105 We have shown that the reasons assigned by the prophets, or those which are formed from revelation, are not assigned in accordance with ideas universal and common to all, 106 but in accordance with the accepted doctrines, however absurd, and with the opinions of those to whom the revelation was given, or those whom the Holy Spirit wished to convince. 107 This we have illustrated by many Scriptural instances, and can further cite Paul, who to the Greeks was a Greek, and to the Jews a Jew. 108 But although these miracles could convince the Egyptians and Jews

from their standpoint, they could not give a true idea and knowledge of God, 109 but only cause them to admit that there was a Deity more powerful than anything known to them, and that this Deity took special care of the Jews, who had just then an unexpectedly happy issue of all their affairs. 110 They could not teach them that God cares equally for all, for this can be taught only by philosophy: 111 the Jews, and all who took their knowledge of God's providence from the dissimilarity of human conditions of life and the inequalities of fortune, persuaded themselves that God loved the Jews above all humans, though they did not surpass their fellows in true human perfection.

112 I now go on to my third point, and show from Scripture that the decrees and mandates of God, and consequently His providence, are merely the order of Nature-- 113 that is, when Scripture describes an event as accomplished by God or God's will, we must understand merely that it was in accordance with the law and order of Nature, 114 not, as most people believe, that Nature had for a season ceased to act, or that Her order was temporarily interrupted.

115 But Scripture does not directly teach matters unconnected with its doctrine, wherefore it has no care to explain things by their natural causes, nor to expound matters merely speculative. 116 Wherefore our conclusion must be gathered by inference from those Scriptural narratives which happen to be written more at length and circumstantially than usual. Of these I will cite a few.

117 In the first book of Samuel, Chapter-9:15-16, it is related that God revealed to Samuel that He would send Saul to him, yet God did not send Saul to Samuel as people are wont to send one person to another. 118 His "sending" was merely the ordinary course of Nature. 119 Saul was looking for the asses he had lost, and was meditating a return home without them, when, at the suggestion of his servant, he went to the prophet Samuel, to learn from him where he might find them. 120 From no part of the narrative does it appear that Saul had any command from God to visit Samuel beyond this natural

motive. 121 In Psalm-105:25 it is said that God changed the hearts of the Egyptians, so that they hated the Israelites. 122 This was evidently a natural change, as appears from Exodus, Chapter-1 where we find no slight reason for the Egyptians reducing the Israelites to slavery.

122 In Genesis, Chapter-9:13, God tells Noah that He will set His bow in the cloud; this action of God's is but another way of expressing the refraction and reflection which the rays of the sun are subjected to in drops of water.

123 In Psalm-147:18, the natural action and warmth of the wind, by which hoar frost and snow are melted, are styled the word of the Lord, and in verse-15 wind and cold are called the commandment and word of God.

124 In Psalm-104:4, wind and fire are called the angels and ministers of God, and various other passages of the same sort are found in Scripture, clearly showing that the decree, commandment, fiat, and word of God are merely expressions for the action and order of Nature.

125 Thus it is plain that all the events narrated in Scripture came to pass naturally, and are referred directly to God because Scripture, as we have shown, does not aim at explaining things by their natural causes, 126 but only at narrating what appeals to the popular imagination, and doing so in the manner best calculated to excite wonder, and consequently to impress the minds of the masses with devotion. 127 If, therefore, events are found in the Bible which we cannot refer to their causes, nay, which seem entirely to contradict the order of Nature, we must not come to a stand, but assuredly believe that whatever did really happen happened naturally. 128 This view is confirmed by the fact that in the case of every miracle there were many attendant circumstances, though these were not always related, especially where the narrative was of a poetic character. 129 The circumstances of the miracles clearly show, I maintain, that natural causes were needed. 130 For instance, in order to infect the Egyptians with blains, it was necessary that Moses should

scatter ashes in the air (Exodus-9: 10); 131 the locusts also came upon the land of Egypt by a command of God in accordance with Nature, namely, by an east wind blowing for a whole day and night; and they departed by a very strong west wind (Exodus 10:14 and19).

132 By a similar Divine mandate the sea opened a way for the Jews (Exodus, Chapter-14:21), namely, by an east wind which blew very strongly all night.

133 So, too, when Elisha would revive the boy who was believed to be dead, he was obliged to bend over him several times until the flesh of the child waxed warm, and at last he opened his eyes (2 Kings – 4:34 and 35).

134 Again, in John's Gospel (Chapter-9.) certain acts are mentioned as performed by Christ preparatory to healing the blind man, 135 and there are numerous other instances showing that something further than the absolute fiat of God is required for working a miracle. 136 Wherefore we may believe that, although the circumstances attending miracles are not related always or in full detail, yet a miracle was never performed without them. 137 This is confirmed by Exodus, Chapter 14:27, where it is simply stated that "Moses stretched forth his hand, and the waters of the sea returned to their strength in the morning," no mention being made of a wind; 138 but in the song of Moses (Exodus, Chapter-15:10) we read, "Thou didst blow with Thy wind (i.e. with a very strong wind), and the sea covered them." 139 Thus the attendant circumstance is omitted in the history, and the miracle is thereby enhanced.

140 But perhaps someone will insist that we find many things in Scripture which seem in nowise explicable by natural causes, 141 as for instance, that the sins of humans and their prayers can be the cause of rain and of the earth's fertility, or that faith can heal the blind, and so on. 142 But I think I have already made sufficient answer: I have shown that Scripture does not explain things by their secondary causes, but only narrates them in the order and the style which has most power to move humans, 143 and especially uneducated people, to devotion; and therefore it speaks

inaccurately of God and of events, seeing that its object is not to convince the reason, but to attract and lay hold of the imagination.

144 If the Bible were to describe the destruction of an empire in the style of political historians, the masses would remain unstirred, 145 whereas the contrary is the case when it adopts the method of poetic description, and refers all things immediately to God. 146 When, therefore, the Bible says that the earth is barren because of humans' sins, or that the blind were healed by faith, we ought to take no more notice than when it says that God is angry at humans sins, 147 that He is sad, that He repents of the good He has promised and done; 148 or that on seeing a sign he remembers something He had promised, and other similar expressions, which are either thrown out poetically or related according to the opinion and prejudices of the writer.

149 We may, then, be absolutely certain that every event which is truly described in Scripture necessarily happened, like everything else, according to natural laws; 150 and if anything is there set down which can be proved in set terms to contravene the order of Nature, or not to be deducible therefrom, we must believe it to have been foisted into the sacred writings by irreligious hands; 151 for whatsoever is contrary to Nature is also contrary to reason, and whatsoever is contrary to reason is absurd, and, ipso facto, to be rejected.

152 There remain some points concerning the interpretation of miracles to be noted, or rather to be recapitulated, for most of them have been already stated. 153 These I proceed to discuss in the fourth division of my subject, and I am led to do so lest anyone should, by wrongly interpreting a miracle, rashly suspect that you have found something in Scripture contrary to human reason.

154 It is very rare for humans to relate an event simply as it happened, without adding any element of their own judgment. 155 When they see or hear anything new, they are, unless strictly on their guard, so occupied with their own preconceived opinions that they perceive something quite different from the plain facts seen

or heard, 156 especially if such facts surpass the comprehension of the beholder or hearer, and, most of all, if you are interested in their happening in a given way. 157 Thus humans relate in chronicles and histories their own opinions rather than actual events, so that one and the same event is so differently related by two people of different opinions, that it seems like two separate occurrences; 158 and, further, it is very easy from historical chronicles to gather the personal opinions of the historian.

159 I could cite many instances in proof of this from the writings both of natural philosophers and historians, but I will content myself with one only from Scripture, and leave the reader to judge of the rest.

160 In the time of Joshua the Hebrews held the ordinary opinion that the sun moves with a daily motion, and that the earth remains at rest; 161 to this preconceived opinion they adapted the miracle which occurred during their battle with the five kings. 162 They did not simply relate that that day was longer than usual, but asserted that the sun and moon stood still, or ceased from their motion-- 163 a statement which would be of great service to them at that time in convincing and proving by experience to the Gentiles, who worshipped the sun, that the sun was under the control of another deity who could compel it to change its daily course. 164 Thus, partly through religious motives, partly through preconceived opinions, they conceived of and related the occurrence as something quite different from what really happened.

165 Thus in order to interpret the Scriptural miracles and understand from the narration of them how they really happened, it is necessary to know the opinions of those who first related them, and have recorded them for us in writing, 166 and to distinguish such opinions from the actual impression made upon their senses, otherwise we shall confound opinions and judgments with the actual miracle as it really occurred: 167 nay, further, we shall confound actual events with symbolical and imaginary ones.

168 For many things are narrated in Scripture as real, and were

believed to be real, which were in fact only symbolical and imaginary.

169 As, for instance, that God came down from heaven (Exodus 19:9, Deuteronomy-5:28), and that Mount Sinai smoked because God descended upon it surrounded with fire; 170 or, again that Elijah ascended into heaven in a chariot of fire, with horses of fire; 171 all these things were assuredly merely symbols adapted to the opinions of those who have handed them down to us as they were represented to them, namely, as real.

172 All who have any education know that God has no right hand nor left; that He is not moved nor at rest, nor in a particular place, but that He is absolutely infinite and contains in Himself all perfections. 173 These things, I repeat, are known to whoever judges of things by the perception of pure reason, and not according as your imagination is affected by your outward senses.

174 Following the example of the masses who imagine a bodily Deity, holding a royal court with a throne on the convexity of heaven, above the stars, which are believed to be not very, far off from the earth. 175 To these and similar opinions very many narrations in Scripture are adapted, and should not, therefore, be mistaken by philosophers for realities.

176 Lastly, in order to understand, in the case of miracles, what actually took place, we ought to be familiar with Jewish phrases and metaphors; 177 anyone who did not make sufficient allowance for these, would be continually seeing miracles in Scripture where nothing of the kind is intended by the writer; 178 you would thus miss the knowledge not only of what actually happened, but also of the mind of the writers of the sacred text.

179 For instance, Zechariah speaking of some future war says (Chapter-14:7): "It shall be one day which shall be known to the Lord, not day, nor night; but at even time it shall be light." 180 In these words he seems to predict a great miracle, yet he only means that the battle will be doubtful the whole day, that the issue will be known only to God, but that in the evening they will gain the victory: 181 the prophets frequently used to

predict victories and defeats of the nations in similar phrases.

182 Thus Isaiah, describing the destruction of Babylon, says (Chapter-13): "The stars of heaven, and the constellations thereof, shall not give their light; the sun shall be darkened in his going forth, and the moon shall not cause her light to shine."

183 Now I suppose no one imagines that at the destruction of Babylon these phenomena actually occurred any more than that which the prophet adds, "For I will make the heavens to tremble, and remove the earth out of her place."

184 So, too, Isaiah in foretelling to the Jews that they would return from Babylon to Jerusalem in safety, and would not suffer from thirst on their journey, says: "And they thirsted not when He led them through the deserts; 185 He caused the waters to flow out of the rocks for them; He clave the rocks, and the waters gushed out."

186 These words merely mean that the Jews, like other people, found springs in the desert, at which they quenched their thirst; 187 for when the Jews returned to Jerusalem with the consent of Cyrus, it is admitted that no similar miracles befell them.

188 In this way many occurrences in the Bible are to be regarded merely as Jewish expressions. 189 There is no need for me to go through them in detail; but I will call attention generally to the fact that the Jews employed such phrases not only rhetorically, but also, and indeed chiefly, from devotional motives. 190 Such is the reason for the substitution of "bless God" for "curse God" in 1 Kings 21:10, and Job 2:9, 191 and for all things being referred to God, whence it appears that the Bible seems to relate nothing but miracles, even when speaking of the most ordinary occurrences, as in the examples given above.

192 Hence we must believe that when the Bible says that the Lord hardened Pharaoh's heart, it only means that Pharaoh was obstinate; 193 when it says that God opened the windows of heaven, it only means that it rained very hard, and so on. 194 When we reflect on these peculiarities, and also on the fact that most things are related very shortly, with very little details and almost in abridgments, 195 we

shall see that there is hardly anything in Scripture which can be proved contrary to natural reason, while, on the other hand, many things which before seemed obscure, will after a little consideration be understood and easily explained.

196 I think I have now very clearly explained all that I proposed to explain, but before I finish this chapter I would call attention to the fact that I have adopted a different method in speaking of miracles to that which I employed in treating of prophecy. 197 Of prophecy I have asserted nothing which could not be inferred from promises revealed in Scripture, whereas in this chapter I have deduced my conclusions solely from the principles ascertained by the natural light of reason. 198 I have proceeded in this way advisedly, for prophecy, in that it surpasses human knowledge, is a purely theological question; 199 therefore, I knew that I could not make any assertions about it, nor learn wherein it consists, except through deductions from premises that have been revealed; 200 therefore I was compelled to collate the history of prophecy, and to draw therefrom certain conclusions which would teach me, in so far as such teaching is possible, the nature and properties of the gift. 201 But in the case of miracles, as our inquiry is a question purely philosophical (namely, whether anything can happen which contravenes or does not follow from the laws of Nature), 202 I was not under any such necessity: I therefore thought it wiser to unravel the difficulty through premises ascertained and thoroughly known by the natural light of reason. 203 I say I thought it wiser, for I could also easily have solved the problem merely from the doctrines and fundamental principles of Scripture: 204 in order that everyone may acknowledge this, I will briefly show how it could be done. Scripture makes the general assertion in several passages that Nature's course is fixed and unchangeable. 205 In Psalm 148:6, for instance, and Jeremiah. 31:35.

The wise man also, in Ecclesiastes. I:10, distinctly teaches that "there is nothing new under the sun," 206 and in Ecclesiastes-1:11 and 12,

illustrating the same idea, he adds that although something occasionally happens which seems new, it is not really new, but "hath been already of old time, which was before us, 207 whereof there is no remembrance, neither shall there be any remembrance of things that are to come with those that come after." 208 Again in Ecclesiastes, Chapter-3:11, he says, "God hath made everything beautiful in his time," and immediately afterwards adds, "I know that whatsoever God doeth, it shall be for ever; nothing can be put to it, nor anything taken from it."

209 Now all these texts teach most distinctly that Nature preserves a fixed and unchangeable order, and that God in all ages, known and unknown, has been the same; 210 further, that the laws of Nature are so perfect, that nothing can be added thereto nor taken therefrom; 211 and, lastly, that miracles only appear as something new because of human's ignorance. 212 Such is the express teaching of Scripture: nowhere does Scripture assert that anything happens which contradicts, or cannot follow from the laws of Nature; and, therefore, we should not attribute to it such a doctrine.

213 To these considerations we must add, that miracles require causes and attendant circumstances, and that they follow, not from some mysterious royal power which the masses attribute to God, but from the Divine rule and decree, that is (as we have shown from Scripture itself) from the laws and order of Nature; 214 lastly, that miracles can be wrought even by false prophets, as is proved from Deuteronomy, chapter-13. and Matthew. chapter-24 verse:24.

215 The conclusion, then, that is most plainly put before us is, that miracles were natural occurrences, and must therefore be so explained as to appear neither new (in the words of Solomon) nor contrary to Nature, but, as far as possible, in complete agreement with ordinary events. 216 This can easily be done by anyone, now that I have set forth the rules drawn from Scripture. 217 Nevertheless, though I maintain that Scripture teaches this doctrine, I do not assert that it teaches it as a truth necessary to

salvation, but only that the prophets were in agreement with ourselves on the point; 218 therefore everyone is free to think on the subject as you likes, according as you thinks it best for yourself, and most likely to conduce to the worship of God and to single-hearted religion.

219 This is also the opinion of Josephus, for at the conclusion of the second book of his "Antiquities," he writes: 220 Let no person think this story incredible of the sea's dividing to save these people, for we find it in ancient records that this hath been seen before, whether by God's extraordinary will or by the course of Nature it is indifferent.

221 The same thing happened one time to the Macedonians, under the command of Alexander, when for want of another passage the Pamphylian Sea divided to make them way; 222 God's Providence making use of Alexander at that time as His instrument for destroying the Persian Empire. 223 This is attested by all the historians who have pretended to write the Life of that Prince. 224 But people are at liberty to think what they please." 225 Such are the words of Josephus, and such is his opinion on faith in miracles.

The Book of Divine Panagogue called

LAW

OF THE DIVINE LAW
Benedict of Spinoza

1 The word law, taken in the abstract, means that by which an individual, or all things, or as many things as belong to a particular species, act in one and the same fixed and definite manner, which manner depends either on natural necessity or on human decree.

2 A law which depends on natural necessity is one which necessarily follows from the nature, or from the definition of the thing in question; 3 a law which depends on human decree, and which is more correctly called an ordinance, is one which humans have laid down for themselves and others in order to live more safely or conveniently, or from some similar reason. 4 For example, the law that all bodies impinging on lesser bodies, lose as much of their own motion as they communicate to the latter is a universal law of all bodies, and depends on natural necessity.

5 So, too, the law that a person in remembering one thing, straightway remembers another either like it, or which you had perceived simultaneously with it, is a law which necessarily follows from the nature of human. 6 But the law that people must yield, or be compelled to yield, somewhat of their natural right, and that they bind themselves to live in a certain way, depends on human decree.

7 Now, though I freely admit that all things are predetermined by universal natural laws to exist and operate in a given, fixed, and definite manner, 8 I still assert that the laws I have just mentioned depend on human decree. 9 Because human, in so far as you are a part of Nature, constitutes a part of the power of Nature. 10 Whatever, therefore, follows necessarily from the necessity of human nature (that is, from Nature Herself, in so far as we conceive of Her as acting through human) follows, even though it be necessarily, from human power. 11 Hence the sanction of such laws may very well be said to depend on human's decree, for it

principally depends on the power of the human mind; 12 so that the human mind in respect to its perception of things as true and false, can readily be conceived as without such laws, but not without necessary law as we have just defined it.

13 I have stated that these laws depend on human decree because it is well to define and explain things by their proximate causes. 14 The general consideration of fate and the concatenation of causes would aid us very little in forming and arranging our ideas concerning particular questions. 15 Let us add that as to the actual coordination and concatenation of things, that is how things are ordained and linked together, we are obviously ignorant; 16 therefore, it is more profitable for right living, nay, it is necessary for us to consider things as contingent. 17 So much about law in the abstract.

18 Now the word law seems to be only applied to natural phenomena by analogy, and is commonly taken to signify a command which humans can either obey or neglect, 19 inasmuch as it restrains human nature within certain originally exceeded limits, and therefore lays down no rule beyond human strength.

20 Thus it is expedient to define law more particularly as a plan of life laid down by human for yourself or others with a certain object. 21 However, as the true object of legislation is only perceived by a few, and most people are almost incapable of grasping it, though they live under its conditions, 22 legislators, with a view to exacting general obedience, have wisely put forward another object, very different from that which necessarily follows from the nature of law: 23 they promise to the observers of the law that which the masses chiefly desire, and threaten its violators with that which they chiefly fear: 24 thus endeavouring to restrain the masses, as far as may be, like a horse with a curb; whence it follows that the word law is chiefly applied to the modes of life enjoined on humans by the sway of others; 25 hence those who obey the law are said to live under it and to be under compulsion.

26 In truth, a person who renders everyone their due because you fears the gallows, acts under the sway and compulsion of others, and cannot be called just. 27 But a person who does the same from a knowledge of the true reason for laws and their necessity, acts from a firm purpose and of own accord, and is therefore properly called just. 28 This, I take it, is Paul's meaning when he says, that those who live under the law cannot be justified through the law, for justice, as commonly defined, is the constant and perpetual will to render every human own due.

29 Thus Solomon says (Proverb, Chapter-21:15), "It is a joy to the just to do judgment," but the wicked fear. 30 Law, then, being a plan of living which humans have for a certain object laid down for themselves or others, may, as it seems, be divided into human law and Divine law.

31 By human law I mean a plan of living which serves only to render life and the state secure. 32 By Divine law I mean that which only regards the highest good, in other words, the true knowledge of God and love. 33 I call this law Divine because of the nature of the highest good, which I will here shortly explain as clearly as I can. 34 Inasmuch as the intellect is the best part of our being, it is evident that we should make every effort to perfect it as far as possible if we desire to search for what is really profitable to us. 35 For in intellectual perfection the highest good should consist.

36 Now, since all our knowledge, and the certainty which removes every doubt, depend solely on the knowledge of God;- firstly, because without God nothing can exist or be conceived; 37 secondly, because so long as we have no clear and distinct idea of God we may remain in universal doubt-- it follows that our highest good and perfection also depend solely on the knowledge of God. 38 Further, since without God nothing can exist or be conceived, it is evident that all natural phenomena involve and express the conception of God as far as their essence and perfection extend, 39 so that we have greater and more perfect knowledge of God in proportion to our knowledge of natural phenomena: 40 conversely (since

the knowledge of an effect through its cause is the same thing as the knowledge of a particular property of a cause) the greater our knowledge of natural phenomena, the more perfect is our knowledge of the essence of God (which is the cause of all things). 41 So, then, our highest good not only depends on the knowledge of God, but wholly consists therein; 42 and it further follows that human is perfect or the reverse in proportion to the nature and perfection of the object of your own special desire; 43 hence the most perfect and the chief sharer in the highest blessedness is you who prizes above all else, and takes especial delight in, the intellectual knowledge of God, the most perfect Being.

44 Hither, then, our highest good and our highest blessedness aim--namely, to the knowledge and love of God; 45 therefore the means demanded by this aim of all human actions, that is, by God in so far as the idea of Him is in us, may be called the commands of God, 46 because they proceed, as it were, from God Himself, inasmuch as He exists in our minds, and the plan of life which has regard to this aim may be fitly called the law of God.

47 The nature of the means, and the plan of life which this aim demands, how the foundations of the best states follow its lines, and how humans' life is conducted, are questions pertaining to general ethics. 48 Here I only proceed to treat of the Divine law in a particular application. 49 As the love of God is human's highest happiness and blessedness, and the ultimate end and aim of all human actions, it follows that you alone lives by the Divine law who loves God not from fear of punishment, or from love of any other object, such as sensual pleasure, fame, or the like; 50 but solely because you have knowledge of God, or is convinced that the knowledge and love of God is the highest good.

51 The sum and chief precept, then, of the Divine law is to love God as the highest good, namely, as we have said, not from fear of any pains and penalties, or from the love of any other object in which we desire to take pleasure. 52 The idea of God lays down the rule that God is our highest good--

in other words, that the knowledge and love of God is the ultimate aim to which all our actions should be directed. 53 The worldling cannot understand these things, they appear foolishness to you, because you have too meager a knowledge of God, 54 and also because in this highest good you can discover nothing which you can handle or eat, or which affects the fleshly appetites wherein you chiefly delights, for it consists solely in thought and the pure reason. 55 They, on the other hand, who know that they possess no greater gift than intellect and sound reason, will doubtless accept what I have said without question.

56 We have now explained that wherein the Divine law chiefly consists, and what are human laws, namely, all those which have a different aim unless they have been ratified by revelation, 57 for in this respect also things are referred to God (as we have shown above) and in this sense the law of Moses, 58 although it was not universal, but entirely adapted to the disposition and particular preservation of a single people, may yet be called a law of God or Divine law, inasmuch as we believe that it was ratified by prophetic insight. 59 If we consider the nature of natural Divine law as we have just explained it, we shall see:

(I.) That it is universal or common to all humans, for we have deduced it from universal human nature.

60 (II.) That it does not depend on the truth of any historical narrative whatsoever, for inasmuch as this natural Divine law is comprehended solely by the consideration of human nature, 61 it is plain that we can conceive it as existing as well in Adam as in any other man, as well in a human living among own fellows, as in a human who lives by the self.

62 The truth of a historical narrative, however assured, cannot give us the knowledge nor consequently the love of God, for love of God springs from knowledge of Him, and knowledge of Him should be derived from general ideas, 63 in themselves certain and known, so that the truth of a historical narrative is very far from being a necessary

requisite for our attaining our highest good. 64 Still, though the truth of histories cannot give us the knowledge and love of God, I do not deny that reading them is very useful with a view to life in the world, 65 for the more we have observed and known of humans' customs and circumstances, which are best revealed by their actions, the more warily we shall be able to order our lives among them, and so far as reason dictates to adapt our actions to their dispositions.

