but properties which, from the very nature of human existence, you are incapacitated to comprehend.

NATURE

135 The doctrine of spirituality, such as it now exists, offers nothing but vague ideas; or rather is the absence of all ideas. 136 What does it present to the mind, but a substance which possesses nothing of which our senses enable us to have a knowledge? 137 Can it be truth that a person is able to figure to oneself a being not material, having neither extent nor parts, 138 which, nevertheless, acts upon matter without having any point of contact, any kind of analogy with it; 139 and which itself receives the impulse of matter by means of material organs, which announce to it the presence of other beings? 140 Is it possible to conceive the union of the soul with the body; to comprehend how this material body can bind, enclose, constrain, determine a fugitive being which escapes all our senses? 141 Is it honest, is it plain dealing, to solve these difficulties, by saying there is a mystery in them; 142 that they are the effects of a power, more inconceivable than the human soul; than its mode of acting, however concealed from our view? 143 When to resolve these problems, human is obliged to have recourse to miracles or to make the Divinity interfere, does human not avow own ignorance? 144 When, notwithstanding the ignorance human is thus obliged to avow by availing oneself of the divine agency, 145 human tells us, this immaterial substance, this soul, shall experience the action of the element of fire, which human allows to be material; 146 when human confidently says this soul shall be burnt; shall suffer in purgatory; have we not a right to believe, that either human has a design to deceive us, 147 or else that human does not itself understand that which you are so anxious we should take upon human's word?

148 Let us not then be surprised at those subtile hypotheses, as ingenious as they are unsatisfactory, to which theological prejudice has obliged the most profound modern speculators to recur; 149 when they have undertaken to reconcile the spirituality of the soul, with the physical action of material beings, on this incorporeal substance; 150 its re-

action upon these beings; its union with the body. 151 When the human mind permits itself to be guided by authority without proof, to be led forward by enthusiasm; 152 when it renounces the evidence of its senses; what can it do more than sink into error? 153 Let those who doubt this, read the metaphysical romances of LEIBNITZ, DESCARTES, MALEBRANCHE, CUDWORTH, and many others: 154 let them coolly examine the ingenious, but fanciful systems entitled the pre-established harmony of occasional causes; physical pre-motion.

155 If you wishes to form to yourself clear, perspicuous ideas of your own soul, let you throw yourself back on your own experience-- 156 let you renounce your own prejudices-- let you avoid theological conjecture-- let you tear the bandages which you have been taught to think necessary, 157 but with which you have been blind-folded, only to confound your own reason. 158 If it be wished to draw human to virtue, let the natural philosopher, let the anatomist, let the physician, unite their experience; 159 let them compare their observations, in order to show what ought to be thought of a substance, so disguised, so hidden by absurdities, as not easily to be known. 160 Their discoveries may perhaps teach moralists the true motive-power that ought to influence the actions of human-- 161 legislators, the true motives that should actuate human, that should excite human to labour to the welfare of society-- 162 sovereigns, the means of rendering their subjects truly happy; of giving solidity to the power of the nations committed to their charge. 163 Physical souls have physical wants, and demand physical happiness. 164 These are real, are preferable objects, to that variety of fanciful chimeras, each in its turn giving place to the other, with which the mind of human has been fed during so many ages. 165 Let us, then, labour to perfect the morality of human; let us make it agreeable to human; let us excite in human an ardent thirst for its purity: 166 we shall presently see human's morals become better, yourself become happier; your soul become calm and serene; 167 your will

determined to virtue, by the natural, by the palpable motives held out to yourself. 168 By the diligence, by the care which legislators shall bestow on natural philosophy, they will form citizens of sound understandings; 169 robust and well constituted; who, finding themselves happy, will be themselves accessory to that useful impulse so necessary for their soul. 170 When the body is suffering, when nations are unhappy, the soul cannot be in a proper state. 171 'Mens sana in corpora sano', a sound mind in a sound body, will be always able to make a good citizen.

172 The more you reflects, the more you will be convinced that the soul, very far from being distinguished from the body, is only the body itself, 173 considered relatively to some of its functions, or to some of the modes of existing or acting, of which it is susceptible whilst it enjoys life. 174 Thus, the soul is human, considered relatively to the faculty you have of feeling, of thinking, of acting in a mode resulting from your own peculiar nature; 175 that is to say, from your properties, from your particular organisation: from the modifications, whether durable or transitory, which the beings who act upon human cause your machine to undergo.

176 Those who have distinguished the soul from the body, appear only to have distinguished their brain from themselves. 177 Indeed, the brain is the common centre, where all the nerves, distributed through every part of the body, meet and blend themselves: 178 it is by the aid of this interior organ that all those operations are performed which are attributed to the soul: 179 it is the impulse, or the motion, communicated to the nerve, which modifies the brain: in consequence, it re-acts, or gives play to the bodily organs; 180 or rather it acts upon itself, and becomes capable of producing within itself a great variety of motion, which has been designated intellectual faculties.

181 From this it may be seen that some philosophers have been desirous to make a spiritual substance of the brain. 182 It is evidently nothing but ignorance that

has given birth to and accredited this system, which embraces so little, either of the natural or the rational. 183 It is from not having studied yourself, that human has supposed one was compounded with an agent, essentially different from your own body: 184 in examining this body, you will find that it is quite useless to recur to hypothesis for the explanation of the various phenomena it presents to your own contemplation; 185 that hypothesis can do nothing more than lead you out of the right road to the information after which you seeks. 186 What obscures this question, arises from this, that you cannot see yourself: 187 indeed, for this purpose, that would be requisite which is impossible; namely, that you could at one and the same moment both within and without yourself: 188 you may be compared to an Eolian harp, that issues sounds of itself, and should demand what it is that causes it to give them forth? 189 It does not perceive that the sensitive quality of its chords causes the air to brace them; 190 that being so braced, it is rendered sonorous by every gust of wind with which it happens to come in contact.

191 When a theologian, obstinately bent on admitting into human two substances essentially different, is asked why he multiplies beings without necessity? he will reply, because "thought cannot be a property of matter." 192 If, then, it be enquired of him, cannot God give to matter the faculty of thought? he will answer, "no! seeing that God cannot do impossible things!" 193 According to his principles, it is as impossible that spirit or thought can produce matter, as it is impossible that matter can produce spirit or thought: 194 it might, therefore, be concluded against him, that the world was not made by a spirit, any more than a spirit was made by the world. 195 But in this case, does not the theologian, according to his own assertion, acknowledge himself to be the true atheist? 196 Does he not, in fact, circumscribe the attributes of the Deity, and deny his power, to suit his own purpose? 197 Yet these people demand implicit belief in doctrines,

which they are obliged to maintain by the most contradictory assertions. 198 The more experience we collect, the more we shall be convinced that the word spirit, in its present received usage, conveys no one sense that is tangible, 199 either to ourselves or to those that invented it; consequently cannot be of the least use, either in physics or morals. 200 What modern metaphysicians believe and understand by the word, is nothing more than an occult power, imagined to explain occult qualities and actions, but which, in fact, explains nothing. 201 Savage nations admit of spirits, to account to themselves for those effects, which to them appear marvellous, 202 as long as their ignorance knows not the cause to which they ought to be attributed. 203 In attributing to spirits the phenomena of Nature, as well as those of the human body, do we, in fact, do anything more than reason like savages? 204 Human has filled Nature with spirits, because human has almost always been ignorant of the true causes of those effects by which human was astonished. 205 Not being acquainted with the powers of Nature, human has supposed Her to be animated by a great spirit: 206 not understanding the energy of the human frame, human has in like manner conjectured it to be animated by a minor spirit: 207 from this it would appear, that whenever human wished to indicate the unknown cause of a phenomena, human knew not how to explain in a natural manner, human had recourse to the word spirit. 208 In short, spirit was a term by which human solved all own doubts, and cleared up own ignorance to oneself. 209 It was according to these principles that when the AMERICANS first beheld the terrible effects of gunpowder, they ascribed the cause to wrathful spirits, to their enraged divinities: 210 it was by adopting these principles, that our ancestors believed in a plurality of gods, in ghosts, in genii, etc, 211 Pursuing the same track, we ought to attribute to spirits gravitation, electricity, magnetism, etc. 212 It is somewhat singular, that priests have in all ages so strenuously upheld those systems which time has

exploded; 213 that they have appeared to be either the most crafty or the most ignorant of humans. 214 Where are now the priests of Apollo, of Juno, of the Sun, and a thousand others? 215 Yet these are the people, who in all times have persecuted those who have been the first to give natural explanations of the phenomena of Nature, as witness ANAXAGORAS, ARISTOTLE, GALLILEO, DESCARTES.

THE INTELLECTUAL FACULTIES DERIVED FROM THE FACULTY OF FEELING

Paul Henri Thiery (Baron D'Holbach)

33 To convince ourselves that the faculties called intellectual, are only certain modes of existence, or determinate manners of acting, which result from the peculiar organisation of the body, we have only to analyse them; 2 we shall then see that all the operations which are attributed to the soul, are nothing more than certain modifications of the body; 3 of which a substance that is without extent, that has no parts, that is immaterial, is not susceptible.

4 The first faculty we behold in the living human, and that from which all your others flow, is feeling: 5 however inexplicable this faculty may appear, on a first view, if it be examined closely, it will be found to be a consequence of the essence, or a result of the properties of organised beings; 6 the same as gravity, magnetism, elasticity, electricity, etc. result from the essence or nature of some others. 7 We shall also find these last phenomena are not less inexplicable than that of feeling. 8 Nevertheless, if we wish to define to ourselves a clear and precise idea of it, we shall find that feeling is a particular manner of being moved-- 9 a mode of receiving an impulse peculiar to certain organs of animated bodies, 10 which is occasioned by the presence of a material object that acts upon these organs, and transmit the impulse or shock to the brain.

11 Human only feels by the aid of nerves dispersed through one’s own body; 12 which is itself, to speak

correctly, nothing more than a great nerve; 13 or may be said to resemble a large tree, of which the branches experience the action of the root, communicated through the trunk. 14 In human the nerves unite and lose themselves in the brain; that intestine is the true seat of feeling: 15 like the spider in the centre of its web, it is quickly warned of all the changes that happen to the body, even at the extremities to which it sends its filaments and branches. 16 Experience enables us to ascertain, that human ceases to feel in those parts of one's own body of which the communication with the brain is intercepted; 17 you feels very little, or not at all, whenever this organ is itself deranged or affected in too lively a manner. 18 A proof of this is afforded in the transactions of the Royal Academy of Sciences at Paris: 19 they inform us of a man who had his scull taken off, in the room of which his brain was recovered with skin; 20 in proportion as a pressure was made by the hand on his brain, the man fell into a kind of insensibility, which deprived him of all feeling. 21 BARTOLIN says, the brain of a human is twice as big as that of an ox. This observation had been already made by ARISTOTLE.

22 In the dead body of an idiot dissected by WILLIS, the brain was found smaller than ordinary: 23 he says the greatest difference he found between the parts of the body of this idiot, and those of wiser men, was, that the plexus of the intercostal nerves, which is the mediator between the brain and the heart, was extremely small, accompanied by a less number of nerves than usual. 24 According to WILLIS, the ape is, of all animals, that which has the largest brain, relatively to its size: it is also, after human, that which has the most intelligence: 25 this is further confirmed, by the name it bears in the soil, to which it is indigenous, which is 'ourang outang', or the human beast. 26 There is, therefore, every reason to believe that it is entirely in the brain, that consists the difference, that is found not only between human and beasts, but also between the human of wit, and the fool: 27 between the thinking human,

and those who are ignorants; between the human of sound understanding, and the mad-people: 28 a multitude of experience, serves to prove, that those people who are most accustomed to use their intellectual faculties, have their brain more extended than others: 29 the same has been remarked of water-people, that they have arms much longer than other people.

30 However this may be, the sensibility of the brain, and all its parts, is a fact: 31 if it be asked, whence comes this property? We shall reply, it is the result of an arrangement, of a combination, peculiar to the animal: 32 it is thus that milk, bread, wine, change themselves in the substance of human, who is a sensible being: 33 this insensible matter becomes sensible, in combining itself with a sensible whole. 34 Some philosophers think that sensibility is a universal quality of matter: in this case, it would be useless to seek from whence this property is derived, as we know it by its effects. 35 If this hypothesis be admitted, in like manner as two kinds of motion are distinguished in Nature, the one called live force, the other dead, or inert force, 36 two sorts of sensibility will be distinguished, the one active or alive, the other inert or dead. 37 Then to animalise a substance, is only to destroy the obstacles that prevent its being active or sensible. 38 In fact, sensibility is either a quality which communicates itself like motion, and which is acquired by combination; 39 or this sensibility is a property inherent in all matter: in both, or either case, an unextended being, without parts, 40 such as the human soul is said to be, can neither be the cause of it nor submitted to its operation; 41 but we may fairly conclude, that all the parts of Nature enjoy the capability to arrive at animation; the obstacle is only in the state, not in the quality. 42 Life is the perfection of Nature: She has no parts which do not tend to it-- which do not attain it by the same means. 43 Life in an insect, a dog, a human, has no other difference, than that this act is more perfect, relatively to ourselves in proportion to the

structure of the organs: 44 if, therefore, it be asked, what is requisite to animate a body? 45 We reply, it needs no foreign aid; it is sufficient that the power of Nature be joined to its organisation.

46 The conformation, the arrangement, the texture, the delicacy of the organs, as well exterior as interior, which compose humans and animals, render their parts extremely mobile, 47 or make their machine susceptible of being moved with great facility. 48 In a body, which is only a heap of fibres, a mass of nerves, contiguous one to the other, united in a common center, always ready to act; 49 in a whole, composed of fluids and solids, of which the parts are in equilibrium, the smallest touching each other, are active in their motion, communicating reciprocally, 50 alternately and in succession, the impression, oscillations, and shocks they receive; 51 in such a composition, it is not surprising that the slightest impulse propagates itself with celerity; 52 that the shocks excited in its remotest parts, make themselves quickly felt in the brain, whose delicate texture renders it susceptible of being itself very easily modified. 53 Air, fire, water, agents the most inconstant, possessing the most rapid motion, circulate continually in the fibres, incessantly penetrate the nerves: 54 without doubt these contribute to that incredible celerity with which the brain is acquainted with what passes at the extremities of the body.

55 Notwithstanding the great mobility with which human's organisation renders you susceptible, 56 although exterior as well as interior causes are continually acting upon human, you does not always feel in a distinct, in a decided manner, the impulse given to your senses: 57 indeed, you does not feel it, until it has produced some change, or given some shock to your brain. 58 Thus, although completely environed by air, human does not feel its action, until it is so modified, as to strike with a sufficient degree of force on your organs; 59 to penetrate your skin, through which your brain is warned of its presence. 60 Thus,

during a profound and tranquil sleep, undisturbed by any dream, human ceases to feel. 61 In short, notwithstanding the continued motion that agitates your frame, you does not appear to feel, when this motion acts in a convenient order; 62 you does not perceive a state of health, but you discovers a state of grief or sickness; 63 because, in the first, your brain does not receive too lively an impulse, whilst in the others, your nerves are contracted, shocked, and agitated, with violent, with disorderly motion: 64 these communicating with your brain, give notice that some cause acts strongly upon them-- 65 impels them in a manner that bears no analogy with their natural habit: this constitutes, in human, that peculiar mode of existing which we calls grief.

66 On the other hand, it sometimes happens that exterior objects produce very considerable changes on human's body, without you perceiving them at the moment. 67 Often, in the heat of battle, the soldier perceives not that one is dangerously wounded, 68 because, at the time, the rapidity, the multiplicity of impetuous motion that assails your brain, does not permit you to distinguish the particular change a part of your own body has undergone by the wound. 69 In short, when a great number of causes are simultaneously acting on human with too much vivacity, human sinks under their accumulated pressure,-- 70 human swoons-- human loses own senses-- human is deprived of feeling.

71 In general, feeling only obtains, when the brain can distinguish distinctly, the impressions made on the organs with which it has communication; 72 it is the distinct shock, the decided modification human undergoes, that constitute conscience. 73 Doctor Clarke, says to this effect: "Conscience is the act of reflecting, by means of which I know that I think, and that my thoughts, or my actions belong to me, and not to another." 74 From this it will appear, that feeling is a mode of being, a marked change, produced on our brain, 75 occasioned by the impulse communicated to our organs,

whether by interior or exterior agents, by which it is modified either in a durable or transient manner: 76 it is not always requisite that human's organs should be moved by an exterior object, to enable you to feel that you should be conscious of the changes effected in yourself: 77 human can feel them within oneself by means of an interior impulse; your brain is then modified, or rather you renews within yourself the anterior modifications. 78 We are not to be astonished that the brain should be necessarily warned of the shocks, of the impediments, of the changes that may happen to so complicated a machine as the human body, 79 in which, notwithstanding all the parts are contiguous to the brain, and concentrate themselves in this brain, and are by their essence in a continual state of action and re-action.

80 When a human experiences the pains of the gout, one is conscious of them; in other words, you feels interiorly, that it has produced very marked, very distinct changes in yourself, 81 without you perceiving, that you have received an impulse from any exterior cause; 82 nevertheless, if you will recur to the true source of these changes, you will find that they have been wholly produced by exterior agents: 83 they have been the consequence, neither of your own temperament; of the organisation received from your parents; of the aliments with which your frame has been nourished; 84 besides a thousand trivial, inappreciable causes, which congregating themselves by degrees produce in human the gouty humour; 85 the effect of which is to make you feel in an acute and very lively manner. 86 The pain of the gout engenders in your brain an idea, so modifies it that it acquires the faculty of representing to itself, of reiterating as it were, this pain when even you shall be no longer tormented with the gout: 87 human brain, by a series of motion interiorly excited, is again placed in a state analogous to that in which it was when you really experienced this pain: 88 but if you had never felt it, you would never have been in a capacity to form to

yourself any just idea of its excruciating torments.

89 The visible organs of human's body, by the intervention of which your brain is modified, take the name of senses. 90 The various modifications which human brain receives by the aid of these senses, assumes a variety of names. 91 Sensation, perception, and idea, are terms that designate nothing more than the changes produced in this interior organ, in consequence of impressions made on the exterior organs by bodies acting on them: 92 these changes considered by themselves, are called sensations; they adopt the term perception when the brain is warned of their presence; 93 ideas is that state of them in which the brain is able to ascribe them to the objects by which they have been produced.

94 Every sensation, then, is nothing more than the shock given to the organs, every perception is this shock propagated to the brain; 95 every idea is the image of the object to which the sensation and the perception is to be ascribed. 96 From whence it will be seen, that if the senses be not moved, there can neither be sensations, perceptions, nor ideas: 97 this will be proved to those, who can yet permit themselves to doubt so demonstrable and striking a truth.

98 It is the extreme mobility of which human is capable, owing to your peculiar organisation, that distinguishes human from other beings that are called insensible or inanimate; 99 the different degrees of this mobility, of which the individuals of one’s species are susceptible, discriminate them from each other; 100 make that incredible variety, that infinity of difference which is to be found, as well in their corporeal faculties, as in those which are mental or intellectual. 101 From this mobility, more or less remarkable in each human being, results wit, sensibility, imagination, taste, 102 for the present, however, let us follow the operation of the senses; let us examine in what manner they are acted upon, and are modified by exterior objects:-- 103 we will

afterwards scrutinise the re-action of the interior organ or brain.

104 The eyes are very delicate, very movable organs, by means of which the sensation of light or colour is experienced: 105 these give to the brain a distinct perception, in consequence of which, human forms an idea, generated by the action of luminous or coloured bodies: 106 as soon as the eyelids are opened, the retina is affected in a peculiar manner; 107 the fluid, the fibres, the nerves, of which they are composed, are excited by shocks which they communicate to the brain; 108 to which they delineate the images of the bodies from which they have received the impulse; 109 by this means, an idea is acquired of the colour, the size, the form, the distance of these bodies: 110 it is thus that may be explained the mechanism of sight.

111 The mobility and the elasticity of which the skin is rendered susceptible, by the fibres and nerves which form its texture, accounts for the rapidity with which this envelope to the human body is affected when applied to any other body; 112 by their agency, the brain has notice of its presence, of its extent, of its roughness, of its smoothness, of its surface, of its pressure of its ponderousity. 113 Qualities from which the brain derives distinct perceptions, which breed in it a diversity of ideas; it is this that constitutes the touch or feeling.

114 The delicacy of the membrane by which the interior of the nostrils is covered, renders them easily susceptible of irritation, 115 even by the invisible and impalpable corpuscles that emanate from odorous bodies: 116 by these means sensations are excited, the brain has perceptions, and generates ideas: it is this that forms the sense of smelling.

117 The mouth, filled with nervous, sensible, movable, irritable glands, saturated with juices suitable to the dissolution of saline substances, 118 is affected in a very lively manner by the aliments which pass through it for the nourishment of the body; 119 these glands transmit to the brain the impressions received: perceptions are of consequence; ideas follow: it is

from this mechanism that results taste.

120 The ear, whose conformation fits it to receive the various impulses of air, diversely modified, communicates to the brain the shocks or sensations; 121 these breed the perception of sound, and generate the idea of sonorous bodies: it is this that constitutes hearing.

122 Such are the only means by which human receives sensations, perceptions, and ideas. 123 These successive modifications of human's brain are effects produced by objects that give impulse to your senses; 124 they become themselves causes, producing in your soul new modifications, which are denominated thought, reflection, memory, imagination, judgment, will, action; the basis, however, of all these is sensation.

125 To form a precise notion of thought, it will be requisite to examine, step by step, what passes in human during the presence of any object whatever. 126 Suppose for a moment this object to be a peach: this fruit makes, at the first view, two different impressions on your eyes; 127 that is to say, it produces two modifications, which are transmitted to the brain, which on this occasion experiences two new perceptions, or has two new ideas or modes of existence, designated by the terms colour and rotundity; 128 in consequence, you have an idea of a body possessing roundness and colour: 129 if you places your hand on this fruit, the organ of feeling having been set in action, your hand experiences three new impressions, which are called softness, coolness, weight, 130 from whence result three new perceptions in the brain, you have consequently three new ideas: 131 if you approximates this peach to your nose, the organ of smelling receives an impulse, which, communicated to the brain, a new perception arises, by which you acquires a new idea, called odour: 132 if you carries this fruit to your mouth, the organ of taste becomes affected in a very lively manner: 133 this impulse communicated to the brain, is followed by a perception that generates in yourself the idea of

flavour. 134 In re-uniting all these impressions, or these various modifications of human's organs, which it have been consequently transmitted to your brain; 135 that is to say, in combining the different sensations, perceptions, and ideas, that result from the impulse you have received, you have an idea of a whole, 136 which you designates by the name of a peach, with which you can then occupy your thoughts.

137 From this it is sufficiently proved that thought has a commencement, a duration, an end; 138 or rather a generation, a succession, a dissolution, like all the other modifications of matter; 139 like them, thought is excited, is determined, is increased, is divided, is compounded, is simplified. 140 If, therefore, the soul, or the principle that thinks, be indivisible; how does it happen, that this soul has the faculty of memory, or of forgetfulness; 141 is capacitated to think successively, to divide, to abstract, to combine, to extend its ideas, to retain them, or to lose them? 142 How can it cease to think?

143 If forms appear divisible in matter, it is only in considering them by abstraction, after the method, of geometricians; 144 but this divisibility of form exists not in Nature, in which there is neither a point, an atom, nor form perfectly regular; 145 it must therefore be concluded, that the forms of matter are not less indivisible than thought.

146 What has been said is sufficient to show the generation of sensations, of perceptions, of ideas, with their association, or connection in the brain: 147 it will be seen that these various modifications are nothing more than the consequence of successive impulses, 148 which the exterior organs transmit to the interior organ, which enjoys the faculty of thought, 149 that is to say, to feel in itself the different modifications it has received, or to perceive the various ideas which it has generated; 150 to combine them, to separate them, to extend them, to abridge them, to compare them, to renew them. 151 From whence it will be seen, that thought is nothing more than the perception of certain

modifications, which the brain either gives to itself, or has received from exterior objects.

152 Indeed, not only the interior organ perceives the modifications it receives from without, but again it has the faculty of modifying itself; 153 of considering the changes which take place in it, the motion by which it is agitated in its peculiar operations, from which it imbibes new perceptions and new ideas. 154 It is the exercise of this power to fall back upon itself, that is called reflection.

155 From this it will appear, that for human to think and to reflect, is to feel, or perceive within yourself the impressions, the sensations, the ideas, which have been furnished to your brain 156 by those objects which give impulse to your senses, with the various changes which your brain produced on itself in consequence.

157 Memory is the faculty which the brain has of renewing in itself the modifications it has received, 158 or rather, to restore itself to a state similar to that in which it has been placed by the sensations, the perceptions, the ideas, 159 produced by exterior objects, in the exact order it received them, without any new action on the part of these objects, or even when these objects are absent; 160 the brain perceives that these modifications assimilate with those it formerly experienced in the presence of the objects to which it relates, or attributes them. 161 Memory is faithful, when these modifications are precisely the same; it is treacherous, when they differ from those which the organs have exteriorly experienced.

162 Imagination in human is only the faculty which the brain has of modifying itself, 163 or of forming to itself new perceptions, upon the model of those which it has anteriorly received through the action of exterior objects on the senses. 164 The brain, then, does nothing more than combine ideas which it has already formed, 165 which it recalls to itself, from which it forms a whole, or a collection of modifications, which it has not received, which exists no-where but in itself, 166 although the individual

ideas, or the parts of which this ideal whole is composed, have been previously communicated to it, in consequence of the impulse given to the senses by exterior objects: 167 it is thus human forms to oneself the idea of centaurs, or a being composed of a human and a horse, of hippogriffs, or a being composed of a horse with wings and a griffin, besides a thousand other objects, equally ridiculous. 168 By memory, the brain renews in itself the sensations, the perceptions, and the ideas which it has received or generated; 169 represents to itself the objects which have actually moved its organs. By imagination it combines them variously: 170 forms objects in their place which have not moved its organs, although it is perfectly acquainted with the elements or ideas of which it composes them. 171 It is thus that human, by combining a great number of ideas borrowed from oneself, such as justice, wisdom, goodness, intelligence, 172 by the aid of imagination, has formed various ideal beings, or imaginary wholes, which human has called JUPITER, JUNO, BRAMAH, SATURN, 173 Judgment is the faculty which the brain possesses of comparing with each other the modifications it receives, the ideas it engenders, or which it has the power of awakening within itself, to the end that it may discover their relations, or their effects.

174 Will is a modification of the brain, by which it is disposed to action, that is to say, to give such an impulse to the organs of the body, as can induce to act in a manner, 175 that will procure for itself what is requisite to modify it in a mode analogous to its own existence, or to enable it to avoid that by which it can be injured. 176 To will is to be disposed to action. 177 The exterior objects, or the interior ideas, which give birth to this disposition are called motives, 178 because they are the springs or movements which determine it to act, that is to say, which give play to the organs of the body. 179 Thus, voluntary actions are the motion of the body, determined by the modification of the brain. 180 Fruit hanging on a tree, through the

agency of the visual organs, modifies the brain in such a manner as to dispose the arm to stretch itself forth to cull it; 181 again, it modifies it in another manner, by which it excites the hand to carry it to the mouth.

182 All the modifications which the interior organ or the brain receives, all the sensations, all the perceptions, all the ideas that are generated by the objects which give impulse to the senses, 183 or which it renews within itself by its own peculiar faculties, are either favourable or prejudicial to human's mode of existence, whether that be transitory or habitual: 184 they dispose the interior organ to action, which it exercises by reason of its own peculiar energy: 185 this action is not, however, the same in all the individuals of the human species, depending much on their respective temperaments. 186 From hence the PASSIONS have their birth: these are more or less violent; they are, however, nothing more than the motion of the will, determined by the objects which give it activity; 187 consequently composed of the analogy or of the discordance which is found between these objects, human's peculiar mode of existence, and the force of your temperament. 188 From this it results, that the passions are modes of existence or modifications of the brain; which either attract or repel those objects by which human is surrounded; 189 that consequently they are submitted in their action to the physical laws of attraction and repulsion.

190 The faculty of perceiving or of being modified, as well by itself as exterior objects which the brain enjoys is sometimes designated by the term understanding. 191 To the assemblage of the various faculties of which this interior organ is susceptible, is applied the name of intelligence. 192 To a determined mode in which the brain exercises the faculties peculiar to itself, is given the appellation of reason. 193 The dispositions or the modifications of the brain, some of them constant, others transitory, 194 which give impulse to the beings of the human species, causing them to act, are styled wit, wisdom, goodness, prudence, virtue.

195 In short, as there will be an opportunity presently to prove, all the intellectual faculties-- that is to say, all the modes of action attributed to the soul, may be reduced to the modifications, 196 to the qualities, to the modes of existence, to the changes produced by the motion of the brain; 197 which is visibly in human the seat of feeling, the principle of all your actions. 198 These modifications are to be attributed to the objects that strike on your senses; of which the impression is transmitted to the brain, or rather to the ideas, 199 which the perceptions caused by the action of these objects on your senses have their generated, and which it has the faculty to re-produce. 200 This brain moves itself in its turn, re-acts upon itself, gives play to the organs, which concentrate themselves in it, 201 or which are rather nothing more than an extension of its own peculiar substance. 202 It is thus the concealed motion of the interior organ, renders itself sensible by outward and visible signs. 203 The brain, affected by a modification which is called FEAR, diffuses a paleness over the countenance, excites a tremulous motion in the limbs called trembling. 204 The brain, affected by a sensation of GRIEF, causes tears to flow from the eyes, even without being moved by any exterior object; 205 an idea which it retraces with great strength, suffices to give it very little modifications, which visibly have an influence on the whole frame.

206 In all this, nothing more is to be perceived than the same substance which acts diversely on the various parts of the body. 207 If it be objected that this mechanism does not sufficiently explain the principles of the motion or the faculties of the soul; 208 we reply, that it is in the same situation as all the other bodies of Nature, 209 in which the most simple motion, the most ordinary phenomena, the most common modes of action are inexplicable mysteries, of which we shall never be able to fathom the first principles. 210 Indeed, how can we flatter ourselves we shall ever be enabled to compass the true principle of that

gravity by which a stone falls? 211 Are we acquainted with the mechanism which produces attraction in some substances, repulsion in others? 212 Are we in a condition to explain the communication of motion from your body to another? 213 But it may be fairly asked,-- Are the difficulties that occur, when attempting to explain the manner in which the soul acts, removed by making it a spiritual being, 214 a substance of which we have not, nor cannot form one idea, which consequently must bewilder all the notions we are capable of forming to ourselves of this being? 215 Let us then be contented to know that the soul moves itself, modifies itself, in consequence of material causes, which act upon it which give it activity: 216 from whence the conclusion may be said to flow consecutively, that all its operations, all its faculties, prove that it is itself material.

THE DIVERSITY OF THE INTELLECTUAL FACULTIES

Paul Henri Thiery (Baron D'Holbach)

34 Nature is under the necessity of diversifying all Her works. 2 Elementary matter, different in its essence, must necessarily form different beings, various in their combinations, in their properties, in their modes of action, in their manner of existence. 3 There is not, neither can there be, two beings, two combinations, which are mathematically and rigorously the same; 4 because the place, the circumstances, the relations; the proportions, the modifications, never being exactly alike, 5 the beings that result can never bear a perfect resemblance to each other: 6 their modes of action must of necessity vary in something, even when we believe we find between them the greatest conformity.

7 In consequence of this principle, which everything we see conspires to prove to be a truth, there are not two individuals of the human species who have precisely the same traits--

8 who think exactly in the same manner-- who view things under the same identical point of sight-- who have decidedly the same ideas; 9 consequently no two of them have uniformly the same system of conduct. 10 The visible organs of human, as well as your concealed organs, have indeed some analogy, some common points of resemblance, some general conformity; 11 which makes them appear, when viewed in the gross, to be affected in the same manner by certain causes: but the difference is infinite in the detail. 12 The human soul may be compared to those instruments, of which the chords, already diversified in themselves, by the manner in which they have been spun, are also strung upon different notes: 13 struck by the same impulse, each chord gives forth the sound that is peculiar to itself; 14 that is to say, that which depends on its texture, its tension, its volume, on the momentary state in which it is placed by the circumambient air. 15 It is this that produces the diversified spectacle, the varied scene, which the moral world offers to our view: 16 it is from this that results the striking contrariety that is to be found in the minds, in the faculties, in the passions, in the energies, in the taste, in the imagination, in the ideas, in the opinions of human. 17 This diversity is as great as that of human's physical powers: like them it depends on your temperament, which is as much varied as your physiognomy. 18 This variety gives birth to that continual series of action and reaction, which constitutes the life of the moral world: 19 from this discordance results the harmony which at once maintains and preserves the human race.

20 The diversity found among the individuals of the human species, causes inequalities between people: this inequality constitutes the support of society. 21 If all humans were equal in their bodily powers, in their mental talents, they would not have any occasion for each other: 22 it is the variation of human's faculties, the inequality which this places yourself in, with regard to your fellows, that renders morals

necessary to human: 23 without these, you would live by yourself, you would remain an isolated being. 24 From whence it may be perceived, that this inequality of which human so often complains without cause-- 25 this impossibility which each human finds when in an isolated state, when left to oneself, when unassociated with one's fellow humans, 26 to labour efficaciously to your own welfare, to make your own security, to ensure your own conservation; 27 places you in the happy situation of associating with your own like, of depending on your fellow associates, of meriting their succour, of propitiating them to your views, of attracting their regard, of calling in their aid to chase away, 28 by common and united efforts, that which would have the power to trouble or derange the order of your own existence.

29 In consequence of human's diversity, of the inequality that results, the weaker is obliged to seek the protection of the stronger; 30 this, in your turn, recurs to the understanding, to the talents, to the industry of the weaker, whenever your judgment points out you can be useful to others: 31 this natural inequality furnishes the reason why nations distinguish those citizens who have rendered their country eminent services. 32 It is in consequence of your exigencies that human honours and recompenses those whose understanding, good deeds, assistance, or virtues, have procured for yourself real or supposed advantages, pleasures, or agreeable sensations of any sort: 33 it is by this means that genius gains an ascendancy over the mind of human, and obliges a whole people to acknowledge its powers.

34 Thus, the diversity and inequality of the faculties, as well corporeal as mental or intellectual, renders human necessary to one's fellow human, 35 makes human a social being, and incontestably proves to human the necessity of morals. 36 According to this diversity of faculties, the individuals of the human species are divided into different classes, 37 each in proportion to the effects produced, or the different qualities that may be

remarked: 38 all these varieties in human flow from the individual properties of one's soul, or from the particular modification of one's brain. 39 It is thus, that wit, imagination, sensibility, talents, diversifies to infinity the differences that are to be found in human. 40 It is thus, that some are called good, others wicked; some are denominated virtuous, others vicious; some are ranked as learned, others as ignorant; some are considered reasonable, others unreasonable.

41 If all the various faculties attributed to the soul are examined, it will be found that like those of the body they are to be ascribed to physical causes, to which it will be very easy to recur. 42 It will be found that the powers of the soul are the same as those of the body; 43 that they always depend on the organisation of this body, on its peculiar properties, on the permanent or transitory modifications that it undergoes; in a word, on its temperament.

44 Temperament is, in each individual, the habitual state in which human finds the fluids and the solids of which your body is composed. 45 This temperament varies, by reason of the elements or matter that predominate in yourself, 46 in consequence of the different combinations, of the various modifications, which this matter, diversified in itself, undergoes in your machine. 47 Thus, in one, the blood is super abundant; in another, the bile; in a third, phlegm.

48 It is from Nature-- from your parents-- from causes, which from the first moment of your own existence have unceasingly modified yourself, that you derive your own temperament. 49 It is in your mother's womb that you have attracted the matter which, during your whole life, shall have an influence on your intellectual faculties-- on your energies-- on your passions-- on your conduct. 50 The very nourishment you takes, the quality of the air you respires, the climate you inhabits, the education you receives, the ideas that are

presented to yourself, the opinions you imbibes, modify this temperament. 51 As these circumstances can never be rigorously the same in every point for any two individuals, 52 it is by no means surprising that such an amazing variety, so great a contrariety, should be found in human; 53 or that there should exist as many different temperaments, as there are individuals in the human species.

54 Thus, although human may bear a general resemblance, humans differs essentially, as well by the texture of your fibres and the disposition of your nerves, 55 as by the nature, the quality, the quantity of matter that gives them play, that sets your organs in motion. 56 You, already different from your fellow, by the elasticity of your fibres, the tension of your nerves, becomes still more distinguished by a variety of other circumstances: 57 you are more active, more robust, when you receives nourishing aliments, when you drinks wine, when you takes exercise: 58 whilst another, who drinks nothing but water, who takes less juicy nourishment, who languishes in idleness, shall be sluggish and feeble.

59 All these causes have necessarily an influence on the mind, on the passions, on the will; in a word, on what are called the intellectual faculties. 60 Thus, it may be observed, that a human of a sanguine constitution, is commonly lively, ingenious, full of imagination, passionate, voluptuous, enterprising; 61 whilst the phlegmatic human is dull, of a heavy understanding, slow of conception, inactive, difficult to be moved, pusillanimous, 62 without imagination, or possessing it in a less lively degree, incapable of taking any strong measures, or of willing resolutely.

63 If experience was consulted, in the room of prejudice, the physician would collect from morals, the key to the human heart: 64 in curing the body, he would sometimes be assured of curing the mind. 65 Human, in making a spiritual substance of your soul, has contented yourself with administering to it spiritual

remedies, which either have no influence over your temperament, or do it an injury. 66 The doctrine of the spirituality of the soul has rendered morals a conjectural science, that does not furnish a knowledge of the true motives which ought to be put in activity, in order to influence human to their welfare. 67 If, calling experience to your assistance, human sought out the elements which form the basis of your temperament, 68 or of the greater number of the individuals composing a nation, you would then discover what would be most proper for yourself,-- 69 that which could be most convenient to your mode of existence-- which could most conduce to your true interest-- what laws would be necessary to your happiness-- what institutions would be most useful for yourself--what regulations would be most beneficial. 70 In short, morals and state-government would be equally enabled to draw from materialism, 71 advantages which the dogma of spirituality can never supply, of which it even precludes the idea. 72 Human will ever remain a mystery, to those who shall obstinately persist in viewing you with eyes prepossessed by metaphysics; 73 human will always be an enigma to those who shall pertinaciously attribute your actions to a principle, of which it is impossible to form to themselves any distinct idea. 74 When human shall be seriously inclined to understand oneself, let you sedulously endeavour to discover the matter that enters into your combination, which constitutes your temperament; 75 these discoveries will furnish human with the clue to the nature of your own desires, to the quality of your passions, to the bent of your inclinations-- 76 will enable you to foresee your conduct on given occasions-- 77 will indicate the remedies that may be successfully employed to correct the defects of a vicious organisation, of a temperament, as injurious to yourself as to the society of which you are a member.

78 Indeed, it is not to be doubted that human's temperament is capable of being corrected, of being modified,

of being changed, by causes as physical as the matter of which it is constituted. 79 We are all in some measure capable of forming our own temperament: 80 a person of a sanguine constitution, by taking less juicy nourishment, by abating its quantity, by abstaining from strong liquor, may achieve the correction of the nature, the quality, the quantity, the tendency, the motion of the fluids, which predominate in his machine. 81 A bilious human, or one who is melancholy, may, by the aid of certain remedies, diminish the mass of this bilious fluid; 82 you may correct the blemish of your humours, by the assistance of exercise; you may dissipate your gloom, by the gaiety which results from increased motion. 83 An European transplanted into Hindostan, will, by degrees, become quite a different person in own humours, in own ideas, in own temperament, in own character.

84 Although but few experiments have been made with a view to learn what constitutes the temperament of human, there are still enough if one would but deign to make use of them-- 85 if you would vouchsafe to apply to useful purposes the little experience you have gleaned. 86 It would appear, speaking generally, that the igneous principle which chemists designate under the name of phlogiston, or inflammable matter, is that which in human yields yourself the most active life, 87 furnishes you with the greatest energy, affords the greatest mobility to your frame, supplies the greatest spring to your own organs, gives the greatest elasticity to your fibres, the greatest tension to your nerves, the greatest rapidity to your fluids.

88 From these causes, which are entirely material, commonly result the dispositions or faculties called sensibility, wit, imagination, genius, vivacity, 89 which give the tone to the passions, to the will, to the moral actions of human. 90 In this sense, it is with great justice we apply the expressions, 'warmth of soul,' 'ardency of imagination,' 'fire of genius.

91 It is this fiery element, diffused unequally, distributed in various proportions through the beings of the

human species, that sets human in motion, 92 gives human activity, supplies human with animal heat, and which, if we may be allowed the expression, renders human more or less alive. 93 This igneous matter, so active, so subtle, dissipates itself with great facility, then requires to be reinstated in your system by means of aliments that contain it, 94 which thereby become proper to restore your machine, to lend new warmth to the brain, to furnish it with the elasticity requisite to the performance of those functions which are called intellectual. 95 It is this ardent matter contained in wine, in strong liquor, that gives to the most torpid, to the dullest, to the most sluggish person, a vivacity of which, without it, human would be incapable-- which urges even the coward on to battle. 96 When this fiery element is too abundant in human, whilst you are labouring under certain diseases, it plunges you into delirium; 97 when it is in too weak or in too small a quantity, human swoons, human sinks to the earth. 98 This igneous matter diminishes in your old age-- it totally dissipates at your death. 99 It would not be unreasonable to suppose, that what physicians call the nervous fluid, which so promptly gives notice to the brain of all that happens to the body, is nothing more than electric matter; 100 that the various proportions of this matter diffused through your system, is the cause of that great diversity to be discovered in the human being, and in the faculties you possesses.

101 If the intellectual faculties of human, or your moral qualities, be examined according to the principles here laid down, the conviction must be complete that they are to be attributed to material causes, 102 which have an influence more or less marked, either transitory or durable, over your peculiar organisation. 103 But where does you derive this organisation, except it be from the parents from whom you receives the elements of a machine necessarily analogous to their own? 104 From whence does you derive the greater or less quantity of igneous matter, or vivifying heat, that decides upon,

that gives the tone to your mental qualities? 105 It is from the mother who bore you in her womb, who has communicated to you a portion of that fire with which she was herself animated, which circulated through her veins with her blood;-- 106 it is from the aliments that have nourished you,-- it is from the climate you inhabits,-- it is from the atmosphere that surrounds: 107 all these causes have an influence over your fluids, over your solids, and decide on your natural dispositions. 108 In examining these dispositions, from whence your faculties depend, it will ever be found, that they are corporeal, that they are material.

109 The most prominent of these dispositions in human, is that physical sensibility from which flows all human's intellectual or moral qualities. 110 To feel, according to what has been said, is to receive an impulse, to be moved, to have a consciousness of the changes operated on your system.

111 To have sensibility is nothing more than to be so constituted as to feel promptly, and in a very lively manner, the impressions of those objects which act upon yourself. 112 A sensible soul is only human's brain, disposed in a mode to receive the motion communicated to it with facility, to re-act with promptness, by giving an instantaneous impulse to the organs.

113 Thus the human is called sensible, whom the sight of the distressed, the contemplation of the unhappy, the recital of a melancholy tale, the witnessing of an afflicting catastrophe, 114 or the idea of a dreadful spectacle, touches in so lively a manner as to enable the brain to give play to your lachrymal organs, which cause you to shed tears; 115 a sign by which we recognise the effect of great grief, of extreme anguish in the human being. 116 The human in whom musical sounds excite a degree of pleasure, or produce very remarkable effects, is said to have a sensible or a fine ear. 117 In short, when it is perceived that eloquence-- the beauty of the arts-- the various objects that strike your senses, excite in you very lively

emotions, you are said to possess a soul full of sensibility.

118 Wit, is a consequence of this physical sensibility; 119 indeed, wit is nothing more than the facility which some beings, of the human species possess, of seizing with promptitude, of developing with quickness, a whole, with its different relations to other objects. 120 Genius, is the facility with which some people comprehend this whole, and its various relations when they are difficult to be known, but useful to forward great and mighty projects. 121 Wit may be compared to a piercing eye which perceives things quickly. 122 Genius is an eye that comprehends at one view, all the points of an extended horizon: or what the French term ‘coup d'oeil’. 123 True wit is that which perceives objects with their relations such as they really are. 124 False wit is that which catches at relations, which do not apply to the object, or which arises from some blemish in the organisation. 125 True wit resembles the direction on a hand-post.

126 Imagination is the faculty of combining with promptitude ideas or images; it consists in the power human possesses of re-producing with ease the modifications of your own brain: of connecting them, of attaching them to the objects to which they are suitable. 127 When imagination does this, it gives pleasure; its fictions are approved, it embellishes Nature, it is a proof of the soundness of the mind, it aids truth: 128 when on the contrary, it combines ideas, not formed to associate themselves with each other-- 129 when it paints nothing but disagreeable phantoms, it disgusts, its fictions are censured, it distorts Nature, it advocates falsehood, it is the proof of a disordered, of a deranged mind: 130 thus poetry, calculated to render Nature more pathetic, more touching, pleases when it creates ideal beings, but which move us agreeably: 131 we, therefore, forgive the illusions it has held forth, on account of the pleasure we have reaped from them. 132 The hideous chimeras of superstition displease, because they are nothing

more than the productions of a distempered imagination, 133 that can only awaken the most afflicting sensations, fills us with the most disagreeable ideas.

134 Imagination, when it wanders, produces fanaticism, superstitious terrors, inconsiderate zeal, phenyl, and the most enormous crimes: 135 when it is well regulated, it gives birth to a strong predilection for useful objects, an energetic passion for virtue, an enthusiastic love of our country, and the most ardent friendship: 136 the person who is divested of imagination, is commonly one in whose torpid constitution phlegm predominates over the igneous fluid, 137 over that sacred fire, which is the great principle of your mobility, of that warmth of sentiment, which vivifies all human's intellectual faculties. 138 There must be enthusiasm for transcendent virtues as well as for atrocious crimes; enthusiasm places the soul in a state similar to that of drunkenness; 139 both the one and the other excite in human that rapidity of motion which is approved, when good results, when its effects are beneficial; 140 but which is censured, is called folly, delirium, crime, fury; when it produces nothing but disorder and confusion.

141 The mind is out of order, it is incapable of judging sanely-- 142 the imagination is badly regulated, whenever human's organisation is not so modified, as to perform its functions with precision. 143 At each moment of human existence, you gathers experience; every sensation you have, furnishes a fact that deposits in your brain an idea which your memory recalls with more or less fidelity: 144 these facts connect themselves, these ideas are associated; their chain constitutes experience; this lays the foundation of science. 145 Knowledge is that consciousness which arises from reiterated experience-- 146 from experiments made with precision of the sensations, of the ideas, of the effects which an object is capable of producing, either in ourselves or in others. 147 All science, to be just, must be founded on truth. 148 Truth

itself rests on the constant, the faithful relation of our senses. 149 Thus, truth is that conformity, that perpetual affinity, which human's senses, when well constituted, when aided by experience, discover to oneself, 150 between the objects of which you have a knowledge, and the qualities with which you clothes them. 151 In short, truth is nothing more than the just, the precise association of human's ideas. 152 But how can you, without experience, assure yourself of the accuracy, of the justness of this association? 153 How, if you does not reiterate this experience, can you compare it? How prove its truth? 154 If human senses are vitiated, how is it possible they can convey to others with precision, the sensations, the facts, with which they store own brain? 155 It is only by multiplied, by diversified, by repeated experience, that human is enabled to rectify the errors of own first conceptions.

156 Human is in error every time your organs, either originally defective in their nature, or vitiated by the durable or transitory modifications which they undergo, render you incapable of judging soundly of objects. 157 Error consists in the false association of ideas, by which qualities are attributed to objects which they do not possess. 158 Human is in error, when you supposes those beings really to have existence, which have no local habitation but in your own imagination: 159 you are in error, when you associates the idea of happiness with objects capable of injuring yourself, whether immediately or by remote consequences which you cannot foresee. 160 But how can you foresee effects of which you have not yet any knowledge?

161 It is by the aid of experience: by the assistance which this experience affords, it is known that analogous, that like causes, produce analogous, produce like effects. 162 Memory, by recalling these effects, enables human to form a judgment of those you may expect, whether it be from the same causes, or from causes that bear a relation to those of which you have already experienced the action.

163 From this it will appear, that prudence, foresight, are faculties that are ascribable to, that grow out of experience. 164 If you have felt that fire excited in your organs painful sensation, this experience suffices you to know, to foresee, that fire so applied, will consequently excite the same sensations. 165 If you have discovered that certain actions, on your part, stirred up the hatred, elicited the contempt of others, 166 this experience sufficiently enables you to foresee, that every time you shall act in a similar manner, you will be either hated or despised.

167 The faculty human has of gathering experience, of recalling it to yourself, of foreseeing effects by which you are enabled to avoid whatever may have the power to injure you, 168 to procure that which may be useful to the conservation of your own existence, which may contribute to that which is the sole end of all your actions, 169 whether corporeal or mental,-- your felicity-- constitutes that, which, in your word, is designated under the name of ‘Reason’.

170 Sentiment, imagination, temperament, may be capable of leading human astray-- may have the power to deceive human; 171 but experience and reflection will rectify your errors, point out your mistakes, place you in the right road, teach you what can really conduce to, what can truly conduct yourself to happiness. 172 From this, it will appear, that reason is human's nature, modified by experience, moulded by judgment, regulated by reflection: 173 it supposes a moderate, sober temperament; a just, a sound mind; a well-regulated, orderly imagination; a knowledge of truth, grounded upon tried, upon reiterated experience; in fact, prudence and foresight: 174 this will serve to prove, that although nothing is more commonly asserted, although the phrase is repeated daily, nay, hourly, that human is a reasonable being, 175 yet there are but a very small number of the individuals who compose the human species, 176 of whom it can with truth be said; who really enjoy the faculty of reason, or who combine the dispositions, the experience, by

which it is constituted. 177 It ought not, then to excite surprise, that the individuals of the human race, who are in a capacity to make true experience, are so few in number.

178 Human, when you are born, brings with you into the world organs susceptible of receiving impulse, amassing ideas, of collecting experience; 179 but whether it be from the vice of your system, the imperfection of your organisation, or from those causes by which it is modified, your own experience is false, 180 your ideas are confused, your images are badly associated, your judgment is erroneous, your brain is saturated with vicious, with wicked systems, 181 which necessarily have an influence over your conduct, which are continually disturbing your mind, and confounding your reason.

182 Human's senses, as it has been shown, are the only means by which you are enabled to ascertain whether your opinions are true or false, 183 whether your conduct is useful to yourself and beneficial to others, whether it is advantageous or disadvantageous. 184 But that your senses may be competent to make a faithful relation-- that they may be in a capacity to impress true ideas on your brain, it is requisite they should be sound; 185 that is to say, in the state necessary to maintain your existence; in that order which is suitable to your preservation-- that condition which is calculated to ensure your permanent felicity. 186 It is also indispensable that your brain itself should be healthy, or in the proper circumstances to enable it to fulfill its functions with precision, to exercise its faculties with vigour. 187 It is necessary that memory should faithfully delineate its anterior sensations, should accurately retrace its former ideas; to the end, 188 that you may be competent to judge, to foresee the effects you may have to hope, the consequences you may have to fear, from those actions to which you may be determined by your will. 189 If your organic system be vicious, if your interior or exterior organs be defective, whether by their natural conformation or from those causes by which they are regulated,

you feels but imperfectly-- in a manner less distinct than is requisite; 190 your ideas are either false or suspicious, you judges badly, you are in a delusion, in a state of ebriety, in a sort of intoxication that prevents your grasping the true relation of things. 191 In short, if your memory is faulty, if it is treacherous, your reflection is void, your imagination leads you astray, your mind deceives you, 192 whilst the sensibility of your organs, simultaneously assailed by a crowd of impressions, shocked by a variety of impulsions, oppose you to prudence, to foresight, to the exercise of your own reason. 193 On the other hand, if the conformation of your organs, as it happens with those of a phlegmatic temperament, of a dull habit, does not permit you to move, except with feebleness, in a sluggish manner, your experience is slow, frequently unprofitable. 194 The tortoise and the butterfly are alike incapable of preventing their destruction. 195 The stupid human, equally with yourself who is intoxicated, are in that state which renders it impossible for them to arrive at or attain the end they have in view.

196 But what is the end? What is the aim of human in the sphere you occupies? 197 It is to preserve yourself; to render your own existence happy. 198 It becomes then of the utmost importance, that you should understand the true means which reason points out, 199 which prudence teaches you to use, in order that you may with certainty, that you may constantly arrive at the end which you proposes to yourself. 200 These human will find are your natural faculties-- your mind-- your talents-- your industry-- your actions, 201 determined by those passions of which your own nature renders you susceptible, which give more or less activity to your own will. 202 Experience and reason again show human, that the people with whom you are associated are necessary to yourself, 203 are capable of contributing to your happiness, are in a capacity to administer to your pleasures, are competent to assist you by those faculties which are peculiar to them; 204 experience

teaches human the mode you must adopt to induce them to concur in your designs, to determine them to will and incline them to act in your favour. 205 This points out to human the actions they approve-- those which displease them-- the conduct which attracts them-- that which repels them-- the judgment by which they are swayed-- 206 the advantages that occur-- the prejudicial effects that result to yourself from their various modes of existence and from their diverse manner of acting. 207 This experience furnishes human with the ideas of virtue and of vice, of justice and of injustice, of goodness and of wickedness, of decency and of indecency, of probity and of knavery: 208 In short, you learns to form a judgment of humans-- to estimate their actions-- to distinguish the various sentiments excited in them, according to the diversity of those effects which they make your experience. 209 It is upon the necessary diversity of these effects that is founded the discrimination between good and evil-- between virtue and vice; 210 distinctions which do not rest, as some thinkers have believed, on the conventions made between humans; 211 still less, as some metaphysicians have asserted, upon the chimerical will of supernatural beings: 212 but upon the solid, the invariable, the eternal relations that subsist between beings of the human species congregated together, and living in society: 213 which relations will have existence as long as human shall remain, as long as society shall continue to exist.

214 Thus virtue is everything that is truly beneficial, everything that is constantly useful to the individuals of the human race, living together in society; 215 vice everything that is really prejudicial, everything that is permanently injurious to them. 216 The greatest virtues are those which procure for human the most durable advantages, 217 from which you derives the most solid happiness, which preserves the greatest degree of order in your association: 218 the greatest vices, are those which most disturb your tendency to happiness, which perpetuate error, which most

interrupt the necessary order of society.

219 The virtuous human, is one whose actions tend uniformly to the welfare, constantly to the happiness, of your fellow creatures. 220 The vicious human, is one whose conduct tends to the misery, whose propensities form the unhappiness of those with whom you lives; 221 from whence your own peculiar misery most commonly results.

222 Everything that procures for a person true and permanent happiness is reasonable; 223 everything that disturbs an individual felicity, or that of the beings necessary to your own happiness, is foolish and unreasonable. 224 The person who injures others, is wicked; 225 the person who injures oneself, is an imprudent being, who neither has a knowledge of reason, of own peculiar interests, nor of truth.

226 Human's duties are the means pointed out to you by experience, the circle which reason describes for yourself, by which you are to arrive at that goal you proposes to yourself; 227 these duties are the necessary consequence of the relations subsisting between mortals, who equally desire happiness, who are equally anxious to preserve their existence. 228 When it is said these duties compel you, it signifies nothing more than that, without taking these means, you could not reach the end proposed to yourself by your own nature. 229 Thus, moral obligation is the necessity of employing the natural means to render the beings with whom you lives happy; 230 to the end that you may determine them in turn to contribute to your own individual happiness: 231 your obligation toward yourself, is the necessity you are under to take those means, without which you would be incapable to conserve yourself, or render your existence solidly and permanently happy. 232 Morals, like the universe, is founded upon necessity, or upon the eternal relation of things.

233 Happiness is a mode of existence of which human naturally wishes the duration, or in which you are willing to continue. 234 It is measured by its

duration, by its vivacity. The greatest happiness is that which has the longest continuance: 235 transient happiness, or that which has only a short duration, is called Pleasure; 236 the more lively it is, the more fugitive, because human's senses are only susceptible of a certain quantum of motion. 237 When pleasure exceeds this given quantity, it is changed into anguish, or into that painful mode of existence, of which you ardently desires the cessation: 238 this is the reason why pleasure and pain frequently so closely approximate each other as scarcely to be discriminated. 239 Immoderate pleasure is the forerunner of regret. It is succeeded by ennui, it is followed by weariness, it ends in disgust: 240 transient happiness frequently converts itself into durable misfortune.

241 According to these principles it will be seen that human, who in each moment of your duration seeks necessarily after happiness, 242 ought, when you are reasonable, to manage, to husband, to regulate your pleasures; 243 to refuse yourself to all those of which the indulgence would be succeeded by regret; 244 to avoid those which can convert themselves into pain; in order that you may procure for yourself the most permanent felicity.

245 Happiness cannot be the same for all the beings of the human species; 246 the same pleasures cannot equally affect humans whose conformation is different, whose modification is diverse. 247 This no doubt, is the true reason why the greater numbers of moral philosophers are so little in accord upon those objects in which they have made human's happiness consist, as well as on the means by which it may be obtained.

248 Nevertheless, in general, happiness appears to be a state, whether momentary or durable, in which human readily acquiesces, because you finds it conformable to your being. 249 This state results from the accord, springs out of the conformity, which is found between yourself and those circumstances in which you have been placed by Nature; 250 or, if it be preferred,

happiness is the co-ordination of human, with the causes that give you impulse.

251 The ideas which human forms to oneself of happiness depend not only on your temperament, on your individual conformation, but also upon the habits you have contracted. 252 Habit is, in human, a mode of existence-- of thinking-- of acting, which your organs, as well interior as exterior, contract, by the frequent reiteration of the same motion; 253 from whence results the faculty of performing these actions with promptitude, of executing them with facility.

254 If things be attentively considered, it will be found that almost the whole conduct of human-- the entire system of your own actions-- your occupations-- your connexions-- your studies-- your amusements-- your manners-- your customs-- your very garments--even your aliments, are the effect of habit. 255 Human owes equally to habit, the facility with which you exercises your mental faculties of thought-- of judgment-- of wit-- of reason-- of taste. 256 It is to habit you owe the greater part of your inclinations-- of your desires-- of your opinions-- of your prejudices-- of the ideas, true or false, you form to yourself of your own welfare. 257 In short, it is to habit, consecrated by time, that you owe those errors into which everything strives to precipitate you; 258 from which everything is calculated to prevent you emancipating yourself. 259 It is habit that attaches you either to virtue or to vice: experience proves this: 260 observations teach incontrovertibly that the first crime is always accompanied by more pangs of remorse than the second; this again, by more than the third; so on to those that follow. 261 A first action is the commencement of a habit; 262 those which succeed confirm it: by force of combating the obstacles that prevent the commission of criminal actions, human arrives at the power of vanquishing them with ease; of conquering them with facility. 263 Thus you frequently becomes wicked from habit.

NATURE

264 Human is so much modified by habit, that it is frequently confounded with your own nature: 265 from hence results, as will presently be seen, those opinions or those ideas, which you have called innate: 266 because you have been unwilling to recur back to the source from whence they sprung: which has, as it were, identified itself with your brain. 267 However this may be, human adheres with great strength of attachment to all those things to which you are habituated; 268 your mind experiences a sort of violence, an incommodious revulsion, a troublesome distaste, when it is endeavoured to make you change the course of your own ideas: 269 a fatal predilection frequently conducts you back to the old track in despite of reason.

270 It is by a pure mechanism that may be explained the phenomena of habit, as well physical as moral; 271 the soul, notwithstanding its spirituality, is modified exactly in the same manner as the body. 272 Habit, in human, causes the organs of voice to learn the mode of expressing quickly the ideas consigned to your brain, 273 by means of certain motion, which, during your infancy, the tongue acquires the power of executing with facility: 274 your tongue, once habituated to move itself in a certain manner, finds much trouble, has great pain, to move itself after another mode; 275 the throat yields with difficulty to those inflections which are exacted by a language different from that to which you have, been accustomed. 276 It is the same with regard to your ideas; your brain, your interior organ, 277 your soul, inured to a given manner of modification, accustomed to attach certain ideas to certain objects, long used to form to itself a system connected with certain opinions, whether true or false, 278 experiences a painful sensation, whenever you undertakes to give it a new impulse, or alter the direction of its habitual motion. 279 It is nearly as difficult to make you change your opinions as your language.

280 Here, then, without doubt, is the cause of that almost invincible attachment which human displays to

those customs-- those prejudices-- 281 those institutions of which it is in vain that reason, experience, good sense prove to yourself the inutility, or even the danger. 282 Habit opposes itself to the clearest, the most evident demonstrations; 283 these can avail nothing against those passions, those vices, which time has rooted in you-- against the most ridiculous systems-- against the most absurd notions-- against the most extravagant hypotheses-- against the strangest customs: 284 above all, when you have learned to attach to them the ideas of utility, of common interest, of the welfare of society. 285 Such is the source of that obstinacy, of that stubbornness, which human evinces for your religion, for ancient usages, for unreasonable customs, 286 for laws so little accordant with justice, for abuses, which so frequently make you suffer, for prejudices of which you sometimes acknowledges the absurdity, yet is unwilling to divest yourself of them. 287 Here is the reason why nations contemplate the most useful novelties as mischievous innovations-- 288 why they believe they would be lost, if they were to remedy those evils to which they have become habituated; 289 which they have learned to consider as necessary to their repose; which they have been taught to consider dangerous to be cured.

290 Education is only the art of making human contract, in early life, that is to say, when your organs are extremely flexible, the habits, the opinions, the modes of existence, adopted by the society in which you are placed. 291 The first moments of human's infancy are employed in collecting experience; 292 those who are charged with the care of rearing you, or who are entrusted to bring you up, teaches you how to apply it: 293 it is they who develop reason in you: the first impulse they give you commonly decides upon your own condition, upon your own passions, upon the ideas you forms to yourself of happiness, upon the means you shall employ to procure it, upon your virtues, and upon your vices. 294 Under the eyes of human's masters, the infant acquires ideas: under their

tuition you learns to associate them,-- to think in a certain manner,-- to judge well or ill. 295 They point out to human various objects, which they accustom you either to love or to hate, to desire or to avoid, to esteem or to despise. 296 It is thus opinions are transmitted from fathers, mothers, nurses, and masters, to human in your infantine state. 297 It is thus, that your mind by degrees saturates itself with truth, or fills itself with error; 298 after which you regulates your conduct, which renders you either happy or miserable, virtuous or vicious, estimable or hateful. 299 It is thus human becomes either contented or discontented with own destiny, according to the objects towards which they have directed your passions-- towards which they have bent the energies of your own mind; 300 that is to say, in which they have shown you your own interest, in which they have taught you to place your felicity: 301 in consequence, you loves and searches after that which they have taught you to revere-- that which they have made the object of your research; 302 you have those tastes, those inclinations, those phantasms, which, during the whole course of your life, you are forward to indulge, 303 which you are eager to satisfy, in proportion to the activity they have excited in you, and the capacity with which you have been provided by Nature.

304 State-government ought to be the art of regulating the passions of human-- of directing them to the welfare of society-- of diverting them into a genial current of happiness-- of making them flow gently to the general benefit of all: 305 but too frequently it is nothing more than the detestable art of arming the passions of the various members of society against each other,-- 306 of making them the engines to accomplish their mutual destruction,-- of converting them into agents which embitter their existence, create jealousies among them, 307 and fill with rancorous animosities that association from which, if properly managed, human ought to derive own felicity. 308 Society is commonly so vicious because it is not founded upon

Nature, upon experience, and upon general utility; 309 but on the contrary, upon the passions, upon the caprices, and upon the particular interests of those by whom it is governed. 310 In short, it is for the most part the advantage of the few opposed to the prosperity of the many. 311 State-government, to be useful, should found its principles upon Nature; that is to say, should conform itself to the essence of human, should mould itself to the great end of society: 312 but what is society? And what is its end?

313 It is a whole, formed by the union of a great number of families, or by a collection of individuals, assembled from a reciprocity of interest, in order that they may satisfy with greater facility their reciprocal wants-- 314 that they may, with more certainty, procure the advantages they desire-- that they may obtain mutual succours-- above all, that they may gain the faculty of enjoying, in security, those benefits with which Nature and industry may furnish them: 315 it follows, of course, that state-government, which are intended to maintain society, and to consolidate the interests of this congregation, ought to enter into its views, 316 to facilitate the means of giving them efficiency, to remove all those obstacles that have a tendency to counteract the intention with which human entered into association.

317 Human, in approximating to your fellow human, to live with others in society, has made, either formally or tacitly, a covenant; 318 by which you engage to render mutual services, to do nothing that can be prejudicial to your neighbour. 319 But as the nature of each individual impels you each instant to seek after your own welfare, 320 which you have mistaken to consist in the gratification of your passions, and the indulgence of your transitory caprices, without any regard to the convenience of your fellows; 321 there needed a power to conduct yourself back to human duty, to oblige you to conform yourself to human's obligations, 322 and to recall yourself to your engagements, which the hurry of your passions frequently

make you forget. 323 This power is the law; it is, or ought to be, the collection of the will of society, 324 reunited to fix the conduct of its members, to direct their action in such a mode, that it may concur to the great end of your association--the general good.

325 But as society, more especially when very numerous, is incapable of assembling itself, unless with great difficulty, as it cannot with tumult make known its intentions, it is obliged to choose citizens in whom it places a confidence, 326 whom it makes the interpreter of its will, whom it constitutes the depositaries of the power requisite to carry it into execution. 327 Such is the origin of all state-government, which to be legitimate can only be founded on the free consent of society. 328 Those who are charged with the care of governing, call themselves sovereigns, chiefs, legislators: 329 according to the form which society has been willing to give to its government: 330 these sovereigns are styled monarchs, magistrates, representatives.

331 Government only borrows its power from society: being established for no other purpose than its welfare, 332 it is evident society can revoke this power whenever its interest shall exact it; change the form of its government; extend or limit the power which it has confided to its chiefs, over whom, by the immutable laws of Nature, it always conserves a supreme authority: 333 because these laws enjoin, that the part shall always remain subordinate to the whole

334 Thus sovereigns are the ministers of society, its interpreters, the depositaries of a greater or of a less portion of its power; 335 but they are not its absolute masters, neither are they the proprietors of nations. 336 By a covenant, either expressed or implied, they engage themselves to watch over the maintenance, to occupy themselves with the welfare of society; 337 it is only upon these conditions society consents to obey them. 338 The price of obedience is protection. 339 There is or ought to be a reciprocity of interest between the governed and the governor: 340

whenever this reciprocity is wanting, society is in that state of confusion: it is verging on destruction. 341 No society upon earth was ever willing or competent to confer irrevocably upon its chiefs the power, the right, of doing it injury. 342 Such a concession, such a compact, would be annulled, would be rendered void by Nature; 343 because She wills that each society, the same as each individual of the human species shall tend to its own conservation; it has not therefore the capacity to consent to its permanent unhappiness. 344 Laws, in order that they may be just, ought invariably to have for their end, the general interest of society; 345 that is to say, to assure to the greater number of citizens those advantages for which human originally associated. 346 These advantages are liberty, property, security.

347 Liberty, to human, is the faculty of doing, for your own peculiar happiness, everything which does not injure or diminish the happiness of your associates: 348 in associating, each individual renounced the exercise of that portion of own natural liberty which would be able to prejudice or injure the liberty of one's fellows. 349 The exercise of that liberty which is injurious to society is called licentiousness.

350 Property, to human, is the faculty of enjoying those advantages which spring from labour; 351 those benefits which industry or talent has procured to each member of society.

352 Security, to human, is the certitude, the assurance, that each individual ought to have, of enjoying in your person, of finding for your property the protection of the laws, 353 as long as you shall faithfully observe, as long as you shall punctually perform, your engagements with society.

354 Justice, to human, assures to all the members of society, the possession of these advantages, the enjoyment of those rights, which belong to them. 355 From this, it will appear, that without justice, society is not in a condition to procure the happiness of any human. 356 Justice is also called equity, because by the assistance of the laws made to

command the whole, it reduces all its members to a state of equality; 357 that is to say, justice prevents them from prevailing one over the other, by the inequality which Nature or industry may have made between their respective powers.

358 Rights, to human, are everything which society, by equitable laws, permits each individual to do for your own peculiar felicity. 359 These rights are evidently limited by the invariable end of all association: 360 society has, on its part, rights over all its members, by virtue of the advantages which it procures for them; 361 all its members, in turn, have a right to claim, to exact from society, or secure from its ministers those advantages for the procuring of which they congregated, in favour of which they renounced a portion of their natural liberty. 362 A society, of which the chiefs, aided by the laws, do not procure any good for its members, evidently loses its right over them: 363 those chiefs who injure society lose the right of commanding. 364 It is not our country, without it secures the welfare of its inhabitants; a society without equity contains only enemies; a society oppressed is composed only of tyrants and slaves; 365 slaves are incapable of being citizens; it is liberty, property, and security, that render our country dear to us; it is the true love of your country that forms the citizen.

366 For want of having a proper knowledge of these truths, or for want of applying them when known, some nations have become unhappy-- 367 have contained nothing but a vile heap of slaves, separated from each other, detached from society, which neither procures for them any good, nor secures to them any one advantage. 368 In consequence of the imprudence of some nations, or of the craft, cunning, and violence of those to whom they have confided the power of making laws, and carrying them into execution, their sovereigns have rendered themselves absolute masters of society. 369 These, mistaking the true source of their power, pretended to hold it from heaven, to be accountable for their

actions to God alone, to owe nothing, not to have any obligation to society, 370 in a word, to be gods upon earth, to possess the right of governing arbitrarily.

371 From thence politics became corrupted: they were only a mockery. Such nations, disgraced and grown contemptible, did not dare resist the will of their chiefs; 372 their laws were nothing more than the expression of the caprice of these chiefs; public welfare was sacrificed to their peculiar interests; 373 the force of society was turned against itself; its members withdrew to attach themselves to its oppressors, to its tyrants; 374 these to seduce them, permitted them to injure it with impunity and to profit by its misfortunes. 375 Thus liberty, justice, security, and virtue, were banished from many nations; 376 politics was no longer anything more than the art of availing itself of the forces of a people and of the treasure of society; 377 of dividing it on the subject of its interest, in order to subjugate it by itself; 378 at length a stupid, a mechanical habit, made them cherish their oppressors, and love their chains.

379 Human when you have nothing to fear, presently becomes wicked; 380 you who believes you have not occasion for your fellow, persuades yourself you may follow the inclinations of your heart without caution or discretion. 381 Thus fear is the only obstacle society can effectually oppose to the passions of its chiefs; without it they will quickly become corrupt, 382 and will not scruple to avail themselves of the means society has placed in their hands, to make them accomplices in their iniquity. 383 To prevent these abuses, it is requisite society should set bounds to its confidence; 384 should limit the power which it delegates to its chiefs; should reserve to itself a sufficient portion of authority to prevent them from injuring it; 385 it must establish prudent checks: it must cautiously divide the power it confers, because re-united, it will by such reunion be infallibly oppressed. 386 The slightest reflection, the most scanty review, will make people feel that the

burthen of governing and weight of administration, is too ponderous and overpowering to be borne by an individual; 387 that the scope of your jurisdiction, that the range of your surveillance, and multiplicity of your duties must always render you negligent; 388 that the extent of your power has ever a tendency to render you mischievous. 389 In short, the experience of all ages will convince nations that human is continually tempted to the abuse of power: 390 that as an abundance of strong liquor intoxicates human's brain, so unlimited power corrupts human's heart; 391 that therefore the sovereign ought to be subject to the law, not the law to the sovereign.

392 Government has necessarily an equal influence over the philosophy, as over the morals of nations. 393 In the same manner that its care produces labour, activity, abundance, salubrity and justice; its negligence induces idleness, sloth, discouragement, penury, contagion, injustice, vices and crimes. 394 It depends upon government either to foster industry, mature genius, give a spring to talents, or stifle them. 395 Indeed government, the disturber of dignities, of riches, of rewards, and punishments; 396 the master of those objects in which human from your infancy has learned to place your felicity, and contemplate as the means of your happiness; 397 acquires a necessary influence over your conduct: it kindles your passions; gives them direction; makes you instrumental to whatever purpose it pleases; 398 it modifies you; determines your manners; which in a whole people, as in the individual, is nothing more than the conduct, the general system of wills, 399 of actions that necessarily result from your education, government, laws, and religious opinions-- your institutions, whether rational or irrational. 400 In short, manners are the habits of a people: these are good whenever society draws from them true felicity and solid happiness; 401 they are bad, they are detestable in the eye of reason, when the happiness of society does not spring from them; 402 they are unwholesome when they have

nothing more in their favour than the suffrage of time, and the countenance of prejudice which rarely consults experience, which is almost ever at variance with good sense: 403 notwithstanding they may have the sanction of the law, custom, religion, public opinion, 404 or for example, they may be unworthy and may be disgraceful, provided society is in disorder; 405 that crime abounds; that virtue shrinks beneath the basilisk eye of triumphant vice; 406 they may then be said to resemble the UPAS, whose luxuriant yet poisonous foliage, the produce of a rank soil, becomes more baneful to those who are submitted to its vortex, in proportion as it extends its branches. 407 If experience you consulted, it will be found there is no action, however abominable, that has not received the applause, that has not obtained the approbation of some people. 408 Parricide, the sacrifice of children, robbery, usurpation, cruelty, intolerance, and prostitution, have all in their turn been licensed actions; 409 have been advocated; have been deemed laudable and meritorious deeds with some nations of the earth. 410 Above all, superstition has consecrated the most unreasonable, the most revolting customs.

411 Human's passions result from and depend on the motion of attraction or repulsion, of which you are rendered susceptible by Nature; 412 who enables human, by your peculiar essence, to be attracted by those objects which appear useful to yourself, to be repelled by those which you considers prejudicial; 413 it follows that government, by holding the magnet, can put these passions into activity, has the power either of restraining them, or of giving them a favourable or an unfavourable direction. 414 All human’s passions are constantly limited by either loving or hating, seeking or avoiding, desiring or fearing. 415 These passions, so necessary to the conservation of human, are a consequence of your organisation; 416 they display themselves with more or less energy, according to your own temperament; 417 education and habit develop

them; government gives them play, conducts them towards those objects, which it believes itself interested in making desirable to its subjects. 418 The various names which have been given to these passions, are relative to the different objects by which they are excited, 419 such as pleasure, grandeur, or riches, which produce voluptuousness, ambition, vanity and avarice. 420 If the source of those passions which predominate in nations be attentively examined it will be commonly found in their governments. 421 It is the impulse received from their chiefs that renders them sometimes warlike, sometimes superstitious, sometimes aspiring after glory, sometimes greedy after wealth, sometimes rational, and sometimes unreasonable; 422 if sovereigns, in order to enlighten and render happy their dominions, were to employ only the tenth part of the vast expenditures which they lavish, 423 only a tithe of the pains which they employ to render them brutish, to stupify them, to deceive them, and to afflict them; 424 their subjects would presently be as wise, would quickly be as happy, as they are now remarkable for being blind, ignorant, and miserable.

425 Let the vain project of destroying, the delusive attempt at rooting your passions from the heart of human, you abandoned; 426 let an effort be made to direct them towards objects that may be useful to yourself, beneficial to your associates. 427 Let education, let government, let the laws, habituate you to restrain your passions within those just bounds that experience fixes and reason prescribes. 428 Let the ambitious have honours, titles, distinctions, and power, when they shall have usefully served their country; 429 let riches be given to those who covet them, when they shall have rendered themselves necessary to their fellow citizens; 430 let commendations, let eulogies, encourage those who shall be actuated by the love of glory. 431 In short, let the passions of human have a free, an uninterrupted course, whenever there shall result from their exercise, real, substantial, and

durable advantages to society. 432 Let education kindle only those, which are truly beneficial to the human species; let it favour those alone which are really necessary to the maintenance of society. 433 The passions of human are dangerous, only because everything conspires to give them an evil direction.

434 Nature does not make human either good or wicked: She combines machines more or less active, mobile, and energetic; 435 She furnishes human with organs and temperament, of which your passions, more or less impetuous, are the necessary consequence; 436 these passions have always your happiness for their object, your welfare for their end: 437 in consequence they are legitimate, they are natural, they can only be called bad or good, relatively, to the influence they have on the beings of your species.

438 Nature gives human legs proper to sustain your weight, and necessary to transport yourself from one place to another; 439 the care of those who rear them strengthens them, habituates you to avail yourself of yourself, accustoms you to make either a good or a bad use of them. 440 The arm which you have received from Nature is neither good nor bad; it is necessary to a great number of the actions of life; 441 nevertheless, the use of this arm becomes criminal, if you have contracted the habit of using it to rob, to assassinate, with a view to obtain that money which you have been taught from your infancy to desire, 442 and which the society in which you lives renders necessary to yourself, but which your industry will enable you to obtain without doing injury to your fellow human.

443 The heart of human is a soil which Nature has made equally suitable to the production of brambles, or of useful grain-- 444 of deleterious poison, or of refreshing fruit, by virtue of the seeds which may be sown in it-- 445 by the cultivation that may be bestowed upon it, 446 In your infancy, those objects are pointed out to you which you are to estimate or to despise, to seek after or to avoid, to love or to hate. 447 It is your parents, your instructors, who render you either

virtuous or wicked, wise or unreasonable, studious or dissipated, steady or trifling, solid or vain. 448 Their example, their discourse, modify you through your whole life, teaching you what are the things you ought either to desire or to avoid; 449 what the objects you ought to fear or to love: you desires them, in consequence; 450 and you imposes on yourself the task of obtaining them, according to the energy of your temperament, which ever decides the force of your passions. 451 It is thus that education, by inspiring yourself with opinions, by infusing into yourself ideas, whether true or false, gives you those primitive impulsions after which you acts, in a manner either advantageous or prejudicial both to yourself and to others.

452 Human, at your birth, brings with you into the world nothing but the necessity of conserving yourself, of rendering your own existence happy: 453 instruction, example, the customs of the world, present you with the means, either real or imaginary, of achieving it; 454 habit procures for human the facility of employing these means: you attaches yourself strongly to those you judges best calculated, 455 most proper to secure to yourself the possession of those objects which they have taught you, which you have learned to desire as the preferable good attached to your own existence. 456 Whenever your education-- whenever the examples which have been afforded you-- whenever the means with which you have been provided, are approved by reason, are the result of experience, everything concurs to render yourself virtuous; 457 habit strengthens these dispositions in yourself; you becomes, in consequence, a useful member of society; 458 to the interests of which, everything ought to prove to you your own permanent well-being, your own durable felicity, is necessarily allied. 459 If, on the contrary, your education-- your institutions-- the examples which are set before you-- the opinions which are suggested to you in your infancy, are of a nature to exhibit to your mind virtue as useless and repugnant-- 460 vice as useful

and congenial to your own individual happiness, you will become vicious; you will believe yourself interested in injuring society, in rendering your associates unhappy; 461 you will be carried along by the general current: you will renounce virtue, which to yourself will no longer be anything more than a vain idol, without attractions to induce you to follow it; 462 without charms to tempt your adoration; because it will appear to exact, that you should immolate at its shrine, 463 that you should sacrifice at its altar all those objects which you have been constantly taught to consider the most dear to yourself; to contemplate as benefits the most desirable.

464 In order that human may become virtuous, it is absolutely requisite that you should have an interest, that you should find advantages in practising virtue. 465 For this end, it is necessary that education should implant in you reasonable ideas; that public opinion should lean towards virtue, as the most desirable good; 466 that example should point it out as the object most worthy esteem; that government should faithfully recompense, should regularly reward it; 467 that honour should always accompany its practice; that vice should constantly be despised; that crime should invariably be punished. 468 Is virtue in this situation amongst humans? 469 Does the education of human infuse into you just, faithful ideas of happiness-- true notions of virtue-- dispositions really favourable to the beings with whom you are to live? 470 The examples spread before you, are they suitable to innocence and manners? 471 Are they calculated to make you respect decency-- to cause you to love probity-- to practice honesty-- to value good faith-- to esteem equity-- to revere conjugal fidelity-- to observe exactitude in fulfilling your duties? 472 Religion, which alone pretends to regulate human's manners, does it render you sociable-- does it make you pacific-- does it teach you to be humane? 473 The arbiters, the sovereigns of society, are they faithful in recompensing, punctual in rewarding, those who have best

served their country? 474 In punishing those who have pillaged, who have robbed, who have plundered, who have divided, who have ruined it? 475 Justice, does she hold her scales with a firm, with an even hand, between all the citizens of the state? 476 The laws, do they never support the strong against the weak-- favour the rich against the poor-- uphold the happy against the miserable? 477 In short, is it an uncommon spectacle to behold crime frequently justified, often applauded, sometimes crowned with success, insolently triumphing, arrogantly striding over that merit which it disdains, over that virtue which it outrages? 478 Well then, in societies thus constituted, virtue can only be heard by a very small number of peaceable citizens, a few generous souls, who know how to estimate its value, who enjoy it in secret. 479 For the others, it is only a disgusting object; they see in it nothing but the supposed enemy to their happiness, or the censor of their individual conduct.

480 If human, according to your own nature, is necessitated to desire own welfare, you are equally obliged to love and cherish the means by which you believes it is to be acquired: 481 it would be useless, it would perhaps be unjust, to demand that a person should be virtuous, if you could not be so without rendering yourself miserable. 482 Whenever you thinks vice renders you happy, you must necessarily love vice; 483 whenever you sees inutility recompensed, crime rewarded-- whenever you witnesses either or both of them honoured,-- what interest will you find in occupying yourself with the happiness of your fellow-creatures? 484 What advantage will you discover in restraining the fury of your passions? 485 Whenever your mind is saturated with false ideas, filled with dangerous opinions, it follows, of course, that your whole conduct will become nothing more than a long chain of errors, a tissue of mistakes, a series of depraved actions.

486 We are informed, that the savages, in order to flatten the heads

of their children, squeeze them between two boards, 487 by that means preventing them from taking the shape designed for them by Nature. 488 It is pretty nearly the same thing with the institutions of human; they commonly conspire to counteract Nature, 489 to constrain and divert, to extinguish the impulse Nature has given human, to substitute others which are the source of all your misfortunes. 490 In almost all the countries of the earth, human is bereft of truth, is fed with falsehoods, and amused with marvellous chimeras: 491 human is treated like those children whose members are, by the imprudent care of their nurses, swathed with little fillets, 492 bound up with rollers, which deprive them of the free use of their limbs, obstruct their growth, prevent their activity, and oppose themselves to their health.