66 (III.) We see that this natural Divine law does not demand the performance of ceremonies-- that is, actions in themselves indifferent, which are called good from the fact of their institution, 67 or actions symbolising something profitable for salvation, or (if one prefers this definition) actions of which the meaning surpasses human understanding.

68 The natural light of reason does not demand anything which it is itself unable to supply, but only such as it can very clearly show to be good, or a means to our blessedness. 69 Such things as are good simply because they have been commanded or instituted, or as being symbols of something good, are mere shadows which cannot be reckoned among actions that are the offsprings as it were, or fruit of a sound mind and of intellect. 70 There is no need for me to go into this now in more detail.

71 (IV.) Lastly, we see that the highest reward of the Divine law is the law itself, namely, to know God and to love Him of our free choice, and with an undivided and fruitful spirit; 72 while its penalty is the absence of these things, and being in bondage to the flesh-- that is, having an inconstant and wavering spirit. 73 These points being noted, I must now inquire: I. Whether by the natural light of reason we can conceive of God as a law-giver or potentate ordaining laws for humans? 74 II. What is the teaching of Holy Writ concerning this natural light of reason and natural law? 75 III. With what objects were ceremonies formerly instituted?

76 (V.) Lastly, what is the good gained by knowing the sacred histories and believing them? 77 Of the first two I will treat in this chapter, of the remaining two in

the following one. 78 Our conclusion about the first is easily deduced from the nature of God's will, which is only distinguished from His understanding in relation to our intellect-- 79 that is, the will and the understanding of God are in reality one and the same, and are only distinguished in relation to our thoughts which we form concerning God's understanding. 80 For instance, if we are only looking to the fact that the nature of a triangle is from eternity contained in the Divine Nature as an eternal verity, we say that God possesses the idea of a triangle, or that He understands the nature of a triangle; 81 but if afterwards we look to the fact that the nature of a triangle is thus contained in the Divine Nature, solely by the necessity of the Divine Nature, and not by the necessity of the nature and essence of a triangle-- 82 in fact, that the necessity of a triangle's essence and Nature, in so far as they are conceived of as eternal verities, depends solely on the necessity of the Divine Nature and intellect, we then style God's will or decree, that which before we styled His intellect. 83 Wherefore we make one and the same affirmation concerning God when we say that He has from eternity decreed that three angles of a triangle are equal to two right angles, as when we say that He has understood it. 84 Hence the affirmations and the negations of God always involve necessity or truth; 85 so that, for example, if God said to Adam that He did not wish him to eat of the tree of knowledge of good and evil, it would have involved a contradiction that Adam should have been able to eat of it, 86 and would therefore have been impossible that he should have so eaten, for the Divine command would have involved an eternal necessity and truth. 87 But since Scripture nevertheless narrates that God did give this command to Adam, and yet that none the less Adam ate of the tree, 88 we must perforce say that God revealed to Adam the evil which would surely follow if he should eat of the tree, but did not disclose that such evil would of necessity come to pass. 89 Thus it was that Adam took the revelation to be not an eternal and necessary truth, but a law-- 90 that

is, an ordinance followed by gain or loss, not depending necessarily on the nature of the act performed, but solely on the will and absolute power of some potentate, 91 so that the revelation in question was solely in relation to Adam, and solely through his lack of knowledge a law, and God was, as it were, a lawgiver and potentate. 92 From the same cause, namely, from lack of knowledge, the Decalogue in relation to the Hebrews was a law, for since they knew not the existence of God as an eternal truth, they must have taken as a law that which was revealed to them in the Decalogue, 93 namely, that God exists, and that God only should be worshipped. 94 But if God had spoken to them without the intervention of any bodily means, immediately they would have perceived it not as a law, but as an eternal truth.

95 What we have said about the Israelites and Adam, applies also to all the prophets who wrote laws in God's name-- they did not adequately conceive God's decrees as eternal truths. 96 For instance, we must say of Moses that from revelation, from the basis of what was revealed to him, he perceived the method by which the Israelitish nation could best be united in a particular territory, and could form a body politic or state, 97 and further that he perceived the method by which that nation could best be constrained to obedience; 98 but he did not perceive, nor was it revealed to him, that this method was absolutely the best, nor that the obedience of the people in a certain strip of territory would necessarily imply the end he had in view. 99 Wherefore he perceived these things not as eternal truths, but as precepts and ordinances, and he ordained them as laws of God, 100 and thus it came to be that he conceived God as a ruler, a legislator, a king, as merciful, just, whereas such qualities are simply attributes of human nature, and utterly alien from the nature of the Deity.

101 Thus much we may affirm of the prophets who wrote laws in the name of God; but we must not affirm it of Christ, 102 for Christ, although He too seems to have written laws in the name of God, must be taken to have had a clear

and adequate perception, for Christ was not so much a prophet as the mouthpiece of God. 103 For God made revelations to humankind through Christ as He had before done through angels-- that is, a created voice, visions. 104 It would be as unreasonable to say that God had accommodated His revelations to the opinions of Christ as that He had before accommodated them to the opinions of angels (that is, of a created voice or visions) as matters to be revealed to the prophets, a wholly absurd hypothesis.

105 Moreover, Christ was sent to teach not only the Jews but the whole human race, and therefore it was not enough that His mind should be accommodated to the opinions the Jews alone, 106 but also to the opinion and fundamental teaching common to the whole human race-- in other words, to ideas universal and true. 107 Inasmuch as God revealed Himself to Christ, or to Christ's mind immediately, and not as to the prophets through words and symbols, we must needs suppose that Christ perceived truly what was revealed, 108 in other words, He understood it, for a matter is understood when it is perceived simply by the mind without words or symbols. 109 Christ, then, perceived (truly and adequately) what was revealed, and if He ever proclaimed such revelations as laws, He did so because of the ignorance and obstinacy of the people, acting in this respect the part of God; 110 inasmuch as He accommodated Himself to the comprehension of the people, and though He spoke somewhat more clearly than the other prophets, 111 yet He taught what was revealed obscurely, and generally through parables, especially when He was speaking to those to whom it was not yet given to understand the kingdom of heaven. (See Matthew, Chapter-13:10, 112 To those to whom it was given to understand the mysteries of heaven, He doubtless taught His doctrines as eternal truths, and did not lay them down as laws, thus freeing the minds of His hearers from the bondage of that law which He further confirmed and established. 113 Paul apparently points to this more than once (e.g. Romans, Chapter-7:6, and 3:28), though he never himself seems to

wish to speak openly, but, to quote his own words (Romans 3:6, and 6:19), "merely humanly." 114 This he expressly states when he calls God just, and it was doubtless in concession to human weakness that he attributes mercy, grace, anger, and similar qualities to God, 115 adapting his language to the popular mind, or, as he puts it (1 Corinthians.3:1, 2), to carnal people. In Rom. 9:18, he teaches undisguisedly that God's auger and mercy depend not on the actions of people, but on God's own nature or will; 116 further, that no one is justified by the works of the law, but only by faith, which he seems to identify with the full assent of the soul; 117 lastly, that no one is blessed unless you have in you the mind of Christ (Romans, Chapter-8:9), whereby he perceives the laws of God as eternal truths. 118 We conclude, therefore, that God is described as a lawgiver or prince, and styled just, merciful, merely in concession to popular understanding, and the imperfection of popular knowledge; 119 that in reality God acts and directs all things simply by the necessity of His nature and perfection, and that His decrees and volitions are eternal truths, and always involve necessity.

120 So much for the first point which I wished to explain and demonstrate. Passing on to the second point, let us search the sacred pages for their teaching concerning the light of Nature and this Divine law. 121 The first doctrine we find in the history of the first human, where it is narrated that God commanded Adam not to eat of the fruit of the tree of the knowledge of good and evil; 122 this seems to mean that God commanded Adam to do and to seek after righteousness because it was good, not because the contrary was evil: that is, to seek the good for its own sake, not from fear of evil. 123 We have seen that you who acts rightly from the true knowledge and love of right, acts with freedom and constancy, whereas you who acts from fear of evil, is under the constraint of evil, and acts in bondage under external control. 124 So that this commandment of God to Adam comprehends the whole Divine natural law, and absolutely agrees with the dictates of the light of

Nature; 125 nay, it would be easy to explain on this basis the whole history or allegory of the first human.

126 But I prefer to pass over the subject in silence, because, in the first place, I cannot be absolutely certain that my explanation would be in accordance with the intention of the sacred writer; 127 and, secondly, because many do not admit that this history is an allegory, maintaining it to be a simple narrative of facts. 128 It will be better, therefore, to adduce other passages of Scripture, especially such as were written by him, who speaks with all the strength of his natural understanding, 129 in which he surpassed all his contemporaries, and whose sayings are accepted by the people as of equal weight with those of the prophets. 130 I mean Solomon, whose prudence and wisdom are commended in Scripture rather than his piety and gift of prophecy. 131 Life being taken to mean the true life (as is evident from Deuteronomy, Chapter 30:19), the fruit of the understanding consists only in the true life, and its absence constitutes punishment. 132 All this absolutely agrees with what was set out in our fourth point concerning natural law. 133 Moreover our position that it is the well-spring of life, and that the intellect alone lays down laws for the wise, is plainly taught by, the sage, 134 for he says (Proverb, Chapter-13:14): "The law of the wise is a fountain of life" - that is, as we gather from the preceding text, the understanding. 135 In Proverb, Chapter-3:13, he expressly teaches that the understanding renders human blessed and happy, and gives you true peace of mind. 136 "Happy is the person that findeth wisdom, and the person that getteth understanding," for "Wisdom gives length of days, and riches and honour; her ways are ways of pleasantness, and all her paths peace" (14:6 and 17). 137 According to Solomon, therefore, it is only the wise who live in peace and equanimity, not like the wicked whose minds drift hither and thither, 138 and (as Isaiah says, Chapter-57:20) "are like the troubled sea, for them there is no peace."

139 Lastly, we should especially note the passage in chapter-2. of Solomon's proverbs which most clearly confirms our contention: 140 "If thou criest after knowledge, and liftest up thy voice for understanding . . . then shalt thou understand the fear of the Lord, and find the knowledge of God; for the Lord giveth wisdom; out of His mouth cometh knowledge and understanding." 141 These words clearly enunciate (1), that wisdom or intellect alone teaches us to fear God wisely-- that is, to worship Him truly; 142 (2), that wisdom and knowledge flow from God's mouth, and that God bestows on us this gift; 143 this we have already shown in proving that our understanding and our knowledge depend on, spring from, and are perfected by the idea or knowledge of God, and nothing else. 144 Solomon goes on to say in so many words that this knowledge contains and involves the true principles of ethics and politics: 145 "When wisdom entereth into thy heart, and knowledge is pleasant to thy soul, discretion shall preserve thee, understanding shall keep thee, then shalt thou understand righteousness, and judgment, and equity, yea every good path." 146 All of which is in obvious agreement with natural knowledge: for after we have come to the understanding of things, and have tasted the excellence of knowledge, she teaches us ethics and true virtue.

147 Thus the happiness and the peace of you who cultivates your natural understanding lies, according to Solomon also, not so much under the dominion of fortune (or God's external aid) as in inward personal virtue (or God's internal aid), for the latter can to a great extent be preserved by vigilance, right action, and thought. 148 Lastly, we must by no means pass over the passage in Paul's Epistle to the Romans, Chapter-1:20, in which he says: 149 "For the invisible things of God from the creation of the world are clearly seen, being understood by the things that are made, even His eternal power and Godhead; so that they are without excuse, because, when they knew God, they glorified Him not as God, neither were they thankful." 150 These words clearly show that

everyone can by the light of Nature clearly understand the goodness and the eternal divinity of God, and can thence know and deduce what they should seek for and what avoid; 151 wherefore the Apostle says that they are without excuse and cannot plead ignorance, as they certainly might if it were a question of supernatural light and the incarnation, passion, and resurrection of Christ. 152 "Wherefore," he goes on to say (Romans, Chapter-1:24), "God gave them up to uncleanness through the lusts of their own hearts;" and so on, through the rest of the chapter, he describes the vices of ignorance, and sets them forth as the punishment of ignorance. 153 This obviously agrees with the verse of Solomon, already quoted, "The instruction of fools is folly," so that it is easy to understand why Paul says that the wicked are without excuse. 154 As every human sows so shall you reap: out of evil, evils necessarily spring, unless they be wisely counteracted.

155 Thus we see that Scripture literally approves of the light of natural reason and the natural Divine law, and I have fulfilled the promises made at the beginning of this chapter.

OF THE CEREMONIAL LAW.

Benedict of Spinoza

2 In the foregoing chapter we have shown that the Divine law, which renders humans truly blessed, and teaches them the true life, is universal to all humans; 2 nay, we have so intimately deduced it from human nature that it must be esteemed innate, and, as it were, ingrained in the human mind. 3 But with regard to the ceremonial observances which were ordained in the Old Testament for the Hebrews only, and were so adapted to their state that they could for the most part only be observed by the society as a whole and not by each individual, 4 it is evident that they formed no part of the Divine law, and had nothing to do with blessedness and virtue, but had reference only to the election of the Hebrews, 5 that is, to their temporal bodily happiness and the

tranquillity of their kingdom, and that therefore they were only valid while that kingdom lasted. 6 If in the Old Testament they are spoken of as the law of God, it is only because they were founded on revelation, or a basis of revelation. 7 Still as reason, however sound, has little weight with ordinary theologians, I will adduce the authority of Scripture for what I here assert, 8 and will further show, for the sake of greater clearness, why and how these ceremonials served to establish and preserve the Jewish kingdom. 9 Isaiah teaches most plainly that the Divine law in its strict sense signifies that universal law which consists in a true manner of life, and does not signify ceremonial observances. 10 In Isaiah, Chapter-1:10, the prophet calls on his countrymen to hearken to the Divine law as he delivers it, and first excluding all kinds of sacrifices and all feasts, 11 he at length sums up the law in these few words, "Cease to do evil, learn to do well: seek judgment, relieve the oppressed." 12 Not less striking testimony is given in Psalm 40:7-9, where the Psalmist addresses God: 13 "Sacrifice and offering Thou didst not desire; mine ears hast Thou opened; burnt offering and sin-offering hast Thou not required; I delight to do Thy will, O my God; yea, Thy law is within my heart." 14 Here the Psalmist reckons as the law of God only that which is inscribed in your heart, and excludes ceremonies therefrom, for the latter are good and inscribed on the heart only from the fact of their institution, and not because of their intrinsic value. 15 Other passages of Scripture testify to the same truth, but these two will suffice.

16 We may also learn from the Bible that ceremonies are no aid to blessedness, but only have reference to the temporal prosperity of the kingdom; 17 for the rewards promised for their observance are merely temporal advantages and delights, blessedness being reserved for the universal Divine law. 18 In all the five books commonly attributed to Moses nothing is promised, as I have said, beyond temporal benefits, such as honours, fame, victories, riches, enjoyments, and health. 19 Though many moral

precepts besides ceremonies are contained in these five books, they appear not as moral doctrines universal to all humans, 20 but as commands especially adapted to the understanding and character of the Hebrew people, and as having reference only to the welfare of the kingdom. 21 For instance, Moses does not teach the Jews as a prophet not to kill or to steal, but gives these commandments solely as a lawgiver and judge; 22 he does not reason out the doctrine, but affixes for its non-observance a penalty which may and very properly does vary in different nations. 23 So, too, the command not to commit adultery is given merely with reference to the welfare of the state; 24 for if the moral doctrine had been intended, with reference not only to the welfare of the state, but also to the tranquillity and blessedness of the individual, Moses would have condemned not merely the outward act, but also the mental acquiescence, 25 as is done by Christ, Who taught only universal moral precepts, and for this cause promises a spiritual instead of a temporal reward.

26 Christ, as I have said, was sent into the world, not to preserve the state nor to lay down laws, but solely to teach the universal moral law, 27 so we can easily understand that He wished in nowise to do away with the law of Moses, inasmuch as He introduced no new laws of His own-- 28 His sole care was to teach moral doctrines, and distinguish them from the laws of the state; 29 for the Pharisees, in their ignorance, thought that the observance of the state law and the Mosaic law was the sum total of morality; 30 whereas such laws merely had reference to the public welfare, and aimed not so much at instructing the Jews as at keeping them under constraint. 31 But let us return to our subject, and cite other passages of Scripture which set forth temporal benefits as rewards for observing the ceremonial law, and blessedness as reward for the universal law.

32 None of the prophets puts the point more clearly than Isaiah. After condemning hypocrisy he commends liberty and charity towards one's self and one's neighbours, and promises as a

reward: 33 "Then shall thy light break forth as the morning, and thy health shall spring forth speedily, thy righteousness shall go before thee, and the glory of the Lord shall be thy reward" (Isaiah, Chapter-58:8). 34 Shortly afterwards he commends the Sabbath, and for a due observance of it, promises: "Then shalt thou delight thyself in the Lord, and I will cause thee to ride upon the high places of the earth, and feed thee with the heritage of Jacob thy father: for the mouth of the Lord has spoken it." 35 Thus the prophet for liberty bestowed, and charitable works, promises a healthy mind in a healthy body, and the glory of the Lord even after death; whereas, for ceremonial exactitude, he only promises security of rule, prosperity, and temporal happiness. 36 In Psalms, Chapter-15. and 24. no mention is made of ceremonies, but only of moral doctrines, inasmuch as there is no question of anything but blessedness, and blessedness is symbolically promised: 37 it is quite certain that the expressions, "the hill of God," and "His tents and the dwellers therein," refer to blessedness and security of soul, not to the actual mount of Jerusalem and the tabernacle of Moses, for these latter were not dwelt in by anyone, and only the sons of Levi ministered there.

38 Further, all those sentences of Solomon to which I referred in the last chapter, for the cultivation of the intellect and wisdom, promise true blessedness, 39 for by wisdom is the fear of God at length understood, and the knowledge of God found.

40 That the Jews themselves were not bound to practise their ceremonial observances after the destruction of their kingdom is evident from Jeremiah. 41 For when the prophet saw and foretold that the desolation of the city was at hand, he said that God only delights in those who know and understand that He exercises loving-kindness, judgment, and righteousness in the earth, and that such persons only are worthy of praise. (Jeremiah 60:23.). 42 As though God had said that, after the desolation of the city, He would require nothing special from the

Jews beyond the natural law by which all humans are bound.

43 The New Testament also confirms this view, for only moral doctrines are therein taught, and the kingdom of heaven is promised as a reward, whereas ceremonial observances are not touched on by the Apostles, after they began to preach the Gospel to the Gentiles.

44 The Pharisees certainly continued to practise these rites after the destruction of the kingdom, but more with a view of opposing the Christians than of pleasing God: 45 for after the first destruction of the city, when they were led captive to Babylon, not being then, so far as I am aware, split up into sects, 46 they straightway neglected their rites, bid farewell to the Mosaic law, buried their national customs in oblivion as being plainly superfluous, and began to mingle with other nations, as we may abundantly learn from Ezra and Nehemiah. 47 We cannot, therefore, doubt that they were no more bound by the law of Moses, after the destruction of their kingdom, than they had been before it had been begun, 48 while they were still living among other peoples before the exodus from Egypt, and were subject to no special law beyond the natural law, 49 and also, doubtless, the law of the state in which they were living, in so far as it was consonant with the Divine natural law.

50 As to the fact that the patriarchs offered sacrifices, I think they did so for the purpose of stimulating their piety, for their minds had been accustomed from childhood to the idea of sacrifice, which we know had been universal from the time of Enoch; 51 and thus they found in sacrifice their most powerful incentive. 52 The patriarchs, then, did not sacrifice to God at the bidding of a Divine right, or as taught by the basis of the Divine law, but simply in accordance with the custom of the time; 53 and, if in so doing they followed any ordinance, it was simply the ordinance of the country they were living in, by which (as we have seen before in the case of Melchisedek) they were bound.

54 I think that I have now given Scriptural authority for my view: it

remains to show why and how the ceremonial observances tended to preserve and confirm the Hebrew kingdom; and this I can very briefly do on grounds universally accepted.

55 The formation of society serves not only for defensive purposes, but is also very useful, and, indeed, absolutely necessary, as rendering possible the division of labour. 56 If humans did not render mutual assistance to each other, no one would have either the skill or the time to provide for own sustenance and preservation: 57 for all humans are not equally apt for all work, and no one would be capable of preparing all that you individually stood in need of. 58 Strength and time, I repeat, would fail, if every one had in person to plough, to sow, to reap, to grind corn, to cook, to weave, to stitch, and perform the other numerous functions required to keep life going; 59 to say nothing of the arts and sciences which are also entirely necessary to the perfection and blessedness of human nature. 60 We see that peoples living, in uncivilised barbarism lead a wretched and almost animal life, and even they would not be able to acquire their few rude necessaries without assisting one another to a certain extent. 61 Now if humans were so constituted by nature that they desired nothing but what is designated by true reason, society would obviously have no need of laws: 62 it would be sufficient to inculcate true moral doctrines; and people would freely, without hesitation, act in accordance with their true interests. 63 But human nature is framed in a different fashion: every one, indeed, seeks own interest, but does not do so in accordance with the dictates of sound reason, 64 for most people's ideas of desirability and usefulness are guided by their fleshly instincts and emotions, which take no thought beyond the present and the immediate object. 65 Therefore, no society can exist without government, and force, and laws to restrain and repress humans' desires and immoderate impulses. 66 Still human nature will not submit to absolute repression. 67 Violent governments, as Seneca says, never last long; the moderate governments endure. 68 So long as humans act simply from fear they

act contrary to their inclinations, taking no thought for the advantages or necessity of their actions, but simply endeavouring to escape punishment or loss of life. 69 They must needs rejoice in any evil which befalls their ruler, even if it should involve themselves; and must long for and bring about such evil by every means in their power. 70 Again, humans are especially intolerant of serving and being ruled by their equals. 71 Lastly, it is exceedingly difficult to revoke liberties once granted.

72 From these considerations it follows, firstly, that authority should either be vested in the hands of the whole state in common, so that everyone should be bound to serve, and yet not be in subjection to your equals; 73 or else, if power be in the hands of a few, or one person, that one person should be something above average humanity, or should strive to get own self accepted as such. 74 Secondly, laws should in every government be so arranged that people should be kept in bounds by the hope of some greatly desired good, rather than by fear, for then everyone will do own duty willingly. 75 Lastly, as obedience consists in acting at the bidding of external authority, it would have no place in a state where the government is vested in the whole people, and where laws are made by common consent. 76 In such a society the people would remain free, whether the laws were added to or diminished, inasmuch as it would not be done on external authority, but their own free consent. 77 The reverse happens when the sovereign power is vested in one person, for all act at own bidding; 78 and, therefore, unless they had been trained from the first to depend on the words of their ruler, the latter would find it difficult, in case of need, to abrogate liberties once conceded, and impose new laws.

79 From these universal considerations, let us pass on to the kingdom of the Jews. 80 The Jews when they first came out of Egypt were not bound by any national laws, and were therefore free to ratify any laws they liked, or to make new ones, and were at liberty to set up a government and occupy a territory wherever they

chose. 81 However, they, were entirely unfit to frame a wise code of laws and to keep the sovereign power vested in the community; 82 they were all uncultivated and sunk in a wretched slavery, therefore the sovereignty was bound to remain vested in the hands of one person who would rule the rest and keep them under constraint, make laws and interpret them. 83 This sovereignty was easily retained by Moses, because he surpassed the rest in virtue and persuaded the people of the fact, proving it by many testimonies (see Exodus, Chapter-14, last verse, and Chapter-19:9). 84 He then, by the Divine virtue he possessed, made laws and ordained them for the people, taking the greatest care that they should be obeyed willingly and not through fear, 85 being specially induced to adopt this course by the obstinate nature of the Jews, who would not have submitted to be ruled solely by constraint; 86 and also by the imminence of war, for it is always better to inspire soldiers with a thirst for glory than to terrify them with threats; 87 each person will then strive to distinguish own self by valour and courage, instead of merely trying to escape punishment.

88 Moses, therefore, by his virtue and the Divine command, introduced a religion, so that the people might do their duty from devotion rather than fear. 89 Further, he bound them over by benefits, and prophesied many advantages in the future; 90 nor were his laws very severe, as anyone may see for own self, especially if he remarks the number of circumstances necessary in order to procure the conviction of an accused person.

91 Lastly, in order that the people which could not govern itself should be entirely dependent on its ruler, you left nothing to the free choice of individuals (who had hitherto been slaves); 92 the people could do nothing but remember the law, and follow the ordinances laid down at the good pleasure of their ruler; 93 they were not allowed to plough, to sow, to reap, nor even to eat; to clothe themselves, to shave, to rejoice, or in fact to do anything whatever as they liked, 94 but were bound to follow the directions given in the law; and

not only this, but they were obliged to have marks on their door-posts, on their hands, and between their eyes to admonish them to perpetual obedience.

95 This, then, was the object of the ceremonial law, that humans should do nothing of their own free-will, 96 but should always act under external authority, and should continually confess by their actions and thoughts that they were not their own masters, but were entirely under the control of others.

97 From all these considerations it is clearer than day that ceremonies have nothing to do with a state of blessedness, 98 and that those mentioned in the Old Testament, i.e. the whole Mosaic Law, had reference merely to the government of the Jews, and merely temporal advantages.

99 As for the Christian rites, such as baptism, the Lord's Supper, festivals, public prayers, and any other observances which are, and always have been, common to all Christendom, 100 if they were instituted by Christ or His Apostles (which is open to doubt), they were instituted as external signs of the universal church, and not as having anything to do with blessedness, or possessing any sanctity in themselves. 101 Therefore, though such ceremonies were not ordained for the sake of upholding a government, they were ordained for the preservation of a society, 102 and accordingly you who lives alone is not bound by them: nay, those who live in a country where the Christian religion is forbidden, are bound to abstain from such rites, and can none the less live in a state of blessedness. 103 We have an example of this in Japan, where the Christian religion was forbidden, and the Dutch who lived there are enjoined by their East India Company not to practise any outward rites of religion. 104 I need not cite other examples, though it would be easy to prove my point from the fundamental principles of the New Testament, and to adduce many confirmatory instances; but I pass on the more willingly, as I am anxious to proceed to my next proposition. 105 I will now, therefore, pass on to what I proposed to treat of in the second part of this chapter,

namely, what persons are bound to believe in the narratives contained in Scripture, and how far they are so bound. 106 Examining this question by the aid of natural reason, I will proceed as follows.

If anyone wishes to persuade own fellows for or against anything which is not self-evident, you must deduce your contention from their admissions, and convince them either by experience or by ratiocination; 107 either by appealing to facts of natural experience, or to self-evident intellectual axioms. 108 Now unless the experience be of such a kind as to be clearly and distinctly understood, though it may convince a person, it will not have the same effect on your mind and disperse the clouds of your doubt so completely as when the doctrine taught is deduced entirely from intellectual axioms-- 109 that is, by the mere power of the understanding and logical order, and this is especially the case in spiritual matters which have nothing to do with the senses.

110 But the deduction of conclusions from general truths a priori, usually requires a long chain of arguments, and, moreover, very great caution, acuteness, and self-restraint-- 111 qualities which are not often met with; therefore people prefer to be taught by experience rather than deduce their conclusion from a few axioms, and set them out in logical order. 112 Whence it follows, that if anyone wishes to teach a doctrine to a whole nation (not to speak of the whole human race), and to be understood by all people in every particular, you will seek to support your teaching with experience, 113 and will endeavour to suit your reasonings and the definitions of your doctrines as far as possible to the understanding of the common people, who form the majority of humankind, 114 and you will not set them forth in logical sequence nor adduce the definitions which serve to establish them. 115 Otherwise you writes only for the learned-- that is, you will be understood by only a small proportion of the human race.

116 All Scripture was written primarily for an entire people, and secondarily for the whole human race; 117 therefore its contents

must necessarily be adapted as far as possible to the understanding of the masses, and proved only by examples drawn from experience. 118 We will explain ourselves more clearly. The chief speculative doctrines taught in Scripture are the existence of God, or a Being Who made all things, and Who directs and sustains the world with consummate wisdom; 119 furthermore, that God takes the greatest thought for humans, or such of them as live piously and honourably, while He punishes, with various penalties, those who do evil, separating them from the good. 120 All this is proved in Scripture entirely through experience-- that is, through the narratives there related. 121 No definitions of doctrine are given, but all the sayings and reasonings are adapted to the understanding of the masses. 122 Although experience can give no clear knowledge of these things, nor explain the nature of God, nor how He directs and sustains all things, it can nevertheless teach and enlighten humans sufficiently to impress obedience and devotion on their minds.

123 It is now, I think, sufficiently clear what persons are bound to believe in the Scripture narratives, and in what degree they are so bound, 124 for it evidently follows from what has been said that the knowledge of and belief in them is particularly necessary to the masses whose intellect is not capable of perceiving things clearly and distinctly. 125 Further, you who denies them because you does not believe that God exists or takes thought for humans and the world, may be accounted impious; 126 but a person who is ignorant of them, and nevertheless knows by natural reason that God exists, as we have said, and has a true plan of life, is altogether blessed-- 127 yes, more blessed than the common herd of believers, because besides true opinions you possesses also a true and distinct conception. 128 Lastly, you who is ignorant of the Scriptures and knows nothing by the light of reason, though you may not be impious or rebellious, is yet less than human and almost brutal, having none of God's gifts. 129 We must here remark that when we say that the knowledge of the

sacred narrative is particularly necessary to the masses, we do not mean the knowledge of absolutely all the narratives in the Bible, but only of the principal ones, 130 those which, taken by themselves, plainly display the doctrine we have just stated, and have most effect over humans' minds.

131 If all the narratives in Scripture were necessary for the proof of this doctrine, and if no conclusion could be drawn without the general consideration of every one of the histories contained in the sacred writings, 132 truly the conclusion and demonstration of such doctrine would overtask the understanding and strength not only of the masses, but of humanity; 133 who is there who could give attention to all the narratives at once, and to all the circumstances, and all the scraps of doctrine to be elicited from such a host of diverse histories? 134 I cannot believe that the people who have left us the Bible as we have it were so abounding in talent that they attempted setting about such a method of demonstration, 135 still less can I suppose that we cannot understand Scriptural doctrine till we have given heed to the quarrels of Isaac, the advice of Achitophel to Absalom, the civil war between Jews and Israelites, and other similar chronicles; 136 nor can I think that it was more difficult to teach such doctrine by means of history to the Jews of early times, the contemporaries of Moses, than it was to the contemporaries of Esdras. 137 But more will be said on this point hereafter, we may now only note that the masses are only bound to know those histories which can most powerfully dispose their mind to obedience and devotion. 138 However, the masses are not sufficiently skilled to draw conclusions from what they read, they take more delight in the actual stories, and in the strange and unlooked-for issues of events than in the doctrines implied; 139 therefore, besides reading these narratives, they are always in need of pastors or church ministers to explain them to their feeble intelligence.

140 But not to wander from our point, let us conclude with what has been our principal object--namely, that the truth of narratives, be they what they may, has

nothing to do with the Divine law, 141 and serves for nothing except in respect of doctrine, the sole element which makes one history better than another. 142 The narratives in the Old and New Testaments surpass profane history, and differ among themselves in merit simply by reason of the salutary doctrines which they inculcate. 143 Therefore, if a person were to read the Scripture narratives believing the whole of them, but were to give no heed to the doctrines they contain, and make no amendment in your life, 144 you might employ yourself just as profitably in reading the Koran or the poetic drama, or ordinary chronicles, with the attention usually given to such writings; 145 on the other hand, if a person is absolutely ignorant of the Scriptures, and none the less has right opinions and a true plan of life, you are absolutely blessed and truly possesses in yourself the spirit of Christ.

146 The Jews are of a directly contrary way of thinking, for they hold that true opinions and a true plan of life are of no service in attaining blessedness, 147 if their possessors have arrived at them by the light of reason only, and not like the documents prophetically revealed to Moses. 148 Maimonides ventures openly to make this assertion: "Every person who takes to heart the seven precepts and diligently follows them, is counted with the pious among the nation, and an heir of the world to come; 149 that is to say, if you takes to heart and follows them because God ordained them in the law, and revealed them to us by Moses, because they were of aforetime precepts to the sons of Noah: 150 but you who follows them as led thereto by reason, is not counted as a dweller among the pious or among the wise of the nations." 151 Such are the words Of Maimonides, to which R. Joseph, the son of Shem Job, adds in his book which he calls "Kebod Elohim, or God's Glory," 152 that although Aristotle (whom he considers to have written the best ethics and to be above everyone else) has not omitted anything that concerns true ethics, and which he has adopted in his own book,

153 carefully following the lines laid down, yet this was not able to suffice for his salvation, inasmuch as he embraced his doctrines in accordance with the dictates of reason and not as Divine documents prophetically revealed. 154 However, that these are mere figments, and are not supported by Scriptural authority will, I think, be sufficiently evident to the attentive reader, so that an examination of the theory will be sufficient for its refutation. 155 It is not my purpose here to refute the assertions of those who assert that the natural light of reason can teach nothing, of any value concerning the true way of salvation. 156 People who lay no claims to reason for themselves, are not able to prove by reason this their assertion; 157 and if they hawk about something superior to reason, it is a mere figment, and far below reason, as their general method of life sufficiently shows. 158 But there is no need to dwell upon such persons. I will merely add that we can only judge of a person by own works. 159 If a person abounds in the fruits of the Spirit, charity, joy, peace, long-suffering, kindness, goodness, faith, gentleness, chastity, against which, as Paul says (Galatians, Chapter-5:22), 160 there is no law, such an one, whether he be taught by reason only or by the Scripture only, has been in very truth taught by God, and is altogether blessed. 161 Thus have I said all that I undertook to say concerning Divine law.

OF THE TRUE ORIGINAL OF THE DIVINE LAW, AND WHEREFORE SCRIPTURE IS CALLED SACRED, AND THE WORD OF GOD

Benedict of Spinoza

HOW THAT, IN SO FAR AS IT CONTAINS THE WORD OF GOD, IT HAS COME DOWN TO US UNCORRUPTED

3 Those who look upon the Bible as a message sent down by God from Heaven to humans, will doubtless cry out that I have committed the sin against the Holy Ghost because I have asserted that the Word of God is faulty, mutilated, tampered with, and inconsistent; 2 that we possess it only in fragments, and that the

original of the covenant which God made with the Jews has been lost. 3 However, I have no doubt that a little reflection will cause them to desist from their uproar: 4 for not only reason but the expressed opinions of prophets and apostles openly proclaim that God's eternal Word and covenant, no less than true religion, is Divinely inscribed in human hearts, 5 that is, in the human mind, and that this is the true original of God's covenant, stamped with His own seal, namely, the idea of Himself, as it were, with the image of His Godhood.

6 Religion was imparted to the early Hebrews as a law written down, because they were at that time in the condition of children, 7 but afterwards Moses (Deuteronomy,Chapter-30:6) and Jeremiah (31:33) predicted a time coming when the Lord should write His law in their hearts. 8 Thus only the Jews, and amongst them chiefly the Sadducees, struggled for the law written on tablets; least of all need those who bear it inscribed on their hearts join in the contest. 9 Those, therefore, who reflect, will find nothing in what I have written repugnant either to the Word of God or to true religion and faith, or calculated to weaken either one or the other: 10 contrariwise, they will see that I have strengthened religion; indeed, had it not been so, I should certainly have decided to hold my peace, 11 nay, I would even have asserted as a way out of all difficulties that the Bible contains the most profound hidden mysteries; 12 however, as this doctrine has given rise to gross superstition and other pernicious results, I have thought such a course unnecessary, especially as religion stands in no need of superstitious adornments, but is, on the contrary, deprived by such trappings of some of her splendour.

13 Still, it will be said, though the law of God is written in the heart, the Bible is none the less the Word of God, and it is no more lawful to say of Scripture than of God's Word that it is mutilated and corrupted. 14 I fear that such objectors are too anxious to be pious, and that they are in danger of turning religion into

superstition, and worshipping paper and ink in place of God's Word. 15 I am certified of thus much: I have said nothing unworthy of Scripture or God's Word, and I have made no assertions which I could not prove by most plain argument to be true. 16 I can, therefore, rest assured that I have advanced nothing which is impious or even savours of impiety. 17 I confess that some profane people, to whom religion is a burden, may, from what I have said, assume a licence to sin, 18 and without any reason, at the simple dictates of their lusts conclude that Scripture is everywhere faulty and falsified, and that therefore its authority is null; 19 but such people are beyond the reach of help, for nothing, as the proverb has it, can be said so rightly that it cannot be twisted into wrong. 20 Those who wish to give rein to their lusts are at no loss for an excuse, nor were those people of old who possessed the original Scriptures, the ark of the covenant, nay, the prophets and apostles in person among them, any better than the people of to-day. 21 Human nature, Jew as well as Gentile, has always been the same, and in every age virtue has been exceedingly rare.

22 Nevertheless, to remove every scruple, I will here show in what sense the Bible or any inanimate thing should be called sacred and Divine; 23 also wherein the law of God consists, and how it cannot be contained in a certain number of books; 24 and, lastly, I will show that Scripture, in so far as it teaches what is necessary for obedience and salvation, cannot have been corrupted. 25 From these considerations everyone will be able to judge that I have neither said anything against the Word of God nor given any foothold to impiety.

26 A thing is called sacred and Divine when it is designed for promoting piety, and continues sacred so long as it is religiously used: 27 if the users cease to be pious, the thing ceases to be sacred: if it be turned to base uses, that which was formerly sacred becomes unclean and profane. 28 For instance, a certain spot was named by the patriarch Jacob the house of God, because he worshipped God there revealed to

him: 29 by the prophets the same spot was called the house of iniquity (see Amos, Chapter-5:5, and Hosea, Chapter-10:5), because the Israelites were wont, at the instigation of Jeroboam, to sacrifice there to idols. 30 Another example puts the matter in the plainest light. Words gain their meaning solely from their usage, and if they are arranged according to their accepted signification so as to move those who read them to devotion, they will become sacred, and the book so written will be sacred also. 31 But if their usage afterwards dies out so that the words have no meaning, or the book becomes utterly neglected, whether from unworthy motives, or because it is no longer needed, then the words and the book will lose both their use and their sanctity: 32 lastly, if these same words be otherwise arranged, or if their customary meaning becomes perverted into its opposite, then both the words and the book containing them become, instead of sacred, impure and profane.

33 From this it follows that nothing is in itself absolutely sacred, or profane, and unclean, apart from the mind, but only relatively thereto. 34 Thus much is clear from many passages in the Bible. Jeremiah (to select one case out of many) says (Chapter-7:4), that the Jews of his time were wrong in calling Solomon's Temple, the Temple of God, 35 for, as he goes on to say in the same chapter, God's name would only be given to the Temple so long as it was frequented by people who worshipped Him, and defended justice, 36 but that, if it became the resort of murderers, thieves, idolaters, and other wicked persons, it would be turned into a den of malefactors.

37 Scripture, curiously enough, nowhere tells us what became of the Ark of the Covenant, though there is no doubt that it was destroyed, or burnt together with the Temple; 38 yet there was nothing which the Hebrews considered more sacred, or held in greater reverence.

39 Thus Scripture is sacred, and its words Divine so long as it stirs humankind to devotion towards God: 40 but if it be utterly neglected, as it formerly was by the Jews, it becomes nothing but

paper and ink, and is left to be desecrated or corrupted: 41 still, though Scripture be thus corrupted or destroyed, we must not say that the Word of God has suffered in like manner, else we shall be like the Jews, who said that the Temple which would then be the Temple of God had perished in the flames. 42 Jeremiah tells us this in respect to the law, for he thus chides the ungodly of his time, "Wherefore, say you we are masters, and the law of the Lord is with us? 43 Surely it has been given in vain, it is in vain that the pen of the scribes" (has been made)-- that is, you say falsely that the Scripture is in your power, and that you possess the law of God; for ye have made it of none effect.

44 So also, when Moses broke the first tables of the law, he did not by any means cast the Word of God from his hands in anger and shatter it-- such an action would be inconceivable, either of Moses or of God's Word-- 45 he only broke the tables of stone, which, though they had before been holy from containing the covenant wherewith the Jews had bound themselves in obedience to God, 46 had entirely lost their sanctity when the covenant had been violated by the worship of the calf, and were, therefore, as liable to perish as the ark of the covenant. 47 It is thus scarcely to be wondered at, that the original documents of Moses are no longer extant, nor that the books we possess met with the fate we have described, when we consider that the true original of the Divine covenant, the most sacred object of all, has totally perished.

48 Let them cease, therefore, who accuse us of impiety, inasmuch as we have said nothing against the Word of God, neither have we corrupted it, 49 but let them keep their anger, if they would wreak it justly, for the ancients whose malice desecrated the Ark, the Temple, and the Law of God, and all that was held sacred, subjecting them to corruption. 50 Furthermore, if, according to the saying of the Apostle in 2 Corinthians, Chapter-3:3, they possessed "the Epistle of Christ, written not with ink, but with the Spirit of the living God, not in tables of stone, but in the fleshy tables of the heart," let them cease

to worship the letter, and be so anxious concerning it.

51 I think I have now sufficiently shown in what respect Scripture should be accounted sacred and Divine; we may now see what should rightly be understood by the expression, the Word of the Lord; debar (the Hebrew original) signifies word, speech, command, and thing. 52 The causes for which a thing is in Hebrew said to be of God, or is referred to Him, have been already detailed in Chapter-1, 53 and we can therefrom easily gather what meaning Scripture attaches to the phrases, the word, the speech, the command, or the thing of God. 54 I need not, therefore, repeat what I there said, nor what was shown under the third head in the chapter on miracles. It is enough to mention the repetition for the better understanding of what I am about to say-- viz., 55 that the Word of the Lord when it has reference to anyone but God Himself, signifies that Divine law treated of; in other words, religion, universal and catholic to the whole human race, as Isaiah describes it (Chapter.-1:10), 56 teaching that the true way of life consists, not in ceremonies, but in charity, and a true heart, and calling it indifferently God's Law and God's Word. 57 The expression is also used metaphorically for the order of Nature and destiny (which, indeed, actually depend and follow from the eternal mandate of the Divine Nature), 58 and especially for such parts of such order as were foreseen by the prophets, for the prophets did not perceive future events as the result of natural causes, but as the fiats and decrees of God. 59 Lastly, it is employed for the command of any prophet, in so far as you had perceived it by your peculiar faculty or prophetic gift, and not by the natural light of reason; this use springs chiefly from the usual prophetic conception of God as a legislator.

60 There are, then, three causes for the Bible's being called the Word of God: because it teaches true religion, of which God is the eternal Founder; 61 because it narrates predictions of future events as though they were decrees of God; 62 because its actual authors generally perceived things not by their ordinary natural

faculties, but by a power peculiar to themselves, and introduced these things perceived, as told them by God.

63 Although Scripture contains much that is merely historical and can be perceived by natural reason, yet its name is acquired from its chief subject matter. 64 We can thus easily see how God can be said to be the Author of the Bible: it is because of the true religion therein contained, and not because He wished to communicate to people a certain number of books. 65 We can also learn from hence the reason for the division into Old and New Testament. It was made because the prophets who preached religion before Christ, preached it as a national law in virtue of the covenant entered into under Moses; 66 while the Apostles who came after Christ, preached it to all humans as a universal religion solely in virtue of Christ's Passion: 67 the cause for the division is not that the two parts are different in doctrine, nor that they were written as originals of the covenant, 68 nor, lastly, that the catholic religion (which is in entire harmony with our nature) was new except in relation to those who had not known it: "it was in the world," as John the Evangelist says, "and the world knew it not."

69 Thus, even if we had fewer books of the Old and New Testament than we have, we should still not be deprived of the Word of God (which, as we have said, is identical with true religion), even as we do not now hold ourselves to be deprived of it, 70 though we lack many cardinal writings such as the Book of the Law, which was religiously guarded in the Temple as the original of the Covenant, 71 also the Book of Wars, the Book of Chronicles, and many others, from whence the extant Old Testament was taken and compiled. 72 The above conclusion may be supported by many reasons.

(I.) Because the books of both Testaments were not written by express command at one place for all ages, but are a fortuitous collection of the works of humans, writing each as own period and disposition dictated. 73 So much is clearly shown by the call of the prophets who were bade to

admonish the ungodly of their time, and also by the Apostolic Epistles.

74 (II.) Because it is one thing to understand the meaning of Scripture and the prophets, and quite another thing to understand the meaning of God, or the actual truth. 75 We showed that it applied to historic narratives, and to miracles: but it by no means applies to questions concerning true religion and virtue.

76 (III.) Because the books of the Old Testament were selected from many, and were collected and sanctioned by a council of the Pharisees. 77 The books of the New Testament were also chosen from many by councils which rejected as spurious other books held sacred by many. 78 But these councils, both Pharisee and Christian, were not composed of prophets, but only of learned people and teachers. 79 Still, we must grant that they were guided in their choice by a regard for the Word of God; and they must, therefore, have known what the law of God was.

80 (IV.) Because the Apostles wrote not as prophets, but as teachers, and chose whatever method they thought best adapted for those whom they addressed: 81 and consequently, there are many things in the Epistles (as we showed at the end of the last Chapter) which are not necessary to salvation.

82 (V.) Lastly, because there are four Evangelists in the New Testament, and it is scarcely credible that God can have designed to narrate the life of Christ four times over, and to communicate it thus to humankind. 83 For though there are some details related in one Gospel which are not in another, and one often helps us to understand another, we cannot thence conclude that all that is set down is of vital importance to us, 84 and that God chose the four Evangelists in order that the life of Christ might be better understood; for each one preached his Gospel in a separate locality, each wrote it down as he preached it, in simple language, in order that the history of Christ might be clearly told, not with any view of explaining own fellow-Evangelists. 85 If there are some passages which can be

better, and more easily understood by comparing the various versions, they are the result of chance, and are not numerous: 86 their continuance in obscurity would have impaired neither the clearness of the narrative nor the blessedness of humankind.

87 We have now shown that Scripture can only be called the Word of God in so far as it affects religion, or the Divine law; 88 we must now point out that, in respect to these questions, it is neither faulty, tampered with, nor corrupt. 89 By faulty, tampered with, and corrupt, I here mean written so incorrectly, that the meaning cannot be arrived at by a study of the language, nor from the authority of Scripture. 90 I will not go to such lengths as to say that the Bible, in so far as it contains the Divine law, has always preserved the same vowel-points, the same letters, or the same words (I leave this to be proved by the Massoretes and other worshippers of the letter), 91 I only, maintain that the meaning by which alone an utterance is entitled to be called Divine, has come down to us uncorrupted, even though the original wording may have been more often changed than we suppose. 92 Such alterations, as I have said above, detract nothing from the Divinity of the Bible, for the Bible would have been no less Divine had it been written in different words or a different language. 93 That the Divine law has in this sense come down to us uncorrupted, is an assertion which admits of no dispute. 94 For from the Bible itself we learn, without the smallest difficulty or ambiguity, that its cardinal precept is: To love God above all things, and one's neighbour as one's self. 95 This cannot be a spurious passage, nor due to a hasty and mistaken scribe, for if the Bible had ever put forth a different doctrine it would have had to change the whole of its teaching, 96 for this is the corner-stone of religion, without which the whole fabric would fall headlong to the ground. The Bible would not be the work we have been examining, but something quite different.

97 We remain, then, unshaken in our belief that this has always been the doctrine of Scripture, and, consequently, that no error

sufficient to vitiate it can have crept in without being instantly, observed by all; 98 nor can anyone have succeeded in tampering with it and escaped the discovery of own malice. 99 As this corner-stone is intact, we must perforce admit the same of whatever other passages are indisputably dependent on it, and are also fundamental, 100 as, for instance, that a God exists, that He foresees all things, that He is Almighty, that by His decree the good prosper and the wicked come to naught, and, finally, that our salvation depends solely on His grace. 101 These are doctrines which Scripture plainly teaches throughout, and which it is bound to teach, else all the rest would be empty and baseless; 102 nor can we be less positive about other moral doctrines, which plainly are built upon this universal foundation-- for instance, to uphold justice, to aid the weak, to do no murder, to covet no human's goods, etc. 103 Precepts, I repeat, such as these, human malice and the lapse of ages are alike powerless to destroy, for if any part of them perished, its loss would immediately be supplied from the fundamental principle, 104 especially the doctrine of charity, which is everywhere in both Testaments extolled above all others. 105 Moreover, though it be true that there is no conceivable crime so heinous that it has never been committed, still there is no one who would attempt in excuse for own crimes to destroy the law, or introduce an impious doctrine in the place of what is eternal and salutary; 106 humans' nature is so constituted that everyone (be you king, queen or subject) who has committed a base action, tries to deck out own conduct with spurious excuses, till you seems to have done nothing but what is just and right.