493 Most of the superstitious opinions of human have for their object only to display to you your supreme felicity in those illusions for which they kindle your passions: 494 but as the phantoms which are presented to your imagination are incapable of being considered in the same light by all who contemplate them, 495 human is perpetually in dispute concerning these objects; human hates own fellow, human persecutes own neighbour, your neighbour in turn persecutes you, 496 and you believes that in doing this you are doing well: that in committing the greatest crimes to sustain your opinions you are acting right. 497 It is thus superstition infatuates human from one's infancy, fills human with vanity, and enslaves human with fanaticism: 498 if you have a heated imagination, it drives you on to fury; 499 if you have activity, it makes you a mad-person, who is frequently as cruel, as you are dangerous to your fellow-creatures, as you are incommodious to others: 500 if, on the contrary, you be phlegmatic, and of a slothful habit, you becomes melancholy and useless to society.

501 Public opinion every instant offers to human's contemplation false ideas of honour, and wrong notions of glory: 502 it attaches human

esteem not only to frivolous advantages, but also to prejudicial interests and injurious actions; 503 which example authorises, which prejudice consecrates, which habit precludes you from viewing with the disgust and horror which they merit. 504 Indeed, habit familiarises human's mind with the most absurd ideas, the most unreasonable customs, the most blameable actions; 505 with prejudices the most contrary to your own interests, and detrimental to the society in which you lives. 506 Human finds nothing strange, nothing singular, nothing despicable, nothing ridiculous, except those opinions and objects to which you are yourself unaccustomed. 507 There are countries in which the most laudable actions appear very blameable and ridiculous-- 508 where the foulest and most diabolical actions pass for very honest and perfectly rational conduct. 509 In some nations they kill the old people; in some the children strangle their parents. 510 The Phoenicians and Carthaginians immolated their children to their gods. 511 Europeans approve duels; you, who refuse to cut the throat of another, or to blow out the brains of your own neighbour, is contemplated by them as dishonoured. 512 The Spaniards and Portuguese think it meritorious to burn an heretic. 513 In some countries women prostitute themselves without dishonour; 514 in others it is the height of hospitality for a man to present his wife to the embraces of the stranger: the refusal to accept this, excites his scorn and calls forth his resentment.

515 Authority commonly believes itself interested in maintaining the received opinions: those prejudices and errors which it considers requisite to the maintenance of its power and the consolidation of its interests, are sustained by force, which is never rational. 516 Princes themselves, filled with deceptive images of happiness, mistaken notions of power, erroneous opinions of grandeur, and false ideas of glory, are surrounded with flattering courtiers, who are interested in keeping up the delusion of their masters: 517 these contemptible men

have acquired ideas of virtue, only that they may outrage it: 518 by degrees they corrupt the people, these become depraved, lend themselves to their debaucheries, pander to the vices of the great, then make a merit of imitating them in their irregularities. 519 A court is too frequently the true focus of the corruption of a people.

520 This is the true source of moral evil. It is thus that everything conspires to render human vicious, and give a fatal impulse to your soul: 521 from whence results the general confusion of society, which becomes unhappy, from the misery of almost every one of its members. 522 The strongest motive-powers are put in action to inspire human with a passion for futile objects which are indifferent to yourself; 523 which make you become dangerous to your fellow human, by the means which you are compelled to employ, in order to obtain them. 524 Those who have the charge of guiding your steps, either impostors themselves, or the dupes to their own prejudices, forbid you to hearken to reason; 525 they make truth appear dangerous to you; they exhibit error as requisite to your welfare, not only in this world, but in the next. 526 In short, habit strongly attaches human to own irrational opinions, to your own perilous inclinations, and to your blind passion for objects either useless or dangerous. 527 Here, then, is the reason why for the most part human finds oneself necessarily determined to evil; 528 the reason why the passions, inherent in human's nature and necessary to your conservation, become the instruments of your destruction, 529 and the bane of that society, which properly conducted, they ought to preserve; 530 the reason why society becomes a state of warfare; why it does nothing but assemble enemies, who are envious of each other, and are always rivals for the prize. 531 If some virtuous beings are to be found in these societies, they must be sought for in the very small number of those, who, born with a phlegmatic temperament have moderate passions, 532 who therefore, either do not desire at all,

or desire very feebly, those objects with which their associates are continually inebriated.

533 Human's nature, diversely cultivated, decides upon your own faculties, as well corporeal as intellectual; upon your own qualities, as well moral as physical. 534 The human who is of a sanguine, robust constitution, must necessarily have strong passions; 535 you who is of a bilious, melancholy habit, will as necessarily have fantastical and gloomy passions; 536 the person of a gay turn, of a sprightly imagination, will have cheerful passions; while the person in whom phlegm abounds, will have those which are gentle, or which have a very slight degree of violence. 537 It appears to be upon the equilibrium of the humours, that depends the state of the person who is called virtuous; 538 your temperament seems to be the result of a combination, in which the elements or principles are balanced with such precision that no one passion predominates over another, or carries into your machine more disorder than your neighbour.

539 Habit, as we have seen, is human's nature modified: this latter furnishes the matter; education, domestic example, national manners, give it the form: 540 these, acting on human’s temperament, make you either reasonable, or irrational-- enlightened, or stupid-- a fanatic, or a hero-- an enthusiast for the public good, or an unbridled criminal-- a wise person, smitten with the advantages of virtue, or a libertine, plunged into every kind of vice. 541 All the varieties of the moral person, depend on the diversity of your ideas; which are themselves arranged and combined in your brain by the intervention of your senses. 542 Human’s temperament is the produce of physical substances, your own habits are the effect of physical modifications; 543 the opinions, whether good or bad, injurious or beneficial, true or false, which form themselves in your mind, are never more than the effect of those physical impulsions which the brain receives by the medium of the senses.

THE SOUL DOES NOT DERIVE ITS IDEAS FROM ITSELF-- IT HAS NO INNATE IDEAS

Paul Henri Thiery (Baron D'Holbach)

35 What has proceeded suffices to prove, that the interior organ of human, which is called your soul, is purely material. 2 Human will be enabled to convince yourself of this truth, by the manner in which you acquires your ideas,-- 3 from those impressions which material objects successively make on your organs, which are themselves acknowledged to be material. 4 It has been seen, that the faculties which are called intellectual, are to be ascribed to that of feeling; 5 the different qualities of those faculties which are called moral, have been explained after the necessary laws of a very simple mechanism: 6 it now remains, to reply to those who still obstinately persist in making the soul a substance distinguished from the body, or who insist on giving it an essence totally distinct. 7 They seem to found their distinction upon this, that this interior organ has the faculty of drawing its ideas from within itself; 8 they will have it, that human, at own birth, brings with oneself ideas into the world, which, according to this wonderful notion, they have called innate. 9 The Jews have a similar doctrine which they borrowed from the Chaldeans: 10 their rabbins taught, that each soul, before it was united to the seed that must form an infant in the womb of a woman, is confided to the care of an angel, which causes you to behold heaven, earth, and hell: 11 this, they pretend, is done by the assistance of a lamp, which extinguishes itself as soon as the infant comes into the world. 12 Some ancient philosophers have held, that the soul originally contains the principles of several notions or doctrines: 13 the Stoics designated this by the term PROLEPSIS, anticipated opinions; the Greek mathematicians, KOINAS ENNOIAS, universal ideas. 14 They have believed that the soul, by a special privilege, in a nature where everything is connected, enjoyed the faculty of moving itself without receiving any impulse; 15 of creating

to itself ideas, of thinking on a subject, without being determined to such action, by any exterior object; 16 which by moving its organs should furnish it with an image of the subject of its thoughts. 17 In consequence of these gratuitous suppositions, of these extraordinary pretensions, which it is only requisite to expose, 18 in order to confute some very able speculators, who were prepossessed by their superstitious prejudices; 19 have ventured the length to assert, that without model, without prototype to act on the senses, the soul is competent to delineate to itself, the whole universe with all the beings it contains. 20 DESCARTES and his disciples have assured us, that the body went absolutely for nothing, in the sensations, in the perceptions, in the ideas of the soul; 21 that it can feel, that it can perceive, that it can understand, that it can taste, that it can touch, even when there should exist nothing that is corporeal or material exterior to ourselves. 22 But what shall be said of a BERKELEY, who has endeavoured, who has laboured to prove to human, that everything in this world is nothing more than a chimerical illusion; 23 that the universe exists nowhere but in yourself; that it has no identity but in human's imagination; 24 who has rendered the existence of all things problematical by the aid of sophisms, insolvable even to those who maintain the doctrine of the spirituality of the soul.

25 Extravagant as this doctrine of the BISHOP OF CLOYNE may appear, it cannot well be more so than that of MALEBRANCHE, 26 the champion of innate ideas; who makes the divinity the common bond between the soul and the body: 27 or than that of those metaphysicians, who maintain that the soul is a substance heterogeneous to the body; 28 who by ascribing to this soul the thoughts of human, have in fact rendered the body superfluous. 29 They have not perceived they were liable to one solid objection, which is, that if the ideas of human are innate, 30 if human derives them from a superior being, independent of exterior causes, if you sees everything in

God; 31 how comes it that so many false ideas are afloat, that so many errors prevail, with which the human mind is saturated? 32 From whence comes these opinions, which according to the theologians are so displeasing to God? 33 Might it not be a question to the Malebranchists, was it in the Divinity that SPINOZA beheld his system?

34 Nevertheless, to justify such monstrous opinions, they assert that ideas are only the objects of thought. 35 But according to the last analysis, these ideas can only reach human from exterior objects, which in giving impulse to your senses modify your brain; 36 or from the material beings contained within the interior of your machine, who make some parts of your body experience those sensations which you perceives, 37 which furnish you with ideas, which you relates, faithfully or otherwise, to the cause that moves you. 38 Each idea is an effect, but however difficult it may be to recur to the cause, can we possibly suppose it is not ascribable to a cause? 39 If we can only form ideas of material substances, how can we suppose the cause of our ideas can possibly be immaterial? 40 To pretend that human without the aid of exterior objects, without the intervention of your senses, is competent to form ideas of the universe, 41 is to assert, that a blind person is in a capacity to form a true idea of a picture, that represents some fact of which you have never heard anyone speak.

42 It is very easy to perceive the source of those errors, into which humans, otherwise extremely profound and very enlightened have fallen, 43 when they have been desirous to speak of the soul: to describe its operations. 44 Obliged either by their own prejudices, or by the fear of combating the opinions of some imperious theologian, they have become the advocates of the principle, that the soul was a pure spirit: 45 an immaterial substance; of an essence directly different from that of the body; from everything we behold: 46 this granted, they have been incompetent to conceive how material objects could operate, in

what manner gross and corporeal organs were enabled to act on a substance, that had no kind of analogy with them; 47 how they were in a capacity to modify it by conveying its ideas; 48 in the impossibility of explaining this phenomenon, at the same time perceiving that the soul had ideas, they concluded that it must draw them from itself, and not from those beings, 49 which according to their own hypothesis, were incapable of acting on it, or rather, of which they could not conceive the manner of action; 50 they therefore imagined that all the modifications, all the actions of this soul, sprung from its own peculiar energy, were imprinted on it from its first formation, by the Author of Nature: 51 that these did not in any manner depend upon the beings of which we have a knowledge, or which act upon it, by the gross means of our senses.

52 There are, however, some phenomena, which, considered superficially, appear to support the opinion of these philosophers; 53 to announce a faculty in the human soul of producing ideas within itself, without any exterior aid; these are dreams, in which the interior organ of human, deprived of objects that move it visibly, does not, however, cease to have ideas-- 54 to be set in activity-- to be modified in a manner that is sufficiently sensible-- to have an influence upon your body. 55 But if a little reflection be called in, the solution to this difficulty will be found: 56 it will be perceived that, even during sleep, human's brain is supplied with a multitude of ideas, with which the eye or time before has stocked it; 57 these ideas were communicated to it by exterior or corporeal objects, by which they have been modified: 58 it will be found that these modifications renew themselves, not by any spontaneous, not by any voluntary motion on its part, 59 but by a chain of involuntary movements which take place in your machine, which determine, which excite those that give play to the brain; 60 these modifications renew themselves with more or less fidelity, with a greater or lesser degree of conformity to those which it has

anteriorly experienced. 61 Sometimes in dreaming, human has memory, then you retraces to yourself the objects which have struck you faithfully;-- 62 at other times, these modifications renew themselves without order, and without connection, very differently from those, which real objects have before excited in your interior organ. 63 If in a dream you believes you sees a friend, your brain renews in itself the modifications or the ideas which this friend had formerly excited-- 64 in the same order that they arranged themselves when your eyes really beheld you-- this is nothing more than an effect of memory. 65 If in your dream you fancies you sees a monster which has no model in nature, your brain is then modified in the same manner that it was by the particular, 66 by the detached ideas, with which it then does nothing more than compose an ideal whole; 67 by assembling, and associating, in a ridiculous manner, the scattered ideas that were consigned to its keeping; 68 it is then, that in dreaming you have imagination.

69 Those dreams that are troublesome, extravagant, whimsical, or unconnected, are commonly the effect of some confusion in your machine; 70 such as painful indigestion-- an overheated blood-- a prejudicial fermentation,-- 71 these material causes excite in human's body a disorderly motion, which precludes the brain from being modified in the same manner it was on the day before; 72 in consequence of this irregular motion the brain is disturbed, it only represents to itself confused ideas that want connection. 73 When in a dream, you believes you sees a Sphinx, a being supposed by the poets to have a head and face like a woman, 74 a body like a dog, wings like a bird, and claws like a lion, who put forth riddles and killed those who could not expound them; 75 either, you have seen the representation of you when you were awake, or else the disorderly motion of the brain is such that it causes it to combine ideas, 76 to connect parts, from which there results a whole without model, of which the parts were not formed to be united. 77 It is

thus, that human's brain combines the head of a woman, of which it already has the idea, with the body of a lioness, of which it also has the image. 78 In this your head acts in the same manner, as when by any defect in the interior organ, your disordered imagination paints to you some objects, notwithstanding you are awake. 79 Human frequently dreams, without being asleep: 80 human's dreams never produce anything so strange but that they have some resemblance, with the objects which have anteriorly acted on one's own senses; 81 which have already communicated ideas to one's brain. 82 The watchful theologians have composed, at their leisure, in their waking hours, those phantoms, of which they avail themselves, to terrify or frighten human; 83 they have done nothing more than assemble the scattered traits which they have found in the most terrible beings of their own species; 84 by exaggerating the powers, by enlarging the rights claimed by tyrants, they have formed ideal beings, before whom human trembles, and is afraid.

85 Thus, it is seen, that dreams, far from proving that the soul acts by its own peculiar energy, that it draws its ideas from its own recesses; 86 prove, on the contrary, that in sleep it is entirely passive, that it does not even renew its modifications, 87 but according to the involuntary confusion, which physical causes produce in the body, of which everything tends to show the identity, the consubstantiality with the soul.

88 What appears to have led those into a mistake, who maintained that the soul drew its ideas from itself, 89 is this, they have contemplated these ideas, as if they were real beings, when, in point of fact, they are nothing more than the modifications produced in the brain of human, by objects to which this brain is a stranger; 90 they are these objects, who are the true models, who are the real archetypes to which it is necessary to recur: here is the source of all their errors.

91 In the individual who dreams, the soul does not act more from itself, than it does in the human who is drunk, 92 that is to say, who is modified by some spirituous liquor: or than it does in the sick person, when you are delirious, 93 that is to say, when you are modified by those physical causes which disturb your machine, which obstruct it in the performance of its functions; 94 or than it, does in you, whose brain is disordered: dreams, like these various states, announce nothing more than a physical confusion in the human machine, 95 under the influence of which the brain ceases to act, after a precise and regular manner: this disorder may be traced to physical causes, 96 such as the aliments-- the humours-- the combinations-- the fermentations, which are but little analogous to the salutary state of human; 97 from hence it will appear, that your brain is necessarily confused, whenever your own body is agitated in an extraordinary manner.

98 Do not let human, therefore, believe that one soul acts by itself, or without a cause, in any one moment of your existence; 99 it is, conjointly with the body, submitted to the impulse of beings, who act on you necessarily, according to their various properties. 100 Wine taken in too great a quantity, necessarily disturbs your own ideas, causes confusion in your corporeal functions, occasions disorder in your mental faculties.

101 If there really existed a being in Nature, with the capability of moving itself by its own peculiar energies, 102 that is to say, able to produce motion, independent of all other causes, such a being would have the power of arresting itself, 103 or of suspending the motion of the universe; which is nothing more than an immense chain of causes linked one to another, acting and re-acting by necessary immutable laws, 104 and which cannot be changed, which are incapable of being suspended, unless the essences of everything in it were changed, without the properties of everything were annihilated. 105 In the general system of the world, nothing more can be

perceived than a long series of motion, received and communicated in succession, by beings capacitated to give impulse to each other: 106 it is thus, that each body is moved by the collision of some other body. The invisible motion of some soul is to be attributed to causes concealed within yourself; 107 human believes that it is moved by itself, because you does not see the springs which put it in motion, 108 or because human conceives those powers are incapable of producing the effects you so much admires: 109 but, does human more clearly conceive, how a spark in exploding gunpowder, is capable of producing the terrible effects you witnesses? 110 The source of human errors arise from this, that you regards your own body as gross and inert, 111 whilst this body is a sensible machine, which has necessarily an instantaneous conscience the moment it receives an impression; 112 which is conscious of its own existence by the recollection of impressions successively experienced; 113 memory by resuscitating an impression anteriorly received, by detaining it, or by causing an impression which it receives to remain, 114 whilst it associates it with another, then with a third, gives all the mechanism of reasoning.

115 An idea, which is only an imperceptible modification of the brain, gives play to the organ of speech, which displays itself by the motion it excites in the tongue: 116 this, in its turn, breeds ideas, thoughts, and passions, in those beings who are provided with organs susceptible of receiving analagous motion; 117 in consequence of which, the wills of a great number of people are influenced, who, combining their efforts, produce a revolution in a state, or even have an influence over the entire globe. 118 It is thus, that an ALEXANDER decided the fate of Asia, it is thus, that a MAHOMET changed the face of the earth; 119 it is thus, that imperceptible causes produce the most terrible, the most extended effects, by a series of necessary motion imprinted on the brain of human.

120 The difficulty of comprehending the effects produced on the soul of human, has made you attribute to it those incomprehensible qualities which have been examined. 121 By the aid of imagination, by the power of thought, this soul appears to quit your body, 122 to carry itself with the greatest ease, to transport itself with the utmost facility towards the most distant objects; 123 to run over, to approximate in the twinkling of an eye, all the points of the universe: 124 human has therefore believed, that a being who is susceptible of such rapid motion, must be of a nature very distinguished from all others; 125 human has persuaded oneself that this soul in reality does travel, that it actually springs over the immense space necessary to meet these various objects; 126 human did not perceive, that to do it in an instant, it had only to run over itself to approximate the ideas consigned to its keeping, by means of the senses.

127 Indeed, it is never by any other means than by your senses, that beings become known to human, or furnish you with ideas; 128 it is only in consequence of the impulse given to human body, that your brain is modified, or that your soul thinks, wills, and acts. 129 If, as ARISTOTLE asserted more than two thousand years ago,--" nothing enters the mind of human but through the medium of your senses,"-- 130 it follows as a consequence, that everything that issues from it must find some sensible object to which it can attach its ideas, 131 whether immediately, as a human, a tree, a bird, or in the last analysis or decomposition, such as pleasure, happiness, vice, virtue. 132 This principle, so true, so luminous, so important in its consequence, has been set forth in all its lustre, by a great number of philosophers; among the rest, by the great LOCKE. 133 Whenever, therefore, a word or its idea does not connect itself with some sensible object to which it can be related, this word or this idea is unmeaning, and void of sense; 134 it were better for human that the idea was banished from your mind, struck out of your language: this principle is only the converse of the axiom of ARISTOTLE,-- "if the direct be evident,

the inverse must be so likewise." 135 How has it happened, that the profound LOCKE, who, to the great mortification of the metaphysicians, has placed this principle of ARISTOTLE in the clearest point of view? 136 How is it, that all those who, like him, have recognised the absurdity of the system of innate ideas, have not drawn the immediate, the necessary consequences? 137 How has it come to pass, that they have not had sufficient courage to apply so clear a principle to all those fanciful chimeras with which the human mind has for such a length of time been so vainly occupied? 138 Did they not perceive that their principle sapped the very foundations of those metaphysical speculations, which never occupy human 139 but with those objects of which, as they are inaccessible to your own senses, you consequently can never form to yourself any accurate idea? 140 But prejudice, when it is generally held sacred, prevents you from seeing the most simple application of the most self-evident principles. 141 In metaphysical researches, the greatest people are frequently nothing more than children, who are incapable of either foreseeing or deducing the consequence of their own data.

142 LOCKE, as well as all those who have adopted his system, which is so demonstrable,-- or to the axiom of ARISTOTLE, which is so clear, 143 ought to have concluded from it that all those wonderful things with which metaphysicians have amused themselves, are mere chimeras; 144 mere wanderings of the imagination; that an immaterial spirit or substance, without extent, without parts, is, in fact, nothing more than an absence of ideas; 145 in short, they ought to have felt that the ineffable intelligence which they have supposed to preside at the helm of the world, is after all nothing more than a being of their own imagination, 146 on which human has never been in accord, whom human has pictured under all the variety of forms, 147 to which human has at different periods, in different climes, ascribed every kind of attribute, good or bad; 148 but of which it is

impossible human senses can ever prove either the existence or the qualities.

149 For the same reason, moral philosophers ought to have concluded, that what is called moral sentiment, moral instinct, that is, innate ideas of virtue, anterior to all experience of the good or bad effects resulting from its practice, are mere chimerical notions, 150 which, like a great many others, have for their guarantee and base only metaphysical speculation. 151 Before human can judge, you must feel; before human can distinguish good from evil, you must compare. 152 Morals, is a science of facts: to found them, therefore, on an hypothesis inaccessible to human senses, of which you have no means of proving the reality, is to render them uncertain; 153 it is to cast the log of discord into your lap, to cause you unceasingly to dispute upon that which you can never understand. 154 To assert that the ideas of morals are innate, or the effect of instinct, is to pretend that human knows how to read before you have learned the letters of the alphabet; 155 that human is acquainted with the laws of society before they are either made or promulgated.

156 To undeceive you, with respect to innate ideas or modifications, imprinted on human soul, at the moment of your birth, it is simply requisite to recur to their source; 157 you will then see that those with which you are familiar, which have, as it were, identified themselves with human existence, have all come to you through the medium of some of your senses; 158 that they are sometimes engraven on your brain with great difficulty,-- that they have never been permanent,-- that they have perpetually varied in human: 159 you will see that these pretended inherent ideas of human soul, are the effect of education, of example, above all, of habit, 160 which by reiterated motion has taught your brain to associate your ideas either in a confused or a perspicuous manner; to familiarise itself with systems either rational or absurd. 161 In short, human takes those for innate ideas of which you have forgotten the origin;

162 human no longer recalls to oneself, either the precise epoch, or the successive circumstances when these ideas were first consigned to human's brain: 163 arrived at a certain age you believes human has always had the same notions; your memory, crowded with experience, loaded with a multitude of facts, 164 is no longer able to distinguish the particular circumstances which have contributed to give your brain its present modifications; its instantaneous mode of thinking; its actual opinions. 165 For example, not one of human race, perhaps, recollects the first time the word God struck your ears-- the first ideas that it formed in yourself-- the first thoughts that it produced in yourself; 166 nevertheless, it is certain that from thence you have searched for some being with whom to connect the idea which you have either formed to yourself, or which have been suggested to you: 167 accustomed to hear God continually spoken of, you have, when in other respects, the most enlightened, regarded this idea as if it were infused into yourself by Nature; 168 whilst it is visibly to be attributed to those delineations of it, which your parents or your instructors have made to you; 169 which you have, in consequence, modified according to your own particular organisation, and the circumstances in which you have been placed; 170 it is thus, that each individual forms to oneself a God, of which you are yourself the model, or which you modifies after your own fashion.

171 His ideas of morals, although more real than those of metaphysics, are not however innate: 172 the moral sentiments human forms on the will, or the judgment you passes on the actions of human, are founded on experience; 173 which alone can enable you to discriminate those which are either useful or prejudicial, virtuous or vicious, honest or dishonest, worthy your esteem, or deserving your censure. 174 Human moral sentiments are the fruit of a multitude of experience that is frequently very long and very complicated. 175 Human gathers it with time; it is more or less faithful,

by reason of your particular organisation and the causes by which you are modified; 176 human ultimately applies this experience with greater or less facility; to this is to be attributed your habit of judging. 177 The celerity with which you applies your experience when you judges of the moral actions of your fellow human, is what has been termed moral instinct.

178 That which in natural philosophy is called instinct, is only the effect of some want of the body, the consequence of some attraction or some repulsion in human or animals. 179 The child that is newly born, sucks for the first time; the nipple of the breast is put into the mouth: by the natural analogy, that is found between the conglomerate glands, filled with nerves; which line the mouth, 180 and the milk which flows from the bosom of the nurse, through the medium of the nipple, causes the child to press it with own mouth, in order to express the fluid appropriate to nourish own tender age; 181 from all this the infant gathers experience; by degrees the idea of a nipple, of milk, of pleasure, associate themselves in the brain: 182 every time the child sees the nipple, the child seizes it, promptly conveys it to own mouth, and applies it to the use for which it is designed.

183 What has been said, will enable us to judge of those prompt and sudden sentiments, which have been designated the force of blood. 184 Those sentiments of love, which fathers and mothers have for their children-- those feelings of affection, which children, with good inclinations, bear towards their parents, are by no means innate sentiments; 185 they are nothing more, than the effect of experience, of reflection, of habit, in souls of sensibility. 186 These sentiments do not even exist in a great number of human beings. We but too often witness tyrannical parents, occupied with making enemies of their children, 187 who appear to have been formed, only to be the victims of their irrational caprices or their unreasonable desires.

188 From the instant in which you commences, until that in which you

ceases to exist, you feels-- you are moved either agreeably or unpleasantly-- you collects facts-- you gathers experience; 189 these produce ideas in your brain, that are either cheerful or gloomy. 190 Not one individual has all this experience present to your memory at the same time, it does not ever represent to you the whole clew at once: 191 it is, however, this experience that mechanically directs you, without your knowledge, in all your actions; 192 it was to designate the rapidity with, which you applied this experience, of which you so frequently loses the connection-- 193 of which human is so often at a loss to render you an account, that you imagined the word instinct: it appears to be the effect of magic, the operation of a supernatural power, to the greater number of individuals: 194 it is a word devoid of sense to many others; but to the philosophers it is the effect of a very lively feeling to them it consists in the faculty of combining, promptly, a multitude of experience-- 195 of arranging with facility-- of comparing with quickness, a long and numerous train of extremely complicated ideas. 196 It is want that causes the inexplicable instinct we behold in animals which have been denied souls without reason, 197 whilst they are susceptible of an infinity of actions that prove they think -- judge -- have memory-- are capable of experience-- can combine ideas-- 198 can apply them with more or less facility to satisfy the wants engendered by their particular organisation; in short, that prove they have passions that are capable of being modified. 199 Nothing but the height of folly can refuse intellectual faculties to animals; they feel, choose, deliberate, express love, show hatred; in many instances their senses are much keener than those of human. 200 Fish will return periodically to the spot where it is the custom to throw them bread.

201 It is well known the embarrassments which animals have thrown in the way of the partisans of the doctrine of spirituality; 202 they have been fearful, if they allowed them to have a spiritual soul, of

elevating them to the condition of human creatures; 203 on the other hand, in not allowing them to have a soul, they have furnished their adversaries with authority to deny it in like manner to human, who thus finds yourself debased to the condition of the animal. 204 Metaphysicians have never known how to extricate themselves from this difficulty. 205 DESCARTES fancied he solved it by saying that beasts have no souls, but are mere machines. 206 Nothing can be nearer the surface, than the absurdity of this principle.

207 Whoever contemplates Nature without prejudice, will readily acknowledge that there is no other difference between human and the beast, 208 than that which is to be attributed to the diversity of human organisation. 209 In some beings of the human species, who appear to be endowed with a greater sensibility of organs than others, may be seen an instinct, 210 by the assistance of which they very promptly judge of the concealed dispositions of their fellows, simply by inspecting the lineaments of their face. 211 Those who are denominated physiognomists, are only people of very acute feelings; 212 who have gathered an experience of which others, whether from the coarseness of their organs, from the little attention they have paid, or from some defect in their senses, are totally incapable: 213 these last do not believe in the science of physiognomy, which appears to them perfectly ideal. 214 Nevertheless, it is certain, that the action of this soul, which has been made spiritual, makes impressions that are extremely marked upon the exterior of the body; 215 these impressions, continually reiterated, their image remains: thus the habitual passions of human paint themselves on your countenance; 216 by which the attentive observer, who is endowed with acute feeling, is enabled to judge with great rapidity of your mode of existence, 217 and even to foresee your actions, your inclinations, your desires, your predominant passions. 218 Although the science of physiognomy appears

chimerical to a great number of people, yet there are few who have not a clear idea of a tender regard-- of a cruel eye-- of an austere aspect-- of a false, dissimulating look-- of an open countenance. 219 Keen practised optics acquire without doubt the faculty of penetrating the concealed motion of the soul, 220 by the visible traces it leaves upon features that it has continually modified. 221 Above all, the eyes of human very quickly undergo changes according to the motion which is excited in yourself: 222 these delicate organs are visibly altered by the smallest shock communicated to your brain. 223 Serene eyes announce a tranquil soul; wild eyes indicate a restless mind; fiery eyes portray a choleric, sanguine temperament; 224 fickle or inconstant eyes give room to suspect a soul either alarmed or dissimulating. 225 It is the study of this variety of shades that renders human practised and acute: upon the spot you combine a multitude of acquired experience, in order to form your judgment of the person you beholds. 226 Human's judgment, thus rapidly formed, partakes in nothing of the supernatural, in nothing of the wonderful: 227 such a person is only distinguished by the fineness of your own organs, and by the celerity with which your brain performs its functions.

228 It is the same with some beings of the human species, in whom may be discovered an extraordinary sagacity, which, to the uninformed, appears miraculous. 229 The most skilful practitioners in medicine, are, no doubt, people endowed with very acute feelings, similar to that of the physiognomists, 230 by the assistance of which they judge with great facility of diseases, and very promptly draw their prognostics. 231 Indeed, we see people who are capable of appreciating in the twinkling of an eye a multitude of circumstances, who have sometimes the faculty of foreseeing the most distant events; 232 yet, this species of prophetic talent has nothing in it of the supernatural; 233 it indicates nothing more than great experience, with an extremely delicate organisation, from which they derive

the faculty of judging with extreme faculty of causes, of foreseeing their very remote effects. 234 This faculty, however, is also found in animals, who foresee much better than human, the variations of the atmosphere with the various changes of the weather. 235 Birds have long been the prophets, and even the guides of several nations who pretend to be extremely enlightened. 236 It is, then, to their organisation, exercised after a particular manner, that must be attributed those wonderous faculties which distinguish some beings, that astonish others. 237 To have instinct, only signifies to judge quickly, without requiring to make a long, reasoning on the subject. 238 Human's ideas upon vice and upon virtue, are by no means innate; they are, like all others, acquired: the judgment you forms, is founded upon experience, whether true or false,-- 239 this depends upon your conformation, and upon the habits that have modified you. 240 The infant has no ideas either of the Divinity or of virtue; it is from those who instruct you that you receives these ideas; 241 you makes more or less use of them, according to your natural organisation, or as your dispositions have been more or less exercised. 242 Nature gives human legs, the nurse teaches you their use, your agility depends upon their natural conformation, and the manner in which you exercises them. 243 What is called taste, in the fine arts, is to be attributed, in the same manner, only to the acuteness of human's organs, 244 practised by the habit of seeing, of comparing, of judging certain objects; 245 from whence results, to some of your species, the faculty of judging with great rapidity, in the twinkling of an eye, the whole with its various relations. 246 It is by the force of seeing, of feeling, of experiencing objects, that you attains to a knowledge of them; 247 it is in consequence of reiterating this experience, that you acquires the power, that you gains the habit of judging with celerity. 248 But this experience is by no means innate, you did not possess it before you

were born; you are neither able to think, to judge, nor to have ideas, before you have feeling; 249 you are neither in a capacity to love, nor to hate; to approve, nor to blame, before you have been moved, either agreeably or disagreeably. 250 Nevertheless, this is precisely what must be supposed by those who are desirous to make human admit of innate ideas, of opinions; 251 infused by Nature, whether in morals, metaphysics, or any other science. 252 That human mind should have the faculty of thought, that it should occupy itself with an object, it is requisite it should be acquainted with its qualities; 253 that it may have a knowledge of these qualities, it is necessary some of your senses should have been struck by them: 254 those objects, therefore, of which you does not know any of the qualities, are nullities; or at least they do not exist for yourself.

255 It will be asserted, perhaps, that the universal consent of human, upon certain propositions, such as the whole is greater than its part, 256 upon all geometrical demonstrations, appear to warrant the supposition of certain primary notions that are innate, not acquired. 257 It may be replied, that these notions are always acquired; that they are the fruit of an experience more or less prompt; 258 that it is requisite to have compared the whole with its part, before conviction can ensue, that the whole is the greater of the two. 259 Human when you are born, does not bring with you the idea that two and two make four; but you are, nevertheless, speedily convinced of its truth. 260 Before forming any judgment whatever, it is absolutely necessary to have compared facts.

261 It is evident, that those who have gratuitously supposed innate ideas, or notions inherent in human, have confounded your organisation, 262 or your natural dispositions, with the habit by which you are modified; with the greater or less aptitude you have of making experience, and of applying it in your judgment. 263 A human who has taste in painting, has, without doubt, brought with oneself into the world eyes more acute, more penetrating than another; 264 but

these eyes would by no means enable you to judge with promptitude, if you had never had occasion to exercise them; 265 much less, in some respects, can those dispositions which are called natural, be regarded as innate. 266 Human is not, at twenty years of age, the same as you were when you came into the world; 267 the physical causes that are continually acting upon human, necessarily have an influence upon your organisation, 268 and so modify it, that your natural dispositions themselves are not at one period what they are at another.

269 La Motte Le Vayer says, "We think quite otherwise of things at one time than at another; 270 when young than when old-- when hungry than when our appetite is satisfied-- in the night than in the day-- when peevish than when cheerful. 271 Thus, varying every hour, by a thousand other circumstances, which keep us in a state of perpetual inconstancy and instability." 272 Everyday may be seen children, who, to a certain age-- display a great deal of ingenuity, a strong aptitude for the sciences, who finish by falling into stupidity.

273 Others may be observed, who, during their infancy, have shown dispositions but little favourable to improvement, yet develop themselves in the end, 274 and astonish us by an exhibition of those qualities of which we hardly thought them susceptible: 275 there arrives a moment in which the mind takes a spring, makes use of a multitude of experience which it has amassed, without its having been perceived; 276 and, if I may be allowed the expression, without their own knowledge.

277 Thus, it cannot be too often repeated, all the ideas, all the notions, all the modes of existence, and all the thoughts of human, are acquired. 278 Human mind cannot act, cannot exercise itself, but upon that of which it has knowledge; 279 it can understand either well or ill, only those things which it has previously felt. 280 Such of human ideas that do not suppose some exterior material object for their model, or one to which human is able to relate them,

which are therefore called abstract ideas, 281 are only modes in which your interior organ considers its own peculiar modifications, of which it chooses some without respect to others. 282 The words which you uses to designate these ideas, such as bounty, beauty, order, intelligence, virtue, do not offer any one sense, 283 if you does not relate them to, or if you does not explain them by, those objects which your senses have shown you to be susceptible of those qualities, 284 or of those modes of existence, of that manner of acting, which is known to yourself. 285 What is it that points out to you the vague idea of beauty, if you does not attach it to some object that has struck your senses in a peculiar manner, to which, in consequence, you attributes this quality? 286 What is it that represents the word intelligence, if you does not connect it with a certain mode of being and of acting? 287 Does the word order signify anything, if you does not relate it to a series of actions, to a chain of motion, by which you are affected in a certain manner? 288 Is not the word virtue void of sense, if you does not apply it to those dispositions of your fellows which produce known effects, different from those which result from contrary inclinations? 289 What do the words pain and pleasure offer to your mind in the moment when your organs neither suffer nor enjoy, 290 if it be not the modes in which you have been affected, of which your brain conserves the remembrance, of those impressions, which experience has shown you to be either useful or prejudicial? 291 But when you bears the words spirituality, immateriality, in corporeality, pronounced, neither your senses nor your memory afford you any assistance; 292 they do not furnish human with any means by which you can form an idea of their qualities, or of the objects to which you ought to apply them; 293 in that which is not matter you can only see vacuum and emptiness, which as long as you remains what you are, cannot, to your mind, be susceptible of any one quality.

294 All the errors, all the disputes of humans, have their foundation in

this, that they have renounced experience, 295 have surrendered the evidence of their senses, to give themselves up to the guidance of notions which they have believed infused or innate; 296 although in reality they are no more than the effect of a distempered imagination, of prejudices, in which they have been instructed from their infancy, 297 with which habit has familiarised them, which authority has obliged them to conserve.

298 Languages are filled with abstract words, to which are attached confused and vague ideas; 299 of which, when they come to be examined, no model can be found in Nature; no object to which they can be related. 300 When human gives oneself the trouble to analyse things, you are quite surprised to find, that those words which are continually in the mouths of people, never present any fixed or determinate idea: 301 you hears them unceasingly speaking of spirits-- of the soul and its faculties-- of duration-- of space-- of immensity-- of infinity-- of perfection--of virtue-- of reason-- of sentiment-- of instinct-- of taste, 302 without your being able to tell precisely, what they themselves understand by these words. 303 Nevertheless, they do not appear to have been invented, but for the purpose of representing the images of things; 304 or to paint, by the assistance of the senses, those known objects on which the mind is able to meditate, which it is competent to appreciate, to compare, and to judge.

305 For human to think of that which has not acted on any of your senses, is to think on words; 306 it is for your senses to dream; it is to seek in your own imagination for objects to which you can attach your wandering ideas: 307 to assign qualities to these objects is, unquestionably, to redouble your extravagance, to set no limits to your folly. 308 If a word be destined to represent to you an object that has not the capacity to act on any one of your organs; of which, it is impossible for you to prove either the existence or the qualities; 309 your imagination, by dint of racking itself, will nevertheless, in some measure, supply you with the ideas

you wants; 310 human composes some kind of a picture, with the images or colours you are always obliged to borrow, from the objects of which you have a knowledge: 311 thus the Divinity has been represented by some under the character of a venerable old person; by others, under that of a puissant monarch; by others, as an exasperated, irritated being. 312 It is evident, however, that human, with some of your qualities, has served for the model of these pictures: 313 but if you be informed of objects that are represented as pure spirits-- that have neither body nor extent-- that are not contained in space-- that are beyond Nature,--here then you are plunged into emptiness; 314 your mind no longer has any ideas-- it no longer knows upon what it meditates. 315 This, as will be seen in the sequel, no doubt, is the source of those unformed notions which some people have formed of the Divinity; 316 they themselves frequently annihilate human, by assembling incompatible and contradictory attributes. 317 In giving human morals-- in composing human of known qualities,-- they make human a human;-- 318 in assigning human the negative attributes of everything they know, they render human inaccessible to their senses-- they destroy all antecedent ideas-- they make human a mere nothing. 319 From this it will appear, that those sublime sciences which are called Theology, Psychology, Metaphysics, have been mere sciences of words: 320 morals and politics, with which they very frequently mix, have, in consequence, become inexplicable enigmas, which there is nothing short of the study of Nature can enable us to expound.

321 Human has occasion for truth; it consists in a knowledge of the true relations you have with those beings competent to have an influence on your welfare; 322 these relations are to be known only by experience: without experience there can be no reason; without reason human is only a blind creature, who conducts oneself by chance. 323 But, how is human to acquire experience upon ideal objects, which your senses

neither enable you to know nor to examine? 324 How is human to assure oneself of the existence, how ascertain the qualities of other beings you are not able to feel? 325 How can human judge whether there objects be favourable or prejudicial to oneself? 326 How is human to know, without the evidence of your senses, what you ought to love, what you should hate, what to seek after, what to shun, what to do, what to leave undone? 327 It is, however, upon this knowledge that your condition in this world rests; it is upon this knowledge that morals is founded.

328 From whence it may be seen, that, by causing human to blend vague metaphysical notions with morals, 329 or the science of the certain and invariable relations which subsist between humankind; 330 or by weakly establishing them upon chimerical ideas, which have no existence but in your imagination; 331 these morals, upon which the welfare of society so much depends, are rendered uncertain, are made arbitrary, are abandoned to the caprices of fancy, are not fixed upon any solid basis.

332 Beings essentially different by their natural organisation, by the modifications they experience, by the habits they contract, by the opinions they acquire, must of necessity think differently. 333 Your temperament, as we have seen, decides the mental qualities of human: this temperament itself is diversely modified in human: 334 from whence it consecutively follows, your imagination cannot possibly be the same; neither can it create to you the same images. 335 Each individual is a connected whole, of which all the parts have a necessary correspondence.

336 Different eyes must see differently, must give extremely varied ideas of the objects they contemplate, even when these objects are real. 337 What, then, must be the diversity of these ideas, if the objects meditated upon do not act upon the senses? 338 Humankind have pretty nearly the same ideas, in the gross, of those substances that act upon your organs with vivacity; 339 human is sufficiently in unison upon

some qualities which you contemplates very nearly in the same manner; 340 I say, very nearly, because the intelligence, the notion, the conviction of any one proposition, however simple, however evident, however clear it may be supposed, is not, nor cannot be, strictly the same, in any two people. 341 Indeed, one person not being another person, the first cannot, for example, have rigorously and mathematically the same notion of unity as the second; 342 seeing that an identical effect cannot be the result of two different causes. 343 Thus, when people are in accord in their ideas, in their modes of thinking, in their judgment, in their passions, in their desires, in their tastes, 344 their consent does not arise from their seeing or feeling the same objects precisely in the same manner, but pretty nearly; 345 language is not, nor cannot be, sufficiently copious to designate the vast variety of shades, the multiplicity of imperceptible differences, which is to be found in their modes of seeing and thinking. 346 Each person, then, has, to say thus, a language which is peculiar to oneself alone, and this language is incommunicable to others. 347 What harmony, what unison, then, can possibly exist between them, when they discourse with each other, upon objects only known to their imagination? 348 Can this imagination in one individual ever be the same as in another? 349 How can they possibly understand each other, when they assign to those objects qualities that can only be attributed to the particular manner in which their brain is affected.

350 For one person to exact from another that one shall think like the other, is to insist that the one shall be organised precisely in the same manner as the other-- 351 that one shall have been modified exactly the same in every moment of the other's existence: 352 that one shall have received the same temperament, the same nourishment, the same education: in a word, that you shall require that the other to be yourself. 353 Wherefore is it not exacted that all people shall have the same

features? 354 Is human more the master of your opinions? 355 Are not your opinions the necessary consequence of your nature, and of those peculiar circumstances which, from your infancy, have necessarily had an influence upon your mode of thinking, and your manner of acting? 356 If human be a connected whole, whenever a single feature differs from your own, ought you not to conclude that it is not possible your brain can either think, associate ideas, imagine, or dream precisely in the same manner with that other.

357 The diversity in the temperament of human, is the natural, the necessary source of the diversity of your passions, of your taste, of your ideas of happiness, of your opinions of every kind. 358 Thus, this same diversity will be the fatal source of your disputes, of your hatreds, of your injustice, every time you shall reason upon unknown objects, but to which you shall attach the greatest importance. 359 Human will never understand either oneself or others, in speaking of a spiritual soul, or of immaterial substances distinguished from Nature; 360 human will, from that moment, cease to speak the same language, and you will never attach the same ideas to the same words. 361 What, then, shall be, the common standard that shall decide which is the person that thinks with the greatest justice? 362 What the scale by which to measure who has the best regulated imagination? 363 What balance shall be found sufficiently exact to determine whose knowledge is most certain, when you agitates subjects, 364 which experience cannot enable you to examine, that escape all your senses, that have no model, that are above reason? 365 Each individual, each legislator, each speculator, each nation, has ever formed to oneself different ideas of these things; 366 each believes, that your own peculiar reveries ought to be preferred to those of your neighbours; 367 which always appear to you an absurd, ridiculous, and false as your own can possibly have appeared to your fellow; 368 each clings to your own opinion, because each retains your own peculiar mode of existence; 369 each believes your

happiness depends upon your attachment to your prejudices, which you never adopts but because you believes them beneficial to your welfare. 370 Propose to a person to change own religion for yours, the person will believe you a mad-person; you will only excite the person's indignation, elicit the person's contempt; 371 the person will propose to you, in own turn, to adopt own peculiar opinions; 372 after much reasoning, you will treat each other as absurd beings, ridiculously opinionated, pertinaciously stubborn: and the person will display the least folly, who shall first yield.

373 But if the adversaries become heated in the dispute, which always happens, when they suppose the matter important, 374 or when they would defend the cause of their own self-love; 375 from thence their passions sharpen, they grow angry, quarrels are provoked, they hate each other, and end by reciprocal injury. 376 It is thus, that for opinions, which no human can demonstrate, we see the Brahmin despised; the Mahommedan hated; the Pagan held in contempt; 377 that they oppress and disdain each with the most rancorous animosity: the Christian burns the Jew at what is called an 'auto-de-fe', because you clings to the faith of your parents: 378 the Roman Catholic condemns the Protestants to the flames, and makes a conscience of massacring them in cold blood: 379 this re-acts in their turn; sometimes the various sects of Christians league together against the incredulous Turk, 380 and for a moment suspend their own bloody disputes that they may chastise the enemies to the true faith: 381 then, having glutted their revenge, return with redoubled fury, to wreak over again their infuriated vengeance on each other.

382 If the imaginations of humans were the same, the chimeras which they bring forth would be everywhere the same; 383 there would be no disputes among them on this subject, if they all dreamt in the same manner; 384 great numbers of human beings would be spared, if human occupied own mind with

objects capable of being known, 385 of which the existence was proved, of which human was competent to discover the true qualities, by sure, by reiterated experience. 386 Systems of Philosophy are not subject to dispute but when their principles are not sufficiently proved; 387 by degrees experience, in pointing out the truth and detecting their errors, terminates these quarrels. 388 There is no variance among geometricians upon the principles of their science; it is only raised, when their suppositions are false, or their objects too much complicated. 389 Theologians find so much difficulty in agreeing among themselves, simply, because, in their contests, they divide without ceasing, not known and examined propositions, but prejudices with which they have been imbued in their youth-- in the schools-- by each other's books. 390 They are perpetually reasoning, not upon real objects, of which the existence is demonstrated, but upon imaginary systems of which they have never examined the reality; 391 they found these disputes, not upon averred experience, or constant facts, 392 but upon gratuitous suppositions, which each endeavour to convince the other are without solidity. 393 Finding these ideas of long standing, that few people, refuse to admit them, they take them for incontestable truths, that ought to be received merely upon being announced; 394 whenever they attach great importance to them, they irritate themselves against the temerity of those who have the audacity to doubt, or even to examine them.

395 If prejudice had been laid aside, it would perhaps have been discovered that many of those objects, which have given birth to the most shocking, the most sanguinary disputes among people, were mere phantoms; 396 which a little examination would have shown to be unworthy their notice: 397 the priests of Apollo would have been harmless, if human had examined for oneself, without prejudice, the tenets they held forth: 398 you would have found, that you were fighting, that you were cutting your neighbour's

throat, for words void of sense; 399 or, at the least, you would have learned to doubt your right to act in the manner you did; 400 you would have renounced that dogmatical, that imperious tone you assumed, by which you would oblige your fellow to unite with yourself in opinion. 401 The most trifling reflection would have shown you the necessity of this diversity in your notions, of this contrariety in your imagination, which depends upon your Natural conformation diversely modified: 402 which necessarily has an influence over your thoughts, over your will, and over your actions. 403 In short, if you had consulted morals, if you had fallen back upon reason, everything would have conspired to prove to you, that beings who call themselves rational, were made to think variously; 404 on that account were designed to live peaceable with each other, to love each other, to lend each other mutual succours 405 whatever may be their opinions upon subjects, either impossible to be known, or to be contemplated under the same point of view: 406 everything would have joined in evidence to convince you of the unreasonable tyranny, of the unjust violence, of the useless cruelty of those people of blood, 407 who persecute, who destroy humankind, in order that they may mould human to their own peculiar opinions; 408 everything would have conducted mortals to mildness, to indulgence, to toleration; 409 virtues, unquestionably of more real importance, much more necessary to the welfare of society, than the marvellous speculations by which it is divided, 410 by which it is frequently hurried on to sacrifice to a maniacal fury, the pretended enemies to these revered flights of the imagination.

411 From this it must be evident, of what importance it is to morals to examine the ideas, to which it has been agreed to attach so much worth; 412 to which human is continually sacrificing one's own peculiar happiness; to which human is immolating the tranquillity of nations, at the irrational command of fanatical cruel guides. 413 Let you fall back on your own experience; let

you return to Nature; let you occupy yourself with reason; 414 let you consult those objects that are real, which are useful to your permanent felicity; 415 let you study Nature's laws; let you study yourself; let you consult the bonds which unite you to your fellow mortals; 416 let you examine the fictitious bonds that enchain you to the most baneful prejudices.

417 If human imagination must always feed itself with illusions, if human remains steadfast in one's own opinions, if human prejudices are dear to oneself, 418 let you at least permit others to ramble in their own manner, or seek after truth as best suits their inclination; 419 but let you always recollect, that all the opinions-- all the ideas-- all the systems-- all the wills-- all the actions of human, are the necessary consequence of human own nature, 420 of your temperament, of your organisation, and of those causes, either transitory or constant, which modify hint: 421 in short, that human is not more a free agent to think than to act.

OF THE SYSTEM OF HUMAN'S FREE AGENCY

Paul Henri Thiery (Baron D'Holbach)

36 Those who have pretended that the soul is distinguished from the body, is immaterial, draws its ideas from its own peculiar source, acts by its own energies without the aid of any exterior object; 2 by a consequence of their own system, have enfranchised it from those physical laws, according to which all beings of which we have a knowledge are obliged to act. 3 They have believed that the soul is mistress of its own conduct, is able to regulate its own peculiar operations; has the faculty to determine its will by its own natural energy; 4 in a word, they have pretended human is a free agent.

5 It has been already sufficiently proved, that the soul is nothing more than the body, considered relatively to some of its functions, more concealed than others: 6 it has been shown, that this soul, even when it shall be supposed immaterial, is continually modified conjointly with

the body; is submitted to all its motion; 7 that without this it would remain inert and dead: 8 that, consequently, it is subjected to the influence of those material, to the operation those physical causes, which give impulse to the body; 9 of which the mode of existence, whether habitual or transitory, depends upon the material elements by which it is surrounded; 10 that form its texture; that constitute its temperament; that enter into it by the means of the aliments; that penetrate it by their subtility; 11 the faculties which are called intellectual, and those qualities which are styled moral, have been explained in a manner purely physical; entirely natural: 12 in the last place, it has been demonstrated, that all the ideas, all the systems, all the affections, all the opinions, whether true or false, which human forms to oneself, are to be attributed to your physical powers; are to be ascribed to your material senses. 13 Thus human is a being purely physical; in whatever manner you are considered, you are connected to universal Nature: 14 submitted to the necessary, to the immutable laws that She imposes on all the beings She contains, according to their peculiar essences; 15 conformable to the respective properties with which, without consulting them, She endows each particular species. 16 Human's life is a line that Nature commands you to describe upon the surface of the earth: without you ever being able to swerve from it even for an instant. 17 Human is born without one’s own consent; human’s organisations does in no wise depend upon yourself; human’s ideas come to you involuntarily; 18 human’s habits are in the power of those who cause you to contract them; human is unceasingly modified by causes, whether visible or concealed, over which you have no control; 19 give the hue to human way of thinking, and determine your manner of acting. 20 Human is good or bad-- happy or miserable-- wise or foolish-- reasonable or irrational, without human’s will going for anything in these various states.

21 Nevertheless, in despite of the shackles by which human is bound, it is pretended you are a free agent, 22 or that independent of the causes by which human is moved, you determines your own will; regulates your own condition. 23 However slender the foundation of this opinion, of which everything ought to point out to you the error; 24 it is current at this day for an incontestable truth, and believed enlightened; 25 it is the basis of religion, which has been incapable of imagining how human could either merit reward or deserve punishment if you were not a free agent. 26 Society has been believed interested in this system, because an idea has gone abroad, 27 that if all the actions of human were to be contemplated as necessary, the right of punishing those who injure their associates would no longer exist. 28 At length human vanity accommodated itself to an hypothesis which, unquestionable, appears to distinguish human from all other physical beings, 29 by assigning to yourself the special privilege of a total independence of all other causes; 30 but of which a very little reflection would have shown you the absurdity or even the impossibility.

31 As a part, subordinate to the great whole, human is obliged to experience its influence. 32 To be a free agent it were needful that each individual was of greater strength than the entire of Nature; 33 or, that you were out of this Nature: who, always in action Herself, obliges all the beings She embraces, to act, and to concur to Her general motion; 34 or, as it has been said elsewhere, to conserve Her active existence, 35 by the motion that all beings produce in consequence of their particular energies, which result from their being submitted to fixed, eternal, and immutable laws. 36 In order that human might be a free agent, it were needful that all beings should lose their essences; 37 it is equally necessary that human itself should no longer enjoy physical sensibility; that human should neither know good nor evil; pleasure nor pain; 38 but if this was the case, from that moment human would no longer be in a state

to conserve oneself, or render your existence happy; 39 all beings would become indifferent to you; you would no longer have any choice; you would cease to know what you ought to love; what it was right you should fear; 40 you would not have any acquaintance with that which you should seek after; or with that which it is requisite you should avoid. 41 In short, human would be an unnatural being; totally incapable of acting in the manner we behold. 42 It is the actual essence of human to tend to your own well-being; to be desirous to conserve your existence; 43 if all the motion of human machine springs as a necessary consequence from this primitive impulse; 44 if pain warns you of that which you ought to avoid; 45 if pleasure announces to you that which you should desire; 46 if it is in your essence to love that which either excites delight, or, that from which you expects agreeable sensations; 47 to hate that which makes you either fear contrary impressions; or, that which afflicts you with uneasiness; 48 it must necessarily be, that you will be attracted by that which you deems advantageous; 49 that your will shall be determined by those objects which you judges useful; 50 that you will be repelled by those beings which you believes prejudicial, either to your habitual, or to your transitory mode of existence; by that which you considers disadvantageous. 51 It is only by the aid of experience, that human acquires the faculty of understanding what you ought to love; of knowing what you ought to fear. 52 Are your organs sound? Your experience will be true: are they unsound? it will be false: in the first instance you will have reason, prudence, foresight; 53 you will frequently foresee very remote effects; you will know, that what you sometimes contemplates as a good, may possibly become an evil, by its necessary or probable consequences: 54 that what must be to yourself a transient evil, may by its result procure you a solid and durable good. 55 It is thus experience enables you to foresee that the amputation of a limb will cause you painful

sensation, 56 you consequently is obliged to fear this operation, and you endeavours to avoid the pain; 57 but if experience has also shown you, that the transitory pain this amputation will cause you may be the means of saving your life; 58 the preservation, of your existence being of necessity dear to yourself, 59 you are obliged to submit oneself to the momentary pain with a view to procuring a permanent good, by which it will be overbalanced.

60 The will, as we have elsewhere said, is a modification of the brain, by which it is disposed to action or prepared to give play to the organs. 61 This will is necessarily determined by the qualities, good or bad, agreeable or painful, of the object or the motive that acts upon your senses; 62 or of which the idea remains with you, and is resuscitated by your memory. 63 In consequence, you acts necessarily; your action is the result of the impulse you receives either from the motive, from the object, or from the idea, which has modified your brain, or disposed your will. 64 When you does not act according to this impulse, it is because there comes some new cause, some new motive, some new idea, which modifies your brain in a different manner, 65 gives you a new impulse, determines your will in another way; by which the action of the former impulse is suspended: 66 thus, the sight of an agreeable object, or its idea, determines your will to set yourself in action to procure it; 67 but if a new object or a new idea more powerfully attracts you, it gives a new direction to your will, annihilates the effect of the former, and prevents the action by which it was to be procured. 68 This is the mode in which reflection, experience, reason, necessarily arrests or suspends the action of human's will; 69 without this, you would, of necessity, have followed the anterior impulse which carried you towards a then desirable object. 70 In all this you always act according to necessary laws, from which you have no means of emancipating yourself.

71 If, when tormented with violent thirst, you figures to yourself an idea,

72 or really perceives a fountain, whose limpid streams might cool your feverish habit, 73 are you sufficient master of yourself to desire or not to desire the object competent to satisfy so lively a want? 74 It will no doubt be conceded, that it is impossible you should not be desirous to satisfy it; 75 but it will be said,-- If at this moment it is announced to you, the water you so ardently desires is poisoned, you will, notwithstanding your vehement thirst, abstain from drinking it; 76 and it has, therefore, been falsely concluded that you are a free agent. 77 The fact, however, is, that the motive in either case is exactly the same: your own conservation. 78 The same necessity that determined you to drink, before you knew the water was deleterious, upon this new discovery, equally determines you not to drink; 79 the desire of conserving yourself, either annihilates or suspends the former impulse; the second motive becomes stronger than the preceding; 80 that is, the fear of death, or the desire of preserving yourself, necessarily prevails over the painful sensation caused by your eagerness to drink. 81 But, it will be said, if the thirst is very parching, an inconsiderate person, without regarding the danger, will risqué swallowing the water. 82 Nothing is gained by this remark: in this case, the anterior impulse only regains the ascendency; 83 you are persuaded, that life may possibly be longer preserved, or that you shall derive a greater good by drinking the poisoned water, than by enduring the torment, 84 which, to your mind, threatens instant dissolution: thus, the first becomes the strongest, and necessarily urges you on to action. 85 Nevertheless, in either case, whether you partakes of the water, or whether you does not, the two actions will be equally necessary; 86 they will be the effect of that motive which finds itself most puissant; which consequently acts in a most coercive manner upon your will.

87 This example will serve to explain the whole phenomena of the human will. 88 This will, or rather the brain, finds itself in the same situation as a bowl, which although it has received

an impulse that drives it forward in a straight line, 89 is deranged in its course, whenever a force, superior to the first, obliges it to change its direction. 90 The person who drinks the poisoned water, appears a mad-person; but the actions of fools are as necessary as those of the most prudent individuals. 91 The motives that determine the voluptuary, that actuate the debauchee to risk their health, are as powerful, their actions are as necessary, as those which decide the wise person to manage one's own. 92 But, it will be insisted, the debauchee may be prevailed on to change own conduct; 93 this does not imply that one is a free agent; but, that motives may be found sufficiently powerful to annihilate the effect of those that previously acted upon oneself; 94 then these new motives determine your will to the new mode of conduct you may adopt, as necessarily as the former did to the old mode.

95 Human is said to deliberate when the action of the will is suspended; 96 this happens when two opposite motives act alternately upon yourself. 97 To deliberate, is to hate and to love in succession; it is to be alternately attracted and repelled; it is to be moved sometimes by one motive, sometimes by another. 98 Human only deliberates when you does not distinctly understand the quality of the objects from which you receives impulse, 99 or when experience has not sufficiently apprised you of the effects, more or less remote, which your actions will produce. 100 Human would take the air, but the weather is uncertain; you deliberates in consequence; you weighs the various motives that urge your will to go out or to stay at home; 101 you are at length determined by that motive which is most probable; this removes your indecision, which necessarily settles your will either to remain within or to go abroad: 102 this motive is always either the immediate or ultimate advantage you finds or thinks you finds in the action to which you are persuaded.

103 Human's will frequently fluctuates between two objects, of which either the presence or the

ideas move you alternately: 104 human waits until one has contemplated the objects or the ideas they have left in your brain; which solicit you to different actions; 105 human then compares these objects or ideas: 106 but even in the time of deliberation, during the comparison, pending these alternatives of love and hatred, which succeed each other sometimes with the utmost rapidity, you are not a free agent for a single instant; 107 the good or the evil which you believes you finds successively in the objects, are the necessary motives of these momentary wills; 108 of the rapid motion of desire or fear that you experiences as long as your uncertainty continues. 109 From this it will be obvious, that deliberation is necessary; that uncertainty is necessary; 110 that whatever part you takes, in consequence of this deliberation, it will always necessarily be that which you have judged, whether well or ill, is most probable to turn to your advantage.

111 When the soul is assailed by two motives that act alternately upon it, or modify it successively, it deliberates; 112 the brain is in a sort of equilibrium, accompanied with perpetual oscillations, sometimes toward one object, sometimes towards the other, until the most forcible carries the point, 113 and thereby extricates it, from this state of suspense, in which consists the indecision of your own will. 114 But when the brain is simultaneously assailed by causes equally strong, that move it in opposite directions; 115 agreeable to the general law of all bodies, when they are struck equally by contrary powers, it stops, it is in 'nisu'; 116 it is neither capable to will nor to act; it waits until one of the two causes has obtained sufficient force to overpower the other, 117 to determine its will, to attract it in such a manner that it may prevail over the efforts of the other cause.

118 This mechanism, so simple, so natural, suffices to demonstrate, why uncertainty is painful; why suspense is always a violent state for human. 119 The brain, an organ so delicate, so mobile, experiences such rapid modifications, that it is fatigued; 120

or when it is urged in contrary directions, by causes equally powerful, it suffers a kind of compression, 121 that prevents the activity which is suitable to the preservation of the whole, which is necessary to procure what is advantageous to its existence. 122 This mechanism will also explain the irregularity, the indecision, the inconstancy of human; 123 and account for that conduct, which frequently appears an inexplicable mystery, which indeed it is, under the received systems. 124 In consulting experience, it will be found that the soul is submitted to precisely the same physical laws as the material body. 125 If the will of each individual, during a given time, was only moved by a single cause or passion, nothing would be more easy than to foresee your actions; 126 but human's heart is frequently assailed by contrary powers, by adverse motives, which either act on you simultaneously or in succession; 127 then your brain, attracted in opposite directions, is either fatigued, or else tormented by a state of compression, which deprives it of activity. 128 Sometimes it is in a state of incommodious inaction; sometimes it is the sport of the alternate shocks it undergoes. 129 Such, no doubt, is the state in which human finds oneself, when a lively passion solicits you to the commission of crime, whilst fear points out to you the danger by which it is attended: 130 such, also, is the condition of you whom remorse, by the continued labour of your distracted soul, prevents from enjoying the objects you have criminally obtained.

131 If the powers or causes, whether exterior or interior, acting on the mind of human, tend towards opposite points, your soul, is well as all other bodies, will take a mean direction between the two; 132 in consequence of the violence with which human's soul is urged, your condition becomes sometimes so painful that your existence is troublesome: 133 you have no longer a tendency to your own peculiar conservation; you seeks after death, as a sanctuary against yourself-- as the only remedy to your despair: 134

it is thus we behold humans, miserable and discontented, voluntarily destroy themselves, whenever life becomes insupportable. 135 Human is competent to cherish one's own existence, no longer than life holds out charms to you; 136 when you are wrought upon by painful sensations, or drawn by contrary impulsions, human natural tendency is deranged, you are under the necessity to follow a new route; 137 this conducts you to your own end, which it even displays to yourself as the most desirable good. 138 In this manner may be explained, the conduct of those melancholy beings, whose vicious temperaments, whose tortured consciences, whose chagrin, whose ennui, sometimes determine them to renounce life.

139 The various powers, frequently very complicated, that act either successively or simultaneously upon the brain of human, 140 which modify you so diversely in the different periods of your existence, are the true causes of that obscurity in morals, 141 of that difficulty which is found, when it is desired to unravel the concealed springs of your enigmatical conduct. 142 The heart of human is a labyrinth, only because it very rarely happens that we possess the necessary gift of judging it; 143 from whence it will appear, that your circumstances, your indecision, your conduct, whether ridiculous, or unexpected, are the necessary consequences of the changes operated in yourself; 144 are nothing but the effect of motives that successively determine your will; which are dependent on the frequent variations experienced by your machine. 145 According to these variations, the same motives have not, always, the same influence over your will, the same objects no longer enjoy the faculty of pleasing you; your temperament has changed, either for the moment, or forever. 146 It follows as a consequence, that your taste, your desires, your passions, will change; 147 there can be no kind of uniformity in your conduct, nor any certitude in the effects to be expected.

148 Choice by no means proves the free-agency of human; human only deliberates when you does not yet know which to choose of the many objects that move you, 149 human is then in an embarrassment, which does not terminate, until your will as decided by the greater advantage you believes be shall find in the object you chooses, or the action you undertakes. 150 From whence it may be seen that choice is necessary, because human would not determine for an object, or for an action, if you did not believe that you should find in it some direct advantage. 151 That human should have free-agency, it were needful that you should be able to will or choose without motive; 152 or, that you could prevent motives coercing your will. 153 Action always being the effect of human's will once determined, as human's will cannot be determined but by a motive, which is not in your own power, 154 it follows that you are never the master of the determination of your own peculiar will; 155 that consequently you never acts as a free agent. 156 It has been believed that human was a free agent, because you had a will with the power of choosing; 157 but attention has not been paid to the fact, that even your will is moved by causes independent of yourself, 158 is owing to that which is inherent in your own organisation, or which belongs to the nature of the beings acting on yourself. 159 Indeed, human passes a great portion of one's life without even willing. Human will attends the motive by which it is determined. 160 If you was to render an exact account of everything you does in the course of each day, from rising in the morning to lying down at night, you would find, that not one of your own actions have been in the least voluntary; 161 that they have been mechanical, habitual, determined by causes you were not able to foresee, to which you were either obliged to, yield, or with which you were allured to acquiesce; 162 you would discover, that all the motives of your labours, of your amusements, of your discourses, of your thoughts, have been necessary; 163 that they have evidently either seduced you or

drawn you along. 164 Is human the master of willing, not to withdraw your hand from the fire when you fears it will be burnt? 165 Or has you the power to take away from fire the property which makes you fear it? 166 Is human the master of not choosing a dish of meat which you knows to be agreeable, or analogous to your palate; of not preferring it to that which you knows to be disagreeable or dangerous? 167 It is always according to your sensations, to your own peculiar experience, or to your suppositions, that you judges of things either well or ill; 168 but whatever may be your judgment, it depends necessarily on your mode of feeling, whether habitual or accidental, and the qualities you finds in the causes that move you, which exist in despite of you.

169 All the causes which by your will is actuated, must act upon you in a manner sufficiently marked, 170 to give you some sensation, some perception, some idea, whether complete or incomplete, true or false; 171 as soon as your will is determined, you must have felt, either strongly or feebly; if this was not the case you would have determined without motive: 172 thus, to speak correctly, there are no causes which are truly indifferent to the will: however faint the impulse you receives, 173 whether on the part of the objects themselves, or on the part of their images or ideas, as soon as your will acts, the impulse has been competent to determine you. 174 In consequence of a slight, of a feeble impulse, the will is weak, it is this weakness of the will that is called indifference. 175 Human's brain with difficulty perceives the sensation, it has received; it consequently acts with less vigour, either to obtain or remove the object or the idea that has modified it. 176 If the impulse is powerful, the will is strong, it makes you act vigorously, to obtain or to remove the object which appears to you either very agreeable or very incommodious.

177 It has been believed human was a free agent, because it has been imagined that your soul could at will recall ideas, which sometimes suffice to check your most unruly desires.

178 Thus, the idea of a remote evil frequently prevents you from enjoying a present and actual good: 179 thus, remembrance, which is an almost insensible, a slight modification of your brain, annihilates, at each instant, the real objects that act upon your will. 180 But human is not master of recalling to oneself own ideas at pleasure; their association is independent of you; 181 they are arranged in your brain, in despite of you, without your own knowledge, where they have made an impression more or less profound; 182 your memory itself depends upon your organisation; its fidelity depends upon the habitual or momentary state in which you finds yourself; 183 when your will is vigorously determined to some object or idea that excites a very lively passion in you, those objects or ideas that would be able to arrest your action no longer present themselves to your mind; 184 in those moments your eyes are shut to the dangers that menace you, of which the idea ought to make you forbear; 185 human marches forward headlong towards the object by whose image you are hurried on; reflection cannot operate upon you in any way; 186 human sees nothing but the object of own desires; the salutary ideas which might be able to arrest your progress disappear, or else display themselves either too faintly or too late to prevent your acting. 187 Such is the case with all those who, blinded by some strong passion, are not in a condition to recall to themselves those motives, 188 of which the idea alone, in cooler moments, would be sufficient to deter them from proceeding; 189 the disorder in which they are, prevents their judging soundly; 190 render them incapable of foreseeing the consequence of their actions; precludes them from applying to their experience; from making use of their reason; natural operations, which suppose a justness in the manner of associating their ideas; 191 but to which their brain is then not more competent, in consequence of the momentary delirium it suffers, than their hand is to write whilst they are taking violent exercise.

192 Human's mode of thinking is necessarily determined by your manner of being; it must, therefore, depend on your natural organisation, and the modification your system receives independently of your will. 193 From this we are obliged to conclude, that human's thoughts, human's reflections, human's manner of viewing things, of feeling, of judging, of combining ideas, is neither voluntary nor free. 194 In a word, that human soul is neither mistress of the motion excited in it, nor of representing to itself, when wanted, those images or ideas that are capable of counterbalancing the impulse it receives. 195 This is the reason why human, when in a passion, ceases to reason; at that moment reason is as impossible to be heard, as it is during an ecstasy, or in a fit of drunkenness. 196 The wicked are never more than people who are either drunk or mad: if they reason, it is not until tranquillity is re-established in their machine; 197 then, and not till then, the tardy ideas that present themselves to their mind, enable them to see the consequence of their actions, 198 and give birth to ideas, that bring on them that trouble, which is designated shame, regret, remorse.

199 The errors of philosophers on the free-agency of human, have arisen from their regarding your will as the primum mobile, the original motive of your actions; 200 for want of recurring back, they have not perceived the multiplied, the complicated causes, which, independently of you, give motion to the will itself, 201 or which dispose and modify your brain, whilst you are purely passive in the motion you receives. 202 Is human the master of desiring or not desiring an object that appears desirable to yourself?

203 Without doubt it will be answered, No: but human is the master of resisting own desire, if you reflects on the consequences. 204 But, I ask, is human capable of reflecting on these consequences when your soul is hurried along by a very lively passion -- 205 which entirely depends upon your natural organisation, and the causes by which you are modified? 206 Is it in

human's power to add to these consequences all the weight necessary to counterbalance your desire? 207 Is human the master of preventing the qualities which render an object desirable from residing in it? 208 I shall be told, you ought to have learned to resist your passions; to contract a habit of putting a curb on your desires. 209 I agree to it without any difficulty: but in reply, I again ask, Is human nature susceptible of this modification? 210 Does human boiling blood, human unruly imagination, the igneous fluid that circulates in human's veins, permit you to make, enable you to apply true experience in the moment when it is wanted? 211 And, even when human temperament has capacitated you, have you education, the examples set before you, the ideas with which you have been inspired in early life, been suitable to make you contract this habit of repressing your own desires? 212 Have not all these things rather contributed to induce human to seek with avidity, to make you actually desire those objects which you say you ought to resist.

213 The ambitious person cries out,-- You will have me resist my passion, but have they not unceasingly repeated to you, that rank, honours, power, are the most desirable advantages in life? 214 Have you not seen your fellow-citizens envy them-- the nobles of your country sacrifice everything to obtain them? 215 In the society in which you live, are you not obliged to feel, that if you are deprived of these advantages, you must expect to languish in contempt, to cringe under the rod of oppression?

216 The miser says,-- You forbid me to love money, to seek after the means of acquiring it: 217 Alas! Does not everything tell me, that in this world money is the greatest blessing; that it is amply sufficient to render me happy? 218 In the country I inhabit, do I not see all my fellow-citizens covetous of riches? 219 But do I not also witness that they are little scrupulous in the means of obtaining wealth? 220 As soon as they are enriched by the means

which you censure, are they not cherished, considered, and respected? 221 By what authority, then, do you object to my amassing treasure? 222 What right have you to prevent my using means, which although you call them sordid and criminal, I see approved by the sovereign? 223 Will you have me renounce my happiness?

224 The voluptuary argues, -- You pretend that I should resist my desires; but was I the maker of my own temperament, which unceasingly invites me to pleasure? 225 You call my pleasures disgraceful; but in the country in which I live, do I not witness the most dissipated people enjoying the most distinguished rank? 226 Do I not behold, that no one is ashamed of adultery but the person it has outraged? 227 Do not I see people making trophies of their debaucheries, boasting of their libertinism, rewarded, with applause?

228 The choleric person vociferates, -- You advise me to put a curb on my passions; to resist the desire of avenging myself: but can I conquer my nature? 229 Can I alter the received opinions of the world? 230 Shall I not be forever disgraced, infallibly dishonoured in society, if I do not wash out, in the blood of my fellow-creature, the injuries I have received?

231 The zealous enthusiast exclaims,-- You recommend to me mildness, you advise me to be tolerant, to be indulgent to the opinions of my fellow-people; but is not my temperament violent? 232 Do I not ardently love my God? Do they not assure me that zeal is pleasing to Him; that sanguinary inhuman persecutors have been His friends? 233 That those who do not think as I do are God's enemies? 234 I wish to render myself acceptable in His sight; I therefore adopt the means you reprobate.

235 In short, the actions of human are never free; they are always the necessary consequence of your temperament, of the received ideas, of the notions, either true or false, 236 which you have formed to yourself of happiness: of your

opinions, strengthened by example, forfeited by education, consolidated by daily experience. 237 So many crimes are witnessed on the earth, only because everything conspires to render human vicious, to make human criminal; 238 very frequently, the superstitions you have adopted, your government, your education, the examples set before you, irresistibly drive you on to evil: 239 under these circumstances morality preaches virtue to you in vain. 240 In those societies where vice is esteemed, where crime is crowned, where venality is constantly recompensed, where the most dreadful disorders are punished, 241 only in those who are too weak to enjoy the privilege of committing them with impunity; 242 the practice of virtue is considered nothing more than a painful sacrifice of fancied happiness. 243 Such societies chastise, in the lower orders, those excesses which they respect in the higher ranks; 244 and frequently have the injustice to condemn those in penalty of death, whom public prejudices, maintained by constant example, have rendered criminal.

245 Human, then, is not a free agent in any one instant of your life; 246 you are necessarily guided in each step by those advantages, whether real or fictitious, that you attaches to the objects by which your passions are roused: 247 these passions themselves are necessary in a being who, unceasingly tends towards your own happiness; 248 their energy is necessary, since that depends on your temperament; 249 your temperament is necessary, because it depends on the physical elements which enter into your composition; 250 the modification of this temperament is necessary, as it is the infallible result, the inevitable consequence of the impulse you receives from the incessant action of moral and physical beings.

251 In despite of these proofs of the want of free-agency in human, so clear to unprejudiced minds, 252 it will, perhaps, be insisted upon with no small feeling of triumph, that if it be proposed to anyone to move or not to move your hand, 253 an action

in the number of those called indifferent, you evidently appears to be the master of choosing; 254 from which it is concluded, evidence has been offered of your free-agency. 255 The reply is, this example is perfectly simple; human in performing some action which you are resolved on doing, does not by any means prove your free-agency: 256 the very desire of displaying this quality, excited by the dispute, becomes a necessary motive which decides your will either for the one or the other of these actions: 257 what deludes you in this instance, or that which persuades you that you are a free agent at this moment, is, that you does not discern the true motive which sets you in action; 258 which is neither more nor less than the desire of convincing your opponent: 259 if in the heat of the dispute you insists and asks, "Am I not the master of throwing myself out of the window?" 260 I shall answer, No; that whilst you preserves your reason, there is not even a probability that the desire of proving your free-agency, will become a motive sufficiently powerful, to make you sacrifice your life to the attempt; 261 if, notwithstanding this, to prove human is a free agent, you should actually precipitate yourself from the window, 262 it would not be a sufficient warranty to conclude you acted freely, but rather that it was the violence of your temperament which spurred you on to this folly. 263 Madness is a state that depends upon the heat of the blood, not upon the will. 264 A fanatic or a hero, braves death as necessarily as a more phlegmatic person or a coward flies from it. 265 There is, in point of fact, no difference between the person who is cast out of the window by another, and the person who throws oneself out of it, 266 except that the impulse in the first instance comes immediately from without, whilst that which determines the fall in the second case, springs from within your own peculiar machine, having its more remote cause also exterior.

267 When Mutius Scaevola held his hand in the fire, he was as much acting under the influence of necessity, caused by interior motives,

that urged him to this strange action, as if his arm had been held by strong men; 268 pride, despair, the desire of braving his enemy, a wish to astonish him, an anxiety to intimidate him, were the invisible chains that held his hand bound to the fire. 269 The love of glory, enthusiasm for their country, in like manner, caused Codrus and Decius to devote themselves for their fellow citizens. 270 The Indian Calanus and the philosopher Peregrinus were equally obliged to burn themselves, by the desire of exciting the astonishment of the Grecian assembly.

271 It is said that free-agency is the absence of those obstacles competent to oppose themselves to the actions of human, or to the exercise of your faculties: 272 it is pretended that you are a free agent, whenever, making use of these faculties, you produces the effect you have proposed to yourself. 273 In reply to this reasoning, it is sufficient to consider that it in no wise depends upon yourself to place or remove the obstacles that either determine or resist you; 274 the motive that causes your action is no more in your own power than the obstacle that impedes you, 275 whether this obstacle or motive be within your own machine or exterior of your person: 276 you are not master of the thought presented to your mind which determines your will; this thought is excited by some cause independent of yourself.

277 To be undeceived on the system of your free-agency, human has simply to recur to the motive by which your will is determined, you will always find this motive is out of your own control. 278 It is said, that in consequence of an idea to which the mind gives birth, human acts freely if one encounters no obstacle. 279 But the question is, what gives birth to this idea in your brain? Have you the power either to prevent it from presenting itself, or from renewing itself in your brain? 280 Does not this idea depend either upon objects that strike you exteriorly and in despite of yourself, or upon causes that without your knowledge act within you and

modify your brain? 281 Can you prevent your eyes, cast without design upon any object whatever, from giving you an idea of this object, from moving your brain? 282 Human is not more master of the obstacles; they are the necessary effects of either interior or exterior causes, which always act according to their given properties. 283 A person insults a coward, who is necessarily irritated against the person's insulter, 284 but your will cannot vanquish the obstacle that cowardice places to the object of your desire, which is, to resent the insult; 285 because your natural conformation, which does not depend upon you, prevents you having courage. 286 In this case the coward is insulted in despite of you, and against your will is obliged patiently to brook the insult you have received.

287 The partisans of the system of free-agency appear ever to have confounded constraint with necessity. 288 Human believes one acts as a free agent, every time you does not see anything that places obstacles to your actions; 289 you does not perceive that the motive which causes you to will is always necessary, is ever independent of yourself. 290 A prisoner loaded with chains is compelled to remain in prison, but you is not a free agent, you is not able to resist the desire to emancipate yourself; 291 your chains prevent you from acting, but they do not prevent you from willing; 292 you would save yourself if they would loose your fetters, but you would not save yourself as a free agent, fear or the idea of punishment would be sufficient motives for your action.

293 Human may therefore cease to be restrained, without, for that reason, becoming a free agent: 294 in whatever manner you acts, human will act necessarily; according to motives by which you shall be determined. 295 Human may be compared to a heavy body, that finds itself arrested in its descent by any obstacle whatever: 296 take away this obstacle, it will gravitate or continue to fall; but who shall say this dense body is free to fall or not? 297 Is not its descent the necessary effect of its

own specific gravity? 298 The virtuous Socrates submitted to the laws of his country, although they were unjust; notwithstanding the doors of his gaol were left open to him he would not save himself; but in this he did not act as a free agent; 299 the invisible chains of opinion, the secret love of decorum, the inward respect for the laws, even when they were iniquitous, the fear of tarnishing his glory, kept him in his prison: 300 they were motives sufficiently powerful, with this enthusiast for virtue, to induce him to wait death with tranquillity; 301 it was not in his power to save himself, because he could find no potential motive to bring himself to depart, even for an instant, from those principles to which his mind was accustomed.

302 Human, says he, frequently acts against own inclination, from whence you have falsely concluded you are a free agent; 303 when you appears to act contrary to your inclination, you are determined to it by some motive sufficiently efficacious to vanquish this inclination. 304 A sick man, with a view to his cure, arrives at conquering his repugnance to the most disgusting remedies: 305 the fear of pain, the dread of death, then become necessary and intelligent motives; consequently, this sick man cannot be said, with truth, by any means, to act freely.

306 When it is said, that human is not a free agent, it is not pretended to compare human to a body moved by a simple impulsive cause: 307 you contains within yourself causes inherent to your existence; 308 you are moved by an interior organ, which has its own peculiar laws; which is itself necessarily determined, 309 in consequence of ideas formed from perceptions, resulting from sensations, which it receives from exterior objects. 310 As the mechanism of these sensations, of these perceptions, and the manner they engrave ideas on the brain of human, are not known to you, because you are unable to unravel all these motions; 311 because you cannot perceive the chain of operations in your soul, or the

motive-principle that acts within yourself, 312 you supposes yourself a free agent; which, literally translated, signifies that you moves yourself by yourself; that a person determines oneself without cause; 313 when a person rather ought to say, you are ignorant how or for why you acts in the manner you does. 314 It is true the soul enjoys an activity peculiar to itself, but it is equally certain that this activity would never be displayed if some motive or some cause did not put it in a condition to exercise itself, 315 at least it will not be pretended that the soul is able either to love or to hate without being moved, without knowing the objects, without having some idea of their qualities. 316 Gunpowder has unquestionably a particular activity, but this activity will never display itself, unless fire be applied to it; this, however, immediately sets in motion.

317 It is the great complication of motion in human, it is the variety of your action, it is the multiplicity of causes that move you, 318 whether simultaneously or in continual succession, that persuades a person you are a free agent: 319 if all human motions were simple, if the causes that move human did not confound themselves with each other, if they were distinct, if human machine was less complicated, 320 you would perceive that all your actions were necessary, because you would be enabled to recur instantly to the cause that made yourself act. 321 A person who should be always obliged to go towards the west would always go on that side, but you would feel extremely well, that in so going you was not a free agent: 322 if human had another sense, as your actions or your motion augmented by a sixth would be still more varied, much more complicated, 323 you would believe yourself still more a free agent than you does with your own five senses.

324 It is, then, for want of recurring to the causes that move you, for want of being able to analyse, 325 from not being competent to decompose the complicated motion of your machine, that human believes oneself a free agent; 326 it is only upon your own

ignorance that you founds the profound yet deceitful notion you have of your free-agency, 327 that you builds those opinions which you brings forward as a striking proof of your pretended freedom of action. 328 If, for a short time, each person was willing to examine your own peculiar actions, to search out their true motives, to discover their concatenation, 329 you would remain convinced that the sentiment you have of your natural free-agency is a chimera that must speedily be destroyed by experience.

330 Nevertheless, it must be acknowledged that the multiplicity, the diversity of the causes which continually act upon human, frequently without even your knowledge, render it impossible, 331 or at least extremely difficult, for you to recur to the true principles of your own peculiar actions, much less the actions of others; 332 they frequently depend upon causes so fugitive, so remote from their effects, and which, superficially examined, appear to have so little analogy, 333 so slender a relation with them, that it requires singular sagacity to bring them into light. 334 This is what renders the study of the moral human a task of such difficulty; this is the reason why human's heart is an abyss, of which it is frequently impossible for you to fathom the depth. 335 Human is, then, obliged to content oneself with a knowledge of the general and necessary laws by which the human heart is regulated; 336 for the individuals of one's own species these laws are pretty nearly the same, they vary only in consequence of the organisation that is peculiar to each, and of the modification it undergoes; 337 this, however, is not, cannot be rigorously the same in any two. 338 It suffices to know that by your essence human tends to conserve oneself, to render your existence happy: 339 this granted, whatever may be your actions, if you recurs back to this first principle, to this general, this necessary tendency of your will, you never can be deceived with regard to your motives. 340 Human, without doubt, for want of cultivating reason, being destitute of experience,

frequently deceives oneself upon the means of arriving at this end; 341 sometimes the means you employs are unpleasant to your fellows, because they are prejudicial to their interests; 342 or else those of which you avails yourself appear irrational, because they remove you from the end to which you would approximate: 343 but whatever may be these means, they have always necessarily and invariably for object, either an existing or imaginary happiness; 344 are directed to preserve you in a state analogous to your mode of existence, to your manner of feeling, to your way of thinking; whether durable or transitory. 345 It is from having mistaken this truth, that the greater number of moral philosophers have made rather the romance, than the history of the human heart; 346 they have attributed the actions of human to fictitious causes; at least they have not sought out the necessary motives of your conduct. 347 Politicians and judicial-legislators have been in the same state of ignorance; 348 or else impostors have found it much shorter to employ imaginary motive-powers, than those which really have existence: 349 they have rather chosen to make human wander out of one's way, to make human tremble under incommodious phantoms, 350 than guide human to virtue by the direct road to happiness; notwithstanding the conformity of the latter with the natural desires of your heart. 351 So true it is, that error can never possibly be useful, to the human species.

352 However this may be, human either sees or believes you sees, much more distinctly, the necessary relation of effects with their causes in natural philosophy than in the human heart; 353 at least you sees in the former sensible causes constantly produce sensible effects, ever the same, when the circumstances are alike. 354 After this, human hesitates not to look upon physical effects as necessary, 355 whilst you refuses to acknowledge necessity in the acts of the human will; 356 these human has, without any just foundation, attributed to a motive-power that acts independently by its own peculiar

energy, 357 that is capable of modifying itself without the concurrence of exterior causes, and which is distinguished from all material or physical beings. 358 Agriculture is founded upon the assurance afforded by experience, 359 that the earth, cultivated and sown in a certain manner, when it has otherwise the requisite qualities, will furnish grain, fruit, and flowers, either necessary for subsistence or pleasing to the senses. 360 If things were considered without prejudice, it would be perceived, that in morals education is nothing more than the agriculture of the mind; 361 that like the earth, by reason of its natural disposition, of the culture bestowed upon it, of the seeds with which it is sown, of the seasons, more or less favourable, that conduct it to maturity, 362 we may be assured that the soul will produce either virtue or vice; moral fruit that will be either salubrious for human or baneful to society. 363 Morals is the science of the relations that subsist between the minds, the wills, and the actions of humans; 364 in the same manner that geometry is the science of the relations that are found between bodies. 365 Morals would be a chimera, it would have no certain principles, if it was not founded upon the knowledge of the motives 366 which must necessarily have an influence upon the human will, and which must necessarily determine the actions of human beings.

367 If in the moral as well as in the physical world, a cause of which the action is not interrupted be necessarily followed by a given effect, 368 it flows consecutively that a reasonable education, grafted upon truth, founded upon wise laws,-- 369 that honest principles instilled during youth, virtuous examples continually held forth, esteem attached solely to merit, recompense awarded to none but good actions, 370 contempt regularly visiting vice, shame following falsehood as its shadow, rigorous chastisements applied without distinction to crime, are causes that would necessarily act on the will of human; 371 that would determine the greater number of human species to exhibit virtue, to

love it for its own sake, to seek after it as the most desirable good, as the surest road to the happiness you so ardently desires. 372 But if, on the contrary, superstition, politics, example, public opinion, all labour to countenance wickedness, to train human viciously; 373 if, instead of fanning your virtues, they stifle good principles; if, instead of directing your studies to own advantage, they render your education either useless or unprofitable; 374 if this education itself, instead of grounding yourself in virtue, only inoculates you with vice; if, instead of inculcating reason, it imbues you with prejudice; 375 if, instead of making you enamoured of truth, it furnishes you with false notions; if, instead of storing your mind with just ideas drawn from experience, it fills you with dangerous opinions; 376 if, instead of fostering mildness and forbearance, it kindles in your breast only those passions which are incommodious to yourself and hurtful to others; 377 it must be of necessity, that the will of the greater number shall determine them to evil; shall render them unworthy, make them baneful to society. 378 Many authors have acknowledged the importance of a good education, that youth was the season to feed the human heart with wholesome diet; 379 but they have not felt, that a good education is incompatible, nay, impossible, with the superstition of human, 380 since this commences with giving your mind a false bias: that it is equally inconsistent with arbitrary government, 381 because this always dreads lest you should become enlightened, and is ever sedulous to render yourself servile, mean, contemptible, and cringing; 382 that it is incongruous with laws that are not founded in equity, that are frequently bottomed on injustice; 383 that it cannot obtain with those received customs that are opposed to good sense; 384 that it cannot exist whilst public opinion is unfavourable to virtue; 385 above all, that it is absurd to expect it from incapable instructors, from masters with weak minds, who have only the ability to infuse into their scholars those false ideas with which they are themselves

infected. 386 Here, without doubt, is the real source from whence springs that universal corruption, that wide-spreading depravity, of which moralists, with great justice, so loudly complain; 387 without, however, pointing out those causes of the evil, which are true as they are necessary: instead of this, they search for it in human nature, 388 say it is corrupt, blame human for loving oneself, and for seeking after your own happiness, insist that you must have supernatural assistance, some marvellous interference, to enable you to become good: 389 this is a very prejudicial doctrine for human, it is directly subversive of human's true happiness; 390 by teaching human to hold oneself in contempt, it tends necessarily to discourage you; it either makes human sluggish, or drives human to despair whilst waiting for this grace: 391 is it not easy to be perceived, that you would always have it if you was well educated; if you was honestly governed? 392 There cannot well exist a wilder or a stranger system of morals, than that of the theologians who attribute all moral evil to an original sin, and all moral good to the pardon of it. 393 It ought not to excite surprise if such a system is of no efficacy; what can reasonably be the result of such an hypothesis? 394 Yet, notwithstanding the supposed, the boasted free-agency of human, it is insisted that nothing less than the Author of Nature itself is necessary to destroy the wicked desires of human's heart: 395 but, alas! No power whatever is found sufficiently efficacious to resist those unhappy propensities, 396 which, under the fatal constitution of things, the most vigorous motives, as before observed, are continually infusing into the will of human; 397 no agency seems competent to turn the course of that unhappy direction these are perpetually giving to the stream of your natural passions. 398 Human is, indeed, incessantly exhorted to resist these passions, to stifle them, and to root them out of own heart; 399 but is it not evident they are necessary to human's welfare? Can it not be perceived they are inherent in human nature? Does not experience prove

them to be useful to human conservation, 400 since they have for object, only to avoid that which may be injurious to human; to procure that which may be advantageous to human's mode of existence? 401 In short, is it not easy to be seen, that these passions, well directed, that is to say, carried towards objects that are truly useful, that are really interesting to you, 402 which embrace the happiness of others, would necessarily contribute to the substantial, to the permanent well-being of society?

403 Theologians themselves have felt, they have acknowledged the necessity of the passions: 404 many of the fathers of the church have broached this doctrine; among the rest Father Senault has written a book expressly on the subject: 405 the passions of human are like fire, at once necessary to the wants of life, suitable to ameliorate the condition of humanity, 406 and equally capable of producing the most terrible ravages, the most frightful devastation.

407 Everything becomes an impulse to the will; a single word frequently suffices to modify a person for the whole course of one's life, to decide for ever your propensities; 408 an infant who has burned own finger by having approached it too near the flame of a lighted taper, is warned from thence, that you ought to abstain from indulging a similar temptation; 409 a person, once punished and despised for having committed a dishonest action, is not often tempted to continue so unfavourable a course. 410 Under whatever point of human is considered, you never acts but after the impulse given to your will, 411 whether it be by the will of others, or by more perceptible physical causes. 412 The particular organisation decides the nature of the impulse; souls act upon souls that are analogous; inflamed, fiery imaginations, act with facility upon strong passions; 413 upon imaginations easy to be inflamed, the surprising progress of enthusiasm; the hereditary propagation of superstition; 414 the transmission of

religious errors from race to race, the excessive ardour with which human seizes on the marvellous, 415 are effects as necessary as those which result from the action and re-action of bodies.

416 In despite of the gratuitous ideas which human has formed to oneself on your pretended free-agency; 417 in defiance of the illusions of this suppose intimate sense, which, contrary to your own experience, persuades you that you are master of your own will,-- 418 all human's institutions are really founded upon necessity: on this, as on a variety of other occasions, practice throws aside speculation. 419 Indeed, if it was not believed that certain motives embraced the power requisite to determine the will of human, 420 to arrest the progress of your passions, to direct them towards an end, to modify yourself; of what use would be the faculty of speech? 421 What benefit could arise from education itself? 422 What does education achieve, save give the first impulse to the human will, make human contract habits, oblige human to persist in them, furnish human with motives, whether true or false, to act after a given manner? 423 When the father either menaces his son with punishment, or promises him a reward, is he not convinced these things will act upon his will? 424 What does legislation attempt, except it be to present to the citizens of a state those motives which are supposed necessary to determine them to perform some actions 425 that are considered worthy; to abstain from committing others that are looked upon as unworthy? 426 What is the object of morals, if it be not to show human that your interest exacts you should suppress the momentary ebullition of your passions, 427 with a view to promote a more certain happiness, a more lasting well-being, than can possibly result from the gratification of your transitory desires? 428 Does not the religion of all countries suppose the human race, together with the entire of Nature, 429 submitted to the irresistible will of a necessary being, who regulates their condition after the eternal laws of immutable wisdom? 430 Is not

God the absolute master of their destiny? Is it not this divine being who chooses and rejects? 431 The anathemas fulminated by religion, the promises it holds forth, are they not founded upon the idea of the effects they will necessarily produce upon humankind? 432 Is not human brought into existence without one's own knowledge? 433 Is human not obliged to play a part against own will? 434 Does not either human happiness or human misery depend on the part one plays?

435 All religion has been evidently founded upon Fatalism. 436 Among the Greeks they supposed people were punished for their necessary faults, as may be seen in Orestes, in Oedipus, who only committed crimes predicted by the oracles. 437 It is rather singular that the theological defenders of the doctrine of free-agency, which they endeavour to oppose to that of predestination,-- 438 which according to them is irreconcilable with Christianity, inasmuch as it is a false and dangerous system,-- 439 should not have been aware that the doctrines of the fall of angels, original sin, the small number of the elect, the system of grace, were most incontestably supporting, by the most cogent arguments, a true system of fatalism.

440 Education, then, is only necessity shown to children: legislation is necessity shown to the members of the body politic: morals is the necessity of the relations subsisting between humans, shown to reasonable beings: 441 in short, human grants necessity in everything for which you believes you have certain, unerring experience: 442 that of which you does not comprehend the necessary connection of causes with their effects you styles probability: 443 you would not act as you does, if you was not convinced, or, at least, if you did not presume you was, that certain effects will necessarily follow your actions. 444 The moralist preaches reason, because you believes it necessary to human: the philosopher writes, because you believes truth must, sooner or later, prevail over falsehood: 445 tyrants and fanatical priests necessarily hate truth, despise

reason, because they believe them prejudicial to their interests: 446 the sovereign, who strives to terrify crime by the severity of own laws, but who nevertheless, from motives of state policy sometimes renders it useful and even necessary to own purposes, 447 presumes the motives you employs will be sufficient to keep your subjects within bounds. 448 All reckon equally upon the power or upon the necessity of the motives they make use of; 449 each individual flatters oneself, either with or without reason, that these motives will have an influence on the conduct of humankind. 450 The education of human is commonly so defective, so inefficacious, so little calculated to promote the end you have in view, because it is regulated by prejudice: 451 even when this education is good, it is but too often speedily counteracted, by almost everything that takes place in society. 452 Legislation and politics are very frequently iniquitous, and serve no better purpose than to kindle passions in the bosom of human, which once set afloat, they are no longer competent to restrain. 453 The great art of the moralist should be, to point out to human, to convince those who are entrusted with the sacred office of regulating your will, 454 that their interests are identified; that their reciprocal happiness depends upon the harmony of their passions; 455 that the safety, the power, the duration of empires, necessarily depend on the good sense diffused among the individual members; 456 on the truth of the notions inculcated in the mind of the citizens, on the moral goodness that is sown in their hearts, on the virtues that are cultivated in their breasts; 457 religion should not be admissible, unless it truly fortified, unless it really strengthened these motives. 458 But in the miserable state into which error has plunged a considerable portion of the human species, human, for the most part, is seduced to be wicked: 459 human injures own fellow-creature as a matter of conscience, because the strongest motives are held out to oneself to be persecuting; 460 because human institutions invite

you to the commission of evil, under the lure of promoting your own immediate happiness. 461 In most countries superstition renders human a useless being, makes human an abject slave, causes human to tremble under its terrors, 462 or else turns human into a furious fanatic, who is at once cruel, intolerant, and inhuman: 463 in a great number of states arbitrary power crushes human, obliges human to become a cringing sycophant, renders human completely vicious: 464 in those despotic states the law rarely visits crime with punishment, except in those who are too feeble to oppose its course? 465 Or when it has become incapable of restraining the violent excesses to which a bad government gives birth. 466 In short, rational education is neglected; a prudent culture of the human mind is despised; 467 it depends, but too frequently, upon bigoted, superstitious priests, who are interested in deceiving human, and who are sometimes impostors; 468 or else upon parents or masters without understanding, who are devoid of morals, who impress on the ductile mind of their scholars those vices with which they are themselves tormented; 469 who transmit to them the false opinions, which they believe they have an interest in making them adopt.

470 All this proves the necessity of falling back to human's original errors, and recurring to the primitive source of your wanderings, 471 if it be seriously intended to furnish you with suitable remedies for such enormous maladies: 472 it is useless to dream of correcting your mistakes, of curing you of your own depravity, until the true causes that move your will are unravelled; 473 until more real, more beneficial, more certain motives are substituted for those which are found so inefficacious; 474 which prove so dangerous both to society and to yourself. 475 It is for those who guide the human will, who regulate the condition of nations, who hold the real happiness of human in their grasp, to seek after these motives,-- 476 with which reason will readily furnish them-- which experience will enable them to

apply with success: 477 even a good book, by touching the heart of a great prince, may become a very powerful cause 478 that shall necessarily have an influence over the conduct of a whole people, and decide upon the felicity of a portion of the human race.

479 From all that has been advanced in this chapter, it results, that in no one moment of your existence human is a free agent: 480 you are not the architect of your own conformation; this, human holds from Nature, human has no control over one's own ideas, or over the modification of one's own brain; 481 these are due to causes, that, in despite of human, very frequently without your own knowledge, unceasingly act upon yourself; 482 you are not the master of not loving that which you finds amiable; of not coveting that which appears to yourself desirable; 483 human is not capable of refusing to deliberate, when you are uncertain of the effects certain objects will produce upon yourself; 484 human cannot avoid choosing that which you believes will be most advantageous to yourself: 485 in the moment when your will is determined by your choice, you are not competent to act otherwise than you does: 486 in what instance, then, are you the master of your own actions? In what moment is you a free agent?

487 That which a human is about to do is always a consequence of that which you have been-- of that which you are-- of that which you have done up to the moment of the action: 488 human's total and actual existence, considered under all its possible circumstances, contains the sum of all the motives to the action you are about to commit; 489 this is a principle, the truth of which no thinking, being will be able to refuse accrediting: 490 human's life is a series of necessary moments; your conduct, whether good or bad, virtuous or vicious, useful or prejudicial, either to yourself or to others, is a concatenation of action, 491 a chain of causes and effects, as necessary as all the moments of your existence. 492 To live, is to exist in a necessary mode during the points of

its duration, which succeed each other necessarily: 493 to will, is to acquiesce or not in remaining such as you are: 494 to be free, is to yield to the necessary motives that you carries within yourself.

495 If you understood the play of your organs, if you was able to recall to yourself all the impulsions they have received, all the modifications they have undergone, all the effects they have produced, 496 you would perceive, that all your actions are submitted to that fatality which regulates your own particular system, 497 as it does the entire system of the universe: 498 no one effect in yourself, any more than in Nature, produce itself by chance; 499 this, as has been before proved, is a word void of sense.

500 All that passes in human, all that is done by human, as well as all that happens in Nature, or that is attributed to Her, is derived from necessary laws, 501 which produce necessary effects; from whence necessarily flow others. 502 Fatality is the eternal, the immutable, the necessary order established in Nature, 503 or the indispensible connection of causes that act with the effects they operate. 504 Conforming to this order, heavy bodies fall, light bodies rise; 505 that which is analogous in matter, reciprocally attracts; that which is heterogeneous, mutually repels; 506 human congregates themselves in society, modifies each your fellow, becomes either virtuous or wicked; 507 either contributes to your mutual happiness, or reciprocates your misery; 508 either loves your neighbour, or hates your companion necessarily; according to the manner in which the you acts upon the other. 509 From whence it may be seen, that the same necessity which regulates the physical, also regulates the moral world: 510 in which everything is in consequence submitted to fatality. 511 Human, in running over, frequently without your own knowledge, often in despite of yourself, the route which Nature has marked out for you, resembles a swimmer who is obliged to follow the current that carries you along; 512 you believes yourself a free agent,

because you sometimes consents, sometimes does not consent, to glide with the stream; which, notwithstanding, always hurries you forward; 513 you believes yourself the master of your own condition, because you are obliged to use your arms under the fear of sinking.

514 The false ideas human has formed to oneself upon free-agency, are in general thus founded: 515 there are certain events which you judges necessary; 516 either because you sees they are effects that are constantly, are invariably linked to certain causes, which nothing seems to prevent; 517 or because you believes you have discovered the chain of causes and effects that is put in play to produce those events: 518 whilst you contemplates as contingent, other events, of whose causes you are ignorant; 519 the concatenation of which you does not perceive; with whose mode of acting you are unacquainted: 520 but in Nature, where everything is connected by one common bond, there exists no effect without a cause. 521 In the moral as well as in the physical world, everything that happens is a necessary consequence of causes, either visible or concealed; 522 which are, of necessity, obliged to act after their peculiar essences. 523 In human, free-agency is nothing more than necessity contained within yourself.

AN EXAMINATION OF THE OPINION WHICH PRETENDS THAT THE SYSTEM OF FATALISM IS DANGEROUS

Paul Henri Thiery (Baron D'Holbach)

37 For a being whose essence obliges you to have a constant tendency to own conservation, to continually seek to render yourself happy, experience is indispensible: 2 without it you cannot discover truth, which is nothing more, as has been already said, than a knowledge of the constant relations which subsist between human, 3 and those objects that act upon you; according to your experience you denominates those that contribute to your permanent welfare useful and salutary; 4 those

that procure you pleasure, more or less durable, you calls agreeable. 5 Truth itself becomes the object of your desires, only when you believe it is useful; you dread it, whenever you presume it will injure you. 6 But has truth the power to injure human? Is it possible that evil can result to human from a correct understanding of the relations you have with other beings? 7 Can it be true, that you can be harmed by becoming acquainted with those things, of which, for your own happiness, you are interested in having a knowledge? 8 No: unquestionably not. It is upon its utility that truth founds its worth; upon this that it builds its rights; 9 sometimes it may be disagreeable to individuals-- it may even appear contrary to their interests-- but it will ever be beneficial to them in the end; 10 it will always be useful to the whole human species; it will eternally benefit the great bulk of humankind; 11 whose interests must forever remain distinct from those of people, who, duped by their own peculiar passions, believe their advantage consists in plunging others into error.

12 Utility, then, is the touchstone of human systems, the test of your opinions, the criterion of the actions of human; 13 it is the standard of the esteem, the measure of the love you owes to truth itself: 14 the most useful truths are the most estimable: those truths which are most interesting for human species, you styles eminent; 15 those of which the utility limits itself to the amusement of some individuals who have not correspondent ideas, 16 similar modes of feeling, wants analogous to your own, you either disdains, or else calls them barren.

17 It is according to this standard, that the principles laid down in this work, ought to be judged. 18 Those who are acquainted with the immense chain of mischief produced on the earth by erroneous systems of superstition, 19 will acknowledge the importance of opposing to them systems more accordant with truth, schemes drawn from Nature, sciences founded on experience. 20 Those who are, or believe they are,

interested in maintaining the established errors, will contemplate, with horror, the truths here presented to them: 21 in short, those infatuated mortals, who do not feel, or who only feel very faintly, the enormous load of misery brought upon humankind by metaphysical speculation; 22 the heavy yoke of slavery under which prejudice makes human groan, will regard all our principles as useless; 23 or, at most, as sterile truths, calculated to amuse the idle hours of a few speculators.

24 No astonishment, therefore, need be excited at the various judgments formed by human: your interests never being the same, any more than your notions of utility, 25 human condemns or disdains everything that does not accord with your own peculiar ideas. 26 This granted, let us examine, if in the eyes of the disinterested person, who is not entangled by prejudice-- 27 who is sensible to the happiness of own species-- who delights in truth-- the doctrine of fatalism be useful or dangerous? 28 Let us see if it is a barren speculation, that you not any influence upon the felicity of the human race? 29 At has been already shown, that it will furnish morals with efficacious arguments, with real motives to determine the will, supply state-governing with the true lever to raise the proper activity in the mind of human. 30 It will also be seen that it serves to explain in a simple manner the mechanism of human's actions; 31 to develop in an easy way the arcana of the most striking phenomena of the human heart: 32 on the other hand, if your ideas are only the result of unfruitful speculations, they cannot interest the happiness of the human species. 33 Whether you believe yourself a free agent, or whether you acknowledge the necessity of things, human always equally follows the desires imprinted on your soul; 34 which are to preserve your existence and render you happy. 35 A rational education, honest habits, wise systems, equitable laws, rewards uprightly distributed, punishments justly inflicted, will conduct human to happiness by making you virtuous; 36 while thorny speculations, filled

with difficulties, can at most only have an influence over people unaccustomed to think.

37 After these reflections, it will be very easy to remove the difficulties that are unceasingly opposed to the system of fatalism, 38 which so many people, blinded by their superstitious prejudices, are desirous to have considered as dangerous-- 39 as deserving of punishment-- as calculated to disturb public tranquillity-- as tending to unchain the passions-- to undermine the opinions human ought to have; and to confound your ideas of vice and of virtue.

40 The opposers of necessity, say, that if all the actions of human are necessary, no right whatever exists to punish bad ones, or even to be angry with those who commit them: 41 that nothing ought to be imputed to them; that the laws would be unjust if they should decree punishment for necessary actions; 42 in short, that under this system human could neither have merit nor demerit. 43 In reply, it may be argued, that, to impute an action to anyone, is to attribute that action to human; to acknowledge human for the author: 44 thus, when even an action was supposed to be the effect of an agent, and that agent necessity, the imputation would lie: 45 the merit or demerit, that is ascribed to an action are ideas originating in the effects, whether favourable or pernicious, that result to those who experience its operation; 46 when, therefore, it should be conceded, that the agent was necessity, it is not less certain, that the action would be either good or bad; 47 estimable or contemptible, to those who must feel its influence; in short that it would be capable of either eliciting their love, or exciting their anger. 48 Love and anger are modes of existence, suitable to modify, beings of the human species: 49 when, therefore, a person irritates oneself against one's fellow, you intends to excite your fear, or even to punish yourself, in order to deter you from committing that which is displeasing to yourself. 50 Moreover human anger is necessary; it is the result of human Nature; the consequence of your temperament.

51 The painful sensation produced by a stone that falls on the arm, does not displease the less, because it comes from a cause deprived of will; which acts by the necessity of its nature. 52 In contemplating human as acting necessarily, it is impossible to avoid distinguishing that mode of action or being which is agreeable, 53 which elicits approbation, from that which is afflicting, which irritates, which Nature obliges you to blame and to prevent. 54 From this it will be seen, that the system of fatalism, does not in any manner change the actual state of things, 55 and is by no means calculated to confound human's ideas of virtue and vice.

56 Human's nature always revolts against that which opposes it: 57 there are people so choleric, that they infuriate themselves even against insensible and inanimate objects; 58 reflection on their own impotence to modify these objects ought to conduct them back to reason. 59 Parents are frequently very much to be blamed for correcting their children with anger: 60 they should be contemplated as beings who are not yet modified; or who have, perhaps, been very badly modified by themselves: 61 nothing is more common in life, than to see people punish faults of which they are themselves the cause.

62 Laws are made with a view to maintain society; to uphold its existence; to prevent human associated, from injuring your neighbour; 63 they are therefore competent to punish those who disturb its harmony, or those who commit actions that are injurious to their fellows; 64 whether these associates may be the agents of necessity, or whether they are free agents, it suffices to know they are susceptible of modification, and are therefore submitted to the operation of the law. 65 Penal laws are, or ought to be, those motives which experience has shown capable of restraining the inordinate passions of human, 66 or of annihilating the impulse these passions give to your own will; 67 from whatever necessary cause human may derive these passions, the legislator proposes to arrest their effect, 68

when they takes suitable means, when they adopts proper methods, they are certain of success. 69 The Judge, in decreeing to crime, gibbets, tortures, or any other chastisement whatever, does nothing more than is done by the architect, 70 who in building a house, places gutters to carry off the rain, and prevent it from sapping the foundation.

71 Whatever may be the cause that obliges human to act, society possesses the right to crush the effects, 72 as much as the person whose land would be ruined by a river, has to restrain its waters by a bank: or even, if you are able, to turn its course. 73 It is by virtue of this right that society has the power to intimidate, the faculty to punish, with a view to its own conservation, those who may be tempted to injure it; 74 or those who commit actions which are acknowledged really to interrupt its repose; to be inimical to its security; repugnant to its happiness.

75 It will, perhaps, be argued, that society does not, usually, punish those faults in which the will has no share; 76 that, in fact, it punishes the will alone; that this it is which decides the nature of the crime, and the degree of its atrocity; 77 that if this will be not free, it ought not to be punished. 78 I reply, that society is an assemblage of sensible beings, susceptible of reason, who desire their own welfare; who fear evil, and seek after good. 79 These dispositions enable their will to be so modified or determined, that they are capable of holding such a conduct as will conduce to the end they have in view. 80 Education, the laws, public opinion, example, habit, fear, are the causes that must modify associated human, 81 influence your will, regulate your passions, restrain the actions of you who is capable of injuring the end of your association, and thereby make you concur to the general happiness. 82 These causes are of a nature to make impressions on every person, whose organisation, whose essence, whose sanity, places you in a capacity to contract the habits, 83 to imbibe the modes of thinking, to adopt the manner of acting, with which society is willing

to inspire you. 84 All the individuals of the human species are susceptible of fear, from whence it flows as a natural consequence, 85 that the fear of punishment, or the privation of the happiness you desires, are motives that must necessarily more or less influence your will, and regulate your actions. 86 If the person is to be found who is so badly constituted as to resist, whose organisation is so vicious as to be insensible to those motives which operate upon all your fellows, the person is not fit to live in society; 87 you would contradict the very end of your association: you would be its enemy; you would place obstacles to its natural tendency; 88 such rebellious disposition, such unsociable will, not being susceptible of that modification which is convenient to your own true interests and to the interests of your fellow-citizens; 89 these would unite themselves against such an enemy; and the law which is, or ought to be the expression of the general will, 90 would visit with condign punishment that refractory individuals upon whom the motives presented to them by society, had not the effect which it had been induced to expect: 91 in consequence, such an unsociable person would be chastised; would be rendered miserable, 92 and according to the nature of their crime they would be excluded from society as a being but little calculated to concur in its views.

93 If society has the right to conserve itself, it has also the right to take the means: 94 these means are the laws which present or ought to present to the will of human those motives which are most suitable to deter you from committing injurious actions. 95 If these motives fail of the proper effect, if they are unable to influence everyone, society, for its own peculiar good, is obliged to wrest from those the power of doing it further injury. 96 From whatever source your actions may arise, therefore, whether they are the result of free-agency, or whether they are the offspring of necessity, 97 society coerces you if, after having furnished you with motives, sufficiently powerful to act upon reasonable beings, 98 it perceives that these

motives have not been competent to vanquish your depraved nature. 99 It punishes you with justice, when the actions from which it dissuades you are truly injurious to society; 100 it has an unquestionable right to punish, when it only commands those things that are conformable to the end proposed by human in your association; 101 or defends the commission of those acts, which are contrary to this end; which are hostile to the nature of beings associated for their reciprocal advantage. 102 But, on the other hand, the law has not acquired the right to punish human: 103 if it has failed to present to human the motives necessary to have an influence over your will, it has not the right to coerce human if the negligence of society has deprived you of the means of subsisting; 104 of exercising your talents; of exerting your industry; of labouring for its welfare. 105 It is unjust, when it punishes those to whom it has, neither given an education, nor honest principles; 106 whom it has not enabled to contract habits necessary to the maintenance of society: it is unjust when it punishes them for faults which the wants of their nature, or the constitution of society has rendered necessary to them: 107 it is unjust, it is irrational, whenever it chastises them for having followed those propensities, which example, which public opinion, which the institutions, which society itself conspires to give them. 108 In short, the law is defective when it does not proportion the punishment to the real evil which society has sustained. 109 The last degree of injustice, the acme of folly is, when society is so blinded as to inflict punishment on those citizens who have served it usefully.

110 The penal laws, in exhibiting terrifying objects to human, who must be supposed susceptible of fear, presents you with motives calculated to have an influence over your will. 111 The idea of pain, the privation of liberty, the fear of death, are, to a being well constituted, in the full enjoyment of your faculties, 112 very puissant obstacles, that strongly oppose themselves to the impulse of

your unruly desires: 113 when these do not coerce your will, when they fail to arrest your progress, you are an irrational being; a mad-person; a being badly organised; 114 against whom society has the right to guarantee itself; against whom it has a right to take measures for its own security. 115 Madness is, without doubt, an involuntary, a necessary state; 116 nevertheless, no one feels it unjust to deprive the insane of their liberty, although their actions can only be imputed to the derangement of their brain. 117 The wicked are people whose brain is either constantly or transitorily disturbed; still they must be punished by reason of the evil they commit; 118 they must always be placed in the impossibility of injuring society: 119 if no hope remains of bringing them back to a reasonable conduct-- if every prospect of recalling them to their duty has vanished-- 120 if they cannot be made to adopt a mode of action conformable to the great end of association-- they must be forever excluded its benefits.

121 It will not be requisite to examine here, how far the punishments which society inflicts upon those who offend against it, may be reasonably carried. 122 Reason should seem to indicate that the law ought to show to the necessary crimes of human, all the indulgence that is compatible with the conservation of society. 123 The system of fatalism, as we have seen, does not leave crime unpunished; 124 but it is, at least, calculated to moderate the barbarity with which a number of nations punish the victims to their anger. 125 This cruelty becomes still more absurd, when experience has shown its inutility: 126 the habit of witnessing ferocious punishments familiarises criminals with the idea. 127 If it be true that society possesses the right of taking away the life of its members-- 128 if it be really a fact, that the death of a criminal, thenceforth useless, can be advantageous for society, which it will be necessary to examine, 129 humanity, at least, exacts that this death should not be accompanied with useless tortures; 130 with which

laws, perhaps in this instance too rigorous, frequently seem to delight in overwhelming their victim. 131 This cruelty seems to defeat its own end, it only serves to make the culprit, who is immolated to the public vengeance, suffer without any advantage to society; 132 it moves the compassion of the spectator, interests human in favour of the miserable offender who groans under its weight; 133 it impresses nothing upon the wicked, but the sight of those cruelties destined for you; 134 which but too frequently renders human more ferocious, more cruel, more the enemy of your associates: 135 if the example of death was less frequent, even without being accompanied with tortures, it would be more efficacious. 136 If experience was consulted, it would be found that the greater number of criminals only look upon death as a bad quarter of an hour. 137 It is an unquestionable fact, that a thief seeing you of your comrades, display a want of firmness under the punishment, 138 said to him: "Is not this what I have often told you, that in our business, we have one evil more than the rest of humankind?"

139 Robberies are daily committed, even at the foot of the scaffolds where criminals are punished. 140 In those nations, where the penalty of death is so lightly inflicted, has sufficient attention been paid to the fact, that society is yearly deprived of a great number of individuals who would be able to render it very useful service, 141 if made to work, and thus indemnify the community for the injuries they have committed? 142 The facility, with which the lives of people are taken away, proves the incapacity of counsellors; is an evidence of the negligence of legislators: 143 they find it a much shorter road, that it gives them less trouble to destroy the citizens than to seek after the means to render them better.

144 What shall be said for the unjust cruelty of some nations, in which the law, that ought to have for its object the advantage of the whole, appears to be made only for the security of the most powerful? 145 How shall we account for the inhumanity of those

societies, in which punishments the most disproportionate to the crime, unmercifully take away the lives of people, 146 whom the most urgent necessity, the dreadful alternative of famishing in a land of plenty, has obliged to become criminal? 147 It is thus that in a great number of civilized nations, the life of the citizen is placed in the same scales with money; 148 that the unhappy wretch who is perishing from hunger, who is writhing under the most abject misery, is put to death for having taken a pitiful portion of the superfluity of another whom you beholds rolling in abundance! 149 It is this that, in many otherwise very enlightened societies, is called justice, or making the punishment commensurate with the crime.

150 Let the human of humanity, whose tender feelings are alive to the welfare of own species-- 151 let the moralist, who preaches virtue, who holds out forbearance to human-- let the philosopher, who dives into the secrets of Nature-- 152 let the theologian say, ‘if this dreadful iniquity, this heinous sin, does not become yet more crying, when the laws decree the most cruel tortures for crimes to which the most irrational customs gave birth’-- 153 which bad institutions engender-- which evil examples multiply? 154 Is not this something like building a sorry, inconvenient hovel, and then punishing the inhabitant, 155 because they does not find all the conveniences of the most complete mansion, of the most finished structure? 156 Human, as at cannot be too frequently repeated, is so prone to evil, only because everything appears to urge you on to the commission of it, by too frequently showing you vice triumphant: 157 your education is void in a great number of states, perhaps defective in nearly all; 158 in many places you receives from society no other principles, save those of an unintelligible superstition; 159 which make but a feeble barrier against those propensities that are excited by dissolute manners; 160 which are encouraged by corrupt examples: in vain the law cries out to human: "abstain from the goods of thy

neighbour;" 161 their wants, more powerful, loudly declare to them that they must live: unaccustomed to reason, having never been submitted to a wholesome discipline, 162 you conceives you must do it at the expense of a society who has done nothing for you: 163 who condemns human to groan in misery, to languish in indigence: frequently deprived of the common necessaries requisite to support their existence, 164 which your essence, of which you are not the master, compels you to conserve. 165 Human compensates oneself by theft, human revenges oneself by assassination, human becomes a plunderer by profession, a murderer by trade; 166 human plunges into crime, and seeks at the risque of your own life, to satisfy those wants, whether real or imaginary, to which everything around you conspires to give birth. 167 Deprived of education, human has not been taught to restrain the fury of your own temperament-- to guide your own passions with discretion-- to curb your inclinations. 168 Without ideas of decency, destitute of the true principles of honour, human engages in criminal pursuits that injure your country: 169 which at the same time has been to human nothing more than a step-mother. 170 In the paroxysm of human's rage, in the exacerbation of human's mind, you loses sight of your neighbour's rights, you overlooks the gibbet, you forgets the torture; 171 human unruly desires have become too potent-- they have completely absorbed human's mind; 172 by a criminal indulgence they have given an inveteracy to human's habits which preclude you from changing them; 173 laziness has made human torpid: remorse has gnawed human peace; despair has rendered human blind; human rushes on to death; 174 and society is compelled to punish human rigorously, for those fatal, those necessary dispositions, which it has perhaps itself engendered in human's heart by evil example: 175 or which at least, it has not taken the pains seasonably to root out; which it has neglected to oppose by suitable motives-- 176 by those calculated to

give human honest principles--to excite human to industrious habits, to imbue human with virtuous inclinations. 177 Thus, society frequently punishes those propensities of which it is itself the author, or which its negligence has suffered to spring up in the mind of human: 178 it acts like those unjust fathers, who chastise their children for vices which they have themselves made them contract.

179 However unjust, however unreasonable this conduct may be, or appear to be, it is not the less necessary: 180 society, such as it is, whatever may be its corruption, whatever vices may pervade its institutions, like everything else in Nature, is willing to subsist; tends to conserve itself: 181 in consequence, it is obliged to punish those excesses which its own vicious constitution has produced: 182 in despite of its peculiar prejudices, notwithstanding its vices, it feels cogently that its own immediate security demands that it should destroy the conspiracies of those who make war against its tranquillity: 183 if these, hurried on by the foul current of their necessary propensities, disturb its repose-- 184 if, borne on the stream of their ill-directed desires, they injure its interests, this following the natural law, 185 which obliges it to labour to its own peculiar conservation, removes them out of its road; 186 punishes them with more or less rigour, according to the objects to which it attaches the greatest importance, or which it supposes best suited to further its own peculiar welfare: 187 without doubt, it deceives itself frequently, both upon these objects and the means; 188 but it deceives itself necessarily, for want of the knowledge calculated to enlighten it, with regard to its true interests; 189 for want of those, who regulate its movements possessing proper vigilance-- suitable talents-- the requisite virtue. 190 From this it will appear, that the injustice of a society badly constituted, and blinded by its prejudices, is as necessary, as the crimes of those by whom it is hostilely attacked-- by whose vices it is distracted. 191 The body politic,

when in a state of insanity, cannot act more consistently with reason, than you of its members whose brain is disturbed by madness.

192 It will still be said that these maxims, by submitting everything to necessity, must confound, or even destroy the notions human forms of justice and injustice; 193 of good and evil; of merit and demerit: I deny it. 194 Although human, in everything you does, acts necessarily, your actions are good, they are just, they are meritorious, every time they tend to the real utility of your fellows; 195 of the society of which you makes a part: they are, of necessity, distinguished from those which are really prejudicial to the welfare of your associates. 196 Society is just, it is good, it is worthy our reverence, when it procures for all its members, their physical wants, 197 when it affords them protection, when it secures their liberty, when it puts them in possession of their natural rights.

198 It is ill this that consists all the happiness of which the social compact is susceptible: 199 society is unjust, it is bad, it is unworthy of our esteem, when it is partial to a few, when it is cruel to the greater number: 200 it is then that it multiplies its enemies, obliges them to revenge themselves by criminal actions which it is under the necessity to punish. 201 It is not upon the caprices of political society that depend the true notions of justice and injustice-- 202 the right ideas of moral good and evil-- a just appreciation of merit and demerit; 203 it is upon utility, upon the necessity of things, which always forces human to feel that there exists a mode of acting on which you implicitly relies, 204 which you are obliged to venerate, which you cannot help approving either in your fellows, in yourself, or in society: 205 whilst there is another mode to which you cannot lend your confidence, which your nature makes you to hate, which your feelings compel you to condemn. 206 It is upon your own peculiar essence that human founds your ideas of pleasure and of pain-- of right and of wrong-- of vice and of virtue: 207 the only

difference between these is, that pleasure and pain make them instantaneously felt in human's brain; human becomes conscious of their existence upon the spot; 208 in the place of which, the advantages that accrue to you from justice, the benefit that you derives from virtue, frequently do not display themselves but after a long train of reflections-- 209 after multiplied experience and complicated attention; which many, either from a defect in their conformation, 210 or from the peculiarity of the circumstances under which they are placed, are prevented from making, or at least from making correctly.

211 By a necessary consequence of this truism, the system of fatalism, although it has frequently been so accused, does not tend to encourage human in crime, to make remorse vanish from your mind. 212 Human's propensities are to be ascribed to your nature; the use you makes of your passions depends upon your habits, upon your opinions, upon the ideas you have received in your education; 213 upon the examples held forth by your society in which you lives. These things are what necessarily decide your conduct. 214 Thus, when human temperament renders you susceptible of strong passions, you are violent in your desires, whatever may be your speculations.

215 Remorse is the painful sentiment excited in human by grief, caused either by the immediate or probable future effect of your indulged passions: 216 if these effects were always useful to yourself, you would not experience remorse; 217 but, as soon as human is assured that your actions render you hateful, that human's passions make you contemptible; 218 or, as soon as you fears you shall be punished in some mode or other, you becomes restless, discontented with yourself-- 219 you reproaches yourself with your own conduct-- you feels ashamed-- you fears the judgement of those beings whose affection you have learned to esteem-- in whose goodwill you finds your own comfort deeply interested. 220 Human's experience proves to you that the wicked person

is odious to all those upon whom your actions have any influence: 221 if these actions are concealed at the moment of commission, you knows it very rarely happens they remain so forever. 222 The smallest reflection convinces yourself that there is no wicked person who is not ashamed of your own conduct-- 223 who is truly contented with you-- who does not envy the condition of the good person-- 224 who is not obliged to acknowledge that you have paid very dearly for those advantages you are never able to enjoy, 225 without experiencing the most troublesome sensations, without making the most bitter reproaches against yourself; 226 then you feels ashamed, despises yourself, hates yourself, your conscience becomes alarmed, remorse follows in it train. 227 To be convinced of the truth of this principle it is only requisite to cast our eyes on the extreme precautions that tyrants and villains, who are otherwise sufficiently powerful not to dread the punishment of human, take to prevent exposure;-- 228 to what lengths they push their cruelties against some, to what meanness's they stoop to others of those who are able to hold them up to public scorn. 229 Have they not, then, a consciousness of their own iniquities? Do they not know that they are hateful and contemptible? Have they not remorse? Is their condition happy? 230 people well brought up acquire these sentiments in their education; which are either strengthened or enfeebled by public opinion, by habit, or by the examples set before them. 231 In a depraved society, remorse either does not exist, or presently disappears; 232 because, in all human's actions, it is ever the judgment of your fellow-people that human is obliged necessarily to regard. 233 Human never feels either shame or remorse for actions you sees approved, that are practised by the world.

234 Under corrupt governments, venal souls, avaricious being, mercenary individuals, do not blush either at meanness, robbery, or rapine, when it is authorised by example; 235 in licentious nations, no one blushes at adultery except the

husband, at whose expense it is committed; 236 in superstitious countries, people does not blush to assassinate their fellow for their opinions. 237 It will be obvious, therefore, that your remorse, as well as the ideas, whether right or wrong, which human has of decency, virtue, justice, are the necessary consequence of your temperament, modified by the society in which you lives: 238 assassins and thieves, when they live only among themselves, have neither shame nor remorse.

239 Thus, I repeat, all the actions of human are necessary those which are always useful, 240 which constantly contribute to the real, tend to the permanent happiness of own species, are called virtues, and are necessarily pleasing to all who experience their influence; 241 at least, if their passions or false opinions do not oblige them to judge in that manner which is but little accordant with the nature of things: 242 each person acts, each individual judges, necessarily, according to your own peculiar mode of existence-- 243 after the ideas, whether true or false, which you have formed with regard to your own happiness. 244 There are necessary actions which human is obliged to approve; there are others, that, in despite of yourself, you are compelled to censure; 245 of which the idea generates shame when your reflection permits you to contemplate them under the same point of view that they are regarded by your associates. 246 The virtuous person and the wicked person act from motives equally necessary: they differ simply in their organisation-- in the ideas they form to themselves of happiness: 247 we love the one necessarily-- we detest the other from the same necessity. 248 The law of human nature, which wills that a sensible being shall constantly labour to preserve yourself, 249 has not left to human the power to choose, or the free-agency to prefer pain to pleasure-- vice to utility-- crime to virtue. 250 It is, then, the essence of human that obliges you to discriminate those actions which are advantageous to yourself, 251 form those which are prejudicial to your

interest, from those which are baneful to your felicity.

252 This distinction subsists even in the most corrupt societies, in which the ideas of virtue, although completely effaced from their conduct, remain the same in their mind. 253 Let us suppose a matt, who had decidedly determined for villainy, who should say to you-- "It is folly to be virtuous in a society that is depraved, in a community that is debauched." 254 Let us suppose also, that you have sufficient address, the unlooked-for good fortune to escape censure or punishment, during a long series of years; 255 I say, that in despite of all these circumstances, apparently so advantageous for you, such a human has neither been happy nor contented with your own conduct, 256 such person has been in continual agonies-- ever at war with your own actions-- in a state of constant agitation. 257 How much pain, how much anxiety, has human not endured in this perpetual conflict with oneself? 258 How many precautions, what excessive labour, what endless solicitude, has human not been compelled to employ in this continued struggle; 259 how many embarrassments, how many cares, has human not experienced in this eternal wrestling with your associates, 260 whose penetration you dreads, whose scorn you fears will follow a true knowledge of your pursuits. 261 Demand of human what you thinks of yourself, you will shrink from the question. 262 Approach the bedside of this villain at the moment he is dying; ask him if he would be willing to recommence, at the same price, a life of similar agitation? 263 If he is ingenuous, he will avow that he has tasted neither repose nor happiness; that each crime filled him with inquietude-- 264 that reflection prevented him from sleeping-- that the world has been to him only one continued scene of alarm-- an uninterrupted concatenation of terror-- an everlasting, anxiety of mind;-- 265 that to live peaceably upon bread and water, appears to him to be a much happier, a more easy condition, than to possess riches, credit, reputation,

honours, on the same terms that he has himself acquired them. 266 If this villain, notwithstanding all his success, finds his condition so deplorable, 267 what must be thought of the feelings of those who have neither the same resources nor the same advantages to succeed in their criminal projects.

268 Thus, the system of necessity is a truth not only founded upon certain experience, 269 but, again, it establishes morals upon an immoveable basis. 270 Far from sapping the foundations of virtue, it points out its necessity; it clearly shows the invariable sentiments it must excite-- 271 sentiments so necessary, so strong, so congenial to human's existence, that all the prejudices of human-- all the vices of your institutions-- 272 all the effect of evil example, have never been able entirely to eradicate them from human's mind. 273 When you mistakes the advantages of virtue, it ought to be ascribed to the errors that are infused into you-- to the irrationality of your institutions: 274 all human wanderings are the fatal consequences of error,-- the necessary result of prejudices which have identified themselves with your existence. 275 Let it not, therefore, any longer be imputed to human nature that you have become wicked, but to those baneful opinions which you have imbibed with your mother's milk,-- 276 that have rendered you ambitious, avaricious, envious, haughty, arrogant, debauched, intolerant, obstinate, prejudiced, incommodious to your fellows, mischievous to yourself. 277 It is education that carries into your system the germ of those vices which necessarily torment you during the whole course of your life.

278 Fatalism is reproached with discouraging human-- with damping the ardour of your soul-- with plunging you into apathy-- with destroying the bonds that should connect you with society. 279 Its opponents say, "If everything is necessary, we must let things go on, and not be disturbed by anything." 280 But does it depend on human to be sensible or not? Is human master of feeling or not feeling pain? 281 If

NATURE

Nature has endowed human with a humane, with a tender soul, is it possible you should not interest yourself in a very lively manner, 282 in the welfare of beings whom you knows are necessary to your own peculiar happiness? 283 Human's feelings are necessary: they depend on your own peculiar nature, cultivated by education. 284 Human's imagination, prompt to concern itself with the felicity of your race, causes your heart to be oppressed at the sight of those evils your fellow-creature is obliged to endure,-- 285 makes human soul tremble in the contemplation of the misery arising from the despotism that crushes you-- 286 from the superstition that leads you astray-- from the passions that distract you in a state of warfare against your neighbour. 287 Although human knows that death is the fatal, the necessary period to the form of all beings, your soul is not affected in a less lively manner at the loss of a beloved wife,-- 288 at the demise of a child calculated to console your old age,-- at the final separation from an esteemed friend who had become dear to your own heart. 289 Although human is not ignorant that it is the essence of fire to burn, human does not believe you are dispensed from using your utmost efforts to arrest the progress of a conflagration. 290 Although you are intimately convinced that the evils to which you are a witness, are the necessary consequence of primitive errors with which your fellow-citizens are imbued, 291 you feels you ought to display truth to them, if Nature has given human the necessary courage; 292 under the conviction, that if they listen to it, it will, by degrees, become a certain remedy for their sufferings, 293 that it will produce those necessary effects which it is of its essence to operate.

294 If the speculations of human modify your conduct, if they change your temperament, you ought not to doubt that the system of necessity would have the most advantageous influence over yourself; 295 not only is it suitable to calm the greater part of your inquietude, but it will also contribute to inspire you with a useful submission, 296 a rational

resignation, to the decrees of a destiny with which your too great sensibility frequently causes you to be overwhelmed. 297 This happy apathy, without doubt, would be, desirable to those whose souls, too tender to brook the inequalities of life, 298 frequently render them the deplorable sport of their fate; or whose organs, too weak to make resistance to the buffettings of fortune, 299 incessantly expose them to be dashed in pieces under the rude blows of adversity.

300 But, of all the important advantages the human race would be enabled to derive from the doctrine of fatalism, 301 if human was to apply it to own conduct, none would be of greater magnitude, none of more happy consequence, none that would more efficaciously corroborate your happiness, 302 than that general indulgence, that universal toleration, that must necessarily spring from the opinion, that all is necessary. 303 In consequence, of the adoption of this principle, the fatalist, if you had a sensible soul, would commisserate the prejudices of your fellow-human-- 304 would lament over your wanderings-- would seek to undeceive you-- would try by gentleness to lead you into the right path, 305 without ever irritating yourself against your weakness, without ever insulting your misery. 306 Indeed, what right have we to hate or despise human for your opinions? 307 Human's ignorance, human's prejudices, human's imbecility, human's vices, human's passions, human's weakness, are they not the inevitable consequence of vicious institutions? 308 Are you not sufficiently punished by the multitude of evils that afflict you on every side? 309 Those despots who crush you with an iron sceptre, are they not continual victims to their own peculiar restlessness--

310 emancipated to their perpetual diffidence-- eternal slaves to their suspicions? 311 Is there one wicked individual who enjoys a pure, an unmixed, a real happiness? 312 Do not nations unceasingly suffer from their follies? Are they not the incessant dupes to their prejudices?

313 Is not the ignorance of chiefs, the ill-will they bear to reason, the hatred they have for truth, punished by the imbecility of their citizens, by the ruin of the states they govern? 314 In short, the fatalist would grieve to witness necessity each moment exercising its severe decrees upon mortals who are ignorant of its power, 315 or who feel its castigation, without being willing to acknowledge the hand from whence it proceeds; 316 you will perceive that ignorance is necessary, that credulity is the necessary result of ignorance-- 317 that slavery and bondage are necessary consequences of ignorant credulity-- that corruption of manners springs necessarily from slavery-- 318 that the miseries of society, the unhappiness of its members, are the necessary offspring of this corruption.

319 The fatalist, in consequence, of these ideas, will neither be a gloomy misanthrope, nor a dangerous citizen; 320 you will pardon in your brethren those wanderings, you will forgive them those errors-- which their vitiated nature, by a thousand causes, has rendered necessary-- 321 you will offer them consolation-- you will endeavour to inspire them with courage-- 322 you will be sedulous to undeceive them in their idle notions, in their chimerical ideas; 323 but you will never display against them bitterness of soul-- you will never show them that rancorous animosity which is more suitable, to make them revolt from your doctrines, than to attract them to reason;-- 324 you will not disturb the repose of society-- you will not raise the people to insurrection against the sovereign authority; 325 on the contrary, you will feel that the miserable blindness of the great, and the wretched perverseness, the fatal obstinacy of so many conductors of the people, are the necessary consequence of that flattery that is administered to them in their infancy-- 326 that feeds their hopes with allusive falsehoods-- of the depraved malice of those who surround them -- who wickedly corrupt them, that they may profit by their folly-- that they may take advantage of their weakness: 327 in short, that these things are the

inevitable effect of that profound ignorance of their true interest, in which everything strives to keep them.

328 The fatalist has no right to be vain of your peculiar talents; no privilege to be proud of your virtues; 329 you knows that these qualities are only the consequence of your natural organisation, modified by circumstances that have in no wise depended upon yourself. 330 Human will neither have hatred nor feel contempt for those whom Nature and circumstances have not favoured in a similar manner. 331 It is the fatalist who ought to be humble, who should be modest from principle: 332 Is human not obliged to acknowledge, that you possesses nothing that you have not previously received?

333 In fact, will not everything conduct to indulgence the fatalist whom experience has convinced of the necessity of things? 334 Will human not see with pain, that it is the essence of a society badly constituted, unwisely governed, enslaved to prejudice, attached to unreasonable customs, submitted to irrational laws, 335 degraded under despotism, corrupted by luxury, inebriated by false opinions, to be filled with trifling members; 336 to be composed of vicious citizens; to be made up of cringing slaves, who are proud of their chains; 337 of ambitious people, without idea of true glory; of misers and prodigals; of fanatics and libertines! 338 Convinced of the necessary connection of things, you will not be surprised to see that the supineness of their chiefs carries discouragement into their country, 339 or that the influence of their governors stirs up bloody wars by which it is depopulated, and causes useless expenditures that impoverish it; 340 that all these excesses united, is the reason why so many nations contain only people wanting happiness, without understanding to attain it; who are devoid of morals, destitute of virtue. 341 In all this human will contemplate nothing more than the necessary action and re-action of physics upon morals, of morals upon physics. 342 In short, all who acknowledge fatality, will

remain persuaded that a nation badly governed is a soil very fruitful in venomous reptiles-- very abundant in poisonous plants; 343 that these have such a plentiful growth as to crowd each other and choak themselves. 344 It is in a country cultivated by the hands of a Lycurgus, that you will witness the production of intrepid citizens, of noble-minded individuals, of disinterested people, who are strangers to irregular pleasures. 345 In a country cultivated by a Tiberius, you will find nothing but villains with depraved hearts, people with mean contemptible souls, despicable informers, execrable traitors. 346 It is the soil, it is the circumstances in which human finds oneself placed, that renders you either a useful object or a prejudicial being: 347 the wise person avoids the one, as you would those dangerous reptiles whose nature it is to sting and communicate their deadly venom; 348 you attaches yourself to the other, esteems them, loves them, as you does those delicious fruits with whose rich maturity your palate is pleasantly gratified, 349 with whose cooling juices you finds yourself agreeably refreshed: 350 you sees the wicked without anger-- you cherishes the good with pleasure-- you delights in the bountiful: 351 you knows full well that the tree which is languishing without culture in the arid, sandy desert, that is stunted for want of attention, leafless for want of moisture, 352 that has grown crooked from neglect, become barren from want of loam, whose tender bark is gnawed by rapacious beasts of prey, pierced by innumerable insects, 353 would perhaps have expanded far and wide its verdant boughs from a straight and stately stem, 354 have brought forth delectable fruit, have afforded from its luxuriant foliage under its lambent leaves an umbrageous refreshing retreat from the scorching rays of a meridian sun, 355 have offered beneath its swelling branches, under its matted tufts a shelter from the pitiless storm, 356 it its seed had been fortunately sown in a more fertile soil, placed in a more congenial climate, had experienced the fostering cares of a skilful cultivator.

357 Let it not then be said, that it is degrading human reduce your functions to a pure mechanism; 358 that it is shamefully to undervalue you, scandalously to abuse you, to compare you to a tree; to an abject vegetation. 359 The philosopher devoid of prejudice does not understand this language, invented by those who are ignorant of what constitutes the true dignity of human. 360 A tree is an object which, in its station, joins the useful with the agreeable; 361 it merits our approbation when it produces sweet and pleasant fruit; when it affords a favourable shade.

362 All machines are precious, when they are truly useful, when they faithfully perform the functions for which they are designed. 363 Yes, I speak it with courage, reiterate it with pleasure, the honest human, when you have talents, when you possesses virtue, 364 is, for the beings of your species, a tree that furnishes them with delicious fruit, that affords them refreshing shelter: 365 the honest human is a machine of which the springs are adapted to fulfil its functions in a manner that must gratify the expectation of all your fellows. 366 No, I should not blush, I should not feel degraded, to be a machine of this sort; 367 and my heart would leap with joy, if I could foresee that the fruit of my reflections would one day be useful to my race, consoling to my fellow-human.

368 Is not Nature herself a vast machine, of which the human species is but a very feeble spring? 369 I see nothing contemptible either in Her or Her productions; 370 all the beings who come out of Her hands are good, are noble, are sublime, whenever they co-operate to the production of another, 371 to the maintenance of harmony in the sphere where they must act. 372 Of whatever nature the soul may be, whether it is made mortal, or whether it be supposed immortal; 373 whether it is regarded as a spirit, or whether it be looked upon as a portion of the body; 374 it will be found noble, it will be estimated great, it will be ranked good, it will be considered sublime, 375 in a Socrates, in an

Aristides, in a Cato: it will be thought abject, it will be viewed as despicable, it will be called corrupt, 376 in a Claudius, in a Sejanus, in a Nero: its energies will be admired, we shall be delighted with its manner, fascinated with its efforts, 377 in a Shakespeare, in a Corneille, in a Newton, in a Montesquieu: its baseness will be lamented, when we behold mean, contemptible people, who flatter tyranny, or who servilely cringe at the foot of superstition.

378 All that has been said in the course of this work, proves clearly that everything is necessary; that everything is always in order, relatively to Nature; 379 where all beings do nothing more than follow the laws that are imposed on their respective classes. 380 It is part of Her plan, that certain portions of the earth shall bring forth delicious fruits, shall blossom beauteous flowers; 381 whilst others shall only furnish brambles, shall yield nothing but noxious vegetables: 382 She has been willing that some societies should produce wise humans, great heroes; that others should only give birth to abject souls, contemptible humans, without energy, destitute of virtue. 383 Passions, winds, tempests, hurricanes, volcanoes, wars, plagues, famines, diseases, death, are as necessary to Her eternal march as the beneficent heat of the sun, 384 the serenity of the atmosphere, the gentle showers of spring, plentiful years, peace, health, harmony, life: vice and virtue, darkness and light, and science are equally necessary; 385 the one are not benefits, the other are not evils, except for those beings whose happiness they influence by either favouring or deranging their peculiar mode of existence. 386 The whole cannot be miserable, but it may contain unhappy individuals.

387 Nature, then, distributes with the same hand that which is called order, and that which is called disorder; that which is called pleasure, and that which is called pain: 388 in short, She diffuses by the necessity of Her existence, good and evil in the world we inhabit.

389 Let not human, therefore, either arraign Her bounty, or tax Her with malice; 390 let you not imagine that

your feeble cries, your weak supplications, can never arrest Her colossal power, always acting after immutable laws; 391 let you submit silently to your condition; and when you suffers, let you not seek a remedy by recurring to chimeras that your own distempered imagination has created; 392 let you draw from the stores of Nature Herself, the remedies which She offers for the evil She brings upon you: 393 if She sends you diseases, let you search in Her bosom for those salutary productions to which She has given birth, which will cure them: 394 if She gives you errors, She also furnishes you with experience to counteract them; in truth, She supplies you with an antidote suitable to destroy their fatal effects. 395 If She permits human to groan under the pressure of their own vices, beneath the load of their follies, She also shows them in virtue, a sure remedy for their infirmities: 396 if the evils that some societies experience are necessary, when they shall have become too incommodious they will be irresistibly obliged to search for those remedies which Nature will always point out to them. 397 If this Nature has rendered existence insupportable, to some unfortunate beings, whom She appears to have selected for Her victims, still death, is a door that will surely be opened to them-- 398 that will deliver them from their misfortunes, although in their puny, imbecile, wayward judgment, they may be deemed impossible of cure.

399 Let not human, then, accuse Nature with being inexorable to you, since there does not exist in Her whole circle an evil for which She has not furnished the remedy, 400 to those who have the courage to seek it, who have the fortitude to apply it. 401 Nature follows general and necessary laws in all Her operations; 402 physical calamity and moral evil are not to be ascribed to Her want of kindness, but to the necessity of things.

403 Physical calamity is the derangement produced in human's organs by physical causes which human sees act: 404 moral evil is the

derangement produced in human by physical causes of which the action is to you a secret. 405 These causes always terminate by producing sensible effects, which are capable of striking your senses; 406 neither the thoughts nor the will of human ever show themselves, but by the marked effects they produce either in yourself 407 or upon those beings whom Nature has rendered susceptible of feeling their impulse. 408 Human suffers, because it is of the essence of some beings to derange the economy of your machine; 409 human enjoys, because the properties of some beings are analogous to your own mode of existence; 410 human is born, because it is of the nature of some matter to combine itself under a determinate form; 411 you lives, you acts, you thinks, because it is of the essence of certain combinations to maintain themselves in existence by given means for a season; 412 at length human dies, because a necessary law prescribes that all the combinations which are formed, shall either be destroyed or dissolve themselves. 413 From all this it results, that Nature is impartial to all its productions; 414 She submits human, like all other beings, to those eternal laws from which She has not even exempted Herself; 415 if She was to suspend these laws, even for an instant, from that moment disorder would reign in Her, system; Her harmony would be disturbed.

416 Those who wish to study Nature, must take experience for their guide; 417 this, and this only, can enable them to dive into Her secrets, to unravel by degrees, the frequently imperceptible woof of those slender causes, of which She avails Herself to operate the greatest phenomena: 418 by the aid of experience, human often discovers in Her properties, perceives modes of action entirely unknown to the ages which have preceded human; 419 those effects which your grandfathers contemplated as marvellous, which they regarded as supernatural efforts, looked upon as miracles, 420 have become familiar to you in the present day, and are at this moment contemplated as simple and natural

consequences, of which you comprehends the mechanism-- 421 of which you understands the cause-- of which you can unfold the manner of action. 422 Human, in fathoming Nature, has arrived at discovering the true causes of earthquakes; of the periodical motion of the sea; of subterraneous conflagrations; of meteors; of the electrical fluid, 423 the whole of which were considered by your ancestors, and are still so by the ignorant, by the uninformed, as indubitable signs of heaven's wrath. 424 Human's posterity, in following up, in rectifying the experience already made, will perhaps go further, and discover those causes which are totally veiled from present eyes. 425 The united efforts of the human species will one day perhaps penetrate even into the sanctuary of Nature, 426 and throw into light many of those mysteries which up to the present time She seems to have refused to all human researches.

427 In contemplating human under own true aspect; in quitting authority to follow experience; in laying aside error to consult reason; in submitting everything to physical laws, 428 from which human's imagination has vainly exerted its utmost power to withdraw them; 429 it will be found that the phenomena of the moral world follow exactly the same general rules as those of the physical; 430 that the greater part of those astonishing effects, which ignorance, aided by human prejudices, make you consider as inexplicable, and regard as wonderful, are natural consequences flowing from simple causes. 431 Human will find that the eruption of a volcano and the birth of a Tamerlane are to Nature the same thing; 432 in recurring to the primitive causes of those striking events which human beholds with consternation, which human contemplates with fearful alarm, 433 in falling back to the sources of those terrible revolutions, those frightful convulsions, those dreadful explosions that distract humankind, 434 lay waste the fairest works of Nature, ravage nations, and tear up society by the roots; 435 human will find the wills that compassed the most surprising changes, that

operated the most extensive alterations in the state of things, 436 that brought about the most unlooked-for events, were moved by physical causes, whose exility made human treat them as contemptible; 437 whose want of consequence in human's own purblind eyes led human to believe them utterly incapable to give birth to the phenomena whose magnitude strikes human with such awe, 438 whose stupendous range fills human with such amazement.

439 If human was to judge of causes by their effects, there would be no small causes in the universe. 440 In a Nature where everything is connected, where everything acts and re-acts, moves and changes, composes and decomposes, forms and destroys, 441 there is not an atom which does not play an important part-- that does not occupy a necessary station; 442 there is not an imperceptible particle, however minute, which, placed in convenient circumstances, does not operate the most prodigious effects.

443 If human was in a capacity to follow the eternal chain, to pursue the concatenated links, that connect with their causes all the effects you witnesses, without losing sight of anyone of its rings,-- 444 if human could unravel the ends of those insensible threads that give impulse to the thoughts, decision to the will, direction to the passions of those people who are called mighty, according to their actions, 445 you would find, they are true atoms which Nature employs to move the moral world; 446 that it is the unexpected but necessary function of these indiscernible particles of matter, 447 it is their aggregation, their combination, their proportion, their fermentation, which modifying the individual by degrees, 448 in despite of yourself, frequently without your own knowledge, make you think, will, and act, in a determinate, but necessary mode. 449 If, then, the will and the actions of this individual have an influence over a great number of other humans, here is the moral world in a state of the greatest combustion, 450 and

those consequences ensue which human contemplates with fearful wonder. 451 Too much acrimony in the bile of a fanatic-- blood too much inflamed in the heart of a conqueror-- 452 a painful indigestion in the stomach of a monarch-- a whim that passes in the mind of a woman-- are sometimes causes sufficient to bring on war-- 453 to send millions of people to the slaughter-- to root out an entire people-- to overthrow walls-- to reduce cities into ashes-- 454 to plunge nations into slavery-- to put a whole people into mourning-- to breed famine in a land-- to engender pestilence-- 455 to propagate calamity-- to extend misery-- to spread desolation far and wide upon the surface of our globe, through a long series of ages.

456 The dominant passion of an individual of the human species, when it disposes of the passions of many others, arrives at combining their will, 457 at uniting their efforts, and thus decides the condition of human. 458 It is after this manner that an ambitious, crafty, and voluptuous Arab, gave to his countrymen an impulse 459 of which the effect was the subjugation and desolation of vast countries in Asia, in Africa, and in Europe; 460 whose consequences were sufficiently potential to erect a new, extensive, but slavish empire; 461 to give a novel system of religion to millions of human beings; to overturn the altars of their former gods; 462 in short, to alter the opinions, to change the customs of a considerable portion of the population of the earth. 463 But in examining the primitive sources of this strange revolution, what were the concealed causes that had an influence over this man-- 464 that excited his peculiar passions, and modified his temperament? 465 What was the matter from the combination of which resulted a crafty, ambitious, enthusiastic, and eloquent man; 466 in short, a personage competent to impose on his fellow-creatures-- capable of making them concur in his most extravagant views. 467 They were, undoubtedly, the insensible particles of his blood; the imperceptible texture of his fibres;

the salts, more or less acrid, that stimulated his nerves; 468 the proportion of igneous fluid that circulated in his system. 469 From whence came these elements? It was from the womb of his mother; from the aliments which nourished him; from the climate in which he had his birth; from the ideas he received; 470 from the air which he respired; without reckoning a thousand inappreciable, a thousand transitory causes, 471 that in the instance given had modified, had determined the passions of this important being, who had thereby acquired the capacity to change the face of this mundane sphere.

472 To causes so weak in their principles, if in the origin the slightest obstacle had been opposed, these wonderful events, which have astounded human, would never have been produced. 473 The fit of an argue, the consequence of bile a little too much inflamed, had sufficed, perhaps, to have rendered abortive all the vast projects, of the legislator of the Mussulmen. 474 Spare diet, a glass of water, a sanguinary evacuation, would sometimes have been sufficient to have saved kingdoms.

475 It will be seen, then, that the condition of the human species, as well as that of each of its individuals, every instant depends on insensible causes, to which circumstances, frequently fugitive, give birth; 476 that opportunity develops, that convenience puts in action: 477 human attributes their effects to chance, whilst these causes operate necessarily, act according to fixed rules: 478 human has frequently neither the sagacity nor the honesty to recur to their true principles; 479 human regards such feeble motives with contempt, because human has been taught to consider them as incapable of producing such stupendous events. 480 They are, however, these motives, weak as they may appear to be, these springs, so pitiful in human's eyes, is which according to Her necessary laws, suffice in the hands of Nature to move the universe. 481 The conquests of a Gengis-Khan have nothing in them that is more strange to the eye

of a philosopher than the explosion of a mine, 482 caused in its principle by a feeble spark, which commences with setting fire to a single grain of powder; 483 this presently communicates itself to many millions of other contiguous grains, of which the united force, the multiplied powers, terminate by blowing up mountains, 484 overthrowing fortifications, or converting populous, well-built cities, into heaps of ruins. 485 Thus, imperceptible causes, concealed in the bosom of Nature, until the moment their action is displayed, frequently decide the fate of human.

486 The happiness or the wretchedness, the prosperity or the misery of each individual, as well as that of whole nations, are attached to powers 487 which it is impossible for human to foresee, which human cannot appreciate, of which human is incapable to arrest the action. 488 Perhaps at this moment atoms are amassing, insensible particles are combining, of which the assemblage shall form a sovereign, 489 who will be either the scourge or the saviour of a mighty empire. 490 Human cannot answer for their own destiny one single instant; 491 you have no cognisance of what is passing within yourself; you is ignorant of the causes which act in the interior of your machine; 492 you knows nothing of the circumstances that will give them activity: you is unacquainted with what may develop their energy; 493 it is, nevertheless, on these causes, impossible to be unravelled by you, that depends your condition in life. 494 Frequently, an unforeseen rencontre gives birth to a passion in human soul, of which the consequences shall, necessarily, have an influence over the person's felicity. 495 It is thus that the most virtuous person, by a whimsical combination of unlooked-for circumstances, may become in an instant the most criminal of your species.

496 This truth, without doubt, will be found frightful-- this fact will unquestionably appear terrible: 497 but at bottom, what has it more revolting than that which teaches human that an infinity of accidents,

as irremediable as they are unforeseen, may every instant wrest from human that life to which you is so strongly attached? 498 Fatalism reconciles the good person easily to death: 499 it makes human contemplate it as a certain means of withdrawing yourself from wickedness; 500 this system shows death, even to the happy people themselves, as a medium between them and those misfortunes which frequently terminate by poisoning their happiness; 501 that end with embittering the most fortunate existence.

502 Let human, then, submit to necessity: in despite of yourself it will always hurry you forward: let you resign yourself to Nature, 503 let you accept the good with which She presents you: let you oppose to the necessary evil which She makes you experience, those necessary remedies which She consents to afford you; 504 let you not disturb your mind with useless inquietude; let you enjoy with moderation, because you will find that pain is the necessary companion of excess: 505 let you follow the paths of virtue, because everything will prove to you, even in this world of perverseness, that it is absolutely necessary to render you estimable in the eyes of others, to make you contented with yourself.

506 Feeble, vain mortal, thou pretendest to be a free agent. Alas! dost thou not see all the threads which enchain thee? 507 Dost thou not perceive that they are atoms which form thee; that they are atoms which move thee; that they are circumstances independent of thyself, that modify thy being; 508 that they are circumstances over which thou hast not any control, that rule thy destiny? 509 In the puissant Nature that environs thee, shalt thou pretend to be the only being who is able to resist Her power? 510 Dost thou really believe that thy weak prayers will induce Her to stop in Her eternal march; 511 that thy sickly desires can oblige Her to change Her everlasting course?

OF THE IMMORTALITY OF THE SOUL

Paul Henri Thiery (Baron D'Holbach)

38 The reflections presented to the reader in this work, tend to show what ought to be thought of the human soul, as well as of its operations and faculties: 2 everything proves, in the most convincing manner, that it acts, that it moves according to laws similar to those prescribed to the other beings of Nature; 3 that it cannot be distinguished from the body; that it is born with it; that it grows up with it; that it is modified in the same progression; 4 in short, everything ought to make human conclude that it perishes with it. 5 This soul, as well as the body, passes through a state of weakness and infancy; 6 it is in this stage of its existence, that it is assailed by a multitude of modifications; 7 that it is stored with an infinity of ideas, which it receives from exterior objects through the medium of the organs; 8 that it amasses facts, that it collects experience, whether true or false, that it forms to itself a system of conduct, 9 according to which it thinks, in conformity with which it acts, from whence results either its happiness or its misery, its reason or its delirium, its virtues or its vices; 10 arrived with the body at its full powers, having in conjunction with it reached maturity, it does not cease for a single instant to partake in common of its sensations, 11 whether these are agreeable or disagreeable; it participates in all its pleasures; it shares in all its pains; 12 in consequence it conjointly approves or disapproves its state; like it, it is either sound or diseased; active or languishing; awake or asleep. 13 In old age human extinguishes entirely, your fibres become rigid, your nerves loose their elasticity, your senses are obtunded, your sight grows dim, your ears lose their quickness, your ideas become unconnected, your memory fails, your imagination cools: 14 what then becomes of your soul? Alas! it sinks down with the body; it gets benumbed as this loses its feeling; becomes sluggish as this decays in

activity; 15 like it, when enfeebled by years it fulfils its functions with pain; 16 this substance, which is deemed spiritual, which is considered immaterial, which it is endeavoured to distinguish from matter, undergoes the same revolutions, 17 experiences the same vicissitudes, submits to the same modifications, as does the body itself.

18 In despite of this proof of the materiality of the soul, of its identity with the body, so convincing to the unprejudiced, 19 some thinkers have supposed, that although the latter is perishable, the former does not perish: 20 that this portion of human enjoys the especial privilege of immortality; that it is exempt from dissolution: free from those changes of form all the beings in Nature undergo: 21 in consequence of this, human has persuaded the self, that this privileged soul does not die: 22 its immortality, above all, appears indubitable to those who suppose it spiritual: 23 after having made it a simple being, without extent, devoid of parts, totally different from anything of which you have a knowledge, 24 you pretended that it was not subjected to the laws of decomposition common to all beings, of which experience shows you the continual operation.

25 Human, feeling within yourself a concealed force, that insensibly produced action, that imperceptibly gave direction to the motion of your machine, 26 believed that the entire of Nature, of whose energies you are ignorant, with whose modes of acting you are unacquainted, owed its motion to an agent analogous to your own soul; 27 who acted upon the great macrocosm, in the same manner that this soul acted upon your body. 28 Human, having supposed yourself double, made Nature double also: 29 you distinguished Nature from Her own peculiar energy; you separated Her from Her mover, which by degrees you made spiritual. 30 Thus Nature, distinguished from Herself, was regarded as the soul of the world; and the soul of human was considered as opinions emanating from this universal soul. 31 This notion upon the origin of the soul is

of very remote antiquity. 32 It was that of the Egyptians, of the Chaldeans, of the Hebrews, of the greater number of the wise men of the east. 33 It should appear that Moses believed with the Egyptians the divine emanation of souls: 34 according to him, "God formed man of the dust of the ground, and breathed into his nostrils the breath of life; and man became a living soul:" 35 nevertheless, the Catholic, at this day, rejects this system of divine emanation, seeing that it supposes the Divinity divisible: 36 which would have, been inconvenient to the Romish idea of purgatory, or to the system of everlasting punishment. 37 Although Moses, in the above quotation, seems to indicate that the soul was a portion of the Divinity, 38 it does not appear that the doctrine of the immortality of the soul was established in any one of the books attributed to him. 39 It was during the Babylonish captivity, that the Jews learned the doctrine of future rewards and punishments, taught by Zoroaster to the Persians, 40 but which the Hebrew legislator did not understand, or, at least, he left his people ignorant on the subject. 41 It was in those schools, that Pherecydes, Pythagoras, and Plato, drew up a doctrine so flattering to the vanity of human nature-- so gratifying to the imagination of mortals. 42 Human thus believed the self a portion of the Divinity; immortal, like the Godhead, in one part of the self: 43 nevertheless, subsequent religions have renounced these advantages, which they judged incompatible with the other parts of their systems; 44 they held forth that the Sovereign of Nature, or Her contriver was not the soul of human, 45 but, that, in virtue of your omnipotence, you created human souls, in proportion as you produced the bodies which they must animate; 46 and they taught, that these souls once produced, by an effect of the same omnipotence, enjoyed immortality.

47 However it may be with these variations upon the origin of souls, those who supposed them emanating from the Divinity, believed that after

the death of the body, which served them for an envelope, they returned, by refunding to their first source. 48 Those who, without adopting the opinion of divine emanation, admired the spirituality, believed the immortality of the soul, were under the necessity to suppose a region, 49 to find out an abode for these souls, which their imagination painted to them, each according to own fears, own hopes, own desires, and own prejudices.

50 Nothing is more popular than the doctrine of the immortality of the soul; nothing is more universally diffused than the expectation of another life. 51 Nature having inspired human with the most ardent love for your existence, the desire of preserving yourself for ever was a necessary consequence; 52 this desire was presently converted into certainty: from that desire of existing eternally which Nature has implanted in you, 53 he made an argument, to prove that human would never cease to exist. Abady says, "our soul has no useless desires, it naturally desires an eternal life;" 54 and by a very strange logic, he concludes that this desire could not fail to be fulfilled. 55 Cicero, before Abady, had declared the immortality of the soul to be an innate idea in human; 56 yet, strange to tell, in another part of his works he considers Pherecydes as the inventor of the doctrine. 57 However this may be, human, thus disposed, listened with avidity to those who announced to you systems so conformable to your wishes. 58 Nevertheless, you ought not to regard as supernatural the desire of existing, which always was, and always will be, of the essence human; 59 it ought not to excite surprise, if you received with eagerness an hypothesis that flattered your hopes, by promising that your desire would one day be gratified; 60 but let you beware how you concludes that this desire itself is an indubitable proof of the reality of this future life, with which at present you seems to be so much occupied. 61 The passion for existence is in human only a natural consequence of the tendency of a sensible being, 62 whose essence it is to be willing to conserve yourself: in the human

being it follows the energy of your soul-- 63 keeps pace with the force of your imagination--always ready to realise that which you strongly desires. 64 You desires the life of the body, nevertheless this desire is frustrated; wherefore should not the desire for the life of the soul be frustrated like the other? 65 The partisans of the doctrine of the immortality of the soul reason thus: "All humans desire to live forever, therefore they will live forever." 66 Suppose the argument retorted on them; would it be believed? If it was asserted, "All humans naturally desire to be rich; therefore all humans will one day be rich," 67 how many partisans would this doctrine find?

68 The most simple reflection upon the nature of your soul, ought to convince human that the idea of its immortality is only an illusion of the brain. 69 Indeed what is your soul, save the principle of sensibility? 70 What is it, to think, to enjoy, to suffer; is it not to feel? 71 What is life, except it be the assemblage of modifications, the congregation of motion, peculiar to an organised being? 72 Thus, as soon as the body ceases to live, its sensibility can no longer exercise itself; 73 when its sensibility is no more, it can no longer have ideas, nor in consequence thoughts. 74 Ideas, as we have proved, can only reach human through the senses; 75 now, how will they have it, that once deprived of your senses, you are yet capable of receiving sensations, of having perceptions, of forming ideas? 76 As they have made the soul of human a being separated from the animated body, wherefore have they not made life a being distinguished from the living body? 77 Life in a body is the totality of this motion; feeling and thought make a part of this motion: 78 thus it is reasonable to suppose, that in the dead human these motions will cease, like all the others.

79 Indeed, by what reasoning will it be proved, that this soul, which cannot feel, think, will, or act, but by aid of human's organs, can suffer pain, 80 be susceptible of pleasure, or even have a consciousness of its own

existence, 81 when the organs which should warn it of their presence are decomposed or destroyed? 82 Is it not evident, that the soul depends on the arrangement of the various parts of the body; 83 on the order with which these parts conspire to perform their functions; on the combined motion of the whole? 84 Thus the organic structure once destroyed, can it be reasonably doubted the soul will be destroyed also? 85 Is it not seen, that during the whole course of human life this soul is stimulated, changed, deranged, disturbed, by all the changes human's organs experience? 86 And yet it will be insisted, that this soul acts, thinks, subsists, when these same organs have entirely disappeared!

87 An organised being may be compared to a clock, which once broken, is no longer suitable to the use for which it was designed. 88 To say, that the soul shall feel, shall think, shall enjoy, shall suffer after the death of the body; is to pretend that a clock, shivered into a thousand pieces, will continue to strike the hour; 89 shall yet have the faculty of marking the progress of time. 90 Those who say, that the soul of human is able to subsist, notwithstanding the destruction of the body, evidently support the position, 91 that the modification of a body will be enabled to conserve itself after the subject is destroyed: 92 this on any other occasion would be considered as completely absurd.

93 It will be said that the conservation of the soul after the death of the body, is an effect of the Divine Omnipotence: 94 but this is supporting an absurdity by a gratuitous hypothesis. 95 It surely is not meant by Divine Omnipotence, of whatever nature it may be supposed, that a thing shall exist and not exist at the same time: 96 unless this be granted, it will be rather difficult to prove, that a soul shall feel and think without the intermediates necessary to thought.

97 Let them then, at least, forbear asserting, that reason is not wounded by the doctrine of the immortality of the soul; or by the expectation of a future life. 98 These notions, formed to flatter human, to disturb the

imagination of the uninformed, 99 who do not reason, cannot appear either convincing or probable to enlightened minds. 100 Reason, exempted from the illusions of prejudice, is, without doubt, wounded by the supposition of a soul, 101 that feels, that thinks, that is afflicted, that rejoices, that has ideas, without having organs; 102 that is to say, destitute of the only known medium, wanting all the natural means, by which, according to what we can understand, it is possible for it to feel sensations, have perceptions, or form ideas. 103 If it be replied, other means are able to exist, which are supernatural or unknown, 104 it may be answered, that these means of transmitting ideas to the soul, separated from the body, are not better known to, 105 or more within the reach of, those who suppose it, that they are of other humans. 106 It is, at least, very certain, it cannot admit even of a controversy, that all those who reject the system of innate ideas, cannot, 107 without contradicting their own principles, admit the doctrine of the immortality of the soul.