107 We may conclude, therefore, that the whole Divine law, as taught by Scripture, has come down to us uncorrupted. 108 Besides this there are certain facts which we may be sure have been transmitted in good faith. For instance, the main facts of Hebrew history, which were perfectly well known to everyone. 109 The Jewish people were accustomed in former times to chant the ancient

history of their nation in psalms. 110 The main facts, also, of Christ's life and passion were immediately spread abroad through the whole Roman empire. 111 It is therefore scarcely credible, unless nearly everybody consented thereto, which we cannot suppose, that successive generations have handed down the broad outline of the Gospel narrative otherwise than as they received it.

112 Whatsoever, therefore, is spurious or faulty can only have reference to details-- 113 some circumstances in one or the other history or prophecy designed to stir the people to greater devotion; or in some miracle, with a view of confounding philosophers; 114 or, lastly, in speculative matters after they had become mixed up with religion, so that some individual might prop up own inventions with a pretext of Divine authority. 115 But such matters have little to do with salvation, whether they be corrupted little or much, as I will show in detail in the next chapter,

IT IS SHOWN THAT SCRIPTURE TEACHES ONLY VERY SIMPLE DOCTRINES, SUCH AS SUFFICE FOR RIGHT CONDUCT.

Benedict of Spinoza

4 In the second chapter of this treatise we pointed out that the prophets were gifted with extraordinary powers of imagination, but not of understanding; 2 also that God only revealed to them such things as are very simple-- not philosophic mysteries,-- and that He adapted His communications to their previous opinions. 3 We further showed that Scripture only transmits and teaches truths which can readily be comprehended by all; 4 not deducing and concatenating its conclusions from definitions and axioms, but narrating quite simply, and confirming its statements, with a view to inspiring belief, 5 by an appeal to experience as exemplified in miracles and history, and setting forth its truths in the style and phraseology which would most appeal to the popular mind. 6 Lastly, we demonstrated in that the difficulty of understanding Scripture lies in the language only,

and not in the abstruseness of the argument.

7 To these considerations we may add that the Prophets did not preach only to the learned, but to all Jews, without exception, while the Apostles were wont to teach the gospel doctrine in churches where there were public meetings; 8 whence it follows that Scriptural doctrine contains no lofty speculations nor philosophic reasoning, but only very simple matters, such as could be understood by the slowest intelligence.

9 I am consequently lost in wonder at the ingenuity of those whom I have already mentioned, who detect in the Bible mysteries so profound that they cannot be explained in human language, 10 and who have introduced so many philosophic speculations into religion that the Church seems like an academy, and religion like a science, or rather a dispute. 11 It is not to be wondered at that people, who boast of possessing supernatural intelligence, should be unwilling to yield the palm of knowledge to philosophers who have only their ordinary faculties; 12 still I should be surprised if I found them teaching any new speculative doctrine, which was not a commonplace to those Gentile philosophers whom, in spite of all, they stigmatise as blind; 13 for, if one inquires what these mysteries lurking in Scripture may be, one is confronted with nothing but the reflections of Plato or Aristotle, or the like, which it would often be easier for an ignorant person to dream than for the most accomplished scholar to wrest out of the Bible.

14 However, I do not wish to affirm absolutely that Scripture contains no doctrines in the sphere of philosophy, for in the last chapter I pointed out some of the kind, as fundamental principles; 15 but I go so far as to say that such doctrines are very few and very simple. Their precise nature and definition I will now set forth. 16 The task will be easy, for we know that Scripture does not aim at imparting scientific knowledge, and, therefore, it demands from humans nothing but obedience, and censures obstinacy, but not ignorance.

17 Furthermore, as obedience to God consists solely in love to our neighbour-- for whosoever loveth own neighbour, as a means of obeying God, hath, as St. Paul says (Romans, Chapter-13:8), fulfilled the law,-- 18 it follows that no knowledge is commended in the Bible save that which is necessary for enabling all humans to obey God in the manner stated, and without which they would become rebellious, or without the discipline of obedience. 19 Other speculative questions, which have no direct bearing on this object, or are concerned with the knowledge of natural events, do not affect Scripture, and should be entirely separated from religion.

20 Now, though everyone, as we have said, is now quite able to see this truth for yourself, I should nevertheless wish, considering that the whole of Religion depends thereon, to explain the entire question more accurately and clearly. 21 To this end I must first prove that the intellectual or accurate knowledge of God is not a gift, bestowed upon all good people like obedience; 22 and, further, that the knowledge of God, required by Him through His prophets from everyone without exception, as needful to be known, is simply a knowledge of His Divine justice and charity. 23 Both these points are easily proved from Scripture. The first plainly follows from Exodus, Chapter-6:2, where God, in order to show the singular grace bestowed upon Moses, 24 says to him: "And I appeared unto Abraham, unto Isaac, and unto Jacob by the name of El Sadai (God Almighty); but by my name Jehovah was I not known to them"-- 25 for the better understanding of which passage I may remark that El Sadai, in Hebrew, signifies the God who suffices, in that He gives to every human that which suffices for you; 26 and, although Sadai is often used by itself, to signify God, we cannot doubt that the word El (God, {power, might}) is everywhere understood.

27 Furthermore, we must note that Jehovah is the only word found in Scripture with the meaning of the absolute essence of God, without reference to created things. 28 The Jews maintain, for this reason, that this is, strictly speaking, the only

name of God; that the rest of the words used are merely titles; 29 and, in truth, the other names of God, whether they be substantives or adjectives, are merely attributive, and belong to Him, in so far as He is conceived of in relation to created things, or manifested through them. 30 Thus El, or Eloah, signifies powerful, as is well known, and only applies to God in respect to His supremacy, as when we call Paul an apostle; 31 the faculties of His power are set forth in an accompanying adjective, as El, great, awful, just, merciful, 32 or else all are understood at once by the use of El in the plural number, with a singular signification, an expression frequently adopted in Scripture.

33 Now, as God tells Moses that He was not known to the patriarchs by the name of Jehovah, it follows that they were not cognisant of any attribute of God which expresses His absolute essence, but only of His deeds and promises that is, of His power, as manifested in visible things. 34 God does not thus speak to Moses in order to accuse the patriarchs of infidelity, but, on the contrary, as a means of extolling their belief and faith, 35 inasmuch as, though they possessed no extraordinary knowledge of God (such as Moses had), they yet accepted His promises as fixed and certain; 36 whereas Moses, though his thoughts about God were more exalted, nevertheless doubted about the Divine promises, and complained to God that, instead of the promised deliverance, the prospects of the Israelites had darkened.

37 As the patriarchs did not know the distinctive name of God, and as God mentions the fact to Moses, in praise of their faith and single-heartedness, and in contrast to the extraordinary grace granted to Moses, 38 it follows, as we stated at first, that people are not bound by, decree to have knowledge of the attributes of God, such knowledge being only granted to a few of the faithful: 39 it is hardly worthwhile to quote further examples from Scripture, for everyone must recognise that knowledge of God is not equal among all good humans. 40 Moreover, a person cannot be

ordered to be wise any more than you can be ordered to live and exist. 41 Men, women, and children are all alike able to obey by commandment, but not to be wise. 42 If any tell us that it is not necessary to understand the Divine attributes, but that we must believe them simply, without proof, you are plainly trifling. 43 For what is invisible and can only be perceived by the mind, cannot be apprehended by any other means than proofs; 44 if these are absent the object remains ungrasped; the repetition of what has been heard on such subjects no more indicates or attains to their meaning than the words of a parrot or a puppet speaking without sense or signification.

45 Before I proceed I ought to explain how it comes that we are often told in Genesis that the patriarchs preached in the name of Jehovah, this being in plain contradiction to the text above quoted. 46 A reference to what was said in Chapter-8 will readily explain the difficulty. It was there shown that the writer of the Pentateuch did not always speak of things and places by the names they bore in the times of which he was writing, but by the names best known to his contemporaries. 47 God is thus said in the Pentateuch to have been preached by the patriarchs under the name of Jehovah, not because such was the name by which the patriarchs knew Him, but because this name was the one most reverenced by the Jews. 48 This point, I say, must necessarily be noticed, for in Exodus it is expressly stated that God was not known to the patriarchs by this name; and in Chapter 3:13, it is said that Moses desired to know the name of God. 49 Now, if this name had been already known it would have been known to Moses. We must therefore draw the conclusion indicated, namely, that the faithful patriarchs did not know this name of God, and that the knowledge of God is bestowed and not commanded by the Deity.

50 It is now time to pass on to our second point, and show that God through His prophets required from humans no other knowledge of Himself than is contained in a knowledge of His justice and charity-- 51 that is, of attributes

which a certain manner of life will enable people to imitate. 52 Jeremiah states this in so many words (Chapter-22:15, 16): "Did not thy father eat, and drink, and do judgment and justice? And then it was well with him. 53 He judged the cause of the poor and needy; then it was well with him: was not this to know Me? saith the Lord." 54 The words in Chapter-9:24 of the same book are equally, clear. "But let you that glorieth glory in this, that you understandeth and knoweth Me, that I am the Lord which exercise loving-kindness, judgment, and righteousness in the earth; for in these things I delight, saith the Lord."

55 The same doctrine maybe gathered from Exodus, Chapter-34:6, where God revealed to Moses only those of His attributes which display the Divine justice and charity. 56 Lastly, we may call attention to a passage in John which we shall discuss at more length hereafter; the Apostle explains the nature of God (inasmuch as no one has beheld Him) through charity only, and concludes that you who possesses charity possesses, and in very truth knows God. 57 We have thus seen that Moses, Jeremiah, and John sum up in a very short compass the knowledge of God needful for all, 58 and that they state it to consist in exactly what we said, namely, that God is supremely just, and supremely merciful-- in other words, the one perfect pattern of the true life. 59 We may add that Scripture nowhere gives an express definition of God, and does not point out any other of His attributes which should be apprehended save these, nor does it in set terms praise any others.

60 Wherefore we may draw the general conclusion that an intellectual knowledge of God, which takes cognisance of His nature in so far as it actually is, 61 and which cannot by any manner of living be imitated by humankind or followed as an example, has no bearing whatever on true rules of conduct, on faith, or on revealed religion; 62 consequently that people may be in complete error on the subject without incurring the charge of sinfulness.

63 We need now no longer wonder that God adapted Himself to the

existing opinions and imaginations of the prophets, or that the faithful held different ideas of God; 64 or, again, that the sacred books speak very inaccurately of God, attributing to Him hands, feet, eyes, ears, a mind, and motion from one place to another; or that they ascribe to Him emotions, such as jealousy, mercy, 65 or, lastly, that they describe Him as a Judge in heaven sitting on a royal throne with Christ on His right hand. 66 Such expressions are adapted to the understanding of the multitude, it being the object of the Bible to make humans not learned but obedient.

67 In spite of this the general run of theologians, when they come upon any of these phrases which they cannot rationally harmonise with the Divine nature, maintain that they should be interpreted metaphorically, passages they cannot understand they say should be interpreted literally. 68 But if every expression of this kind in the Bible is necessarily to be interpreted and understood metaphorically, Scripture must have been written, not for the people and the unlearned masses, but chiefly for accomplished experts and philosophers.

69 If it were indeed a sin to hold piously and simply the ideas about God we have just quoted, the prophets ought to have been strictly on their guard against the use of such expressions, 70 seeing the weak-mindedness of the people, and ought, on the other hand, to have set forth first of all, duly and clearly, those attributes of God which are needful to be understood. 71 This they have nowhere done; we cannot, therefore, think that opinions taken in themselves without respect to actions are either pious or impious, 72 but must maintain that a person is pious or impious in own beliefs only in so far as you are thereby incited to obedience, or derives from them license to sin and rebel. 73 If a person, by believing what is true, becomes rebellious, your creed is impious; if by believing what is false you becomes obedient, your creed is pious; 74 for the true knowledge of God comes not by commandment, but by Divine gift. 75 God has required nothing from human but a knowledge of His Divine justice

and charity, and that not as necessary to scientific accuracy, but to obedience.

The Book of Divine Panagogue called

POESY

POETRY AND PHILOSOPHY

Ralph Barton Perry

WHO IS THE PHILOSOPHER-POET?

1 As the ultimate criticism of all human interests, philosophy may be approached by avenues as various as these interests. 2 Only when philosophy is discovered as the implication of well-recognised special interests, is the significance of its function fully appreciated. 3 For the sake of such a further understanding of philosophy, those who find either inspiration or entertainment in poetry are invited in the present chapter to consider certain of the relations between poetry and philosophy. 4 We must at the very outset decline to accept unqualifiedly the poet's opinion in the matter, for they would not think it presumptuous to incorporate philosophy in poetry. 5 "No human," said Coleridge, "was ever yet a great poet without being at the same time a great philosopher." 6 This would seem to mean that a great poet is a great philosopher, and more too. 7 We shall do better to begin with the prosaic and matter of fact minimum of truth: some poetry is philosophical. 8 This will enable us to search for the portion of philosophy that is in some poetry, without finally defining their respective boundaries. 9 It may be that all true poetry is philosophical, as it may be that all true philosophy is poetical; 10 but it is much more certain that much actual poetry is far from philosophical, and that most actual philosophy was not conceived or written by a poet. 11 The mere poet and the mere philosopher must be tolerated, if it be only for the purpose of shedding light upon the philosopher-poet and the poet-philosopher. 12 And it is to the philosopher-poet that we turn, in the hope that under the genial spell of poetry we may be brought with understanding to the more forbidding land of philosophy.

POETRY AS APPRECIATION

13 Poetry is well characterised, though not defined, as an interpretation of life. 14 The term "life" here signifies the human purposive consciousness, and active pursuit of ends. 15 An interpretation of life is, then, a selection and account of such values in human experience as are actually sought or are worth the seeking. 16 For the poet all things are good or bad, and never only matters of fact. You are neither an annalist nor a statistician, and is even an observer only for the sake of a higher design. 17 You are one who appreciates, and expresses your appreciation so fittingly that it becomes a kind of truth, and a permanently communicable object. 18 That "unbodied joy," the skylark's song and flight, is through the genius of Shelley so faithfully embodied, that it may enter as a definite joy into the lives of countless human beings. 19 The sensuous or suggestive values of Nature are caught by the poet's quick feeling for beauty, and fixed by own creative activity. 20 Or with your ready sympathy you may perceive the value of some human ideal or mastering passion, and make it a reality for our common feeling. 21 Where the poet has to do with the base and hateful, your attitude is still appreciative. The evil is apprehended as part of a dramatic whole having positive moral or æsthetic value.

22 Moral ideas may appear in both poetry and life as the inspiration and justification of struggle. 23 Where there is no conception of its moral significance, the repulsive possesses for the poet's consciousness the æsthetic value of diversity and contrast. 24 Even where the evil and ugly is isolated, as in certain of Browning's dramatic monologues, it forms, both for the poet and the reader, but a part of some larger perception of life or character, which is sublime or beautiful or good.

25 Poetry involves, then, the discovery and presentation of human experiences that are satisfying and appealing. 26 It is a language for human pleasures and ideals. Poetry is without doubt a great deal more than this, and only

after a careful analysis of its peculiar language could one distinguish it from kindred arts; 27 but it will suffice for our purposes to characterise and not differentiate. Starting from this most general truth respecting poetry, we may now look for that aspect of it whereby it may be a witness of philosophical truth.

SINCERITY IN POETRY- Whitman

28 For the answer to our question, we must turn to an examination of the intellectual elements of poetry. 29 In the first place, the common demand that the poet shall be accurate in own representations is suggestive of an indispensable intellectual factor in own genius. 30 As we have seen, you are not to reproduce Nature, but the human appreciative experience of Nature. 31 Nevertheless, you must even here be true to your object. Your art involves your ability to express genuinely and sincerely what you yourself experiences in the presence of Nature, or what you can catch of the inner lives of others by virtue of your intelligent sympathy. 32 No amount of emotion or even of imagination will profit a poet, unless you can render a true account of them. 33 To be sure, you need not define, or even explain; for it is your function to transfer the immediate qualities of experience: but you must be able to speak the truth, and, in order to speak it, you must have known it.

34 In all this, however, we have made no demand that the poet should see more than one thing at a time. 35 Sincerity of expression does not require what is distinctly another mode of intelligence, 'comprehensiveness of view'. 36 It is easier, and accordingly more usual, to render an account of the moments and casual units of experience, than of its totality. 37 There are poets, little and great, who possess the intellectual virtue of sincerity, without the intellectual power of synthesis and reconciliation. 38 This distinction will enable us to separate the intelligence exhibited in all poetry, from that distinct form of intelligence exhibited in such poetry as is properly to be called philosophical.

39 The "barbarian" in poetry has recently been defined as "the person who regards own passions as their own excuse for being; who does not domesticate them either by understanding their cause or by conceiving their ideal goal." 40 One will readily appreciate the application of this definition to Walt Whitman. What little unity there is in this poet's world, is the composition of a purely sensuous experience,

41 "The earth expending right hand and left hand,
The picture alive, every part in its best light,
The music falling in where it is wanted, and stopping where it is not wanted."

42 In many passages Whitman manifests a marvellous ability to discover and communicate a fresh gladness about the commonest experiences. 43 We cannot but rejoice with him in all sights and sounds. But though we cannot deny him truth, his truth is honesty and not understanding. 44 The experiences in which he discovers so much worth, are random and capricious, and do not constitute a universe. 45 To the solution of ultimate questions he contributes a sense of mystery, and the conviction

"That you are here-- that life exists and identity,
That the powerful play goes on, and you may contribute a verse."

46 His world is justly described by the writer just quoted as "a phantasmagoria of continuous visions, vivid, impressive, but monotonous and hard to distinguish in memory, 47 like the waves of the sea or the decorations of some barbarous temple, sublime only by the infinite aggregation of parts."

48 As is Walt Whitman, so are many poets greater and less. Some who have seen the world-view, exhibit the same particularism in their lyric moods; 49 although, generally speaking, a poet who once has comprehended the world, will see the parts of it in the light of that wisdom. 50 But Walt Whitman is peculiarly representative of the poetry that can be true, without being wise in the manner that we shall come shortly to understand as the

manner of philosophy. 51 He is as desultory in his poet raptures as is the common person when he lives in his immediate experiences. 52 The truth won by each is the clear vision of one thing, or of a limited collection of things, and not the broad inclusive vision of all things.

53 The transition from Whitman to Shakespeare may seem somewhat abrupt, but the very differences between these poets serve to mark out an interesting affinity. 54 Neither has put any unitary construction upon human life and its environment. Neither, as poet, is the witness of any world-view; which will mean for us that neither is a philosopher-poet.

55 As respects Shakespeare, this is a hard saying. We are accustomed to then critical judgment that finds in the Shakespearian dramas an apprehension of the universal in human life. 56 But though this judgment is true, it is by no means conclusive as respects Shakespeare's relation to the philosophical type of thought. For there can be universality without philosophy. 57 Thus, to know the groups and the marks of the vertebrates is to know a truth which possesses generality, in contradistinction to the particularism of Whitman's poetic consciousness. 58 Even so to know well the groups and marks of human character, vertebrate and invertebrate, is to know that of which the average human, in your hand to hand struggle with life, is ignorant. 59 Such a wisdom Shakespeare possessed to a unique degree, and it enabled him to reconstruct human life. 60 He did not merely perceive human states and motives, but he understood human nature so well that he could create consistent men and women.

61 Moreover, Shakespeare's knowledge was not only thus universal in being a knowledge of general groups and laws, but also in respect of its extensity. 62 His understanding was as rich as it was acute. It is true, then, that Shakespeare read human life as an open book, knowing certainly the manner of human thinking and feeling, and the power and interplay of human motives. 63 But it is equally true, on the other hand, that he possessed no unitary conception of the meaning and

larger relations of human life. 64 Such a conception might have been expressed either by means of the outlook of some dominating and persistent type of personality, or by a pervading suggestion of some constant world-setting for the variable enterprise of humankind. 65 It could appear only provided the poet's appreciation of life in detail were determined by an interpretation of the meaning of life as a whole. 66 Shakespeare apparently possessed no such interpretation. Even when Hamlet is groping after some larger truth that may bear upon the definite problems of life, he represents but one, and that a strange and unusual, type of human nature.

67 And Hamlet's reflections, it should be noted, have no outcome. There is no Shakespearian answer to the riddles that Hamlet propounds. 68 The poet's genius is not less amazing for this fact; indeed, his peculiar distinction can only be comprehended upon this basis. 69 Shakespeare put no construction upon life, and by virtue of this very reserve accomplished an art of surpassing fidelity and vividness. 70 The absence of philosophy in Shakespeare, and the presence of the most characteristic quality of his genius, may both be imputed by the one affirmation, that 'there is no Shakespearian point of view'. 71 This truth signifies both gain and loss. The philosophical criticism of life may vary from the ideal objectivity of absolute truth, to the subjectivity of a personal religion. 72 Philosophy aims to correct the partiality of particular points of view by means of a point of view that shall comprehend their relations, and effect such reconciliations or transformations as shall enable them to constitute a universe.

73 Philosophy always assumes the hypothetical view of omniscience. 74 The necessity of such a final criticism is implicit in every scientific item of knowledge, and in every judgment that is passed upon life. 75 Philosophy makes a distinct and peculiar contribution to human knowledge by its heroic effort to measure all knowledges and all ideals by the standard of totality. 76 Nevertheless it is significant that no human

individual can possibly possess the range of omniscience. The most adequate knowledge of which any generation of humans is capable, 77 will always be that which is conceived by the most synthetic and vigorously metaphysical minds; but every individual philosophy will nevertheless be a premature synthesis.

78 The effort to complete knowledge is the indispensable test of the adequacy of prevailing conceptions, but the completed knowledge of any individual mind will shortly become an historical monument. 79 It will belong primarily to the personal life of its creator, as the articulation of his personal covenant with the universe. 80 There is a sound justification for such a conclusion of things in the case of the individual, for the conditions of human life make it inevitable; 81 but it will always possess a felt unity, and many distinct features, that are private and subjective. 82 Now such a projection of personality, with its colouring and its selection, Shakespeare has avoided; and very largely as a consequence, his dramas are a storehouse of genuine human nature. 83 Ambition, mercy, hate, madness, guilelessness, conventionality, mirth, bravery, deceit, purity-- these, and all human states and attributes save piety, are upon his pages as real, and as mysterious withal, as they are in the great historical society. 84 For an ordinary reader, these states and attributes are more real in Hamlet or Lear than in his own direct experience, because in Hamlet and Lear he can see them with the eye and intelligence of genius. 85 But Shakespeare is the world all over again, and there is loss as well as gain in such realism. 86 Here is human life, no doubt, and a brilliant pageantry it is; but human life as varied and as problematic as it is in the living. 87 Shakespeare's fundamental intellectual resource is the historical and psychological knowledge of such principles as govern the construction of human natures.

88 The goods for which humans undertake, and live or die, are any goods, justified only by the actual human striving for them. 89 The virtues are the old winning virtues

of the secular life, and the heroisms of the common conscience. 90 Beyond its empirical generality, his knowledge is universal only in the sense that space and time are universal. 91 His consciousness 'contains' its representative creations, and expresses them unspoiled by any transforming thought. 92 His poetic consciousness is like the very stage to which he likens all the world: men and women meet there, and things happen there. 93 The stage itself creates no unity save the occasion and the place. 94 Shakespeare's consciousness is universal because it is a fair field with no favours. But even so it is particular, because, though each may enter and depart in peace, when all enter together there is anarchy and a babel of voices. 95 All Shakespeare is like all the world seen through the eyes of each of its inhabitants. 96 Human experience in Shakespeare is human experience as everyone feels it, as comprehensive as the aggregate of innumerable lives. 97 But human experience in philosophy is the experience of all as thought by a synthetic mind. 98 Hence the wealth of life depicted by Shakespeare serves only to point out the philosopher's problem, and to challenge his powers. 99 Here he will find material, and not results; much to philosophise about, but no philosophy.