108 In defiance of the consolation that so many people pretend to find in the notion of an eternal existence; 109 in despite of that firm persuasion which such numbers of people assure us they have, that their souls will survive their bodies, 110 they seem so very much alarmed at the dissolution of this body, that they do not contemplate their end, 111 which they ought to desire as the period of so many miseries, but with the greatest inquietude; 112 so true it is, that the real, the present, even accompanied with pain, has much more influence over humankind, 113 than the most beautiful chimeras of the future; which you never views but through the clouds of uncertainty. 114 Indeed the most religious people, notwithstanding the conviction they express of a blessed eternity, do not find these flattering hopes sufficiently consoling to repress their fears; 115 to prevent their trembling, when they think on the necessary dissolution of their bodies. 116 Death was always, for mortals, the most

frightful point of view; 117 they regard it as a strange phenomenon, contrary to the order of things, opposed to Nature; 118 in a word, as an effect of the celestial vengeance, as the wages of sin. 119 Although everything proves to human that death is inevitable, you are never able to familiarise yourself with its idea; 120 you never thinks on it without shuddering; the assurance of possessing an immortal soul but feebly indemnifies you for the grief you feels in the deprivation of your perishable body. 121 Two causes contribute to strengthen your fears, to nourish your alarm; 122 the one is, that this death, commonly accompanied with pain, wrests from you an existence that pleases you-- 123 with which you are acquainted-- to which you are accustomed; 124 the other is the uncertainty of the state that must succeed your actual existence.

125 The illustrious Bacon has said, that "humans fear death for the same reason that children dread being alone in darkness." 126 Human naturally challenges everything with which you are unacquainted; 127 you are desirous to see clearly to the end, that you may guarantee yourself against those objects which may menace your safety; 128 that you may also be enabled to procure for yourself those which may be useful to you; 129 the person who exists cannot form to oneself any idea of non-existence; 130 as this circumstance disturbs you, for want of experience, your imagination sets to work; 131 this points out to you, either well or ill, this uncertain state: 132 accustomed to think, to feel, to be stimulated into activity, to enjoy society, you contemplates as the greatest misfortune, 133 a dissolution that will strip you of these objects, that will deprive you of those sensations which your present nature has rendered necessary to you; 134 you views with dismay a situation that will prevent your being warned of your own existence-- 135 that shall bereave you of your pleasures-- to plunge you into nothing. 136 In supposing it even exempt from pain, you always looks upon this nothing as an afflicting solitude--as an heap

of profound darkness; 137 you sees yourself in a state of general desolation; destitute of all assistance; and you feels keenly all the rigour of this frightful situation. 138 But does not a profound sleep help to give you a true idea of this nothing? 139 Does not that deprive you of everything? 140 Does it not appear to annihilate the universe to you, and you to the universe? 141 Is death anything more than a profound, a permanent steep? 142 It is for want of being able to form an idea of death that human dreads it; 143 if you could figure to yourself a true image of this state of annihilation, you would from thence cease to fear it; 144 but you are not able to conceive a state in which there is no feeling; 145 you therefore believes, that when you shall no longer exist, you will have the same feelings, the same consciousness of things, which, during your existence, appear so sad to your mind; 146 which your fancy paints in such gloomy colours. 147 Imagination pictures to you your funeral pomp--the grave they are digging for you--the lamentations that will accompany you to your last abode-- 148 the epicedium that surviving friendship may dictate; you persuades yourself that these melancholy objects will affect you as painfully even after your decease, 149 as they do in your present condition, in which you are in full possession of your senses.

150 Mortal, led astray by fear! after thy death thine eyes will see no more; thine ears will hear no longer; 151 in the depth of thy grave thou wilt no more be witness to this scene, which thine imagination, at present, represents to thee under such dismal colours; 152 thou wilt no longer take part in what shall be done in the world; thou wilt no more be occupied with what may befall thine inanimate remains, 153 than thou wast able to be the day previous to that which ranked thee among the beings of thy species. 154 To die is to cease to think; to lack feeling; no longer to enjoy; 155 to find a period to suffering; thine ideas will perish with thee; thy sorrows will not follow thee to the silent tomb. 156 Think of death, not to feed thy fears-- not to nourish thy

melancholy--but to accustom thyself to look upon it with a peaceable eye; 157 to cheer thee up against those false terrors with which the enemies to thy repose labour to inspire thee! 158 The fears of death are vain illusions, that must disappear as soon as we learn to contemplate this necessary event under its true point of view. 159 A great man has defined philosophy to be a meditation on death; 160 he is not desirous by that to have it understood that human ought to occupy the self sorrowfully with own end, with a view to nourish own fears; 161 on the contrary, you wishes to invite yourself to familiarise yourself with an object that Nature has rendered necessary to you; 162 to accustom yourself to expect it with a serene countenance. 163 If life is a benefit, if it be necessary to love it, it is no less necessary to quit it; 164 reason ought to teach you a calm resignation to the decrees of fate: 165 your welfare exacts that you should contract the habit of contemplating with placidity, of viewing without alarm, an event that your essence has rendered inevitable: 166 your interest demands that you should not brood gloomily over your misfortune; 167 that you should not, by continual dread, embitter your life; 168 the charms of which you must inevitably destroy, if you can never view its termination but with trepidation. 169 Reason and your interest then, concur to assure you against those vague terrors with which your imagination inspires you, in this respect. 170 If you was to call them to your assistance, they would reconcile you to an object that only startles you, because you have no knowledge of it; 171 because it is only shown to you with those hideous accompaniments with which it is clothed by superstition. 172 Let you then, endeavour to despoil death of these vain illusions, and you will perceive that it is only the sleep of life; 173 that this sleep will not be disturbed with disagreeable dreams; that an unpleasant awakening is never likely to follow it. 174 To die is to sleep; it is to enter into that state of insensibility in which you was previous to your birth; 175 before you

had senses; before you was conscious of your actual existence. 176 Laws, as necessary as those which gave you birth, will make you return into the bosom of Nature, 177 from whence you was drawn, in order to reproduce you afterwards under some new form, which it would be useless for you to know: 178 without consulting you, Nature places you for a season in the order of organised beings; 179 without your consent, She will oblige you to quit it, to occupy some other order.

180 Let you not complain then, that Nature is callous; 181 She only makes you undergo a law from which She does not exempt any one being She contains. 182 Human complains of the short duration of life-- of the rapidity with which time flies away; 183 yet the greater number of people do not know how to employ either time or life. 184 If all are born and perish-- if everything is changed and destroyed-- if the birth of a being is never more than the first step towards its end; 185 how is it possible to expect that human, whose machine is so frail, of which the parts are so complicated, the whole of which possesses such extreme mobility, should be exempted from the common law; 186 which decrees, that even the solid earth you inhabits shall experience change--shall undergo alteration--perhaps be destroyed!

187 Feeble, frail mortal! Thou pretendest to exist forever; 188 whit thou, then, that for thee alone eternal Nature shall change Her undeviating course? 189 Dost thou not behold in those eccentric comets with which thine eyes are sometimes astonished, that the planets themselves are subject to death? 190 Live then in peace for the season that Nature permits thee; if thy mind be enlightened by reason thou wilt die without terror!

191 Notwithstanding the simplicity of these reflections; nothing is more rare than the sight of people truly fortified against the fears of death: 192 the wise person turns pale at its approach; you have occasion to collect the whole force of your mind, to expect it with serenity. 193 It cannot then, furnish matter for

surprise, if the idea of death is so revolting to the generality of mortals; 194 it terrifies the young-- it redoubles the chagrin of the middle-aged-- it even augments the sorrow of the old, who are worn down with infirmity: 195 indeed the aged, although enfeebled by time, dread it much more than the young, who are in the full vigour of life; 196 the person of many lustres is more accustomed to live years as they roll over your head, confirm your attachment to existence; 197 nevertheless, long unwearied exertions weaken the powers of your mind; 198 labour, sickness, and pain, waste your animal strength; you have less energy; your volition becomes faint, superstitious terrors easily appal you; 199 at length disease consumes you; sometimes with excruciating tortures: 200 the unhappy wretch, thus plunged into misfortune, have, notwithstanding, scarcely ever dared to contemplate death; 201 which you ought to consider as the period to all your anguish.

202 If the source of this pusillanimity be sought, it will be found in your nature, which attaches you to life; 203 in that deficiency of energy in your soul, which hardly anything tends to corroborate, but which everything strives to enfeeble: 204 which superstition, instead of strengthening, contributes to bruise. 205 Almost all human institutions, nearly all the opinions of human, conspire to augment your fears; 206 to render your ideas of death more terrible; to make them more revolting to your feelings.

207 Indeed, superstition pleases itself with exhibiting death under the most frightful traits: 208 it represents it to human under the most disgusting colours; as a dreadful moment, which not only puts an end to your pleasures, but gives you up without defence to the strange rigour of a pitiless decree, which nothing can soften. 209 According to this superstition, the most virtuous person has reason to tremble for the severity of own fate; 210 is never certain of being happy; the most dreadful torments, endless punishments, await

the victim to involuntary weakness; 211 to the necessary faults of a short-lived existence; your infirmities, your momentary offences, the propensities that have been planted in your heart, 212 the errors of your mind, the opinions you have imbibed, even in the society in which you were born without your own consent, 213 the ideas you have formed, the passions you have indulged above all, you not being able to comprehend all the extravagant dogmas offered to your acceptance, 214 are to be implacably avenged with the most severe and never-ending penalties.

215 Ixion is forever fastened to your wheel; Sisyphus must to all eternity roll your stone without ever being able to reach the apex of your mountain; 216 the vulture must perpetually prey on the liver of the unfortunate Prometheus: 217 those who dare to think for themselves--those who have refused to listen to their enthusiastic guides-- 218 those who have not reverenced the oracles-- those who have had the audacity to consult their reason--those who have boldly ventured to detect impostors-- 219 those who have doubted the divine mission of the Phythonissa-- those who believe that Jupiter violated decency in his visit to Danae-- those who look upon Apollo as no better than a strolling musician-- those who think that Mahomet was an arch knave-- 220 are to smart everlastingly in flaming oceans of burning sulpher; 221 are to float to all eternity in the most excruciating agonies on seas of liquid brimstone, wailing and gnashing their teeth: 222 what wonder, then, if human dreads to be cast into these hideous gulfs; 223 if your mind loathes the horrific picture; if you wishes to defer for a season these dreadful punishments; 224 if you clings to an existence, painful as it may be, rather than encounter such revolting cruelties.

225 Such, then, are the afflicting objects with which superstition occupies its unhappy, its credulous disciples; 226 such are the fears which the tyrant of human thoughts points out to them as salutary. 227 In defiance Of the exility of the effect

which these notions produce oil the greater number, even of those who say they are, or who believe themselves persuaded, 228 they are held forth as the most powerful rampart that can be opposed to the irregularities of human. 229 Nevertheless, as will be seen presently, it will be found that these systems, or rather these chimeras, so terrible to behold, operate little or nothing on the larger portion of humankind, 230 who dream of them but seldom, never in the moment that passion, interest, pleasure, or example, hurries them along. 231 If these fears act, it is commonly on those, who have but little occasion to abstain from evil; they make honest hearts tremble, but fail of effect on the perverse. 232 They torment sensible souls, but leave those that are hardened in repose; 233 they disturb tractable, gentle minds, but cause no trouble to rebellious spirits: 234 thus they alarm none but those who are already sufficiently alarmed; they coerce only those who are already restrained.

235 These notions, then, impress nothing on the wicked; when by accident they do act on them, it is only to redouble the wickedness of their natural character-- 236 to justify them in their own eyes-- to furnish them with pretexts to exercise it without fear-- to follow it without scruple.

237 Indeed, the experience of a great number of ages has shown to what excess of wickedness, to what lengths, the passions of human have carried you, 238 when they have been authorised by the priesthood-- when they have been unchained by superstition-- or, at least, when you have been enabled to cover yourself with its mantle. 239 Human has never been more ambitious, never more covetous, never more crafty, never more cruel, never more seditious, 240 than when you have persuaded yourself that superstition permitted or commanded you to be so: 241 thus, superstition did nothing more than lend an invincible force to your natural passions, 242 which under its sacred auspices you could exercise with impunity, indulge without

remorse; 243 still more, the greatest villains, in giving free vent to the detestable propensities of their natural wickedness, have under its influence believed, that, by displaying an over-heated zeal, they merited well of heaven; 244 that they exempted themselves by new crimes, from that chastisement which they thought their anterior conduct had richly merited.

245 These, then, are the effects which what are called the salutary notions of superstition, produce on mortals. 246 These reflections will furnish an answer to those who say that, "If heaven was promised equally to the wicked as to the righteous, there would be found none incredulous of another life." 247 We reply, that, in point of fact, superstition does accord heaven to the wicked, 248 since it frequently places in this happy abode the most useless, the most depraved of people. 249 Is not Mahomet himself enthroned in the empyrean by this superstition? 250 If the calendar of the Romish saints was examined, would it be found to contain none but righteous, none but good people? 251 Does not Mahometanism cut off from all chance of future existence, consequently from all hope of reaching heaven, the female part of humankind? 252 Have the Jews exalted no one to the celestial regions, save the virtuous? 253 When the Jew is condemned to the devouring flames, do not the people who thus torture an unhappy wretch, whose only crime is adherence to the religion of their forefathers, expect to be rewarded for the deed with everlasting happiness? 254 Are they not promised eternal salvation for their orthodoxy? 255 Was Constantine, was St. Cyril, was St. Athanasius, was St. Dominic, worthy beatification? 256 Were Jupiter, Thor, Mercury, Woden, and a thousand others, deserving of celestial diadems? 257 Is erring, feeble person, with all your imbecilities, competent to form a judgment of the heavenly deserts of your fellows?

258 Can be, with your dim optics, with your limited vision, fathom the human heart? 259 Can you sound its depths, trace its meanderings, dive

into its recesses, with sufficient precision, 260 to determine who amongst your race is or is not possessed of the requisite merit to enjoy a blessed eternity? 261 Thus wicked people are held up as models by superstition, which as we shall see, sharpens the passions of evil-disposed people, 262 by legitimating those crimes, at which, without this sanction, they would shudder; which they would fear to commit; 263 or for which, at least, they would feel shame; for which they would experience remorse. 264 In short, the ministers of superstition furnish to the most profligate people the power of indulging their inflamed passions, 265 and then hold forth to them means of diverting from their own heads the thunderbolt that should strike their crimes, 266 by spreading before them fresh incentives to intolerant persecution, with the promise of a never-fading happiness. 267 With respect to the incredulous, without doubt, there may be amongst them wicked people, as well as amongst the most credulous; 268 but incredulity no more supposes wickedness, than credulity supposes righteousness. 269 On the contrary, the person who thinks, who meditates, knows far better the true motives to goodness, than you who suffers yourself to be blindly guided by uncertain motives, or by the interest of others. 270 Sensible people have the greatest advantage in examining opinions, which it is pretended must have an influence over their eternal happiness: 271 if these are found false, if they appear injurious to their present life, they will not therefore conclude, that they have not another life either to fear or to hope; 272 that they are permitted to deliver themselves up with impunity to vice, which would do an injury to themselves, 273 that would draw upon them the contempt of their neighbour, which would subject them to the anger of society: 274 the person who does not expect another life, is only more interested in prolonging one’s own existence in this; 275 in rendering yourself dear to your fellows, by cultivating virtue; 276 by performing all your duties with more strictness, in the only life

of which you have any knowledge: 277 you have made a great stride towards felicity, in disengaging yourself from those terrors which afflict others, which frequently prevent their acting. 278 Such a person has nothing to fear, but everything to hope; 279 if, contrary to what you are able to judge, there should be an hereafter existence, will not your actions have been so regulated by virtue, 280 will you not have so comported yourself in your present existence, as to stand a fair chance of enjoying in their fullest extent those felicities prepared for your species?

281 Superstition, in fact, takes a pride in rendering human slothful, in moulding you to credulity, in making you pusillanimous. 282 It is its principle to afflict you without intermission; to redouble in you the horrors of death: 283 ever ingenious in tormenting you, it has extended your inquietudes beyond even your own existence; 284 its ministers, the more securely to dispose of you in this world, invented, in future regions, a variety of rewards and punishments, 285 reserving to themselves the privilege of awarding these heavenly recompences to those who yielded most implicitly to their arbitrary laws; 286 of decreeing punishment to those refractory beings who rebelled against their power: 287 thus, according to them, Tantalus for divulging their secrets, must eternally fear, engulfed in burning sulphur, the stone ready to fall on your devoted head; 288 whilst Romulus was beatified and worshipped as a god under the name of Quirinus. 289 The same system of superstition caused the philosopher Callisthenes to be put to death, for opposing the worship of Alexander; 290 and elevated the monk Athanasius to be a saint in heaven. 291 Far from holding forth consolation to mortals, far from cultivating human's reason, far from teaching you to yield under the hands of necessity, 292 superstition, in a great many countries, strives to render death still more bitter to you; 293 to make its yoke sit heavy; to fill up its retinue with a multitude of hideous phantoms; to paint it in the

most frightful colours; to render its approach terrible: 294 by this means it has crowded the world with enthusiasts, whom it seduces by vague promises; with contemptible slaves, whom it coerces with the fear of imaginary evils: 295 it has at length persuaded human, that your actual existence is only a journey, by which you will arrive at a more important life: 296 this doctrine, whether it be rational or irrational, prevents you from occupying yourself with your true happiness; 297 from even dreaming of ameliorating your institutions, of improving your laws, of advancing the progress of science, of perfectioning your morals. 298 Vain and gloomy ideas have absorbed your attention: 299 you consents to groan under fanatical tyranny-- to writhe under political inflictions-- to live in error-- to languish in misfortune-- 300 in the hope, when you shall be no more, of being one day happier; 301 in the firm confidence, that after you have disappeared, your calamities, your patience, will conduct you to a never-ending felicity: 302 you have believed yourself submitted to cruel priests, who are willing to make you purchase your future welfare at the expense of everything most dear to your peace, most valuable to your existence here below: 303 they have pictured heaven as irritated against you, as disposed to appease itself by punishing you eternally, for any efforts you should make to withdraw yourself from, their power. 304 It is thus the doctrine of a future life has been made fatal to the human species: 305 it plunged whole nations into sloth, made them languid, filled them with indifference to their present welfare, 306 or else precipitated them, into the most furious enthusiasm, 307 which hurried them on to such lengths that they tore each other in pieces in order to merit the promised heaven.

308 It will be asked, perhaps, by what road has human been conducted to form to yourself these gratuitous ideas of another world? 309 I reply, that it is a truth human has no idea of a future life, they are the ideas of the past and the present that furnish your

imagination with the materials of which you constructs the edifice of the regions of futurity. 310 Hobbes says, "We believe that, that which is will always be, and that the same causes will have the same effects." 311 Human in your actual state, has two modes of feeling, one that you approves, another that you disapproves: 312 thus, persuaded that these two modes of feeling must accompany you, even beyond your present existence, 313 you placed in the regions of eternity two distinguished abodes, one destined to felicity, the other to misery: 314 the one must contain those who obey the calls of superstition, who believe in its dogmas; 315 the other is a prison, destined to avenge the cause of heaven, on all those who shall not faithfully believe the doctrines promulgated by the ministers of a vast variety of superstitions. 316 Has sufficient attention been paid to the fact that results as a necessary consequence from this reasoning; 317 which on examination will be found to have rendered the first place entirely useless, 318 seeing, that by the number and contradiction of these various systems, let human believe whichever you may, let you follow it in the most faithful manner, 319 still you must be ranked as an infidel, as a rebel to the Divinity, because you cannot believe in all; 320 and those from which you dissents, by a consequence of their own creed, condemn you to the prison-house?

321 Such is the origin of the ideas upon a future life, so diffused among humankind. 322 Everywhere may be seen an Elysium and a Tartarus; a Paradise and a Hell; 323 in a word, two distinguished abodes, constructed according to the imagination of the enthusiasts who have invented them, who have accommodated them to their own peculiar prejudices, 324 to the hopes, to the fears, of the people who believe in them. 325 The Indian figures the first of these abodes as one of in-action, of permanent repose, 326 because, being the inhabitant of a hot climate, they have learned to contemplate rest as the extreme of felicity: 327 the Mussulman promises himself

corporeal pleasures, similar to those that actually constitute the object of his research in this life: 328 each figures to himself, that on which he has learned to set the greatest value.

329 Of whatever nature these pleasures may be, human apprehended that a body was needful, in order that your soul might be enabled to enjoy the pleasures, or to experience the pains in reserve for you: 330 from hence the doctrine of the resurrection; 331 but as you beheld this body putrify, as you saw it dissolve, as you witnessed its decomposition, after death, 332 you was at a loss how to form anew what you conceived so necessary to your system 333 you therefore had recourse to the Divine Omnipotence, by whose interposition you now believes it will be effected. 334 This opinion, so incomprehensible, is said to have originated in Persia, among the Magi, and finds a great number of adherents, who have never given it a serious examination: 335 but the doctrine of the resurrection appears perfectly useless to all those, who believe in the existence of a soul that feels, thinks, suffers, and enjoys, after a separation from the body: 336 indeed, there are already sects who begin to maintain, that the body is not necessary; that therefore it will not be resurrected. 337 Like Berkeley, they conceive that "the soul has need neither of body nor any exterior being, either to experience sensations, or to have ideas:" 338 the Malebranchists, in particular, must suppose that the rejected souls will see everything in the Divinity; 339 will feel themselves burn, without having occasion for bodies for that purpose. 340 Others, incapable of elevating themselves to these sublime notions, believed, that under divers forms, human animated successively different animals of various species; 341 that you never ceased to be an inhabitant of the earth; such was the opinion of those who adopted the doctrine of Metempsychosis.

342 As for the miserable abode of souls, the imagination of fanatics, who were desirous of governing the people, 343 strove to assemble the most frightful images, to render it

still more terrible: 344 fire is of all beings that which produces in human the most pungent sensation; 345 not finding anything more cruel, the enemies to the several dogmas were to be everlastingly punished with this torturing element: 346 fire, therefore, was the point at which their imagination was obliged to stop. 347 The ministers of the various systems agreed pretty generally, that fire would one day avenge their offended divinities: 348 thus they painted the victims to the anger of the gods, or rather those who questioned their own creeds, 349 as confined in fiery dungeons, as perpetually rolling in a vortex of bituminous flames, as plunged in unfathomable gulphs of liquid sulphur, 350 making the infernal caverns resound with their useless groanings, with their unavailing gnashing of teeth.

351 But it will, perhaps, be enquired, how could human reconcile the self to the belief of an existence accompanied with eternal torments; 352 above all, as many according to their own superstitions had reason to fear it for themselves? 353 Many causes have concurred to make you adopt so revolting an opinion: 354 in the first place, very few thinking people have ever believed such an absurdity, when they have deigned to make use of their reason; 355 or, when they have accredited it, this notion was always counterbalanced by the idea of the goodness, by a reliance on the mercy, 356 which they attributed to their respective divinities: 357 in the second place, those who were blinded by their fears, never rendered to themselves any account of these strange doctrines, 358 which they either received with awe from their legislators, or which were transmitted to them by their fathers: 359 in the third place, each sees the object of own terrors only at a favourable distance: 360 moreover, superstition promises you the means of escaping the tortures you believes you have merited. 361 At length, like those sick people whom we see cling with fondness, even to the most painful life, human preferred the idea of an unhappy, though unknown existence, to that of non-existence,

362 which you looked upon as the most frightful evil that could befall you; 363 either because you could form no idea of it, or because your imagination painted to you this non-existence this nothing, as the confused assemblage of all evils. 364 A known evil, of whatever magnitude, alarmed you less-- 365 above all, when there remained the hope of being able to avoid it,-- than an evil of which you knew nothing, 366 upon which, consequently, your imagination was painfully employed, but to which you knew not how to oppose a remedy.

367 It will be seen, then, that superstition, far from consoling human upon the necessity of death, only redoubles your terrors, 368 by the evils with which it pretends your decease will be followed; 369 these terrors are so strong, that the miserable wretches who believe strictly in these formidable doctrines, pass their days in affliction, bathed in the most bitter tears. 370 What shall be said of an opinion so destructive to society, yet adopted by so many nations, 371 which announces to them, that a severe fate may at each instant take them unprovided; 372 that at each moment they are liable to pass under the most rigorous judgment? 373 What idea can be better suited to terrify human-- what more likely to discourage you--what more calculated to damp the desire of ameliorating your condition-- 374 than the afflicting prospect of a world always on the brink of dissolution; of a Divinity seated upon the ruins of Nature, ready to pass judgment on the human species? 375 Such are, nevertheless, the fatal opinions with which the mind of nations has been fed for thousands of years: 376 they are so dangerous, that if by a happy want of just inference, you did not derogate in your conduct from these afflicting ideas, you would fall into the most abject stupidity. 377 How could human occupy the self with a perishable world, ready every moment to crumble into atoms? 378 How dream of rendering yourself happy on earth, when it is only the porch to an eternal kingdom? 379 Is it then,

surprising, that the superstitions to which similar doctrines serve for a basis, have prescribed to their disciples a total detachment from things below-- 380 an entire renunciation of the most innocent pleasures; have given birth to a sluggishness, to a pusillanimity, to an abjection of soul, 381 to an in sociability, that renders you useless to yourself, dangerous to others? 382 If necessity did not oblige human to depart in your practice from these irrational systems-- 383 if your wants did not bring you back to reason, in despite of these superstitious doctrines-- 384 the whole world would presently become a vast desert, inhabited by some few isolated savages, who would not even have courage to multiply themselves. 385 What are these, but notions which you must necessarily put aside, in order that human association may subsist?

386 Nevertheless, the doctrine of a future life, accompanied with rewards and punishments, 387 has been regarded for a great number of ages as the most powerful, 388 or even as the only motive capable of coercing the passions of human; 389 as the sole means that can oblige you to be virtuous: 390 by degrees, this doctrine has become the basis of almost all religions and political systems, 391 so much so, that at this day it is said, this prejudice cannot be attacked without absolutely rending asunder the bonds of society. 392 The founders of superstition have made use of it to attach their credulous disciples; 393 legislators have looked upon it as the curb best calculated to keep humankind under discipline; 394 religion considers it necessary to your happiness; 395 many philosophers themselves have believed with sincerity, that this doctrine was requisite to terrify human, was the only means to divert you from crime: 396 notwithstanding, when the doctrine of the immortality of the soul first came out of the school of Plato; when it first diffused itself among the Greeks, it caused the greatest ravages; 397 it determined a multitude of people, who were discontented with their condition, to terminate their existence: 398

Ptolemy Philadelphus, king of Egypt, seeing the effect this doctrine, which at the present day is looked upon as so salutary, 399 produced on the brains of his subjects, prohibited the teaching of it under the penalty of death.

400 It must, indeed, be allowed that this doctrine has been of the greatest utility to those who have given superstitions to nations, 401 who at the same time made themselves its ministers; it was the foundation of their power, the source of their wealth, 402 the permanent cause of that blindness, the solid basis of those terrors, which it was their interest to nourish in the human race.

403 It was by this doctrine the priest became first the rival, then the master of kings: 404 it is by this dogma that nations are filled with enthusiasts inebriated with superstition, always more disposed to listen to its menaces, 405 than to the counsels of reasons, to the orders of the sovereign, to the cries of Nature, or to the laws of society. 406 Politics itself was enslaved to the caprice of the priest; 407 the temporal monarch was obliged to bend under the yoke of the monarch of superstition; 408 the one only disposed of this perishable world, the other extended his power into the world to come; 409 much more important for human than the earth, on which you are only a pilgrim, a mere passenger. 410 Thus the doctrine of another life placed the government itself in a state of dependence upon the priest; 411 the monarch was nothing more than your first subject; he was never obeyed, but when the two were in accord.

412 Nature in vain cried out to human, to be careful of your present happiness; 413 the priest ordered you to be unhappy, in the expectation of future felicity; 414 reason in vain exhorted you to be peaceable; 415 the priest breathed forth fanaticism, fulminated fury, obliged you to disturb the public tranquillity, 416 every time there was a question of the supposed interests of the invisible monarch of another life, and the real interests of your ministers in this.

417 Such is the fruit that politics has gathered from the doctrine of a

future life; 418 the regions of the world to come have enabled the priesthood to conquer the present world. 419 The expectation of celestial happiness, and the dread of future tortures, only served to prevent human from seeking after the means to render yourself happy here below. 420 Thus error, under whatever aspect it is considered, will never be more than a source of evil for humankind. 421 The doctrine of another life, in presenting to mortals an ideal happiness, will render them enthusiasts; 422 in overwhelming them with fears, it will make useless beings; generate cowards; form atrabilarious or furious people; 423 who will lose sight of their present abode, to occupy themselves with the pictured regions of a world to come, 424 with those dreadful evils which they must fear after their death.

425 If it be insisted that the doctrine of future rewards and punishments is the most powerful curb to restrain the passions of human, we shall reply by calling in daily experience. 426 If we only cast our eyes around, if for a moment we examine what passes in review before us, we shall see this assertion contradicted; 427 we shall find that these marvellous speculations do not in any manner diminish the number of the wicked, 428 because they are incapable of changing the temperament of human, of annihilating those passions which the vices of society engender in your heart. 429 In those nations who appear the most thoroughly convinced of this future punishment, may be seen assassins, thieves, crafty knaves, oppressors, adulterers, voluptuaries; 430 all these pretend they are firmly persuaded of the reality of an hereafter; 431 yet in the whirlwind of dissipation, in the vortex of pleasure, in the fury of their passions, they no longer behold this formidable future existence, 432 which in those moments has no kind of influence over their earthly conduct.

433 In short, in many of those countries where the doctrine of another life is so firmly established, that each individual irritates the self against whoever may have the temerity to combat the opinion, or

even to doubt it, 434 we see that it is utterly incapable of impressing anything on rulers who are unjust, who are negligent of the welfare of their people, 435 who are, debauched, on courtezans who are lewd in their habits, on covetous misers, on flinty extortioners who fatten on the substance of a nation, on women without modesty, 436 on a vast multitude of drunken, intemperate, vicious people, on great numbers even amongst those priests, whose function it is to preach this future state, 437 who are paid to announce the vengeance of heaven, against vices which they themselves encourage by their example. 438 If it be enquired of them, how they dare to give themselves up to such scandalous actions, which they ought to know are certain to draw upon them eternal punishment? 439 They will reply, that the madness of their passions, the force of their habits, the contagion of example, or even the power of circumstances, have hurried them along; 440 have made them forget the dreadful consequences in which their conduct is likely to involve them; 441 besides, they will say, that the treasures of the divine mercy are infinite; that repentance suffices to efface the foulest transgressions; 442 to cleanse the blackest guilt; to blot out the most enormous crimes: 443 in this multitude of wretched beings, who each after your own manner desolates society with your criminal pursuits, 444 you will find only a small number who are sufficiently intimidated by the fears of the miserable hereafter, to resist their evil propensities.

445 What did I say? These propensities are in themselves too weak to carry them forward without the aid of the doctrine of another life; 446 without this, the law and the fear of censure would have been motives sufficient to prevent them from rendering themselves criminal. 447 It is indeed, fearful, timorous souls, upon whom the terrors of another life make a profound impression; 448 human beings of this sort come into the world with moderate passions, are of a weakly organisation, possess a cool imagination; 449 it is not

therefore surprising, that in such people, who are already restrained by their nature, the fear of future punishment counterbalances the weak efforts of their feeble passions; 450 but it is by no means the same with those determined sinners, with those hardened criminals, with those people who are habitually vicious, 451 whose unseemly excesses nothing can arrest, who in their violence shut their eyes to the fear of the laws of this world, despising still more those of the other. 452 Nevertheless, how many people say they are, and even believe themselves, restrained by the fears of the life to come? 453 But, either they deceive us, or they impose upon themselves, by attributing to these fears, 454 that which is only the effect of motives much nearer at hand; such as the feebleness of their machine, the mildness of their temperament, the slender energy of their souls, 455 their natural timidity, the ideas imbibed in their education, the fear of consequences immediately resulting from criminal actions, the physical evils attendant on unbridled irregularities: 456 these are the true motives that restrain them; not the notions of a future life: 457 which people, who say they are most firmly persuaded of its existence, forget whenever a powerful interest solicits them to sin. 458 If for a time human would pay attention to what passes before your eyes, you would perceive that you ascribes to the fear of the gods that which is in reality only the effect of peculiar weakness, 459 of pusillanimity, of the small interest found to commit evil: 460 these people would not act otherwise than they do, if they had not this fear before them; 461 if, therefore you reflected, you would feel that it is always necessity that makes people act as they do.

462 Human cannot be restrained, when you does not find within yourself motives sufficiently powerful to conduct you back to reason. 463 There is nothing, either in this world or in the other, that can render you virtuous, 464 when an untoward organisation-- a mind badly cultivated-- a violent imagination--inveterate habits-- fatal

examples-- powerful interests-- invite you from every quarter to the commission of crime.

465 No speculations are capable of restraining the person who braves public opinion, who despises the law, 466 who is careless of its censure, who turns a deaf ear to the cries of conscience, whose power in this world places the self out of the reach of punishment; 467 in the violence of your transports, you will fear still less a distant futurity, 468 of which the idea always recedes before that which you believes necessary to your immediate interests, consistent with your present happiness. 469 All lively passions blind human to everything that is not its immediate object; 470 the terrors of a future life, of which your passions always possess the secret to diminish to you the probability, 471 can effect nothing upon the wicked person, who does not fear even the much nearer punishment of the law; 472 who sets at nought the assured hatred of those by whom you are surrounded. 473 Human, when you delivers yourself up to crime, sees nothing certain except the supposed advantage which attends it; 474 the rest always appear to you either false or problematical.

475 If human would but open own eyes, even for a moment, you would clearly perceive, that to effect anything upon hearts hardened by crime, you must not reckon upon the chastisement of an avenging Divinity, 476 which the self-love natural to human always shows you as pacified in the long run.

477 He who has arrived at persuading himself he cannot be happy without crime, will always readily deliver himself up to it, notwithstanding the menaces of religion. 478 Whoever is sufficiently blind not to read your infamy in your own heart, to see your own vileness in the countenances of your associates, 479 your own condemnation in the anger of your fellow-people, your own unworthiness in the indignation of the judges established to punish the offences you may commit: 480 such a person, I say, will never feel the impression your crimes shall make on the features of a judge, 481 that is

either hidden from your view, or that you only contemplates at a distance.
482 The tyrant who with dry eyes can hear the cries of the distressed, who with callous heart can behold the tears of a whole people, 483 of whose misery you are the cause, will not see the angry countenance of a more powerful master: 484 like another Menippus, you may indeed destroy yourself from desperation, to avoid reiterated reproach; 485 which only proves, that when a haughty, arrogant despot pretends to be accountable for your actions to the Divinity alone, it is because you fears your nation more than you does your God.
486 On the other hand, does not superstition itself, does not even religion, annihilate the effects of those fears which it announces as salutary? 487 Does it not furnish its disciples with the means of extricating themselves from the punishments with which it has so frequently menaced them? 488 Does it not tell them, that a sterile repentance will, even at the moment of death, disarm the celestial wrath; that it will purify the filthy souls of sinners? 489 Do not even the priests, in some superstitions, arrogate to themselves the right of remitting to the dying the punishment due to the crimes committed during the course of a disorderly life? 490 In short, do not the most perverse people, encouraged in iniquity, countenanced in debauchery, upheld in crime, reckon, even to the last moment, either upon the assistance of superstition, or upon the aid of religion, 491 that promises them the infallible means of reconciling themselves to the Divinity, whom they have irritated; 492 of avoiding the rigorous punishments pronounced against their enormities?
493 In consequence of these notions, so favourable to the wicked, so suitable to tranquillize their fears, 494 we see that the hope of an easy expiation, far from correcting human, engages you to persist, until death, in the most crying disorders.
495 Indeed, in despite of the numberless advantages which you are assured flows from the doctrine of a life to come, 496 in defiance of

its pretended efficacy to repress the passions of people, 497 do not the priests themselves, although so interested in the maintenance of this system, every day complain of its insufficiency?

498 They acknowledge, that mortals, who from their infancy they have imbued with these ideas, are not less hurried forward by their evil propensities-- 499 less sunk in the vortex of dissipation-- less the slaves to their pleasures--less captivated by bad habits-- less driven along by the torrent of the world-- less seduced by their present interest-- 500 which make them forget equally the recompence and the chastisement of a future existence. 501 In a word, the interpreters of superstition, the ministers of religion themselves, allow that their disciples, 502 for the greater part, conduct themselves in this world as if they had nothing either to hope or fear in another.

503 In short, let it be supposed for a moment, that the doctrine of eternal punishments was of some utility; 504 that it really restrained a small number of individuals; what are these feeble advantages compared to the numberless evils that flow from it? 505 Against one timid man whom this idea restrains, there are thousands upon whom it operates nothing; 506 there are thousands whom it makes irrational; whom it renders savage persecutors; whom it converts into fanatics; 507 there are thousands whose mind it disturbs; whom it diverts from their duties towards society; 508 there are an infinity whom it grievously afflicts, whom it troubles without producing any real good for their associates.

509 Notwithstanding so many are inclined to consider those who do not fall in with this doctrine as the enemies of society; 510 it will be found on examination that the wisest the most enlightened people of antiquity, as well as many of the moderns, 511 have believed not only that the soul is material and perishes with the body, but also that they have attacked without subterfuge the opinion of future everlasting punishments; 512 it will also be found that many of the systems, set up to establish the immortality of the soul,

are in themselves the best evidence that can be adduced of the futility of this doctrine; 513 if for a moment we only follow up the natural the just inferences that are to be drawn from them. 514 This sentiment was far from being, as some have supposed, peculiar to the Epicureans, 515 it has been adopted by philosophers of all sects, by Pythagoreans, by Stoics, by Peripatetics, by Academics; 516 in short by the most godly the most virtuous people of Greece and of Rome.

517 Pythagoras, according to Ovid, speaks strongly to the fact. 518 Timaeus of Locris, who was a Pythagorean, admits that the doctrine of future punishments was fabulous, 519 solely destined for the imbecility of the uninformed; but little calculated for those who cultivate their reason.

520 Aristotle expressly says, that "human has neither good to hope nor evil to fear after death." 521 Zeno, according to Cicero, supposed the soul to be an igneous substance, from whence he concluded it destroyed itself. 522 Cicero, the philosophical orator, who was of the sect of Academics, although he is not on all occasions, 523 in accord with himself, treats openly as fables the torments of Hell; and looks upon death as the end of everything for human.

524 Seneca, the philosopher, is filled with passages which contemplate death as a state of total annihilation, particularly in speaking of it to his brother: 525 and nothing can be more decisive of his holding this opinion, than what he writes to Marcia, to console him. 526 Seneca, the tragedian, explains himself in the same manner as the philosopher. 527 The Platonists, who made the soul immortal, could not have an idea of future punishments, 528 because the soul according to them was a portion of the divinity which after the dissolution of the body it returned to rejoin.

529 Epictetus has the same idea. In a passage reported by Arrian, he says, "but where are you going? It cannot be to a place of suffering: 530 you will only return to the place from whence you came; you are about to

be again peaceably associated with the elements from which you are derived. 531 That which in your composition, is of the nature of fire, will return to the element of fire; 532 that which is of the nature of earth, will rejoin itself to the earth; 533 that which is air, will re-unite itself with air; 534 that which is water, will resolve itself into water; 535 there is no Hell, no Acheron, no Cocytus, no Phlegethon."

536 In another place he says, "the hour of death approaches; but do not aggravate your evil, nor render things worse than they are: 537 represent them to yourself under their true point of view. 538 The time is come when the materials of which you are composed, go to resolve themselves into the elements from whence they were originally borrowed. 539 What is there that is terrible or grievous in that? 540 Is there anything in the world that perishes totally?"

541 The sage and pious Antoninus says, "he who fears death, either fears to be deprived of all feeling, or dreads to experience different sensations. 542 If you lose all feeling, you will no longer be subject either to pain or to misery. 543 If you are provided with other senses of a different nature, you will become a creature of a different species." 544 This great emperor further says, "that we must expect death with tranquillity, 545 seeing, that it is only a dissolution of the elements of which each animal is composed."

546 To the evidence of so many great people of Pagan antiquity, may be joined, that of the author of Ecclesiastes, 547 who speaks of death, and of the condition of the human soul, like an epicurean; 548 he says, "for that which befalleth the sons of humans, befalleth beasts; even one thing befalleth them: as the one dieth, so dieth the other; yea, they have all one breath: so that a person hath no pre-eminence above a beast; for all is vanity. 549 All go unto one place; all are of the dust, and all turn to dust again." 550 And further, "wherefore I perceive that there is nothing better than that a human should rejoice in own works; 551 for that is your portion: for who

shall bring you to see what shall be after you."

552 In short, how can the utility or the necessity of this doctrine be reconciled with the fact, 553 that the great legislator of the Jews; who is supposed to have been inspired by the Divinity, should have remained silent on a subject, that is said to be of so much importance? 554 In the third chapter of Genesis, it is said, "In the sweat of thy face shalt thou eat bread, till thou return unto the ground; 555 for out of it wast thou taken: for dust thou art, and unto dust shalt thou return."

EDUCATION, MORALS, AND THE LAWS SUFFICE TO RESTRAIN HUMAN

Paul Henri Thiery (Baron D'Holbach)

39 It is not then in an ideal world, existing nowhere perhaps, but in the imagination of human, that you must seek to collect motives calculated to make you act properly in this; 2 it is in the visible world that will be found incitements to divert you from crime; to rouse you to virtue.

3 It is in Nature,-- in experience, -- in truth, that you must search out remedies for the evils of your own species; 4 for motives suitable to infuse into the human heart, propensities truly useful to society; 5 calculated to promote its advantage; to conduce to the end for which it was designed.

6 If attention has been paid to what has been said in the course of this work, it will be seen that above all it is education that will best furnish the true means of rectifying the errors, 7 of recalling the wanderings of humankind. 8 It is this that should scatter the Seeds in your heart; cultivate the tender shoots; make a profitable use of your dispositions; 9 turn to account those faculties, which depend on your organisation: which should cherish the fire of your imagination, kindle it for useful objects; 10 damp it, or extinguish it for others; 11 in short, it is this which should make sensible souls contract habits which are advantageous for society and beneficial to the

individual. 12 Brought up in this manner, human would not have occasion for celestial punishments, to teach you the value of virtue; 13 you would not need to behold burning gulphs of brimstone under your feet, to induce you to feel horror for crime; 14 Nature without these fables, would teach much better what you owes to yourself; 15 the law would point out what you owes to the body politic, of which you are a member. 16 It is thus, that education grounded upon utility, would form valuable citizens to the state; 17 the depositaries of power would distinguish those whom education should have thus formed, 18 by reason of the advantages which they would procure for their country; they would punish those who should be found injurious to it; 19 it would make the citizens see, that the promises of reward which education held forth, the punishments denounced by morals, are by no means vain; 20 that in a state well constituted, virtue is the true, the only road to happiness; 21 talents the way to gain respect; that inutility conducts to misfortune: that crime leads to contempt.

22 A just, enlightened, virtuous, and vigilant government, who should honestly propose the public good, would have no occasion either for fables or for falsehoods, to govern reasonable subjects; 23 it would blush to make use of imposture, to deceive its citizens; who, instructed in their duties, would find their interest in submitting to equitable laws; 24 who would be capable of feeling the benefit these have the power of conferring on them; 25 it would feel, that habit is sufficient to inspire them with horror, even for those concealed crimes that escape the eyes of society; 26 it would understand that the visible punishments of this world impose much more on the generality of people, than those of an uncertain and distant futurity: 27 in short, it would ascertain that the sensible benefits within the compass of the sovereign power to distribute, touch the imagination of mortals more keenly, 28 than those vague recompences which are held forth to them in a future existence: 29 above

all, it would discover that those on whom these distant advantages do operate, would be still more attached to virtue by receiving their reward both here and hereafter.

30 Human is almost everywhere so wicked, so corrupt, so rebellious to reason, 31 only because you are not governed according to human nature, nor properly instructed in Nature's necessary laws: 32 you are almost in every climate fed with superstitious chimeras; submitted to masters who neglect your instruction or who seek to deceive you. 33 On the face of this globe, may be frequently witnessed unjust sovereigns, who, enervated by luxury, corrupted by flattery, depraved by licentiousness, 34 made wicked by impunity, devoid of talents, without morals, destitute of virtue, 35 are incapable of exerting any energy for the benefit of the states they govern; 36 they are consequently but little occupied with the welfare of their people; indifferent to their duties; of which indeed they are often ignorant. 37 Such governors suffer their whole attention to be absorbed by frivolous amusement; 38 stimulated by the desire of continually finding means to feed their insatiable ambition they engage in useless depopulating wars; 39 and never occupy their mind with those objects which are the most important to the happiness of their nation: 40 yet these weak people feel interested in maintaining the received prejudices, and visit with severity those who consider the means of curing them: 41 in short themselves deprived of that understanding, which teaches human that it is your interest to be kind, just, and virtuous; 42 they ordinarily reward only those crimes which their imbecility makes them imagine as useful to them; 43 they generally punish those virtues which are opposed to their own imprudent passions, but which reason would point out as truly beneficial to their interests. 44 Under such masters is it surprising that society should be ravaged; that weak beings should be willing to imitate them; 45 that perverse people should emulate each other in oppressing its members; in

sacrificing its dearest interests; in despoiling its happiness?

46 The state of society in such countries, is a state of hostility of the sovereign against the whole, of each of its members the one against the other. 47 Human is wicked, not because you are born so, but because you are rendered so; 48 the great, the powerful, crush with impunity the indigent and the unhappy; 49 these, at the risk of their lives seek to retaliate, to render back the evil they have received: 50 they attack either openly or in secret a country, who to them is a step-mother, who gives all to some of her children, and deprives the others of everything: 51 they punish it for its partiality, and clearly show that the motives borrowed from a life hereafter are impotent against the fury of those passions to which a corrupt administration has given birth; 52 that the terror of the punishments in this world are too feeble against necessity; 53 against criminal habits; against dangerous organisation uncorrected by education.

54 In many countries the morals of the people are neglected; 55 the government is occupied only with rendering them timid; with making them miserable.

56 Human is almost everywhere a slave; it must then follow of necessity, that you are base, interested, dissimulating, without honour, 57 in a word that you have the vices of the state of which you are a citizen. 58 Almost everywhere you are deceived; encouraged in ignorance; prevented from cultivating your reason; 59 of course you must be stupid, irrational, and wicked almost everywhere you sees vice applauded, and crime honoured; 60 thence you concludes vice to be a good; virtue, only a useless sacrifice of yourself: 61 almost every where you are miserable, therefore you injures your fellow-people in a fruitless attempt to relieve your own anguish: 62 it is in vain to show you heaven in order to restrain you; your views presently descend again to earth; you are willing to be happy at any price; 63 therefore, the laws which have neither provided for your

instruction, for your morals, nor your happiness, menace you uselessly; 64 you plunges on in your pursuits, and these ultimately punish you, for the unjust negligence of your legislators. 65 If politics more enlightened, did seriously occupy itself with the instruction, with the welfare of the people; 66 if laws were more equitable; if each society, less partial, bestowed on its members the care, the education, and the assistance which they have a right to expect; 67 if governments less covetous, and more vigilant, were sedulous to render their subjects more happy, there would not be seen such numbers of malefactors, of robbers, of murderers, who everywhere infest society; 68 they would not be obliged to destroy life, in order to punish wickedness; which is commonly ascribable to the vices of their own institutions: 69 it would be unnecessary to seek in another life for fanciful chimeras, which always prove abortive against the infuriate passions; against the real wants of human. 70 In short, if the people were instructed, they would be more happy; politics would no longer be reduced to the exigency of deceiving them, in order to restrain them; 71 nor to destroy so many unfortunates, for having procured necessaries, at the expense of their hard-hearted fellow-citizens.

72 When it shall be desired to enlighten human, let you always have truth laid before you. 73 Instead of kindling your imagination by the idea of those punishments that a future state has in reserve for you, let you be solaced-- 74 let you be succoured; or, at least, let you be permitted to enjoy the fruit of your labour-- 75 let not your substance be ravished from you by cruel imposts-- 76 let you not be discouraged from work, by finding all your labour inadequate to support your existence; 77 let you not be driven into that idleness, that will surely lead you on to crime: 78 let you consider your present existence, without carrying your views to that which may attend you after your death; 79 let your industry be excited-- let your talents be rewarded-- let you be rendered active, labourious, beneficent, and

virtuous, in the world you inhabits; 80 let it be shown to you, that your actions are capable of having an influence over your fellow-people. 81 Let you not be menaced with the tortures of a future existence when you shall be no more; 82 let you behold society armed against those who disturb its repose; 83 let you see the consequence of the hatred of your associates; let you learn to feel the value of their affection; 84 let you be taught to esteem yourself; let you understand, that to obtain it, you must have virtue; 85 above all, that the virtuous person in society has nothing to fear, but everything to hope.

86 If it be desired to form honest, courageous, industrious citizens, who may be useful to their country, let them beware of inspiring human from your infancy with an ill-founded dread of death; 87 of amusing your imagination with marvellous fables; 88 of occupying your mind with your destiny in a future life, quite useless to be known, which has nothing in common with your real felicity. 89 Let them speak of immortality to intrepid, noble souls; 90 let them show it as the price of their labours to energetic minds, who are solely occupied with virtue; 91 who springing forward beyond the boundaries of their actual existence-- 92 who, little satisfied with eliciting the admiration, with gaining the love of their contemporaries, are will also to wrest the homage, to secure the affection of future races. 93 Indeed, this is an immortality to which genius, talents, above all virtue, has a just right to pretend; 94 do not therefore let them censure-- do not let them endeavour to stifle so noble a passion in human; 95 which is founded upon your nature; which is so calculated to render you happy; from which society gather the most advantageous fruits.

96 The idea of being buried in total oblivion, of having nothing in common after your death with the beings of your species; 97 of losing all possibility of again having any influence over them, is a thought extremely painful to human; it is above all afflicting to those who possess an ardent imagination. 98

The desire of immortality, or of living in the memory of your fellow people, was always the passion of great souls; 99 it was the motive to the actions of all those who have played a great part on the earth. 100 Heroes whether virtuous or criminal, philosophers as well as conquerors, people of genius and people of talents, 101 those sublime personages who have done honour to their species, as well as those illustrious villains who have debased and ravaged it, have had an eye to posterity in all their enterprises; 102 have flattered themselves with the hope of acting upon the souls of humans, even when they themselves should no longer exist. 103 If human in general does not carry own views so far, you are at least sensible to the idea of seeing yourself regenerated in your children; 104 whom you knows are destined to survive you; to transmit your name; to preserve your memory; to represent you in society; 105 it is for them that you rebuilds your cottage; it is for them that you plants the tree which your eyes will never behold in its vigour; it is that they may be happy that you labours. 106 The sorrow which embitters the life of those rich people, frequently so useless to the world, when they have lost the hope of continuing their race, has its source in the fear of being entirely forgotten: 107 they feel that the useless person dies entirely. 108 The idea that your name will be in the mouths of people, the thought that it will be pronounced with tenderness, that it will be recollected with kindness, 109 that it will excite in their hearts favourable sentiments, is an illusion that is useful; is a vision suitable to flatter even those who know that nothing will result from it. 110 Human pleases the self with dreaming that you shall have power, that you shall pass for something in the universe, even after the term of your human existence; 111 you partakes by imagination in the projects, in the actions, in the discussions of future ages, and would be extremely unhappy if you believed yourself entirely excluded from their society. 112 The laws in all countries have entered into these views; they have so far been willing

to console their citizens for the necessity of dying, 113 by giving them the means of exercising their will, even for a long time after their death: 114 this condescension goes to that length, that the dead frequently regulate the condition of the living during a long series of years.

115 Everything serves to prove the desire in human of surviving yourself. 116 Pyramids, mausoleums, monuments, epitaphs, all show that you are willing to prolong your existence even beyond your decease. 117 You, are not insensible to the judgment of posterity; 118 it is for you the philosopher writes; it is to astonish you that the monarch erects sumptuous edifices, gorgeous palaces; 119 it is your praises, it is your commendations, that the great person already hears echo in your ears; 120 it is to you that the virtuous citizen appeals from unjust laws; from prejudiced contemporaries-- 121 happy chimera! generous illusion! mild vision! its power is so consoling, so bland, that it realises itself to ardent imaginations; 122 it is calculated to give birth, to sustain, to nurture, to mature enthusiasm of genius, constancy of courage, grandeur of soul, transcendency of talent; 123 its force is so gentle, its influence so pleasing, that it is sometimes able to repress the vices, to restrain the excesses of the most powerful people; 124 who are, as experience has shown, frequently very much disquieted for the judgment of their posterity; 125 from a conviction that this will sooner or later avenge the living of the foul injustice which they may be inclined to make them suffer.

126 No person, therefore, can consent to be entirely effaced from the remembrance of own fellows; 127 some people have not the temerity to place themselves above the judgment of the future human species, to degrade themselves in your eyes. 128 Where is the being who is insensible to the pleasure of exciting the tears of those who shall survive him or her; 129 of again acting upon their souls; of once more occupying their thoughts; of exercising upon them your power even from the bottom of your grave? 130 Let then eternal

silence be imposed upon those superstitious beings, upon those melancholy people, upon those furious bigots, 131 who censure a sentiment from which society derives so many real advantages; 132 let not humankind listen to those passionless philosophers who are willing to smother this great, this noble spring of your soul; 133 let you not be seduced by the sarcasms of those voluptuaries, who pretend to despise an immortality, towards which they lack the power to set forward; 134 the desire of pleasing posterity, of rendering your name agreeable to generations yet to come, is a respectable, a laudable motive, 135 when it causes you to undertake those things, of which the utility may be felt, of which the advantages may have an influence not only over your contemporaries, but also over nations who have not yet an existence. 136 Let you not treat as irrational, the enthusiasm of those beneficent beings, of those mighty geniuses, of those stupendous talents, whose keen, whose penetrating regards, have foreseen you even in their day; 137 who have occupied themselves for you; for your welfare; for your happiness; 138 who have desired your suffrage; who have written for you; who have enriched you by their discoveries; who have cured you of some of your errors. 139 Let you render them the homage which they have expected at your hands; 140 let you, at least, reverence their memory for the benefits you have derived from them; 141 let you treat their mouldering remains with respect, for the pleasure you receives from their labours; 142 let you pay to their ashes a tribute of grateful recollection, for the happiness they have been sedulous to procure for you. 143 Let you sprinkle with your tears, let you hallow with your remembrance, let you consecrate with your finest sensibilities, the urns of Socrates, of Phocion; of Archimedes; of Anaxarchus; 144 let you wash out the stain that their punishment has made on the human species; 145 let you expiate by your regret the Athenian ingratitude, the savage barbarity of Nicocreon; 146 let you learn by their example to dread superstitious

fanaticism; to hold political intolerance in abhorrence; 147 let you fear to harass merit; 148 let you be cautious how you insults virtue, in persecuting those who may happen to differ from you in your prejudices. 149 Let you strew flowers over the tombs of an Homer-- of a Tasso-- of a Shakespeare-- of a Milton-- of a Goldsmith; 150 let you revere the immortal shades of those happy geniuses, whose songs yet vibrate on your ears; whose harmonious lays excite in your soul the most tender sentiments; 151 let you bless the memory of all those benefactors to the people, who were the delight of the human race; 152 let you adore the virtues Of a Titus-- of a Trajan-- of an Antoninus-- of a Julian: 153 let you merit in your sphere, the eulogies of future ages; 154 let you always remember, that to carry with you to the grave the regret of your fellow people, you must display talents; evince integrity; practice virtue. 155 The funeral ceremonies of the most powerful monarchs, have rarely been wetted with the tears of the people, they have commonly drained them while living. 156 The names of tyrants excite the horror of those who bear them pronounced. 157 Tremble then cruel kings! ye who plunge your subjects into misery; 158 who bathe them with bitter tears-- who ravage nations-- who deluge the land with the vital stream-- who change the fruitful earth into a barren cemetery; 159 tremble for the sanguinary traits under which the future historian will paint you, to generations yet unborn: 160 neither your splendid monuments--your imposing victories--your innumerable armies, nor your sycophant courtiers, can prevent posterity from avenging their grandfathers; 161 from insulting your odious manes; from treating your execrable memories with scorn; 162 from showering their contempt on your transcendent crimes.

163 Not only human sees own dissolution with pain, but again, you wishes your death may be an interesting event for others. 164 But, as we have already said, you must have talents-- you must have beneficence--you must have virtue,

in order, that those who surround you, may interest themselves in your condition; 165 that those who survive you, may give regret to your ashes. 166 Is it, then, surprising if the greater number of people, occupied entirely with themselves, completely absorbed by their own vanity, devoted to their own puerile objects, 167 forever busied with the care of gratifying their vile passions, at the expense, perhaps, of their family happiness, 168 unheedful of the wants of a wife, unmindful of the necessity of their children, careless of the calls of friendship, 169 regardless of their duty to society, do not by their death excite the sensibilities of their survivors; or that they should be presently forgotten? 170 There is an infinity of monarchs of which history does not tell us anything, save that they have lived. 171 In despite of the inutility in which people for the most part pass their existence, maugre the little care they bestow, to render themselves dear to the beings who environ them; 172 notwithstanding the numerous actions they commit to displease their associates; 173 the self love of each individual, persuades you, that your death must be an interesting occurrence: 174 few people but think themselves an Euryalus in friendship, all expect to find a Nisus, 175 thus human's over-weening philauty shows you to say thus the order of things are overturned at your decease.

176 O mortal! feeble and vain! Dost thou not know the Sesostris's, the Alexanders, the Caesars are dead? 177 Yet the course of the universe is not arrested; the demise of those famous conquerors, afflicting to some few favoured slaves, was a subject of delight for the whole human race.

178 Dost thou then foolishly believe that thy talents ought to interest thy species, that they are of sufficient extent to put it into mourning at thy decease? 179 Alas! The Corneilles, the Lockes, the Newtons, the Boyles, the Harveys, the Montesquieus, the Sheridans are no more! 180 Regretted by a small number of friends, who have presently consoled themselves by their necessary avocations, their death was indifferent to the greater

number of their fellow citizens. 181 Darest thou then flatter thyself, that thy reputation, thy titles, thy riches, thy sumptuous repasts, thy diversified pleasures, will make thy funeral a melancholy event! 182 It will be spoken of by some few for two days, and do not be at all surprised: 183 learn that there have died in former ages, in Babylon, in Sardis, in Carthage, in Athens, in Rome, 184 millions of citizens more illustrious, more powerful, more opulent, more voluptuous, than thou art; 185 of whom, however, no one has taken care to transmit to thee even the names. 186 Be then virtuous, O man! in whatever station thy destiny assigns thee, and thou shalt be happy in thy life time; 187 do thou good and thou shalt be cherished; acquire talents and thou shalt be respected; 188 posterity shall admire thee, if those talents, by becoming beneficial to their interests, shall bring them acquainted with the name under which they formerly designated thy annihilated being. 189 But the universe will not be disturbed by thy loss; 190 and when thou comest to die, whilst thy wife, thy children, thy friends, fondly leaning over thy sickly couch, shall be occupied with the melancholy task of closing thine eyes, 191 thy nearest neighbour shall perhaps be exulting with joy!

192 Let not then human occupy yourself with your condition that may be to come, but let you sedulously endeavour to make yourself useful, to those with whom you lives; 193 let you for your own peculiar happiness render yourself dutiful to your parents-- faithful to your wife-- attentive to your children-- kind to your relations--- true to your friends-- lenient to your servants; 194 let you strive to become estimable in the eyes of your fellow citizens; 195 let you faithfully serve a country which assures to you your welfare; 196 let the desire of pleasing posterity, of meriting its applause, excite you to those labours that shall elicit their eulogies: 197 let a legitimate self-love, when you shall be worthy of it, make you taste in advance those commendations which you are willing to deserve; 198 let

you learn to love yourself-- to esteem yourself; 199 but never let you consent that concealed vices, that sacred crimes, shall degrade you in your own eyes; shall oblige you to be ashamed of your own conduct.

200 Thus disposed, let you contemplate your own decease with the same indifference, that it will be looked upon by the greater number of your fellows; 201 let you expect death with constancy; wait for it with calm resignation; 202 let you learn to shake off those vain terrors with which superstition, would overwhelm you; 203 let you leave to the enthusiast your vague hopes; to the fanatic your mad-brained speculations; 204 to the bigot those fears with which you ministers to your own melancholy; 205 but let your heart, fortified by reason, corroborated by a love of virtue, no longer dread a dissolution that will destroy all feeling.

206 Whatever may be the attachment human has to life, whatever may be your fear of death, it is every day witnessed, that habit, that opinion, that prejudice, are motives sufficiently powerful to annihilate these passions in your breast; 207 to make you brave danger; to cause you to hazard your existence. 208 Ambition, pride, jealousy, love, vanity, avarice, the desire of glory, that deference of opinion which is decorated with the sounding title of a point of honour, 209 have the efficacy to make you shut your eyes to danger; to laugh at peril; to push you on to death: 210 vexation, anxiety of mind, disgrace, want of success, softens to you its hard features; makes you regard it as a door that will afford you shelter from the injustice of humankind: 211 indigence, trouble, adversity, familiarises you with this death, so terrible to the happy. 212 The poor human, condemned to labour, inured to privations, deprived of the comforts of life, views its approach with indifference: 213 the unfortunate, when you are unhappy, when you are without resource, embraces it in despair; 214 the wretched accelerates its march as soon as you sees that happiness is no longer within your grasp.

NATURE

215 Human in different ages, in different countries, has formed opinions extremely various upon the conduct of those, who have had the temerity to put an end to their own existence. 216 Your ideas upon this subject, as upon all others, have taken their tone from your religion, 217 have been governed by your superstitious systems, have been modified by your political institutions. 218 The Greeks, the Romans, and other nations, which everything conspired to make intrepid, to render courageous, to lead to magnanimity, regarded as heroes, contemplated as Gods, those who voluntarily cut the thread of life. 219 In Hindoostan, the Brahmin yet knows how to inspire even women with sufficient fortitude to burn themselves upon the dead bodies of their husbands. 220 The Japanese, upon the most trifling occasion, takes no kind of difficulty in plunging a dagger into your bosom.

221 Among the people of western country, religion renders human less prodigal of life; it teaches that it is offensive to the Deity that you should destroy yourself. 222 Some moralists, abstracting the height of religious ideas, have held that it is never permitted to human to break the conditions of the covenant that you have made with society. 223 Others have looked upon suicide as cowardice; they have thought that it was weakness, 224 that it displayed pusillanimity, to suffer, yourself to be overwhelmed with the shafts of your destiny; 225 and have held that there would be much more courage, more elevation of soul, in supporting your afflictions, in resisting the blows of fate.

226 If nature be consulted upon this point, it will be found that all the actions of human, that feeble plaything in the hands of necessity, are indispensable; 227 that they depend on causes which move you in despite of yourself-- 228 that without your knowledge, make you accomplish at each moment of your existence some one of its decrees. 229 If the same power that obliges all intelligent beings to cherish their existence, renders that of human so painful, so cruel, that you finds it

insupportable you quits your species; 230 order is destroyed for you, you accomplishes a decree of Nature, that wills you shall no longer exist. 231 This Nature has laboured during thousands of years, to form in the bowels of the earth the iron that must number your days.

232 If the relation of human with Nature be examined, it will be found that your engagement was neither voluntary on your part, nor reciprocal on the part of Nature. 233 The volition of your will had no share in your birth; it is commonly against your will that you are obliged to finish life; 234 your actions are, as we have proved, only the necessary effects of unknown causes which determine your will. 235 You are, in the hands of Nature, that which a sword is in your own hands; 236 you can fall upon it without its being able to accuse you with breaking your engagements; or of stamping with ingratitude the hand that holds it: 237 human can only love own existence on condition of being happy; 238 as soon as the entire of Nature refuses you this happiness; as soon as all that surrounds you becomes incommodious to you, as soon as your melancholy ideas offer nothing but afflicting pictures to your imagination; you already exists no longer; 239 you are suspended in the void; you quits a rank which no longer suits you; in which you finds no one interest; 240 which offers you no protection; which overwhelms you with calamity; in which you can no more be useful either to yourself or to others.

241 If the covenant which unites human to society be considered, it will be obvious that every contract is conditional, must be reciprocal; 242 that is to say, supposes mutual advantages between the contracting parties. 243 The citizen cannot be bound to own country, to own associates, but by the bonds of happiness. Are these bonds cut asunder? 244 You are restored to liberty. Society, or those who represent it, do they use you with harshness, do they treat you with injustice, do they render your existence painful? 245 Does disgrace hold you out to the finger of scorn;

does indigence menace you in an obdurate world? 246 Perfidious friends, do they forsake you in adversity? An unfaithful wife, does she outrage your heart? Rebellious, ungrateful children, do they afflict your old age?

247 Have you placed your happiness exclusively on some object which it is impossible for you to procure? 248 Chagrin, remorse, melancholy, and despair, have they disfigured to you the spectacle of the universe? 249 In short, for whatever cause it may be: if you are not able to support your evils, you quits a world, 250 which from henceforth, is for you only a frightful desert you removes yourself for ever from a country you thinks no longer willing to reckon you amongst the number of her children-- 251 you quits a house that to your mind is ready to bury you under its ruins-- 252 you renounces a society, to the happiness of which you can no longer contribute; which your own peculiar felicity alone can render dear to you: 253 and could the person be blamed, who, finding yourself useless; who being without resources, in the town where destiny gave you birth, should quit it in chagrin, to plunge yourself in solitude? 254 Death appears to the wretched the only remedy for despair; 255 it is then the sword seems the only friend, the only comfort that is left to the unhappy: 256 as long as hope remains the tenant of your bosom-- as long as your evils appear to you at all supportable-- as long as you flatters yourself with seeing them brought to a termination-- 257 as long as you finds some comfort in existence, however slender, you will not consent to deprive yourself of life: 258 but when nothing any longer sustains in you the love of this existence, then to live, is to you the greatest of evils; to die, the only mode by which you can avoid the excess of despair. 259 This has been the opinion of many great people: Seneca, the moralist, whom Lactantius calls the divine Pagan, 260 who has been praised equally by St. Austin and St. Augustine, endeavours by every kind of

argument to make death a matter of indifference to human.

261 Cato has always been commended, because he would not survive the cause of liberty; for that he would not live a slave. 262 Curtius, who rode voluntarily into the gap, to save his country, has always been held forth as a model of heroic virtue. 263 Is it not evident, that those martyrs who have delivered themselves up to punishment, have preferred quitting the world to living in it contrary to their own ideals of happiness?

264 When Samson wished to be revenged on the Philistines, did he not consent to die with them as the only means? 265 If your country is attacked, do you not voluntarily sacrifice your lives in its defence?

266 That society who has not the ability, or who is not willing to procure human any one benefit, loses all its rights over its citizens; 267 Nature, when it has rendered your existence completely miserable, has in fact, ordered you to quit it: 268 in dying you does no more than fulfil one of Her decrees, as you did when you drew your first breath. 269 To you who is fearless of death, there is no evil without a remedy; for you who refuses to die, there yet exists benefits which attach you to this world; 270 in this case let you rally your powers-- let you oppose courage to a destiny that oppresses you-- let you call forth those resources with which Nature yet furnishes you; 271 Nature cannot have totally abandoned you, while She yet leaves you the sensation of pleasure; the hopes of seeing a period to your pains.

272 Human regulates own judgment on own fellows, only by your own peculiar mode of feeling; you deems as folly, you calls delirium all those violent actions which you believes but little commensurate with their causes; 273 or which appear to you calculated to deprive you of that happiness, towards which you supposes a being in the enjoyment of your senses, cannot cease to have a tendency: 274 you treats your associate as a weak creature, when you sees yourself affected with that which touches you but lightly; 275 or

when you are incapable of supporting those evils, which your self-love flatters you, you would yourself be able to endure with more fortitude. 276 You accuses with madness whoever deprives you of life, for objects that you thinks unworthy so dear a sacrifice; 277 you taxes yourself with phrenzy, because you have yourself learned to regard this life as the greatest blessing. 278 It is thus that you always erects yourself into a judge of the happiness of others-- of their mode of seeing-- of their manner of feeling: 279 a miser who destroys the self after the loss of own treasure, appears a fool in the eyes of those who is less attached to riches; 280 you does not feel, that without money, life to this miser is only a continued torture; that nothing in the world is capable of diverting the miser from own painful sensations: 281 the miser will proudly tell you, that in own place you had not done so much; 282 but to be exactly in the place of another person, it is needful to have your organisation-- your temperament-- your passions-- your ideas; 283 it is in fact needful to be that other; to be placed exactly in the same circumstances; to be moved by the same causes; 284 and in this case all people, like the miser, would sacrifice their life, after being deprived of the only source of their happiness.

285 You who deprives yourself of your existence, does not adopt this extremity, so repugnant to your natural tendency; 286 but when nothing in this world has the faculty of rejoicing you; when no means are left of diverting your affliction; when reason no longer acts; your misfortune whatever it may be, for you is real; 287 your organisation, be it strong, or be it weak, is your own, not that of another: 288 a person who is sick only in imagination, really suffers considerably; even troublesome dreams place you in a very uncomfortable situation. 289 Thus when a person kills the self, it ought to be concluded, that life, in the room of being a benefit, had become a very great evil to this individual; 290 that existence had lost all its charms in own eyes; that the

entire of Nature was to this person destitute of attraction; that it no longer contained anything that could seduce the self; 291 that after the comparison which one's own disturbed imagination had made of existence with non-existence, the latter appeared to the self preferable to the first.

292 Many will consider these maxims as dangerous; they certainly account why the unhappy cut the thread of life, in a manner not corresponding with the received prejudices; 293 but, nevertheless, it is a temperament soured by chagrin, a bilious constitution, a melancholy habit, a defect in the organisation, a derangement in the mind; 294 it is in fact necessity and not reasonable speculations, that breed in human the design of destroying the self. 295 Nothing invites you to this step so long as reason remains with you; or whilst you yet possesses hope, that sovereign balm for every evil: 296 as for the unfortunate, who cannot lose sight of own sorrows-- who cannot forget own pains-- who has own evils always present to own mind; 297 you are obliged to take counsel from these alone: besides, what assistance, what advantage can society promise to you, 298 from a miserable wretch reduced to despair; from a misanthrope overwhelmed with grief; from a wretch tormented with remorse, 299 who has no longer any motive to render you useful to others-- who has abandoned you-- who finds no more interest in preserving your life? 300 Frequently, those who destroy themselves are such, that had they lived, the offended laws must have ultimately been obliged to remove them from a society which they disgraced; from a country which they had injured.

301 As life is commonly the greatest blessing for human, it is to be presumed that you who deprives yourself of it, is compelled to it by an invincible force. 302 It is the excess of misery, the height of despair, the derangement of your brain, caused by melancholy, that urges human on to destroy the self. 303 Agitated by contrary impulsions, you are, as we have before said, obliged to follow a middle course that conducts you to

your death; 304 if human be not a free-agent, in any one instant of your life, you are again much less so in the act by which it is terminated.

305 It will be seen then, that you who kills yourself, does not, as it is pretended, commit an outrage on Nature. 306 You follows an impulse which has deprived you of reason; adopts the only means left you to quit your anguish; you goes out of a door which Nature leaves open to you; 307 you cannot offend in accomplishing a law of necessity: 308 the iron hand of this having broken the spring that renders life desirable to you; 309 which urged you to self-conservation, shows you that you ought to quit a rank or system where you finds yourself too miserable to have the desire of remaining. 310 Your country or your family have no right to complain of a member, whom it has no means of rendering happy; 311 from whom consequently they have nothing more to hope: 312 to be useful to either, it is necessary you should cherish your own peculiar existence; that you should have an interest in conserving yourself-- 313 that you should love the bonds by which you are united to others-- that you should be capable of occupying yourself with their felicity-- that you should have a sound mind. 314 That the suicide should repent of own precipitancy, you should outlive yourself, 315 you should carry with you into your future residence, your organs, your senses, your memory, your ideas, your actual mode of existing, your determinate manner of thinking.

316 In short, nothing is more useful for society, than to inspire human with a contempt for death; to banish from your mind the false ideas you have of its consequences. 317 The fear of death can never do more than make cowards; 318 the fear of its consequences will make nothing but fanatics or melancholy beings, who are useless to themselves, unprofitable to others. 319 Death is a resource that ought not by any means to be taken away from oppressed virtue; which the injustice of human frequently reduces to despair. 320 If human feared death less, you would neither be a slave nor superstitious;

321 truth would find defenders more zealous; the rights of humankind would be more hardily sustained; 322 virtue would be intrepidly upheld: error would be more powerfully opposed; tyranny would be banished from nations: cowardice nourishes it, fear perpetuates it. 323 In fact, human can neither be contented nor happy whilst your opinions shall oblige you to tremble.

HUMAN CANNOT BE HAPPY WITHOUT VIRTUE

Paul Henri Thiery (Baron D'Holbach)

40 Utility, as has been before observed, ought to be the only standard of the judgment of human. 2 To be useful, is to contribute to the happiness of your fellow creatures; to be prejudicial, is to further their misery. 3 This granted, let us examine if the principles we have hitherto established be prejudicial or advantageous, useful or useless, to the human race. 4 If human unceasingly seeks after own happiness, you can only approve of that which procures for you your object, or furnishes you the means by which it is to be obtained.

5 What has been already said will serve in fixing our ideas upon what constitutes this happiness: 6 it has been already shown that it is only continued pleasure: 7 but in order that an object may please, it is necessary that the impressions it makes, the perceptions it gives, the ideas which it leaves, in short, that the motion it excites in human should be analogous to your organisation; 8 conformable to your temperament; assimilated to your individual nature:--modified as it is by habit, determined as it is by an infinity of circumstances, 9 it is necessary that the action of the object by which you are moved, or of which the idea remains with you, far from enfeebling you, 10 far from annihilating your feelings, should tend to strengthen you; 11 it is necessary, that without fatiguing your mind, exhausting your faculties, or deranging your organs, this object should impart to your machine that degree of activity for which it

continually has occasion. 12 What is the object that unites all these qualities? 13 Where is the human whose organ are susceptible of continual agitation without being fatigued; without experiencing a painful sensation; without sinking? 14 Human is always willing to be warned of own existence in the most lively manner, as long as you can be so without pain. 15 What do I say? Human consents frequently to suffer, rather than not feel. 16 Human accustoms the self to a thousand things which at first must have affected you in a disagreeable manner; 17 but which frequently end either by converting themselves into wants, or by no longer affecting you any way: 18 of this truth tobacco, coffee, and above all brandy furnish examples: this is the reason you runs to see tragedies; that you witnesses the execution of criminals. 19 In short, the desire of feeling, of being powerfully moved, appears to be the principle of curiosity; 20 of that avidity with which human seizes on the marvellous; of that earnestness with which you clings to the supernatural; of the disposition you evinces for the incomprehensible. 21 Where, indeed, can you always find objects in Nature capable of continually supplying the stimulus requisite to keep you in activity, 22 that shall be ever proportioned to the state of your own organisation; which your extreme mobility renders subject to perpetual variation? 23 The most lively pleasures are always the least durable, seeing they are those which exhaust you most.

24 That person should be uninterruptedly happy, it would be requisite that your powers were infinite; 25 it would require that to your mobility you joined a vigour, attached a solidity, which nothing could change; 26 or else it is necessary that the objects from which you receives impulse, should either acquire or lose properties, 27 according to the different states through which your machine is successively obliged to pass; 28 it would need that the essences of beings should be changed in the same proportion as your dispositions; 29 should be submitted to the

continual influence of a thousand causes, which modify you without your knowledge, and in despite of yourself. 30 If, at each moment, your machine undergoes changes more or less marked, which are ascribable to the different degrees of elasticity, of density, of serenity of the atmosphere; 31 to the portion of igneous fluid circulating through your blood; to the harmony of your organs; to the order that exists between the various parts of your body; 32 if, at every period of your existence, your nerves have not the same tensions, your fibres the same elasticity, your mind the same activity, your imagination the same ardour, 33 it is evident that the same causes in preserving to you only the same qualities, cannot always affect you in the same manner. 34 Here is the reason why those objects that please you in one season displease you in another: these objects have not themselves sensibly changed; 35 but your organs, your dispositions, your ideas, your mode of seeing, your manner of feeling, have changed:-- such is the source of human's inconstancy.

36 If the same objects are not constantly in that state competent to form the happiness of the same individual, it is easy to perceive that they are yet less in a capacity to please all humans; 37 or that the same happiness cannot be suitable to all. 38 Beings already various by their temperament, unlike in their faculties, diversified in their organisation, 39 different in their imagination, dissimilar in their ideas, of distinct opinions, of contrary habits, 40 which an infinity of circumstances, whether physical or moral, have variously modified, must necessarily form very different notions of happiness. 41 Those of a MISER cannot be the same as those of a PRODIGAL; those of a VOLUPTUARY, the same as those of one who is PHLEGMATIC; 42 those of an intemperate, the same as those of a rational person, who husbands your health. 43 The happiness of each, is in consequence composed of your natural organisation, and of those circumstances, of those habits, of

those ideas, whether true or false, that have modified you: 44 this organisation and these circumstances, never being the same in any two people, it follows, that what is the object of one person's views, must be indifferent, or even displeasing to another; 45 thus, as we have before said, no one can be capable of judging of that which may contribute to the felicity of own fellow human.

46 Interest is the object to which each individual according to own temperament and your own peculiar ideas, attaches your welfare; 47 from which it will be perceived that this interest is never more than that which each contemplates as necessary to your happiness. 48 It must, therefore, be concluded, that no human is totally without interest. 49 That of the miser to amass wealth; that of the prodigal to dissipate it: the interest of the ambitious is to obtain power; 50 that of the modest philosopher to enjoy tranquillity; the interest of the debauchee is to give the self up, without reserve, to all sorts of pleasure; 51 that of the prudent person, to abstain from those which may injure the self: the interest of the wicked is to gratify own passions at any price: 52 that of the virtuous to merit by own conduct the love, to elicit by own actions the approbation of others; to do nothing that can degrade the self in one's own eyes.

53 Thus, when it is said that Interest is the only motive of human actions; it is meant to indicate that each person labours after one's own manner, to one's own peculiar happiness; 54 that you places it in some object either visible or concealed; either real or imaginary; that the whole system of your conduct is directed to its attainment. 55 This granted, no human can be called disinterested; this appellation is only applied to those of whose motives we are ignorant; or whose interest we approve.

56 Thus the person who finds a greater pleasure in assisting own friends in misfortune than preserving in own coffers useless treasure, is called generous, faithful, and disinterested; 57 in like manner all

humans are denominated disinterested, who feel their glory far more precious than their fortune. 58 In short, all humans are designated disinterested who place their happiness in making sacrifices which human considers costly, 59 because you does not attach the same value to the object for which the sacrifice is made.

60 Human frequently judges very erroneously of the interest of others, either because the motives that animate them are too complicated for you to unravel; 61 or because to be enabled to judge of them fairly, it is needful to have the same eyes, the same organs the same passions, the same opinions: 62 nevertheless, obliged to form your judgment of the actions of humankind, by their effect on yourself, you approves the interest that actuates them whenever the result is advantageous for your species: 63 thus, you admires valour, generosity, the love of liberty, great talents, virtue, you then only approves of the objects in which the beings you applauds have placed their happiness; 64 you approves these dispositions even when you are not in a capacity to feel their effects; but in this judgment you are not yourself disinterested; 65 experience, reflection, habit, reason, have given you a taste for morals, and you finds as much pleasure in being witness to a great and generous action, 66 as the person of virtue finds in the sight of a fine picture of which you are not the proprietor.

67 You who has formed to yourself a habit of practising virtue, is a person who has unceasingly before your eyes the interest that you have in meriting the affection, 68 in deserving the esteem, in securing the assistance of others, as well as to love and esteem yourself: 69 impressed with these ideas which have become habitual to you, you abstains even from concealed crimes, since these would degrade you in your own eyes: 70 you resembles a person who having from own infancy contracted the habit of cleanliness, would be painfully affected at seeing the self dirty, even when no one should witness it. 71 The honest person is one to whom truth has

shown your interest or your happiness in a mode of acting that others are obliged to love, are under the necessity to approve for their own peculiar interest.

72 These principles, duly developed, are the true basis of morals; nothing is more chimerical than those which are founded upon imaginary motives placed out of Nature; 73 or upon innate sentiments; which some speculators have regarded as anterior to human's experience; 74 as wholly independant of those advantages which result to you from its use: 75 it is the essence of human to love yourself; to tend to your own conservation; to seek to render your existence happy: 76 thus interest, or the desire of happiness, is the only real motive of all your actions; 77 this interest depends upon your natural organisation, rests itself upon your wants, is bottomed upon your acquired ideas, springs from the habits you have contracted: 78 you are without doubt in error, when either a vitiated organisation or false opinions show you your welfare in objects either useless or injurious to yourself, as well as to others; 79 you marches steadily in the paths of virtue when true ideas have made you rest your happiness on a conduct useful to your species; 80 in that which is approved by others; which renders you an interesting object to your associates. 81 Morals would be a vain science if it did not incontestably prove to human that your interest consists in being virtuous. 82 Obligation of whatever kind, can only be founded upon the probability or the certitude of either obtaining a good or avoiding an evil.

83 Indeed, in no one instant of your duration, can a sensible, an intelligent being, either lose sight of your own preservation or forget your own welfare; 84 you owes happiness to yourself; but experience quickly proves to you, that bereaved of assistance, quite alone, left entirely to yourself, you cannot procure all those objects which are requisite to your felicity: 85 you lives with sensible, with intelligent beings, occupied like yourself with their own peculiar happiness; 86 but capable of assisting you, in obtaining those

objects you most desires; you discovers that these beings will not be favourable to your views, 87 but when they find their interest involved; from which you concludes, that your own happiness demands, 88 that your own wants render it necessary you should conduct yourself at all times in a manner suitable to conciliate the attachment, 89 to obtain the approbation, to elicit the esteem, to secure the assistance of those beings who are most capacitated to further your designs. 90 You perceives, that it is human who is most necessary to the welfare of human: 91 that to induce you to join in your interests, you ought to make your find real advantages in recording your projects: 92 but to procure real advantages to the beings of the human species, is to have virtue; 93 the reasonable person, therefore, is obliged to feel that it is your interest to be virtuous. 94 Virtue is only the art of rendering yourself happy, by the felicity of others. 95 The virtuous person is one who communicates happiness to those beings who are capable of rendering your own condition happy; 96 who are necessary to your conservation; who have the ability to procure you a felicitous existence.

97 Such, then, is the true foundation of all morals; merit and virtue are founded upon the nature of human; have their dependence upon your wants. 98 It is virtue alone that can render you truly happy: without virtue society can neither be useful nor indeed subsist; 99 it can only have real utility when it assembles beings animated with the desire of pleasing each other, and disposed to labour to their reciprocal advantage: 100 there exists no comfort in those families whose members are not in the happy disposition to lend each other mutual succours; 101 who have not a reciprocity of feeling that stimulates them to assist one another; 102 that induces them to cling to each other, to support the sorrows of life; to unite their efforts, to put away those evils to which Nature has subjected them; 103 the conjugal bonds, are sweet only in proportion as they identify the interest of two beings, united by the want of

legitimate pleasure; 104 from whence results the maintenance of political society, and the means of furnishing it with citizens. 105 Friendship has charms only when it more particularly associates two virtuous beings; that is to say, animated with the sincere desire of conspiring to their reciprocal happiness. 106 In short, it is only by displaying virtue, that human can merit the benevolence, can win the confidence, can gain the esteem, of all those with whom you have relation; 107 in a word, no human can be independently happy.

108 Indeed, the happiness of each human individual depends on those sentiments to which you gives birth, 109 on those feelings which you nourishes in the beings amongst whom your destiny has placed you; 110 grandeur may dazzle them; power may wrest from them an involuntary homage; force may compel an unwilling obedience; 111 opulence may seduce people, may attract venal souls; but it is humanity, it is benevolence, it is compassion, it is equity, that unassisted by these, can without efforts obtain for you, 112 from those by whom you are surrounded, those delicious sentiments of attachments, those soothing feelings of tenderness, those sweet ideas of esteem, of which all reasonable people feel the necessity. 113 To be virtuous then, is to place your interest in that which accords with the interest of others; 114 it is to enjoy those benefits, to partake of that pleasure which you yourself diffuses over your fellows. 115 You whom, your nature, your education, your reflections, your habits, have rendered susceptible of these dispositions, 116 and to whom your circumstances have given you the faculty of gratifying them, becomes an interesting object to all those who approach you: 117 you enjoys every instant, you reads with satisfaction the contentment, you contemplates with pleasure the joy which you have diffused over all countenances: 118 your conjugal partner, your children, your friends, your workers greet you with gay, serene faces, indicative of that content, harbingers of that peace,

which you recognises for your own work: 119 everything that environs you is ready to partake your pleasures; to share your pains; cherished, respected, looked up to by others, 120 everything conducts you to agreeable reflections; you knows the rights you have acquired over their hearts; 121 you applauds yourself for being the source of a felicity that captivates all the world; 122 your own condition, your sentiments of self-love, become an hundred times more delicious when you sees them participated by all those with whom your destiny has connected you. 123 The habit of virtue creates for you no wants but those which virtue itself suffices to satisfy; 124 it is thus that virtue is always its own peculiar reward, that it remunerates itself with all the advantages which it incessantly procures for others.

125 It will be said, and perhaps even proved, that under the present constitution of things, virtue far from procuring the welfare of those who practice it frequently plunges human into misfortune; 126 often places continual obstacles to your felicity; that almost every where it is without recompence. 127 What do I say? A thousand examples could be adduced as evidence, that in almost every country it is hated, persecuted, obliged to lament the ingratitude of human nature. 128 I reply with avowing, that by a necessary consequence of the errors of your race, virtue rarely conducts human to those objects in which the uninformed make their happiness consist. 129 The greater number of societies, too frequently ruled by those whose ignorance makes them abuse their power,-- 130 whose prejudices render them enemies of virtue,--who flattered by sycophants, secure in the impunity their actions enjoy, commonly lavish their esteem, bestow their kindness, on none but the most unworthy objects; 131 reward only the most frivolous, recompense none but the most prejudicial qualities; and hardly ever accord that justice to merit which is unquestionably its due. 132 But the truly honest person, is neither ambitious of remuneration, nor

sedulous of the suffrages of a society thus badly constituted: 133 contented with domestic happiness, you seeks not to augment relations, which would do no more than increase your danger; 134 you knows that a vitiated community is a whirlwind, with which an honest person cannot co-order the self: 135 you therefore steps aside; quits the beaten path, by continuing in which you would infallibly be crushed. 136 You does all the good of which you are capable in your sphere; you leaves the road free to the wicked, who are willing to wade through its mire; 137 you laments the heavy strokes they inflict on themselves; you applauds mediocrity that affords you security: you pities those nations made miserable by their errors,-- 138 rendered unhappy by those passions which are the fatal but necessary consequence; you sees they contain nothing but wretched citizens, 139 who far from cultivating their true interest, far from labouring to their mutual felicity, far from feeling the real value of virtue, 140 unconscious how dear it ought to be to them, do nothing but either openly attack, or secretly injure it; 141 in short, who detests a quality which would restrain their disorderly propensities.

142 In saying that virtue is its own peculiar reward, it is simply meant to announce, that in a society whose views were guided by truth, trained by experience, conducted by reason, each individual would be acquainted with own real interests; 143 would understand the true end of association; would have sound motives to perform own duties; find real advantages in fulfilling them; 144 in fact, it would be convinced, that to render yourself solidly happy, you should occupy your actions with the welfare of your fellows; 145 by their utility merit their esteem, elicit their kindness, and secure their assistance.

146 In a well-constituted society, the government, the laws, education, example, would all conspire to prove to the citizen, that the nation of which you forms a part, is a whole that cannot be happy, that cannot subsist without virtue; 147 experience would, at each step, convince you that the welfare of its parts can only

result from that of the whole body corporate; 148 justice would make you feel, that no society, can be advantageous to its members, 149 where the volition of wills in those who act, is not so conformable to the interests of the whole, as to produce an advantageous re-action.

150 But, alas! by the confusion which the errors of human have carried into your ideas: 151 virtue disgraced, banished, and persecuted, finds not one of those advantages it has a right to expect: 152 human is indeed shown those rewards for it in a future life, of which you are almost always deprived in your actual existence. 153 It is thought necessary to deceive, considered proper to seduce, right to intimidate you, in order to induce you to follow that virtue which everything renders incommodious to you; 154 you are fed with distant hopes, in order to solicit you to practice virtue, while contemplation of the world makes it hateful to you; 155 you are alarmed by remote terrors, to deter you from committing evil, which your associates paint as amiable; which all conspires to render necessary.

156 It is thus that politics, thus that superstition, by the formation of chimeras, by the creation of fictitious interests pretend to supply those true, those real motives which Nature furnishes,-- 157 which experience would point out,-- which an enlightened government should hold forth,-- which the law ought to enforce,-- which instruction should sanction,-- which example should encourage,-- which rational opinions would render pleasant. 158 Human, blinded by own passions, not less dangerous than necessary, led away by precedent, authorised by custom, enslaved by habit, 159 pays no attention to these uncertain promises, is regardless of the menaces held out; 160 the actual interests of your immediate pleasures, the force of your passions, the inveteracy of your habits, always rise superior to the distant interests pointed out in your future welfare, 161 or the remote evils with which you are threatened; which always appear doubtful,

whenever you compares them with present advantages.

162 Thus superstition, far from making human virtuous by principle, does nothing more than impose upon you a yoke as severe as it is useless; 163 it is borne by none but enthusiasts, or by the pusillanimous; who, without becoming better, tremblingly champ the feeble bit put into their mouth; 164 who are either rendered unhappy by their opinions, or dangerous by their tenets; 165 indeed, experience, that faithful monitor, incontestably proves, that superstition is a dyke inadequate to resist the torrent of corruption, to which so many accumulated causes give an irresistible force: 166 Nay more, does not this superstition itself augment the public disorder, by the dangerous passions which it lets loose, by the conduct which it sanctions, by the actions which it consecrates? 167 Virtue, in almost every climate, is confined to some few rational souls, who have sufficient strength of mind to resist the stream of prejudice; 168 who are contented by remunerating themselves with the benefits they diffuse over society: 169 whose temperate dispositions are gratified with the suffrages of a small number of virtuous approvers; 170 in short, who are detached from those frivolous advantages which the injustice of society but too commonly accords only to baseness, 171 which it rarely bestows, except to intrigue, with which in general it rewards nothing but crime.

172 In despite of the injustice that reigns in the world, there are, however, some virtuous people in the bosom even of the most degenerate nations; 173 notwithstanding the general depravity, there are some benevolent beings, still enamoured of virtue; 174 who are fully acquainted with its true value; who are sufficiently enlightened to know that it exacts homage even from its enemies; 175 who to use the language of ECCLESIASTES, "rejoice in their own works;" 176 who are, at least, happy in possessing contented minds, who are satisfied with concealed pleasures, those internal recompences of which no earthly

power is competent to deprive them. 177 The honest person acquires a right to the esteem, has a just claim to the veneration, wins the confidence, gains the love, even of those whose conduct is exposed by a contrast with your own. 178 In short, vice is obliged to cede to virtue; of which it blushingly, though unwillingly, acknowledges the superiority. 179 Independent of this ascendancy so gentle, of this superiority so grand, of this pre-eminence so infallible, 180 when even the whole universe should be unjust to you, when even every tongue should cover you with venom, when even every arm should menace you with hostility, 181 there yet remains to the honest person the sublime advantage of loving your own conduct; the ineffable pleasure of esteeming yourself; the unalloyed gratification of diving with satisfaction into the recesses of your own heart; 182 the tranquil delight of contemplating your own actions with that delicious complacency that others ought to do, if they were not hood-winked. 183 No power is adequate to ravish from you the merited esteem of yourself; no authority is sufficiently potent to give it to you when you deserves it not; 184 the mightiest monarch cannot lend stability to this esteem, when it is not well founded; 185 it is then a ridiculous sentiment: it ought to be considered, it really is "vanity and vexation of spirit," it is not wisdom, but folly in the extreme; 186 it ought to be censured when it displays itself in a mode that is mortifying to its neighbour, in a manner that is troublesome to others; 187 it is then called ARROGANCE; it is called VANITY; 188 but when it cannot be condemned, when it is known for legitimate when it is discovered to have a solid foundation, 189 when it bottoms itself upon talents, when it rises upon great actions that are useful to the community, when it erects its edifice upon virtue; 190 even though society should not set these merits at their just price, it is NOBLE PRIDE, ELEVATION OF MIND, and GRANDEUR OF SOUL.

191 Of what consequence then, is it to listen to those superstitious beings,

those enemies to human's happiness, who have been desirous of destroying it, even in the inmost recesses of their own heart; 192 who have prescribed to you hatred of your follower; who have filled you with contempt for yourself; 193 who pretend to wrest from the honest person that self-respect which is frequently the only reward that remains to virtue, in a perverse world.

194 To annihilate in you this sentiment, so full in justice, this love of yourself, is to break the most powerful spring, to weaken the most efficacious stimulus, that urges you to act right; 195 that spurs you on to do good to your fellow mortals. 196 What motive, indeed, except it be this, remains for you in the greater part of human societies? 197 Is not virtue discouraged? Is not honesty contemned? Is not audacious crime encouraged? Is not subtle intrigue eulogised? Is not cunning vice rewarded? 198 Is not love of the public weal taxed as folly; exactitude in fulfilling duties looked upon as a bubble? 199 Is not compassion laughed to scorn? ARE NOT TRAITORS DISTINGUISHED BY PUBLIC HONOURS? 200 Is not negligence of morals applauded,-- sensibility derided,-- tenderness scoffed,-- conjugal fidelity jeered,-- sincerity despised,-- inviolable friendship treated with ridicule: 201 while seduction, adultery, hard-heartedness, punic faith, avarice, and fraud, stalk forth unabashed, decked in gorgeous array, lauded by the world? 202 Human must have motives for action: you neither acts well nor ill, but with a view to your own happiness: 203 that which you judges will conduce to this "consummation so devoutly to be wished," you thinks your interest; you does nothing gratuitously; 204 when reward for useful actions is withheld from you, you are reduced either to become as abandoned as others, or else to remunerate yourself with your own applause.

205 This granted; the honest person can never be completely unhappy; you can never be entirely deprived of the recompence which is your due; 206 virtue is competent to repay you

for all the benefits you may bestow on others; can amply make up to you all the happiness denied you by public opinion; 207 but nothing can compensate to you the want of virtue. 208 It does not follow that the honest person will be exempted from afflictions: like, the wicked, you are subject to physical evils; 209 you may pine in indigence; you may be deprived of friendship; you may be worn down with disease; you may frequently be the subject of calumny; you may be the victim to injustice; you may be treated with ingratitude; you may be exposed to hatred; 210 but in the midst of all your misfortunes, in the very bosom of your sorrows, in the extremity of your vexation, you finds support in yourself; 211 you are contented with your own conduct; you respects yourself; you feels your own dignity; you knows the equity of your rights; 212 you consoles yourself with the confidence inspired by the justness of your cause; you cheers yourself amidst the most sullen circumstances. 213 These supports are not calculated for the wicked; they avail you nothing: equally liable with the honest person to infirmities, 214 equally submitted to the caprices of your destiny, equally the sport of a fluctuating world, you finds the recesses of your own heart filled with dreadful alarms; 215 diseased with care; cankered with solitude; corroded with regret; gnawed by remorse; you dies within yourself; your conscience sustains you not but loads you with reproach; 216 your mind, overwhelmed, sinks beneath its own turpitude; your reflection is the bitter dregs of hemlock; 217 maddening anguish holds you to the mirror that shows you your own deformity; that recalls unhallowed deeds; gloomy thoughts rush on your too faithful memory; 218 despondence benumbs you; your body, simultaneously assailed on all sides, bends under the storm of your own unruly passions; 219 at last despair grapples you to her filthy bosom, you flies from yourself. 220 The honest person is not an insensible Stoic; virtue does not procure impassibility; honesty gives no exemption from misfortune, 221

but it enables you to bear cheerly up against it; to cast off despair, to keep your own company: 222 if you are infirm, if you are worn with disease, you have less to complain of than the vicious being who is oppressed with sickness, who is enfeebled by years; 223 if you are indigent, you are less unhappy in your poverty; 224 if you are in disgrace, you can endure it with fortitude, you are not overwhelmed by its pressure, like the wretched slave to crime.

225 Thus the happiness of each individual depends on the cultivation of your own temperament; 226 Nature makes both the happy and the unhappy; 227 it is culture that gives value to the soil Nature has formed; it is instruction that makes the fruit it produces palatable; It is reflection that makes it useful. 228 For human to be happily born, is to have received from Nature a sound body, organs that act with precision-- 229 a just mind, a heart whose passions are analogous, whose desires are conformable to the circumstances in which your destiny has placed you: 230 Nature, then, has done everything for you, when She has joined to these faculties the quantum of vigour, 231 the portion of energy, sufficient to enable you to obtain those Proper things, which your station, your mode of thinking, your temperament, have rendered desirable. 232 Nature has made you a fatal present, when She has filled your sanguinary vessels with an over-heated fluid; 233 when She has given you an imagination too active; when She has infused into you desires too impetuous; 234 when you have a hankering after objects either impossible or improper to be obtained under your circumstances; 235 or which you least you cannot procure without those incredible efforts, that either place your own welfare in danger or disturb the repose of society. 236 The most happy person, is commonly one who possesses a peaceful soul; who only desires those things which you can procure by labour, suitable to maintain your activity; 237 which you can obtain without causing those shocks, that are either too violent for society, or troublesome to your

associates. 238 A philosopher whose wants are easily satisfied, who is a stranger, to ambition, who is contented with the limited circle of a small number of friends, 239 is, without doubt a being much more happily constituted than an ambitious conqueror, 240 whose greedy imagination is reduced to despair by having only one world to ravage. 241 You who is happily born, or whom Nature has rendered susceptible of being conveniently modified, is not a being injurious to society: 242 it is generally disturbed by people who are unhappily born, whose organisation renders them turbulent; who are discontented with their destiny; 243 who are inebriated with their own licentious passions; who are infatuated with their own vile schemes; who are smitten with difficult enterprises; 244 who set the world in combustion, to gather imaginary benefits in order to attain which they must inflict the heaviest curses on humankind, but in which they make their own happiness consist. 245 An ALEXANDER requires the destruction of empires, nations to be deluged with blood, cities to be laid in ashes, its inhabitants to be exterminated, 246 to content that passion for glory, of which you have formed to yourself a false idea; but which your too ardent imagination, your too vehement mind anxiously thirsts after: 247 for a DIOGENES there needs only a tub with the liberty of appearing whimsical; 248 a SOCRATES wants nothing but the pleasure of forming disciples to virtue.

249 Human by your organisation is a being to whom motion is always necessary; you must therefore always desire it: 250 this is the reason why too much facility In procuring the objects of your search, renders them quickly insipid. 251 To feel happiness, it is necessary to make efforts to obtain it; 252 to find charms in its enjoyment, it is necessary that the desire should be whetted by obstacles; 253 you are presently disgusted with those benefits which have cost you but little pains. 254 The expectation of happiness, the labour requisite to procure it, the varied prospects it holds forth, the

multiplied pictures which your imagination forms to you, supply your brain with that motion for which it has occasion; 255 this gives impulse to your organs, puts your whole machine into activity, exercises your faculties, sets all your springs in play, 256 in a word, puts you into that agreeable activity, for the want of which the enjoyment of happiness itself cannot compensate you. 257 Action is the true element of the human mind; as soon as it ceases to act, it falls into disgust, sinks into lassitude. 258 Your soul has the same occasion for ideas, your stomach has for aliment.

259 Thus the impulse given you by desire, is itself a great benefit; it is to the mind what exercise is to the body; without it you would not derive any pleasure in the aliments presented to you; 260 it is thirst that renders the pleasure of drinking so agreeable; 261 life is a perpetual circle of regenerated desires and wants satisfied: repose is only a pleasure to you who labours; it is a source of weariness, the cause of sorrow, the spring of vice to you who has nothing to do. 262 To enjoy without interruption is not to enjoy anything: the person who has nothing to desire is certainly more unhappy than you who suffers.

263 These reflections, grounded upon experience, drawn from the fountain of truth, ought to prove to human, that good as well as evil depends on the essence of things. 264 Happiness to be felt cannot be continued. 265 Labour is necessary, to make intervals between your pleasures; 266 your body has occasion for exercise, to co-order you with the beings who surround you; 267 your heart must have desires; trouble alone can give you the right relish of your welfare; it is this which puts in the shadows, this which furnishes the true perspective to the picture of human life. 268 By an irrevocable law of your destiny, human is obliged to be discontented with own present condition; 269 to make efforts to change it; to reciprocally envy that felicity which no individual enjoys perfectly. 270 Thus the poor person envies the opulence of your richer neighbour, although this is frequently

more unhappy than your needy maligner; 271 thus the rich person views with pain the advantages of a poverty, which you sees active, healthy, and frequently jocund, even in the bosom of penury.

272 If human was perfectly contented, there would no longer be any activity in the world; 273 it is necessary that you should desire; it is requisite that you should act; it is incumbent you should labour, in order that you may be happy: such is the course of Nature of which the life consists in action. 274 Human societies can only subsist, by the continual exchange of those things in which human places own happiness. 275 The poor person is obliged to desire, you are necessitated to labour, that you may procure what you knows is requisite to the preservation of your existence; 276 the primary wants given to you by Nature, are to nourish you, clothe you, lodge you, and propagate your species; have you satisfied these? 277 You are quickly obliged to create others entirely new; or rather, your imagination only refines upon the first; 278 you seeks to diversify them; you are willing to give them fresh zest; arrived at opulence, when you have run over the whole circle of wants, when you have completely exhausted their combinations, you falls into disgust. 279 Dispensed from labour, your body amasses humours; destitute of desires, your heart feels a languor; 280 deprived of activity, you are obliged to participate your riches, with beings more active, more labourious than yourself: 281 these, following their own peculiar interests, take upon themselves the task of labouring for your advantage; 282 of procuring for your means to satisfy your want; of ministering to your caprices, in order to remove the languor that oppresses you. 283 It is thus the great, the rich excite the energies, give play to the activity, rouse the faculties, spur on the industry of the indigent; these labour to their own peculiar welfare by working for others: 284 thus the desire of ameliorating your condition, renders human necessary to your fellow human; 285 thus wants, always regenerating, never

satisfied, are the principles of life,-- the soul of activity,-- the source of health,-- the basis of society. 286 If each individual was competent to the supply of one's own exigencies, there would be no occasion for you to congregate in society; 287 but it is your wants, your desires, your whims, that place you in a state of dependence on others: 288 these are the causes that each individual, in order to further your own peculiar interest, is obliged to be useful to those, who have the capability of procuring for you the objects which you yourself has not. 289 A nation is nothing more than the union of a great number of individuals, connected with each other by the reciprocity of their wants; by their mutual desire of pleasure. 290 The most happy person is one who has the fewest wants, and who has the most numerous means of satisfying them. 291 The person who would be truly rich, has no need to increase own fortune, it suffices you should diminish your wants.

292 In the individuals of the human species, as well as in political society, the progression of wants, is a thing absolutely necessary; 293 it is founded upon the essence of human, it is requisite that the natural wants once satisfied, should be replaced by those which you calls Imaginary, or wants of the Fancy: 294 these become as necessary to your happiness as the first. 295 Custom, which permits the native American to go quite naked, obliges the more civilised inhabitant of Europe to clothe themselves; 296 the poor person contents the self with very simple attire, which equally serve you for winter and for summer, for autumn and for spring; 297 the rich person desires to have garments suitable to each mutation of these seasons; 298 you would experience pain if you had not the convenience of changing your raiment with every variation of your climate; 299 you would be wretched if you was obliged to wear the same habiliments in the heat of summer, which you uses in the winter; 300 in short, you would be unhappy if the expense and variety of your costume did not display to the surrounding multitude your opulence, mark your rank,

announce your superiority. 301 It is thus habit multiplies, the wants of the wealthy; 302 it is thus that vanity itself becomes a want which sets a thousand hands in, motion, a thousand heads to work, who are all eager to gratify its cravings; 303 in short, this very vanity procures for the necessitous human, the means of subsisting at the expense of your opulent neighbours. 304 You who is accustomed to pomp, who is used to ostentatious splendour, whose habits are luxurious, whenever you are deprived of these insignia of opulence, to which you have attached the idea of happiness, finds yourself just as unhappy as the needy wretch who has not wherewith to cover your nakedness. 305 The civilised nations of the present day were in their origin savages composed of erratic tribes,-- 306 mere wanderers who were occupied with war; employed in, the chace; painfully obliged to seek precarious subsistence by hunting in those woods which the industry of their successors has cleared; 307 which their labour has covered with yellow waving ears of nutritious corn; in time they have become stationary: they first applied themselves to Agriculture, afterwards to commerce: 308 by degrees they have refined on their primitive wants, extended their sphere of action, given birth to a thousand new wants, imagined a thousand new means to satisfy them; 309 this is the natural course, the necessary progression, the regular march of active beings, who cannot live without feeling; who to be happy, must of necessity diversify their sensations. 310 In proportion as human's wants multiply the means to satisfy them becomes more difficult, you are obliged to depend on a greater number of your fellow creatures; 311 your interest obliges you to rouse their activity; to engage them to concur with your views; 312 consequently you are obliged to procure for them those objects by which they can be excited; 313 you are under the necessity of contenting their desires, which increase like your own, by the very food that satisfies them. 314 The savage needs

only put forth own hand to gather the fruit that offers itself spontaneously to their reach: this you finds sufficient for your nourishment. 315 The opulent citizen of a flourishing society is obliged to set innumerable hands to work to produce the sumptuous repast; 316 the four quarters of the globe are ransacked to procure the far-fetched viands become necessary to revive your languid appetite; 317 the merchant, the sailor, the mechanic, leave nothing unattempted to flatter your inordinate vanity. 318 From this it will appear, that in the same proportion the wants of human are multiplied, you are obliged to augment the means to satisfy them. 319 Riches are nothing more than the measure of a convention, by the assistance of which human is enabled to make a great number of own fellows concur in the gratification of own desires; 320 by which you are capacitated to invite them, for their own peculiar interests, to contribute to your pleasures. 321 What, in fact, does the rich person do, except announce to the needy, that you can furnish them with the means of subsistence if they consent to lend themselves to your will? 322 What does the person in power, except show to others, that you are in a state to supply the requisites to render them happy? 323 Sovereigns, nobles, people of wealth, appear to be happy, only because they possess the ability, 324 are masters of the motives sufficient to determine a great number of individuals to occupy themselves with their respective felicity.

325 The more things are considered the more human will be convinced that your false opinion are the true source of your misery; 326 the clearer it will appear to you that happiness is so rare, 327 only because you attaches it to objects either indifferent or useless to your welfare; 328 which, when enjoyed, convert themselves into real evils; which afflict you; which become the cause of your misfortune. 329 Riches are indifferent in themselves, it is only by their application, by the purposes they compass, 330 that they either become objects of utility to human,

or are rendered prejudicial to your welfare. 331 Money, useless to the savage who understands not its value, is amassed by the miser, for fear it should be employed uselessly; 332 lest it should be squandered by the prodigal; or dissipated by the voluptuary; who make no other use of it than to purchase infirmities; to buy regret.

333 Pleasures are nothing for the person who is incapable of feeling them; 334 they become real evils when they are too freely indulged, when they are destructive to your health,-- 335 when they derange the economy of your machine,-- when they entail diseases on you and on your posterity,-- 336 when they make you neglect your duties,-- when they render you despicable in the eyes of others.

337 Power is nothing in itself, it is useless to human if you does not avail yourself of it to promote your own peculiar felicity, 338 by augmenting the happiness of your species; it becomes fatal to you as soon as you abuses it; it becomes odious whenever you employs it to render others miserable; 339 it is always the cause of your own misery whenever you stretches it beyond the due bounds prescribed by Nature.

340 For want of being enlightened on your true interest, the human who enjoys all the means of rendering the self completely happy, 341 scarcely ever discovers the secret of making those means truly subservient to one's own peculiar felicity: 342 the art of enjoying, is that which of all others is least understood; human should learn this art before you begins to desire; 343 the earth is covered with individuals who only occupy themselves with the care of procuring the means without ever being acquainted with the end. 344 All the world desire fortune, solicit power, seek after pleasure, yet very few, indeed, are those whom objects render truly happy.

345 It is quite natural in human, it is extremely reasonable, it is absolutely necessary, to desire those things which can contribute to augment the sum of your felicity. 346 Pleasure, riches, power, are objects worthy your ambition, deserving your most

strenuous efforts, when you have learned how to employ them; 347 when you have acquired the faculty of making them render your existence really more agreeable. 348 It is impossible to censure you who desires them, to despise you who commands them, but when to obtain them you employs odious means; 349 or when after you have obtained them you makes a pernicious use of them, injurious to yourself, prejudicial to others; 350 let you wish for power, let you seek after grandeur, let you be ambitious of reputation, when you can show just pretensions to them; 351 when you can obtain them, without making the purchase at the expense of your own repose, or that of the beings with whom you lives: 352 let you desire riches, when you knows how to make a use of them that is truly advantageous for yourself, really beneficial for others; 353 but never let you employ those means to procure them of which you may be ashamed; with which you may be obliged to reproach yourself; 354 which may draw upon you the hatred of your associates; or which may render you obnoxious to the castigation of society: 355 let you always recollect, that your solid happiness should rest its foundations upon its own esteem,-- upon the advantages you procures for others; 356 above all, never let you for a moment forget, that of all the objects to which your ambition may point, the most impracticable for a being who lives in society, is that of attempting to render you exclusively happy.

THE ERRORS OF HUMAN; UPON WHAT CONSTITUTES HAPPINESS

Paul Henri Thiery (Baron D'Holbach)

41 Reason by no means forbids human from forming capacious desires; 2 ambition is a passion useful to your species when it has for, its object the happiness of your race. 3 Great minds, elevated souls, are desirous of acting on an extended sphere; 4 geniuses who are powerful, beings who are enlightened, people who are beneficent, distribute very

widely their benign influence; 5 they must necessarily, in order to promote their own peculiar felicity, render great numbers happy. 6 So many nobles fail to enjoy true happiness only, because their feeble, narrow souls, are obliged to act in a sphere too extensive for their energies: 7 it is thus that by the supineness, the indolence, the incapacity of their chiefs, nations frequently pine in misery; 8 are often submitted to masters, whose exility of mind is as little calculated to promote their own immediate happiness, as it is to further that of their miserable subjects. 9 On the other hand, souls too vehement, too much inflamed, too active, are themselves tormented by the narrow sphere that confines them; 10 their ardour misplaced, becomes the scourge of the human race. 11 Alexander was a monarch who was equally injurious to the earth, equally discontented with own condition, as the indolent despot whom you dethroned. 12 The souls of neither were by any means commensurate with their sphere of action.

13 The happiness of human will never be more than the result of the harmony that subsists between your desires and your circumstances. 14 The sovereign power to you who knows not how to apply it to the advantage of your citizens, is as nothing; 15 it cannot even conduce to your own peculiar happiness. 16 If it renders you miserable, it is a real evil; if it produces the misfortune of a portion of the human race, it is a detestable abuse. 17 The most powerful princes are ordinarily such strangers to happiness, their subjects are commonly so unfortunate, 18 only because the first possess all the means of rendering themselves happy without ever giving them activity; 19 or because the only knowledge they have of them, is their abuse. 20 A wise person seated on a throne, would be the most happy of mortals. 21 A monarch is a person for whom own power, let it be of whatever extent, cannot procure other organs, other modes of feeling, than the meanest of own subjects; 22 if you have an advantage over them, it is by the grandeur, the

variety, the multiplicity of the objects with which you can occupy yourself; 23 which by giving perpetual activity to your mind, can prevent it from decay; from falling into sloth. 24 If your soul is virtuous, if your mind is expansive, your ambition finds continual food in the contemplation of the power you possesses, 25 to unite by gentleness, to consolidate by kindness, the will of your subjects with your own; 26 to interest them in your own conservation, to merit their affections,-- to draw forth the respect of strangers,-- to render luminous the page of history-- to elicit the eulogies of all nations-- to clothe the orphan,-- to dry the widow's tears. 27 Such are the conquests that reason proposes to all those whose destiny it is to govern the fate of empires; 28 they are sufficiently grand to satisfy the most ardent imagination, of a sublimity to gratify the most capacious ambition: 29 for a monarch they are paramount duties.--KINGS are the most happy of men, only because they have the power of making others happy; 30 because they possess the means of multiplying the causes of legitimate content with themselves.

31 The advantages of the sovereign power are participated by all those who contribute to the government of states. 32 Thus grandeur, rank, reputation, are desirable, are legitimate objects for all who are acquainted with the means of rendering them subservient to their own peculiar felicity; 33 they are useless, they are illegitimate to those ordinary people who have neither the energy nor the capacity to employ them in a mode advantageous to themselves; 34 they are detestable whenever to obtain them human compromises own happiness, when you implicates the welfare of society: 35 this society itself is in an error every time it respects people who only employ to its destruction, 36 a power, the exercise of which it ought never to approve but when it reaps from it substantial benefits.

37 Riches, useless to the miser, who is no more than their miserable gaoler; prejudicial to the debauchee, for whom they only procure

infirmities; 38 injurious to the voluptuary, to whom they only bring disgust-- whom they oppress with satiety; 39 can in the hands of the honest person produce unnumbered means of augmenting the sum of own happiness; 40 but before human covets wealth it is proper you should know how to employ it; 41 money is only a token, a representative of happiness; to enjoy it is so to use it as to make others happy: this is the great secret, this is the talisman, this is the reality. 42 Money, according to the compact of human, procures for you all those benefits you can desire; 43 there is only one, which it will not procure, that is, the knowledge how to apply it properly. 44 For human to have money, without the true secret how to enjoy it, is to possess the key of a commodious palace to which you are interdicted entrance; 45 to lavish it, prodigally, is to throw the key into the river; to make a bad use of it, is only to make it the means of wounding yourself. 46 Give the most ample treasures to the enlightened person, you will not be overwhelmed with them; 47 if you have a capacious mind, if you have a noble soul, you will only extend more widely your benevolence; 48 you will deserve the affection of a greater number of your fellow people; you will attract the love, you will secure the homage, of all those who surround you; 49 you will restrain yourself in your pleasures, in order that you may be enabled truly to enjoy them; 50 you will know that money cannot re-establish a soul worn out with enjoyment; 51 cannot give fresh elasticity to organs enfeebled by excess; cannot give fresh tension to nerves grown flaccid by abuse; cannot invigorate a body enervated by debauchery; 52 cannot corroborate a machine, from thenceforth become incapable of sustaining you, except by the necessity of privations; 53 you will know that the licentiousness of the voluptuary stifles pleasure in its source; that all the treasure in the world cannot renew your senses.

54 From this, it will be obvious, that nothing is more frivolous than the declamations of a gloomy philosophy against the desire of power; 55 nothing more absurd than

the rant of superstition against the pursuit of grandeur; 56 nothing more inconsistent than homilies against the acquisition of riches; 57 nothing more unreasonable than dogmas that forbid the enjoyment of pleasure. 58 These objects are desirable for human, whenever your situation allows you to make pretensions to them; 59 they are useful to society, conducive to public happiness, whenever you have acquired the knowledge of making them turn to your own real advantage; 60 reason cannot censure you, virtue cannot despise you, when in order to obtain them, you never travels out of the road of truth; 61 when in their acquisition, you wounds no one's interest; when you pursues only legitimate means: your associates will applaud you; your contemporaries will esteem you: 62 you will respect yourself, when you only employs their agency to secure your own happiness, and that of your fellows. 63 Pleasure is a benefit, it is of the essence of human to love, it is even rational when it renders your existence really valuable to yourself-- 64 when it does not injure you in your own esteem; when its consequences are not grievous to others. 65 Riches are the symbols of the great majority of the benefits of this life; they become a reality in the hands of the person who has the clew to their just application. 66 Power is the most sterling of all benefits, when you who is its depositary has received from Nature a soul sufficiently noble, 67 a mind sufficiently elevated, a heart sufficiently benevolent, faculties sufficiently energetic, 68 above all, when you have derived from education a true regard for virtue, 69 that sacred love for truth which enables you to extend your happy influence over whole nations; 70 which by this means you places in, a state of legitimate dependence on your will; 71 human only acquires the right of commanding people, when you renders them happy.

72 The right of human over one’s own fellow human can only be founded either upon the actual happiness you secures to others, or that which you gives others reason to

hope you will procure for them; 73 without this, the power you exercises would be violence, usurpation, manifest tyranny; 74 it is only upon the faculty of rendering others happy, that legitimate authority builds its structure; without this it is the "baseless fabric of a vision." 75 No person derives from Nature the right of commanding another; but it is voluntarily accorded to those, from whom you expect your welfare. 76 Government is the right of commanding, conferred on the sovereign only for the advantage of those who are governed. 77 Sovereigns are the defenders of the people, the guardians of the property, the protectors of the liberty of their subjects: 78 this is the price of their obedience; it is only on this condition these consent to obey; 79 government would not be better than a robbery whenever it availed itself of the powers confided to it, to render society unhappy. 80 The empire of religion is founded on the opinion human entertains of its having power to render nations happy; 81 government and religion are reasonable institutions; but only so, inasmuch as they equally contribute to the felicity of human: 82 it would be folly in you to submit yourself to a yoke from which there resulted nothing but evil. 83 It would be folly to expect that human should bind the self to misery; 84 it would be rank injustice to oblige you to renounce your rights without some corresponding advantage!

85 The authority which a father exercises over own family is only founded on the advantages which you are supposed to procure for it. 86 Rank, in political society, has only for its basis the real or imaginary utility of some citizens for which the others are willing to distinguish them-- agree to respect them-- consent to obey them. 87 The rich acquire rights over the indigent, the wealthy claim the homage of the needy, only by virtue of the welfare they are conditioned to procure them. 88 Genius, talents, science, arts, have rights over human, only in consequence of their utility; 89 of the delight they confer; of the advantages they procure for society.

NATURE

90 In a word, it is happiness, it is the expectation of happiness, it is its image that human cherishes-- that you esteems-- that you unceasingly adores. 91 Monarchs, the rich, the great, may easily impose on you, may dazzle you, may intimidate you, 92 but they will never be able to obtain the voluntary submission of your heart, which alone can confer upon them legitimate rights, 93 without they make you experience real benefits-- without they display virtue. 94 Utility is nothing more than true happiness; to be useful is to be virtuous; to be virtuous is to make others happy.

95 The happiness which human derives from them is the invariable, the necessary standard of your sentiments, 96 for the beings of your species; for the objects you desires; for the opinions you embraces; for those actions on which you decides. 97 You are the dupe of your prejudices every time you ceases to avail yourself of this standard to regulate your judgment. 98 You will never run the risk of deceiving yourself, when you shall examine strictly what is the real utility resulting to your species 99 from the religion, from the superstition, from the laws, from the institutions, from the inventions, from the various actions of all humankind.

100 A superficial view may sometimes seduce you; but experience, aided by reflection, will re-conduct you to reason, which is incapable of deceiving you. 101 This teaches you that pleasure is a momentary happiness, which frequently becomes an evil; 102 that evil is a fleeting trouble that frequently becomes a good: 103 it makes you understand the true nature of objects, enables you to foresee the effects you may expect; 104 it makes you distinguish those desires to which your welfare permits you to lend yourself, 105 from those to whose seduction you ought to make resistance. 106 In short, it will always convince you that the true interest of intelligent beings, who love happiness, who desire to render their own existence felicitous, 107 demands that they should root out all those phantoms, abolish all those

chimerical ideas, destroy all those prejudices, 108 which by traducing virtue, obstruct their felicity in this world.

109 If you consult experience, you will perceive that it is in illusions, in false opinions, rendered sacred by time, 110 that you ought to search out the source of that multitude of evils which almost everywhere overwhelms humankind. 111 From ignorance of natural causes, human has created imaginary causes; 112 not knowing to what cause to attribute thunder, human ascribed it to an imaginary being whom you called JUPITER; 113 imposture availing itself of this disposition, rendered these causes terrible to you; 114 these fatal ideas haunted you without rendering you better; made you tremble without either benefit to yourself or to others; 115 filled your mind with chimeras that opposed themselves to the progress of your reason; that prevented you from really seeking after your happiness. 116 Your vain fears rendered you the slave of those who deceived you, under pretence of consulting your welfare; 117 you committed evil, because they persuaded you that your gods demanded sacrifices; 118 you lived in misfortune, because they made you believe these gods condemned you to be miserable; 119 the slave of beings, to which your own imagination had given birth, you never dared to disentangle yourself from your chains; 120 the artful ministers of these divinities gave you to understand that stupidity, the renunciation of reason, sloth of mind, abjection of soul, were the sure means of obtaining eternal felicity.

121 Prejudices, not less dangerous, have blinded human upon the true nature of government. 122 Nations in general are ignorant of the true foundations of authority; 123 they dare not demand happiness from those leaders who are charged with the care of procuring it for them: 124 some have believed their sovereigns were gods disguised, who received with their birth the right of commanding the rest of humankind; 125 that they could at their pleasure dispose of the felicity of the people; that they were not accountable for

the misery they engendered. 126 By a necessary consequence of these erroneous opinions, politics have almost everywhere degenerated 127 into the fatal art of sacrificing the interests of the many, either to the caprice of an individual, or to some few privileged irrational beings.

128 In despite of the evils which assailed them, nations fell down in adoration before the idols they themselves had made: 129 foolishly respected the instruments of their misery; 130 had a stupid veneration for those who possessed the sovereign power of injuring them; obeyed their unjust will; lavished their blood; exhausted their treasure; 131 sacrificed their lives, to glut the ambition, to feed the cupidity to minister to the regenerated phantasms, to gratify the never-ending caprices of these people; 132 they bend the knee to established opinion, bowed to rank, yielded to title, to opulence, to pageantry, to ostentation: 133 at length victims to their prejudices, they in vain expected their welfare at the hands of people who were themselves unhappy from their own vices; 134 whose neglect of virtue, had rendered them incapable of enjoying true felicity; 135 who are but little disposed to occupy themselves with their prosperity: 136 under such chiefs their physical and moral happiness were equally neglected or even annihilated.

137 The same blindness may be perceived in the science of morals. 138 Superstition, which never had anything but ignorance for its basis, 139 which never had more than a disordered imagination for its guide, did not found ethics upon human's nature; 140 upon your relations with your fellows; upon those duties which necessarily flow from these relations; 141 it preferred, as more in unison with itself, founding them upon imaginary relations 142 which it pretended subsisted between you and those invisible powers it had so gratuitously imagined; 143 that were delivered by oracles which their priests had the address to make you believe spoke the will of the Divinity: 144 thus, TROPHONIUS, from his cave made affrightened mortals

tremble; shook the stoutest nerves; made them turn pale with fear; 145 his miserable, deluded supplicants, who were obliged to sacrifice to him, anointed their bodies with oil, bathed in certain rivers, 146 and after they had offered their cake of honey and received their destiny, became so dejected, so wretchedly forlorn, 147 that to this day their descendants, when they behold a malencholy human, exclaim, "He has consulted the oracle of Trophonius."

148 It was these invisible gods, which superstition always paints as furious tyrants, who were declared the arbiters of human's destiny; 149 the models of your conduct: when you was willing to imitate them, when you was willing to conform yourself to the lessons of their interpreters, 150 you became wicked, was an unsociable creature, an useless being or else a turbulent maniac-- a zealous fanatic. 151 It was these alone who profited by superstition, who advantaged themselves by the darkness in which they contrived to involve the human mind; 152 nations were ignorant of Nature; they knew nothing of reason; they understood no truth; they had only a gloomy superstition, without one certain idea of either morals or virtue. 153 When human committed evil against own fellow creature, you believed you had offended these gods; 154 but you also believed yourself forgiven, as soon as you had prostrated yourself before them; 155 as soon as you had by costly presents gained over the priest to your interest.

156 Thus superstition, far from giving a sure, far from affording a natural, far from introducing a known basis to morals, only rested it on an unsteady foundation; 157 made it consist in ideal duties impossible to be accurately understood. 158 What did I say? It first corrupted you, and your expiations finished by ruining yourself. 159 Thus when superstition was desirous to combat the unruly passions of human it attempted it in vain; 160 always enthusiastic, ever deprived of experience, it knew nothing of the true remedies: 161 those which it applied were disgusting, only suitable to make the sick revolt against them; 162 it made

them pass for divine, because they were not made of human; 163 they were inefficacious, because chimeras could effectuate nothing against those substantive passions to which motives more real, 164 impulsions more powerful, concurred to give birth, which everything conspired, to flourish in your heart.

165 The voice of superstition or of the gods, could not make itself heard amidst the tumult of society-- where all was in confusion-- 166 where the priest cried out to human, that you could not render yourself happy without injuring your fellow creatures, who happened to differ from you in opinion: 167 these vain clamours only made virtue hateful to you, because they always represented it as the enemy to your happiness; 168 as the bane of human pleasures: you consequently failed in the observation of your duties, because real motives were never held forth to induce you to make the requisite sacrifice; 169 the present prevailed over the future; the visible over the invisible; the known over the unknown: 170 human became wicked because everything informed human you must be so, in order to obtain the happiness after which you sighed.

171 Thus the sum of human misery was never diminished; on the contrary, it was accumulating either by your superstition, 172 by your government, by your education, by your opinions or by the institutions you adopted under the idea of rendering your condition more pleasant: 173 it not infrequently happened that the whole of these acted upon you simultaneously; you was then completely wretched. 174 It cannot be too often repeated, it is in error that human will find the true spring of those evils with which the human race is afflicted; 175 it is not Nature that renders you miserable; it is not Nature that makes you unhappy; 176 it is not an irritated Divinity who is desirous you should live in tears; it is not hereditary depravation that has caused you to be wicked; 177 it is to error, to long cherished, consecrated error, to error identified with your very existence, that these deplorable effects are to be ascribed.

NATURE

178 The sovereign good, so much sought after by some philosophers, announced with so much emphasis by others, 179 may be considered as a chimera, like unto that marvellous panacea which some adepts have been willing to pass upon humankind for an universal remedy. 180 All people are diseased; the moment of their birth delivers them over to the contagion of error; 181 but individuals are variously affected by it by a consequence of their natural organisation; of their peculiar circumstances. 182 If there is a sovereign remedy, which can be indiscriminately applied to the diseases of human, there is without doubt only ONE, 183 this catholic balsam is TRUTH, Which you must draw from Nature.

184 At the afflicting sight of those errors which blind the greater number of mortals-- 185 of those delusions which human is doomed to suck in with your mother's milk; 186 viewing with painful sensations those irregular desires, those disgusting propensities, by which you are perpetually agitated; 187 seeing the terrible effect of those licentious passions which torment you; of those lasting inquietudes which gnaw your repose; 188 of those stupendous evils, as well physical as moral, which assail you on every side: 189 the contemplator of humanity would be tempted to believe that happiness was not made for this world; 190 that any effort to cure those minds which everything unites to poison, would be a vain enterprise; 191 that it was an Augean stable, requiring the strength of another Hercules.

192 When you considers those numerous superstitions by which human is kept in a continual state of alarm-- 193 that divide you from your fellow-- that render you vindictive, persecuting, and irrational; 194 when you beholds the many despotic governments that oppress you; 195 when you examines those multitudinous, unintelligible, contradictory laws that torture you; the manifold injustice under which you groans; 196 when you turns your mind to the barbarous ignorance in which you are steeped, almost over

the whole surface of the earth; 197 when you witnesses those enormous crimes that debase society; 198 when you unmasks those rooted vices that render it so hateful to almost every individual; 199 you have great difficulty to prevent your mind from embracing the idea that misfortune is the only appendage of the human species; 200 that this world is made solely to assemble the unhappy; 201 that human felicity is a chimera, or at least a point so fugitive, that it is impossible it can be fixed.

202 Thus superstitious mortals, atrabilious people, beings nourished in melancholy, unceasingly see either Nature or its author exasperated against the human race; 203 they suppose that human is the constant object of heaven's wrath; 204 that you irritates it even by your desires: 205 that you renders yourself criminal by seeking a felicity which is not made for you: 206 struck with beholding that those objects which you covets in the most lively manner, are never competent to content your heart, 207 they have decried them as abominations, as things prejudicial to your interest, as odious to your gods; 208 they prescribe you abstinence from all search after them; that you should entirely shun them; 209 they have endeavoured to put to the rout all your passions, without any distinction even of those which are the most useful to yourself, 210 the most beneficial to those beings with whom you lives: 211 they have been willing that human should render the self insensible; 212 should become your own enemy; that you should separate yourself from your fellow creatures; 213 that you should renounce all pleasure; that you should refuse happiness; 214 in short, that you should cease to be a human, that you should become unnatural. 215 "Mortals!" have they said, "ye were born to be unhappy; the author of your existence has destined ye for misfortune; enter then into His views, and render yourselves miserable.

216 Combat those rebellious desires which have felicity for their object; 217 renounce those pleasures which it is your essence to love; 218 attach yourselves to nothing in this world;

by a society that only serves to inflame your imagination, to make you sigh after benefits you ought not to enjoy; 219 break up the spring of your souls; repress that activity that seeks to put a period to your sufferings; 220 suffer, afflict yourselves, groan, be wretched; such is for you the true road to happiness." 221 Blind physicians! Who have mistaken for a disease the natural state of human! they have not seen that your desires were necessary; 222 that your passions were essential to you; 223 that to defend yourself from loving legitimate pleasures; to interdict you from desiring them, is to deprive you of that activity which is the vital principle of society; 224 that to tell you to hate, to desire you to despise yourself, is to take from you the most substantive motive, that can conduct you to virtue. 225 It is thus, by its supernatural remedies, by its wretched panacea, superstition, far from curing those evils which render human decrepit, 226 which bend you almost to the earth, has only increased them; made them more desperate; 227 in the room of calming your passions, it gives them inveteracy; makes them more dangerous; renders them more venomous; 228 turns that into a curse which Nature has given you for your preservation; to be the means of your own happiness. 229 It is not by extinguishing the passions of human that you are to be rendered happier; it is by turning them into proper channels, by directing them towards useful objects, 230 which by being truly advantageous to yourself, must of necessity be beneficial to others.

231 In despite of the errors which blind the human race, in despite of the extravagance of human's superstition, 232 maugre the imbecility of your political institutions, notwithstanding the complaints, 233 in defiance of the murmurs you are continually breathing forth against your destiny, there are yet happy individuals on the earth. 234 Human has sometimes the felicity to behold sovereigns animated by the noble passion to render nations flourishing; 235 full of the laudable ambition to make their people happy; now and then you

encounters an ANTONINUS, a TRAJAN, a JULIAN, an ALFRED, a WASHINGTON; 236 you meets with elevated minds who place their glory in encouraging merit-- who rest their happiness in succouring indigence-- 237 who think it honourable to lend a helping hand to oppressed virtue: 238 you sees genius occupied with the desire of meriting the eulogies of posterity; 239 of eliciting the admiration of your fellow-citizens by serving them usefully, satisfied with enjoying that happiness you procures for others.

240 Let it not be believed that the human of poverty themselves are excluded from happiness: 241 mediocrity and indigence frequently procure for you advantages that opulence and grandeur are obliged to acknowledge; which title and wealth are constrained to envy: 242 the soul of the needy person, always in action, never ceases to form desires which your activity places within your reach; 243 whilst the rich, the powerful, are frequently in the afflicting embarrassment, of either not knowing what to wish for, 244 or else of desiring those objects which their listlessness renders it impossible for them to obtain. 245 The poor person's body, habituated to labour, knows the sweets of repose; 246 this repose of the body, is the most troublesome fatigue to you who is wearied with your idleness; 247 exercise, and frugality, procure for the one vigour, health, and contentment; 248 the intemperance and sloth of the other, furnish you only with disgust-- load you with infirmities. 249 Indigence sets all the springs of the soul to work; it is the mother of industry; from its bosom arises genius; 250 it is the parent of talents, the hot-bed of that merit to which opulence is obliged to pay tribute; to which grandeur bows its homage. 251 In short the blows of fate find in the poor person a flexible reed, who bends without breaking, 252 whilst the storms of adversity tear the rich person like the sturdy oak in the forest, up by the very roots.

253 Thus Nature is not a step-mother to the greater number of Her children. 254 You, whom fortune has placed in an obscure station is ignorant of that ambition which

devours the courtier; 255 knows nothing of the inquietude which deprives the intriguer of your rest; is a stranger to the remorse, an alien to the disgust, 256 is unconscious of the weariness of the human, who, enriched with the spoils of a nation, does not know how to turn them to own profit. 257 The more the body labours, the more the imagination reposes itself; 258 it is the diversity of the objects human runs over that kindles it; it is the satiety of those objects that causes you disgust; 259 the imagination of the indigent is circumscribed by necessity: you receives but few ideas: you are acquainted with but few objects: in consequence, you have but little to desire; 260 you contents yourself with that little: whilst the entire of Nature with difficulty suffices to satisfy the insatiable desires, 261 to gratify the imaginary wants of the human, plunged in luxury, who has run over and exhausted all common objects.

262 Those, whom prejudice contemplates; as the most unhappy of people, frequently enjoy advantages more real, happiness much greater, than those who oppress them-- 263 who despise them-- but who are nevertheless often reduced to the misery of envying them. 264 Limited desires are a real benefit: the person of meaner condition, in your humble fortune, desires only bread: 265 you obtain it by the sweat of your brow; you would eat it with pleasure if injustice did not sometimes render it bitter to you. 266 By the delirium of some governments, those who roll in abundance, without for that reason being more happy, 267 dispute with the cultivator even the fruits which the earth yields to the labour of your hands. 268 Princes sometimes sacrifice their true happiness, as well as that of their states, to these passions-- 269 to those caprices which discourage the people; which plunge their provinces in misery: which make millions unhappy, without any advantage to themselves. 270 Tyrants oblige the subjects to curse their existence; to abandon labour; take from them the courage of propagating a progeny who would be as unhappy as their fathers: 271

the excess of oppression sometimes obliges them to revolt; makes them avenge themselves by wicked outrages of the injustice it has heaped on their devoted heads: 272 injustice, by reducing indigence to despair, obliges it to seek in crime, resources, against its misery. 273 An unjust government, produces discouragement in the soul: 274 its vexations depopulate a country; under its influence, the earth remains without culture; 275 from thence is bred frightful famine, which gives birth to contagion and plague. 276 The misery of a people produce revolutions; soured by misfortunes, their minds get into a state of fermentation; the overthrow of an empire, is the necessary effect. 277 It is thus that physics and morals are always connected, or rather are the same thing.

278 If the bad morals of chiefs do not always produce such marked effects, at least they generate slothfulness, of which their effect is to fill society with mendicants; 279 to crowd it with malefactors; whose vicious course neither superstition nor the terror of the laws can arrest; 280 which nothing can induce to remain the unhappy spectators of a welfare they are not permitted to participate. 281 They seek a fleeting happiness at the expense even of their lives, 282 when injustice has shut up to them the road of labour, those paths of industry which would have rendered them both useful and honest.

283 Let it not then be said that no government can render all its subjects happy; 284 without doubt it cannot flatter itself with contenting the capricious humours of some idle citizens who are obliged to rack their imagination, to appease the disgust arising from lassitude: 285 but it can, and it ought to occupy itself with ministering to the real wants of the multitude, with giving a useful activity to the whole body politic. 286 A society enjoys all the happiness of which it is susceptible whenever the greater number of its members are wholesomely fed, decently clothed, comfortably lodged-- 287 in short when they can without an excess of toil beyond their strength, procure wherewith to satisfy those wants

which Nature has made necessary to their existence. 288 Their mind rests contented; as soon as they are convinced no power can ravish from them the fruits of their industry; 289 that they labour for themselves; that the sweat of their brow is for the immediate comfort of their own families. 290 By a consequence of human folly in some regions, whole nations are obliged to toil incessantly, 291 to waste their strength, to sweat under their burdens to undulate the air with their sighs, to drench the earth with their tears, 292 in order to maintain the luxury, to gratify the whims, to support the corruption of a small number of irrational beings; 293 of some few useless people to whom happiness has become impossible, because their bewildered imaginations no longer know any bounds. 294 It is thus that superstitious, thus that political errors have changed the fair face of Nature into a valley of tears.

295 For want of consulting reason, for want of knowing the value of virtue, for want of being instructed in their true interest, 296 for want of being acquainted with what constitutes solid happiness, in what consists real felicity, 297 the prince and the people, the rich and the poor, the great and the little, are unquestionably, frequently very far removed from content; 298 nevertheless if an impartial eye be glanced over the human race, it will be found to comprise a greater number of benefits than of evils.

299 No person is entirely happy, but you are so in detail; 300 those who make the most bitter complaints of the rigour of their fate, are however, held in existence by threads frequently imperceptible; 301 are prevented from the desire of quitting it by circumstances of which they are not aware. 302 In short, habit lightens to human the burden of one's own troubles; 303 grief suspended becomes true enjoyment; 304 every want is a pleasure in the moment when it is satisfied; 305 freedom from chagrin, the absence of disease, is a happy state which you enjoys secretly, without even perceiving it; 306 hope, which rarely abandons you

entirely, helps you to support the most cruel disasters. 307 The PRISONER laughs in own irons. The wearied VILLAGER returns singing to own cottage. 308 In short, the person who calls the self the most unfortunate, never sees death approach without dismay, at least, if despair has not totally disfigured Nature in your eyes.

309 As long as human desire the continuation of own being, you have no right to call yourself completely unhappy; 310 whilst hope sustains you, you still enjoys a great benefit. 311 If human was more just, in rendering to yourself an account of your pleasures, in estimating your pains, you would acknowledge that the sum of the first exceeds by much the amount of the last; 312 you would perceive that you keeps a very exact ledger of the evil, but a very unfaithful journal of the good: 313 indeed you would avow, that there are but few days entirely unhappy during the whole course of your existence. 314 Your periodical wants procure for you the pleasure of satisfying them; 315 your soul is perpetually moved by a thousand objects, of which, the variety, the multiplicity, the novelty, rejoices you, suspends your sorrows, divert your chagrin. 316 Your physical evils, are they violent? 317 They are not of long duration; they conduct you quickly to your end: the sorrows of your mind, when too powerful, conduct you to it equally. 318 At the same time Nature refuses you every happiness, She opens to you a door by which you quits life; does you refuse to enter it? 319 It is that you yet finds pleasure in existence. Are nations reduced to despair? Are they completely miserable? 320 They have recourse to arms; at the risque of perishing, they make the most violent efforts to terminate their sufferings.

321 Thus because you sees so many of your fellows cling to life, human ought to conclude they are not so unhappy as you thinks. 322 Then let you not exaggerate the evils of the human race, 323 but let you impose silence on that gloomy humour that persuades you these evils are without remedy; 324 let you only diminish by

degrees the number of your errors, your calamities will vanish in the same proportion; 325 you is not to conclude yourself infelicitous because your heart never ceases to form new desires, which you finds it difficult, sometimes impossible to gratify. 326 Since your body daily requires nourishment, let you infer that it is sound, that it fulfils its functions.

327 As long as you have desires, the proper deduction ought to be, that your mind is kept in the necessary activity; 328 you should gather from all this that passions are essential to you, that they constitute the happiness of a being who feels; 329 are indispensable to a human who thinks; are requisite to furnish you with ideas; 330 that they are a vital principle with a creature who must necessarily love that which procures you comfort, 331 who must equally desire that which promises you a mode of existence analogous to your natural energies. 332 As long as you exists, as long as the spring of your soul maintains its elasticity, this soul desires; 333 as long as it desires, you experiences the activity which is necessary to you; as long as you acts, so long you lives.

334 Human life may be compared to a river, of which the waters succeed each other, drive each other forward, and flow on without interruption; 335 these waters, obliged to roll over an unequal bed, encounter at intervals those obstacles which prevent their stagnation; 336 they never cease to undulate; sometimes they recoil, then again rush forward, thus continuing to run with more or less velocity, until they are restored to the ocean of Nature.

THOSE IDEAS WHICH ARE TRUE, OR FOUNDED UPON NATURE, ARE THE ONLY REMEDIES FOR THE EVILS OF HUMAN

Paul Henri Thiery (Baron D'Holbach)

42 Whenever human ceases to take experience for your guide, you falls into error. 2 Your errors become yet more dangerous, assume a more determined inveteracy, when they are clothed with the sanction of

superstition; 3 it is then that you hardly ever consents to return into the paths of truth; 4 you believes yourself deeply interested in no longer seeing clearly that which lies before you; 5 you fancies you have an essential advantage in no longer understanding yourself; 6 you supposes your happiness exacts that you should shut your eyes to truth.

7 If the majority of moral philosophers have mistaken the human heart-- if they have deceived themselves upon its diseases-- 8 if they have miscalculated the remedies that are suitable-- if the remedies they have administered have been inefficacious or even dangerous-- 9 it is because they have abandoned Nature--because they have resisted experience-- 10 because they have not had sufficient steadiness to consult their reason--because they have renounced the evidence of their senses-- 11 because they have only followed the caprices of an imagination either dazzled by enthusiasm or disturbed by fear; 12 because they have preferred the illusions it has held forth to the realities of Nature, who never deceives.

13 It is for want of having felt that an intelligent being cannot for an instant lose sight of your own peculiar conservation-- 14 of your particular interests, either real or fictitious-- 15 of your own welfare, whether permanent or transitory; 16 in short, of your happiness, either true or false. 17 It is for want of having considered that desires are natural, that passions are essential, that both the one and the other are motions necessary to the soul of human,-- 18 that the physicians of the human mind have supposed supernatural causes for your wanderings; 19 have only applied to your evils topical remedies, either useless or dangerous.

20 Indeed, in desiring you to stifle your desires, to combat your propensities, to annihilate your passions, they have done no more than give you sterile precepts, at once vague and impracticable; 21 these vain lessons have influenced no one; they have at most restrained some few mortals whom a quiet

imagination but feebly solicited to evil; 22 the terrors with which they have accompanied them have disturbed the tranquillity of those people who were moderate by their nature, 23 without ever arresting the ungovernable temperament of those who were inebriated by their passions, or hurried along; by the torrent of habit. 24 In short, the promises of superstition, as well as the menaces it holds forth, have only formed fanatics, 25 given birth to enthusiasts, who are either dangerous or useless to society, without ever making human truly virtuous; that is to say, useful to own fellow creatures.

26 These, empirics guided by a blind routine have, not seen that human as long as you exists, is obliged to feel, to desire, to have passions, 27 to satisfy them in proportion to the energy which your organisation has given you; 28 they have not perceived that education planted these desires in your heart-- that habit rooted them-- 29 that your government, frequently vicious, corroborated their growth-- 30 that public opinion stamped them with its approbation-- that experience render them necessary-- 31 that to tell people thus constituted to destroy their passions, was either to plunge them into despair or else to order them remedies too revolting for their temperament.

32 In the actual state of opulent societies, to say to a person who knows by experience that riches procure every pleasure, that you must not desire them; 33 that you must not make any efforts to obtain them; that you ought to detach yourself from them: is to persuade you to render yourself miserable. 34 To tell an ambitious person not to desire grandeur, not to covet power, which everything conspires to point out to you as the height of felicity, 35 is to order you to overturn at one blow the habitual system of your ideas; 36 it is to speak, to a deaf person. 37 To tell a lover of an impetuous temperament to stifle your passions for the object that enchants you, 38 is to make you understand, that you ought to renounce your happiness. 39 To oppose superstition

to such substantive, such puissant interests are to combat realities by chimerical speculations.

40 Indeed, if things were examined without prepossession, it would be found that the greater part of the precepts inculcated by superstition, 41 which fanatical dogmas hold forth, which, supernatural mortals gives to human, are as ridiculous as they are impossible to be put into practice.

42 To interdict passion to human, is to desire of you not to be a human creature; 43 to counsel an individual of a violent imagination to moderate own desires, is to advise you to change your temperament-- is to request your blood to flow more sluggishly. 44 To tell a person to renounce own habits, is to be willing that a citizen, accustomed to clothe the self, should consent to walk quite naked; 45 it would avail as much, to desire you to change the lineament of your face, to destroy your configuration, to extinguish your imagination, to alter the course of your fluids, 46 as to command you not to have passions which excite an activity analogous with your natural energy; 47 or to lay aside those which confirmed habit has made you contract; 48 which your circumstances, by a long succession of causes and effects, have converted into wants. 49 Such are, however, the so much boasted remedies which the greater number of moral philosophers apply to human depravity.

50 Is it, then surprising they do not produce the desired effect, or that they only reduce human to a state of despair 51 by the effervescence that results from the continual conflict which they excite between the passions of your heart and these fanciful doctrines; 52 between your vices and your virtues; between your habits and those chimerical fears with which superstition is at all times ready to overwhelm you? 53 The vices of society, aided by the objects of which it avails itself to what the desires of human, 54 the pleasures, the riches, the grandeur which your government holds forth to you as so many seductive magnets, 55 the advantage which education, the benefits which example, the interests

which public opinion render dear to you, 56 attract you on one side; whilst a gloomy morality, founded upon superstitious illusions, vainly solicit you on the other; 57 thus, superstition plunges you into misery; holds a violent struggle with your heart, without scarcely ever gaining the victory; 58 when by accident it does prevail against so many united forces, it renders you unhappy; it completely destroys the spring of your soul.

59 Passions are the true counterpoise to passions; then let you not seek to destroy them; 60 but let you endeavour to direct them; let you balance those which are prejudicial, by those which are useful to society. 61 Reason, the fruit of experience, is only the art of choosing those passions to which for your own peculiar happiness you ought to listen. 62 Education is the true art of disseminating the proper method of cultivating advantageous passions in the heart of human. 63 Legislation is the art of restraining dangerous passions; of exciting those which may be conducive to the public welfare. 64 Superstition is only the miserable art of planting the unproductive labour-- 65 of nourishing in the soul of human those chimeras, those illusions, those impostures, those incertitude from whence spring passions fatal to yourself as well as to others: 66 it is only by bearing up with fortitude against these that you can securely place yourself on the road to happiness. 67 True religion is the art of advocating truth-- of renouncing error-- of contemplating reality-- of drawing wisdom from experience-- 68 of cultivating human nature to own felicity, by teaching you to contribute to that of your associates; 69 in short it is reason, education, and legislation, united to further the great end of human existence, 70 by causing the passions of human to flow in a current genial to your own happiness.

71 Reason and morals cannot effect anything on humankind if they do not point out to each individual 72 that your true interest is attached to a conduct that is either useful to others or beneficial to yourself; 73 this

conduct to be useful must conciliate for you the benevolence, gain for you the favour of these beings who are necessary to your happiness: 74 it is then for the interest of humankind, for the happiness of the human race, 75 it is for the esteem of yourself, for the love of your fellows, for the advantages which ensue, 76 that education in early life should kindle the imagination of the citizen; 77 this is the true means of obtaining those happy results with which habit should familiarise you; which public opinion should render dear to your heart; 78 for which example ought continually to rouse your faculties; after which you should be taught to search with unceasing attention.

79 Government, by the aid of recompences ought to encourage you to follow this plan; 80 by visiting crime with punishment it ought to deter those who are willing to interrupt it.

81 Thus the hope of a true welfare, the fear of real evil, will be passions suitable to countervail those which by their impetuosity would injure society; 82 these last will at least become very rare, if instead of feeding human's mind with unintelligible speculations, in lieu of vibrating on your ears words void of sense, 83 you are only spoken to of realities, only shown those interests which are in unison with truth.

84 Human is frequently so wicked, only, because you almost always feel yourself interested in being so; 85 let you be more enlightened, more familiarised with truth, more accustomed to virtue, you will be made more happy; you will necessarily become better. 86 An equitable government, a vigilant administration, will presently fill the state with honest citizens; 87 it will hold forth to them present reasons for benevolence; real advantages in truth; palpable motives to be virtuous; 88 it will instruct them in their duties; it will foster them with its cares; it will allure them by the assurance of their own peculiar happiness; 89 its promises faithfully fulfilled-- its menaces regularly executed, will unquestionably have much more weight than those of a gloomy superstition, 90 which never

exhibits to their view other than illusory benefits, fallacious punishments, 91 which the person hardened in wickedness will doubt every time you finds an interest in questioning them: 92 present motives will tell more home to your heart than those which are distant and at best uncertain.

93 The vicious and the wicked are so common upon the earth, so pertinacious in their evil courses, so attached to their irregularities, 94 only because there are but few governments that make human feel the advantage of being just, the pleasure of being honest, the happiness of being benevolent on the contrary, 95 there is hardly any place where the most powerful interests do not solicit you to crime, 96 by favouring the propensities of a vicious organisation; by countenancing those appetencies which nothing has attempted to rectify or lead towards virtue.

97 A savage, who in own horde knows not the value of money, certainly would not commit a crime, 98 if when transplanted into civilized society, you should presently learn to desire it, should make efforts to obtain it, 99 and if you could without danger finish by stealing it; above all, if you had not been taught to respect the property of the beings who environ you. 100 The savages and the child are precisely in the same state; 101 it is the negligence of society, of those entrusted with their education, that renders both the one and the other wicked. 102 The son of a noble, from your infancy learns to desire power, at a riper age you becomes ambitious; 103 if you have the address to insinuate yourself into favour, you perhaps becomes wicked, 104 because in some societies you have been taught to know you may be so with impunity when you can command the ear of your sovereign. 105 It is not therefore Nature that makes human wicked, they are your institutions which determine you to vice. 106 The infant brought up amongst robbers, can generally become nothing but a malefactor; 107 if you had been reared with honest people, the

chance is you would have been a virtuous person.

108 If the source be traced of that profound ignorance in which human is with respect to your morals, to the motives that can give volition to your will, 109 it will be found in those false ideas which the greater number of speculators has formed to themselves, of human nature. 110 The science of morals has become an enigma which it is impossible to unrevel; 111 because human has made the self double; has distinguished own soul from own body; 112 supposed it of a nature different from all known beings, with modes of action, with properties distinct from all other bodies, 113 because you have emancipated this soul from physical laws, in order to submit it to capricious laws 114 emanating from people who have pretended they are derived from imaginary regions, placed at very remote distances: 115 metaphysicians seized upon these gratuitous suppositions, and by dint of subtilising them, have rendered them completely unintelligible.

116 These moralists have not perceived that motion is essential to the soul as well as to the living body; 117 that both the one and the other are never moved but by material, by physical objects; 118 that the want of each regenerate themselves unceasingly; 119 that the wants of the soul, as well as those of the body are purely physical; 120 that the most intimate, the most constant connection subsists between the soul and the body; 121 or rather they have been unwilling to allow that they ate only the same thing considered under different points of view.

122 Obstinate in their supernatural, unintelligible opinions, they have refused to open their eyes, 123 which would have convinced them that the body in suffering rendered the soul miserable; 124 that the soul afflicted undermined the body and brought it to decay; 125 that both the pleasures and agonies of the mind have an influence over the body, either plunge it into sloth or give it activity: 126 they have rather chosen to believe, that the soul draws its thoughts, whether pleasant or

gloomy, from its own peculiar sources, 127 while the fact is, that it derives its ideas only from material objects that strike on the physical organs; 128 that it is neither determined to gaiety nor led on to sorrow, but by the actual state, whether permanent or transitory, in which the fluids and solids of the body are found.

129 In short, they have been loath to acknowledge that the soul, purely passive, undergoes the same changes which the body experiences; 130 is only moved by its intervention; acts only by its assistance, receives its sensations, its perceptions, forms its ideas, 131 derives either its happiness or its misery from physical objects, through the medium of the organs of which the body is composed; 132 frequently without its own cognisance, often in despite of itself.

133 By a consequence of these opinions, connected with marvellous systems, or systems invented to justify them, they have supposed the human soul to be a free agent; 134 that is to say, that it has the faculty of moving itself; 135 that it enjoys the privilege of acting independent of the impulse received from exterior objects, through the organs of the body; 136 that regardless of these impulsions it can even resist them, and follow its own directions by its own energies; 137 that it is not only different in its nature from all other beings, but has a separate mode of action; 138 in other words, that it is an isolated point which is, not submitted to that uninterrupted chain of motion 139 which bodies communicate to each other in a nature, whose parts are always in action.

140 Smitten with their sublime notions, these speculators were not aware that in thus distinguishing the soul from the body and from all known beings, 141 they rendered it an impossibility to form any true ideas of it, either to themselves or to others: 142 they were unwilling to perceive the perfect analogy which is found between the manner of the soul's action and that by which the body is afflicted; 143 they shut their eyes to the necessary and continual correspondence which is found

between the soul and the body; 144 they perhaps did not perceive that like the body it is subjected to the motion of attraction and repulsion; 145 has an aptitude to be attracted, a disposition to repel, which is ascribable to qualities inherent in those physical substances, which give play to the organs of the body; 146 that the volition of its will, the activity of its passions, the continual regeneration of its desires, are never more than consequences of that activity 147 which is produced in the body by material objects which are not under its control; 148 that these objects render it either happy or miserable, active or languishing, contented or discontented, in despite of itself,-- 149 in defiance of all the efforts it is capable of making to render it otherwise; 150 they have rather chosen to seek in the heavens for unknown powers to set it in motion; 151 they have held forth to human distant, imaginary interests: 152 under the pretext of procuring for you future happiness, you have been prevented from labouring to own present felicity, 153 which has been studiously withheld from your knowledge: your regards have been fixed upon the heavens, that you might lose sight of the earth: 154 truth has been concealed from you; and it has been pretended you would be rendered happy by dint of terrors, always at an immense distance; 155 by means of shadows, with whose substances you could never come in contact; 156 of chimeras formed by your own bewildered imagination, which changed nearly as often as the governments to which you was submitted. 157 In short, hoodwinked by your fears, blinded by your own credulity, you was only guided through the flexuous paths of life, 158 by people blind as yourself, where both the one and the other were frequently lost in the maze.

A SUMMARY OF THE SYSTEM OF NATURE

Paul Henri Thiery (Baron D'Holbach)

43 From everything which has been hitherto said, it evidently results that all the errors of humankind, of

whatever nature they may be, arise from human's having renounced reason, 2 quitted experience, and refused the evidence of their senses that they might be guided by imagination, frequently deceitful; by authority, always suspicious. 3 Human will ever mistake own true happiness as long as you neglects to study Nature, 4 to investigate Her laws, to seek in Her alone the remedies for those evils which are the consequence of your errors: 5 you will be an enigma to yourself, as long as you shall believe yourself double; 6 that you are moved by an inconceivable spiritual power, of the laws and nature of which you are ignorant; 7 your intellectual, as well as your moral faculties, will remain unintelligible to you if you does not contemplate them with the same eyes as you does your corporeal qualities; 8 if you does not view them as submitted in everything to the same impulse, as governed by the same regulations.

9 The system of your pretended free agency is without support; 10 experience contradicts it every instant, and proves that you never ceases to be under the influence of necessity in all your actions; 11 this truth, far from being dangerous to human, far from being destructive of your morals, furnishes you with their true basis 12 by making you feel the necessity of those relations which subsists between sensible beings united in society: 13 who have congregated with a view of uniting their common efforts for their reciprocal felicity. 14 From the necessity of these relations, spring the necessity of your duties; 15 these point out to you the sentiments of love, which you should accord to virtuous conduct; 16 that aversion you should have for what is vicious; the horror you should feel for everything criminal.

17 From hence the true foundation of Moral Obligation will be obvious, which is only the necessity of taking means to obtain the end human proposes to the self by uniting in society; 18 in which each individual for your own peculiar interest, your own particular happiness, your own personal security, is obliged to

display dispositions 19 requisite to conciliate the affections of your associates; to hold a conduct suitable to the preservation of the community; to contribute by your actions to the happiness of the whole. 20 In a word, it is upon the necessary action and re-action of the human will upon the necessary attraction and repulsion of human's soul, that all your morals are bottomed: 21 it is the unison of your will, the concert of your actions, that maintains society; 22 it is rendered miserable by your discordance; it is dissolved by your want of union.

23 From what has been said, it may be concluded that the names under which human has designated the concealed causes acting in Nature, and their various effects, 24 are never more than necessity considered under different points of view, 25 with the original cause of which-- the great cause of causes-- you must ever remain ignorant. 26 It will be found that what you calls order, is a necessary consequence of causes and effects, 27 of which you sees, or believes you sees, the entire connection, the complete routine, which pleases you as a whole, when you finds it conformable to your existence.

28 In like manner it will be seen that what you calls confusion, is a consequence of like necessary causes and effects, 29 of which you loses the concatenation, which you therefore thinks unfavourable to yourself, or but little suitable to your being. 30 That you have designated by the names of Intelligence, those necessary causes that necessarily operate the chain of events which you comprises under the term order: 31 Divinity, those necessary but invisible causes which give play to Nature, in which everything acts according to immutable and necessary laws: 32 Destiny or fatality, the necessary connection of those unknown causes and, effects which you beholds in the world: 33 Chance, those effects which you are not able to foresee, or of which you are ignorant of the necessary connection, with their causes: 34 Intellectual and moral faculties, those effects and those modifications

necessary to an organised being, 35 whom you have supposed to be moved by an inconceivable agent; 36 who you have believed distinguished from your body, of a nature totally different from it, and which you have designated by the word SOUL. 37 In consequence, you have believed this agent immortal; not dissoluble like the body. 38 It has been shown that the marvellous doctrine of another life, is founded upon gratuitous suppositions, 39 contradicted by reflections, unsupported by experience, that may or may not be, without human's knowing anything on the subject.

40 It has been proved, that the hypothesis is not only useless to human's morals, but again, that it is calculated to palsy your exertions; 41 to divert you from actively pursuing the true road to your own happiness; 42 to fill you with romantic caprices; 43 to inebriate you with opinions prejudicial to your tranquillity; 44 in short, to lull to slumber the vigilance of legislators; 45 by dispensing them from giving to education, to the institutions, to the laws of society, all that attention, which it is the duty and for your interest they should bestow. 46 It must have been felt, that politics has unaccountably rested itself upon wrong opinions; 47 upon ideas little capable of satisfying those passions, which everything conspires to kindle in the heart of human; 48 who ceases to view the future, while the present seduces and hurries you along. 49 It has been shown, that contempt of death is an advantageous sentiment, calculated to inspire human's mind with courage; 50 to render you intrepid; to induce you to undertake that which may be truly useful to society; 51 in short, from what has preceded, it will be obvious, what is competent to conduct human to happiness, and also what are the obstacles that error opposes to your felicity.

52 Let us not then, be accused of demolishing prejudice, without edifying the mind; 53 with combating error without substituting truth; 54 with underrating the power of the great cause of causes; 55 with sapping at one and the same time the foundations of superstition and of

sound morals. 56 The last is necessary to human; it is founded upon your nature; 57 its duties are certain, they must last as long as the human race remains; 58 it imposes obligations on you, because, without it, neither individuals nor society could be able to subsist, either obtain or enjoy those advantages which Nature obliges them to desire.

59 Listen then, O human! To those morals which are established upon experience; which are grounded upon the necessity of things; 60 do not lend thine ear to those superstitions founded upon reveries; rested upon imposture; built upon the capricious whims of a disordered imagination. 61 Follow the lessons of those humane, those gentle morals, which conduct human to virtue, by the voice of happiness: 62 turn a deaf ear to the inefficacious cries of superstition, which renders human really unhappy; which can never make you reverence VIRTUE; 63 which renders truth hateful; which paints veracity in hideous colours; 64 in short, let you see if REASON, without the assistance of a rival, who prohibits its use, will not more surely conduct you towards that great end, 65 which is the object of your research, which is the natural tendency of all your views.

66 Indeed, what benefit has the human race hitherto drawn from those sublime, those supernatural notions with which superstition has fed mortals during so many ages? 67 All those phantoms conjured-- up by ignorance-- brooded by imagination; 68 all those hypothesis, subtile as they are irrational; from which experience is banished, 69 all those words devoid of meaning with which languages are crowded; 70 all those fantastical hopes; those panic terrors which have been brought to operate on the will of human; 71 what have they done? Has any or the whole of them rendered you better, more enlightened to your duties, more faithful in their performance? 72 Have those marvellous systems, or those sophistical inventions, by which they have been supported, carried conviction to your mind, reason into your conduct, virtue into your heart?

73 Have they led you to the least acquaintance with the great Cause of Causes? 74 Alas! it is a lamentable fact, that cannot be too often exposed, 75 that all these things have done nothing more than plunge the human understanding into that darkness from which it is difficult to be withdrawn; 76 sown in human's heart the most dangerous errors; of which it is scarcely possible to divest you; 77 given birth to those fatal passions, in which may be found the true source of those evils, with which your species is afflicted: 78 but have never enlightened your mind with truth, nor led you to that right healthy worship, which human best pays by a rational enjoyment of the faculties with which you are gifted.

79 Cease then, O mortal! to let thyself be disturbed with chimeras, 80 to let thy mind be troubled with phantoms which thine own imagination has created, or to which arch imposture has given birth. 81 Renounce thy vague hopes, disengage thyself from thine overwhelming fears, 82 follow without inquietude the necessary routine which Nature has marked out for thee; 83 strew the road with flowers if thy destiny permits; remove, if thou art able, the thorns scattered over it. 84 Do not attempt to plunge thy views into an impenetrable futurity; 85 its obscurity ought to be sufficient to prove to thee, that it is either useless or dangerous to fathom. 86 Think of making thyself happy in that existence which is known to thee: 87 if thou wouldst preserve thyself, be temperate, be moderate, be reasonable: 88 if thou seekest to render thy existence durable, be not prodigal of pleasure; 89 abstain from everything that can be hurtful to thyself, injurious to others: 90 be truly intelligent; that is to say, learn to esteem thyself, to preserve thy being, to fulfil that end which at each moment thou proposest to thyself.

91 Be virtuous, to the end that thou mayest render thyself solidly happy, 92 that thou mayest enjoy the affections, secure the esteem, partake of the assistance of those by whom thou art surrounded; 93 of those beings whom Nature has made

necessary to thine own peculiar felicity. 94 Even when they should be unjust, render thyself worthy of their applause, of thine own love, 95 and thou shalt live content, thy serenity shall not be disturbed, the end of thy career shall not slander thy life; 96 which will be exempted from remorse: death will be to thee the door to a new existence, a new order, 97 in which thou wilt be submitted, as thou art at present, to the eternal laws of Nature, 98 which ordains, that to LIVE HAPPY HERE BELOW, THOU MUST MAKE OTHERS HAPPY.

99 Suffer thyself then, to be drawn gently along thy journey, until thou shalt sleep peaceable on that bosom which has given thee birth: 100 if contrary to thine expectation, there should be another life of eternal felicity, thou canst not fail being a partaker. 101 For thou, wicked unfortunate! who art found in continual contradiction with thyself; 102 thou whose disorderly machine can neither accord with thine own peculiar nature, nor with that of thine associates, 103 whatever may be thy crimes, whatever may be thy fears of punishment in another life, thou art at least already cruelly punished in this? 104 Do not thy follies, thy shameful habits, thy debaucheries, damage thine health? 105 Dost thou not linger out life in disgust, fatigued with thine own excesses? 106 Does not listlessness punish thee for thy satiated passions? 107 Has not thy vigour, thy gaiety, thy content, already yielded to feebleness, crouched under infirmities, given place to regret? 108 Do not thy vices every day dig thy grave? 109 Every time thou hast stained thyself with crime, hast thou dared without horror to return into thyself, to examine thine own conscience? 110 Hast thou not found remorse, error, shame, established in thine heart? 111 Hast thou not dreaded the scrutiny of thy fellow human? 112 Hast thou not trembled when alone; unceasingly feared, that truth, so terrible for thee, should unveil thy dark transgressions, throw into light thine enormous iniquities? 113 Do not then any longer fear to part with thine existence, it will at least put an end to those richly merited torments thou

hast inflicted on thyself; 114 Death, in delivering the earth from an incommodious burthen, will also deliver thee from thy most cruel enemy, thyself.

THE ORIGIN OF HUMAN'S IDEAS UPON THE DIVINITY

Paul Henri Thiery (Baron D'Holbach)

44 If human possessed the courage, if we had the requisite industry to recur to the source of those opinions which are most deeply engraven in our brain; 2 if you rendered to yourself a faithful account of the reasons which make you hold these opinions as sacred; 3 if you coolly examined the basis of your hopes, the foundation of your fears, you would find that it very frequently happens, 4 those objects, or those ideas which move you most powerfully, either have no real existence, or are words devoid of meaning, 5 which terror has conjured up to explain some sudden disaster; 6 that they are often phantoms engendered by a disordered imagination, modified by ignorance; 7 the effect of an ardent mind distracted by contending passions, which prevent you from either reasoning justly, or consulting experience in your judgment; 8 that this mind often labours with a precipitancy that throws your intellectual faculties into confusion; that bewilders your ideas; 9 that consequently you gives a substance and a form to chimeras, to airy nothings, which you afterwards idolises from sloth, reverences from prejudice.