100 The discussion up to this point has attributed to poetry very definite intellectual factors that nevertheless do not constitute philosophy. 101 Walt Whitman speaks his feeling with truth, but in general manifests no comprehensive insight. Shakespeare has not only sincerity of expression but an understanding mind. 102 He has a knowledge not only of particular experiences, but of human nature; and a consciousness full and varied like society itself. 103 But there is a kind of knowledge possessed by neither, the knowledge sought by coördinating all aspects of human experience, both particular and general. 104 Not even Shakespeare is wise as one who, having seen the whole, can fundamentally interpret a part.

POESY

105 But though the philosopher-poet may not yet be found, we cannot longer be ignorant of your nature. 106 You will be, like all poets, one who appreciates experiences or finds things good, and you will faithfully reproduce the values which you discovers. 107 But you must 'justify yourself in view of the fundamental nature of the universe'. 108 The values which you apprehends must be harmonious, and so far above the plurality of goods as to transcend and unify them. 109 The philosopher-poet will find reality as a whole to be something that accredits the order of values in your inner life. 110 You will not only find certain things to be most worthy objects of action or contemplation, but you will see why they are worthy, because you will have construed the judgment of the universe in their favour.

111 In this general sense, Omar Khayyam is a philosopher-poet. 112 To be sure his universe is quite the opposite of that which most poets conceive, and is perhaps profoundly antagonistic to the very spirit of poetry; 113 but it is none the less true that the joys to which Omar invites us are such as his universe prescribes for human life.

114 "Some for the Glories of This World; and some
Sigh for the Prophet's Paradise to come;
Ah, take the Cash, and let the Credit go,
Nor heed the rumble of a distant Drum."

115 Herein is both poetry and philosophy, albeit but a poor brand of each. 116 We are invited to occupy ourselves only with spiritual cash, because the universe is spiritually insolvent. 117 The immediately gratifying feelings are the only feelings that the world can guarantee. 118 Omar Khayyam is a philosopher-poet, because his immediate delight in "youth's sweet-scented manuscript" is part of a consciousness that vaguely sees, though it cannot grasp, "this sorry scheme of things entire."

119 "Drink for you know not whence you come, nor why;
Drink for you know not why you go, nor where."

120 But the poet in own world-view ordinarily sees other than darkness. The same innate spiritual

enterprise that sustains religious faith leads the poet more often to find the universe positively congenial to own ideals, and to ideals in general. 121 You interprets human experience in the light of the spirituality of all the world.

122 It is to Wordsworth that we of the present age are chiefly indebted for such imagery, and it will profit us to consider somewhat carefully the philosophical quality of his poetry.

123 Walter Pater, in introducing his appreciation of Wordsworth, writes that "an intimate consciousness of the expression of natural things, which weighs, listens, penetrates, where the earlier mind passed roughly by, is a large element in the complexion of modern poetry." 124 We recognise at once the truth of this characterisation as applied to Wordsworth. But there is something more distinguished about this poet's sensibility even than its extreme fineness and delicacy; 125 a quality that is suggested, though not made explicit, by Shelley's allusion to Wordsworth's experience as "a sort of thought in sense." 126 Nature possessed for him not merely enjoyable and describable characters of great variety and minuteness, but an immediately apprehended unity and meaning. 127 It would be a great mistake to construe this meaning in sense as analogous to the crude symbolism of the educator Froebel, to whom, as he said, "the world of crystals proclaimed, in distinct and univocal terms, the laws of human life."

128 Wordsworth did not attach ideas to sense, but regarded sense itself as a communication of truth. 129 We readily call to mind his unique capacity for apprehending the characteristic flavour of a certain place in a certain moment of time, the individuality of a situation. 130 Now in such moments he felt that he was receiving intelligences, none the less direct and significant for their inarticulate form. Like the boy on Windermere, whom he himself describes,

131 "while he hung
Loitering, a gentle shock of mild surprise
Has carried far into his heart the voice
Of mountain torrents; or the visible scene
Would enter unawares into his mind,
With all its solemn imagery, its rocks,
Its woods, and that uncertain heaven received
Into the bosom of the steady lake."

132 For our purpose it is essential that we should recognise in this appreciation of Nature, expressed in almost every poem that Wordsworth wrote, a consciousness respecting the fundamental nature of the world.

133 Conversation, as we know, denotes an interchange of commensurable meanings. 134 Whatever the code may be, whether words or the most subtle form of suggestion, communication is impossible without community of Nature.

135 Hence, in believing himself to be holding converse with the so-called physical world, Wordsworth conceives that world as fundamentally like himself. 136 He finds the most profound thing in all the world to be the universal spiritual life. 137 In Nature this life manifests itself most directly, clothed in its own proper dignity and peace. 138 But it may be discovered in the humanity that is most close to Nature, in the avocations of plain and simple people, and the unsophisticated delights of children; and, with the perspective of contemplation, even "among the multitudes of that huge city."

139 So Wordsworth is rendering a true account of his own experience of reality when, as in "The Prelude," he says unequivocally:

140 "A gracious spirit o'er this earth presides,
And in the heart of human; invisibly
It comes to works of unreproved delight,
And tendency benign; directing those
Who care not, know not, think not, what they do."

141 Wordsworth is not a philosopher-poet because by searching his pages we can find an explicit philosophical creed such as this, 142 but because all the joys

of which his poet-soul compels him to sing have their peculiar note, and compose their peculiar harmony, by virtue of such an indwelling consciousness. 143 Here is one who is a philosopher in and through his poetry. He is a philosopher in so far as the detail of his appreciation finds fundamental justification in a world-view.

144 From the immanence of "the universal heart" there follows, not through any mediate reasoning, but by the immediate experience of its propriety, a conception of that which is of supreme worth in life. 145 The highest and best of which life is capable is contemplation, or the consciousness of the universal indwelling of God. 146 Of those who fail to live thus fittingly in the midst of the divine life, Walter Pater speaks for Wordsworth as follows:

147 "To higher or lower ends they
move too often with something of
a sad countenance, with hurried and
ignoble gait, becoming,
unconsciously, something like
thorns, in their anxiety to bear
grapes; it being possible for people,
in the pursuit of even
great ends, to become themselves
thin and impoverished in
spirit and temper, thus diminishing
the sum of perfection in
the world at its very sources."

148 The quiet and worshipful spirit, won by the cultivation of the emotions appropriate to the presence of Nature and society, is the mark of the completest life and the most acceptable service. 149 Thus for Wordsworth the meaning of life is inseparable from the meaning of the universe. 150 In apprehending that which is good and beautiful in human experience, he was attended by a vision of the totality of things. 151 Herein he has had to do, if not with the form, at any rate with the very substance of philosophy.

152 Unquestionably the supreme philosopher-poet is Dante. 153 He is not only philosophical in the temper of his mind, but his greatest poem is the incarnation of a definite system of philosophy, the most definite that the world has seen. 154 That conception of the world which in the thirteenth

century found argumentative and orderly expression in the "Summa Theologiæ" of Thomas of Aquino, and constituted the faith of the church, is visualized by Dante, and made the basis of an interpretation of life.

155 The "Divina Commedia" deals with all the heavens to the Empyrean itself, and with all spiritual life to the very presence of God. 156 It derives its imagery from the cosmology of the day, its dramatic motive from the Christian and Greek conceptions of God and his dealings with the world. 157 Sin is punished because of the justice of God; knowledge, virtue, and faith lead, through God's grace and mercy manifested in Christ, to a perpetual union with Him. 158 Hell, purgatory, and paradise give place and setting to the events of the drama. But the deeper meaning of the poem is allegorical. 159 In a letter quoted by Lowell, Dante writes: "The literal subject of the whole work is the state of the soul after death, simply considered. But if the work be taken allegorically the subject is human, as by merit or demerit, through freedom of the will, human renders the self liable to the reward or punishment of justice."

160 In other words, the inner and essential meaning of the poem has to do not with external retribution, but with character, and the laws which determine its own proper ruin or perfection.

161 The punishments described in the "Inferno" are accounts of the state of guilt itself, implications of the will that has chosen the part of brutishness. 162 Sin itself is damnable and deadening, but the knowledge that the soul that sinneth shall die is the first way of emancipation from sin. 163 The guidance of Virgil through hell and purgatory signifies the knowledge of good and evil, or moral insight, as the guide of human through this life of struggle and progress.

164 The earthly paradise, at the close of the "Purgatorio," represents the highest state to which human character can attain when choice is determined by ordinary experience, intelligence, and understanding. 165 Here human stands alone, endowed with an enlightened conscience. 166 Here are uttered the last words of

Virgil to Dante, the explorer of the spiritual country:

"Expect no more or word or sign from me.
Free, upright, and sane is thine own free will, and it would be wrong not to act according to its pleasure; wherefore thee over thyself I crown and mitre."

167 But moral self-reliance is not the last word. As Beatrice, the image of tenderness and holiness, comes to Dante in the earthly paradise, and leads him from the summit of purgatory into the heaven of heavens, and even to the eternal light; 168 so there is added to the mere human, intellectual, and moral resources of the soul, the sustaining power of the divine grace, the illuminating power of divine truth, and the transforming power of divine love. 169 Through the aid of this higher wisdom, the journey of life becomes the way to God.

170 Thus the allegorical truth of the "Divina Commedia" is not merely an analysis of the moral nature of human, but the revelation of a universal spiritual order, 171 manifesting itself in the moral evolution of the individual, and above all in your ultimate community with the eternal goodness.

172 "Thou shouldst not, if I deem aright, wonder more at thy ascent, than at a stream if from a high mountain it descends to the base.
A marvel it would be in thee, if, deprived of hindrance, thou hadst sat below, even as quiet by living fire in earth would be."

173 Such, in brief, is Dante's world-view, so suggestive of the freer idealistic conceptions of later thought as to justify a recent characterisation of him as one who, 174 "accepting without a shadow of a doubt or hesitation all the constitutive ideas of mediæval thought and life, grasped them so firmly and gave them such luminous expression that the spirit in them broke away from the form."

175 But it must be added, as in the case of Wordsworth, that Dante is a philosopher-poet not because St. Thomas Aquinas appears and speaks with authority in the Thirteenth Canto of the "Paradiso," 176 nor even because a

philosophical doctrine can be consistently formulated from his writings, but because his consciousness of life is informed with a sense of its universal bearings. 177 There is a famous passage in the Twenty-second Canto of the "Paradiso," in which Dante describes himself as looking down upon the earth from the starry heaven.

178 "'Thou art so near the ultimate salvation,' began Beatrice,
'that thou oughtest to have thine eyes clear and sharp.
And therefore ere thou further enterest it, look back downward, and see how great a world I have already set beneath thy feet,
in order that thy heart, so far as it is able, may present
itself joyous to the triumphant crowd which comes glad through this round ether.'
With my sight I returned through each and all the seven spheres, and saw this globe such that I smiled at its mean semblance; and that counsel I approve as the best which holds it of least account; and he who thinks of other things maybe called truly worthy."

179 Dante's scale of values is that which appears from the starry heaven. 180 His austere piety, his invincible courage, and his uncompromising hatred of wrong, are neither accidents of temperament nor blind reactions, 181 but compose the proper character of one who has both seen the world from God, and returned to see God from the world. 182 He was, as Lowell has said, "a man of genius who could hold heartbreak at bay for twenty years, and would not let himself die till he had done his task"; 183 and his power was not obstinacy, but a vision of the ways of God. He knew a truth that justified him in his sacrifices, and made a great glory of his defeat and exile. 184 Even so his poetry or appreciation of life is the expression of an inward contemplation of the world in its unity or essence. 185 It is but an elaboration of the piety which he attributes to the lesser saints of paradise, when he has them say: "Nay, it is essential to this blessed existence to hold ourselves within the divine will, whereby our very wills are made one. 186 So that as we are from stage to stage

throughout this realm, to all the realm is pleasing, as to the King who in wills us with His will. 187 And His will is our peace; it is that sea whereunto is moving all that which It creates and which Nature makes."

188 There now remains the brief task of distinguishing the philosopher-poet from the philosopher himself. 189 The philosopher-poet is one who, having made the philosophical point of view your own, expresses yourself in the form of poetry. 190 The philosophical point of view is that from which the universe is comprehended in its totality. 191 The wisdom of the philosopher is the knowledge of each through the knowledge of all.

192 Wherein, then, does the poet, when possessed of such wisdom, differ from the philosopher proper? 193 To this question one can give readily enough the general answer, that the difference lies in the mode of utterance. 194 Furthermore, we have already given some account of the peculiar manner of the poet. You invites us to experience with you the beautiful and moving in Nature and life. 195 That which the poet has to express, and that which you aims to arouse in others, is an appreciative experience. 196 You requires what Wordsworth calls "an atmosphere of sensation in which to move your wings." 197 Therefore if you are to be philosophical in intelligence, and yet essentially a poet, you must find your universal truth in immediate experience. 198 You must be one who, in seeing the many, sees the one. 199 The philosopher-poet is you who visualises a fundamental interpretation of the world. "A poem," says one poet, "is the very image of life expressed in its eternal truth."

200 The philosopher proper, on the other hand, has the sterner and less inviting task of rendering such an interpretation articulate to thought. 201 That which the poet sees, the philosopher must define. That which the poet divines, the philosopher must calculate. The philosopher must dig for that which the poet sees shining through. 202 As the poet transcends thought for the sake of experience, the philosopher must

transcend experience for the sake of thought. 203 As the poet sees all, and all in each, so the philosopher, knowing each, must think all consistently together, and then know each again. 204 It is the part of philosophy to collect and criticise evidence, to formulate and coördinate conceptions, and finally to define in exact terms. 205 The reanimation of the structure of thought is accomplished primarily in religion, which is a general conception of the world made the basis of daily living.

206 For religion there is no subjective correlative less than life itself. 207 Poetry is another and more circumscribed means of restoring thought to life. 208 By the poet's imagination, and through the art of your expression, thought may be sensuously perceived. 209 "If the time should ever come," says Wordsworth, "when what is now called Science, thus familiarised to humans, shall be ready to put on, as it were, a form of flesh, and blood, 210 the Poet will lend own divine spirit to aid the transfiguration, and will welcome the Being thus produced, as a dear and genuine inmate of the household of human."

211 As respects truth, philosophy has an indubitable priority. The very sternness of the philosopher's task is due to own supreme dedication to truth. 212 But if validity be the merit of philosophy, it can well be supplemented by immediacy, which is the merit of poetry. 213 Presuppose in the poet conviction of a sound philosophy, and we may say with Shelley, of his handiwork, that "it is the perfect and consummate surface and bloom of all things; 214 it is as the odour and the colour of the rose to the texture of the elements which compose it, as the form and splendour of unfaded beauty to the secrets of anatomy and corruption." 215 "Indeed," as he adds, "what were our consolations on this side of the grave-- and our aspirations beyond it-- if poetry did not ascend to bring light and fire from those eternal regions where the owl-winged faculty of calculation dare not ever soar?"

216 The unity in outlook, attended by differences of method and form, which may exist between

poet and philosopher, is signally illustrated by the relation between Goethe and Spinoza. What Goethe saw and felt, Spinoza proved and defined. 217 The universal and eternal substance was to Spinoza, as philosopher, a theorem, and to Goethe, as poet, a perception and an emotion. 218 Goethe writes to Jacobi that when philosophy "lays itself out for division," he cannot get on with it, but when it "confirms our original feeling as though we were one with Nature," it is welcome to him. 219 In the same letter Goethe expresses his appreciation of Spinoza as the complement of his own nature:

220 "His all-reconciling peace contrasted with my all-agitating endeavour; his intellectual method was the opposite counterpart of my poetic way of feeling and expressing myself; 221 and even the inflexible regularity of his logical procedure, which might be considered ill-adapted to moral subjects, made me his most passionate scholar and his devoted adherent. 222 Mind and heart, understanding and sense, were drawn together with an inevitable elective affinity, and this at the same time produced an intimate union between individuals of the most different types."

223 It appears, then, that some poets share with all philosophers that point of view from which the horizon line is the boundary of all the world. 224 Poetry is not always or essentially philosophical, but may be so; and when the poetic imagination restores philosophy to immediacy, human experience reaches its most exalted state, excepting only religion itself, wherein God is both seen and also served. 225 Nor is the part of philosophy in poetry and religion either ignoble or presumptuous, for, humanly speaking, "the owl-winged faculty of calculation" is the only safe and sure means of access to that place on high,

226 "Where the nightingale doth sing
Not a senseless, trancèd thing,
But a divine melodious truth;
Philosophic numbers smooth;
Tales and golden histories
Of heaven and its mysteries."

POESY

POEMS OF CHEER
Ella Wheeler Wilcox

2 I step across the mystic border-land,
And look upon the wonder-world of Art.
How beautiful', 'how beautiful its hills!
And all its valleys', 'how surpassing fair!

2 The winding paths that lead up to the heights
Are polished by the footsteps of the great.
The mountain-peaks stand very near to God:
The chosen few whose feet have trod thereon
Have talked with Him', 'and with the angels walked.

3 Here are no sounds of discord--no profane
Or senseless gossip of unworthy things
'Only the songs of chisels and of pens',
'Of busy brushes', 'and ecstatic strains'

'Of souls surcharged with music most divine'.
'Here is no idle sorrow', 'no poor grief'

4 'For any day or object left behind'
'For time is counted precious', 'and herein'
'Is such complete abandonment of Self'

5 'That tears turn into rainbows', 'and enhance'
'The beauty of the land where all is fair'.
'Awed and afraid', 'I cross the border-land'.
'Oh', 'who am I', 'that I dare enter here'
'Where the great artists of the world have trod--'
'The genius-crowned aristocrats of Earth'?
'Only the singer of a little song';
'Yet loving Art with such a mighty love'

6 'I hold it greater to have won a place'
'Just on the fair land’s edge', 'to make my grave',
'Than in the outer world of greed and gain'
'To sit upon a royal throne and reign'.

POESY

WORTH WHILE

3 It is easy enough to be pleasant
When life flows by like a song,
But the human worth while is the
one who will smile

2 When everything goes dead
wrong.
For the test of the heart is trouble,
And it always comes with the years,
And the smile that is worth the
praises of earth
Is the smile that shines through
tears.

3 It is easy enough to be prudent
When nothing tempts you to stray,
When without or within no voice of
sin
Is luring your soul away;
But it's only a negative virtue
Until it is tried by fire,
And the life that is worth the honour
on earth
Is the one that resists desire.

4 By the cynic, the sad, the fallen,
Who had no strength for the strife,
The world's highway is cumbered
to-day--
They make up the sum of life;
But the virtue that conquers passion,
And the sorrow that hides in a
smile--
It is these that are worth the homage
on earth,
For we find them but once in a
while.

THE HOUSE OF LIFE

4 All wondering, and eager-eyed,
within her portico
I made my plea to Hostess Life, one
morning long ago.

2 "Pray show me this great house of
thine, nor close a single door;
But let me wander where I will, and
climb from floor to floor!
For many rooms, and curious things,
and treasures great and small
Within your spacious mansion lie,
and I would see them all."

3 Then Hostess Life turned silently,
her searching gaze on me,
And with no word, she reached her
hand, and offered up the key.
It opened first the door of Hope, and
long I lingered there,
Until I spied the room of Dreams,
just higher by a stair.

4 And then a door whereon the one
word "Happiness" was writ;
But when I tried the little key I
could not make it fit.

POESY

It turned the lock of Pleasure's
room, where first all seemed so
bright--
But after I had stayed awhile it
somehow lost its light.

5 And wandering down a lonely hall,
I came upon a room
Marked "Duty," and I entered it-- to
lose myself in gloom.
Along the shadowy halls I groped
my weary way about,
And found that from dull Duty's
room, a door of Toil led out.
It led out to another door, whereon a
crimson stain
Made sullenly against the dark these
words: "The Room of Pain."

6 But oh the light, the light, the light,
that spilled down from above
And upward wound, the stairs of
Faith, right to the Tower of Love!
And when I came forth from that
place, I tried the little key--
And lo! the door of Happiness
swung open, wide and free.

A SONG OF LIFE

5 In the rapture of life and of
living,
I lift up my heart and rejoice,
And I thank the great Giver for
giving

2 The soul of my gladness a voice.
In the glow of the glorious weather,
In the sweet-scented, sensuous air,
My burdens seem light as a feather
They are nothing to bear.

3 In the strength and the glory of
power,
In the pride and the pleasure of
wealth
(For who dares dispute me my
dower
Of talents and youth-time and
health?),

4 I can laugh at the world and its
sages--
I am greater than seers who are sad,
For you are most wise in all ages
Who knows how to be glad.

5 I lift up my eyes to Apollo,
The god of the beautiful days,
And my spirit soars off like a
swallow,
And is lost in the light of its rays.
Are you troubled and sad? I
beseech you
Come out of the shadows of strife
Come out in the sun while I teach
you
The secret of life.

POESY

6 Come out of the world-- come above it--
Up over its crosses and graves,
Though the green earth is fair and I love it,
We must love it as masters, not slaves.

7 Come up where the dust never rises--
But only the perfume of flowers--
And your life shall be glad with surprises
Of beautiful hours.

8 Come up where the rare golden wine is
Apollo distills in my sight,
And your life shall be happy as mine is,
And as full of delight.

.PRAYER

6 I do not undertake to say
That literal answers come from Heaven,
But I know this-- that when I pray
A comfort, a support is given
That helps me rise o'er earthly things
As larks soar up on airy wings.

2 In vain the wise philosopher
Points out to me my fabric's flaws,
In vain the scientists aver
That "all things are controlled by laws."
My life has taught me day by day
That it availeth much to pray.

3 I do not stop to reason out
The why and how. I do not care,
Since I know this, that when I doubt,
Life seems a blackness of despair,
The world a tomb; and when I trust,
Sweet blossoms spring up in the dust.

4 Since I know in the darkest hour,
If I lift up my soul in prayer,
Some sympathetic, loving Power
Sends hope and comfort to me there.
Since balm is sent to ease my pain,
What need to argue or explain?

5 Prayer has a sweet, refining grace,
It educates the soul and heart.
It lends a lustre to the face,
And by its elevating art
It gives the mind an inner sight
That brings it near the Infinite.

6 From our gross selves it helps us rise
To something which we yet may be.
And so I ask not to be wise,
If thus my faith is lost to me.
Faith, that with angel's voice and touch

Says, “Pray, for prayer availeth much.”

IN THE LONG RUN

7 In the long run fame finds the deserving person.
The lucky wight may prosper for a day,
But in good time true merit leads the van
And vain pretence, unnoticed, goes its way.
There is no Chance, no Destiny, no Fate,
But Fortune smiles on those who work and wait,
In the long run.

2 In the long run all godly sorrow pays,
There is no better thing than righteous pain,
The sleepless nights, the awful thorn-crowned days,
Bring sure reward to tortured soul and brain.
Unmeaning joys enervate in the end,
But sorrow yields a glorious dividend
In the long run.

3 In the long run all hidden things are known,
The eye of truth will penetrate the night,
And good or ill, thy secret shall be known,
However well ’tis guarded from the light.
All the unspoken motives of the breast
Are fathomed by the years and stand confess’d
In the long run.

4 In the long run all love is paid by love,
Though undervalued by the hosts of earth;
The great eternal Government above
Keeps strict account and will redeem its worth.
Give thy love freely; do not count the cost;
So beautiful a thing was never lost
In the long run.

AS YOU GO THROUGH LIFE

8 Don’t look for the flaws as you go through life;
And even when you find them,
It is wise and kind to be somewhat blind,
And look for the virtue behind them;
For the cloudiest night has a hint of light

POESY

Somewhere in its shadows hiding;
It's better by far to hunt for a star,
Than the spots on the sun abiding.

2 The current of life runs ever away
To the bosom of God's great ocean.
Don't set your force 'gainst the river's course,
And think to alter its motion.
Don't waste a curse on the universe,
Remember, it lived before you;
Don't butt at the storm with your puny form,
But bend and let it go o'er you.

3 The world will never adjust itself
To suit your whims to the letter,
Some things must go wrong your whole life long,
And the sooner you know it the better.
It is folly to fight with the Infinite,
And go under at last in the wrestle.
The wiser person shapes into God's plan,
As water shapes into a vessel.

TWO SUNSETS

9 In the fair morning of your life,
When your pure heart lay in your breast,
Panting, with all that wild unrest
To plunge into the great world's strife

2 That fills young hearts with mad desire,
You saw a sunset. Red and gold
The burning billows surged and rolled,
And upward tossed their caps of fire.