10 A sensible being placed in a Nature where every part is in motion, has various feelings, 11 in consequence of either the agreeable or disagreeable effects which you are obliged to experience from this continued action and re-action; 12 in consequence you either finds yourself happy or miserable; 13 according to the quality of the sensations excited in you, you will love or fear, seek after or fly from, the real or supposed causes of such marked effects operated on your machine. 14 But if you are ignorant

of Nature, if you are destitute of experience, you will frequently deceive yourself as to these causes; 15 for want of either capability or inclination to recur back to them, you will neither have a true knowledge of their energy, nor a clear idea of their mode of acting: 16 thus until reiterated experience shall have formed your ideas, until the mirror of truth shall have shown you the judgment you ought to make, 17 you will be involved in trouble, a prey to incertitude, a victim to credulity.

18 Human is a being who brings with the self nothing into the world, 19 save an aptitude to feeling in a manner more or less lively according to own individual organisation: 20 you have no innate knowledge of any of the causes that act upon you: 21 by degrees your faculty of feeling discovers to you their various qualities; you learns to judge of them; time familiarises you with their properties; 22 you attaches ideas to them, according to the manner in which they have affected you; 23 these ideas are correct or otherwise, in a ratio to the soundness of your organic structure: 24 your judgment is faulty or not, as these organs are either well or ill-constituted; 25 in proportion as they are competent to afford you sure and reiterated experience.

26 The first moments of human are marked by own wants; 27 that is to say, the first impulse you receives is to conserve your existence; 28 this you would not be able to maintain without the concurrence of many analogous causes: 29 these wants in a sensible being, manifest themselves by a general languor, 30 a sinking, a confusion in your machine, which gives you the consciousness of a painful sensation: 31 this derangement subsists, is even augmented, until the cause suitable to remove it re-establishes the harmony so necessary to the existence of the human frame.

32 Want, therefore, is the first evil human experiences; nevertheless it is requisite to the maintenance of your existence. 33 Was it not for this derangement of your body, which obliges you to furnish its remedy, 34

you would not be warned of the necessity of preserving the existence you have received. 35 Without wants human would be an insensible machine, similar to a vegetable; 36 like that you would be incapable of preserving yourself; you would not be competent to using the means required to conserve your being.

37 To your wants are to be ascribed your passions; your desires; the exercise of your corporeal functions; the play of your intellectual faculties: 38 they are your wants that oblige you to think; that determine your will, that induce you to act; 39 it is to satisfy them or rather to put an end to the painful sensations excited by their presence, 40 that according to your capacity, to the natural sensibility of your soul, to the energies which are peculiar to yourself, 41 you gives play to your faculties, exerts the activity of your bodily strength, or displays the extensive powers of your mind.

42 Your wants being perpetual, you are obliged to labour without relaxation, to procure objects competent to satisfy them. 43 In a word, it is owing to your multiplied wants that human's energy is kept in a state of continual activity: 44 as soon as you ceases to have wants, you falls into inaction--becomes listless-- declines into apathy-- 45 sinks into a languor that is incommodious to your feelings or prejudicial to your existence: 46 this lethargic state of weariness lasts until new wants, by giving you fresh activity, rouse your dormant faculties-- throw off your stupor-- re-animate your vigour, 47 and destroy the sluggishness to which you had become a prey.

48 From hence it will be obvious that evil is necessary to human; 49 without it you would neither be in a condition to know that which injures you; to avoid its presence; or to seek your own welfare: 50 without this stimulus, you would differ in nothing from insensible, unorganised beings: 51 if those evanescent evils which you calls wants, did not oblige you to call forth your faculties, 52 to set your energies in motion, to cull experience, to compare objects, to discriminate them, 53 to separate

those which have the capabilities to injure you, from those which possess the means to benefit you, 54 you would be insensible to happiness-- inadequate to enjoyment. 55 In short, without evil human would be ignorant of good; you would be continually exposed to perish like the leaf on a tree. 56 You would resemble an infant, who, destitute of experience, runs the risque of meeting your destruction at every step you takes, unguarded by your nurse.

57 What the nurse is to the child, experience is to the adult; 58 when either are wanting, these children of different lustres generally go astray: frequently encounter disaster. 59 Without evil you would be unable to judge of anything; 60 you would have no preference; your will would be without volition, you would be destitute of passions; 61 desire would find no place in your heart; you would not revolt at the most disgusting objects; you would not strive to put them away; 62 you would neither have stimuli to love, nor motives to fear anything; you would be an insensible automaton; you would no longer be a human.

63 If no evil had existed in this world, human would never have dreamt of those numerous divinities, to whom you have rendered such various modes of worship. 64 If Nature had permitted you easily to satisfy all your regenerating wants, 65 if She had given you none but agreeable sensations, your days would have uninterruptedly rolled on in one perpetual uniformity; 66 you would never have discovered your own nakedness; 67 you would never have had motives to search after the unknown causes of things-- to meditate in pain.

68 Therefore human, always contented, would only have occupied the self with satisfying own wants; 69 with enjoying the present, with feeling the influence of objects, that would unceasingly warn you of your existence in a mode that you must necessarily approve; 70 nothing would alarm your heart; everything would be analogous to your existence: 71 you would neither know fear, experience distrust, nor

have inquietude for the future: 72 these feelings can only be the consequence of some troublesome sensation, which must have anteriorly affected you, 73 or which by disturbing the harmony of your machine, has interrupted the course of your happiness; which has shown you that you are naked.

74 Independent of those wants which in human renew themselves every instant; which you frequently finds it impossible to satisfy; 75 every individual experiences a multiplicity of evils-- you suffers from the inclemency of the seasons-- you pines in penury-- 76 you are infected with plague-- you are scourged by war-- you are the victim of famine-- you are afflicted with disease-- you are the sport of a thousand accidents.

77 This is the reason why all humans are fearful; why the whole human race are diffident. 78 The knowledge you have of pain alarms you upon all unknown causes, that is to say, upon all those of which you have not yet experienced the effect; 79 this experience made with precipitation, or if it be preferred, by instinct, 80 places you on your guard against all those objects from the operation of which you are ignorant of what consequences may result to yourself.

81 Your inquietude is in proportion; your fears keep pace with the extent of the disorder which these objects produce in you; 82 they are measured by their rarity, that is to say, by the inexperience you have of them; 83 by the natural sensibility of the soul; and by the ardour of your imagination. 84 The more ignorant human is, the less experience you have, the more you are susceptible of fear; 85 solitude, the obscurity of a forest, silence, and the darkness of night, desolate ruins, the roaring of the wind, sudden confused noises, are objects of terror to all who are unaccustomed to these things.

86 The uninformed person is a child whom everything astonishes; who trembles at everything you encounters: 87 your alarms disappear, your fears diminish, your mind becomes calm, in proportion as experience familiarises you, more or less, with natural effects; 88 your fears cease entirely, as soon as you

understands, or believes you understands, the causes that act; or when you knows how to avoid their effects. 89 But if you cannot penetrate the causes which disturb you, 90 if you cannot discover the agents by whom you suffers, 91 if you cannot find to what account to place the confusion you experiences, 92 your inquietude augments; your fears redouble; your imagination leads you astray; 93 it exaggerates your evil; paints in a disorderly manner these unknown objects of your terror; magnifies their powers; 94 then making an analogy between them and those terrific objects, with whom you are already acquainted, 95 you suggests to yourself the means you usually takes to mitigate their anger; to conciliate their kindness; 96 you employs similar measures to soften the anger, to disarm the power, to avert the effects of the concealed cause 97 which gives birth to your inquietudes, which fills you with anxiety, which alarms your fears. 98 It is thus your weakness, aided by ignorance, renders you superstitious.

99 There are very few people, even in our own day, who have sufficiently studied Nature, 100 who are fully apprised of physical causes, or with the effects they must necessarily produce. 101 This ignorance, without doubt, was much greater in the more remote ages of the world, 102 when the human mind, yet in its infancy, had not collected that experience, taken that expansion, made those strides towards improvement, which distinguishes the present from the past. 103 Savages dispersed, erratic, thinly scattered up and down, knew the course of Nature either very imperfectly or not at all; 104 society alone perfects human knowledge: it requires not only multiplied but combined efforts to unravel the secrets of Nature. 105 This granted, all natural causes were mysteries to our wandering ancestors; the entire of Nature was an enigma to them; 106 all its phenomena was marvellous, every event inspired terror to beings who were destitute of experience; 107 almost everything they saw must have appeared to them strange,

unusual, contrary to their idea of the order of things.

108 It cannot then furnish matter for surprise, if we behold people in the present day trembling at the sight of those objects which have formerly filled their fathers with dismay. 109 Eclipse, comets, meteors, were, in ancient days, subjects of alarm to all the people of the earth: 110 these effects, so natural in the eyes of the sound philosopher, who has by degrees fathomed their true causes, 111 have yet the right, possess the power, to alarm the most numerous, to excite the fears of the least instructed part of modern nations. 112 The people of the present day, as well as their ignorant ancestors, find something marvellous, 113 believe there is a supernatural agency in all those objects to which their eyes are unaccustomed; 114 they consider all those unknown causes as wonderful, that act with a force of which their mind has no idea it is possible the known agents are capable. 115 The ignorant see wonders, prodigies, miracles, in all those striking effects of which they are unable to render themselves a satisfactory account; 116 all the causes which produce them they think supernatural; 117 this, however, really implies nothing more than that they are not familiar to them, 118 or that they have not hitherto witnessed natural agents, whose energy was equal to the production of effects so rare, 119 so astonishing, as those with which their sight has been appalled.

120 Besides the ordinary phenomena to which nations were witnesses without being competent to unravel the causes, 121 they have in times very remote from ours, experienced calamities, whether general or local, 122 which filled them with the most cruel inquietude; which plunged them into an abyss of consternation. 123 The traditions of all people, the annals of all nations, recall, even at this day, melancholy events, physical disasters, dreadful catastrophes, 124 which had the effect of spreading universal terror among our forefathers. 125 But when history should be silent on these stupendous revolutions, would not our own reflection on what passes under our

eyes be sufficient to convince us, 126 that all parts of our globe have been, and following the course of things, will necessarily be again violently agitated, overturned, changed, overflowed, in a state of conflagration?

127 Vast continents have been inundated, seas breaking their limits have usurped the dominion of the earth; 128 at length retiring, these waters have left striking, proofs of their presence, by the marine vestiges of shells, skeletons of sea fish, 129 which the attentive observer meets with at every step, in the bowels of those fertile countries we now inhabit-- 130 subterraneous fires have opened to themselves the most frightful volcanoes, whose craters frequently issue destruction on every side. 131 In short, the elements unloosed, have at various times, disputed among themselves the empire of our globe; 132 this exhibits evidence of the fact, by those vast heaps of wreck, those stupendous ruins spread over its surface.

133 What, then, must have been the fears of humankind, 134 who in those countries believed you beheld the entire of Nature armed against your peace, menacing with destruction your very abode? 135 What must have been the inquietude of a people taken thus unprovided, who fancied they saw Nature cruelly labouring to their annihilation? 136 Who beheld a world ready to be dashed into atoms; 137 who witnessed the earth suddenly rent asunder; whose yawning chasm was the grave of large cities, whole provinces entire nations?

138 What ideas must mortals, thus overwhelmed with terror, form to themselves of the irresistible cause that could produce such extended effects? 139 Without doubt they did not attribute these wide spreading calamities to Nature; neither did they conceive they were mere physical causes; 140 they could not suspect She was the author, the accomplice of the confusion She Herself experienced; 141 they did not see that these tremendous revolutions, these overpowering disorders, were the necessary result of Her immutable laws; 142 that they contributed to the general order by which She subsists;

143 that, in point of fact, there was nothing more surprising in the inundation of large portions of the earth, 144 in the swallowing up an entire nation, in a volcanic conflagration spreading destruction over whole provinces, 145 than there is in a stone falling to the earth, or the death of a fly; 146 that each equally has its spring in the necessity of things.

147 It was under these astounding circumstances, that nations, bathed in the most bitter tears, perplexed with the most frightful visions, 148 electrified with terror, not believing there existed on this mundane ball, causes sufficiently powerful to operate the gigantic phenomena that filled their minds with dismay, 149 carried their streaming eyes towards heaven, where their tremulous fears led them to suppose these unknown agents, 150 whose unprovoked enmity destroyed, their earthly felicity, could alone reside.

151 It was in the lap of ignorance, in the season of alarm, in the bosom of calamity, that humankind ever formed own first notions of the Divinity. 152 From hence it is obvious that your ideas on this subject are to be suspected, that your notions are in a great measure false, that they are always afflicting. 153 Indeed, upon whatever part of our sphere we cast our eyes, whether it be upon the frozen climates of the north, upon the parching regions of the south, 154 or under the more temperate zones, we everywhere behold the people when assailed by misfortunes, have either made to themselves national gods, 155 or else have adopted those which have been given them by their conquerors; 156 before these beings, either of their own creation or adoption, they have tremblingly prostrated themselves in the hour of calamity, soliciting relief; 157 have ignorantly attributed to blocks of stone, or to people like themselves, those natural effects which were above their comprehension; 158 the inhabitants of many nations, not contented with the national gods, made each to the self one or more gods, 159 which you supposed presided exclusively over your own household, from whom

you supposed you derived your own peculiar happiness, 160 to whom you attributed all your domestic misfortunes.

161 The idea of these powerful agents, these supposed distributors of good and evil, was always associated with that of terror; 162 their name was never pronounced without recalling to human's wind either your own particular calamities or those of your fathers. 163 In many places human trembles at this day, because your progenitors have trembled for thousands of years past. 164 The thought of your gods always awakened in human the most afflicting ideas. 165 If you recurred to the source of your actual fears, to the commencement of those melancholy impressions that stamp themselves in your mind when their name is announced, 166 you would find it in the conflagrations, in the revolutions, in those extended disasters, that have at various times destroyed large portions of the human race; 167 that overwhelmed with dismay those miserable beings who escaped the destruction of the earth; 168 these in transmitting to posterity, the tradition of such afflicting events, have also transmitted to you their fears; 169 have delivered down to their successors, those gloomy ideas 170 which their bewildered imaginations, coupled with their barbarous ignorance of natural causes, had formed to them of the anger of their irritated gods, 171 to which their alarm falsely attributed these sweeping disasters.

172 If the gods of nations had their birth in the bosom of alarm, it was again in that of despair that each individual formed the unknown power that you made exclusively for yourself. 173 Ignorant of physical causes, unpractised in their mode of action, unaccustomed to their effects, 174 whenever you experienced any serious misfortune, whenever you was afflicted with any grievous sensation, you was at a loss how to account for it; 175 you therefore attributed it to your household gods, to whom you made an immediate supplication for assistance, or rather for forbearance of further affliction: 176 this disposition in human has

been finely portrayed by Aesop in his fable of "the Waggoner and Hercules."

177 The motion which in despite of yourself was excited in your machine, your diseases, your troubles, your passions, your inquietude, 178 the painful alterations your frame underwent, without your being able to fathom the true causes; 179 at length death, of which the aspect in so formidable to a being strongly attached to existence, 180 were effects you looked upon either as supernatural, or else you conceived they were repugnant to your actual nature; 181 you attributed them to some mighty cause, which maugre all your efforts, disposed of you at each, moment.

182 Thus palsied with alarm, benumbed with terror, you pensively meditated upon your sorrows; 183 agitated with fear, you sought for means to avert the calamities that threatened you with destruction; 184 your imagination, thus rendered desperate by your endurance of evils which you found inevitable, formed to you those phantoms which you called gods; 185 before whom you trembled from a consciousness of your own weakness; 186 thus disposed, you endeavoured by prostration, by sacrifices, by prayers, to disarm the anger of these imaginary beings to which your trepidation had given birth; 187 whom your ignorantly imagined to be the cause of your misery, whom your fancy painted to you as endowed with the power of alleviating your sufferings: 188 it was thus in the extremity of your grief, in the exacerbation of your mind, weighed down with misfortune, that unhappy person fashioned those chimeras which filled you with the most gloomy ideas, 189 which you transmitted to your posterity, as the surest means of avoiding the evils to which you had been yourself subjected.

190 Human never judges of those objects of which you are ignorant, but through the medium of those which come within your knowledge: 191 thus human, taking yourself for the model, ascribed will, intelligence, design, projects, passions; 192 in a

word, qualities analogous to your own, to all those unknown causes of which you experienced the action. 193 As soon as a visible or supposed cause affects you in an agreeable manner, or in a mode favourable to your existence, you conclude it to be good, to be well intentioned towards you: 194 on the contrary, you judges all those to be bad in their nature, evilly disposed, to have the intention of injuring you, which cause you any painful sensations. 195 You attributes views, plans, a system of conduct like your own, to everything which to your limited ideas appears of itself to produce connected effects; 196 to act with regularity; to constantly operate in the same manner; that uniformly produces the same sensations in your own person. 197 According to these notions, which you always borrows from yourself, from your own peculiar mode of action, 198 you either loves or fears those objects which have affected you; you in consequence approaches them with confidence or timidity; 199 seeks after them or flies from them in proportion as the feelings they have excited are either pleasant or painful.

200 Having travelled thus far, you presently addresses them; you invokes their aid; prays to them for succour; 201 conjures them to cease your afflictions; to forbear tormenting you; 202 as you finds yourself sensible to presents, pleased with submission, you tries to win them to your interests by humiliation, by sacrifices; 203 you exercises towards them the hospitality you yourself loves; you gives them an asylum; you builds them a dwelling; you furnishes them with costly raiment; 204 you makes their altars smoke with delicious food; you proffers to their acceptance the earliest flowers of spring; the finest fruits of autumn; the rich grain of summer; 205 in short you sets before them all those things which you thinks will please them the most, because you yourself places the highest value on them. 206 These dispositions enable us to account for the formation of tutelary gods, of lares, of larvae, which every human makes to the self in savage and

unpolished nations. 207 Thus we perceive that weak superstitious mortals, ignorant of truth, devoid of experience, 208 regard as the arbiters of their fate, as the dispensers of good and evil, animals, stones, unformed inanimate substances, 209 which the effort of their heated imaginations transform into gods, whom they invest with intelligence, whom they clothe with desires, to whom they give volition.

210 Another disposition which serves to deceive the savage person, which will equally deceive those whom reason shall not enlighten on these subjects, is his attachment to omens; 211 or the fortuitous concurrence of certain effects, with causes which have not produced them; 212 the co-existence of these effects with certain causes, which have not the slightest connection with them, has frequently led astray very intelligent beings; 213 nations who considered themselves very enlightened; who have either been disinclined or unable to disentangle the one from the other: 214 thus the savage attributes bounty or the will to render you service, to any object whether animate or inanimate, 215 such as a stone of a certain form, a rock, a mountain, a tree, a serpent, an owl, 216 if every time you encounters these objects in a certain position, it should so happen that you are more than ordinarily successful in hunting, 217 that you should take an unusual quantity of fish, that you should be victorious in war, or that you should compass any enterprise whatever that you may at that moment undertake: 218 the same savage will be quite as gratuitous in attaching malice, wickedness, the determination to injure you, to either the same object in a different position, 219 or any others in a given posture, which may have met your eyes on those days when you shall have suffered some grievous accident, 220 have been very unsuccessful in your undertakings, unfortunate in the chace, disappointed in your draught of fish: 221 incapable of reasoning you connects these effects with causes, that reflection would convince you have nothing in common with each other; 222 that are entirely due to

physical causes, to necessary circumstances, over which neither yourself nor your omens have the least control: 223 nevertheless you finds it much easier to attribute them to these imaginary causes; 224 you therefore deifies them; looks upon them as either your guardian angels, or else as your most inveterate enemies.

225 Having invested them with supernatural powers, you becomes anxious to explain to yourself their mode of action; 226 your self-love prevents your seeking elsewhere for the model: thus you assigns them all those motives that actuate yourself; 227 you endows them with passions; you gives them design-- intelligence-- will-- 228 imagines they can either injure you or benefit you, as you may render them propitious or otherwise to your views: 229 you ends with worshipping them; with paying them divine honours; you appoints them priests; 230 or at least always consults them before you undertakes any object of moment: 231 such is their influence, that if they put on the evil position, you will lay aside the most important undertaking.

232 The savage in this is never more than an infant that is angry with the object that displeases the self; 233 just like the dog who gnaws the stone by which you have been wounded, without recurring to the hand by which it was thrown. 234 Such is the foundation of human's faith, in either happy or unhappy omens: 235 devoid of experience, unaccustomed to reason with precision, fearing to call in the evidence of truth, you looks upon them either as gods themselves, 236 or else as warnings given you by your other gods, to whom you attributes the faculties of sagacity and foresight, of which you are yourself miserably deficient.

237 Ignorance, when involved in disaster, when immersed in trouble, believes a stone, a reptile, a bird, much better instructed than yourself. 238 The slender observation of the ignorant only serves to render you more superstitious; 239 you sees certain birds announce by their flight, by their cries, certain changes in the weather, such as cold, heat,

rain, storms; 240 you beholds at certain periods, vapours arise from the bottom of some particular caverns? 241 Their needs nothing further to impress upon you the belief, that these beings possess the knowledge of future events; 242 enjoy the gifts of prophecy: you looks upon them as supernatural agents, employed by your gods: 243 it is thus you becomes the dupe to your own credulity.

244 If by degrees the truth flashing occasionally on your mind, experience and reflection arrive at undeceiving you, 245 with respect to the power, the intelligence, the virtues actually residing in these objects; 246 you at least supposes them put in activity by some secret, some hidden cause; 247 that they are the instruments, employed by some invisible agent, who is either friendly or inimical to your welfare. 248 To this concealed agent, therefore, you addresses yourself; 249 pays you your vows; implores your assistance; deprecates your wrath; seeks to propitiate you to your interests; is willing to soften your anger; 250 for this purpose you employs the same means, of which you avails yourself, either to appease or gain over the beings of your own species.

251 Societies in their origin, seeing themselves frequently afflicted by Nature, 252 supposed either the elements, or the concealed powers who regulated them, possessed a will, views, wants, desires, similar to their own. 253 From hence, the sacrifices imagined to nourish them; the libations poured out to them; the steams, the incense to gratify their olfactory nerves. 254 Their superstition led them to believe these elements or their irritated movers were to be appeased like irritated person, by prayers, by humiliation, by presents. 255 Their imagination was ransacked to discover the presents that would be most acceptable in their eyes; 256 to ascertain the oblations that would be most agreeable, the sacrifices that would most surely propitiate their kindness: 257 as these did not make known their inclinations, human differed with own fellow on those most suitable; 258 each followed own

disposition; or rather each offered what was most estimable in own eyes; 259 hence arose differences never to be reconciled the bitterest animosities; the most unconquerable aversions; the most, destructive jealousies! 260 Thus some brought the fruits of the earth, others offered sheaves of corn: 261 some strewed flowers over their fanes; some decorated them with the most costly jewels; 262 some served them with meats; others sacrificed lambs, heifers, bulls; 263 at length such was their delirium, such the wildness of their imaginations, that they stained their altars with human gore, 264 made oblations of young children immolated virgins, to appease the anger of these supposed deities.

265 The old people, as having the most experience, were usually charged with the conduct of these peace-offerings, 266 from whence, the name PRIEST; [Greek letters], presbos, in the Greek meaning an old person. 267 These accompanied them with ceremonies, instituted rites, used precautions by consulting omens; 268 adopted formalities, retraced to their fellow citizens the notions transmitted to them by their forefathers; 269 collected the observations made by their ancestors; repeated the fables they had received; added commentaries of their own; 270 subjoined supplications to the idols at whose shrine they were sacrificing.

271 It is thus the sacerdotal order was established; thus that public worship was established; by degrees each community formed a body of tenets to be observed by the citizens; 272 these were transmitted from race to race; held sacred out of reverence for their fathers; 273 at length it was deemed sacrilege to doubt these pandects in any one particular; even the errors, that had crept into them with time, were beheld with reverential awe; 274 you that ventured to reason upon them, was looked upon as an enemy to the commonwealth; 275 as one whose impiety drew down upon them the vengeance of these adored beings, to which alone imagination had given birth; 276 not contented with adopting the rituals, with following

the ceremonies invented by themselves, 277 one community waged war against another, to oblige it to receive their particular creeds; 278 which the old people who regulated them, declared would infallibly win them the favour of their tutelary deities: 279 thus very often to conciliate their favour, the victorious party immolated on the altars of their gods, the bodies of their unhappy captives; 280 frequently they carried their savage barbarity the length of exterminating whole nations, who happened to worship gods different from their own: 281 thus it frequently happened, that the friends of the serpent, when victorious, covered own altars with the mangled carcases of the worshippers of the stone, whom the fortune of war had placed in their hands: 282 such were the unformed, the precarious elements of which rude nations everywhere availed themselves to compose their superstitions: 283 they were always a system of conduct invented by imagination: conceived in ignorance, organised in misfortune, 284 to render the unknown powers, to whom they believed Nature was submitted, either favourable to their views, 285 or to induce them to cease those afflictions, which natural causes, for the wisest purposes, were continually heaping upon them; 286 thus some irascible, at the same time placable being, was always chosen for the basis of the adopted superstition; 287 it was upon these puerile tenets, upon these absurd notions, that the old people or the priests rested their doctrines; founded their rights; established their authority: 288 it was to render these fanciful beings friendly to the race of human, that they erected, temples, raised altars, loaded them with wealth; 289 in short, it was from such rude foundations, that arose the magnificent structure of superstition; 290 under which human trembled for thousands of years: which governed the condition of society, 291 which determined the actions of the people, gave the tone to the character, deluged the earth with blood, for such a long series of ages.

NATURE

292 But although these superstitions were originally invented by savages, they still have the power of regulating the fate of many civilised nations, 293 who are not less tenacious of their chimeras, than their rude progenitors. 294 These systems, so ruinous in their principles, have been variously modified by the human mind, 295 of which it is the essence, to labour incessantly on unknown objects; 296 it always, commences by attaching to these, a very first-rate importance, which it afterwards never dares coolly to examine.

297 Such was the course of human's imagination, in the successive ideas which you either formed to yourself, or which you received from your fathers, upon the divinity. 298 The first theology of human was grounded on fear, modelled by ignorance: either afflicted or benefitted by the elements, they adored these elements themselves; 299 by a parity of reasoning, if reasoning it can be called, you extended your reverence to every material, coarse object; 300 you afterwards rendered your homage to the agents you supposed presiding over these elements; 301 to powerful genii; to inferior genii; to heroes; to people endowed with either great or striking qualities.

302 Time, aided by reflection, with here and there a slight corruscation of truth, induced you in some places to relinquish your original ideas; 303 you believed you simplified the thing by lessening the number of your gods, but you achieved nothing by this towards attaining to the truth; 304 in recurring from cause to cause human finished by losing sight of everything; 305 in this obscurity, in this dark abyss, your mind still laboured, you formed new chimeras, you made new gods, or rather you formed a very complex machinery; 306 still, as before, whenever you could not account for any phenomenon that struck your sight, you was unwilling to ascribe it to physical causes; 307 and the name of your Divinity, whatever that might happen to be, was always brought in to supply your own ignorance of natural causes.

308 If a faithful account was rendered of human's ideas upon the Divinity, you would be obliged to acknowledge, 309 that for the most part the word God has been used to express the concealed, remote, unknown causes of the effects you witnessed; 310 that you applies this term when the spring of natural, the source of known causes ceases to be visible: 311 as soon as you loses the thread of these causes, or as soon as your mind can no longer follow the chain, you solves the difficulty, terminates your research, by ascribing it to your gods; 312 thus giving a vague definition to an unknown cause, at which either your idleness, or your limited knowledge, obliges you to stop.

313 When, therefore, you ascribes to your gods the production of some phenomenon, the novelty or the extent of which strikes you with wonder, 314 but of which your ignorance precludes you from unravelling the true cause, 315 or which you believes the natural powers with which you are acquainted are inadequate to bring forth; 316 does you, in fact, do anything more than substitute for the darkness of your own mind, 317 a sound to which you have been accustomed to listen with reverential awe? 318 Ignorance may be said to be the inheritance of the generality of humans; 319 these attribute to their gods not only those uncommon effects that burst upon their senses with an astounding force, 320 but also the most simple events, the causes of which are the most easy to be known to whoever shall be willing to meditate upon them. 321 In short, human has always respected those unknown causes, those surprising effects which your ignorance prevented you from fathoming.

322 But does this afford us one single, correct idea of the Divinity? 323 Can it be possible we are acting rationally, thus eternally to make Him the agent of our stupidity, of our sloth, of our want of information on natural causes? 324 Do we, in fact, pay any kind of adoration to this being, by thus bringing Him forth on every trifling occasion, to solve the difficulties ignorance throws in our

way? 325 Of whatever nature this great cause of causes may be, it is evident to the slightest reflection that He has been sedulous to conceal Himself from our view; 326 that He has rendered it impossible for us to have the least acquaintance with Him, except through the medium of Nature, which He has unquestionably rendered competent to everything: 327 this is the rich banquet spread before human; you are invited to partake, with a welcome you have no right to dispute; 328 to enjoy therefore is to obey; to be happy is to render that worship which must make you most acceptable; 329 to be happy yourself is to make others happy; to make others happy is to be virtuous; to be virtuous you must revere truth: 330 to know what truth is, you must examine with caution, scrutinise with severity, every opinion you adopts: 331 this granted, is it at all consistent with the majesty of the Divinity, is it not insulting to such a being to clothe Him with our wayward passions; 332 to ascribe to Him designs similar to our narrow view of things; to give Him our filthy desires; to suppose He can be guided by our finite conceptions; 333 to bring Him on a level with frail humanity, by investing Him with our qualities, however much we may exaggerate them; 334 to indulge an opinion that He can either act or think as we do; 335 to imagine He can in any manner resemble such a feeble play-thing, as is the greatest, the most distinguished human?

336 No! it is to degrade Him in the eye of reason; to violate every regard for truth; to set moral decency at defiance; to fall back into the depth of cimmerian darkness. 337 Let human therefore sit down cheerfully to the feast; let you contentedly partake of what you finds; 338 but let you not worry the Divinity with your useless prayers, with your shallow-sighted requests, 339 to solicit at your hands that which, if granted, would in all probability be the most injurious for yourself; 340 these supplications are, in fact, at once to say, that with our limited experience, with our slender knowledge, we better understand what is suitable to

our condition, 341 what is convenient to our welfare, than the mighty Cause of all causes who has left us in the hands of Nature: 342 it is to be presumptuous in the highest degree of presumption; 343 it is impiously to endeavour to lift up a veil which it is evidently forbidden human to touch; that even your most strenuous efforts attempt in vain.

344 It remains, then, to inquire, if human can reasonably flatter the self with obtaining a perfect knowledge of the power of Nature; 345 of the properties of the beings She contains; of the effects which may result from their various combinations? 346 Do we know why the magnet attracts iron? Are we better acquainted with the cause of polar attraction? 347 Are we in a condition to explain the phenomena of light, electricity, elasticity? 348 Do we understand the mechanism by which that modification of our brain, which we call volition, puts our arm or our legs into motion? 349 Can we render to ourselves an account of the manner in which our eyes behold objects, in which our ears receive sounds, in which our mind conceives ideas?

350 All we know upon these subjects is, that they are so. If then we are incapable of accounting for the most ordinary phenomena, which Nature daily exhibits to us, 351 by what chain of reasoning do we refuse to Her the power of producing other effects equally incomprehensible to us? 352 Shall we be more instructed, when every time we behold an effect of which we are not in a capacity to develop the cause, 353 we may idly say, this effect is produced by the power, by the will of God? 354 Undoubtedly it is the great Cause of causes must have produced everything; 355 but is it not lessening the true dignity of the Divinity, to introduce Him as interfering in every operation of Nature; nay, in every action of so insignificant a creature as human?

356 As a mere agent executing His own eternal, immutable laws; 357 when experience, when reflection, when the evidence of all we contemplate, warrants the idea, that this ineffable being has rendered

NATURE

Nature competent to every effect, 358 by giving Her those irrevocable laws, that eternal, unchangeable system, according to which all the beings She contains must eternally act? 359 Is it not more worthy the exalted mind of the GREAT PARENT OF PARENTS, ens entium, more consistent with truth, 360 to suppose that His wisdom in giving these immutable, these eternal laws to the macrocosm, foresaw everything that could possibly be requisite for the happiness of the beings contained in it; 361 that therefore He left it to the invariable operation of a system, which never can produce any effect 362 that is not the best possible that circumstances however viewed will admit: 363 that consequently the natural activity of the human mind, which is itself the result of this eternal action, was purposely given to human, 364 that you might endeavour to fathom, that you might strive to unravel, that you might seek out the concatenation of these laws, 365 in order to furnish remedies against the evils produced by ignorance.

366 How many discoveries in the great science of natural philosophy has humankind progressively made, 367 which the ignorant prejudices of our forefathers on their first announcement considered as impious, 368 as displeasing to the Divinity, as heretical profanations, which could only be expiated by the sacrifice of the enquiring individuals; 369 to whose labour their posterity owes such an infinity of gratitude? 370 Even in modern days we have seen a SOCRATES destroyed, a GALLILEO condemned, 371 whilst multitudes of other benefactors to humankind have been held in contempt by their uninformed cotemporaries, 372 for those very researches into Nature which the present generation hold in the highest veneration.

373 Whenever ignorant priests are permitted to guide the opinions of nations, science can make but a very slender progress: 374 natural discoveries will be always held inimical to the interest of bigoted superstitious people. 375 It may, to the minds of infatuated mortals, to

the shallow comprehension of prejudiced beings, appear very pious to reply on every occasion our gods do this, our gods do that; 376 but to the contemplative philosopher, to the person of reason, to the real adorers of the great Cause of causes, it will never be convincing, that a sound, a mere word, can attach the reason of things; 377 can have more than a fixed sense; can suffice to explain problems.

378 The word GOD is for the most part used to denote the impenetrable cause of those effects which astonish humankind; which human is not competent to explain. 379 But is not this wilful idleness? Is it not inconsistent with our nature? 380 Is it not being truly impious, to sit down with those fine faculties we have received, and give the answer of a child to everything we do not understand; 381 or rather which our own sloth, or our own want of industry has prevented us from knowing? 382 Ought we not rather to redouble our efforts to penetrate the cause of those phenomena which strike our mind? 383 Is not this, in fact, the duty we owe to the great, the universal Parent? 384 When we have given this answer, what have we said? -- Nothing but what everyone knows.

385 Could the great Cause of causes make the whole, without also making its part? 386 But does it of necessity follow that He executes every trifling operation, 387 when He has so noble an agent as His own nature, whose laws He has rendered unchangeable, 388 whose scale of operations can never deviate from the eternal routine He has marked out for Her and all the beings She embraces? 389 Whose secrets, if sought out, contain the true balsam of life-- the sovereign remedy for all the diseases of human.

390 When we shall be ingenuous with ourselves, we shall be obliged to agree that it was uniformly the ignorance in which our ancestors were involved, 391 their want of knowledge of natural causes, their unenlightened ideas on the powers of Nature, which gave birth to the gods they worshipped; 392 that it is, again, the impossibility which the greater

part of humankind find to withdraw themselves out of this ignorance, 393 the difficulty they consequently find to form to themselves simple ideas of the formation of things, 394 the labour that is required to discover the true sources of those events, which they either admire or fear, 395 that makes them believe these ideas are necessary to enable them to render an account of those phenomena, to which their own sluggishness renders them incompetent to recur. 396 Here, without doubt, is the reason they treat all those as irrational who do not see the necessity of admitting an unknown agent, 397 or some secret energy, which for want of being acquainted with Nature, they have placed out of Herself.

398 The phenomena of Nature necessarily breed various sentiments in human: 399 some you thinks favourable to you, some prejudicial, while the whole is only what it can be. 400 Some excite your love, your admiration, your gratitude; 401 others fill you with trouble, cause aversion, drive you to despair. 402 According to the various sensations you experiences, you either loves or fears the causes to which you attributes the effects, which produce in you these different passions: 403 these sentiments are commensurate with the effects you experiences; 404 your admiration is enhanced, your fears are augmented, 405 in the same ratio as the phenomena which strikes your senses are more or less extensive, more or less irresistible or interesting to you.

406 Human necessarily makes the self the centre of Nature; 407 indeed you can only judge of things, as you are yourself affected by them; 408 you can only love that which you thinks favourable to your being; 409 you hates, you fears everything which causes you to suffer: 410 in short, as we have seen in the former volume, you calls confusion everything that deranges the economy of your machine; 411 you believes all is in order, as soon as you experiences nothing but what is suitable to your peculiar mode of existence. 412 By a necessary consequence of these ideas, human firmly believes that the entire of

NATURE

Nature was made for you alone; 413 that it was only yourself which She had in view in all Her works; 414 or rather that the powerful cause to which this Nature was subordinate, had only for object human and your convenience, in all the stupendous effects which are produced in the universe.

415 If there existed on this earth other thinking beings besides human, they would fall exactly into similar prejudices with yourself; 416 it is a sentiment founded upon that predilection which each individual necessarily has for the self; 417 a predilection that will subsist until reason, aided by experience, in pointing out the truth, shall have rectified your errors.

418 Thus, whenever human is contented, whenever everything is in order with respect to yourself, 419 you either admires or loves the causes to which you believes you are indebted for your welfare; 420 when you becomes discontented with your mode of existence, you either fears or hates the cause which you supposes has produced these afflicting effects. 421 But your welfare confounds itself with your existence; 422 it ceases to make itself felt when it has become habitual, when it has been of long continuance; 423 you then thinks it is inherent to your essence; you concludes from it that you are formed to be always happy; 424 you finds it natural that everything should concur to the maintenance of your being.

425 It is by no means the same when you experiences a mode of existence that is displeasing to yourself: 426 the person who suffers is quite astonished at the change which your taken place in your machine; 427 you judges it to be contrary to the entire of Nature, because it is incommodious to your own particular nature; 428 you, imagines those events by which you are wounded, to be contrary to the order of things; 429 you believes that Nature is deranged every time She does not procure for you that mode of feeling which is suitable to your ideas: 430 you concludes from these suppositions that Nature, or rather

that the agent who moves Her; is irritated against you.

431 It is thus that human, almost insensible to good, feels evil in a very lively manner; 432 the first you believes natural, the other you thinks opposed to Nature. 433 You are either ignorant, or forgets, that you constitutes part of a whole, 434 formed by the assemblage of substances, of which some are analogous, others heterogeneous; 435 that the various beings of which Nature is composed, are endowed with a variety of properties, 436 by virtue of which they act diversely on the bodies who find themselves within the sphere of their action; 437 that some have an aptitude to attraction, whilst it is of the essence of others to repel; 438 that even those bodies that attract at one distance, repel at another; 439 that the peculiar attractions and repulsions of the particles of bodies perpetually oppose, invariably counteract the general ones of the masses of matter: 440 you does not perceive that these beings, as destitute of goodness, as devoid of malice, act only according to their respective essences; 441 follow the laws their properties impose upon them; without being in capacity to act otherwise than they do. 442 It is, therefore, for want of being acquainted with these things, that you looks upon the great Author of Nature, 443 the great Cause of causes, as the immediate cause of those evils to which you are submitted; 444 that you judges erroneously when you imagines that the Divinity is exasperated against you.

445 The fact is, human believes that your welfare is a debt due to you from Nature; 446 that when you suffers evil She does you an injustice; 447 fully persuaded that this Nature was made solely for yourself, 448 you cannot conceive She would make you, who is Her lord paramount, suffer, if She was not moved thereto by a power who is inimical to your happiness; 449 who has reasons with which you are unacquainted for afflicting, who has motives which you wishes to discover, for punishing you. 450 From hence it will be obvious, that

evil, much more than good, is the true motive of those researches which human has made concerning the Divinity-- 451 of those ideas which you have formed to yourself-- of the conduct you have held towards Him.

452 The admiration of the works of Nature, or the acknowledgment of its goodness, seem never alone to have determined the human species to recur painfully by thought to the source of these things; 453 familiarised at once with all those effects which are favourable to your existence, 454 you does not by any means give yourself the same trouble to seek the causes, 455 that you does to discover those which disquiet you, or by which you are afflicted. 456 Thus, in reflecting upon the Divinity, it was generally upon the cause of your evils that human meditated; 457 your meditations were fruitless, because the evil you experiences, as well as the good you partakes, are equally necessary effects of natural causes, 458 to which your mind ought rather to have bent its force, than to have invented fictitious causes of which you never could form to yourself any but false ideas; 459 seeing that you always borrowed them, from your own peculiar mariner of existing, acting, and feeling. 460 Obstinately refusing to see anything, but yourself, you never became acquainted with that universal Nature of which you constitute such a very feeble part.

461 The slightest reflection, however, would have been sufficient to undeceive you on these erroneous ideas. 462 Everything tends to prove that good and evil are modes of existence that depend upon causes by which a person is moved; 463 that a sensible being is obliged to experience them. 464 In a Nature composed of a multitude of beings infinitely varied, the shock occasioned by the collision of discordant matter must necessarily disturb the order, 465 derange the mode of existence of those beings who have no analogy with them: 466 these act in everything they do after certain laws, which are in themselves immutable; 467 the good or evil, therefore, which human experiences,

are necessary consequences of the qualities inherent to the beings, within whose sphere of action you are found.

468 Our birth, which we call a benefit, is an effect as necessary as our death, which we contemplate as an injustice of fate: 469 it is of the nature of all analogous beings to unite themselves to form a whole: 470 it is of the nature of all compound beings to be destroyed, or to dissolve themselves; 471 some maintain their union for a longer period than others; some disperse very quickly, as the ephemeron; some endure for ages, as the planets; 472 every being in dissolving itself gives birth to new beings; 473 these are destroyed in their turn; to execute the eternal, the immutable laws of a Nature that only exists by the continual changes that all its parts undergo.

474 Thus Nature cannot be accused of malice, since everything that takes place in it is necessary-- 475 is produced by an invariable system, to which every other being, as well as Herself, is eternally subjected. 476 The same igneous matter that in human is the principle of life, frequently becomes the principle of your destruction, 477 either by the conflagration of a city, the explosion of a volcano, or human mad passion for war. 478 The aqueous fluid that circulates through human machine, so essentially necessary to your actual existence, frequently becomes too abundant, and terminates you by suffocation; 479 is the cause of those inundations which sometimes swallow up both the earth and its inhabitants.

480 The air, without which you are not able to respire, is the cause of those hurricanes, of those tempests, which frequently render useless the labour of mortals. 481 These elements are obliged to burst their bonds, when they are combined in a certain manner; 482 their necessary but fatal consequences are those ravages, those contagions, those famines, those diseases, 483 those various scourges, against which human, with streaming eyes and violent emotions, vainly implores the aid of those powers who are deaf to your cries: 484 your prayers are never granted;

but the same necessity which afflicted you, the same immutable laws which overwhelmed you with trouble, 485 replaces things in the order you finds suitable to your species: a relative order of things which was, is, and always will be the only standard of your judgment.

486 Human, however, made no such simple reflections: 487 you either did not or would not perceive that everything in Nature acted by invariable laws; 488 you continued steadfast in contemplating the good of which you was partaker, as a favour; 489 in considering the evil you experienced, as a sign of anger in this nature, which you supposed to be animated by the same passions as yourself 490 or at least that it was governed by secret agents, who acted after your own manner, 491 who obliged it to execute their will, that was sometimes favourable, sometimes inimical to the human species.

492 It was to these supposed agents, with whom in the sunshine of your prosperity you was but little occupied, 493 that in the bosom of your calamity you addressed your prayers; 494 you thanked them, however, for their favours, fearing lest their ingratitude might farther provoke their fury: 495 thus when assailed by disaster, when afflicted with disease, you invoked them with fervour: 496 you required them to change in your favour the mode of acting which was the very essence of beings; 497 you was willing that to make the slightest evil you experienced cease, that the eternal chain of things might be broken; 498 and the unerring, undeviating course of Nature might be arrested.

499 It was upon such ridiculous pretensions, that were founded those supplications, those fervent prayers, 500 which mortals, almost always discontented with their fate, never in accord in their respective desires, addressed to their gods. 501 They were unceasingly upon their knees before the altars, were ever prostrate before the power of the beings, whom they judged had the right of commanding Nature; 502 who they supposed to have sufficient energy to divert Her course; 503 who they

considered to possess the means to make Her subservient to their particular views; 504 thus each hoped by presents, by humiliation, to induce them to oblige this Nature, to satisfy the discordant desires of their race.

505 The sick person, expiring in own bed, asks that the humours accumulated in own body should in an instant lose those properties which renders them injurious to own existence; 506 that by an act of their puissance, own gods should renew or recreate the springs of a machine worn out by infirmities. 507 The cultivators of a low swampy country, makes complaint of the abundance of rain with which their fields are inundated; 508 whilst the inhabitants of the hill, raises their thanks for the favours they receives, solicits a continuance of that which causes the despair of their neighbour. 509 In this, each is willing to have a god for the self, 510 and asks according to own momentary caprices, to own fluctuating wants, that the invariable essence of things, should be continually changed in own favour.

511 From this it must be obvious, that human every moment asks a miracle to be wrought in own support. 512 It is not, therefore, at all surprising that you displayed such ready credulity, 513 that you adopted with such facility the relation of the marvellous deeds which were universally announced to you as the acts of the power, 514 or the effects of the benevolence, of the various gods which presided over the nations of the earth: 515 these wonderful tales, which were offered to your acceptance, as the most indubitable proofs of the empire of these gods over Nature, 516 which human always found deaf to own entreaties, were readily accredited by you; 517 in the expectation, that if you could gain them over to your interest, this Nature, which you found so sullen, so little disposed to lend Herself to your views, would then be controlled in your own favour.

518 By a necessary consequence of these ideas, Nature was despoiled of all power; 519 She was contemplated only as a passive instrument, who acted at the will, 520 under the

influence of the numerous, all-powerful agents to whom the various superstitions had rendered Her subordinate. 521 It was thus for want of contemplating Nature under Her true point of view, that human has mistaken Her entirely, 522 that you believed Her incapable of producing anything by Herself; 523 that you ascribed the honour of all those productions, whether advantageous or disadvantageous to the human species, 524 to fictitious powers, whom you always clothed with your own peculiar dispositions, only you aggrandised their force. 525 In short, it was upon the ruins of Nature, that human erected the imaginary colossus of superstition, 526 that you reared the altars of a Jupiter, the temples of an Apollo.

527 If the ignorance of Nature gave birth to such a variety of gods, the knowledge of this Nature is calculated to destroy them. 528 As soon as human becomes enlightened, your powers augment, your resources increase in a ratio with your knowledge; 529 the sciences, the protecting arts, industrious application, furnish you assistance; 530 experience encourages your progress, truth procures for you the means of resisting the efforts of many causes, 531 which cease to alarm you as soon as you obtains a correct knowledge of them. 532 In a word, your terrors dissipate in proportion as your mind becomes enlightened, 533 because your trepidation is ever commensurate with your ignorance, and furnishes this great lesson, that human instructed by truth, cease to be superstitious.

OF MYTHOLOGY, AND THEOLOGY

Paul Henri Thiery (Baron D'Holbach)

45 The elements of Nature were, as we have shown, the first divinities of human; 2 you have generally commenced with adoring material beings; 3 each individual, as we have already said, as may be still seen in savage nations, made to the self a particular god, of some physical object, 4 which you supposed to be

the cause of those events, in which you was yourself interested; 5 you never wandered to seek out of visible Nature, the source either of what happened to yourself, or of those phenomena to which you was a witness. 6 As you everywhere saw only material effects, you attributed them to causes of the same genus; 7 incapable in your infancy of those profound reveries, of those subtle speculations, which are the fruit of time, the result of leisure, 8 you did not imagine any cause distinguished from the objects that met your sight, nor of any essence totally different from everything you beheld.

9 The observation of Nature was the first study of those who had leisure to meditate: 10 they could not avoid being struck with the phenomena of the visible world. 11 The rising and setting of the sun, the periodical return of the seasons, the variations of the atmosphere, 12 the fertility and sterility of the earth, the advantages of irrigation, the damage caused by floods, 13 the useful effects of fire, the terrible consequences of conflagration, 14 were proper and suitable objects to occupy their thoughts. 15 It was natural for them to believe that those beings they saw move of themselves, acted by their own peculiar energies; 16 according as their influence over the inhabitants of the earth was either favourable or otherwise, they concluded them to have either the power to injure them, or the disposition to confer benefits.

17 Those who first acquired the knowledge of gaining an ascendancy over human, 18 then savage, wandering, unpolished, or dispersed in woods, with but little attachment to the soil, 19 of which they had not yet learned to reap the advantage, were always more practised observers-- 20 individuals more instructed in the ways of Nature, than the people, or rather the scattered hordes, whom they found ignorant and destitute of experience: 21 their superior knowledge placed them in a capacity to render these services--to discover to them useful inventions, 22 which attracted the confidence of the unhappy beings to whom they came to offer an assisting hand; 23 savages who were naked, half

famished, exposed to the injuries of the weather, obnoxious to the attacks of ferocious beasts, dispersed in caverns, scattered in forests, 24 occupied with hunting, painfully labouring to procure themselves a very precarious subsistence, 25 had not sufficient leisure to make discoveries calculated to facilitate their labour, or to render it less incessant.

26 These discoveries are generally the fruit of society: 27 isolated beings, detached families, hardly ever make any discoveries-- scarcely ever think of making any. 28 The savage is a being who lives in a perpetual state of infancy, who never reaches maturity unless someone comes to draw them out of their misery. 29 At first repulsive, unsociable, intractable, they by degrees familiarises themselves with those who render them service; 30 once gained by their kindness, they readily lends them their confidence; in the end they goes the length of sacrificing to them their liberty.

31 It was commonly from the bosom of civilised nations that have issued those personages who have carried sociability, agriculture, art, laws, gods, superstition, forms of worship, 32 to those families or hordes as yet scattered; who united them either to the body of some other nations, or formed them into new nations, 33 of which they themselves became the leaders, sometimes the king, frequently the high priest, and often their god. 34 These softened their manners-- gathered them together-- taught them to reap the advantages of their own powers-- to render each other reciprocal assistance-- to satisfy their wants with greater facility.

35 In thus rendering their existence more comfortable, thus augmenting their happiness, they attracted their love; 36 obtained their veneration, acquired the right of prescribing opinions to them, 37 made them adopt such as they had either invented themselves, or else drawn up in the civilised countries from whence they came. 38 History points out to us the most famous legislators as people, who, enriched with useful knowledge they had gleaned in the

bosom of polished nations, 39 carried to savages without industry, needing assistance, those arts, of which, until then, these rude people were ignorant: 40 such were the Bacchus's, the Orpheus's, the Triptolemus's, the Numa's, the Zamolixis's; 41 in short, all those who first gave to nations their gods-- their worship-- the rudiments of agriculture, of science, of superstition, of jurisprudence, of religion.

42 It will perhaps be enquired, If those nations which at the present day we see assembled, were all originally dispersed? 43 We reply, that this dispersion may have been produced at various times, 44 by those terrible revolutions, of which it has before been remarked our globe has more than once been the theatre; 45 in times so remote, that history has not been able to transmit us the detail. 46 Perhaps the approach of more than one comet may have produced on our earth several universal ravages, 47 which have at each time annihilated the greater portion of the human species.

48 These hypotheses will unquestionably appear bold to those who have not sufficiently meditated on Nature, but to the philosophic enquirer they are by no means inconsistent. 49 There may not only have been one general deluge, but even a great number since the existence of our planet; 50 this globe itself may have been a new production in Nature; it may not always have occupied the place it does at present. 51 Whatever idea may be adopted on this subject, if it is very certain that, independent of those exterior causes, which are competent to totally change its face, 52 as the impulse of a comet may do, this globe contains within itself, a cause adequate to alter it entirely, 53 since, besides the diurnal and sensible motion of the earth, it has one extremely slow, almost imperceptible, by which everything must eventually be changed in it: 54 this is the motion from whence depends the precession of the equinoctial points, observed by Hipparchus and other mathematicians, now well

understood by astronomers; 55 by this motion, the earth must at the end of several thousand years change totally: 56 this motion will at length cause the ocean to occupy that space which at present forms the lands or continents.

57 From this it will be obvious that our globe, as well as all the beings in Nature, has a continual disposition to change. 58 This motion was known to the ancients, and was what gave rise to what they called their great year, 59 which the Egyptians fixed at thirty-six thousand five hundred and twenty-five years: 60 the Sabines at thirty-six thousand four hundred and twenty-five, whilst others have extended it to one hundred thousand, some even to seven hundred and fifty-three thousand years.

61 Again, to those general revolutions which our planet has at different times experienced, 62 may be added those that have been partial, such as inundations of the sea, earthquakes, subterraneous conflagrations, 63 which have sometimes had the effect of dispersing particular nations, and to make them forget all those sciences with which they were, before acquainted. 64 It is also probable that the first volcanic fires, having had no previous vent, were more central, and greater in quantity, before they burst the crust of earth; 65 as the sea washed the whole, it must have rapidly sunk down into every opening, 66 where, falling on the boiling lava, it was instantly expanded into steam, producing irresistible explosion: 67 whence it is reasonable to conclude, that the primaeval earthquakes were more widely extended, and of much greater force, than those which occur in our days. 68 Other vapours may be produced by intense heat, possessing a much greater elasticity, from substances that evaporate, such as mercury, diamonds; 69 the expansive force of these vapours would be much greater than the steam of water, 70 even at red hot heat consequently they may have had sufficient energy to raise islands, continents, or even to have detached the moon from the earth; 71 if the moon, as has been supposed by some

philosophers, was thrown out of the great cavity which now contains the South Sea; 72 the immense quantity of water flowing in from the original ocean, and which then covered the earth, 73 would much contribute to leave the continents and islands, which might be raised at the same time, above the surface of the water. 74 In later days we have accounts of huge stones falling, from the firmament, which may have been thrown by explosion from some distant earthquake, 75 without having been impelled with a force sufficient to cause them to circulate round the earth, and thus produce numerous small moons or satellites.

76 Those who were able to escape from the ruin of the world, filled with consternation, plunged in misery, were but little conditioned to preserve to their posterity a knowledge, 77 effaced by those misfortunes, of which they had been both the victims and the witnesses: 78 overwhelmed with dismay, trembling with fear, they were not able to hand down the history of their frightful adventures, except by obscure traditions; 79 much less to transmit to us the opinions, the systems, the arts, the sciences, anterior to these petrifying revolutions of our sphere. 80 There have been perhaps people upon the earth from all eternity; but at different periods they may have been nearly annihilated, 81 together with their monuments, their sciences, and their arts; 82 those who outlived these periodical revolutions, each time formed a new race of people, 83 who by dint of time, labour, and experience, have by degrees withdrawn from oblivion the inventions of the primitive races. 84 It is, perhaps, to these periodical revolutions of the human species, that is to be ascribed the profound ignorance 85 in which we see human yet plunged upon those objects that are the most interesting to you.

86 This is, perhaps, the true source of the imperfection of human knowledge-- 87 of the vices of human political institutions-- of the defect in human religion-- of the growth of superstition, over which terror has always presided; 88 here, in all

probability, is the cause of that puerile inexperience, of those jejune prejudices, which almost everywhere keep human in a state of infancy, 89 and which render you so little capable of either listening to reason or of consulting truth. 90 To judge by the slowness of human progress, by the feebleness of human advance, in a number of respects, we should be inclined to say, the human race has either just quitted its cradle, 91 or that human was never destined to attain the age of virility-- to corroborate your reason.

92 However it may be with these conjectures, whether the human race may always have existed upon the earth, whether it may have been a recent production of Nature, 93 whether the larger animals we now behold were originally derived from the smallest microscopic ones, who have increased in bulk with the progression of time, 94 or whether, as the Egyptian philosophers thought, humankind were originally hermaphrodites, who like the aphis produced the sexual distinction after some generations, 95 which was also the opinion of Plato, and seems to have been that of Moses, 96 who was educated amongst these Egyptians, as may be gathered from the 27th and 28th verses of the first chapter of GENESIS: 97 "So God created human in His own image, in the image of God He created them; male and female He created them-- 98 And GOD blessed them, and GOD said unto them, be fruitful, and multiply, and replenish the earth, and subdue it: 99 and have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth:" 100 it is not therefore presuming too much to suppose, as the Egyptians were a nation very fond of explaining their opinions by hieroglyphics, 101 that that part which describes Eve as taken out of Adam's rib, was an hieroglyphic emblem: 102 showing that humankind was in the primitive state of both sexes, united, who was afterwards divided into males and females.

103 However, I say, this may be, it is extremely easy to recur to the origin of many existing nations: 104 we

shall find them always in the savage state; that is, to say, dispersed; composed of families detached from each other; of wandering, hordes; 105 these were collected together, approximated at the voice of some missionary or legislator, from whom they received great benefits, who gave them gods, opinions, and laws. 106 These personages, of whom the people newly congregated readily acknowledged the superiority, 107 fixed the national gods, leaving to each individual, those which one had formed to the self, according to one's own peculiar ideas, 108 or else substituting others brought from those regions, from whence they themselves had emigrated.

109 The better to imprint their lessons on the minds of their new subjects, these people became the guides, the priests, the sovereigns, the masters of these infant societies; 110 they formed discourses by which they spoke to the imagination of their willing auditors. 111 POETRY seem best adapted to strike the mind of these rude people, 112 to engrave on their memory those ideas with which they were willing to imbue them: its images, its fictions, its numbers, its rhyme its harmony, 113 all conspired to please their fancy, to render permanent the impressions it made: 114 thus, the entire of Nature, as well as all its parts, was personified, by its beautiful allegories: at its soothing voice, trees, stones, rocks, earth, air, fire, water, 115 by imagination took intelligence, held conversation with human, and with themselves; 116 the elements were deified by its songs, everything was figuratively detailed in harmonious lays.

117 The sky, which according to the then philosophy, was an arched concave, spreading over the earth, which was supposed to be a level plain;-- 118 for the doctrine of antipodes is of rather modern date-- was itself made a god; 119 was considered a more suitable residence, as making a greater distinction for these imaginary deities than the earth on which human resided. 120 Thus the firmament was filled with deities. 121 Time, under the name of Saturn, was pictured as the son of heaven; or Coelus by earth, called Terra, or

Thea; 122 he was represented as an inexorable divinity--naturally artful, who devoured his own children-- 123 who revenged the anger of his mother upon his father; for which purpose she armed him with a scythe, formed of metals drawn from her own bowels, 124 with which he struck Coelus, in the act of uniting himself to Thea, and so mutilated him, 125 that he was ever after incapacitated to increase the number of his children: 126 he was said to have divided the throne with Janus king of Italy, his reign seems to have been so mild, so beneficent, that it was called the golden age; 127 human victims were sacrificed on his altars, until abolished by Hercules, who substituted small images of clay.

128 Festivals in honour of this god, called Saturnalia, were instituted long antecedent to the foundation of Rome 129 they were celebrated about the middle of December, either on the 16th, 17th, or 18th; 130 they lasted in latter times several days, originally but one. 131 Universal liberty prevailed at the celebration, slaves were permitted to ridicule their masters-- 132 to speak freely on every subject-- no criminals were executed-- war never declared; 133 the priests made their human offerings with their heads uncovered; a circumstance peculiar to the Saturnalia, not adopted at other festivals.

134 The igneous matter, the etherial electric fluid, that invisible fire which vivifies Nature, that penetrates all beings, that fertilises the earth, 135 which is the great principle of motion, the source of heat, was deified under the name of Jupiter: 136 his combination with every being in Nature was expressed by own metamorphoses-- by the frequent adulteries imputed to him. 137 He was armed with thunder, to indicate he produced meteors, to typify the electric fluid that is called lightning. 138 He married the winds, which were designated under the name of Juno, therefore called the Goddess of the Winds, their nuptials were celebrated with great solemnity; 139 all the gods, the entire brute creation, the whole of humankind attended, 140 except one young woman named

Chelone, who laughed at the ceremonies, for which impiety she was changed by Mercury into a tortoise, and condemned to perpetual silence.

141 He was the most powerful of all the gods, and considered as the king and father both of gods and humans: 142 his worship was very extended, performed with greater solemnity, than that of any other god. 143 Upon his altars smoked goats, sheep, and white bulls, in which he is said to have particularly delighted; 144 the oak was rendered sacred to him, because he taught humankind to live upon acorns; 145 he had many oracles where his precepts were delivered, the most celebrated of these were at Dodona and Ammon in Lybia; 146 he was supposed to be invisible to the inhabitants of the earth; 147 the Lacedemonians erected his statue with four heads, thereby indicating, that he listened readily to the solicitations of every quarter of the earth.

148 Minerva is represented as having no mother, but to have come completely armed from his brains, when his head was opened by Vulcan; 149 by which it is meant to infer that wisdom is the result of this ethereal fluid. 150 Thus, following the same fictions, the sun, that beneficent star which has such a marked influence over the earth, became an Osiris, a Belus, a Mithras, an Adonis, an Apollo. 151 Nature, rendered sorrowful by his periodical absence, was an Isis, an Astarte, a Venus, a Cybele. 152 Astarte had a magnificent temple at Hieropolis served by three hundred priests, who were always employed in offering sacrifices. 153 The priests of Cybele, called Corybantes, also Galli, were not admitted to their sacred functions without previous mutilation. 154 In the celebration of their festivals these priests used all kinds of indecent expressions, beat drums, cymbals, and behaved just like mad-people: 155 his worship extended all over Phrygia, and was established in Greece under the name of Eleusinian mysteries. 156 In short, everything was personified: the sea was under the empire of Neptune; fire was adored by the Egyptians under the

name of Serapis; 157 by the Persians, under that of Ormus or Oromaze; and by the Romans, under that of Vesta and Vulcan.

158 Such was the origin of mythology: it may be said to be the daughter of natural philosophy, embellished by poetry; only destined to describe Nature and its parts. 159 If antiquity is consulted, it will be perceived without much trouble, 160 that these famous sages, those legislators, those priests, those conquerors, who were the instructors of infant nations, themselves adored active nature, 161 or the great whole considered relatively to its different operations or qualities; 162 that this was what they caused the ignorant savages whom they had gathered together to adore.

163 It was the great whole they deified; it was its various parts which they made their inferior gods; it was from the necessity of Her laws they made fate. 164 The Greeks called it Nature, a divinity who had a thousand names. 165 Varro says, "I believe that God is the soul of the universe, and that the universe is God." 166 Cicero says "that in the mysteries of Samothracia, of Lemnos, of Eleusis, it was Nature much more than the gods, they explained to the initiated." 167 Pliny says, "we must believe that the world, or that which is contained under the vast extent of the heavens, is the Divinity; even eternal, infinite, without beginning or end." 168 It was these different modes of considering Nature that gave birth to Polytheism, to idolatry. 169 Allegory masqued its mode of action: it was at length parts of this great whole, that idolatry represented by statues and symbols.

170 To complete the proofs of what has been said; to show distinctly that it was the great whole, the universe, the nature of things, which was the real object of the worship of Pagan antiquity, 171 hardly anything can be more decisive than the beginning of the hymn of Orpheus addressed to the god Pan. 172 "O Pan! I invoke thee, O powerful god! O universal Nature! The heavens, the sea, the earth, who nourish all, and the eternal fire, because these are thy members, O all powerful Pan," 173

Nothing can be more suitable to confirm these ideas, than the ingenious explanation which is given of the fable of Pan, as well as of the figure under which he is represented. 174 It is said, "Pan, according to the signification of his name, is the emblem by which the ancients have designated the great assemblage of things or beings: 175 he represents the universe; and, in the mind of the wisest philosophers of antiquity, he passed for the greatest and most ancient of the gods. 176 The features under which he is delineated form the portrait of Nature, and of the savage state in which She was found in the beginning. 177 The spotted skin of the leopard, which serves him for a mantle, imagined the heavens filled with stars and constellations. 178 His person was compounded of parts, some of which were suitable to a reasonable animal, that is to say, to human; 179 and others to the animal destitute of reason, such as the goat. 180 It is thus," says he, "that the universe is composed of an intelligence that governs the whole, and of the prolific, fruitful elements of fire, water, earth, air. 181 Pan, loved to drink and to follow the nymphs; this announces the occasion Nature has for humidity in all Her productions, 182 and that this god, like Nature, is strongly inclined to propagation. 183 According to the Egyptians, and the most ancient Grecian philosophers, Pan had neither father nor mother; 184 he came out of Demogorgon at the same moment with the Destinies, his fatal sisters; 185 a fine method of expressing that the universe was the work of an unknown power, and that it was formed after the invariable relations, the eternal laws of necessity; 186 but his most significant symbol, that most suitable to express the harmony of the universe, is his mysterious pipe, composed of seven unequal tubes, 187 but calculated to produce the nicest, the most perfect concord. 188 The orbs which compose the seven planets of our solar system, are of different diameters; 189 being bodies of unequal mass, they describe their revolutions round the sun in various periods; 190 nevertheless it is from

the order of their motion that results the harmony of the spheres".

191 Here then is the great macrocosm, the mighty whole, the assemblage of things adored and deified by the philosophers of antiquity; 192 whilst the uninformed stopped at the emblem under which this Nature was depicted; at the symbols under which its various parts, its numerous functions were personified; 193 his narrow mind, his barbarous ignorance, never permitted him to mount higher; 194 they alone were deemed worthy of being, initiated into the mysteries, who knew the realities masqued under these emblems. 195 Indeed, it is not to be doubted for an instant, that the wisest among the Pagans adored Nature; 196 which ethnic theology designated under a great variety of nomenclature, under an immense number of different emblems. 197 Apuleius, although a decided Platonist, accustomed to the mysterious, unintelligible notions of his master, 198 calls "Nature the parent of all; the mother of the elements, the first offspring of the world;" 199 again, "the mother of the stars, the parent of the seasons, and the governess of the whole world." 200 Nature was worshipped by many under the appellation of the mother of the gods.

201 Indeed, the first institutors of nations, and their immediate successors in authority, only spoke to the people by fables, allegories, enigmas, 202 of which they reserved to themselves the right of giving an explanation: 203 this, in fact, constituted the mysteries of the various worship paid to the Pagan divinities. 204 This mysterious tone they considered necessary, whether it was to mask their own ignorance, or whether it was to preserve their power over the uninformed, 205 who for the most part only respect that which is above their comprehension. 206 Their explications were generally dictated either by interest, or by a delirious imagination, frequently by imposture; 207 thus from age to age, they did no more than render Nature and its parts, which they had originally depicted, more unknown, until they completely lost sight of the

primitive ideas; 208 these were replaced by a multitude of fictitious personages, under whose features this Nature had primarily been represented to them.

209 The people, either unaccustomed to think, or deeply steeped in ignorance, adored these personages, 210 without penetrating into the true sense of the emblematical fables recounted to them. 211 These ideal beings, with material figures, in whom they believed there resided a mysterious virtue, a divine power, 212 were the objects of their worship, the source of their fears, the fountain of their hopes. 213 The wonderful, the incredible actions ascribed to these fancied divinities, were an inexhaustible fund of admiration, 214 which gave perpetual play to the fancy; which delighted not only the people of those days, but even the children of latter ages. 215 Thus were transmitted from age to age, those marvellous accounts, 216 which, although necessary to the existence of the power usurped by the ministers of these gods, did, in fact, nothing more than confirm the blindness of the ignorant: 217 these never supposed that it was Nature, its various operations, its numerous component parts-- 218 that it was the passions of human and your diverse faculties that lay buried under an heap of allegories; 219 they did not perceive that the passions and faculties of human nature were used as emblems, because human was ignorant of the true cause of the phenomena you beheld.

220 As strong passions seemed to hurry human along, in despite of yourself, they either attributed these passions to a god, or deified them; 221 frequently they did both: it was thus love became a deity; 222 that eloquence, poetry, industry, were transformed into gods, under the names of Hermes, Mercury, Apollo; 223 the stings of conscience were called the Furies: the people, bowed down in stupid ignorance, had no eyes but for these emblematical people, under which Nature was masked: 224 they attributed to their influence the good, to their displeasure the evil, which they experienced: 225 they entered into

every kind of folly, into the most delirious acts of madness, to render them propitious to their views; 226 thus, for want of being acquainted with the reality of things, their worship frequently degenerated into the most cruel extravagance, into the most ridiculous folly. 227 Thus it is obvious, that everything proves Nature and its various parts to have every where been the first divinities of human.

228 Natural philosophers studied these deities, either superficially or profoundly,-- 229 explained some of their properties, detailed some of their modes of action. 230 Poets painted them to the imagination of mortals, either in the most fascinating colours, or under the most hideous deformities; 231 embodied them--furnished them with reasoning faculties--recounted their exploits--recorded their will. 232 The statuary executed sometimes with the most enrapturing art, the ideas of the poets,-- gave substance to their shadows-- form to their airy nothings.

233 The priest decorated these united works with a thousand marvellous qualities-- with the most terrible passions-- with the most inconceivable attributes; 234 gave them, "a local habitation and a name." 235 The people adored them; prostrated themselves before these gods, who were neither susceptible of love or hatred, goodness, or malice; 236 they became persecuting, malevolent, cruel, unjust, in order to render themselves acceptable to powers generally described to them under the most odious features.

237 By dint of reasoning upon these emblems, by meditating upon Nature, thus decorated, or rather disfigured, 238 subsequent speculators no longer recollected the source from whence their predecessors had drawn their gods, nor the fantastic ornaments with which they had embellished them. 239 Natural philosophers and poets were transformed by leisure into metaphysicians and theologians; 240 tired with contemplating what they could have understood, they believed they had made an important

discovery by subtly distinguishing Nature from Herself-- 241 from Her own peculiar energies-- from Her faculty of action. 242 By degrees they made an incomprehensible being of this energy, which as before they personified, 243 this they called the mover of Nature, divided it into two, one congenial to human's happiness, the other inimical to your welfare; 244 these they deified in the same manner as they had before done Nature with Her various parts.

245 These abstract, metaphysical beings, became the sole object of their thoughts; were the subject of their continual contemplation; 246 they looked upon them as realities of the highest importance: 247 thus Nature quite disappeared; She was despoiled of Her rights; 248 She was considered as nothing more than an unwieldy mass, destitute of power; devoid of energy, as an heap of ignoble matter purely passive: 249 who, incapable of acting by Herself, was not competent to any of the operations they beheld, 250 without the direct, the immediate agency of the moving powers they had associated with Her: which they had made the fulcrum necessary to the action of the lever.

251 They either did not or would not perceive, that the great Cause of causes, ens entium, Parent of parents, had, in unravelling chaotic matter, 252 with a wisdom for which human can never be sufficiently grateful, with a sagacity which you can never sufficiently admire, 253 foreseen everything that could contribute not only to your own individual happiness, but also to that of all the beings in Nature; 254 that you had given this Nature immutable laws, according to which She is forever regulated; after which She is obliged invariably to act; 255 that human have described for Her an eternal course, from which it is not permitted Her to deviate, even for an instant; 256 that She is therefore, rendered competent to the production of every phenomena, not only that you beholds, but of an infinity that human have never yet contemplated; 257 that She needs not any exterior energy for this purpose, having received Her powers from a hand far

superior to any the feeble weak imagination of human is able to form; 258 that when this Nature appears to afflict you, it is only from the contraction of your own views, from the narrowness of your own ideas, that you judges; 259 that, in fact, what you considers the evils of Nature, are the greatest possible benefits you can receive, 260 if you was but in a condition to be acquainted with previous causes, with subsequent effects.

261 That the evils resulting to you from your own vices, have equally their remedies in this Nature, which it is your duty to study; 262 which if you does you will find, that the same omnipotent goodness, who gave Her irrefragable laws, also planted in Her bosom, balsams for all your maladies, whether physical or moral: 263 but that it is not given you to know what this great, this universal cause is, 264 for purposes of which you ought not to dispute the wisdom, when you contemplates the mighty wonders that surround you.

265 Thus human ever preferred an unknown power, to that of which you was enabled to have some knowledge, if you had only deigned to consult your experience; 266 but you presently ceases to respect that which you understands; to estimate those objects which are familiar to you: 267 you figures to yourself something marvellous in everything you does not comprehend; 268 your mind, above all, labours to seize upon that which appears to escape your consideration; 269 in default of experience, you no longer consults anything, but your imagination, which feeds you with chimeras.

270 In consequence, those speculators who have subtly distinguished Nature from Her own powers, have successively laboured to clothe the powers thus separated with a thousand incomprehensible qualities: 271 as they did not see this power, which is only a mode, they made it a spirit-- an intelligence-- an incorporeal being; 272 that is to say, of a substance totally different from everything of which we have a knowledge. 273 They never perceived that all their inventions, that all the words which they

imagined, only served to mask their real ignorance; 274 that all their pretended science was limited to saying, in what manner Nature acted, by a thousand subterfuges which they themselves found it impossible to comprehend.

275 Human always deceives the self for want of studying Nature; you leads yourself astray, every time you are disposed to go out of it; 276 you are always quickly necessitated to return; you are even in error when you substitutes words which you does not yourself understand, 277 for things which you would much better comprehend if you was willing to look at them without prejudice.

278 Can a theologian ingenuously believe the self more enlightened, for having substituted the vague words spirit, incorporeal substance, 279 to the more intelligible terms Nature, matter, mobility, necessity? 280 However this may be, these obscure words once imagined, it was necessary to attach ideas to them; 281 in doing this, you have not been able to draw them from any other source than the beings of this despised Nature, 282 which are ever the only beings of which you are enabled to have any knowledge. 283 Human, consequently, drew them up in the self; your own soul served for the model of the universal soul, of which indeed according to some it only formed a portion; 284 your own mind was the standard of the mind that regulated Nature; 285 your own passions, your own desires, were the prototypes of those by which you actuated this being; 286 your own intelligence was that from which you formed that of the mover of Nature; 287 that which was suitable to yourself, you called the order of Nature; 288 this pretended order was the scale by which you measured the wisdom of this being; 289 in short, those qualities which you calls perfections in yourself, were the archetypes in miniature, of the perfections of the being, 290 you thus gratuitously supposed to be the agent, who operated the phenomena of Nature.

291 It was thus, that in despite of all their efforts, the theologians were, perhaps always will be, true

Anthropomorphites. 292 A sect of this denomination appeared in 359, in Egypt, they held the doctrine that their god had a bodily shape. 293 Indeed it is very difficult, if not impossible to prevent human from making the self the sole model of own divinity. 294 Montaigne says "human is not able to be other than you are, nor imagine but after you capacity; 295 let you take what pains you may, you will never have a knowledge of any soul but your own." 296 Xenophanes said, "if the ox or the elephant understood either sculpture or painting, they would not fail to represent the divinity under their own peculiar figure 297 that in this, they would have as much reason as Polyclitus or Phidias, who gave Him the human form."

298 It was said to a very celebrated person that "God made human after His own image;" 299 "human has returned the compliment," replied the philosopher. 300 Indeed, human generally sees in own God, nothing but a human. 301 Let you subtilise as you will, let you extend your own powers as you may, let you swell your own perfections to the utmost, 302 you will have done nothing more than make a gigantic, exaggerated human, whom you will render illusory by dint of heaping together incompatible qualities. 303 You will never see in such a god, but a being of the human species, 304 in whom you will strive to aggrandise the proportions, until you have formed a being totally inconceivable.

305 It is according to these dispositions that you attributes intelligence, wisdom, goodness, justice, science, power, to your divinity, 306 because you are yourself intelligent; because you have the idea of wisdom in some beings of your own species; 307 because you loves to find in them ideas favourable to yourself: because you esteems those who display equity; 308 because you have a knowledge, which you holds more extensive in some individuals than yourself; 309 in short, because you enjoys certain faculties which depend on your own organisation. 310 You presently extends or exaggerates all these qualities in forming your god; 311 the sight of the

phenomena of Nature, which you feels you are yourself incapable of either producing or imitating, 312 obliges you to make this difference between the being you portrays and yourself; 313 but you knows not at what point to stop; you fears lest you should deceive yourself, 314 if you should see any limits to the qualities you assigns, the word infinite, therefore, is the abstract, the vague term which you uses to characterise them.

315 You says that His power is infinite, which signifies that when you beholds those stupendous effects which Nature produces, you have no conception at what point His power can rest; 316 that His goodness, His wisdom, His knowledge are infinite: 317 this announces that you are ignorant how far these perfections may be carried in a being whose power so much surpasses your own; 318 that He is of infinite duration, because you are not capable of conceiving He could have had a beginning or can ever cease to be; 319 because of this you considers a defect in those transitory beings of whom you beholds the dissolution, whom you sees are subjected to death. 320 You presumes the cause of those effects to which you are a witness, of those striking phenomena that assail your sight, is immutable, permanent, not subjected to change, 321 like all the evanescent beings whom you knows are submitted to dissolution, to destruction, to change of form.

322 This mover of Nature being always invisible to human, His mode of action being impenetrable, 323 you believe that, like your soul or the concealed principle which animates your own body, which you calls spiritual, a spirit, is the moving power of the universe; 324 in consequence you makes a spirit the soul, the life, the principle of motion in Nature. 325 Thus when by dint of subtilising, you have arrived at believing the principle by which your body is moved in a spiritual, immaterial substance, 326 you makes the spirit of the universe immaterial in like manner: 327 you makes it immense, although without extent; immoveable, although capable of

moving Nature: 328 immutable, although you supposes Him to be the author of all the changes, operated in the universe.

329 The idea of the unity of God, which cost Socrates his life, because the Athenians considered those Atheists who believed but in one, was the tardy fruit of human meditation. 330 Plato himself did not dare to break entirely the doctrine of Polytheism; 331 he preserved Venus, an all-powerful Jupiter, and a Pallas, who was the goddess of the country. 332 The sight of those opposite, frequently contradictory effects, which human saw take place in the world, 333 had a tendency to persuade him there must be a number of distinct powers or causes independent of each other. 334 He was unable to conceive that the various phenomena he beheld, sprung from a single, from an unique cause; 335 he therefore admitted many causes or gods, acting upon different principles; 336 some of which he considered friendly, others as inimical to his race.

337 Such is the origin of that doctrine, so ancient, so universal, which supposed two principles in Nature, 338 or two powers of opposite interests, who were perpetually at war with each other; 339 by the assistance of which he explained, that constant mixture of good and evil, that blending of prosperity with misfortune, 340 in a word, those eternal vicissitudes to which in this world the human being, is subjected. 341 This is the source of those combats which all antiquity has supposed to exist between good and wicked gods, 342 between an Osiris and a Typhoeus; between an Orosmadis and an Arimanis; between a Jupiter and the Titanes; 343 in these encounters human for your own peculiar interest always gave the palm of victory to the beneficent deity; 344 this, according to all the traditions handed down, ever remained in possession of the field of battle; 345 it was so far right, as it is evidently for the benefit of humankind that the good should prevail over the wicked.

NATURE

346 When, however, human acknowledged only one God, you generally supposed the different departments of Nature were confided to powers subordinate to your supreme orders, 347 under whom the sovereign of the gods discharged his care in the administration of the world. 348 These subaltern gods were prodigiously multiplied; each person, each town, each country, had their local, their tutelary gods; 349 every event, whether fortunate or unfortunate, had a divine cause; was the consequence of a sovereign decree; 350 each natural effect, every operation of Nature, each passion, depended upon a divinity, 351 which a theological imagination, disposed to see gods everywhere, mistaking Nature, either embellished or disfigured. 352 Poetry tuned its harmonious lays, on these occasions, exaggerated the details, animated its pictures; 353 credulous ignorance received the portraits with eagerness-- heard the doctrines with submission.

354 Such is the origin of Polytheism: 355 indeed the Greek word Theos, [Greek letters], is derived from Theaomai, [Greek letters], which implies to contemplate, or take a view of secret or hidden things. 356 Such are the foundations, such the titles of the hierarchy, which human established between the self and own gods, 357 because you generally believed you was incapable of the exalted privilege of immediately addressing yourself to the incomprehensible Being 358 whom you had acknowledged for the only sovereign of Nature, without even having any distinct idea on the subject: 359 such is the true genealogy of those inferior gods whom the uninformed place as a proportional means between themselves and the first of all other causes. 360 In consequence, among the Greeks and the Romans, we see the deities divided into two classes, 361 the one were called great gods, because the whole world were nearly in accord in deifying the most striking parts of Nature, such as the sun, fire; 362 the sea, time, these formed a kind of aristocratic order, who were distinguished from the

minor gods, or from the multitude of ethnic divinities, who were entirely local; 363 that is to say, were reverenced only in particular countries, or by individuals; 364 as in Rome, where every citizen had own familiar spirit, called lares; and household god, called penates.

365 Nevertheless, the first rank of these Pagan divinities, like the latter, were submitted to Fate, 366 that is, to destiny, which obviously is nothing more than Nature acting by immutable, rigorous, necessary laws; 367 this destiny was looked upon as the god of gods; it is evident, that this was nothing more than necessity personified; 368 that therefore it was a weakness in the heathens to fatigue with their sacrifices, to solicit with their prayers, 369 those divinities whom they themselves believed were submitted to the decrees of an inexorable destiny, of which it was never possible for them to alter the mandates. 370 But human, generally, ceases to reason, whenever your theological notions are either brought into question, or are the subject of your inquiry.

371 What has been already said, serves to show the common source of that multitude of intermediate powers, subordinate to the gods, but superior to human, with which you filled the universe: 372 they were venerated under the names of nymphs, demi-gods, angels, daemons, good and evil genii, spirits, heroes, saints. 373 Among the Romans they were called Dei medioxumi, intermediate angels; they were looked upon as intercessors, as mediators, as powers whom it was necessary to reverence, 374 in order either to obtain their favour, appease their anger, or divert their malignant intentions; 375 these constitute different classes of intermediate divinities, who became either the foundation of their hopes, the object of their fears, the means of consolation, 376 or the source of dread to those very mortals who only invented them 377 when they found it impossible to form to themselves distinct, perspicuous ideas of the incomprehensible Being who governed the world in chief; 378 or when they despaired of being able to

hold communication with Him directly.

379 Meditation and reflection diminished the number of those deities which composed the ethnic polytheism: 380 some who gave the subject more consideration than others, reduced the whole to one all-powerful Jupiter; 381 but still they painted this being in the most hideous colours, gave Him the most revolting features, 382 because they were still obstinately bent on making human, His action and His passions, the model: 383 this folly led them into continual perplexities, because it heaped together contradictory, incompatible, extravagant qualities; 384 it was quite natural it should do so: the limited views, the superficial knowledge, the irregular desires of frail, feeble mortals, were but little calculated to typify the mind of the real Divinity; 385 of that great Cause of causes, that Parent of parents, from whom everything must have emanated.

386 Although they persuaded themselves it was sinning to give Him rivals, yet they described Him as a jealous monarch who could not bear a division of empire; 387 thus taking the vanity of earthly princes for their emblem, as if it was possible such a being could have a competitor like a terrestrial monarch.

388 Not having contemplated the immutable laws with which He has invested Nature, 389 to which everything it contains is subjected, which are the result of the most perfect wisdom, 390 they were puzzled to account for the contrariety of those effects which their weak minds led them to suppose as evils; 391 seeing that sometimes those who fulfilled in the most faithful manner their duties in this life, were involved in the same ruin with the boldest, the most inconsiderate violaters: 392 thus in making Him the immediate agent, instead of the first author, the executive instead of the formative power, they caused him to appear capricious, 393 as unreasonably vindictive against His creatures, 394 when they ought to have known that His wisdom was unlimited, His kindness without bounds, 395 when He infused into Nature that power

which produces these apparently contradictory effects; 396 which, although they seem injurious to human's interests, are, if you was but capacitated to judge fairly, the most beneficial advantages that you can possibly derive. 397 Thus they made the Divinity appear improvident, by continually employing Him to destroy the work of His own hands: 398 they, in fact, taxed Him with impotence, by the perpetual non-performance of those projects of which their own imbecility, their own erring judgment, had vainly supposed Him to be the contriver.

399 To solve these difficulties, human created enemies to the Divinity, 400 who although subordinate to the supreme God, were nevertheless competent to disturb His empire, to frustrate His views. 401 Can anything be worse conceived, can anything be more truly derogatory to the great Parent of parents, than thus to make Him resemble a king, 402 who is surrounded with adversaries, willing to dispute with Him His diadem? 403 Such, however, is the origin of the Fable of the Titanes, or of the rebellious angels, whose presumption caused them to be plunged into the abyss of misery-- 404 who were changed into demons, or into evil genii: 405 these according to their mythology, had no other functions, than to render abortive the projects of the Divinity; 406 to seduce, to raise to rebellion, those who were His subjects. 407 Miserable invention, feeble subterfuge, for the vices of humankind, although decorated with all the beauty of language. 408 Can then sublimity of versification, the harmony of numbers, reconcile human 409 to the idea that the puny offspring of natural causes is adequate for a single instant to dispute the commands, to thwart the desires, 410 to render nugatory the decrees of a Being whose wisdom is of the most polished perfection; 411 whose goodness is boundless; whose power must be more capacious than the human mind can possibly conceive?

412 In consequence of this Fable of the Titanes, the monarch of Nature was represented as perpetually in a scuffle with the enemies He had

Himself created; 413 as unwilling totally to subdue those with whom these fabulists have described Him as dividing His authority-- partaking His supreme power. 414 This again was borrowed from the conduct of earthly monarchs, who, when they find a potent enemy, make a treaty with Him; 415 but this was quite unnecessary for the great Cause of causes; and only shows that human is utterly incapable of forming any other ideas 416 than those which you derives from the situation of those of your own race, or of the beings by whom you are surrounded.

417 According to this fable the subjects of the universal Monarch were never properly submitted to His authority; 418 like an earthly king, He was in a continual state of hostility, and punished those who had the misfortune to enter into the conspiracies of the enemies of His glory: 419 seeing that human legislators put forth laws, issued decrees, they established similar institutions for the Divinity; established oracles; 420 His ministers pretended, through these mysterious mediums, to convey to the people His heavenly mandates, to unveil His concealed intentions: 421 the ignorant multitude received these without examination, they did not perceive that it was human, and not the Divinity, who thus spoke to them; 422 they did not feel that it must be impossible for weak creatures to act contrary to the will of God.

423 The Fable of the Titanes, or rebellious angels, is extremely ancient; very generally diffused over the world; 424 it serves for the foundation of the theology of the Brachmins of Hindostan: 425 according to these, all living bodies are animated by fallen angels, who under these forms expiate their rebellion. 426 These contradictory notions were the basis of nearly all the superstitions of the world; 427 by these means they imagined they accounted for the origin of evil-- demonstrated the cause why the human species experience misery.

428 In short, the conduct of the most arbitrary tyrants of the earth was but too frequently brought forth, too often acted upon, 429 in forming the

character of the Divinity, held forth to the worship of human: 430 their imperfect jurisprudence was the source from whence they drew that which they ascribed to their god. 431 Pagan theology was remarkable for displaying in the character of their divinities the most dissolute vices; for making them vindictive; 432 for causing them to punish with extreme rigour those crimes which the oracles predicted; 433 to doom to the most lasting torments those who sinned without knowing their transgression; 434 to hurl vengeance on those who were ignorant of their obscure will, delivered in language which set comprehension at defiance; 435 unless it was by the priest who both made and fulminated it. 436 It was upon these unreasonable notions, that the theologians founded the worship which human ought to render to the Divinity.

437 Do not then let us be at all surprised if the superstitious human was in a state of continual alarm: 438 if you experienced trances-- if your mind was ever in the most tormenting dread; 439 the idea of your gods recalled to you unceasingly, that of a pitiless tyrant who sported with the miseries of your subjects; 440 who, without being conscious of their own wrong, might at each moment incur your displeasure: 441 you could not avoid feeling that although they had formed the universe entirely for human, yet justice did not regulate the actions of these powerful beings, or rather those of the priests; 442 but you also believed that their elevated rank placed them infinitely above the human species, that therefore they might afflict you at their pleasure.

443 It is then for want of considering good and evil as equally necessary; 444 it is for want of attributing them to their true causes, that human has created to the self fictitious powers, malicious divinities, respecting whom it is found so difficult to undeceive you. 445 Nevertheless, in contemplating Nature, you would have been able to have perceived, that physical evil is a necessary consequence of the peculiar properties of some beings; 446 you would have acknowledged that

plague, contagion, disease, are due to physical causes under particular circumstances; 447 to combinations, which, although extremely natural, are fatal to your species; 448 you would have sought--in the bosom of Nature Herself the remedies suitable to diminish these evils, 449 or to have caused the cessation of those effects under which you suffered: 450 you would have seen in like manner that moral evil was the necessary consequence of defective institutions; 451 that it was not to the Divinity, but to the injustice of your fellows you ought to ascribe those wars, that poverty, those famines, those reverses of fortune, 452 those multitudinous calamities, those vices, those crimes, under which you so frequently groans.

453 Thus to rid yourself of these evils you would not have uselessly extended your trembling hands towards shadows incapable of relieving you; 454 towards beings who were not the authors of your sorrows; 455 you would have sought remedies for these misfortunes in a more rational administration of justice-- 456 in more equitable laws--in more reasonable institutions--in a greater degree of benevolence towards your fellow human-- in a more punctual performance of your own duties.

457 As these gods were generally depicted to human as implacable to your frailties 458 as they denounced nothing but the most dreadful punishments against those who involuntarily offended, 459 it is not at all surprising that the sentiment of fear prevailed over that of love: 460 the gloomy ideas presented to your mind were calculated to make you tremble, without making you better; 461 an attention to this truth will serve to explain the foundation of that fantastical, irrational, frequently cruel worship, which was paid to these divinities; 462 you often committed the most cruel extravagancies against your own person, the most hideous crimes against the person of others, 463 under the idea that in so doing, you disarmed the anger, appeased the justice, recalled the clemency, deserved the mercy of your gods.

464 In general, the superstitious systems of human, your human and other sacrifices, your prayers, your ceremonies, your customs; 465 have had only for their object either to divert the fury of your gods, whom you believed you had offended; 466 to render them propitious to your own selfish views; 467 or to excite in them that good disposition towards yourself, which your own perverse mode of thinking made you imagine they bestowed exclusively on others: 468 on the other hand, the efforts, the subtilties of theology, have seldom had any other end, than to reconcile in the divinities it has portrayed, 469 those discordant ideas which its own dogmas has raised in the minds of mortals. 470 From what has preceded, it may fairly be concluded that ethnic theology undermined itself by its own inconsistencies; 471 that the art of composing chimeras may therefore with great justice be defined to be that of combining those qualities which are impossible to be reconciled with each other.

OF THE CONFUSED AND CONTRADICTORY IDEAS OF THEOLOGY

Paul Henri Thiery (Baron D'Holbach)

46 Everything that has been said, proves pretty clearly, that, in despite of all human efforts, human has never been able to prevent the self 2 from drawing together from own peculiar nature, the qualities you have assigned to the Being who governs the universe. 3 The contradictions necessarily resulting from the incompatible assemblage of these human qualities, 4 which cannot become suitable to the same subject, seeing that the existence of one destroys the existence of the other, have been shown:-- 5 the theologians themselves have felt the insurmountable difficulties which their divinities presented to reason: 6 they were so substantive, that as they felt the impossibility of withdrawing themselves out of the dilemma, 7 they endeavoured to prevent human from reasoning, by throwing your mind into confusion-- 8 by continually augmenting the

perplexity of those ideas, already so discordant, which they offered you of the gods. 9 By these means they enveloped them in mystery, covered them with dense clouds, and rendered them inaccessible to humankind: 10 thus they themselves became the interpreters, the masters of explaining, according either to their fancy or their interest, the ways of those enigmatical beings they made you adore. 11 For this purpose they exaggerated them more and more-- neither time nor space, nor the entire of Nature could contain their immensity-- 12 everything became an impenetrable mystery.

13 Although human has originally borrowed from the self the traits, the colours, the primitive lineaments of which you composed your gods; 14 although you have made them jealous, powerful, vindictive monarchs, yet your theology, by force of dreaming, entirely lost sight of human nature. 15 In order to render your divinities still more different from their creatures, it assigned them, over and above the usual qualities of human, 16 properties so marvellous, so uncommon, so far removed from everything of which human mind could form a conception, that you lost sight of them yourself. 17 From thence you persuaded yourself these qualities were divine, because you could no longer comprehend them; 18 you believed them worthy of your gods, because no person could figure to the self any one distinct idea of them.

19 Thus theology obtained the point of persuading human you must believe that which you could not conceive; 20 that you must receive with submission improbable systems; 21 that you must adopt, with pious deference, conjectures contrary to your reason; 22 that this reason itself was the most agreeable sacrifice you could make on the altars of your gods, who were unwilling you should use the gift they had bestowed upon you. 23 In short, it had made mortals implicitly believe that they were not formed to comprehend the thing of all others the most important to themselves. 24 Thus it is evident that superstition

founded its basis upon the absurd principle 25 that human is obliged to accredit firmly that which you are in the most complete impossibility of comprehending.

26 On the other hand, human persuaded the self that the gigantic, the truly incomprehensible attributes which were assigned to these celestial monarchs, 27 placed between them and their slaves a distance so immense, that these could not be by any means offended with the comparison; 28 that these distinctions rendered them still greater; made them more powerful, more marvellous, more inaccessible to observation. 29 Human always entertains the idea, that what you are not in a condition to conceive, in much more noble, much more respectable, than that which you have the capacity to comprehend. 30 The more a thing is removed from your reach, the more valuable it always appears.

31 These prejudices in human for the marvellous appear to have been the source that gave birth to those wonderful, unintelligible qualities with which superstition clothed these divinities. 32 The invincible ignorance of the human mind, whose fears reduced you to despair, engendered those obscure, vague notions, with which mythology decorated its gods. 33 You believed you could never displease them, provided you rendered them incommensurable; 34 impossible to be compared with anything, of which you had a knowledge; 35 either with that which was most sublime, or that which possessed the greatest magnitude.

36 From hence the multitude of negative attributes with which ingenious dreamers have successively embellished their phantoms, 37 to the end that they might more surely form a being distinguished from all others, 38 or which possessed nothing in common with that which the human mind had the faculty of being acquainted with: 39 they did not perceive that after all their endeavours, it was nothing more than exaggerated human qualities, which they thus heaped together, 40 with no more skill than a

painter would display who should delineate all the members of the body of the same size, taking a giant for dimension.

41 The theological attributes with which metaphysicians decorated these divinities, were in fact nothing but pure negations of the qualities found in human, 42 or in those beings of which you have a knowledge; 43 by these attributes their gods were supposed exempted from everything which they considered weakness or imperfection in human, or in the beings by whom you are surrounded: 44 they called every quality infinite, which has been shown is only to affirm, that unlike human, or the beings with whom you are acquainted, it is not circumscribed by the limits of space; 45 this, however, is what you can never in any manner comprehend, because you are yourself finite.

46 Hobbes in his Leviathan, says, "whatsoever we imagine is finite. Therefore there is no idea, or conception of anything we call infinite. 47 No person can have in own mind an image of infinite magnitude, nor conceive infinite swiftness, infinite time, infinite force, or infinite power. 48 When we say anything is infinite, we signify only, that we are not able to conceive the ends and bound of the thing named, having no conception of the thing, but of our own inability."

49 Sherlock says, "the word infinite is only a negation, which signifies that which has neither end, nor limits, nor extent, 50 and, consequently, that which has no positive and determinate nature, and is therefore nothing;" 51 he adds, "that nothing but custom has caused this word to be adopted, which without that, would appear devoid of sense, and a contradiction."

52 When it is said these gods are eternal, it signifies they have not had, like human or like everything that exists, a beginning, and that they will never have an end: 53 to say they are immutable, is to say, that unlike yourself or everything which you sees, they are not subject to change: 54 to say they are immaterial, is to advance, that their substance or essence is of a nature not

conceivable by yourself, 55 but which must from that very circumstance be totally different from everything of which you have cognisance.

56 It is from the confused collection of these negative qualities, that has resulted the theological gods; 57 those metaphysical wholes of which it is impossible for human to form to the self any correct idea. 58 In these abstract beings everything is infinity,--immensity,-- spirituality,-- omniscience,-- order,--wisdom,-- intelligence,-- omnipotence. 59 In combining these vague terms, or these modifications, the ethnic priests believed they formed something, 60 they extended these qualities by thought, and they imagined they made gods, whilst they only composed chimeras. 61 They imagined that these perfections or these qualities must be suitable to their gods, because they were not suitable to anything of which they had a knowledge; 62 they believed that incomprehensible beings must have inconceivable qualities. 63 These were the materials of which theology availed itself to compose those inexplicable shadows before which they commanded the human race to bend the knee.

64 Nevertheless, experience soon proved that beings so vague, so impossible to be conceived, so incapable of definition, so far removed from everything of which human could have any knowledge, 66 were but little calculated to fix your restless views; your mind requires to be arrested by qualities which you are capacitated to ascertain; 67 of which you are in a condition to form a judgment. 68 Thus after it had subtilised these metaphysical gods, after it had rendered them so different in idea, from everything that acts upon the senses, 69 theology found itself under the necessity of again assimilating them to human, from whom it had so far removed them: 70 it therefore again made them human by the moral qualities which it assigned them; 71 it felt that without this it would not be able to persuade humankind there could possibly exist any relation between you and such vague, ethereal,

fugitive, incommensurable beings; 72 that it would never be competent to secure for them your adoration.

73 It began to perceive that these marvellous gods were only calculated to exercise the imagination of some few thinkers, 74 whose minds were accustomed to labour upon chimerical subjects, or to take words for realities; 75 in short it found, that for the greater number of the material children of the earth it was necessary to have gods 76 more analogous to themselves, more sensible, more known to them. 77 In consequence these divinities were re-clothed with human qualities; 78 theology never felt the incompatibility of these qualities with beings it had made essentially different from human, 79 who consequently could neither have your properties, nor be modified like yourself. 80 It did not see that gods who were immaterial, destitute of corporeal organs, were neither able to think nor to act as material beings, 81 whose peculiar organisations render them susceptible of the qualities, the feelings, the will, the virtues, that are found in them.

82 The necessity it felt to assimilate the gods to their worshippers, to make an affinity between them, 83 made it pass over without consideration these palpable contradictions--this want of keeping in their portrait: 84 thus ethnic theology obstinately continued to unite those incompatible qualities, 85 that discrepancy of character, which the human mind attempted in vain either to conceive or to reconcile: 86 according to it, pure spirits were the movers of the material world; 87 immense beings were enabled to occupy space, without however excluding Nature; 88 immutable deities were the causes of those continual changes operated in the world: 89 omnipotent beings did not prevent those evils which were displeasing to them; 90 the sources of order submitted to confusion: in short, the wonderful properties of these theological beings every moment contradicted themselves.

91 There is not less discrepancy, less incompatibility, less discordance in

the human perfections, less contradiction in the moral qualities attributed to them, 92 to the end that human might be enabled to form to the self some idea of these beings. 93 These were all said to be eminently possessed by the gods, although they every moment contradicted each other: 94 by this means they formed a kind of patch-work character, heterogeneous beings, discrepant phenomena, entirely inconceivable to human, 95 because Nature had never constructed anything like them, whereby you was enabled to form a judgment. 96 Human was assured they were eminently good--that it was visible in all their actions.

97 Now goodness is a known quality, recognisable in some beings of the human species; 98 this is, above every other, a property you are desirous to find in all those upon whom you are in a state of dependence; 99 but you are unable to bestow the title of good on any among your fellows, 100 except their actions produce on you those effects which you approves-- that you finds in unison with your existence-- in conformity with your own peculiar modes of thinking. 101 It was evident, according to this reasoning, these ethnic gods did not impress human with this idea; 102 they were said to be equally the authors of human pleasures, as of human pains, which were to be either secured or averted by sacrifices: 103 thus when human suffered by contagion, when you was the victim of shipwreck, when your country was desolated by war, 104 when you saw whole nations devoured by rapacious earthquakes, when you was a prey to the keenest sorrows, 105 you at least was unable to conceive the bounty of those beings. 106 How could you perceive the beautiful order which they had introduced into the world, while you groaned under such a multitude of calamities? 107 How were you able to discern the beneficence of people whom you beheld sporting as it were with your species? 108 How could you conceive the consistency of those who destroyed that which you was assured they had taken such pains to establish, solely for your own peculiar happiness?

NATURE

109 But had your mind been properly enlightened, had you been taught to know, 110 that Nature, acting by unerring laws, produces all the phenomena you beholds as a necessary consequence of Her primitive impulse-- 111 that like the rest of Nature you was yourself subjected to the general operation-- 112 that no peculiar exemption had been made in your behalf-- that sacrifices were useless-- 113 that the great Parent of parents, equally mindful of all your creatures, had set in action with the most consummate wisdom an invariable system, 114 the apparent, casual evils of which were ever counterbalanced by the resulting good; 115 that without repining, it was your duty, your interest, to submit; 116 at the same time to examine with sedulity, to search with earnestness, into the recesses of this Nature for remedies to the sorrows you endured.

117 If you had been thus instructed, we should never behold you arraigning either the kindness, the wisdom, or the consistency of the gods; 118 you would neither have ascribed your sufferings to the malicious interference of inferior deities, 119 so derogatory to the divine majesty of the Great Cause of causes, 120 nor would you have taxed with either inconsistency or unkindness, that Nature which cannot act otherwise than She does. 121 Perhaps of all the ideas that can be infused into the mind of human, none is more really subversive of your true happiness, 122 none more incompatible with the reality of things, than that which persuades you that you are yourself a privileged being, 123 the king of a nature where everything is submitted to laws, the extent of which your finite mind cannot possibly conceive. 124 Even admitting it should ultimately turn out to be a fact, you have yet no one positive evidence to justify the assumption; 125 experience, which after all must always prove the best criterion for your judgment, 126 daily proves, that in everything you are subjected, like every other part of Nature, to those invariable decrees from which nothing that you beholds is exempted.

NATURE

127 Feeble monarch! of whom a grain of sand, some atoms of bile, some misplaced humours, destroy at once the existence and the reign: 128 yet thou pretendest everything was made for thee! Thou desirest that the entire of Nature should be thy domain, 129 and thou canst not even defend thyself from the slightest of Her shocks! 130 Thou makest to thyself a god for thyself alone; thou supposest that you unceasingly occupieth yourself only for thy peculiar happiness; 131 thou imaginest everything was made solely for thy pleasure; and, following up thy presumptuous ideas, thou hast the audacity to call Nature good or bad as thy weak intellect inclines: 132 thou darest to think that the kindness exhibited towards thee, in common with other beings, is contradicted by the evil genii thy fancy has created! 133 Dost thou not see that those beasts which thou supposes submitted to thine empire, frequently devour thy fellow-creatures; 134 that fire consumeth them; that the ocean swalloweth them up; 135 that those elements of which thou sometimes admirest the order, which sometimes thou accusest of confusion, frequently sweep them off the face of the earth; 136 dost thou not see that all this is necessarily what it must be; that thou art not in any manner consulted in any of this phenomena?

137 Indeed, according to thine own ideas, if thou wast to examine them with care, dost thou not admit that thy gods are the universal cause of all; 138 that they maintain the whole by the destruction of its parts. 139 Are they not then according to thyself, the gods of Nature-- of the ocean-- of rivers-- of mountains-- of the earth, 140 in which they occupiest, so very small a space-- of all those other globes that thou seest roll in the regions of space-- of those orbs that revolve round the sun that enlighteneth thee?

141 Cease, then, obstinately to persist in beholding nothing but thy sickly self in Nature; 142 do not flatter thyself that the human race, which reneweth itself, which disappeareth like the leaves on the trees, 143 can absorb all the care, can ingross all the tenderness of that universal

being, 144 who, according to thyself, properly understood, ruleth the destiny of all things. 145 Submit thyself in silence to mandates which thy unavailing prayers; can never change; to a wisdom which thy imbecility cannot fathom; 146 to the unerring shafts of a fate, which nothing but thine own vanity, aided by thy perverse ignorance, could ever question, being the best possible good that can befall thee! 147 Which if thou couldst alter, thou wouldst with thy defective judgment render worse!

148 What is the human race compared to the earth? What is this earth compared to the sun? 149 What is our sun compared to those myriads of suns which at immense distances occupy the regions of space? 150 not for the purpose of diverting thy weak eyes; not with a view to excite thy stupid admiration, as thou vainly imaginest; 151 since multitudes of them are placed out of the range of thy visual organs: but to occupy the place which necessity hath assigned them.

152 Mortal, feeble and vain! Restore thyself to thy proper sphere; acknowledge every where the effect of necessity; 153 recognise in thy benefits, behold in thy sorrows, the different modes of action 154 of those various beings endowed with such a variety of properties, which surround thee; of which the macrocosm is the assemblage; 155 and do not any longer suppose that this Nature, much less its great cause, can possess such incompatible qualities 156 as would be the result of human views or of visionary ideas, which have no existence but in thyself.

157 As long as theologians shall continue obstinately bent to make human the model of their gods; 158 as long as they shall pertinaciously undertake to explain the nature of these gods, 159 which they will never be able to do, but after human ideas, although they may associate the most heterogeneous properties, the most discrepant functions; 160 so long, I say, experience will contradict at every moment the beneficent views they attach to their divinities; 161 it will be in vain that they call them

good: 162 human reasoning thus, will never be able to find good but in those objects which impel you in a manner favourable to your actual mode of existence; 163 you always finds confusion in that which fills you with grievous sensations; 164 you calls evil everything that painfully affects you, even cursorily; 165 those beings that produce in you two modes of feeling, so very opposite to each other, you will naturally conclude are sometimes favourable, sometimes unfavourable to you; 166 at least, if you will not allow that they act necessarily, consequently are neither one nor the other, 167 you will say that a world where you experiences so much evil cannot be submitted to people who are perfectly good; 168 on the other hand, you will also assume that a world in which human receives so many benefits, cannot be governed by those who are without kindness. 169 Thus you are obliged to admit of two principles equally powerful, who are in hostility with each other; 170 or rather, you must agree that the same people are alternately kind and unkind; 171 this after all is nothing more than avowing they cannot be otherwise than they are; 172 in this case it would be useless to sacrifice to them-- to make solicitation; 173 seeing it would be nothing but destiny-- the necessity of things submitted invariable rules.

174 In order to justify these beings, constructed upon mortal principles, from injustice, in consequence of the evils the human species experience, 175 the theologian is reduced to the necessity of calling them punishments inflicted for the transgressions of human. 176 But then these general calamities include all people. 177 Some, at least, may be supposed not to have offended. 178 Thus you involves contradictions you finds it difficult to reconcile; 179 to effectuate this you makes your anthropomorphites immaterial-- incorporeal; 180 that is, you says they are the negation of everything of which you have a knowledge; 181 consequently, beings who can have no relation with corporeal beings: and this avails you no better, as will

be evident by reasoning on the subject.

182 To offend anyone, is to diminish the sum of your happiness; it is to afflict you, to deprive him of something, to make you experience a painful sensation. 183 How is it possible human can operate on such beings; 184 how can the physical actions of a material substance have any influence over an immaterial substance, devoid of parts, having no point of contact. 185 How can a corporeal being make an incorporeal being experience incommodious sensations? 186 On the other hand, justice, according to the only ideas human can ever form of it, supposes, a permanent disposition to render to what is due to each person; 187 the theologians will not admit that the beings they have jumbled together owe any thing to human; 188 they insists that the benefits they bestow are all the gratuitous effects of their own goodness; 189 that they have the right to dispose of the work of their hands according to their own pleasure; to plunge it if they please into the abyss of misery; 190 in short, that their volition is the only guide of their conduct. 191 It is easy to see, that according to human's idea of justice, this does not even contain the shadow of it; 192 that it is, in fact, the mode of action adopted by what he calls the most frightful tyrants. 193 How then can you be induced to call people just who act after this manner?

194 Indeed, while you sees innocence suffering, virtue in tears, crime triumphant, vice recompensed, and at the same time, is told the beings whom theology has invented are the authors, 195 you will never be able to acknowledge them to have justice. 196 But you will find no such contradictory qualities in Nature, where everything is the result of immutable laws: 197 you will at once perceive that these transient evils produce more permanent good; 198 that they are necessary to the conservation of the whole, or else result from modifications of matter, 199 which it is competent for you to change, by altering your own mode of action; a lesson that Nature

Herself teaches you when you are willing to receive Her instructions.
200 But to form gods with human passions, is to make them appear unjust; 201 to say that such beings chastise their friends for their own good, is at once to upset all the ideas you have either of kindness or unkindness: 202 thus the incompatible human qualities ascribed to these beings, do in fact destroy their existence. 203 If it be insisted they have the knowledge and power of human, only that they are more extended, 204 then it becomes a very natural reply, to say, since they know everything, they ought at least to restrain mischief; 205 because this would be the observation of human upon the action of own fellows;-- 206 if it be urged these qualities are similar to the same qualities possessed by human, then it may be fairly asked in what do they differ? 207 To this, if any answer be given, be what it may, it will still be only changing the language: 208 it will be invariably another method of expressing the same thing; 209 seeing that human with all your ingenuity, will never be able to describe properties but after yourself or those of the beings by whom you are surrounded.
210 Where is the person filled with kindness, endowed with humanity, who does not desire with all own heart to render own fellow creatures happy? 211 If these beings, as the theologians assert, really have human's qualities augmented, 212 would they not, by the same reasoning, exercise their infinite power to render them all happy? 213 Nevertheless, in despite of these theologists, we scarcely find anyone who is perfectly satisfied with own condition on earth: 214 for one mortal that enjoys, we behold a thousand who suffer; 215 for one rich person who lives in the midst of abundance, there are thousands of poor who want common necessaries: 216 whole nations groan in indigence, to satisfy the passions of some avaricious princes, of some few nobles, 217 who are not thereby rendered more contented-- who do not acknowledge themselves more fortunate on that account.

218 In short, under the dominion of these beings, the earth is drenched with the tears of the miserable. 219 What must be the inference from all this? That they are either negligent of, or incompetent to your happiness. 220 But the mythologists will tell you coolly, that the judgments of their gods are impenetrable! How do we understand this term? 221 Not to be taught-- not to be informed-- impervious-- not to be pierced: 222 in this case it would be an unreasonable question to inquire by what authority do you reason upon them? 223 How do you become acquainted with these impenetrable mysteries? 224 Upon what foundation do you attribute virtues which you cannot penetrate? 225 What idea do you form to yourself of a justice that never resembles that of human? 226 Or is it a truth that you yourself are not a human, but one of those impenetrable beings whom you say you represent?

227 To withdraw themselves from this, they will affirm that the justice of these idols are tempered with mercy, with compassion, with goodness: 228 these again are human qualities: what, therefore, shall we understand by them? What idea do we attach to mercy? 229 Is it not a derogation from the severe rules of an exact, a rigorous justice, which causes a remission of some part of a merited punishment? 230 Here hinges the great incompatibility, the incongruity of those qualities, especially when augmented by the word omni; 231 which shows how little suitable human properties are to the formation of divinities.

232 In a prince, clemency is either a violation of justice, or the exemption from a too severe law: 233 nevertheless, human approves of clemency in a sovereign, when its too great facility does not become prejudicial to society; 234 he esteems it, because it announces humanity, mildness, a compassionate, noble soul; qualities he prefers in his governors to rigour, cruelty, inflexibility: 235 besides, human laws are defective; they are frequently too severe; 236 they are not competent to foresee all the circumstances of every case: 237 the punishments they

decree are not always commensurate with the offence: 238 you therefore does not always think them just: but you feels very well, you understands distinctly, that when the sovereign extends their mercy, they relaxes from their justice-- 239 that if mercy be merited, the punishment ought not to take place-- that then its exercise is no longer clemency, but justice: 240 thus you feels, that in your fellow creatures these two qualities cannot exist at the same moment. 241 How then are you to form your judgment of beings who are represented to possess both in the extremest degree? 242 Is it not, in fact, announcing these beings to be people like ourselves, who act with our imperfections on an enlarged scale?

243 They then say, well, but in the next world these idols will reward you for all the evils you suffer in this: 244 this, indeed, is something to look to, if it could be contemplated alone; unmixed with all they have formerly asserted: 245 if we could also find that there was an unison of thinking on this point--if there was a reasonable comprehensible view of it held forth: 246 but alas! here again human pleasures, human feelings, are the basis on which these rewards are rested; 247 only they are promised in a way we cannot comprehend them; 248 houris, or females who are to remain forever virgins, notwithstanding the knowledge of human, are so opposed to all human comprehension, so opposite to all experience, 249 are such mystic assertions, that the human mind cannot possibly embrace an idea of them: 250 besides, this is only promised by one class of these beings; others affirm it will be altogether different: 251 in short, the number of modes in which this hereafter reward is promised to you, obliges human to ask the self one plain question, Which is the real history of these blissful abodes?

252 At this question you staggers-- you seeks for advice: each assures you that the other is in error-- 253 that your peculiar mode is that which will really have place; that to believe the other is a crime. 254 How are you to judge now? Take what course you will, you runs the chance of being

wrong; 255 you have no standard whereby to measure the correctness of these contradictory assurances; 256 your mind is held suspended; you feels the impossibility of the whole being right; you knows not that which you ought to elect! 257 Again, they have positively asserted these beings owe nothing to human: 258 how then are you to expect in a future life, a more real happiness than you enjoys in the present? 259 This they parry, by assuring you it is founded upon their promises, contained in their revealed oracles.

260 Granted: but are you quite certain these oracles have emanated from themselves? 261 If they are so different in their detail, may there not be reasonable ground for suspecting some of them are not authentic? 262 If there is, which are the spurious, which are the genuine? 263 By what rule are you to guide yourself in the choice; 264 how, with your frail methods of judging, are you to scrutinise oracles delivered by such powerful beings-- to discriminate the true from the false? 265 The ministers of each will give you an infallible method, one that, is according to their own asseveration, cannot err; 266 that is, by an implicit belief in the particular doctrine each promulgates.

267 Thus will be perceived the multitude of contradictions, the extravagant hypotheses which these human attributes, with which theology clothes its divinities, must necessarily produce. 268 Beings embracing at one time so many discordant qualities will always be undefinable-- 269 can only present a train of ideas calculated to displace each other; they will consequently ever remain beings of the imagination. 270 These beings, say their ministers, created the heavens, the earth, the creatures who inhabit it, to manifest their own peculiar glory; 271 they have neither rivals, nor equals in Nature; nothing which can be compared with them.

272 Glory is, again, a human passion: it is in human the desire of giving your fellow-creatures an high opinion of you; 273 this passion is laudable when it stimulates you to undertake great projects-- when it

determines you to perform useful actions-- 274 but it is very frequently a weakness attached to your nature; 275 it is nothing more than a desire to be distinguished from those beings with whom you compares yourself, without exciting you to one noble, one generous act. 276 It is easy to perceive that beings who are so much elevated above people, cannot be actuated by such a defective passion. 277 They say these beings are jealous of their prerogatives. 278 Jealousy is another human passion, not always of the most respectable kind: 279 but it is rather difficult to conceive the existence of jealousy with profound wisdom, unlimited power, and the perfection of justice.

280 Thus the theologians by dint of heaping quality on quality, aggrandising each as is added, 281 seem to have reduced themselves to the situation of a painter, who spreading all his colours upon his canvas together, 282 after thus blending them into an unique mass, loses sight of the whole in the composition. 283 They will, nevertheless, reply to these difficulties, that goodness, wisdom, justice, are in these beings qualities so pre-eminent, so distinct, 284 have so little affinity with these same qualities in human, that they are totally dissimilar-- have not the least relation.

285 Admit this to be the case, how then can you form to yourself any idea of these perfections, seeing they are totally unlike those with which you are acquainted? 286 They surely cannot mean to insinuate that they are the reverse of everything you understands; 287 because that would, in effect, bring them to a precise point which would not need any explanation; 288 it is therefore a matter of certainty this cannot be the case: 289 then if these qualities, when exercised by the beings they have described, are only human actions so obscured, so hidden, as not to be recognisable by human, 290 how can weak mortals pretend to announce them, to have a knowledge of them, to explain them to others? 291 Does then theology impart to the mind the ineffable boon of enabling it to conceive that which no human is

competent to understand? 292 Does it procure for its agents the marvellous faculty of having distinct ideas of beings composed of so many contradictory properties? 293 Does it, in fact, make the theologians themselves one of these incomprehensible beings?

294 They will impose silence, by saying the oracles have spoken; that through these mystical means they have made themselves known to mortals. 295 The next question would naturally be, when, where, or to whom have these oracles spoken? Where are these oracles? 296 An hundred voices raise themselves in the same moment; hands of Briaraeus are immediately stretched forth to show them in a number of discordant collections, 297 which each maintains, with an equal degree of vehemence, is the true code-- the only doctrine human ought to believe: 298 you runs them over, finds they scarcely agree in any one particular; but that in all the heaviest penalties are denounced against those who doubt the smallest part of any one of them.

299 These beings of consummate wisdom are made to speak an obscure, irrational language; 300 some of them, although their goodness is proclaimed, have been cruel and sanguinary; 301 others, although their justice is held forth, have been partial, unjust, capricious; 302 some, who are represented as all merciful, destine to the most hideous punishments the unhappy victims to their wrath: 303 examine any one of them more closely, you will find that they have never in any two countries held literally the same language: 304 that although they are said to have spoken in many places, that they have always spoken variously: 305 What is the necessary result? The human mind, incapable of reconciling such manifest contradictions, 306 unable to obtain from their ministers any corroborative evidence, that is not disputed by the others, falls into the strangest perplexity; 307 is involved in doubts, entangled in a labyrinth to which no clue is to be found.

308 Thus the relations, which are supposed to exist between human

and these theological idols, can only be founded on the moral qualities of these beings: 309 if these are not known to you, if you cannot in any manner comprehend them, they cannot by any ingenuity of argument serve you for models. 310 In order that they may be imitated, it is needful that these qualities were cognisable by the being who is to imitate them. 311 How can you imitate that goodness, that justice, that mercy, which does not resemble either your own, or anything you can conceive? 312 If these beings partake in nothing of that which forms human-- 313 if the properties they do possess, although different, are not within the reach of your comprehension-- 314 if, you cannot embrace the most distant idea of them, which the theologian assures you that you cannot, 315 how is it possible you can set about imitating them? How follow a conduct suitable to please them--to render yourself acceptable in their sight?

316 What can in effect be the motive of that worship, of that homage, of that obedience, which these beings are said to exact-- 317 which you are informed you should offer at their altars, if you does not establish it upon their goodness-- their veracity-- their justice: 318 in short, upon qualities which you are competent to understand? 319 How can you have clear, distinct ideas of those qualities, if they are no longer of the same nature as those which you have learned to reverence in the beings of your own species? 320 To this they will reply, because none of them ever admit the least doubt of the rectitude of their own individual creed, 321 that there can be no proportion between these idols and mortals, who are the work of their hands; 322 that it is not permitted to the clay to demand of the potter who has formed it, "why ye have fashioned me thus;"-- 323 but if there can be no common measure between the workman and his work-- if there can be no analogy between them, because the one is immaterial, the other corporeal, 324 how do they reciprocally act upon each other? How can the gross organs of the one,

comprehend the subtile quality of the other?

325 Reasoning in the only way you are capable, and it surely will never be seriously argued that you are not to reason, 326 will you not perceive that the earthen vase could only have received the form which it pleased the potter to give; 327 that if it is formed badly, if it is rendered inadequate to the use for which it was designed, the vase is not in this instance to be blamed; 328 the potter certainly has the power to break it; the vase cannot prevent you; it will neither have motives nor means to soften your anger; it will be obliged to submit to its destiny; 329 but you will not be able to prevent your mind from thinking the potter harsh in thus punishing the vase, 330 rather than by forming it anew, by giving it another figure, render it competent to the purposes you intended.

331 According to these notions the relations between human and these theological beings have no existence, 332 they owe nothing to you, are dispensed from showing you either goodness or justice; 333 that human, on the contrary, owes them everything: but contradictions appear at every step. 334 If these have promised by their oracles anything to human, it is rather difficult for you to believe, 335 that what is so solemnly promised does not belong to you if you fulfil the condition of the promise. 336 The difference a theologian may choose to find in these relations will hardly be convincing to a reasonable mind. 337 The duties of human towards these beings can, according to their own showing, have no other foundation than the happiness you expects from them: 338 thus the relation has a reciprocity, it is founded upon their goodness, upon their justice, it demands obedience on your part, a conduct suitable to the benefits you receives.

339 Thus, in whatever manner the theological system is viewed, it destroys itself. 340 Will theology never feel that the more it endeavours to exaggerate the human qualities, the less it exalts the beings it pictures; 341 the more incomprehensible it renders them,

the more it contributes to swell its own ocean of contradictions; 342 that to take human passions, mortal faculties at all, is perhaps the worst means it can pursue to form a perfect being; 343 but that if it must persist in this method, then the further they remove them from human, the more they debase you, the more they weaken the relations subsisting between them: 344 that in thus aggregating human properties, it should carefully abstain from associating in these pictures those qualities which human finds detestable in own fellows.

345 Thus, despotism in human is looked upon as an unjust, unreasonable power; 346 if it introduces such a quality into its portraits, it cannot rationally suppose them suitable to cultivate the esteem, to attract the voluntary homage of the human race: 347 if, however, the canvas be examined, we shall frequently be struck, with perceiving this the leading feature; 348 we shall equally find a want of keeping through the whole; 349 that shadows are introduced, where lights ought to prevail; that the colouring is incongruous-- the design without harmony.

350 The discrepancy of conduct which theology imputes to these idols, is not less remarkable than the contrariety of qualities it ascribes to them, 351 or the inconsistency of the passions with which it invests them; 352 sometimes, according to this, they are the friends to reason, desirous of the happiness of society; sometimes they are inimical to virtue; interdict the use of reason; 353 flattered with seeing society disturbed, they sometimes afflict human without you being able to guess the cause of their displeasure; 354 sometimes they are favourable to humankind-- at others, indisposed towards the human species: 355 sometimes they are represented as permitting crimes for the pleasure of punishing them-- at others, they exert all their power to arrest crime in its birth; 356 sometimes they elect a small number to receive eternal happiness, predestinating the rest to perpetual misery-- to everlasting torments; 357 at others, they throw

open the gates of mercy to all who choose to enter them; 358 sometimes they are portrayed as destroying the universe-- at others, as establishing the most beautiful order in the planet we inhabit; 359 sometimes they are held forth as countenancing deception-- at others, as having the highest reverence for truth-- as holding deceit in abomination. 360 This, again, is the necessary result of the human faculties, the mortal passions, the frail qualities of which they compose, 361 the beings they hold forth to the admiration, to the worship, to the homage of the world.

362 Perhaps the most fatal consequences have arisen from founding the moral character of these divinities upon that of human. 363 Those who first had the confidence to tell human that in these matters it was not permitted you to consult your reason, that the interests of society demanded its sacrifice, 364 evidently proposed to themselves to make you the sport of their own wantonness-- 365 to make you the blind instrument of their own unworthiness. 366 It is from this radical error that has sprung all those extravagances which the various superstitions have introduced upon the earth: 367 from hence has flowed that sacred fury which has frequently deluged it with blood: 368 here is the cause of those inhuman persecutions which have so often desolated nations: 369 in short, all those horrid tragedies which have been acted on the vast theatre of the world, 370 by command of the different ministers of the various systems, whose gods they have said ordained these shocking spectacles.

371 The theologians themselves have thus been the means, of calumniating the gods they pretended to serve, 372 under the pretext of exalting their name-- of covering them with glory; in this they may have been said to be true atheists, 373 since they seem only to have been anxious to destroy the idols they themselves had raised, by the actions they have attributed to them-- 374 which has debased them in the eye of reason-- rendered their existence more than doubtful to the human of humanity. 375 Indeed, it would require more than human

credulity to accredit the assertion that these beings ever could order the atrocities committed in their name. 376 Every time they have been willing to disturb the harmony of humankind-- whenever they have been desirous to render you unsociable, 377 they have cried out that their gods ordained that you should be so. 378 Thus they render mortals uncertain, make the ethical system fluctuate by founding it upon changeable, capricious idols, 379 whom they represent much more frequently cruel and unjust, than filled with bounty and benevolence.

380 However it may be, admitting if they will for a moment that their idols possess all the human virtues in an infinite degree of perfection, 381 we shall quickly be obliged to acknowledge that they cannot connect them with those metaphysical, theological, negative attributes, of which we have already spoken. 382 If these beings are spirits that are immaterial, how can they be able to act like human, who is a corporeal being? 383 Pure spirits, according to the only idea human can form of them, having no organs, no parts, cannot see anything; 384 can neither hear our prayers, attend to our solicitations, nor have compassion for our miseries.

385 They cannot be immutable, if their dispositions can suffer change: 386 they cannot be infinite, if the totality of Nature, without being them, can exist conjointly with them: 387 they cannot be omnipotent, if they either permit or do not prevent evil: 388 they cannot be omnipresent, if they are not every where: 389 they must therefore be in the evil as well as in the good. 390 Thus in whatever manner they are contemplated, under whatever point of view they are considered, the human qualities which are assigned to them, necessarily destroy each other; 391 neither can these same properties in any possible manner combine themselves with the supernatural attributes given to them by theology.

392 With respect to the revealed will of these idols, by means of their oracles, far from being a proof of their good will, of their commiseration for human, it would

rather seem evidence of their ill-will. 393 It supposes them capable of leaving humankind for a considerable season unacquainted with truths highly important to their interests; 394 these oracles communicated to a small number of chosen people, are indicative of partiality, of predilections, that are but little compatible with the common Father of the human race. 395 These oracles were ill imagined, since they tend to injure the immutability ascribed to these idols, 396 by supposing that they permitted human to be ignorant at one time of their will, whilst at another time they were willing you should be instructed on the subject. 397 Moreover, these oracles frequently predicted offences for which afterwards severe punishments were inflicted on those who did no more than fulfil them. 398 This, according to the reasoning of human, would be unjust. 399 The ambiguous language in which they were delivered, the almost impossibility of comprehending them, the inexplicable mysteries they contained, seemed to render them doubtful; 400 at least they are not consistent with the ideas human is capable of forming of infinite perfection: 401 but the fact clearly is, they were thus rendered capable of application to the contingency of events--could be made to suit almost any circumstances: 402 this would render it not a very improbable conjecture, that these oracles were solely delivered by the priests themselves.

403 If these were tried by the only test of which you have any knowledge-- YOUR REASON, it would naturally occur to the mind of human, 404 that mystery could never, on any occasion, be used in the promulgation of substantive decrees meant to operate on the obedience, to actuate the moral conduct of human: 405 it is quite usual with most legislators to render their laws as explicit as possible, to adapt them to the meanest understanding; 406 in short, it would be reckoned want of good faith in a government, to throw a thick, mysterious veil over the announcement of that conduct which

it wished its citizens to adopt; 407 they would be apt to think such a procedure was either meant to cover its own peculiar ignorance, or else to entrap them into a snare; 408 at best, it would be considered as furnishing a never-failing source of dispute, which a wise government would endeavour to avoid.

409 It will thus be obvious, that the ideas which theology has at various times, under various systems, held forth to human, 410 have for the most part been confused, discordant, incompatible, and have had a general tendency to disturb the repose of humankind. 411 The obscure notions, the vague speculations of these multiplied creeds, would be matter of great indifference, 412 if human was not taught to hold them as highly important to your welfare-- 413 if you did not draw from them conclusions pernicious to yourself-- 414 if you did not learn from these theologians that you must sharpen your asperity against those who do not contemplate them in the same point of view with yourself: 415 as you perhaps, then, will never have a common standard, a fixed rule, a regular graduated scale, whereby to form your judgment on these points-- 416 as all efforts of the imagination must necessarily assume divers shapes, undergo a variety of modifications, which can never be assimilated to each other, 417 it was little likely that humankind would at all times be able to understand each other on this subject; 418 much less that they would be in accord in the opinions they should adopt.

419 From hence that diversity of superstitions which in all ages have given rise to the most irrational disputes; 420 which have engendered the most sanguinary wars; which have caused the most barbarous massacres; 421 which have divided human from your fellow by the most rancorous animosities, that will perhaps never be healed; 422 because you have been impelled to consider the peculiar tenets you adopted, not only as immediately essential to your individual welfare, 423 but also as intimately connected with the happiness, closely interwoven with the tranquillity of the nation of which

you was a citizen. 424 That such contrariety of sentiment, such discrepancy of opinion should exist, is not in the least surprising; 425 it is, in fact, the natural result of those physical causes to which, as long as you exists, you are at all times submitted.

426 The person of a heated imagination cannot accommodate the self to the god of a phlegmatic, tranquil being: 427 the infirm, bilious, discontented, angry mortal, cannot view you under the same aspect as you who enjoys a sounder constitution,-- 428 as the individual of a gay turn, who enjoys the blessing of content, who wishes to live in peace. 429 An equitable, kind, compassionate, tender-hearted person, will not delineate to the self the same portrait of own god, 430 as the person who is of an harsh, unjust, inflexible, wicked character. 431 Each individual will modify own god after own peculiar manner of existing, after own mode of thinking, according to own particular mode of feeling. 432 A wise, honest, rational human will always figure to self own god as humane and just.

433 Nevertheless, as fear usually presided at the formation of those idols human set up for the object of own worship; 434 as the ideas of these beings were generally associated with that of terror as the recollections of sufferings, 435 which human attributed to them, often made you tremble; frequently awakened in your mind the most afflicting, reminiscence; 436 as it sometimes filled you with inquietude, sometimes inflamed your imagination, sometimes overwhelmed you with dismay, 437 the experience of all ages proves, that these vague idols became the most important of all considerations-- was the affair which most seriously occupied the human race: 438 that they everywhere spread consternation-- produced the most frightful ravages, by the delirious inebriation resulting from the opinions with which they intoxicated the mind. 439 Indeed, it is extremely difficult to prevent habitual fear, which of all human passions is the

most incommodious, from becoming a dangerous leaven; 440 which in the long run will sour, exasperate, and give malignancy to the most moderate temperament.

441 If a misanthrope, in hatred of your race, had formed the project of throwing human into the greatest perplexity,-- 442 if a tyrant, in the plenitude of your unruly desire to punish, had sought out the most efficacious means; 443 could either the one or the other have imagined that which was so well calculated to gratify their revenge, 444 as thus to occupy you unceasingly with objects not only unknown to you, but which no two of them should ever see with precisely the same eyes; 445 which notwithstanding they should be obliged to contemplate as the centre of all their thoughts-- 446 as the only model of their conduct-- as the end of all their actions-- as the subject of all their research-- as a thing of more importance to them than life itself; 447 upon which all their present felicity, all their future happiness, must necessarily depend? 448 Could the gods themselves, in their solicitude to punish the impious Prometheus, for having stolen fire from the sun, have imagined a more certain method of executing their wishes? 449 Was not Pandora's box, though stuffed with evils, trifling when compared with this? 450 That at least left hope, to the unfortunate Epimetheus; this effectually cut it off.

451 If human was subjected to an absolute monarch, to a sultan who should keep the self secluded from own subjects; 452 who followed no rule but own desires; who did not feel the self bound by any duty; 453 who could for ever punish the offences committed against the self; whose fury it was easy to provoke; 454 who was irritated even by the ideas, the thoughts of own subjects; whose displeasure might be incurred without even their own knowledge; 455 the name of such a sovereign would assuredly be sufficient to carry trouble, to spread terror, to diffuse consternation into the very souls of those who should hear it pronounced; 456 His idea would haunt them everywhere-- would

unceasingly afflict them--would plunge them into despair.

457 What tortures would not their mind endure to discover this formidable being, to ascertain the secret of pleasing Him! 458 What labour would not their imagination bestow, to discover what mode of conduct might be able to disarm His anger! 459 What fears would assail them, lest they might not have justly hit upon the means of assuaging His wrath! 460 What disputes would they not enter into upon the nature, the qualities of a ruler, equally unknown to them all! 461 What a variety of means would not be adopted, to find favour in His eyes; to avert His chastisement!

462 Such is the history of the effects superstition has produced upon the earth. 463 Human has always been panic-struck, because the systems adopted never enable you to form any correct opinion, any fixed ideas, upon a subject so material to your happiness; 464 because everything conspired either to give your ideas a fallacious turn, or else to keep your mind in the most profound ignorance; 465 when you was willing to set yourself right, when you was sedulous to examine the path which conducted to your felicity, 466 when you was desirous of probing opinions so consequential to your peace, involving so much mystery, yet combining both your hopes and your fears, 467 you was forbidden to employ the only proper method,--YOUR REASON, guided by your experience; 468 you was assured this would be an offence the most indelible.

469 If you asked, wherefore your reason had then been given you, since you was not to use it in matters of such high behest?-- 470 You was answered, those were mysteries of which none but the initiated could be informed; 471 that it sufficed for you to know, that the reason which you seemed so highly to prize, which you held in so much esteem, was your most dangerous enemy-- 472 your most inveterate, most determined foe.

473 Where can be the propriety of such an argument? Can it really be that reason is dangerous? 474 If so,

the Turks are justified in their predilection for mad-people: 475 but to proceed, you are told that you must believe in the gods, not question the mission of their priests; 476 in short, that you had nothing to do with the laws they imposed, but to obey them: 477 when you then required that these laws might at least be made comprehensible to you; that you might be placed in a capacity to understand them; 478 the old answer was returned, that they were mysteries; you must not inquire into them.

479 But where is the necessity for mystery in points of such vast importance? 480 You might, indeed, from time to time consult these oracles, when you was able to make the sacrifices demanded; 481 you would then receive precepts for your conduct: 482 these were always, however, given in such vague, indeterminate terms, that you had scarcely the chance of acting right. 483 At different times the same oracles delivered different opinions: thus you had nothing, steady; nothing permanent, whereby to guide your steps; 484 like a blind man left to himself in the streets, he was obliged to grope his way at the peril of his existence. 485 This will serve to show the urgent necessity there is for truth to throw its radiant lustre on systems big with so much importance; 486 that are so calculated to corroborate the animosities, to confirm the bitterness of soul, between those whom Nature intended should always act as brothers.

487 By the magical charms with which these idols were surrounded, the human species has remained either as if it was benumbed, in a state of stupid apathy, 488 or else you have become furious with fanaticism: 489 sometimes, desponding with fear, human cringed like a slave who bends under the scourge of an inexorable master, always ready to strike you; 490 you trembled under a yoke made too ponderous for your strength: 491 you lived in continual dread of a vengeance you was unceasingly striving to appease, without ever knowing when you had succeeded:

492 as you was always bathed in tears, continually enveloped in misery-- 493 as you was never permitted to lose sight of your fears-- as you was continually exhorted to nourish your alarm, 494 you could neither labour for your own happiness nor contribute to that of others; nothing could exhilarate you; 495 you became the enemy of yourself, the persecutor of your fellow-creatures, because your felicity here below was interdicted; 496 you passed your time in heaving the most bitter sighs; your reason being forbidden you, you fell into either a state of infancy or delirium, which submitted you to authority; 497 you was destined to this servitude from the hour you quitted your mother's womb, until that in which you was returned to your kindred dust; 498 tyrannical opinion bound you fast in her massive fetters; a prey to the terrors with which you was inspired, 499 you appeared to have come upon the earth for no other purpose than to dream-- 500 with no other desire than to groan--with no other motives than to sigh; 501 your only view seemed to be to injure yourself; to deprive yourself of every rational pleasure, to embitter your own existence; to disturb the felicity of others. 502 Thus, abject, slothful, irrational, you frequently became wicked, under the idea of doing honour to your gods; 503 because they instilled into your mind that it was your duty to avenge their cause, to sustain their honour, to propagate their worship.

504 Mortals were prostrate from race to race, before vain idols to which fear had given birth in the bosom of ignorance, during the calamities of the earth; 505 they tremblingly adored phantoms which credulity had placed in the recesses of their own brain, 506 where they found a sanctuary which time only served to strengthen; 507 nothing could undeceive them; nothing was competent to make them feel, it was themselves they adored-- 508 that they bent the knee before their own work-- that they terrified themselves with the extravagant pictures they had themselves delineated; 509 they obstinately persisted in prostrating

themselves, in perplexing themselves, in trembling; 510 they even made a crime of endeavouring to dissipate their fears; they mistook the production of their own folly; 511 their conduct resembled that of children, who having disfigured their own features, become afraid of themselves when a mirror reflects the extravagance they have committed. 512 These notions so afflicting for themselves, so grievous to others, have their epoch from the calamities of human; 513 they will continue, perhaps augment, until their mind, enlightened by discarded reason, illumined by truth, shall set in their true colours these various systems; 514 until reflection guided by experience, shall attach no more importance to them, than is consistent with the happiness of society; 515 until human, bursting the chains of superstition-- recalling to mind the great end of own existence-- taking a rational view of that which surrounds you, 516 shall no longer refuse to contemplate Nature under Her true character; 517 shall no longer persist in refusing to acknowledge She contains within Herself the cause of that wonderful phenomena which strikes on the dazzled optics of human: 518 until thoroughly persuaded of the weakness of their claim to the homage of humankind, 519 you shall make one pious, simultaneous, mighty effort, and overthrow the altars of Moloch and his priests.

EXAMINATION OF THE PROOFS OF THE EXISTENCE OF THE DIVINITY, AS GIVEN BY CLARKE

Paul Henri Thiery (Baron D'Holbach)

47 The unanimity of human in acknowledging the Divinity, is commonly looked upon as the strongest proof of your existence. 2 There is not, it is said, any people on the earth who have not some ideas, whether true or false, of an all-powerful agent who governs the world. 3 The rudest savages as well as the most polished nations, are equally obliged to recur by thought to the first cause of everything that exists; 4 thus it is affirmed, the cry of

NATURE

Nature Herself ought to convince us of the existence of the Godhead, 5 of which She has taken pains to engrave the notion in the minds of humans: they therefore conclude, that the idea of God is innate.

6 Perhaps there is nothing of which human should be more sedulously careful than permitting a promiscuous assemblage of right with wrong-- 7 of suffering false conclusions to be drawn from true propositions; 8 this will not improbably be found to be pretty much the case in this instance; 9 the existence of the great Cause of causes, the Parent of parents, does not, I think, admit of any doubt in the mind of anyone who has reasoned: 10 but, if this existence did not rest upon better foundations than the unanimity of human on this subject, 11 I am fearful it would not be placed upon so solid a rock as those who make this asseveration may imagine: 12 the fact is, human is not generally agreed upon this point; if you was, superstition could have no existence; 13 the idea of God cannot be innate, because, independent of the proofs offered on every side of the almost impossibility of innate ideas, 14 one simple fact will set such an opinion for ever at rest, 15 except with those who are obstinately determined not to be convinced by even their own arguments: 16 if this idea was innate, it must be everywhere the same; 17 seeing that that which is antecedent to human being, cannot have experienced the modifications of own existence, which are posterior.

18 Even if it were waived, that the same idea should be expected from all humankind, but that only every nation should have their ideas alike on this subject, 19 experience will not warrant the assertion, since nothing can be better established than that the idea is not uniform even in the same town; 20 now this would be an insuperable quality in an innate idea. 21 It not infrequently happens, that in the endeavour to prove too much, that which stood firm before the attempt, is weakened; 22 thus a bad advocate frequently injures a good cause, although you may not be able to overturn the rights on which it is rested. 23 It would, therefore,

perhaps, come nearer to the point if it was said, 24 "that the natural curiosity of humankind have in all ages, and in all nations, led human to seek after the primary cause of the phenomena you beholds; 25 that owing to the variations of your climate, to the difference of your organisation, the greater or less calamity you have experienced, 26 the variety of your intellectual faculties, and the circumstances under which you have been placed, 27 human has had the most opposite, contradictory, extravagant notions of the Divinity, 28 but that He has uniformly been in accord in acknowledging both the existence, and the wisdom of His work-- NATURE."

29 If disengaged from prejudice, we analyse this proof, we shall see that the universal consent of human, so diffused over the earth, 30 actually proves little more than that you have been in all countries exposed to frightful revolutions, experienced disasters, been sensible to sorrows of which you have mistaken the physical causes; 31 that those events to which you have been either the victim or the witness, have called forth your admiration or excited your fear; 32 that for want of being acquainted with the powers of Nature, for want of understanding Her laws, 33 for want of comprehending Her infinite resources, for want of knowing the effects She must necessarily produce under given circumstances, 34 you have believed these phenomena were due to some secret agent of which you have had vague ideas-- 35 to beings whom you have supposed conducted themselves after your own manner; who were operated upon by similar motives with yourself.

36 The consent then of human in acknowledging a variety of gods, proves nothing, 37 except that in the bosom of ignorance you have either admired the phenomena of Nature, or trembled under their influence; 38 that your imagination was disturbed by what you beheld or suffered; 39 that you have sought in vain to relieve your perplexity, upon the unknown cause of the phenomena you witnessed, which frequently

obliged you to quake with terror: 40 the imagination of the human race has laboured variously upon these causes, which have almost always been incomprehensible to you; 41 although everything confessed your ignorance, your inability to define these causes, yet you maintained that you was assured of their existence; 42 when pressed, you spoke of a spirit,-- a word to which it was impossible to attach any determinate idea-- 43 which taught nothing but the sloth, which evidenced nothing but the stupidity of those who pronounced it.

44 It ought, however, not to excite any surprise that human is incapable of forming any substantive ideas, 45 save of those things which act, or which have heretofore acted upon your senses; 46 it is very evident that the only objects competent to move your organs are material,-- 47 that none but physical beings can furnish you with ideas,-- 48 a truth which has been rendered sufficiently clear in the commencement of this work, not to need any further proof. 49 It will suffice therefore to say that the idea of God is not an innate, but an acquired notion; 50 that it is the very nature of this notion to vary from age to age; to differ in one country from another; to be viewed variously by individuals.

51 What do I say? It is, in fact, an idea hardly ever constant in the same mortal. 52 This diversity, this fluctuation, this change, stamps it with the true character of an acquired opinion. 53 On the other hand, the strongest proof that can be adduced that these ideas are founded in error, 54 is, that human by degrees has arrived at perfectioning all the sciences which have any known objects for their basis, whilst the science of theology has not advanced; 55 it is almost everywhere at the same point; people seem equally undecided on this subject; 56 those who have most occupied themselves with it, have effected but little; 57 they seem, indeed, rather to have rendered the primitive ideas human formed to the self on this head more obscure,-- to have involved in greater mystery all your original opinions.

58 As soon as it is asked of human, what are the gods before whom you prostrates yourself, forthwith your sentiments are divided. 59 In order that your opinions should be in accord, it would be requisite that uniform ideas, analogous sensations, 60 unvaried perceptions, should everywhere have given birth to your notions upon this subject: 61 but this would suppose organs perfectly similar, modified by sensations which have a perfect affinity: this is what could not happen: 62 because human, essentially different by your temperament, who is found under circumstances completely dissimilar, 63 must necessarily have a great diversity of ideas upon objects which each individual contemplates so variously.

64 Agreed in some general points, each made the self a god after own manner; you feared him, you served him, after your own mode. 65 Thus the god of one person, or of one nation, was hardly ever that of another person, or of another nation. 66 The god of a savage, foreign people, is commonly some material object, upon which the mind has exercised itself but little; 67 this god appears very ridiculous in the eyes of a more polished community, whose minds have laboured more intensely upon the subject. 68 A spiritual god, whose adorers despise the worship paid by the savage to a coarse, material object, is the subtle production of the brain of thinkers, 69 who, lolling in the lap of polished society quite at their leisure, have deeply meditated, have long occupied themselves with the subject. 70 The theological god, although for the most part incomprehensible, is the last effort of the human imagination; 71 it is to the god of the savage, what an inhabitant of the city of Sybaris, 72 where effeminacy and luxury reigned, where pomp and pageantry had reached their climax, clothed with a curiously embroidered purple habit of silk, 73 was to a person either quite naked, or simply covered with the skin of a beast perhaps newly slain.

74 It is only in civilised societies, that leisure affords the opportunity of dreaming-- that ease procures the

facility of reasoning; 75 in these associations, idle speculators meditate, dispute, form metaphysics: 76 the faculty of thought is almost void in the savage, who is occupied either with hunting, with fishing, 77 or with the means of procuring a very precarious subsistence by dint of almost incessant labour. 78 The generality of people, however, have not more elevated notions of the divinity, have not analysed Him more than the savage. 79 A spiritual, immaterial God, is formed only to occupy the leisure of some subtle people, who have no occasion to labour for a subsistence.

80 Theology, although a science so much vaunted, considered so important to the interests of human, is only useful to those who live at the expense of others; 81 or of those who arrogate to themselves the privilege of thinking for all those who labour. 82 This science becomes, in some polished societies, who are not on that account more enlightened, 83 a branch of commerce extremely advantageous to its professors; equally unprofitable to the citizens; 84 above all when these have the folly to take a very decided interest in their unintelligible system-- in their discordant opinions.

85 What an infinite distance between an unformed stone, an animal, a star, a statue, and the abstracted Deity, 86 which theology hath clothed with attributes under which it loses sight of Him itself! 87 The savage without doubt deceives the self in the object to which they addresses their vows; 88 like a child you are smitten with the first object that strikes your sight-- that operates upon you in a lively manner; 89 like the infant, your fears are alarmed by that from which you conceives you have either received an injury or suffered disgrace; 90 still your ideas are fixed by a substantive being, by an object which you can examine by your senses.

91 The Laplander who adores a rock,-- the negro who prostrates the self before a monstrous serpent, at least see the objects they adore. 92 The idolater falls upon the knees before a statue, in which you believes there resides some

concealed virtue, some powerful quality, which you judges may be either useful or prejudicial to yourself; 93 but that subtle reasoner, called a metaphysician, who in consequence of your unintelligible science, 94 believes you have a right to laugh at the savage, to deride the Laplander, to scoff at the negro, to ridicule the idolater, 95 doth not perceive that you are yourself prostrate before a being of your own imagination, of which it is impossible you should form to yourself any correct idea, 96 unless, like the savage, you re-enters into visible Nature, to clothe you with qualities capable of being brought within the range of your comprehension.

97 For the most part the notions on the Divinity, which obtain credit even at the present day, are nothing more than a general terror diversely acquired, variously modified in the mind of nations, 98 which do not tend to prove anything, save that they have received them from their trembling, ignorant ancestors. 99 These gods have been successively altered, decorated, subtilised, by those thinkers, those legislators, those priests, who have meditated deeply upon them; 100 who have prescribed systems of worship to the uninformed; who have availed themselves of their existing prejudices, to submit them to their yoke; 101 who have obtained a dominion over their mind, by seizing on their credulity,-- by making them participate in their errors,-- by working on their fears; 102 these dispositions will always be a necessary consequence of human's ignorance, when steeped in the sorrows of your heart.

103 If it be true, as asserted, that the earth has never witnessed any nation so unsociable, so savage, 104 to be without some form of religious worship-- who did not adore some god-- but little will result from it respecting the Divinity. 105 The word GOD, will rarely be found to designate more than the unknown cause of those effects which human has either admired or dreaded. 106 Thus, this notion so generally diffused, upon which so much stress

is laid; will prove little more than that human in all generations has been ignorant of natural causes,-- 107 that you are been incompetent, from some cause or other, to account for those phenomena which either excited your surprise or roused your fears.

108 If at the present day a people cannot be found destitute of some kind of worship, entirely without superstition, 109 who do not acknowledge a God, who have not adopted a theology more or less subtle, 110 it is because the uninformed ancestors of these people have all endured misfortunes-- have been alarmed by terrifying effects, which they have attributed to unknown causes-- 111 have beheld strange sights, which they have ascribed to powerful agents, whose existence they could not fathom; 112 the details of which, together with their own bewildered notions, they have handed down to their posterity who have not given them any kind of examination.

113 It will readily be allowed, that the universality of an opinion by no means proves its truth. 114 Do we not see a great number of ignorant prejudices, a multitude of barbarous errors, even at the present day, receive the almost universal sanction of the human race? 115 Are not nearly all the inhabitants of the earth imbued with the idea of magic-- 116 in the habit of acknowledging occult powers-- given to divination-- believers in enchantment-- the slaves to omens-- supporters of witchcraft-- thoroughly persuaded of the existence of ghosts? 117 If some of the most enlightened people are cured of these follies, they still find very zealous partisans in the greater number of humankind, who accredits them with the firmest confidence. 118 It would not, however, be concluded by people of sound sense, in many instances not by the theologians themselves, 119 that therefore these chimeras actually have existence, although sanctioned with the credence of the multitude.

120 Before Copernicus, there was no one who did not believe that the earth was stationary, that the sun described its annual revolution round

it. 121 Was, however, this universal consent of human upon a principle of astronomical science, which endured for so many thousand years, less an error on that account? 122 Yet to have doubted the truth of such a generally-diffused opinion, one that had received the sanction of so many learned people-- 123 that was clothed with the sacred vestments of so many ages of credulity-- 124 that had been adopted by Moses, acknowledged by Solomon, accredited by the Persian magi-- that Elijah himself had not refuted-- 125 that had obtained the fiat of the most respectable universities, the most enlightened legislators, the wisest kings, the most eloquent ministers; 126 in short, a principle that embraced all the stability that could be derived from the universal consent of all ranks: 127 to have doubted, I say, of this, would at one period have been held as the highest degree of profanation, as the most presumptuous scepticism, as an impious blasphemy, 128 that would have threatened the very existence of that unhappy country from whose unfortunate bosom such a venomous, sacrilegious mortal could have arisen.

129 It is well known what opinion was entertained of Gallileo for maintaining the existence of the antipodes. 130 Pope Gregory excommunicated as atheists, all those who gave it credit. 131 Thus each person has own God: But do all these gods exist? 132 In reply it will be said, somewhat triumphantly, each person hath own ideas of the sun, do all these suns exist? 133 However narrow may be the pass by which superstition imagines it has thus guarded its favourite hypothesis, nothing will perhaps be more easy than the answer: 134 the existence of the sun is a fact verified by the daily use of the senses; 135 all the world see the sun; no one bath ever said there is no sun; nearly all humankind have acknowledged it to be both luminous and hot: 136 however various may be the opinions of human, upon this luminary, no one has ever yet pretended there was more than one attached to our planetary system.

NATURE

137 But we may perhaps be told, there is a wide difference between that which can be contemplated by the visual organs, 138 which can be understood by the sense of feeling, and that which does not come under the cognisance of any part of the organic structure of human. 139 We must confess theology here has the advantage; that we are unable to follow it through its devious sinuosities; amidst its meandering labyrinths: 140 but then it is the advantage of those who see sounds, over those who only hear them; 141 of those who hear colours, over those who only see them; 142 of the professors of a science, where everything is built upon laws inverted from those common to the globe we inhabit; 143 over those common understandings, who cannot be sensible to anything that does not give an impulse to some of their organs.

144 If human, therefore, had the courage to throw aside own prejudices, which everything conspires to render as durable as the self-- 145 if divested of fear you would examine coolly-- 146 if guided by reason you would dispassionately view the nature of things, the evidence adduced in support of any given doctrine; 147 you would, at least, be under the necessity to acknowledge, that the idea of the Divinity is not innate--that it is not anterior to your existence-- 148 that it is the production of time, acquired by communication with your own species-- 149 that, consequently, there was a period when it did not actually exist in human: 150 you would see clearly, that you holds it by tradition from those who reared you: 151 that these themselves received it from their ancestors: 152 that thus tracing it up, it will be found to have been derived in the last resort, from ignorant savages, who were our first fathers and mothers.

153 The history of the world will show that crafty legislators, ambitious tyrants, blood-stained conquerors, have availed themselves of the ignorance, the fears, the credulity of own progenitors, 154 to turn to their own profit an idea to which they rarely attached any other

substantive meaning than that of submitting them to the yoke of their own domination. 155 Without doubt there have been mortals who have dreamed they have seen the Divinity. 156 Mahomet, I believe, boasted he had a long conversation with the Deity, who promulgated to him the system of the Mussulmans. 157 But are there not thousands, even of the theologians, who will exhaust their breath, and fatigue their lungs with vociferating this man was a liar; 158 whose object was to take advantage of the simplicity, to profit by the enthusiasm, to impose on the credulity of the Arabs; 159 who promulgated for truths, the crazy reveries of own distempered imagination?

160 Nevertheless, is it not a truth, that this doctrine of the crafty Arab, is at this day the creed of millions, transmitted to them by their ancestors, rendered sacred by time, 161 read to them in their mosques, adorned with all the ceremonies of superstitious worship; 162 of which the inhabitants of a vast portion of the earth do not permit themselves for an instant to doubt the veracity; 163 who, on the contrary, hold those who do not accredit it as dogs, as infidels, as beings of an inferior rank, of meaner capacities than themselves? 164 Indeed that person, even if one were a theologian, would not experience the most gentle treatment from the infuriated Mahometan, 165 who should to your face venture to dispute the divine mission of your prophet.

166 Thus the ancestors of the Turk have transmitted to their posterity, those ideas of the Divinity which they manifestly received from those who deceived them; 167 whose impositions, modified from age to age, subtilised by the priests, clothed with the reverential awe inspired by fear, 168 have by degrees acquired that solidity, received that corroboration, attained that veteran stability, 169 which is the natural result of public sanction, backed by theological parade.

170 The word God is, perhaps, among the first that vibrate on the ear of human; 171 it is reiterated to you incessantly; you are taught to lisp it

with respect; to listen to it with fear; to bend the knee when it is reverberated: 172 by dint of repetition, by listening to the fables of antiquity, by hearing it pronounced by all ranks and persuasions, you seriously believes all people bring the idea with them into the world; 173 you thus confounds a mechanical habit with instinct; 174 whilst it is for want of being able to recall to yourself the first circumstances under which your imagination was awakened by this name; 175 for want of recollecting all the recitals made to you during the course of your infancy; 176 for want of accurately defining what was instilled into you by your education; 177 in short, because your memory does not furnish you with the succession of causes that have engraven it on your brain, 178 that you believes this idea is really inherent to your being; innate in all your species.

179 Iamblicus, indeed, who was a Pythagorean philosopher not in the highest repute with the learned world, although one of those visionary priests in some estimation with theologians,-- 180 at least if we may venture to judge by the unlimited draughts they have made on the bank of own doctrines-- 181 who was unquestionably a favourite with the emperor Julian, says, "that anteriorly to all use of reason, the notion of the gods is inspired by Nature, 182 and that we have even a sort of feeling of the Divinity, preferable to the knowledge of Him." 183 It is, however, uniformly by habit, that human admires, that you fears a being, whose name you have attended to from your earliest infancy. 184 As soon as you hears it uttered, you without reflection mechanically associates it with those ideas with which your imagination has been filled by the recitals of others; 185 with those sensations which you have been instructed to accompany it. 186 Thus, if for a season human would be ingenuous with the self, 187 you would concede that in the greater number of your race, the ideas of the gods, and of those attributes with which they are clothed, 188 have their foundation,

take their rise in, are the fruit of the opinions of your fathers, 189 traditionally infused into you by education-- confirmed by habit-- corroborated by example-- enforced by authority.

190 That it very rarely happens you examines these ideas; that they are for the most part adopted by inexperience, propagated by tuition, rendered sacred by time, 191 inviolable from respect to your progenitors, reverenced as forming part of those institutions you have most learned to value. 192 You thinks you have always had them, because you have had them from your infancy; 193 you considers them indubitable, because you are never permitted to question them-- because you never have the intrepidity to examine their basis.

194 If it had been the destiny of a Brachman, or a Mussulman, to have drawn own first breath on the shores of Africa, 195 they would adore, with as much simplicity, with as much fervour, the serpent reverenced by the Negroes, as they does the God their own metaphysicians have offered to their reverence. 196 They would be equally indignant if anyone should presumptuously dispute the divinity of this reptile, 197 which human would have learned to venerate from the moment one quitted the womb of own mother, as the most zealous, enthusiastic fakir, 198 when the marvellous wonders of own prophet should be brought into question; 199 or as the most subtile theologian when the inquiry turned upon the incongruous qualities with which you have decorated your gods. 200 Nevertheless, if this serpent god of the Negro should be contested, they could not at least dispute His existence.

201 Simple as may be the mind of this dark son of Nature, uncommon as may be the qualities with which you have clothed your reptile, 202 you still may be evidenced by all who choose to exercise their organs of sight; not so with the theologian; 203 you absolutely questions the existence of every other god but that which you yourself has formed; 204 which is questioned in its turn by your brother metaphysician. 205 They

are by no means disposed to admit the proofs offered by each other. 206 Descartes, Paschal, and Doctor Samuel Clarke himself, have been accused of atheism by the theologians of their time. 207 Subsequent reasoners have made use of their proofs, and even given them as extremely valid. 208 Doctor Bowman published a work, in which he pretends all the proofs hitherto brought forward are crazy and fragile: 209 he of course substitutes his own; which in their turn have been the subject of animadversion. 210 Thus it would appear these theologians are not more in accord with themselves than they are with Turks or Pagans. 211 They cannot even agree as to their proofs of existence: 212 from age to age new champions arise, new evidence is adduced, the old discarded, or treated with contempt; 213 profound philosophers, subtle metaphysicians, are continually attacking each other for their ignorance on a point of the very first importance. 214 Amidst this variety of discussion, it is very difficult for simple winds, for those who steadily search after truth, 215 who only wish to understand what they believe, to find a point upon which they can fix with reliance-- 216 a standard round which they may rally without fear of danger-- 217 a common measure that may serve them for a beacon to avoid the quicksands of delusion--the sophistry of polemics.

218 People of very great genius have successively miscarried in their demonstrations; 219 have been held to have betrayed their cause by the weakness of the arguments by which they have supported it; 220 by the manner in which they have attempted to establish their positions. 221 Thus many of them, when they believed they had surmounted a difficulty, had the mortification to find they had only given birth to an hundred others. 222 They seem, indeed, not to be in a capacity to understand each other, 223 or to agree among themselves, when they reason upon the nature and qualities of beings created by such a variety of imaginations, which each contemplates diversely, 224 upon

which the natural self-love of each disputant induces you to reject with vehement indignation everything that does not fall in with your own peculiar mode of thinking-- 225 that does not quadrate either with your superstition or your ignorance, or sometimes with both.

226 The opponents of Clarke charge him with begging the question in his work on ‘The Being and Attributes of God’. 227 They say he has pretended to prove this existence a-priori, which they deem impossible, seeing there is nothing anterior to the first of causes; 228 that therefore it can only be proved ‘a posteriori’, that is to say, by its effects. 229 Law, in his Inquiry into the Ideas of Space, Time, Immensity, has attacked him very triumphantly, 230 for this manner of proof, which is stated to be so very repugnant to the school-people. 231 His arguments have been treated with no more ceremony by Thomas D'Aquinas, John Scott, and others of the schools. 232 At the present day I believe he is held in more respect-- that his authority outweighs that of all his antagonists together. 233 Be that as it may, those who have followed him have done nothing more than either repeat his ideas, or present his evidence under a new form. 234 Tillotson argues at great length, but it would be rather difficult to understand which side of the question he adopts on this momentous subject; 235 whether he is a Necessitarian, or among the opposers of Fatalism.

236 Speaking of human, he says, "human is liable to many evils and miseries, which you can neither prevent or redress; 237 you are full of wants, which you cannot supply, 238 and compassed about with infirmities which you cannot remove, 239 and obnoxious to dangers which you can never sufficiently provide against: 240 you are apt to grieve for what you cannot help, and eagerly to desire what you are never able to obtain." 241 If the proofs of Clarke, who has drawn them up in twelve propositions, are examined with attention, 242 I think they may be fairly shielded from the reproach with which they have been loaded; 243 it does not appear that he has

proved his positions a priori, but a-posteriori, according to rule. 244 It seems clear, however, that he has mistaken the proof of the existence of the effects, for the proof of the existence of the cause: 245 but here he seems to have more reason than his critics, who in their eagerness to prove that Clarke has not conformed to the rules of the schools, would entirely overlook the best, 246 the surest foundation whereon to rest the existence of the Great Cause of causes, that Parent of Parents, 247 whose wisdom shines so manifestly in Nature, of which Clarke's work may be said to be such a masterly evidence.

248 We shall follow, step by step, the different propositions in which this learned divine develops the received opinions upon the Divinity; 249 which, when applied to Nature, will be found to be so accurate, so correct, 250 as to leave no further room to doubt either the existence or the wisdom of Her great author, thus proved through Her own existence. 251 Dr. Clarke sets out with saying: "1st. Something has existed from all eternity." 252 This proposition is evident-- hath no occasion for proofs. 253 Matter has existed from all eternity, its forms alone are evanescent; 254 matter is the great engine used by Nature to produce all Her phenomena, or rather it is Nature Herself. 255 We have some idea of matter, sufficient to warrant the conclusion that this has always existed.

256 First, that which exists, supposes existence essential to its being. 257 That which cannot, annihilate itself, exists necessarily; 258 it is impossible to conceive that that which cannot cease to exist, or that which cannot annihilate itself, could ever have had a beginning. 259 If matter cannot be annihilated, it could not commence to be. 260 Thus we say to Dr. Clarke, that it is matter, it is Nature, acting by Her own peculiar energy, of which no particle is ever in an absolute state of rest, which hath always existed. 261 The various material bodies which this Nature contains often change their form, their combination, their properties, their mode of action: 262 but their

principles or elements are indestructible-- have never been able to commence. 263 What this great scholar actually understands, when he makes the assertion "that an eternal duration is now actually past," is not quite so clear; 264 yet he affirms, "that not to believe it would be a real and express contradiction." 265 We may, however, safely admit his argument, "that when once any proposition is clearly demonstrated to be true, 266 it ought not to disturb us that there be perhaps some perplexing difficulties on the other side, 267 which merely for want of adequate ideas of the manner of the existence of the things demonstrated, are not easily to be cleared."

268 2nd, "There has existed from eternity someone unchangeable and independent Being." 269 We may fairly inquire what is this Being? Is it independent of its own peculiar essence, or of those properties which constitute it such as it is? 270 We shall further inquire, if this Being, whatever it may be, can make the other beings which it produces, 271 or which it moves, act otherwise than they do, according to the properties which it has given them? 272 And in this case we shall ask, if this Being, such as it may be supposed to be, does not act necessarily; 273 if it is not obliged to employ indispensible means to fulfil its designs, to arrive at the end which it either has, or may be supposed to have in view? 274 Then we shall say, that Nature is obliged to act after Her essence; 275 that everything which takes place in Her is necessary; but that She is independent of Her forms.

276 A person is said to be independent, when you are determined in your actions only by the general causes which are accustomed to move you; 277 you are equally said to be dependent on another, when you cannot act but in consequence of the determination which this last gives you. 278 A body is dependent on another body when it owes to it its existence, and its mode of action. 279 A being existing from eternity cannot owe your existence to any other being; 280 you cannot then be dependent upon Him, except you owes your action to Him; 281 but it is

evident that an eternal or self-existent Being contains in your own nature everything that is necessary for you to act: 282 then, matter being eternal, is necessarily independent in the sense we have explained; 283 of course it hath no occasion for a mover upon which it ought to depend.

284 This eternal Being is also immutable, if by this attribute be understood that He cannot change His nature; 285 but if it be intended to infer by it that He cannot change His mode of action or existence, it is without doubt deceiving themselves, 286 since even in supposing an immaterial being, they would be obliged to acknowledge in Him different modes of being, different volitions, different ways of acting; 287 particularly if He was not supposed totally deprived of action, in which case He would be perfectly useless.

288 Indeed it follows of course that to change your mode of action you must necessarily change your manner of being. 289 From hence it will be obvious, that the theologians, in making their gods immutable, render them immoveable, consequently they cannot act. 290 An immutable being, could evidently neither have successive volition, nor produce successive action; 291 if this being hath created matter, or given birth to the universe, there must have been a time in which He was willing that this matter, this universe, should exist; 292 and this time must have been preceded by another time, in which He was willing that it might not yet exist.

293 If God be the author of all things, as well as of the motion and of the combinations of matter, He is unceasingly occupied in producing and destroying; 294 in consequence, He cannot be called immutable, touching His mode of existing. 295 The material world always maintains itself by motion, and the continual change of its parts; 296 the sum of the beings who compose it, or of the elements which act in it, is invariably the same; 297 in this sense the immutability of the universe is much more easy of comprehension, 298 much more demonstrable than that of

another being to whom, they would attribute all the effects, all the mutations which take place.

299 Nature is not more to be accused of mutability, on account of the succession of its forms, than the eternal Being is by the theologians, by the diversity of his decrees. 300 Here we shall be able to perceive that, supposing the laws by which Nature acts to be immutable, 301 it does not require tiny of these logical distinctions to account for the changes that take place: 302 the mutation which results, is, on the contrary, a striking proof of the immutability of the system which produces them; 303 and completely brings Nature under the range of this second proposition as stated by Dr. Clarke.

304 3dly, "That unchangeable and independent Being which has existed from eternity without any eternal cause of its existence, must be self-existent, that is, necessarily existing." 305 This proposition is merely a repetition of the first; we reply to it by inquiring, Why matter, which is indestructible, should not be self-existent? 306 It is evident that a being who had no beginning, must be self-existent; 307 if He had existed by another, He would have commenced to be; consequently He would not be eternal.