3 You looked. And as you looked, the sight
Sent from your soul through breast and brain
Such intense joy, it hurt like pain.
Your heart seemed bursting with delight.

4 So near the Unknown seemed, so close
You might have grasped it with your hands
You felt your inmost soul expand,
As sunlight will expand a rose

5 One day you heard a singing strain
A human voice, in bird-like trills.
You paused, and little rapture-rills
Went trickling downward through each vein.

6 And in your heart the whole day long,
As in a temple veiled and dim,

POESY

You kept and bore about with you
The beauty of that singer's song.

7 And then? But why relate what then?
Your smouldering heart flamed into fire--
You had your one supreme desire,
And plunged into the world of humans.

8 For years queen Folly held her sway.
With pleasures of the grosser kind
She fed his flesh and drugged his mind,
Till, shamed, he sated, turned away.

9 He sought his boyhood's home.
That hour Triumphant should have been, in sooth,
Since he went forth, an unknown youth,
And came back crowned with wealth and power.

10 The clouds made day a gorgeous bed;
You saw the splendour of the sky
With unmoved heart and stolid eye;
You only knew the West was red.

11 Then suddenly a fresh young voice
Rose, bird-like, from some hidden place,
You did not even turn your face—
It struck you simply as a noise.

12 You trod the old paths up and down.
Their rich-hued leaves by Fall winds whirled
How dull they were-- how dull the world
Dull even in the pulsing town.

13 O! worst of punishments, that brings
A blunting of all finer sense,
A loss of feelings keen, intense,
And dulls us to the higher things.

14 O! penalty most dire, most sure,
Swift following after gross delights,
That we no more see beauteous sights,
Or hear as hear the good and pure.

15 O! shape more hideous and more dread
Than Vengeance takes in creed-taught minds,
This certain doom that blunts and blinds,
And strikes the holiest feelings dead.

POESY

UNREST

10 In the youth of the year, when the birds were building,
When the green was showing on tree and hedge,
And the tenderest light of all lights was gilding
The world from zenith to outermost edge,
My soul grew sad and longingly lonely!
I sighed for the season of sun and rose,
And I said, “In the Summer and that time only
Lies sweet contentment and blest repose.”

2 With bee and bird for her maids of honour
Came Princess Summer in robes of green.
And the King of day smiled down upon her
And wooed her, and won her, and made her queen.
Fruit of their union and true love’s pledges,
Beautiful roses bloomed day by day,
And rambled in gardens and hid in hedges
Like royal children in sportive play.

3 My restless soul for a little season
Revelled in rapture of glow and bloom,
And then, like a subject who harbours treason,
Grew full of rebellion and grey with gloom.
And I said, “I am sick of the summer’s blisses,
Of warmth and beauty, and nothing more.
The full fruition my sad soul misses
That beauteous Fall-time holds in store!”

4 But now when the colours are almost blinding,
Burning and blending on bush and tree,
And the rarest fruits are mine for the finding,
And the year is ripe as a year can be,
My soul complains in the same old fashion;
Crying aloud in my troubled breast
Is the same old longing, the same old passion.
O where is the treasure which humans call rest?

“ARTIST’S LIFE”

11 Of all the waltzes the great Strauss wrote,
Mad with melody, rhythm-- rife

POESY

From the very first to the final note.
Give me your “Artist’s Life!”

2 It stirs my blood to my finger-ends,
Thrills me and fills me with vague unrest,
And all that is sweetest and saddest blends
Together within my breast.

3 It brings back that night in the dim arcade,
In love’s sweet morning and life’s best prime,
When the great brass orchestra played and played,
And set our thoughts to rhyme.

4 It brings back that Winter of mad delights,
Of leaping pulses and tripping feet,
And those languid moon-washed Summer nights
When we heard the band in the street.

5 It brings back rapture and glee and glow,
It brings back passion and pain and strife,
And so of all the waltzes I know,
Give me the “Artist’s Life.”

6 For it is so full of the dear old time
So full of the dear old friends I knew.
And under its rhythm, and lilt, and rhyme,
I am always finding-- 'you'.

NOTHING BUT STONES

12 I think I never passed so sad an hour,
Dear friend, as that one at the church to-night.
The edifice from basement to the tower
Was one resplendent blaze of coloured light.
Up through broad aisles the stylish crowd was thronging,
Each richly robed like some king’s bidden guest.
“Here will I bring my sorrow and my longing,”
I said, “and here find rest.”

2 I heard the heavenly organ’s voice of thunder,
It seemed to give me infinite relief.
I wept. Strange eyes looked on in well-bred wonder.
I dried my tears: their gaze profaned my grief.
Wrapt in the costly furs, and silks, and laces,

POESY

Beat alien hearts, that had no part with me.
I could not read, in all those proud cold faces,
One thought of sympathy.
I watched them bowing and devoutly kneeling,
3 Heard their responses like sweet waters roll
But only the glorious organ's sacred pealing
Seemed gushing from a full and fervent soul.
I listened to the human of holy calling,
You spoke of creeds, and hailed your own as best;
Of human's corruption and of Adam's-falling,
But naught that gave me rest:

4 Nothing that helped me bear the daily grinding
Of soul with body, heart with heated brain;
Nothing to show the purpose of this blinding
And sometimes overwhelming sense of pain.
And then, dear friend, I thought of thee, so lowly,
So unassuming, and so gently kind,
And lo! a peace, a calm serene and holy,
Settled upon my mind.

5 Ah, friend, my friend! one true heart, fond and tender,
That understands our troubles and our needs,
Brings us more near to God than all the splendour
And pomp of seeming worship and vain creeds.
One glance of thy dear eyes so full of feeling,
Doth bring me closer to the Infinite
Than all that throng of worldly people kneeling
In blaze of gorgeous light.

INEVITABLE

13 To-day I was so weary and I lay
In that delicious state of semi-waking,
When baby, sitting with own nurse at play,
Cried loud for "mamma," all own toys forsaking.

2 I was so weary and I needed rest,
And signed to nurse to bear child from the room.
Then, sudden, rose and caught child to my breast,
And kissed the grieving mouth and cheeks of bloom.

POESY

3 For swift as lightning came the thought to me,
With pulsing heart-throes and a mist of tears,
Of days inevitable, that are to be,
If my fair darling grows to humanhood's years;

4 Days when child will not call for "mamma," when
The world, with many a pleasure and bright joy,
Shall tempt child forth into the haunts of humans
And I shall lose the first place with my child;

5 When other homes and loves shall give delight,
When younger smiles and voices will seem best.
And so I held child to my heart to-night,
Forgetting all my need of peace and rest.

THE OCEAN OF SONG

14 In a land beyond sight or conceiving,
In a land where no blight is, no wrong,
No darkness, no graves, and no grieving,
There lies the great ocean of song.
And its waves, oh, its waves unbeholden
By any save gods, and their kind,
Are not blue, are not green, but are golden,
Like moonlight and sunlight combined.

2 It was whispered to me that their waters
Were made from the gathered-up tears
That were wept by the sons and the daughters
Of long-vanished eras and spheres.
Like white sands of heaven the spray is
That falls all the happy day long,
And whoever it touches straightway is
Made glad with the spirit of song.

3 Up, up to the clouds where their hoary
Crowned heads melt away in the skies,
The beautiful mountains of glory
Each side of the song-ocean rise.
Here day is one splendour of sky-light--
Of God's light with beauty replete.
Here night is not night, but is twilight,
Pervading, enfolding, and sweet.

POESY

4 Bright birds from all climes and all regions,
That sing the whole glad summer long,
Are dumb, till they flock here in legions
And lave in the ocean of song.
It is here that the four winds of heaven,
The winds that do sing and rejoice,
It is here they first came and were given
The secret of sound and a voice.

5 Far down along beautiful beeches,
By night and by glorious day,
The throng of the gifted ones reaches,
Their foreheads made white with the spray,
And a few of the sons and the daughters
Of this kingdom, cloud-hidden from sight,
Go down in the wonderful waters,
And bathe in those billows of light.

6 And their souls evermore are like fountains,
And liquid and lucent and strong,
High over the tops of the mountains
Gush up the sweet billows of song.
No drouth-time of waters can dry them.
Whoever has bathed in that sea,
All dangers, all deaths, they defy them,
And are gladder than gods are, with glee.

"IT MIGHT HAVE BEEN"

15 We will be what we could be.
Do not say,
"It might have been, had not or that, or this."
No fate can keep us from the chosen way;
He only might, who 'is'.

2 We will do what we could do.
Do not dream
Chance leaves a hero, all uncrowned to grieve.
I hold, all humans are greatly what they seem;
You does, who could achieve.

3 We will climb where we could climb. Tell me not
Of adverse storms that kept thee from the height.
What eagle ever missed the peak you sought?
You always climbs who might.

4 I do not like the phrase, "It might have been!"

It lacks all force, and life's best
truths perverts
For I believe we have, and reach,
and win,
Whatever our deserts.

MOMUS, GOD OF LAUGHTER

16 Though with gods the world is
cumbered,
Gods unnamed, and gods
unnumbered,
Never god was known to be
Who had not his devotee.
So I dedicate to mine,
Here in verse, my temple-shrine.

2 'Tis not Ares,-- mighty Mars,
Who can give success in wars.
'Tis not Morpheus, who doth keep
Guard above us while we sleep,
'Tis not Venus, she whose duty
'Tis to give us love and beauty;
Hail to these, and others, after
Momus, gleesome god of laughter.

3 Quirinus would guard my health,
Plutus would insure me wealth;
Mercury looks after trade,
Hera smiles on youth and maid.
All are kind, I own their worth,
After Momus, god of mirth.

4 Though Apollo, out of spite,
Hides away his face of light,
Though Minerva looks askance,
Deigning me no smiling glance,
Kings and queens may envy me
While I claim the god of glee.

5 Wisdom wearies, Love has wings
Wealth makes burdens, Pleasure
stings,
Glory proves a thorny crown
So all gifts the gods throw down
Bring their pains and troubles after;
All save Momus, god of laughter.
He alone gives constant joy.
Hail to Momus, happy boy.

I DREAM

17 Oh, I have dreams. I
sometimes dream of Life
In the full meaning of that splendid
word.
Its subtle music which few people
have heard,
Though all may hear it, sounding
through earth's strife.
Its mountain heights by mystic
breezes kissed
Lifting their lovely peaks above the
dust;
Its treasures which no touch of time
can rust,
Its emerald seas, its dawns of
amethyst,

POESY

Its certain purpose, its serene repose,
Its usefulness, that finds no hour for woes,
This is my dream of Life.

2 Yes, I have dreams. I ofttimes dream of Love
As radiant and brilliant as a star.
As changeless, too, as that fixed light afar
Which glorifies vast worlds of space above.
Strong as the tempest when it holds its breath,
Before it bursts in fury; and as deep
As the unfathomed seas, where lost worlds sleep,
And sad as birth, and beautiful as death.
As fervent as the fondest soul could crave,
Yet holy as the moonlight on a grave.
This is my dream of Love.

3 Yes, yes, I dream. One oft-recurring dream
Is beautiful and comforting and blest,
Complete with certain promises of rest,
Divine content, and ecstasy supreme.
When that strange essence, author of all faith,
That subtle something, which cries for the light,
Like a lost child who wanders in the night,
Shall solve the mighty mystery of Death,
Shall find eternal progress, or sublime
And satisfying slumber for all time.
This is my dream of Death.

THE SONNET

18 Alone it stands in Poesy's fair land,
A temple by the muses set apart;
A perfect structure of consummate art,
By artists builded and by genius planned,
Beyond the reach of the apprentice hand,
Beyond the ken of the untutored heart,
Like a fine carving in a common mart,
Only the favoured few will understand.
A 'chef-d'œvre' toiled over with great care,
Yet which the unseeing careless crowd goes by,
A plainly set, but well-cut solitaire,
An ancient bit of pottery, too rare

POESY

To please or hold aught save the special eye,
These only with the sonnet can compare.

THE PAST

19 Fling my past behind me, like a robe
Worn threadbare in the seams, and out of date.
I have outgrown it. Wherefore should I weep
And dwell up on its beauty, and its dyes
Of Oriental splendour, or complain
That I must needs discard it? I can weave
Upon the shuttles of the future years
A fabric far more durable. Subdued,
It may be, in the blending of its hues,
Where sombre shades commingle, yet the gleam
Of golden warp shall shoot it through and through,
While over all a fadeless lustre lies,
And starred with gems made out of crystalled tears,
My new robe shall be richer than the old.

A DREAM

20 That was a curious dream; I thought the three
Great planets that are drawing near the sun
With such unerring certainty begun
To talk together in a mighty glee.
They spoke of vast convulsions which would be
Throughout the solar system-- the rare fun
Of watching haughty stars drop, one by one,
And vanish in a seething vapour sea.

2 I thought I heard them comment on the earth--
That small dark object-- doomed beyond a doubt.
They wondered if live creatures moved about
Its tiny surface, deeming it of worth.
And then they laughed-- 'twas such a singing shout
That I awoke and joined too in their mirth.

USELESSNESS

21 Let mine not be that saddest fate of all
To live beyond my greater self; to see
My faculties decaying, as the tree

POESY

Stands stark and helpless while its green leaves fall.
Let me hear rather the imperious call,
Which all men dread, in my glad morning time,
And follow death ere I have reached my prime,
Or drunk the strengthening cordial of life's gall.
The lightning's stroke or the fierce tempest blast
Which fells the green tree to the earth to-day
Is kinder than the calm that lets it last,
Unhappy witness of its own decay.
May no human ever look on me and say,
"She lives, but all her usefulness is past."

WILL

22 There is no chance, no destiny, no fate,
Can circumvent or hinder or control
The firm resolve of a determined soul.
Gifts count for nothing; will alone is great;
All things give way before it, soon or late.
What obstacle can stay the mighty force
Of the sea-seeking river in its course,
Or cause the ascending orb of day to wait?

2 Each well-born soul must win what it deserves.
Let the fool prate of luck. The fortunate
Is you whose earnest purpose never swerves,
Whose slightest action or inaction serve.
The one great aim.
Why, even Death stands still,
And waits an hour sometimes for such a will.

WINTER RAIN

23 Falling upon the frozen world last
I heard the slow beat of the Winter rain--
Poor foolish drops, down-dripping all in vain;
The ice-bound Earth but mocked their puny might,
Far better had the fixedness of white
And uncomplaining snows-- which make no sign,

But coldly smile, when pitying moonbeams shine--
Concealed its sorrow from all human sight.
Long, long ago, in blurred and burdened years,
I learned the uselessness of uttered woe.
Though sinewy Fate deals her most skilful blow,
I do not waste the gall now of my tears,
But feed my pride upon its bitter, while
I look straight in the world's bold eyes, and smile.

LIFE

24 Life, like a romping schoolboy, full of glee,
Doth bear us on his shoulder for a time.
There is no path too steep for him to climb.
With strong, lithe limbs, as agile and as free,
As some young roe, he speeds by vale and sea,
By flowery mead, by mountain peak sublime,
And all the world seems motion set to rhyme,
Till, tired out, he cries, "Now carry me!"
In vain we murmur; "Come," Life says, "Fair play!"
And seizes on us. God! he goads us so!
He does not let us sit down all the day.
At each new step we feel the burden grow,
Till our bent backs seem breaking as we go,
Watching for Death to meet us on the way.

BURDENED

25 "Genius, a man's weapon, a woman's burden."-- Lamartine.

2 Dear God! there is no sadder fate in life
Than to be burdened so that you can not
Sit down contented with the common lot
Of happy mother and devoted wife.

3 To feel your brain wild and your bosom rife
With all the sea's commotion; to be fraught
With fires and frenzies which you have not sought,

And weighed down with the wild
world's weary strife;

4 To feel a fever always in your
breast;
To lean and hear, half in affright,
half shame,
A loud-voiced public boldly mouth
your name;
To reap your hard-sown harvest in
unrest,
And know, however great your
meed of fame,
You are but a weak woman at the
best.

LET THEM GO

26 Let the dream go. Are there
not other dreams
In vastness of clouds hid from thy
sight
That yet shall gild with beautiful
gold gleams,
And shoot the shadows through and
through with light?
What matters one lost vision of the
night?
Let the dream go!!

2 Let the hope set. Are there not
other hopes
That yet shall rise like new stars in
thy sky?
Not long a soul in sullen darkness
gropes
Before some light is lent it from on
high;
What folly to think happiness gone
by!
Let the hope set!

3 Let the joy fade. Are there not
other joys,
Like frost-bound bulbs, that yet
shall start and bloom?
Severe must be the winter that
destroys
The hardy roots locked in their
silent tomb.
What cares the earth for her brief
time of gloom
Let the joy fade!

4 Let the love die. Are there not
other loves
As beautiful and full of sweet
unrest,
Flying through space like snowy-
pinioned doves?
They yet shall come and nestle in
thy breast,
And thou shalt say of each, "Lo, this
is best!"
Let the love die!

POESY

FIVE KISSES

THE MOTHER'S KISS

I

27 Love breathed a secret to her listening heart,
And said "Be silent." Though she guarded it,
And dwelt as one within a world apart,
Yet sun and star seemed by that secret lit.
And where she passed, each whispering wind ablow,
And every little blossom in the sod,
Called joyously to her, "We know, we know,
For are we not the intimates of God?"
Life grew so radiant, and so opulent,
That when her fragile body and her brain
By mortal throes of agony were rent,
She felt a curious rapture in her pain.
Then, after anguish, came the supreme bliss--
They brought the little baby, for her kiss!

THE BETROTHAL

II

28 There was a little pause between the dances;
Without, somewhere, a tinkling fountain played.
The dusky path was lit by ardent glances
As forth they fared, a lover and a maid.
He chose a nook, from curious eyes well hidden--
All redolent with sweet midsummer charm,
And by the great primeval instinct bidden,
He drew her in the shelter of his arm.
The words that long deep in his heart had trembled
Found sudden utterance; she at first dissembled,
Refused her lips, and half withdrew her hand,
Then murmured "Yes," and yielded, woman fashion,
Her virgin mouth to young love's kiss of passion.

THE BRIDAL KISS

III

29 As fleecy clouds trail back across the skies,
Showing the sweet young moon in azure space,
The lifted veil revealed her shining face--

POESY

A sudden wonder to his eager eyes.
In that familiar beauty lurked surprise:
For now the wife stood in the maiden's place--
With conscious dignity, and woman's grace,
And love's large pride grown trebly fair and wise.

2 The world receded, leaving them alone.
The universe was theirs, from sphere to sphere,
And life assumed new meaning, and new worth.
Love held no privilege they did not own,
And when they kissed each other without fear,
They understood why God had made the earth.

DOMESTIC BLISS
IV

30 Sequestered in their calm domestic bower,
They sat together. He in manhood's prime
And she a matron in her fullest flower.
The mantel clock gave forth a warning chime.
She put her work aside; his bright cigar
Grew pale, and crumbled in an ashen heap.
The lights went out, save one remaining star
That watched beside the children in their sleep.
She hummed a little song and nestled near,
As side by side they went to their repose.
His arm about her waist, he whispered "Dear,"
And pressed his lips upon her mouth's full rose--
The sacred sweetness of their wedded life
Breathed in that kiss of husband and of wife.

OLD AGE
V

31 The young see heaven-- but to the old who wait
The final call, the hills of youth arise
More beautiful than shores of Paradise.
Beside a glowing and voracious grate
A dozing couple dream of yesterday;

POESY

The islands of a vanished past
appear,
Bringing forgotten names and faces
near;
While lost in mist, the present fades
away.
The fragrant winds of tender
memories blow
Across the gardens of the “Used-to-
be!”
They smile into each other’s eyes,
and see
The bride and bridegroom of the
long ago.
And tremulous lips, pressed close to
faded cheek
Love’s silent tale of deathless
passion speak.

RETROSPECTION

32 I look down the lengthening
distance
Far back to youth’s valley of hope.
How strange seemed the ways of
existence,
How infinite life and its scope!

2 What dreams, what ambitions
came thronging
To people a world of my own!
How the heart in my bosom was
longing,
For pleasures and places unknown.

3 But the hill-tops of pleasure and
beauty
Were covered with mist at the dawn;
And only the rugged road Duty
Shone clear, as my feet wandered
on.

4 I loved not the path and its leading,
I hated the rocks and the dust;
But a Voice from the Silence was
pleading,
It spoke but one syllable-- “Trust.”

5 I saw, as the morning grew older,
The fair flowered hills of delight;
And the feet of my comrades grew
bolder,
They hurried away from my sight.

6 And when on the pathway I
faltered,
And when I rebelled at my fate,
The Voice with assurance unaltered,
Again spoke one syllable—“Wait.”

7 Along the hard highway I travelled
And saw, with dim vision, how soon
The morning’s gold locks were
unravelled,
By fingers of amorous noon.

8 A turn in the pathway of duty
I stood in the perfect day’s prime,
Close, close to the hillside of beauty

POESY

The Voice from the Silence said
"Climb"

9 The road to the beautiful Regions
Lies ever through Duty's hard way.
Oh ye who go searching in legions,
Know this and be patient to-day.

HELENA

33 Last night I saw Helena. She whose praise
Of late all men have sounded. She for whom
Young Angus rashly sought a silent tomb
Rather than live without her all his days.

2 Wise men go mad who look upon her long,
She is so ripe with dangers. Yet meanwhile
I find no fascination in her smile,
Although I make her theme of this poor song.

3 "Her golden tresses?" yes, they may be fair,
And yet to me each shining silken tress
Seems robbed of beauty and all lustreless--
Too many hands have stroked
Helena's hair.

4 (I know a little maiden so demure
She will not let her one true lover's hands
In playful fondness touch her soft brown bands
So dainty-minded is she, and so pure.)

5 "Her great dark eyes that flash like gems at night?
Large, long-lashed eyes and lustrous?" that may be,
And yet they are not beautiful to me.
Too many hearts have sunned in their delight.

6 (I mind me of two tender blue eyes, hid
So underneath white curtains, and so veiled
That I have sometimes plead for hours, and failed
To see more than the shyly lifted lid.)

7 "Her perfect mouth so liked a carved kiss?"
"Her honeyed-mouth, where hearts do, fly-like, drown?"
I would not taste its sweetness for a crown;

POESY

Too many lips have drank its
nectared bliss.

8 (I know a mouth whose virgin
dew, undried,
Lies like a young grape's bloom,
untouched and sweet,
And though I plead in passion at her
feet,
She would not let me brush it if I
died.)

9 In vain, Helena! though wise men
may vie
For thy rare smile, or die from loss
of it,
Armoured by my sweet lady's trust,
I sit,
And know thou are not worth her
faintest sigh.

NOTHING REMAINS

34 Nothing remains of unrecorded
ages
That lie in the silent cemetery time;
Their wisdom may have shamed our
wisest sages,
Their glory may have been indeed
sublime.
How weak do seem our strivings
after power,
How poor the grandest efforts of our
brains,
If out of all we are, in one short hour
Nothing remains.

2 Nothing remains but the Eternal
Spaces,
Time and decay uproot the forest
trees.
Even the mighty mountains leave
their places,
And sink their haughty heads
beneath strange seas
The great earth writhes in some
convulsive spasms
And turns the proudest cities into
plains.
The level sea becomes a yawning
chasm--
Nothing remains.

3 Nothing remains but the Eternal
Forces,
The sad seas cease complaining and
grow dry,
Rivers are drained and altered in
their courses,
Great stars pass out and vanish from
the sky.
Ideas die and old religions perish,
Our rarest pleasures and our keenest
pains
Are swept away with all we hate or
cherish--
Nothing remains.

POESY

4 Nothing remains but the Eternal Nameless
And all-creative spirit of the Law,
Uncomprehended, comprehensive, blameless,
Invincible, resistless, with no flaw;
So full of love it must create for ever,
Destroying that it may create again,
Persistent and perfecting in endeavour,
It yet must bring forth angels, after humans--
This, this remains!

COMRADES

35 I and my Soul are alone to-day,
All in the shining weather;
We were sick of the world, and put it away,
So we could rejoice together.

2 Our host, the Sun, in the blue, blue sky
Is mixing a rare, sweet wine,
In the burnished gold of this cup on high,
For me, and this Soul of mine.

3 We find it a safe and royal drink,
And a cure for every pain;
It helps us to love, and helps us to think,
And strengthens body and brain.