308 4thly, "What the substance or essence of that Being which is self-existent, or necessarily existing, is, we have no idea; neither is it at all possible for us to comprehend it." 309 Dr. Clarke would perhaps have spoken more correctly if he had said his essence is impossible to be known: 310 nevertheless, we shall readily concede that the essence of matter is incomprehensible, 311 or at least that we conceive it very feebly by the manner in which we are affected by it; 312 but without this we should be less able to conceive the Divinity, who would then be impervious on any side. 313 Thus it must necessarily be concluded, that it is folly to argue upon it, since it is by matter alone we can have any knowledge of Him; 314 that is to say, by which we can assure ourselves of His existence,-- by which we can at all guess at His qualities. 315 In short

we must conclude, that everything related of the Divinity, either proves Him material, 316 or else proves the impossibility in which the human mind will always find itself, of conceiving any being different from matter; 317 without extent, yet omnipresent; immaterial, yet acting upon matter; spiritual, yet producing matter; immutable, yet putting everything in activity.

318 Indeed it must be allowed that the incomprehensibility of the Divinity does not distinguish Him from matter; 319 this will not be more easy of comprehension when we shall associate it with a being much less comprehensible than itself; 320 we have some slender knowledge of it through some of its parts. 321 We do not certainly know the essence of any being, if by that word we are to understand that which constitutes its peculiar nature. 322 We only know matter by the sensations, the perceptions, the ideas which it furnishes; 323 it is according to these that we judge it to be either favourable or unfavourable, following the particular disposition of our organs. 324 But when a being does not act upon any part of our organic structure, it does not exist for us; 325 we cannot, without exhibiting folly, without betraying our ignorance, without falling into obscurity, either speak of its nature, or assign its qualities; 326 our senses are the only channel by which we could have formed the slightest idea of it; 327 these not having received any impulse, we are, in point of fact, unacquainted with its existence.

328 The incomprehensibility of the Divinity ought to convince human that it is a point at which you are bound to stop; 329 indeed you are placed in a state of utter incapacity to proceed: 330 this, however, would not suit with those speculators who are willing to reason upon Him continually, to show the depth of their learning,-- 331 to persuade the uninformed they understand that which is incomprehensible to all humans; by which they expect to be able to submit Him to their own views. 332 Nevertheless, if the Divinity be incomprehensible, It would not be straining a point

beyond its tension, 333 to conclude that a priest, or metaphysician, did not comprehend Him better than other people: 334 it is not, perhaps, either the wisest or the surest way to become acquainted with Him, to represent Him to ourselves, by the imagination of a theologian.

335 5thly, "Though the substance, or essence of the self-existent Being, is in itself absolutely incomprehensible to us, 336 yet many of the essential attributes of His nature are strictly demonstrable, as well as His existence. 337 Thus, in the first place, the self-existent Being must of necessity be eternal." 338 This proposition differs in nothing from the first, except Dr. Clarke does not here understand that as the self-existent Being had no beginning, he can have no end. 339 However this may be, we must ever inquire, why this should not be matter? 340 We shall further observe, that matter not being capable of annihilation, exists necessarily, consequently will never cease to exist; 341 that the human mind has no means of conceiving how matter should originate from that which is not itself matter: 342 is it not obvious, that matter is necessary; 343 that there is nothing, except its powers, its arrangement, its combinations, which are contingent or evanescent?

344 The general motion is necessary, but the given motion is not so; 345 only during the season that the particular combinations subsist, of which this motion is the consequence, or the effect: 346 we may be competent to change the direction, to either accelerate or retard, to suspend or arrest, a particular motion, 347 but the general motion can never possibly be annihilated. 348 Human, in dying, ceases to live; that is to say, you no longer either walks, thinks, or acts in the mode which is peculiar to human organisation: 349 but the matter which composed your body, the matter which formed your mind, does not cease to move on that account: it simply becomes susceptible of another species of motion.

350 6thly, "The self-existent Being must of necessity be infinite and

omnipresent." 351 The word infinite presents only a negative idea-- which excludes all bounds: 352 it is evident that a being who exists necessarily, who is independent, cannot be limited by anything which is out of Himself; 353 He must consequently be His own limits; in this sense we may say He is infinite. 354 Touching what is said of His omnipresence, it is equally evident that if there be nothing exterior to this being, 355 either there is no place in which He must not be present, or that there will be only Himself and the vacuum.

356 This granted, I shall inquire if matter exists; if it does not at least occupy a portion of space? 357 In this case, matter, or the universe, must exclude every other being who is not matter, from that place which the material beings occupy in space. 358 In asking whether the gods of the theologians be by chance the abstract being which they call the vacuum or space, they will reply, “No!” 359 They will further insist, that their gods, who are not matter, penetrate that which is matter. 360 But it must be obvious, that to penetrate matter, it is necessary to have some correspondence with matter, consequently to have extent; 361 now to have extent, is to have one of the properties of matter.

362 If the Divinity penetrates matter, then He is material; by a necessary deduction He is inseparable from matter; then if He is omnipresent, He will be in everything. 363 This, the theologians will not allow: they will say it is a mystery; 364 by which I shall understand that they are themselves ignorant how to account for their own positions; 365 this will not be the case with making Nature act after immutable laws; 366 She will of necessity be everywhere, in my body, in my arm, in every other material being, because matter composes them all. 367 The Divinity who has given this invariable system, will without any incongruous reasoning, without any subterfuge, be also present everywhere, 368 inasmuch as the laws He has prescribed will unchangeably act through the whole; this does not seem inconsistent with reason to suppose.

369 7th, "The Self-existent Being must of necessity be but one." 370 If there be nothing exterior to a being who exists necessarily, it must follow that He is unique. 371 It will be obvious that this proposition is the same with the preceding one; at least, if they are not willing to deny the existence of the material world.

372 8th, "The self-existent and original Cause of all things, must be an intelligent being." 373 Here Dr. Clarke most unquestionably assigneth a human quality: 374 intelligence is a faculty appertaining to organised or animated beings, of which we have no knowledge out of these beings. 375 To have intelligence, it is necessary to think; to think, it is requisite to have ideas; to have ideas, supposes senses; 376 when senses exist they are material; when they are material, they cannot be a pure spirit, in the language of the theologian.

377 The necessary Being who comprehends, who contains, who produces animated beings, contains, includes, and produceth intelligence. 378 But has the great whole a peculiar intelligence, which moveth it, which maketh it act, 379 which determineth it in the mode that intelligence moves and determines animated bodies; 380 or rather, is not this intelligence the consequence of immutable laws, 381 a certain modification resulting from certain combinations of matter, 382 which exists under one form of these combinations, but is wanting under another form? 383 This is assuredly what nothing is competent absolutely, and demonstrably to prove.

384 Human having placed yourself in the first rank in the universe, has been desirous to judge of everything after what you saw within yourself, 385 because you hath pretended that in order to be perfect it was necessary to be like yourself. 386 Here is the source of all your erroneous reasoning upon Nature--the foundation of your ideas upon your gods. 387 You have therefore concluded, perhaps not with the most polished wisdom, that it would be indecorous in yourself, injurious to the Divinity, 388 not to invest Him

with a quality which is found estimable in human-- which you prizes highly-- 389 to which you attaches the idea of perfection-- which you considers as a manifest proof of superiority. 390 You sees your fellow-creature is offended when you are thought to lack intelligence; 391 you therefore judges it to be the same with the Divinity. 392 You denies this quality to Nature, because you considers Her a mass of ignoble matter, incapable of self-action; 393 although She contains and produces intelligent beings. But this is rather a personification of an abstract quality, than an attribute of the Deity, 394 with whose perfections, with whose mode of existence, you cannot by any possible means become acquainted according to the fifth proposition of Dr. Clarke himself.

395 It is in the earth that is engendered those living animals called worms; yet we do not say the earth is a living creature. 396 The bread which human eats, the wine that you drinks, are not themselves thinking substances; 397 yet they nourish, sustain, and cause those beings to think, who are susceptible of this modification of their existence. 398 It is likewise in Nature, that is formed intelligent, feeling, thinking beings; 399 yet it cannot be rationally said, that Nature feels, thinks, and is intelligent after the manner of these beings, who nevertheless spring out of Her bosom.

400 How! Cries the metaphysician, the subtilising philosopher, what! Refuse to the Divinity, those qualities we discover in His creatures? 401 Must, then, the work be more perfect than the workman? Shall God, who made the eye, not Himself see? Shall God, who formed the ear, not Himself hear! 402 This at a superficial view appears insuperable: 403 but are the questioners, however triumphantly they may make the inquiry, themselves aware of the length this would carry them, even if their queries were answered with the most unqualified affirmative? 404 Have they sufficiently reflected on the tendency of this mode of reasoning?

405 If this be admitted as a postulatum, are they prepared to follow it in all its extent?

406 Suppose their argument granted, what is to be done with all those other qualities upon which human does not set so high a value? 407 Are they also to be ascribed to the Divinity, because we do not refuse Him qualities possessed by His creatures? 408 By a parity of reasoning we should attach faculties that would be degrading to the Divinity. 409 Thus it ever happens with those who travel out of the limits of their own knowledge; they involve themselves in perpetual contradictions which they can never reconcile; 410 which only serve to prove that in arguing upon points, on which universal ignorance prevails, 411 the result is constantly that all the deductions made from such unsteady principles, must of necessity be at war with each other, in hostility with themselves.

412 Thus, although we cannot help feeling the profound wisdom, that must have dictated the system we see act with such uniformity, with such constancy, with such astonishing power, 413 we cannot form the most slender idea of the particular nature of that wisdom; 414 because if we were for an instant to assimilate it to our own, weak and feeble as it is, we should from that instant be in a state of contradiction; 415 seeing we could not then avoid considering the evil we witness, the sorrow we experience, as a dereliction of this wisdom, 416 which at least proves one great truth, that we are utterly incapable of forming an idea of the Divinity. 417 But in contemplating things as our own experience warrants in whatever we do understand, 418 in considering Nature as acting by unchangeable laws, we find good and evil necessarily existing, without at all involving the wisdom of the great Cause of causes; 419 who thus has no need to remedy that, which the further progress of the eternal system will regulate of itself, 420 or which industry and patient research on our parts will enable us to discover the means of futurely avoiding.

421 9th, "The self-existent and original Cause of all things, is not a necessary agent, but a being endued with liberty and choice." 422 Human is called free, when you finds within yourself motives that determine you to action, 423 or when your will meets no obstacle to the performance of that to which your motives have determined you. 424 The necessary Being of which question is here made, doth He find no obstacles to the execution of the projects which are attributed to Him? 425 Are you willing, adopting their own hypothesis, that evil should be committed, or can you not prevent it? 426 In this latter case you are not free; 427 if your will does meet with obstacles, if you are willing to permit evil; then you suffers human to restrain own liberty, by deranging your projects; 428 if you have not these projects, then they are themselves in error who ascribe them to you.

429 How will the metaphysicians draw themselves out of this perplexing intricacy? 430 The further a theologian goes, whilst considering your gods as possessed of human qualities, as acting by mortal motives, the more you flounders-- 431 the greater the mass of contradiction you heaps together: 432 thus if it be asked of you, can God reward crime, punish virtue, you will immediately answer, “No!” 433 In this answer you will have truth: but then this truth, and the freedom which is ascribed to Him, cannot, according to human ideas, exist together; 434 because if this being cannot love vice, cannot hate virtue, and it is evident He cannot, He is in fact not more free than humans themselves.

435 Again, God is said to have made a covenant with His creatures; 436 now it is the very essence of a covenant to restrict choice; and that being must be considered a necessary agent who is under the necessity of fulfilling any given act. 437 As it is impossible to suppose the Divinity can act irrationally, it must be conceded that as He made these laws, He is Himself obliged to follow them: 438 because if He was not, as we must again suppose He does

nothing without a good reason, 439 He would thereby imply, that the mode of action He adopted would be wiser; which would again involve a contradiction. 440 The theologians fearing, without doubt, to restrain the liberty of the Divinity, have supposed it was necessary that He should not be bound by His own laws, 441 in which they have shown somewhat more ignorance of their subject than they imagined.

442 10th, "The self-existent Being, the supreme Cause of all things, must of necessity have infinite power." 443 As Nature is adequate to produce everything we see-- as She contains the whole united power of the universe, Her power has consequently no limits: 444 the being who conferred this power cannot have less. 445 But if the ideas of the theologians were adopted, this power would not appear quite so unlimited; 446 since, according to them, human is a free agent, consequently has the means of acting contrary to this power, which at once sets a boundary to it. 447 An equitable monarch is perhaps nothing less than they are a free agent; 448 when they believes themselves bound to act conformably to the laws, which they have sworn to observe, or which they cannot violate without wounding their justice. 449 The theologians are people who may be very fairly estimated neuter; because they destroys with one hand what they establishes with the other.

450 11th, "The Supreme Cause and Author of all things, must of necessity be infinitely wise." 451 As Nature produces all things by certain immutable laws, it will require no great difficulty to allow that She may be infinitely wise: 452 indeed, whatever side of the argument may be taken, this fact will result as a necessary consequence. 453 It will hardly admit of a question that all things are produced by Nature: 454 if, therefore, we do not allow Her wisdom to be first rate, it would be an insult to the Divinity, who gave Her Her system. 455 If the theologian themselves are to take the lead, they also admits that Nature operates under the immediate auspices of their gods; 456 whatever She does, must

then, according to their own showing, be executed with the most polished wisdom. 457 But the theologians are not satisfied with going thus far: they will insist, not only that they knows what these things are, but also that they knows the end they have in view: 458 this, unfortunately, is the rock they splits upon.

459 According to their own admission, the ways of God are impenetrable to human. 460 If we grant their position, what is the result? Why, that it is at random they speaks. 461 If these ways are impenetrable, by what means did they acquire their knowledge of them? How did they discover the end proposed by the Deity? 462 If they are not impenetrable, they then can be equally known to other people as to themselves. 463 The theologian would be puzzled to show they have any more privileges in Nature than their fellow mortals.

464 Again, if they have asserted these things to be impenetrable, when they are not so, they are then in the situation that they has themselves placed Mahomet: 465 he is no longer worthy of being attended to, because he has swerved from veracity. 466 It certainly is not very consistent with the sublime idea of the Divinity that He should be clothed with that weak, vain passion of human, called glory: 467 the being who had the faculty of producing such a system as it operated in Nature, could hardly be supposed to have such a frivolous passion as we know this to be in our fellows: 468 and as we can never reason but after what we do know, it would appear nothing can be more inconsistent than thus continually heaping together our own feeble, inconsistent views, 469 and then supposing the great Cause of causes acts by such futile rules.

470 12th, "The supreme Cause and Author of all things must of necessity be a being of infinite goodness, justice, and truth, 471 and all other moral perfections, such as become the supreme governor and judge of the world." 472 We must again repeat that these are human qualities drawn from the model of human; 473 they only suppose a

being of the human species, who should be divested of what we call imperfections: 474 this is certainly the highest point of view in which our finite minds are capable of contemplating the Divinity: 475 but as this being has neither species nor cause, consequently no fellow creatures, He must necessarily be of an order so different to human, 476 that human faculties can in no wise be appropriately assigned to Him.

477 The idea of perfection, as human understands it, is an abstract, metaphysical, negative idea, of which you have no archetype whereby to form a judgment: 478 you would call that a perfect being, who, similar to yourself, was wanting in those qualities which you finds prejudicial to Him; 479 but such a being would after all be no more than a human. 480 It is always relatively to yourself, to your own mode of feeling and of thinking, that a thing is either perfect or imperfect; 481 it is according to this, that in your eyes a thing is more or less useful or prejudicial; agreeable or disagreeable.

482 Justice includes all moral perfections. 483 One of the most prominent features of justice, in the ideas of human, is the equity of the relations subsisting between beings, founded upon their mutual wants. 484 According to the theologian, their gods owe nothing to human. How then does they measure out His ideas of justice? 485 For a monarch to say he owed nothing to his subjects, would be considered, even by this theologian himself, as rank injustice; 486 because he would expect the fulfilment of duties on their part, without exercising those which devolved upon himself.

487 Duties, according to the only idea human can form of them, must be reciprocal. 488 It is rather stretching the human capabilities, to understand the relations between a pure spirit and material beings-- 489 between finity and infinity-- between eternal beings and those which are transitory: 490 thus it is, that metaphysics hold forth an inconceivable being by the very attributes with which they clothe Him; 491 for either He has these

attributes, or He has them not: 492 whether He has them or has them not, human can only understand them after own powers of comprehension. 493 If you does at all understand them, you cannot have the slightest idea of justice unaccompanied by duties, 494 which are the very basis, the superstructure, the pillars upon which this virtue rests. 495 Whether we are to view it as self-love or ignorance in the theologian, that they thus dresses up their gods after themselves, 496 it certainly was not the happiest effort of their imagination to work by an inverse rule: 497 for, according to them, the qualities they describes are all the negation of what they calls them.

498 Doctor Clarke himself stumbles a little upon these points; he insists upon free agency, and uses this extraordinary method to support his argument; 499 he says, "God is, by necessity, a free agent: and he can no more possibly cease to be so, than he can cease to exist. 500 He must of necessity, every moment chooses to act, or choose to forbear acting; because two contradictories cannot possibly be true at once. 501 Human also is by necessity, not in the nature of things, but through God's appointment, a free agent. 502 And it is no otherwise in your power to cease to be such, than by depriving yourself of life." 503 Will Doctor Clarke permit us to put one simple question: If to be obligated to do a certain given thing, is to be free, what is it to be coerced? 504 Or if two contradictories cannot be true at once, by what rule of logic are we to measure the idea of that freedom which arises out of necessity.

505 Supposing necessity to be what Dr. Johnson, --using Milton as his authority-- says it is, "compulsion," "fatality," 506 would it be considered a human was less restrained in own actions because you was only compelled to do what was right? 507 The restraint would undoubtedly be beneficial to you, but it would not therefore render you more a free agent. 508 If the Divinity cannot love wickedness, cannot hate goodness,-- and surely the theologians themselves will not pretend He can,--

509 then the power of choice has no existence as far as these two things are concerned; 510 and this upon Clarke's own principle, because two contradictories cannot be true at once. 511 Nothing could, I think, appear a greater contradiction, than the idea that the Great Cause of causes could by any possibility love vice: 512 if such a monstrous principle could for a moment have existence, there would be an end of all the foundations of religion. 513 The Doctor is very little happier in reasoning upon immateriality. 514 He says, by way of illustrating his argument, "that it is possible to infinite power to create an immaterial cogitative substance, endued with a power of beginning motion, and with a liberty of will or choice."

515 Again, "that immaterial substances are not impossible; or, that a substance immaterial is not a contradictory notion. 516 Now, whoever asserts that it is contradictory, must affirm that whatever is not matter is nothing; 517 and that, to say anything exists which is not matter, is saying that there exists something which is nothing, 518 which in other words is plainly this,-- that whatever we have not an idea of, is nothing, and impossible to be." 519 It could, I am apt to believe, never have entered into any reasonable mind that a thing was impossible because you could have no idea of it:-- 520 many things, on the contrary, are possible, of which we have not the most slender notion: 521 but it does not, I presume, flow consecutively out of this admission, that therefore everything is, which is not impossible.

522 Doctor Clarke then, rather begs the question on this occasion. 523 In the schools it is never considered requisite to prove a negative; 524 indeed, this is ranked by logicians amongst those things impossible to be, 525 but it is considered of the highest importance to soundness of argument, to establish the affirmative by the most conclusive reasoning. 526 Taking this for granted, we will apply the doctor's own reasoning. He says, "Nothing is that of which everything, can truly be affirmed. 527

So that the idea of nothing, if I may so speak, is absolutely the negative of all ideas; 528 the idea, therefore, either of a finite or infinite nothing is a contradiction in terms."

529 To affirm, of a thing with truth, it must be necessary to be acquainted with that thing. 530 To have ideas, as we have already proved, it is necessary to have perceptions; to have perceptions, it is requisite to have sensations; to have sensations, requires organs. 531 An idea cannot be, and not be, at the same moment: the idea of substance, it will scarcely be denied, is that of a thing solid, real, according to Dryden; 532 capable of supporting accidents, according to Watts; something of which we can say that it is, according to Davies; body, corporeal nature, according to Newton; 533 the idea of immaterial, according to Hooker, is incorporeal. 534 How then am I to understand immaterial substance? Is it not, according to these definitions, that which cannot couple together?

535 If a thing be immaterial, it cannot be a substance; if a substance, it cannot be immaterial: 536 those I apprehend will not have many ideas, who do not see this is a complete negative of all ideas. 537 If, therefore, on the outset, the doctor cannot find words, by which he can convey the idea of that of which he is so desirous to prove the existence, 538 by what chain of reasoning does he flatter himself that he is to be understood? 539 He will endeavour to draw out of this dilemma, by assuring as there are things which we can neither see nor touch, but which do not the less exist on that account. 540 Granted: but from thence we can neither reason upon them, nor assign them qualities; 541 we must at least either feel them or something like them, before we can have any idea of them: 542 this, however, would not prove they were not substances, nor that substances can be immaterial.

543 A thing may with great possibility exist of which we have no knowledge, and yet be material; 544 but I maintain until we have a knowledge of it, it exists not for us, any more than colours exist for a person born blind; 545 the person who has sight knows they do exist,

can describe them to own dark neighbour; 546 from this description the blind person may form some idea of them by analogy with what he or she already knows; 547 or, perhaps, having a finer tact than own neighbour, one may be enabled to distinguish them by their surfaces; 548 it would, therefore, be bad reasoning in the person born blind, to deny the existence of colours; 549 because although these colours may have no relation with the senses in the absence of sight, they have with those who have it in their power to see and to know them: 550 this blind person, however, would-appear a little ridiculous if one undertook to define them with all their gradations of shade; with all their variations under different masses of light.

551 Again, if those who were competent to discriminate these modifications of matter called colours, were to define them to this blind person, as those modifications of matter called sound, 552 would the blind person be able to have any conception of them? 553 It certainly would not be wise in you to aver, that such a thing as colorific sound had no existence, was impossible; 554 but at least you would be very justifiable in saying, they appeared contradictions, because you had some ideas of sound which did not at all aid you in forming those of colour; 555 you would not, perhaps, be very inconclusive if you suspected the competency of your informer to the definition attempted, 556 from your inability to convey to you in any distinct, understood terms, your own ideas of colours.

557 The theologian is a blind person, who would explain to others who are also blind, the shades and colours of a portrait whose original he has not even stumbled upon in the dark. 558 There is nothing incongruous in supposing that everything which has existence is matter; 559 but it requires the complete inversion of all our ideas, to conceive that which is immaterial; 560 because, in point of fact, this would be a quality of which "nothing can with truth be affirmed."

561 It is, indeed true, that Plato, who was a great creator of chimeras, says, 562 "those who admit nothing but

what they can see and feel, are stupid ignorant beings, who refuse to admit the reality of the existence of invisible things." 563 With all due deference to such an authority, we may still venture to ask, is there then no difference, no shade, no gradation, between an admission of possibilities and the proof of realities. 564 Theology would then be the only science in which it is permitted to conclude that a thing is, as soon as it is possible to be.

565 Will the assertion of either Clarke or Plato stand absolutely in place of all evidence? 566 Would they themselves permit such to be convincing if used against them? 567 The theologians evidently hold this Platonic, this dogmatical language; they have dreamed the dreams of their master; 568 perhaps if they were examined a little, they would be found nothing more than the result of those obscure notions, 569 those unintelligible metaphysics, adopted by the Egyptian, Chaldean, and Assyrian priests, among whom Plato drew up his philosophy. 570 If, however, philosophy means that which we are led to suppose it does, by the great John Locke, it is "a system by which natural effects are explained."

571 Taken in this sense we shall be under the necessity of agreeing, that the Platonic doctrines in no wise merit this distinction, 572 seeing he has only drawn the human mind from the contemplation of visible Nature, 573 to plunge it into the unfathomable depths of invisibility-- of intangibility-- of suppositious speculation, where it can find little other food except chimeras or conjecture. 574 Such a philosophy is rather fantastical, yet it would seem we are required to subscribe to its positions 578 without being allowed to compare them with reason, to examine them through the medium of experience, to try the gold by the action of fire: 579 thus we have in abundance the terms spirits, incorporeal substances, invisible powers, supernatural effects, innate ideas, mysterious virtues, possessed by demons, 580 which render our senses entirely useless, which put to flight everything like experience; 581

while we are gravely told that "nothing is that, of which nothing can truly be affirmed." 582 Whoever may be willing to take the trouble of reading the works of Plato and his disciples, such as Proclus, Iamblicus, Plotinus, and others, 583 will not fail to find in them almost every doctrine, every metaphysical subject of the theologian; 584 in fact, the theurgy of many of the modern superstitions, which for the most part seems to be little more than a slight variation of that adopted by the ethnic priests. 585 Dreamers have not had that variety in their follies, that has generally been imagined.

586 That some of these things should be extensively admitted, by no means affords proof of their existence. 587 Nothing appears more facile than to make humankind admit the greatest absurdities, under the imposing name of mysteries; 588 after having imbued you from your infancy with maxims calculated to hoodwink your reason-- to lead you astray-- 589 to prevent you from examining that which you are told you must believe. 590 Of this there cannot well exist a more decisive proof than the great extent of country, 591 the millions of human beings who faithfully and without examination have adopted the idle dreams, the rank absurdities, of that arch impostor Mahomet.

592 However this may be, we shall be obliged again to reply to Plato, and to those of his followers who impose upon us the necessity of believing that which we cannot comprehend, 593 that, in order to know that a thing exists, it is at least necessary to have some idea of it; 594 that this idea can only come to us by the medium of our senses; 595 that consequently everything of which our senses do not give us a knowledge, is in fact nothing for us; and can only rest upon our faith; 596 upon that admission which is pretty generally, even by the theologians themselves, considered as rather a sandy foundation whereon to erect the altar of truth: 597 that if there be an absurdity in not accrediting the existence of that which we do not know, there is no less extravagance in assigning it qualities; 598 in

reasoning upon its properties; in clothing it with faculties, which may or may not be suitable to its mode of existence; 599 in substituting idols of our own creation; in combining incompatible attributes, which will neither bear the test of experience nor the scrutiny of reason; 600 and then endeavouring to make the whole pass current by dint of the word infinite, which we will now examine.

601 Infinite, according to Dennis, means "boundless, unlimited." Doctor Clarke thus describes it:-- 602 he says, "The self-existent being must be a most simple, unchangeable incorruptible being; without parts, figure, motion, divisibility, or any other such properties as we find in matter. 603 For all these things do plainly and necessarily imply finiteness in their very notion, and are utterly inconsistent with complete infinity." 604 Ingenuously, is it possible for human to form any true notion of such a quality? The theologians themselves acknowledge you cannot. 605 Further, the Doctor allows, "That as to the particular manner of your being infinite, or everywhere present, in opposition to the manner of created things being present in such or such finite places, 606 this is as impossible for our finite understandings to comprehend or explain, as it is for us to form an adequate idea of infinity."

607 What is this, then, but that which no person can explain or comprehend? 608 If it cannot be comprehended, it cannot be detailed; if it cannot be detailed, it is precisely "that of which nothing can with truth be affirmed;" and this is Dr. Clarke's own explanation of nothing. 609 Indeed, is not the human mind obliged by its very nature to join limited quantities to other quantities, which it can only conceive as limited, 610 in order to form to itself a sort of confused idea of something beyond its own grasp, without ever reaching the point of infinity, which eludes every attempt at definition? 611 Then it would appear that it is an abstraction, a mere negation of limitation.

612 Our learned adversary seems to think it strange that the existence of

incorporeal, immaterial substances, the essence of which we are not able to comprehend, should not be generally accredited. 613 To enforce this belief, he says, "There is not so mean and contemptible a plant or animal, that does not confound the most enlarged understanding, upon earth: 614 Nay, even the simplest and plainest of all inanimate beings have their essence or substance hidden from us in the deepest and most impenetrable obscurity."

615 We shall reply to him, First, That the idea of an immaterial substance; or being without extent, is only an absence of ideas, a negation of extent, as we have already shown; 616 that when we are told a being is not matter, they speak to us of that which is not, and do not teach us that which is; 617 because by insisting that a being is such, that it cannot act upon any of our senses, they, in fact, inform us that we have no means of assuring ourselves whether such being exists or not.

618 Secondly, We shall avow without the least hesitation, that people of the greatest genius, of the most indefatigable research, are not acquainted with the essence of stones, plants, animals, 619 nor with the secret springs which constitute some, which make others vegetate or act: 620 but then at least we either feel them or see them; our senses have a knowledge of them in some respects; we can perceive some of their effects; 621 we have something whereby to judge of them, either accurately or inaccurately; 622 we can conceive that which is matter, however varied, however subtle, however minute, by analogy with other matter; 623 but our senses cannot compass that which is immaterial on any side; 624 we cannot by any possible means understand it; we have no means whatever of ascertaining its existence; consequently we cannot even form an idea of it; 625 such a being is to us an occult principle, or rather a being which imagination has composed, by deducting from it every known quality.

626 If we are ignorant of the intimate combination of the most material beings, we at least discover, with the

aid of experience, some of their relations with ourselves: 627 we have a knowledge of their surface, their extent, their form, their colour, their softness, their density; 628 by the impressions they make on our senses, we are capable of discriminating them-- of comparing them-- of judging of them in some manner-- of seeing them-- 629 of either avoiding or courting them, according to the different modes in which we are affected by them; 630 we cannot apply any of these tests to immaterial beings; to spirits; neither can those people who are unceasingly talking to humankind of these inconceivable things.

631 Thirdly, We have a consciousness of certain modifications in ourselves, which we call sentiment, thought, will, passions: 632 for want of being acquainted with our own peculiar essence; for want of precisely understanding the energy of our own particular organisation, 633 we attribute these effects to a concealed cause, distinguished from ourselves; 634 which the theologians call a spiritual cause, inasmuch as it appears to act differently from our body. 635 Nevertheless, reflection, experience, everything by which we are enabled to form any kind of judgment, proves that material effects can only emanate from material causes. 636 We see nothing in the universe but physical, material effects, these can only be produced by analogous causes; 637 it is, then certainly more rational to attribute them to Nature Herself, 638 of which we may know something, if we will but deign to meditate Her with attention, rather than to spiritual causes, 639 of which we must for ever remain ignorant, let us study them as long as we please.

640 If incomprehensibility be not a sufficient reason for absolutely denying the possibility of immateriality, it certainly is not of a cogency to establish its existence; 641 we shall always be less in a capacity to comprehend a spiritual cause, than one that is material; 642 because materiality is a known quality; spirituality is an occult, an unknown quality; 643 or rather it is a mode of

speech of which we avail ourselves to throw a veil over our own ignorance. 644 We are repeatedly told that our senses only bring us acquainted with the external of things; 645 that our limited ideas are not capable of conceiving immaterial beings: 646 we agree frankly to this position; but then our senses do not even show us the external of these immaterial substances, 647 which the theologians will nevertheless attempt to define to us; upon which they unceasingly dispute among themselves; 648 upon which even until this day they are not in perfect unison with each other. 649 The great John Locke in his familiar letters, says, "I greatly esteem all those who faithfully defend their opinions; 650 but there are so few people who, according to the manner they do defend them, appear fully convinced of the opinions they profess, 651 that I am tempted to believe there are more sceptics in the world than are generally imagined."

652 Abady, one of the most strenuous supporters of immaterialism, says, "The question is not what incorporeity is, but whether it be." 653 To settle this disputable point, it were necessary to have some data whereon to form our judgment; 654 but how assure ourselves of the existence of that, of which we shall never be competent to have a knowledge? 655 If we are not told what this is; if some tangible evidence be not offered to the human mind; 656 how shall we feel ourselves capacitated to judge whether or not its existence be even possible? 657 How form an estimate of that picture whose colours elude our sight, whose design we cannot perceive, 658 whose features have no means of becoming familiar to our mind, whose very canvas refuses itself to our all research, 659 of which the artist himself can afford no other idea, no other description, but that it is, although he himself can neither show us how or where!

660 We have seen the ruinous foundations upon which people have hitherto erected this fanciful idea of immateriality; 661 we have examined the proofs which they have offered, if proofs they can be called, in

support of their hypothesis; 662 we have sifted the evidence they have been willing to have accredited, in order to establish their position; 663 we have pointed out the numberless contradictions that result from their want of union on this subject, 664 from the irreconcilable qualities with which they clothe their imaginary system. 665 What conclusion, then, ought fairly, rationally, consistently, to be drawn from the whole? 666 Can we, or can we not admit their argument to be conclusive, such as ought to be received by beings who think themselves sane? 667 Will it allow any other inference than that it has no existence; that immateriality is a quality hitherto unproved; 668 the idea of which the mind of human has no means of compassing? 669 Still they will insist, "there are no contradictions between the qualities which they attribute to these immaterial substances; 670 but there is a difference between the understanding of human and the nature of these substances."

671 This granted, are they nearer the point at which they labour? 672 What standard is it necessary human should possess, to enable you to judge of these substances? 673 Can they show the test that will lead to an acquaintance with them? 674 Are not those who have thus given loose to their imagination, who have given birth to this system, themselves humans? 675 Does not the disproportion, of which they speak with such amazing confidence, attach to themselves as well as to others? 676 If it needs an infinite mind to comprehend infinity-- to form an idea of incorporeity-- can the theologians themselves boast they are in a capacity to understand it? 677 To what purpose then is it they speak of these things to others? 678 Why do they attempt descriptions of that which they allow to be indescribable? 679 Human, who will never be an infinite being, will never be able to conceive infinity; 680 if, then, you have hitherto been incompetent to this perfection of knowledge, can you reasonably flatter yourself you will ever obtain it; 681 can you hope under any circumstances to conquer that which

according to the showing of all is unconquerable?

682 Nevertheless it is pretended, that it is absolutely necessary to know these substances: 683 but how prove the necessity of having a knowledge of that which is impossible to be known? 684 We are then told that good sense and reason are sufficient to convince us of its existence: 685 this is taking new ground, when the old has been found untenable: 686 for we are also told that reason is a treacherous guide; one that frequently leads us astray; 687 that in religious matters it ought not to prevail: at least then they ought to show us the precise time when we must resume this reason. 688 Shall we consult it again, when the question is, whether what they relate is probable; 689 whether the discordant qualities which they unite are consistently combined; 690 whether their own arguments have all that solidity which they would themselves wish them to possess? 691 But we have strangely mistaken them if they are willing that we should recur to it upon these points; 692 they will instead, insist we ought blindly to be directed by that which they vouchsafe to inform us; 693 that the most certain road to happiness is to submit in all things to that which they have thought proper to decide on the nature of things, 694 of which they avow their own ignorance, when they assert them to be beyond the reach of mortals.

695 Thus it would appear that when we should consent to accredit these mysteries, it would never arise of our own knowledge; 696 seeing this can no otherwise obtain but by the effect of demonstrable evidence; 697 it would never arise from any intimate conviction of our minds; but it would be entirely on the word of the theologians themselves, that we should ground our faith; that we should yield our belief. 698 If these things are to the human species what colours are to the person born blind, they have at least no existence with relation to ourselves. 699 It will avail the blind person nothing to tell you these colours have no less existence, because you cannot see them. 700 But what shall we say of that portrait

whose colours the blind person attempts to explain, whose features you are willing we should receive upon your authority, 701 whose proportions are to be taken from your description, merely because we know you cannot behold them?

702 The Doctor, although unwilling to relinquish his subject, removes none of the difficulty when he asks, 703 "Are our five senses, by an absolute necessity in the nature of the thing, all and the only possible ways of perception? 704 And is it impossible and contradictory there should be any being in the universe, induced with ways of perception different from these that are the result of our present composition? 705 Or are these things, on the contrary, purely arbitrary; 706 and the same power that gave us these, may have given others to other beings, and might, if He had pleased have given to us others in this present state?"

707 It seems perfectly unnecessary to the true point of the argument to reason upon what can or cannot be done: 708 I therefore reply, that the fact is, we have but five senses: 709 by the aid of these human is not competent to form any idea whatever of immateriality; 710 but you are also in as absolute a state of ignorance, upon what might be your capabilities of conception, if you had more senses. 711 It is rather acknowledging a weakness in your evidence, on the part of the Doctor, 712 to be thus obliged to rest it upon the supposition of what might be the case, if human was a being different to what you are; 713 in other words, that they would be convincing to humankind if the human race were not human beings.

714 Therefore to demand what the Divinity could have done in such a case, is to suppose the thing in question, 715 seeing we cannot form an idea how far the power of the Divinity extends: but we may be reasonably allowed to use the theological argument in elucidation; 716 these people very gravely insist, upon what authority must be best known to themselves, 717 "that God cannot communicate to His works than perfection which He Himself

possesses;" 718 at the same moment they do not fail to announce His omnipotence. 719 Will it require any capacity, more than is the common lot of a child, to comprehend the absurd contradiction of the two assertions?

720 As beings possessing but five senses, we must then, of necessity, regulate our judgment by the information they are capable of affording us: 721 we cannot, by any possibility, have a knowledge of those, which confer the capacity to comprehend beings, of an order entirely distinguished from that in which we occupy a place. 722 We are ignorant of the mode in which even plants vegetate, how then be acquainted with that which has no affinity with ourselves? 723 A person born blind, has only the use of four senses; 724 you have not the right, however, of assuming it as a fact, there does not exist an extra sense for others; 725 but you may very reasonably, and with great truth aver, that you have no idea of the effects which would be produced in you, by the sense which you lacks: 726 notwithstanding, if this blind person was surrounded by other people, whose birth had also left them devoid of sight, 727 might you not without any very unwarrantable presumption, be authorised to inquire of them by what right, upon what authority, they spoke to you of a sense they did not themselves possess; 728 how they were enabled to reason, to detail the minutiae of that sensation upon which their own peculiar experience taught them nothing?

729 In short, we can again reply to Dr. Clarke, and to the theologians, that following up their own systems, the supposition is impossible, and ought not to be made, 730 seeing that the Divinity, who according to their own showing, made human, was not willing that you should have more than five senses; 731 in other words, that you should be nothing but what you actually is; 732 they all found the existence of these immaterial substances upon the necessity of a power that has the faculty to give a commencement to motion. 733 But if matter has always existed, of which

there does not seem to exist a doubt, it has always had motion, 734 which is as essential to it as its extent, and flows from its primitive properties.

735 Indeed the human mind, with its five senses, is not more competent to comprehend matter devoid of motion, than it is to understand the peculiar quality of immateriality: 736 motion therefore exists only in and by matter; mobility is a consequence of its existence; 737 not that the great whole can occupy other parts of space than it actually does; 738 the impossibility of that needs no argument, but all its parts can change their respective situations-- do continually change them; 739 it is from thence results the preservation, the life of Nature, which is always as a whole immutable: 740 but in supposing, as is done every day, that matter is inert, that is to say, incapable of producing anything by itself, without the assistance of a moving power, which sets it in motion, 741 are we by any means enabled to conceive that material Nature receives this activity from an agent, who partakes in nothing of material substance?

742 Can human really figure to the self, even in idea, that that which has no one property of matter, can create matter, 743 draw it from its own peculiar source, arrange it, penetrate it, give it play, guide its course? 744 Is it not, on the contrary, more rational to the mind, more consistent with truth, more congenial to experience, 745 to suppose that the being who made matter is Himself material: is there the smallest necessity to suppose otherwise? 746 Can it make human either better or worse, that you should consider the whole that exists as material? 747 Will it in any manner make you a worse subject to your sovereign; a worse father to your children; a more unkind husband; a more faithless friend?

748 Motion, then, is co-eternal with matter: 749 from all eternity the particles of the universe have acted and reacted upon each other, 750 by virtue of their respective energies; of their peculiar essences; of their primitive elements; of their various

combinations. 751 These particles must have combined in consequence of their affinity; 752 they must have been either attracted or repelled by their respective relations with each other; 753 in virtue of these various essences, they must have gravitated one upon the other; 754 united when they were analagous; separated when that analogy was dissolved, by the approach of heterogeneous matter; 755 they must have received their forms, undergone a change of figure, by the continual collision of bodies.

756 In a material world the acting powers must be material: 757 in a whole every part of which is essentially in motion, there is no occasion for a power distinguished from itself; 758 the whole must be in perpetual motion by its own peculiar energy. 759 The general motion, as we have elsewhere proved, has its birth from the individual motion, which beings ever active must uninterruptedly communicate to each other. 760 Thus every cause produces its effect; this effect in its turn becomes a cause, which in like manner produces an effect; 761 this constitutes the eternal chain of things, which although perpetually changing in its detail, suffers no change in its whole.

762 Theology, after all, has seldom done more than personify this eternal series of motion; 763 the principle of mobility inherent to matter: it has clothed this principle with human qualities, by which it has rendered it unintelligible: 764 in applying these properties, they have taken no means of understanding how far they were suitable or not: 765 in their eagerness to make them assimilate, they have extended them beyond their own conception; 766 they have heaped them together without any judgment; 767 and they have been surprised when these qualities, contradictory in themselves, did not enable them satisfactorily to account for all the phenomena they beheld; 768 from thence they have wrangled; accused each other of imbecility; 769 yet infuriated themselves against whoever had the temerity to question that which they did not themselves understand; 770 in short, they have acted like a person who should insist

that all other people should have precisely the same vision that you yourself had dreamed.

771 Be this as it may, the greater portion of what either Dr. Clarke or the theologians tell us, becomes, in some respects, sufficiently intelligible as soon as applied to Nature-- to matter: 772 it is eternal, that is to say, it cannot have had a commencement, it never will have an end; 773 it is infinite, that is to say, we have no conception of its limits. 774 Nevertheless, human qualities, which must be always borrowed from ourselves, and with others we have a very slender acquaintance, cannot be well suitable to the entire of Nature; 775 seeing that these qualities are in themselves modes of being, 776 or modes which appertain only to particular beings: not to the great whole which contains them.

777 Thus, to resume the answers which have been given to Dr. Clarke, we shall say: 778 First, we can conceive that matter has existed from all eternity, seeing that we cannot conceive it to have been capable of beginning.

779 Secondly, that matter is independent, seeing there is nothing exterior to itself; 780 that it is immutable, seeing it cannot change its nature, although it is unceasingly changing its form and its combinations.

781 Thirdly, that matter is self-existent, since not being able to conceive it can be annihilated, we cannot possibly conceive it can have commenced to exist.

782 Fourthly, that we do not know the essence, or the true nature of matter, although we have a knowledge of some of its properties; 783 of some of its qualities: according to the mode in which they act upon us.

784 Fifthly, that matter not having had a beginning, will never have an end, 785 although its numerous combinations, its various forms, have necessarily a commencement and a period.

786 Sixthly, that if all that exists, or everything our mind can conceive is matter, this matter is infinite; 787 that is to say, cannot be limited by anything; that it is omnipresent, seeing there is no place exterior to

itself, 788 indeed, if there was a place exterior to it, that would be a vacuum.

789 Seventhly, that Nature is unique, although its elements or its parts may be varied to infinity, induced with properties extremely opposite; with qualities essentially different.

790 Eighthly, that matter, arranged, modified, and combined in a certain mode, produces in some beings what we call intelligence, 791 which is one of its modes of being, not one of its essential properties.

792 Ninthly, that matter is not a free agent, since it cannot act otherwise than it does, in virtue of the laws of its Nature, or of its existence; 793 that consequently, heavy bodies must necessarily fall; light bodies by the same necessity rise; 794 fire must burn; human must experience good and evil, according to the quality of the beings whose action you experiences.

795 Tenthly, that the power or the energy of matter, has no other bounds than those which are prescribed by its own existence.

796 Eleventhly, that wisdom, justice, goodness, are qualities peculiar to matter combined and modified, as it is found in some beings of the human species; 797 that the idea of perfection is an abstract, negative, metaphysical idea, or mode of considering objects, which supposes nothing real to be exterior to itself.

798 Twelfthly, that matter is the principle of motion, which it contains within itself: since matter alone is capable of either giving or receiving motion: 799 this is what cannot be conceived of immateriality or simple beings destitute of parts, devoid of extent, without mass, having no ponderousity, 800 which consequently cannot either move itself or other bodies.

EXAMINATION OF THE PROOFS OFFERED BY DESCARTES, MALEBRANCHE, NEWTON

Paul Henri Thiery (Baron D'Holbach)

48 If the evidence of Clarke did not prove satisfactory-- if the theologians of his day disputed the

manner in which he handled his subject-- 2 if they were disposed to think he had not established his argument upon proper foundations, 3 it did not seem probable that either the system of Descartes, the sublime reveries of Malebranche, or the more methodical mode adopted by Newton, were at all likely to meet with a better reception; 4 the same objections will lie against them all, that they have not demonstrated the existence of their immaterial substances; 5 although they have incessantly spoken of them, as if they were things of which they had the most intimate knowledge. 6 Unfortunately this is a rock which the most sublime geniuses have not been competent to avoid: 7 the most enlightened people have done little more than stammer upon a subject which they have all concurred in considering of the highest importance; 8 which they unceasingly hold forth as the most necessary for human to know; 9 without at the same time considering you are not in a condition to occupy yourself with objects inaccessible to your senses-- 10 which your mind, consequently, can never grasp-- which your utmost research cannot bring into that tangible shape by which alone you can be enabled to form a judgment.

11 To the end that we may be convinced of that want of solidity which the greatest people have not known how to give to the proofs they have offered, 12 but which they have successively imagined has established their positions, 13 let us briefly examine what the most celebrated philosophers, what the most subtile metaphysicians have said. 14 For this purpose we will begin with Descartes, the restorer of philosophy among the moderns, 15 to whose sublime errors we are indebted for the effulgent truths of the Newtonian system. 16 This great man himself tells us, "All the strength of argument which I have hitherto used to prove the existence of immaterial substances, consists in this, 17 that I acknowledge it would not be possible, my nature was such as it is, that is to say, that I should have in me the idea of immateriality,

if this incorporeity did not truly exist; 18 this same immateriality, of which the idea is in me, possesses all those high perfections of which our mind can have some slight idea, without however being able to comprehend them." 19 In another place he says, "We must necessarily conclude from this alone, that because I exist, and have the idea of immateriality, 20 that is to say, of a most perfect being, the existence is therefore most evidently demonstrated." 21 There are not, perhaps, many except Descartes himself, to whom this would appear quite so conclusive; 22 who would be impressed with the conviction which he seems to imagine is so very substantive.

23 First, We shall reply to Descartes, it is not a warrantable deduction, that because we have an idea of a thing, we must therefore conclude it exists; 24 to give validity to such a mode of reasoning would be productive of the greatest mischief; would, in fact, tend to subvert all human institutions. 25 Our imagination presents us with the idea of a sphinx, or of an hippogriff, besides a thousand other fantastical beings; 26 are we, on that authority, to insist that these things really exist? 27 Is the mere circumstance of our having an idea of various parts of Nature, discrepantly jumbled together, without any other evidence as to the assemblage, 28 a sufficient warranty for calling upon humankind to accredit the existence of such heterogeneous masses? 29 If a philosopher of the most consummate experience, of the greatest celebrity, 30 one who enjoyed the confidence of humankind above every other, was to detail the faculties and perfections of these visionary beings, 31 although he should hold them forth as the perfection of all natural combinations, would, 32 I say, any reasonable being lend the self to the asseveration?

33 Secondly, It is obvious that the mere circumstance of existence, does not prove the absolute existence of anything anterior to itself; 34 although in human, as well as the other beings of Nature, it is evidence that something has existed before

human. 35 If this argument was to be admitted, are they aware how far it would carry them? 36 To maintain that the existence of one being demonstrably proves the existence of an anterior being, would be, in fact, denying that anything was self-existent. 37 The fallacy of such a position is too glaring to need refutation.

38 Thirdly, It is not possible you should have a distinct, positive idea of immateriality, of which be, as well as the theologian, labours to prove the existence. 39 It is impossible for human, for a material being, to form to the self a correct idea, or indeed any idea, of incorporeity; 40 of a substance without extent, acting upon Nature, which is corporeal; 41 a truth which it may not be presuming too much to say we have already sufficiently proved.

42 Fourthly, It is equally impossible for human to have any clear, decided idea of perfection, of infinity, of immensity, and other theological attributes. 43 To Descartes we must therefore reply as we have done to Dr. Clarke on his twelfth proposition. 44 Thus nothing can well be less conclusive than the proofs upon which Descartes rests the existence of immateriality. 45 He gives it thought and intelligence, but how conceives these qualities without a subject to which they may adhere? 46 He pretends that we cannot conceive it but "as a power which applies itself successively to the parts of the universe."

47 Again, he says, "that an immaterial substance cannot be said to have extent, 48 but as we say of fire contained in a piece of iron, which has not, properly speaking, any other extension than that of the iron itself." 49 According to these notions we shall be justified in taxing him with having announced in a very clear, in a most unequivocal manner, that this is Nature Herself: 50 this indeed is a pure Spinozism; it was decidedly on the principles of Descartes that Spinoza drew up his system; in fact it flows out of it consecutively.

51 We might, therefore, with great reason, accuse Descartes of atheism, seeing that he very effectually

destroys the feeble proofs he adduces in support of his own hypothesis; 52 we have solid foundation for insisting that his system overturns the idea of the creation, 53 because if from the modification we subtract the subject, the modification itself disappears: 54 and if, according to the Cartesians, this immateriality is nothing without Nature, they are complete Spinozians, with another name.

55 If incorporeity is the motive-power of this Nature, it no longer exists independently; 56 it, in fact, exists no longer than the subject to which it is inherent subsists. 57 Thus no longer existing independently, it will exist only while the nature which it moves shall endure; 58 without matter, without a subject to move, to preserve, what is to become of it, according to this doctrine, or rather according to this elucidation of a system which is in itself untenable?

59 It will be obvious from this, that Descartes, far from establishing on a rocky foundation the existence of this immateriality, totally destroys his own system. 60 The same thing will necessarily happen to all those who reason upon his principles; they will always finish by confuting him, and by contradicting themselves. 61 The same want of just inference, the same discrepancy, will obtrude themselves in the principles of the celebrated Father Malebranche; 62 which, if considered with the slightest attention, appear to conduct directly to Spinozism; 63 in fact, can anything be more in unison with the language of Spinoza himself, than to say, as does Malebranche, "that the universe is only an emanation from God; 64 that we see everything in God, that everything we see is only God; that God alone does everything that is done; 65 that all the action, with every operation that takes place in Nature, is God Himself; 66 in a word, that God is every being and the only being." 67 Is not this formally asserting that Nature Herself is God? 68 Moreover, at the same time Malebranche assures us we see everything in God, he pretends that it is not yet clearly demonstrated that matter and bodies

have existence; 69 that faith alone teaches us these mysteries, of which, without it, we should not have any knowledge whatever. 70 In reply, it might be a very fair question, how the existence of the being who created matter can be demonstrated, if the existence of this matter itself be yet a problem?

71 He himself acknowledges "that we can have no distinct demonstration of the existence of any other being than of that which is necessary;" 72 he further adds, "that if it be closely examined, it will be seen, that it is not even possible to know with certitude, if God be or be not truly the creator of a material, of a sensible world." 73 According to these notions, it is evident, that, following up the system of Malebranche, human has only own faith to guarantee the existence of the world; 74 yet faith itself supposes its existence; if it be not, however, certain that it does exist, 75 and the Bishop of Cloyne, Dr. Berkeley, has also held this in doubt, 76 how shall we be persuaded that we must believe the oracles which have been delivered to a visionary world?

77 On the other hand, these notions of Malebranche completely overturns all the theological doctrines of free agency. 78 How can the liberty of human's action be reconciled with the idea that it is the Divinity who is the immediate mover of Nature; 79 who actually gives impulse to matter and bodies, without whose immediate interference nothing takes place; who pre-determines His creatures to everything they do? 80 How can it be pretended, if this doctrine is to be accredited, that human souls have the faculty of forming thoughts-- 81 have the power of volition-- are in a condition to move themselves-- have the capacity to modify their existence?

82 If it be supposed with the theologians, that the conservation of the creatures in the universe is a continued creation, 83 must it not appear, that being thus perpetually recreated, they are enabled to commit evil? 84 It will then be a self-evident fact, that, admitting the system of Malebranche, God does

everything, and that His creatures are no more than passive instruments in His hands. 85 Under this idea they could not be answerable for their sins, because they would have no means of avoiding them. 86 Under this notion they could neither have merit or demerit; they would be like a sharp instrument in their own hands, 87 which whether it was applied to a good or to an evil purpose, it would attach to themselves, not to the instrument: 88 this would annihilate all religion: it is thus that theology is continually occupied with committing suicide.

89 Let us now see, if the immortal Newton, the great luminary of science, the champion of astronomical truth, 90 will afford us clearer notions, more distinct ideas, more certain evidence of the existence of immaterial substances. 91 This great man, whose comprehensive genius unravelled Nature, whose capacious mind developed Her laws, seems to have bewildered himself, the instant he lost sight of them. 92 A slave to the prejudices of his infancy, he had not the courage to hold the lamp of his own enlightened understanding to the agent theology has so gratuitously associated with Nature; 93 he has not been able to allow that Her own peculiar powers were adequate to the production of that beautiful phenomena, 94 he has with such masterly talents so luminously explained.

95 In short, the sublime Newton himself becomes an infant when he quits physics, when he lays aside demonstration, 96 to lose himself in the devious sinuosities, in the inextricable labyrinths, in the delusive regions of theology. 97 This is the manner in which he speaks of the Divinity: 98 "This God," says he, "governs all, not as the soul of the world, but as the lord and sovereign of all things. 99 It is in consequence of His sovereignty that He is called the Lord God, [Greek letters], pantokrator, the universal emperor. 100 Indeed the word God is relative and relates itself with slaves; 101 the Deity is the dominion or the sovereignty of God, not over own body, as those think who look upon

God as the soul of the world, but over slaves."

102 From this it will be seen that Newton, as well as the theologians, makes the Divinity a pure spirit, who presides over the universe as a monarch, as a lord paramount; 103 that is to say, what human defines in earthly governors, despot, absolute princes, powerful monarchs, whose governments have no model but their own will, 104 who exercise an unlimited power over their subjects, transformed into slaves; 105 whom they usually compel to feel in a very grievous manner the weight of their authority.

106 But according to the ideas of Newton, the world has not existed from eternity, the staves of God have been formed in the course of time; 107 from this it would be a just inference, that before the creation of the world the god of Newton was a sovereign without subjects. 108 Let us see if this truly great philosopher is more in unison with himself in the subsequent ideas which he delivers on this subject. 109 "The supreme God," he says, "is an eternal, infinite, and absolutely perfect being; 110 but however perfect a being may be, if He has no sovereignty He is not the supreme God. 111 The word God signifies Lord, but every lord is not god; 112 it is the sovereignty of the spiritual Being which constitutes God; it is the true sovereignty which constitutes the true God; 113 it is the supreme sovereignty which constitutes the supreme God; it is a false sovereignty which constitutes a false god. 114 From true sovereignty, it follows, that the true God is living, intelligent, and powerful; 115 and from His other perfections, it follows, that He is supremely or sovereignty perfect. 116 He is eternal, infinite, omniscient; that is to say, he exists from eternity, and will never have an end; 117 he governs all, and he knows everything that is done, or that can be done. 118 He is neither eternity nor infinity, but He is eternal and infinite; 119 He is not space or duration, but He exists and is present." 120 The term here used is adest, which appears to have been placed there to avoid saying that God is contained in space.

121 In all this unintelligible series, nothing is to be found but incredible efforts to reconcile the theological attributes, 122 the abstract with the human qualities, which have been ascribed to the Divinity; 123 we see in it negative qualities, which can no longer be suitable to human, given, however, to the Sovereign of Nature, whom He has supposed a king. 124 However it may be, this picture always supposes the Supreme God to have occasion for subjects to establish His sovereignty. 125 It makes God stand in need of human for the exercise of His empire; 126 without these, according to the text, He would not be a king; he could have had no empire when there was nothing: 127 but if this description of Newton was just, if it really represented the Divinity, we might be very fairly permitted to ask, 128 Does not this Spiritual King exercise his spiritual empire in vain, upon refractory beings, who do not at all times do that which He is willing they should; 129 who are continually struggling against His power; who spread disorder in His states?

130 This Spiritual Monarch, who is master of the minds, of the souls, of the wills, of the passions of His slaves, does He leave them the freedom of revolting against Him? 131 This infinite Monarch, who fills everything with His immensity, who governs all, does He also govern the human who sins; 132 does He direct your actions; is He in you when you offends your God? 133 The devil, the false god, the evil principle, hath he not, according to this, a more extensive empire than the true God, 134 whose projects, if we are to believe the theologians, he is unceasingly overturning?

135 In earthly governments the true sovereign is generally considered to be Him whose power in a state influences the greater number of His subjects. 136 If, then, we could suppose Him to be omnipresent, that is, present in all places, should we not say He was the sad witness to all the outrages committed against His authority, 137 and we should not entertain a very exalted opinion of His power if He permitted them to continue. 138 This, it is true, would

be arguing upon a monarch of this world, still it would be the language held by observers.

139 Is the spirituality of the Divinity well supported by those who say He fills all space, 140 who from that instant give Him extent, ascribe to Him volume, make Him correspond with the various points of space? 141 This is the very reverse of an immaterial substance. "God is One," continues Newton, "and He is the same forever, and everywhere, 142 not only by His virtue alone, or by His energy, but also by His substance." 143 But how are we to conceive that a being who is in continual activity, who produces all the changes which beings undergo, can always be Himself the same? 144 What is to be understood by either this virtue or this energy? These are relative terms, which do not present any clear, distinct idea to our mind, except as they apply to human: 145 what are we, however, to understand by the divine substance? 146 If this substance be spiritual, that is, devoid of extent, how can there exist in it any parts? 147 How can it give impulse to matter, how set it in motion? How can it even be conceived by mortals?

148 Nevertheless Newton informs us, "that all things are contained in Him, and are moved in Him, but without reciprocity of action: 149 God experiences nothing by the motion of bodies; these experience no resistance whatever by His omnipresence." 150 It would here appear that he clothes the Divinity with that which bears the character of vacuum-- of nothing; 151 without that, it would be almost impossible not to have a reciprocal action or relation between these substances, which are either penetrated or encompassed on all sides. 152 It must be obvious, that in this instance our scientific author does not distinctly understand himself.

153 He proceeds, "It is an incontestable truth, that God exists necessarily, and the same necessity obliges to exist always and everywhere: 154 from whence it follows, that He is in everything similar to itself; He is all eyes, all ears, all brains, all arms, all feeling,

all intelligence, all action; 155 but in a mode by no means human, by no means corporeal, and which is totally unknown to us. 156 In the same manner as a blind person has no idea of colours, it is that we have no idea of the mode in which God feels and understands." 157 The necessary existence of the Divinity is precisely the thing in question; 158 it is this existence that it was needful to have verified by proofs as clear, by evidence as distinct, by demonstration as strong, as gravitation and attraction. 160 One would have hardly thought it possible the expansive capabilities of Newton would not have compassed it.

161 But Oh, unrivalled genius! so mighty, so powerful, so colossal, while yet you was a geometrician; 162 so insignificant, so weak, so inconsistent; when you became a theologian; 163 that is to say, when you reasoned upon that which can neither be calculated, nor submitted to experience; 164 how could you think of speaking to us on a subject which, by your own confession is to you just what a picture is to a human born blind? 165 Wherefore quit Nature, which had already explained to you so much? 166 Why seek in imaginary spaces those causes, those powers, that energy, which She would have distinctly pointed out to you, 167 had you been willing to have consulted Her with your usual sagacity? 168 The gigantic, the intelligent Newton, suffers himself to be hoodwinked-- to be blinded by prejudice; 169 he has not courage to look a question fairly in the face, when that question involves notions which habit has rendered sacred to him; 170 he turns his eyes from truth, he casts behind him his experience, he lulls to sleep his reason, 171 when it becomes necessary to probe opinions full of contradictions, yet fraught with the best interests of humanity.

172 Let us, however, continue to examine how far the most transcendent genius is capable of leading himself astray, 173 when once he abandons experience, when once he chains up his reason, when once he suffers himself to be guided

by his imagination. 174 "God," continues the father of modern philosophy, "is totally destitute of body and of corporeal figure; 175 here is the reason why He cannot be either seen, touched, or understood; and ought not to be adored under any corporeal form." 176 What idea, however, can be formed of a being who is resembled by nothing of which we have any knowledge? 177 What are the relations that can be supposed to exist between such very dissimilar beings?

178 When human renders this being your adoration, does you not, in fact, in despite of yourself, make Him a being similar to your own species; 179 does you not suppose that, like yourself, He is sensible to homage-- to be won by presents-- gained by flattery; 180 in short, He is treated like a king of the earth, who exacts the respect, demands the fealty, requires the obedience of all who are submitted to Him. 181 Newton adds, "we have ideas of His attributes, but we do not know that it is any one substance; 182 we only see the figures and the colours of bodies; we only hear sounds; we only touch the exterior surfaces; we only scent odours; we only taste flavours: 183 no one of our senses, no one of our reflections, can show us the intimate nature of substances: we have still less ideas of God."

184 If we have an idea of the attributes of God, it is only because we clothe Him with those which belong to ourselves; 185 which we never do more than aggrandise, which we only augment or exaggerate; 186 we then mistake them for those qualities with which we were at first acquainted. 187 If in all those substances which are pervious to our senses, we only know them by the effects they produce on us, 188 after which we assign them qualities, at least these qualities are something tangible, they give birth to clear and distinct ideas. 189 This superficial knowledge, however slender it may be, with which our senses furnish us, is the only one we can possibly have; 190 constituted as we are, we find ourselves under the necessity of resting contented with it, and we discover that it is sufficient

for our wants; 191 but we have not even the most superficial idea of immateriality, or a substance distinguished from all those with which we have the slightest acquaintance. 192 Nevertheless, we hear people hourly reasoning upon it, disputing about its properties, advancing its faculties, as if they had the most demonstrable evidence of the fact; 193 tearing each other in pieces, because the one does not readily admit what the other asserts, upon a subject which no human is competent to understand.

194 Our author goes on "We only have a knowledge of God by His attributes, by His properties, 195 by the excellent and wise arrangement which He has given to all things, and by their FINAL CAUSES: 196 we admire Him in consequence of His perfections." 197 I repeat, that we have no real knowledge of the Divinity; that we borrow His attributes from ourselves; 198 but it is evident these cannot be suitable to the Universal Being, who neither can have the same nature nor the same properties as particular beings; 199 it is nevertheless after ourselves that we assign Him intelligence, wisdom, perfection, in subtracting from them what we call defects.

200 As to the order, or the arrangement of the universe, human finds it excellent, esteems it the perfection of wisdom, 201 as long as it is favourable to your species; or when the causes which are co-existent with yourself do not disturb your own peculiar existence; 202 otherwise you are apt to complain of confusion, and final causes vanish: 203 you then attributes to an immutable God, motives equally borrowed from your own peculiar mode of action, for deranging the beautiful order you so much admires in the universe. 204 Thus it is always in yourself, that is, in your own individual mode of feeling, that you draws up the ideas of the order, 205 the wisdom, the excellence, the perfection which you ascribes to the Deity; 206 whilst the good as well as the evil which take place in the world, are the necessary consequence of the essence of things; 207 of the general, immutable laws of Nature;

in short, of the gravitation, of the repulsion of matter; 208 of those unchangeable laws of motion, which Newton himself has so ably thrown into light; 209 but which he has by a strange fatuity forborne to apply when the question was concerning the cause of these phenomena, which prejudice has refused to the capabilities of Nature.

210 He goes on, "We revere, and we adore God, on account of His sovereignty: we worship Him like His slaves; 211 a God destitute of sovereignty, of providence, and of final causes, would be no more than Nature and destiny." 212 It is true that superstition enjoins human to adore its gods like ignorant slaves, who tremble under a master whom they know not; 213 you certainly prays to them on all occasions, sometimes requesting nothing less than an entire change in the essence of things, 214 to gratify your capricious desires, and it is perhaps well for you they are not competent to grant your request: 215 in the origin, as we have shown, these gods were nothing more than Nature acting by necessary laws, 216 clothed under a variety of fables; or necessity personified under a multitude of names.

217 However this may be, we do not believe that true religion, that sterling worship which renders human grateful, 218 whilst it exalts the majesty of the Divinity, requires any such meanness from human that you should act like a slave; 219 you are rather expected to sit down to the banquet prepared for Him, with all the dignity of an invited guest; 220 under the cheering consciousness of a welcome that is never accorded to slaves; 221 nothing is required at His hands, but that you should conduct yourself temperately in the banqueting-house; 222 that you should be grateful for the good cheer you receives; that you should have virtue;-- 223 which we have already sufficiently explained is to render yourself useful, by making others happy;-- 224 that you should not by pertinaciously setting up whimsical opinions, and insisting on their adoption by your neighbour, disturb the harmony of the feast; 225 that you

should be sufficiently intelligent to know when you are really felicitous, and not seek to put down the gaiety of your fellow guests; 226 but that you should rise from the board satisfied with yourself, contented with others; 227 in short, to comprise the whole in a trite axiom of one of the Greek philosophers, you should learn the invaluable secret, "to bear and forbear."

228 But to proceed. Newton tells us, "that from a physical and blind necessity, which should preside everywhere, and be always the same, there could not emanate any variety in the beings; 229 the diversity which we behold, could only have its origin in the ideas and in the will of a being which exists necessarily;" 230 but wherefore should not this diversity spring out of natural causes, from matter acting upon matter; 231 the action of which either attracts and combines various yet analogous elements, 232 or else separates beings by the intervention of those substances which have not a disposition to unite? 233 Is not bread the result of the combination of flour, yeast and water? 234 As for the blind necessity, as it is elsewhere said, we must acknowledge it is that of which we are ignorant, either of its properties or its energies; 235 of which being blind ourselves we have no knowledge of its mode of action.

236 Philosophers explain all the phenomena that occur by the properties of matter; 237 and though they feel the want of a more intimate acquaintance with natural causes, 238 they do not therefore the less believe them deducible from these properties or these causes. 239 Are, therefore, the philosophers atheists, because they do not reply, it is God who is the author of these effects? 240 Is the industrious workman, who makes gunpowder, to be challenged as an atheist, 241 because he says the terrible effects of this destructive material, which inspired the native Americans with such awe, which raised in their winds such wonder, 242 are to be ascribed to the junction of the apparently harmless substances of nitre, charcoal and sulpher, 243 set in activity by the accession of trivial scintillations,

produced from the collision of steel with flint, 244 merely because some bigoted Priest of the Sun, who is ignorant of the composition, 245 chooses to think it is not possible such a striking phenomenon could be the work of anything short of the secret agents, whom he has himself appointed to govern the world?

246 "It is allegorically said that God sees, hears, speaks, smiles, loves, hates, desires, gives, receives, rejoices, grows angry, fights, makes, or fashions, 247 because all that is said of God, is borrowed from the conduct of human, by an imperfect analogy." 248 Human has not been able to act otherwise, for want of being acquainted with Nature and Her eternal course: 249 whenever you have imagined a peculiar energy which you have not been able to fathom, you have given it the name of God; 250 and you have then made Him act upon the self-same principles, as He Himself would adopt, according to which you would act if you was the master. 251 It is from this proneness to Theanthropy, that has flowed all those absurd, and frequently dangerous ideas, upon which are founded the superstitions of the world; 252 who all adore in their gods either natural causes of which they are ignorant, or else powerful mortals of whose malice they stand in awe. 253 The sequel will show the fatal effects that have resulted to humankind from the absurd ideas they have very frequently formed to themselves of the Divinity; 254 that nothing could be more degrading to Him, more injurious to themselves, than the idea of comparing Him to an absolute sovereign, to a despot, to a tyrant. 255 For the present let us continue to examine the proofs offered in support of their various systems.

256 It is unceasingly repeated that the regular action, the invariable order, which reigns in the universe, the benefits heaped upon mortals, 257 announce a wisdom, an intelligence, a goodness, which we cannot refuse to acknowledge, in the cause which produces these marvellous effects. 258 To this we must reply, that it is unquestionably true that not only these things, but all the phenomena

you beholds, 259 indicate the existence of something gifted very superiorly to erring human; 260 the great question, however, is one that perhaps will never be solved, what is this being?

261 Is this question answered by heaping together the estimable qualities of human? 262 Speaking with relation to ourselves, which is all that the theologians really does, although in such numerous regions they pretends to do a great deal more, 263 we can apply the terms goodness, wisdom, intelligence, the best with which we are acquainted, to this being for the want of having those that may be appropriate; 264 but I maintain, this does not, in point of fact, afford us one single idea of the Great Cause of causes; 265 we admire His works; and knowing that what we approve highly in our own species, we attribute to their being wise, we say the Divinity displays wisdom. 266 So far it is well; but this, after all, is a human quality. 267 If we consult experience, we shall presently be convinced that our wisdom does not bear the least affinity to the actions attributed to the Divinity. 268 To get at this a little closer, we must endeavour to find out what we do not call wisdom in human; 269 this will help us to form an estimate, how very incompetent we are to describe the qualities of a being that differs so very materially from ourselves.

270 We most certainly should not call Him a wise person, who having built a beautiful residence, should by the self set it on fire; 271 and thus destroy what the self had laboured so much to bring to perfection: 272 yet this happens every day in Nature, without its being in any manner a warranty for us to charge Her with folly. 273 If therefore we were to form our judgments after our own puny ideas of wisdom, what should we say? 274 Why, in point of fact, just what the human does, who, thinking you have had too much rain, implores fine weather? 275 Which, properly translated, is neither more nor less than giving the Divinity to understand you best knows what is proper for yourself.

276 The just, the only fair inference to be drawn from this, is, that we positively know nothing about the matter; 277 that those who pretend they do, would, if it was upon any other subject, you suspected of having an unsound mind. 278 We do not mean to insist that we are in the right, but we mean to aver that the object of this work is not so much either to build up new systems, or to put down old ones, 279 as by showing human the inconclusiveness of own reasonings upon matters not accessible to own comprehension-- 280 to induce you to be more tolerant to your neighbour-- 281 to invite you to be less rancorous against those who do not see with your eyes-- 282 to hold forth to those motives for forbearance, against those whose system of faith may not exactly harmonise with your own-- 283 to render you less ferocious in support of opinions, which, if you will but discard your prejudices, you may find not so solidly bottomed as you imagines. 284 All we know is scarcely more than that the motion we witness in the universe is the necessary consequence of the laws of matter; 285 that the uniformity of this motion is evidence of their immutability; 286 that it is not too much to say it cannot cease to act in the manner it does, as long as the same causes operate, governed by the same circumstances.

287 We evidently see that motion, however regular in our mind, that order, however beautiful to our admiring optics, yields to what we term disorder, 288 to that which we designate frightful confusion, as soon as new causes, not analogous to the preceding, either disturb or suspend their action. 289 We further know that a better knowledge of Nature, the consequence of time, the result of patient, laborious, physical researches, with the comparison of facts and the application of experience, 290 has enabled human in many instances to divert from the self the evil effects of inevitable causes, 291 which anterior to these discoveries overwhelmed your unhappy progenitors with ruin. 292 How far these salutary developments are to be carried by industry, what

may be achieved by honesty, 293 what light is to be gathered from the recession of prejudice, the wisest among people is not competent to decide. 294 Certain it is, that phenomena which for ages were supposed to denounce the anger of the Deity against humankind, are now well understood to be common effects of natural causes.

295 Order, as we have elsewhere shown, is only the effects which result to ourselves from a series of motion; 296 there cannot be any disorder relatively to the great whole; in which all that takes place is necessary; in which everything is determined by laws which nothing can change. 297 The order of Nature may be damaged or destroyed relatively to ourselves, but it is never contradicted relatively to Herself, since She cannot act otherwise than She does: 298 if we attribute to Her the evils we sustain, we are equally obliged to acknowledge we owe to Her the good we experience.

299 It is said, that animals furnish a convincing proof of the powerful cause of their existence; 300 that the admirable harmony of their parts, the mutual assistance they lend each other, the regularity with which they fulfill their functions, 301 the preservation of these parts, the conservation of such complicated wholes, announce a workman who unites wisdom with power; 302 in short, whole tracts of anatomy and botany have been copied to prove nothing more than that these things exist, 303 for of the power that produced them there cannot remain a doubt. 304 We shall never learn more from these erudite tracts, save that there exists in Nature certain elements with an aptitude to attraction; 305 a disposition to unite, suitable to form wholes, to induce combinations capable of producing very striking effects.

306 To be surprised that the brain, the heart, the arteries, the veins, the eyes, the ears of an animal, act as we see them-- 307 that the roots of plants attract juices, or that trees produce fruit, is to be surprised that a tree, a plant, or an animal exists at all. 308 These beings would not exist, or would no longer be that which we

know they are, if they ceased to act as they do: this is what happens when they die. 309 If the formation, the combination, the modes of action, variously possessed by these beings, 310 if their conservation for a season, followed by their destruction or dissolution, prove anything, it is the immutability of those laws which operate in Nature: 311 we cannot doubt the power of Nature; She produces all the animals we behold, by the combination, of matter, continually in motion; 312 the harmony that subsists between the component parts of these beings, is a consequence of the necessary laws of their nature, and of that which results from their combination. 313 As soon as this accord ceases, the animal is necessarily destroyed: from this we must conclude that every mutation in Nature is necessary; 314 is only a consequence of its laws; that it could not be otherwise than it is, under the circumstances in which it is placed.

315 Human, who looks upon the self as the chef d'oeuvre, furnishes more than any other production a proof of the immutability of the laws of Nature: 316 in this sensible, intelligent, thinking being, whose vanity leads you to believe yourself the sole object of the divine predilection, 317 who forms your God after your own peculiar model, we see only a more inconstant, a more brittle machine; 318 one more subject to be deranged by its extreme complication, than the grosser beings: 319 beasts destitute of our knowledge, plants that vegetate, stones devoid of feeling, are in many respects beings more highly favoured than human: 320 they are at least exempted from the sorrows of the mind--from the torments of reflection-- from that devouring, chagrin to which you are so frequently a prey.

321 Who are you who would not be a plant or a stone, every time reminiscence forces upon your imagination the irreparable loss of a beloved object? 322 Would it not be better to be an inanimate mass, than a restless, turbulent, superstitious being, 323 who does nothing but tremble under the imaginary displeasure of beings of own

creation; 324 who to support own gloomy opinions, immolates own fellow creatures at the shrine of own idol; 325 who ravages the country, and deluges the earth with the blood of those who happen to differ from you on a speculative point of an unintelligible creed? 326 Beings destitute of life, bereft of feeling, without memory, not having the faculties of thought, at least are not afflicted by the idea of either the past, the present, or the future; 327 they do not at any rate believe themselves in danger of becoming eternally unhappy, because they may have reasoned badly; 328 or because they happened to be born in a land where truth has never yet shed its refulgent beams on the darkened mind of perplexed mortals.

329 Let it not then be said that we cannot have an idea of a work, without also having an idea of the workman, as distinguished from His work: 330 the savage, when they first beheld the terrible operation of gunpowder, did not form the most distant idea that it was the work of a human like themselves. 331 Nature is not to be contemplated as a work of this kind; She is self-existent. 332 In Her bosom everything is produced: She is an immense laboratory, provided with materials, who makes the instruments of which She avails Herself in Her operations. 333 All Her works are the effects of Her own energies; of those agents which She Herself produces; of those immutable laws by which She sets everything in activity.

334 Eternal, indestructible elements, ever in motion, combine themselves variously, and thus give birth to all beings, 335 to all the phenomena which fill the weak eyes of erring mortals with wonder and dismay; 336 to all the effects, whether good or bad, of which human experiences the influence; 337 to all the vicissitudes you undergoes, from the moment of your birth until that of your death; 338 to order and to confusion, which you never discriminates but by the various modes in which you are affected: 339 in short, to all those miraculous spectacles with which you occupies your meditation-- upon which you exercises your reason--

340 which frequently spread consternation over the surface of the earth. 341 These elements need nothing when circumstances favour their junction, save their own peculiar properties, whether individual or united, with the motion that is essential to them, 342 to produce all those phenomena which powerfully striking the senses of humankind, either fill you with admiration, or stagger you with alarm.

343 But supposing for a moment that it was impossible to conceive the work, without also conceiving the workman, who watches over own work, 344 where must we place this workman? Shall it be interior or exterior to own production? Is He matter and motion, or is He only space or the vacuum?

345 In all these cases either He would be nothing, or He would be contained in Nature: 346 as Nature contains only matter and motion, it must be concluded that the agent who moves it is material; that He is corporeal; 347 if this agent be exterior to Nature, then we can no longer form any idea of the place which He occupieth: 348 neither can we better conceive an immaterial being; nor the mode in which a spirit without extent can act upon matter from which it is separated.

349 These unknown spaces, which imagination has placed beyond the visible world, can have no existence for a being, who with difficulty sees down to His feet; 350 you cannot paint to your mind any image of the power which inhabit them; 351 but if you are compelled to form some kind of a picture, you must combine at random the fantastical colours which you are ever obliged to draw from the world you inhabits: 352 in this case you will really do no more than reproduce an idea, part or parcels of that which you have actually seen; 353 you will form a whole which perhaps has no existence in Nature, but which it will be in vain you strives to distinguish from Her; to place out of Her bosom. 354 When you shall be ingenuous with yourself, When you shall be no longer willing to delude others, 355 you will be obliged to acknowledge, that the

portrait you have painted, although in its combination it resembles nothing in the universe, 356 is nevertheless in all its constituent members an exact delineation of that which Nature presents to our view.

357 Hobbes in his Leviathan says, "The universe, the whole mass of things, is corporeal, that is to say, body; 358 and hath the dimensions of magnitude, namely, length, breadth, and depth: 359 also every part of body is likewise body, and hath the like dimensions; 360 and consequently every part of the universe is body; and that which is not body, is no part of the universe; 361 and because the universe is all, that which is no part of it is nothing; and consequently no where: 362 nor does it follow from hence, that spirits are nothing, for they have dimensions, and are therefore really bodies; 363 though that name in common speech be given to such bodies only as are visible, or palpable, that is, that have some degree of opacity: 364 but for spirits they call them incorporeal; which is a name of more honour, and may therefore with more piety be attributed to God Himself, 365 in whom we consider not what attribute expresseth best His nature, which is incomprehensible; but what best expresseth our desire to honour Him."

366 It will be insisted that if a statue or a watch were shown to a savage, who had never before seen either, 367 the savage would not be able to prevent the self from acknowledging that these things were the works of some intelligent agent of greater ability, possessing more industry than the self: 368 it will be concluded from thence, that we are in like manner obliged to acknowledge that the universe, that human, that the various phenomena, are the works of an agent, 369 whose intelligence is more comprehensive, whose power far surpasses our own. 370 Granted: who has ever doubted it? 371 The proposition is self-evident; it cannot admit of even a cavil.

372 Nevertheless we reply, in the first place, that it is not to be doubted that Nature is extremely powerful; diligently industrious: 373 we admire

Her activity every time we are surprised by the extent, every time we contemplate the variety, 374 every time we behold those complicated effects which are displayed in Her works; or whenever we take the pains to meditate upon them: 375 nevertheless, She is not really more industrious in one of Her works than She is in another; 376 She is not fathomed with more ease in those we call Her most contemptible productions, than She is in Her most sublime efforts: 377 we no more understand how She has been capable of producing a stone or a metal, than the means by which She organised a head like that of the illustrious Newton.

378 We call that person industrious who can accomplish things which we cannot; 379 Nature is competent to everything: 380 as soon therefore as a thing exists, it is a proof She has been capable of producing it: 381 but it is never more than relatively to ourselves that we judge beings to be industrious: we then compare them to ourselves; 382 and as we enjoy a quality which we call intelligence, by the assistance of which we accomplish things, by which we display our diligence, 383 we naturally conclude from it, that those works which most astonish us, do not belong to Her, but are to be ascribed to an intelligent being like ourselves, 384 but in whom we make the intelligence commensurate with the astonishment these phenomena excite in us; 385 that is to say, in other words, to our own peculiar ignorance, and the weakness incident to our nature.

386 In the second place, we must observe, that the savage, to whom either the statue or the watch is brought, will or will not have ideas of human industry: 387 if you have ideas of it, you will feel that this watch or this statue, may be the work of a being of your own species, enjoying faculties of which you are yourself deficient: 388 if you have no idea of it, if you have no comprehension of the resources of human art, when you beholds the spontaneous motion of the watch, 389 you will be impressed with the belief

that it is an animal, which cannot be the work of human.

390 Multiplied experience confirms this mode of thinking which is ascribed to the savage. 391 The Peruvians mistook the Spaniards for gods, because they made use of gunpowder, rode on horseback, and came in vessels which sailed quite alone. 392 The inhabitants of the island of Tenian being ignorant of fire before the arrival of Europeans, 393 the first time they saw it, conceived it to be an animal who devoured the wood. 394 Thus it is, that the savage, in the same manner as many great and learned people, who believe themselves much more acute, 395 will attribute the strange effects that strike own organs, to a genius or to a spirit; 396 that is to say, to an unknown power; to whom they will ascribe capabilities of which they believes the beings of their own species are entirely destitute: 397 by this you will prove nothing, except that you are yourself ignorant of what human is capable of producing.

398 It is thus that a raw unpolished people raise their eyes to heaven, every time they witness some unusual phenomenon. 399 It is thus that the people denominate all those strange effects, with the natural causes of which they are ignorant, miraculous, supernatural, divine; 400 but these are not by reasonable people therefore considered proofs of what they assert: 401 as the multitude are generally unacquainted with the cause of anything, every object becomes a miracle in their eyes; 402 at least they imagine God is the immediate cause of the good they enjoy-- of the evil they suffer. 403 In short, it is thus that the theologians themselves solve every difficulty that starts in their road; 404 they ascribe to God all those phenomena, of the causes of which either they are themselves ignorant, or else unwilling that human should be acquainted with the source.

405 In the third place, the savage, in opening the watch, and examining its parts, will perhaps feel, that this machinery announces a work which can only be the result of human labour. 406 The savage will perhaps perceive, that they very obviously

differ from the immediate productions of Nature, whom they have not observed to produce wheels made of polished metal. 407 They will further notice, perhaps, that these parts when separated, no longer act as they did when they were combined; 408 that the motion they so much admired, ceases when their union is broken. 409 After these observations, they will attribute the watch to the ingenuity of human; 410 that is to say, to a being like yourself, of whom you have some ideas, but whom you judges capable to construct machines to which you are yourself utterly incompetent. 411 In short, you will ascribe the honour of your watch to a being known to you in some respects, provided with faculties very far superior to your own; 412 but you will be at an immense distance from the belief, that this material work, whose ingenuity pleases you so much, can be the effect of an immaterial cause; 413 or of an agent destitute of organs, without extent; whose action upon material beings cannot be within, the sphere of your comprehension.