4 And sitting here, with my Soul alone,
Where the yellow sun-rays fall,
Of all the friends I have ever known
I find it the 'best' of all.

5 We rarely meet when the world is near,
For the World hath a pleasing art
And brings me so much that is bright and dear
That my Soul it keepeth apart.

6 But when I grow weary of mirth and glee,
Of glitter, glow, and splendour,
Like a tried old friend it comes to me,
With a smile that is sad and tender.

7 And we walk together as two friends may,
And laugh and drink God’s wine.
Oh, a royal comrade any day
I find this Soul of mine.

WHAT GAIN?

36 Now, while thy rounded cheek is fresh and fair,
While beauty lingers, laughing, in thine eyes,

POESY

Ere thy young heart shall meet the stranger, “Care,”
Or thy blithe soul become the home of sighs,
Were it not kindness should I give thee rest
By plunging this sharp dagger in thy breast?
Dying so young, with all thy wealth of youth,
What part of life wouldst thou not claim, in sooth?
Only the woe,
Sweetheart, that sad souls know.

2 Now, in this sacred hour of supreme trust,
Of pure delight and palpitating joy,
Ere change can come, as come it surely must,
With jarring doubts and discords, to destroy
Our far too perfect peace, I pray thee, Sweet,
Were it not best for both of us, and meet,
If I should bring swift death to seal our bliss?
Dying so full of joy, what could we miss?
Nothing but tears,
Sweetheart, and weary years.

3 How slight the action! Just one well-aimed blow
Here, where I feel thy warm heart’s pulsing beat,
And then another through my own, and so
Our perfect union would be made complete:
So, past all parting, I should claim thee mine.
Dead with our youth, and faith, and love divine,
Should we not keep the best of life that way?
What shall we gain by living day on day?
What shall we gain,
Sweetheart, but bitter pain?

TO THE WEST

37 In an interview with Lawrence Barrett, he said: “The literature of the New World must look to the West for its poetry.”

2 Not to the crowded East,
Where, in a well-worn groove,
Like the harnessed wheel of a great machine,
The trammelled mind must move--
Where Thought must follow the fashion of Thought,
Or be counted vulgar and set at naught.

POESY

3 Not to the languid South,
Where the mariners of the brain
Are lured by the Sirens of the Sense,
And wrecked upon its main
Where Thought is rocked, on the sweet wind's breath
To a torpid sleep that ends in death.

4 But to the mighty West,
That chosen realm of God,
Where Nature reaches Her hands to humans,
And Freedom walks abroad--
Where mind is King, and fashion is naught,
There shall the New World look for thought

5 To the West, the beautiful West,
She shall look, and not in vain--
For out of its broad and boundless store
Come muscle, and nerve, and brain.
Let the bards of the East and the South be dumb--
For out of the West shall the Poets come.

6 They shall come with souls as great
As the cradle where they were rocked;
They shall come with brows that are touched with fire
Like the gods with whom they have walked;
They shall come from the West in royal state,
The Singers and Thinkers for whom we wait.

THE LAND OF CONTENT

38 I set out for the Land of Content,
By the gay crowded pleasure-highway,
With laughter, and jesting, I went
With the mirth-loving throng for a day;
Then I knew I had wandered astray,
For I met returned pilgrims, belated,
Who said, "We are weary and sated,
But we found not the Land of Content."

2 I turned to the steep path of fame,
I said, "It is over yon height--
This land with the beautiful name
Ambition will lend me its light."
But I paused in my journey ere night,
For the way grew so lonely and troubled;
I said-- my anxiety doubled
"This is not the road to Content."

3 Then I joined the great rabble and throng
That frequents the moneyed world's mart;
But the greed, and the grasping and wrong,
Left me only one wish-- to depart.
And sickened, and saddened at heart,
I hurried away from the gateway,
For my soul and my spirit said straightway.
"This is not the road to Content."

4 Then weary in body and brain,
An overgrown path I detected,
And I said "I will hide with my pain
In this byway, unused and neglected."
Lo! it led to the realm God selected
To crown with His best gifts of beauty,
And through the dark pathway of duty
I came to the land of Content.

WARNING

39 High in the heavens I saw the moon this morning,
Albeit the sun shone bright;
Unto my soul it spoke, in voice of warning,
"Remember Night!"

AFTER THE BATTLES ARE OVER

[Read at Reunion of the G. A. T., Madison, Wis., July 4, 1872.]

40 After the battles are over,
And the war drums cease to beat,
And no more is heard on the hillside
The sound of hurrying feet,
Full many a noble action,
That was done in the days of strife
By the soldier is half forgotten,
In the peaceful walks of life.

2 Just as the tangled grasses,
In Summer's warmth and light,
Grow over the graves of the fallen
And hide them away from sight,
So many an act of valour,
And many a deed sublime,
Fade from the mind of the soldier
O'ergrown by the grass of time

3 Not so should they be rewarded,
Those noble deeds of old!
They should live for ever and ever,
When the heroes' hearts are cold.
Then rally, ye brave old comrades,
Old veterans, reunite!
Uproot Time's tangled grasses--
Live over the march, and the fight.

4 Let Grant come up from the White House,
And clasp each brother's hand,
First chieftain of the army,

POESY

Last chieftain of the land.
Let him rest from a nation's burdens,
And go, in thought, with his men,
Through the fire and smoke of Shiloh,
And save the day again.

5 This silent hero of battles
Knew no such word as defeat.
It was left for the rebels' learning,
Along with the word-- retreat.
You was not given to talking,
But they found that guns would preach
In a way that was more convincing
Than fine and flowery speech

6 Three cheers for the grave commander
Of the grand old Tennessee!
Who won the first great battle--
Gained the first great victory.
His motto was always "Conquer,"
"Success" was his countersign,
And "though it took all Summer,"
He kept fighting upon "that line."

7 Let Sherman, the stern old General,
Come rallying with his men;
Let them march once more through Georgia
And down to the sea again.
Oh! that grand old tramp to Savannah,
Three hundred miles to the coast,
It will live in the heart of the nation,
For ever its pride and boast.

8 As Sheridan went to the battle,
When a score of miles away,
He has come to the feast and banquet,
By the iron horse to-day.
Its pace is not much swifter
Than the pace of that famous steed
Which bore him down to the contest
And saved the day by his speed.

9 Then go over the ground to-day, boys
Tread each remembered spot.
It will be a gleesome journey,
On the swift-shod feet of thought;
You can fight a bloodless battle,
You can skirmish along the route,
But it's not worth while to forage,
There are rations enough without.

10 Don't start if you hear the cannon,
It is not the sound of doom,
It does not call to the contest--
To the battle's smoke and gloom.
"Let us have peace," was spoken,
And lo! peace ruled again;
And now the nation is shouting,

POESY

Through the cannon's voice,
"Amen."

11 O boys who besieged old
Vicksburgh,
Can time e'er wash away
The triumph of her surrender,
Nine years ago to-day?
Can you ever forget the moment,
When you saw the flag of white,
That told how the grim old city
Had fallen in her might?

12 Ah, 'twas a bold, brave army,
When the boys, with a right good
will,
Went gaily marching and singing
To the fight at Champion Hill.
They met with a warm reception,
But the soul of "Old John Brown"
Was abroad on that field of battle,
And our flag did NOT go down.

13 Come, heroes of Look Out
Mountain,
Of Corinth and Donelson,
Of Kenesaw and Atlanta,
And tell how the day was won!
Hush! bow the head for a moment
There are those who cannot come.
No bugle-call can arouse them--
No sound of fife or drum.

14 Oh, people who died for the
country,
Oh, dear and sainted dead!
What can we say about you
That has not once been said?
Whether you fell in the contest,
Struck down by shot and shell,
Or pined 'neath the hand of sickness
Or starved in the prison cell,

15 We know that you died for
Freedom,
To save our land from shame,
To rescue a perilled Nation,
And we give you deathless fame.
'Twas the cause of Truth and Justice
That you fought and perished for,
And we say it, oh, so gently,
"Our people who died in the war."

16 Saviours of our Republic,
Heroes who wore the blue,
We owe the peace that surrounds
us--
And our Nation's strength to you.
We owe it to you that our banner,
The fairest flag in the world,
Is to-day unstained, unsullied,
On the Summer air unfurled.

17 We look on its stripes and
spangles,
And our hearts are filled the while
With love for the brave
commanders,
And the boys of the rank and file.
The grandest deeds of valour

POESY

Were never written out,
The noblest acts of virtue
The world knows nothing about.

18 And many a private soldier,
Who walks his humble way,
With no sounding name or title,
Unknown to the world to-day,
In the eyes of God is a hero
As worthy of the bays
As any mighty General
To whom the world gives praise.

19 Brave men of a mighty army,
We extend you friendship's hand
I speak for the "Loyal Women,"
Those pillars of our land.
We wish you a hearty welcome,
We are proud that you gather here
To talk of old times together
On this brightest day in the year.

20 And if Peace, whose snow-white pinions
Brood over our land to-day,
Should ever again go from us,
(God grant she may ever stay!)
Should our Nation call in her peril
For "Six hundred thousand more,"
The loyal women would hear her,
And send you out as before.

21 We would bring out the treasured knapsack,
We would take the sword from the wall,
And hushing our own hearts' pleadings,
Hear only the country's call.
For next to our God is our Nation;
And we cherish the honoured name
Of the bravest of all brave armies
Who fought for that Nation's fame.

AND THEY ARE DUMB

41 I have been across the bridges of the years.
Wet with tears
Were the ties on which I trod, going back
Down the track
To the valley where I left, 'neath skies of Truth,
My lost youth.

2 As I went, I dropped my burdens, one and all--
Let them fall;
All my sorrows, all my wrinkles, all my care,
My white hair,
I laid down, like some lone pilgrim's heavy pack,
By the track.

3 As I neared the happy valley with light feet,

POESY

My heart beat
To the rhythm of a song I used to know
Long ago,
And my spirits gushed and bubbled like a fountain
Down a mountain.
4 On the border of that valley I found you,
Tried and true;
And we wandered through the golden Summer-Land
Hand in hand.
And my pulses beat with rapture in the blisses
Of your kisses.

5 And we met there, in those green and verdant places,
Smiling faces,
And sweet laughter echoed upward from the dells
Like gold bells.
And the world was spilling over with the glory
Of Youth's story.

6 It was but a dreamer's journey of the brain;
And again
I have left the happy valley far behind;
And I find
Time stands waiting with own burdens in a pack
For my back.

7 As it speeds me, like a rough, well-meaning friend,
To the end,
Will I find again the lost ones loved so well?
Who can tell!
But the dead know what the life will be to come--
And they are dumb!

NIGHT

42 As some dusk mother shields from all alarms
The tired child she gathers to her breast,
The brunette Night doth fold me in her arms,
And hushes me to perfect peace and rest.
Her eyes of stars shine on me, and I hear
Her voice of winds low crooning on my ear.
O Night, O Night, how beautiful thou art!
Come, fold me closer to thy pulsing heart.

2 The day is full of gladness, and the light

POESY

So beautifies the common outer things,
I only see with my external sight,
And only hear the great world's voice which rings.
But silently from daylight and from din
The sweet Night draws me--whispers, "Look within!"
And looking, as one wakened from a dream,
I see what 'is'-- no longer what doth seem.

3 The Night says, "Listen!" and upon my ear
Revealed, as are the visions to my sight,
The voices known as "Beautiful" come near
And whisper of the vastly Infinite.
Great, blue-eyed Truth, her sister Purity,
Their brother Honour, all converse with me,
And kiss my brow, and say, "Be brave of heart!"
O holy three! how beautiful thou art!

4 The Night says, "Child, sleep that thou may'st arise
Strong for to-morrow's struggle."
And I feel
Her shadowy fingers pressing on my eyes:
Like thistledown I float to the Ideal
The Slumberland, made beautiful and bright
As death, by dreams of loved ones gone from sight,
O food for souls, sweet dreams of pure delight,
How beautiful the holy hours of Night!

ALL FOR ME

43 The world grows green on a thousand hills--
By a thousand willows the bees are humming,
And a million birds by a million rills,
Sing of the golden season coming.
But, gazing out on the sun-kist lea,
And hearing a thrush and a blue-bird singing,
I feel that the summer is all for me,
And all for me are the joys it is bringing.

2 All for me the bumble-bee
Drones his song in the perfect weather;
And, just on purpose to sing to me,
Thrush and blue-bird came North together.

POESY

Just for me, in red and white,
Bloom and blossom the fields of clover;
And all for me and my delight
The wild Wind follows and plays the lover.

3 The mighty sun, with a scorching kiss
(I have read, and heard, and do not doubt it)
Has burned up a thousand worlds like this,
And never stopped to think about it.
And yet I believe he hurries up
Just on purpose to kiss my flowers
To drink the dew from the lily-cup,
And help it to grow through golden hours.

4 I know I am only a speck of dust,
An individual mite of masses,
Clinging upon the outer crust
Of a little ball of cooling gases.
And yet, and yet, say what you will,
And laugh, if you please, at my lack of reason,
For me wholly, and for me still,
Blooms and blossoms the Summer season.

5 Nobody else has ever heard
The story the Wind to me discloses;
And none but I and the humming-bird
Can read the hearts of the crimson roses.
Ah, my Summer-- my love--
my own!
The world grows glad in your smiling weather;
Yet all for me, and me alone,
You and your Court came North together.

INTO SPACE

44 If the sad old world should jump a cog
Sometime, in its dizzy spinning,
And go off the track with a sudden jog,
What an end would come to the sinning,
What a rest from strife and the burdens of life
For the millions of people in it,
What a way out of care, and worry and wear,
All in a beautiful minute.

2 As 'round the sun with a curving sweep
It hurries and runs and races,
Should it lose its balance, and go with a leap
Into the vast sea-spaces,
What a blest relief it would bring to the grief,

And the trouble and toil about us,
To be suddenly hurled from the solar world
And let it go on without us.

3 With not a sigh or a sad good-bye
For loved ones left behind us,
We would go with a lunge and a mighty plunge
Where never a grave should find us.
What a wild mad thrill our veins would fill
As the great earth, like a feather,
Should float through the air to God knows where,
And carry us all together.

4 No dark, damp tomb and no mourner's gloom,
No tolling bell in the steeple,
But in one swift breath a painless death
For a million billion people.
What greater bliss could we ask than this,
To sweep with a bird's free motion
Through leagues of space to a resting place,
In a vast and vapoury ocean--
To pass away from this life for aye
With never a dear tie sundered,
And a world on fire for a funeral pyre,
While the stars looked on and wondered?

THROUGH DIM EYES

45 Is it the world, or my eyes, that are sadder?
I see not the grace that I used to see
In the meadow-brook whose song was so glad, or
In the boughs of the willow tree.
The brook runs slower-- its song seems lower
And not the song that it sang of old;
And the tree I admired looks weary and tired
Of the changeless story of heat and cold.

2 When the sun goes up, and the stars go under,
In that supreme hour of the breaking day,
Is it my eyes, or the dawn, I wonder,
That finds less of the gold, and more of the gray
I see not the splendour, the tints so tender,
The rose-hued glory I used to see;
And I often borrow a vague half-sorrow
That another morning has dawned for me.

3 When the royal smile of that welcome comer
Beams on the meadow and burns in the sky,

POESY

Is it my eyes, or does the Summer
Bring less of bloom than in days gone by?
The beauty that thrilled me, the rapture that filled me,
To an overflowing of happy tears,
I pass unseeing, my sad eyes being
Dimmed by the shadow of vanished years.

4 When the heart grows weary, all things seem dreary;
When the burden grows heavy, the way seems long.
Thank God for sending kind death as an ending,
Like a grand Amen to a minor song.

THE PUNISHED

46 Not they who know the awful gibbet's anguish,
Not they who, while sad years go by them, in
The sunless cells of lonely prisons languish,
Do suffer fullest penalty for sin.

2 'Tis they who walk the highways unsuspected,
Yet with grim fear for ever at their side,
Who hug the corpse of some sin undetected,
A corpse no grave or coffin-lid can hide

3 'Tis they who are in their own chambers haunted
By thoughts that like unbidden guests intrude,
And sit down, uninvited and unwanted,
And make a nightmare of the solitude.

HALF FLEDGED

47 I feel the stirrings in me of great things.
New half-fledged thoughts rise up and beat their wings,
And tremble on the margin of their nest,
Then flutter back, and hide within my breast.

Beholding space, they doubt their untried strength.
Beholding humans, they fear them.
But at length,
Grown all too great and active for the heart
That broods them with such tender mother art,
Forgetting fear, and humans, and all, that hour,

POESY

Save the impelling consciousness of power
That stirs within them-- they shall soar away
Up to the very portals of the Day.

2 Oh, what exultant rapture thrills me through
When I contemplate all those thoughts may do;
Like snow-white eagles penetrating space,
They may explore full many an unknown place,
And build their nests on mountain heights unseen,
Whereon doth lie that dreamed-of rest serene.
Stay thou a little longer in my breast,
Till my fond heart shall push thee from the nest
Anxious to see thee soar to heights divine--
Oh, beautiful but half-fledged thoughts of mine.

THE YEAR

48 What can be said in New Year rhymes,
That's not been said a thousand times?

2 The new years come, the old years go,
We know we dream, we dream we know.

3 We rise up laughing with the light,
We lie down weeping with the night.

4 We hug the world until it stings,
We curse it then and sigh for wings.

5 We live, we love, we woo, we wed,
We wreathe our brides, we sheet our dead.

6 We laugh, we weep, we hope, we fear,
And that's the burden of the year.

THE UNATTAINED

49 A vision beauteous as the morn,
With heavenly eyes and tresses streaming,
Slow glided o'er a field late shorn
Where walked a poet idly dreaming.
He saw her, and joy lit his face,
"Oh, vanish not at human speaking,"
He cried, "thou form of magic grace,
Thou art the poem I am seeking.

POESY

2 “I’ve sought thee long! I claim thee now--
My thought embodied, living, real.”
She shook the tresses from her brow.
“Nay, nay!” she said, “I am ideal.
I am the phantom of desire--
The spirit of all great endeavour,
I am the voice that says,
‘Come higher,’
That calls people up and up for ever.

3 “’Tis not alone thy thought supreme
That here upon thy path has risen;
I am the artist’s highest dream,
The ray of light you cannot prison.
I am the sweet ecstatic note
Than all glad music gladder, clearer,
That trembles in the singer’s throat,
And dies without a human hearer.

4 “I am the greater, better yield,
That leads and cheers thy farmer neighbour,
For me you bravely tills the field
And whistles gaily at your labour.
Not thou alone, O poet soul,
Dost seek me through an endless morrow,
But to the toiling, hoping whole
I am at once the hope and sorrow.

5 “The spirit of the unattained,
I am to those who seek to name me,
A good desired but never gained:
All shall pursue, but none shall claim me.”

IN THE CROWD

50 How happy they are, in all seeming,
How gay, or how smilingly proud,
How brightly their faces are beaming,
These people who make up the crowd!
How they bow, how they bend, how they flutter,
How they look at each other and smile,
How they glow, and what 'bon mots' they utter!
But a strange thought has found me the while!

2 It is odd, but I stand here and fancy
These people who now play a part,
All forced by some strange necromancy
To speak, and to act, from the heart.
What a hush would come over the laughter!
What a silence would fall on the mirth!
And then what a wail would sweep after,

POESY

As the night-wind sweeps over the earth!

3 If the secrets held under and hidden
In the intricate hearts of the crowd
Were suddenly called to, and bidden
To rise up and cry out aloud,
How strange one would look to another!
Old friends of long standing and years--
Own brothers would not know each other,
Robed new in their sorrows and fears.
4 From broadcloth, and velvet, and laces,
Would echo the groans of despair,
And there would be blanching of faces
And wringing of hands and of hair.
That man with his record of honour,
That lady down there with the rose,
That girl with Spring's freshness upon her,
Who knoweth the secrets of those?

5 Smile on, O ye maskers, smile sweetly!
Step lightly, bow low and laugh loud!
Though the world is deceived and completely,
I know ye, O sad-hearted crowd!
I watch you with infinite pity:
But play on, play ever your part,
Be gleeful, be joyful, be witty!
'Tis better than showing the heart.

LIFE AND I

51 Life and I are lovers, straying
Arm in arm along:
Often like two children Maying,
Full of mirth and song,

2 Life plucks all the blooming hours
Growing by the way;
Binds them on my brow like flowers,
Calls me Queen of May.

3 Then again, in rainy weather,
We sit vis-à-vis,
Planning work we'll do together
In the years to be.

4 Sometimes Life denies me blisses,
And I frown or pout;
But we make it up with kisses
Ere the day is out.

5 Woman-like, I sometimes grieve him,
Try his trust and faith,
Saying I shall one day leave him
For his rival, Death.

POESY

6 Then he always grows more zealous,
Tender, and more true;
Loves the more for being jealous,
As all lovers do.

7 Though I swear by stars above him,
And by worlds beyond,
That I love him-- love him-- love him;
Though my heart is fond;

8 Though he gives me, doth my lover,
Kisses with each breath--
I shall one day throw him over,
And plight troth with Death.

GUERDON

52 Upon the white cheek of the Cherub Year
I saw a tear.
Alas! I murmured, that the Year should borrow
So soon a sorrow.
Just then the sunlight fell with sudden flame:
The tear became
A wondrous diamond sparkling in the light--
A beauteous sight.

2 Upon my soul there fell such woeful loss,
I said, “The Cross
Is grievous for a life as young as mine.”
Just then, like wine,
God’s sunlight shone from His high Heavens down;
And lo! a crown
Gleamed in the place of what I thought a burden--
My sorrow’s guerdon.

SNOWED UNDER

53 Of a thousand things that the Year snowed under--
The busy Old Year who has gone away--
How many will rise in the Spring, I wonder,
Brought to life by the sun of May?
Will the rose-tree branches, so wholly hidden
That never a rose-tree seems to be,
At the sweet Spring’s call come forth unbidden,
And bud in beauty, and bloom for me?

2 Will the fair green Earth, whose throbbing bosom
Is hid like a maid’s in her gown at night,

POESY

Wake out of her sleep, and with blade and blossom
Gem her garments to please my sight?
Over the knoll in the valley yonder
The loveliest buttercups bloomed and grew;
When the snow has gone that drifted them under,
Will they shoot up sunward, and bloom anew?

3 When wild winds blew, and a sleet-storm pelted,
I lost a jewel of priceless worth;
If I walk that way when snows have melted,
Will the gem gleam up from the bare brown Earth?
I laid a love that was dead or dying,
For the year to bury and hide from sight;
But out of a trance will it waken, crying,
And push to my heart, like a leaf to the light?

4 Under the snow lie things so cherished--
Hopes, ambitions, and dreams of humans--
Faces that vanished, and trusts that perished,
Never to sparkle and glow again.
The Old Year greedily grasped his plunder,
And covered it over and hurried away:
Of the thousand things that he did, I wonder
How many will rise at the call of May?
O wise Young Year, with your hands held under
Your mantle of ermine, tell me, pray!

"LEUDEMANNS-ON-THE-RIVER."

54 Toward even, when the day leans down
To kiss the upturned face of night,
Out just beyond the loud-voiced town
I know a spot of calm delight.
Like crimson arrows from a quiver
The red rays pierce the waters flowing,
While we go dreaming, singing, rowing
To Leudemanns-on-the-River.

2 The hills, like some glad mocking-bird,
Send back our laughter and our singing,
While faint-- and yet more faint is heard

POESY

The steeple bells all sweetly ringing.
Some message did the winds deliver
To each glad heart that August night,
All heard, but all heard not aright,
By Leudemanns-on-the-River.

3 Night falls as in some foreign clime,
Between the hills that slope and rise.
So dusk the shades at landing-time,
We could not see each other's eyes.
We only saw the moonbeams quiver
Far down upon the stream! that night
The new moon gave but little light
By Leudemanns-on-the-River.

4 How dusky were those paths that led
Up from the river to the hall.
The tall trees branching overhead
Invite the early shades that fall.
In all the glad blithe world, oh, never
Were hearts more free from care than when
We wandered through those walks, we ten,
By Leudemanns-on-the-River.

5 So soon, so soon, the changes came.
This August day we two alone,
On that same river, not the same,
Dream of a night for ever flown.
Strange distances have come to sever
The hearts that gaily beat in pleasure,
Long miles we cannot cross or measure--
From Leudemanns-on-the-River.

6 We'll pluck two leaves, dear friend, to-day.
The green, the russet! seems it strange
So soon, so soon, the leaves can change!
Ah me! so runs all life away.
This night-wind chills me, and I shiver;
The Summer-time is almost past.
One more good-bye-- perhaps the last
To Leudemanns-on-the-River.

LITTLE BLUE HOOD

55 Every morning and every night
There passes our window near the street,
A little girl with an eye so bright,
And a cheek so round and a lip so sweet!
The daintiest, jauntiest little miss
That ever any one longed to kiss,

POESY

2 She is neat as wax, and fresh to view,
And her look is wholesome, and clean, and good.
Whatever her gown, her hood is blue,
And so we call her our “Little Blue Hood,”
For we know not the name of the dear little lass,
But we call to each other to see her pass,

3 “Little Blue Hood is coming now!”
And we watch from the window while she goes by,
She has such a bonny, smooth, white brow,
And a fearless look in her long-lashed eye!
And a certain dignity wedded to grace
Seems to envelop her form and face.

4 Every morning, in sun or rain,
She walks by the window with sweet, grave air,
And never guesses behind the pane
We two are watching and thinking her fair;
Lovingly watching her down the street,
Dear little Blue Hood, bright and sweet.

5 Somebody ties that hood of blue
Under the face so fair to see,
Somebody loves her, beside we two,
Somebody kisses her-- why can’t we?
Dear Little Blue Hood fresh and fair,
Are you glad we love you, or don’t you care?

NO SPRING

56 Up from the South come the birds that were banished,
Frightened away by the presence of frost.
Back to the vale comes the verdure that vanished,
Back to the forest the leaves that were lost.
Over the hillside the carpet of splendour,
Folded through Winter, Spring spreads down again;
Along the horizon, the tints that were tender,
Lost hues of Summer-time, burn bright as then.

2 Only the mountains’ high summits are hoary,
To the ice-fettered river the sun gives a key.

POESY

Once more the gleaming shore lists to the story
Told by an amorous Summer-kissed sea.
All things revive that in Winter time perished,
The rose buds again in the light o' the sun,
All that was beautiful, all that was cherished,
Sweet things and dear things and all things-- save one.

3 Late, when the year and the roses were lying
Low with the ruins of Summer and bloom,
Down in the dust fell a love that was dying,
And the snow piled over it, and made it a tomb.
Lo! now the roses are budded for blossom--
Lo! now the Summer is risen again.
Why dost thou bud not, O Love of my bosom?
Why dost thou rise not, and thrill me as then?

4 Life without love is a year without Summer,
Heart without love is a wood without song.
Rise then, revive then, thou indolent comer:
Why dost thou lie in the dark earth so long?
Rise! ah, thou can'st not! the rose-tree that sheddest
Its beautiful leaves, in the Springtime may bloom,
But of cold things the coldest, of dead things the deadest,
Love buried once, rises not from the tomb.
Green things may grow on the hillside and heather,
Birds seek the forest and build there and sing.
All things revive in the beautiful weather,
But unto a dead love there cometh no Spring.

MIDSUMMER

57 After the May time, and after the June time,
Rare with blossoms and perfumes sweet,
Cometh the round world's royal noon time,
The red midsummer of blazing heat.
When the sun, like an eye that never closes,
Bends on the earth its fervid gaze,
And the winds are still, and the crimson roses
Droop and wither and die in its rays.

POESY

2 Unto my heart has come that season,
O my lady, my worshipped one,
When over the stars of Pride and Reason
Sails Love's cloudless, noonday sun.
Like a great red ball in my bosom burning
With fires that nothing can quench or tame.
It glows till my heart itself seems turning
Into a liquid lake of flame.

3 The hopes half shy, and the sighs all tender,
The dreams and fears of an earlier day,
Under the noontide's royal splendour,
Droop like roses and wither away.
From the hills of doubt no winds are blowing,
From the isle of pain no breeze is sent.
Only the sun in a white heat glowing
Over an ocean of great content.

4 Sink, O my soul, in this golden glory,
Die, O my heart, in thy rapture-swoon,
For the Autumn must come with its mournful story,
And Love's midsummer will fade too soon.

A REMINISCENCE

58 I saw the wild honey-bee kissing a rose
A wee one, that grows
Down low on the bush, where her sisters above
Cannot see all that's done
As the moments roll on.
Nor hear all the whispers and murmurs of love.

2 They flaunt out their beautiful leaves in the sun,
And they flirt, every one,
With the wild bees who pass, and the gay butterflies.
And that wee thing in pink--
Why, they never once think
That she's won a lover right under their eyes.

3 It reminded me, Kate, of a time--
you know when!
You were so petite then,
Your dresses were short, and your feet were so small.
Your sisters, Maud-Belle
And Madeline-- well,
They 'both' set their caps for me, after that ball.

POESY

4 How the blue eyes and black eyes
smiled up in my face!
'Twas a neck-and-neck race,
Till that day when you opened the
door in the hall,
And looked up and looked down,
With your sweet eyes of brown,
And 'you' seemed so tiny, and 'I' felt
so tall.

5 Your sisters had sent you to keep
me, my dear,
Till they should appear.
Then you were dismissed like a
child in disgrace.
How meekly you went!
But your brown eyes, they sent
A thrill to my heart, and a flush to
my face.

6 We always were meeting some
way after that.
You hung up my hat,
And got it again, when I finished my
call.
Sixteen, and 'so' sweet!
Oh, those cute little feet!
Shall I ever forget how they tripped
down the hall?

7 Shall I ever forget the first kiss by
the door,
Or the vows murmured o'er,
Or the rage and surprise of Maud-
Belle? Well-a-day,
How swiftly time flows,
And who would suppose
That a 'bee' could have carried me
so far away.

A GIRL'S FAITH

59 Across the miles that stretch
between,
Through days of gloom or glad
sunlight,
There shines a face I have not seen
Which yet doth make my world
more bright.

2 He may be near, he may be far,
Or near or far I cannot see,
But faithful as the morning star
He yet shall rise and come to me.

3 What though fate leads us separate
ways,
The world is round, and time is
fleet.
A journey of a few brief days,
And face to face we two shall meet.

4 Shall meet beneath God's arching
skies,
While suns shall blaze, or stars shall
gleam,
And looking in each other's eyes
Shall hold the past but as a dream.

5 But round and perfect and complete,
Life like a star shall climb the height,
As we two press with willing feet
Together toward the Infinite.

6 And still behind the space between,
As back of dawns the sunbeams play,
There shines the face I have not seen,
Whose smile shall wake my world to-day.

TWO

60 One leaned on velvet cushions like a queen--
To see him pass, the hero of an hour,
Whom men called great. She bowed with languid mien,
And smiled, and blushed, and knew her beauty's power.

2 One trailed her tinselled garments through the street,
And thrust aside the crowd, and found a place
So near, the blooded courser's prancing feet
Cast sparks of fire upon her painted face.

3 One took the hot-house blossoms from her breast,
And tossed them down, as he went riding by,
And blushed rose-red to see them fondly pressed
To bearded lips, while eye spoke unto eye.

4 One, bold and hardened with her sinful life,
Yet shrank and shivered painfully, because
His cruel glance cut keener than a knife,
The glance of him who made her what she was.

5 One was observed, and lifted up to fame,
Because the hero smiled upon her! while
One who was shunned and hated, found her shame
In basking in the death-light of his smile.

SLIPPING AWAY

61 Slipping away-- slipping away!
Out of our brief year slips the May;

POESY

And Winter lingers, and Summer flies;
And Sorrow abideth, and Pleasure dies;
And the days are short, and the nights are long;
And little is right, and much is wrong.

2 Slipping away is the Summer time;
It has lost its rhythm and lilting rhyme--
For the grace goes out of the day so soon,
And the tired head aches in the glare of noon,
And the way seems long to the hills that lie
Under the calm of the western sky.

3 Slipping away are the friends whose worth
Lent a glow to the sad old earth:
One by one they slip from our sight;
One by one their graves gleam white;
Or we count them lost by the crueller death
Of a trust betrayed, or a murdered faith.

4 Slipping away are the hopes that made
Bliss out of sorrow, and sun out of shade,
Slipping away is our hold on life;
And out of the struggle and wearing strife,
From joys that diminish, and woes that increase,
We are slipping away to the shores of Peace.

IS IT DONE?

62 It is done! in the fire's fitful flashes,
The last line has withered and curled.
In a tiny white heap of dead ashes
Lie buried the hopes of your world.
There were mad foolish vows in each letter,
It is well they have shrivelled and burned,
And the ring! oh, the ring was a fetter,
It was better removed and returned.

2 But ah, is it done? In the embers
Where letters and tokens were cast,
Have you burned up the heart that remembers,
And treasures its beautiful past?
Do you think in this swift reckless fashion
To ruthlessly burn and destroy
The months that were freighted with passion,

POESY

The dreams that were drunken with joy?

3 Can you burn up the rapture of kisses
That flashed from the lips to the soul,
Or the heart that grows sick for lost blisses
In spite of its strength of control?
Have you burned up the touch of warm fingers
That thrilled through each pulse and each vein,
Or the sound of a voice that still lingers
And hurts with a haunting refrain?
4 Is it done? is the life drama ended?
You have put all the lights out, and yet,
Though the curtain, rung down, has descended,
Can the actors go home and forget?
Ah, no! they will turn in their sleeping
With a strange restless pain in their hearts,
And in darkness, and anguish, and weeping,
Will dream they are playing their parts.

A LEAF

63 Somebody said, in the crowd, last eve,
That you were married, or soon to be.
I have not thought of you, I believe,
Since last we parted. Let me see:
Five long Summers have passed since then--
Each has been pleasant in its own way--
And you are but one of a dozen men
Who have played the suitor a Summer day.

2 But, nevertheless, when I heard your name,
Coupled with some one's, not my own,
There burned in my bosom a sudden flame,
That carried me back to the day that is flown.
I was sitting again by the laughing brook,
With you at my feet, and the sky above,
And my heart was fluttering under your look--
The unmistakable look of Love.

3 Again your breath, like a South wind, fanned

POESY

My cheek, where the blushes came
and went;
And the tender clasp of your strong,
warm hand
Sudden thrills through my pulses
sent.
Again you were mine by Love's
own right--
Mine for ever by Love's decree:
So for a moment it seemed last
night,
When somebody mentioned your
name to me.

4 Just for the moment I thought you
mine--
Loving me, wooing me, as of old.
The tale remembered seemed half
divine--
Though I held it lightly enough
when told.
The past seemed fairer than when it
was near,
As "blessings brighten when taking
flight;"
And just for the moment I held you
dear--
When somebody mentioned your
name last night.

ÆSTHETIC

64 In a garb that was guiltless of
colours
She stood, with a dull, listless air
A creature of dumps and of dolours,
But most undeniably fair.

2 The folds of her garment fell round
her,
Revealing the curve of each limb;
Well proportioned and graceful I
found her,
Although quite alarmingly slim.

3 From the hem of her robe peeped
one sandal--
"High art" was she down to her feet;
And though I could not understand
all
She said, I could see she was sweet.

4 Impressed by her limpness and
languor,
I proffered a chair near at hand;
She looked back a mild sort of anger
Posed anew, and continued to stand.

5 Some praises I next tried to mutter
Of the fan that she held to her face;
She said it was "utterly utter,"
And waved it with languishing
grace.

6 I then, in a strain quite poetic,

POESY

Begged her gaze on the bow in the sky,
She looked-- said its curve was "æsthetic."
But the "tone was too dreadfully high."

7 Her lovely face, lit by the splendour
That glorified landscape and sea,
Woke thoughts that were daring and tender:
Did 'her' thoughts, too, rest upon me?
"Oh, tell me," I cried, growing bolder,
"Have I in your musings a place?"
"Well, yes," she said over her shoulder:
"I was thinking of nothing in space."

POEMS OF THE WEEK

SUNDAY

65 Lie still and rest, in that serene repose
That on this holy morning comes to those
Who have been burdened with the cares which make
The sad heart weary and the tired head ache.
Lie still and rest--
God's day of all is best.

MONDAY

2 Awake! arise! Cast off thy drowsy dreams!
Red in the East, behold the Morning gleams.
"As Monday goes, so goes the week," dames say.
Refreshed, renewed, use well the initial day.
And see! thy neighbour
Already seeks own labour.

TUESDAY

3 Another morning's banners are unfurled--
Another day looks smiling on the world.
It holds new laurels for thy soul to win;
Mar not its grace by slothfulness or sin,
Nor sad, away,
Send it to yesterday.

WEDNESDAY

4 Half-way unto the end--
the week's high noon.
The morning hours do speed away so soon!
And, when the noon is reached, however bright,
Instinctively we look toward the night.
The glow is lost
Once the meridian cross'd.

POESY

THURSDAY

5 So well the week has sped, hast thou a friend,
Go spend an hour in converse.
It will lend
New beauty to thy labours and thy life
To pause a little sometimes in the strife.
Toil soon seems rude
That has no interlude.

FRIDAY

6 From feasts abstain; be temperate, and pray;
Fast if thou wilt; and yet, throughout the day,
Neglect no labour and no duty shirk:
Not many hours are left thee for thy work--
And it were meet
That all should be complete.

SATURDAY

7 Now with the almost finished task make haste.
So near the night thou hast no time to waste.
Post up accounts, and let thy Soul's eyes look
For flaws and errors in Life's ledger-book.
When labours cease,
How sweet the sense of peace!

GHOSTS

66 There are ghosts in the room.
As I sit here alone, from the dark corners there
They come out of the gloom,
And they stand at my side and they lean on my chair.

2 There's the ghost of a Hope
That lighted my days with a fanciful glow.
In her hand is the rope
That strangled her life out. Hope was slain long ago.

3 But her ghost comes to-night,
With its skeleton face and expressionless eyes,
And it stands in the light,
And mocks me, and jeers me with sobs and with sighs.

4 There's the ghost of a Joy,
A frail, fragile thing, and I prized it too much,
And the hands that destroy
Clasped it close, and it died at the withering touch.

5 There's the ghost of a Love,
Born with joy, reared with hope, died in pain and unrest,
But he towers above

POESY

All the others-- this ghost: yet a
ghost at the best.

6 I am weary, and fain
Would forget all these dead: but the
gibbering host
Make my struggle in vain,
In each shadowy corner there
lurketh a ghost.

FLEEING AWAY

67 My thoughts soar not as they
ought to soar,
Higher and higher on soul-lent
wings;
But ever and often, and more and
more
They are dragged down earthward
by little things,
By little troubles and little needs,
As a lark might be tangled among
the weeds.

2 My purpose is not what it ought to
be,
Steady and fixed, like a star on high,
But more like a fisherman's light at
sea;
Hither and thither it seems to fly--
Sometimes feeble, and sometimes
bright,
Then suddenly lost in the gloom of
night.

3 My life is far from my dream of
life
Calmly contented, serenely glad;
But, vexed and worried by daily
strife,
It is always troubled, and ofttimes
sad--
And the heights I had thought I
should reach one day
Grow dimmer and dimmer, and
farther away.

4 My heart finds never the longed-
for rest;
Its worldly striving, its greed for
gold,
Chilled and frightened the calm-
eyed guest,
Who sometimes sought me in days
of old;
And ever fleeing away from me
Is the higher self that I long to be.

ALL MAD

68 "He is mad as a hare, poor
fellow,
And should be in chains," you say.
I haven't a doubt of your statement,
But who isn't mad, I pray?
Why, the world is a great asylum,
And people are all insane,
Gone daft with pleasure or folly,
Or crazed with passion and pain.

POESY

2 The infant who shrieks at a shadow,
The child with own Santa Claus faith,
The woman who worships Dame Fashion,
Each person with own notions of death,
The miser who hoards up own earnings,
The spendthrift who wastes them too soon,
The scholar grown blind in own delving,
The lover who stares at the moon.

3 The poet who thinks life a pæan,
The cynic who thinks it a fraud,
The youth who goes seeking for pleasure,
The preacher who dares talk of God,
All priests with their creeds and their croaking,
All doubters who dare to deny,
The gay who find aught to wake laughter,
The sad who find aught worth a sigh,
Whoever is downcast or solemn,
Whoever is gleeful and glad,
Are only the dupes of delusions--
We are all of us-- all of us mad.

HIDDEN GEMS

69 We know not what lies in us, till we seek;
People dive for pearls-- they are not found on shore,
The hillsides most unpromising and bleak
Do sometimes hide the ore.

2 Go, dive in the vast ocean of thy mind,
O human! far down below the noisy waves,
Down in the depths and silence thou mayst find
Rare pearls and coral caves.

3 Sink thou a shaft into the mine of thought;
Be patient, like the seekers after gold;
Under the rocks and rubbish lieth what
May bring thee wealth untold.

4 Reflected from the vastly Infinite,
However dulled by earth, each human mind
Holds somewhere gems of beauty and of light
Which, seeking, thou shalt find.

POESY

BY-AND-BYE

70 “By-and-bye,” the maiden sighed-- “by-and-bye
He will claim me for his bride,
Hope is strong and time is fleet;
Youth is fair, and love is sweet,
Clouds will pass that fleck my sky,
He will come back by-and-bye--
by-and-bye.”

2 “By-and-bye,” the soldier said--
“by-and-bye,
After I have fought and bled,
I shall go home from the wars,
Crowned with glory, seamed with scars.
Joy will flash from some one’s eyes
When they greets me by-and-bye--
by-and-bye.”

3 “By-and-bye,” the mother cried--
“by-and-bye,
Strong and sturdy at my side,
Like a staff supporting me,
Will my bonnie baby be.
Break my rest, then, wail and cry
Thou’lt repay me by-and-bye--
by-and-bye.”

4 Fleeting years of time have sped--
hurried by--
Still the maiden is unwed:
All unknown the soldier lies,
Buried under alien skies;
And the child, with blood-shot eye,
Saw own mother starve and die.
God in Heaven! dost Thou on high,
Keep the promised “by-and-bye”--
by-and-bye?

OVER THE MAY HILL

71 All through the night time, and all through the day time,
Dreading the morning and dreading the night,
Nearer and nearer we drift to the May time
Season of beauty and season of blight,
Leaves on the linden, and sun on the meadow,
Green in the garden, and bloom everywhere,
Gloom in my heart, and a terrible shadow,
Walks by me, sits by me, stands by my chair.

2 Oh, but the birds by the brooklet are cheery,
Oh, but the woods show such delicate greens,
Strange how you droop and how soon you are weary--
Too well I know what that weariness means.

POESY

But how could I know in the crisp winter weather
(Though sometimes I noticed a catch in your breath),
Riding and singing and dancing together,
How could I know you were racing with death?

3 How could I know when we danced until morning,
And you were the gayest of all the gay crowd--
With only that shortness of breath for a warning,
How could I know that you danced for a shroud?
Whirling and whirling through moonlight and starlight.
Rocking as lightly as boats on the wave,
Down in your eyes shone a deep light-- a far light,
How could I know 'twas the light to your grave?

4 Day by day, day by day, nearing and nearing,
Hid under greenness, and beauty and bloom,
Cometh the shape and the shadow I'm fearing,
"Over the May hill" is waiting your tomb.
The season of mirth and of music is over--
I have danced my last dance, I have sung my last song,
Under the violets, under the clover,
My heart and my love will be lying ere long

FOES

72 Thank Fate for foes! I hold mine dear
As valued friends. You cannot know
The zest of life who runneth here
Your earthly race without a foe.

2 I saw a prize. "Run," cried my friend;
"'Tis thine to claim without a doubt."
But ere I half-way reached the end,
I felt my strength was giving out.

3 My foe looked on the while I ran;
A scornful triumph lit your eyes.
With that perverseness born in human,
I nerved myself, and won the prize.
4 All blinded by the crimson glow
Of sin's disguise, I tempted Fate.
"I knew thy weakness!" sneered my foe,

POESY

I saved myself, and balked your
hate.

5 For half my blessings, half my
gain,
I needs must thank my trusty foe;
Despite your envy and disdain,
You serves me well where'er I go.

6 So may I keep you to the end,
Nor may your enmity abate:
More faithful than the fondest
friend,
You guards me ever with your hate.

FRIENDSHIP

73 Dear friend, I pray thee, if thou
wouldst be proving
Thy strong regard for me,
Make me no vows. Lip-service is
not loving;
Let thy faith speak for thee.

2 Swear not to me that nothing can
divide us--
So little such oaths mean.
But when distrust and envy creep
beside us
Let them not come between.

3 Say not to me the depths of thy
devotion
Are deeper than the sea;
But watch, lest doubt or some
unkind emotion
Embitter them for me.

4 Vow not to love me ever and for
ever,
Words are such idle things;
But when we differ in opinions,
never
Hurt me by little stings.

5 I'm sick of words: they are so
lightly spoken,
And spoken, are but air.
I'd rather feel thy trust in me
unbroken
Than list thy words so fair.

6 If all the little proofs of trust are
heeded,
If thou art always kind,
No sacrifice, no promise will be
needed
To satisfy my mind.

TWO SAT DOWN

74 Two sat down in the morning
time,
One to sing and one to spin.
All people listened the song sublime
But no one listened the dull wheel's
din.

POESY

2 The singer sat in a pleasant nook,
And sang of a life that was fair and sweet,
While the spinner sat with a steadfast look,
Busily plying her hands and feet.

3 The singer sang on with a rose in her hair,
And all men listened her dulcet tone;
And the spinner spun on with a dull despair
Down in her heart as she sat alone.

4 But lo! on the morrow no one said
Aught of the singer or what she sang.
Men were saying: “Behold this thread,”
And loud the praise of the spinner rang.

5 The world has forgotten the singer’s name--
Her rose is faded, her songs are old;
But far o’er the ocean the spinner’s fame
Yet is blazoned in lines of gold.

BOUND AND FREE

75 Come to me, Love! Come on the wings of the wind!
Fly as the ring-dove would fly to own mate!
Leave all your cares and your sorrows behind!
Leave all the fears of your future to Fate!
Come! and our skies shall be glad with the gold
That paled into gray when you parted from me.
Come! but remember that, just as of old,
You must be bound, Love, and I must be free.

2 Life has lost savour since you and I parted;
I have been lonely, and you have been sad.
Youth is too brief to be sorrowful-hearted--
Come! and again let us laugh and be glad.
Lips should not sigh that are fashioned to kiss--
Breasts should not ache that joy’s secrets have found.
Come! but remember, in spite of all this,
I must be free, Love, while you must be bound.

3 You must be bound to be true
while you live,
And I keep my freedom for ever, as
now.
You must ask only for that which I
give--
Kisses and love-words, but never a
vow.
Come! I am lonely, and long for
your smile,
Bring back the lost lovely Summer
to me!
Come! but remember, remember the
while,
That you must be bound, Love, and
I must be free.

AQUILEIA

76 On the election of the Roman Emperor Maximus, by the Senate, A.D. 238, a powerful army, headed by the Thracian giant Maximus, laid siege to Aquileia. 2 Though poorly prepared for war, the constancy of her citizens rendered her impregnable. 3 The women of Aquileia cut off their hair to make ropes for the military engines. The small body of troops was directed by Chrispinus, a Lieutenant of the Senate. 4 Apollo was the deity supposed to protect them.-- 'Gibbon's Roman History'.

5 "The ropes, the ropes! Apollo
send us ropes,"
Chrispinus cried, "or death attends
our hopes."
Then panic reigned, and many a
mournful sound
Hurt the cleft air; for where could
ropes be found?

6 Up rose a Roman mother; tall was
she
As her own son, a youth of noble
height.
A little child was clinging to her
knee--
She loosed his twining arms and put
him down,
And her dark eyes flashed with a
sudden light.

7 How like a queen she stood! her
royal crown,
The rich dark masses of her splendid
hair.
Just flecked with spots of sunshine
here and there,
Twined round her brow; 'twas like a
coronet,
Where gems of gold lie bedded deep
in jet.

8 She loosed the comb that held the shining strands,
And threaded out the meshes with her hands.
The purple mass fell to her garment's hem.
A queen new clothed without her diadem
She stood before her subjects.

9 "Now," she cried,
"Give me thy sword, Julianus!"
And her son
Unsheathed the blade (that had not left his side
Save when it sought a foeman's blood to shed),
Awed by her regal bearing, and obeyed.

10 With the white beauty of her firm fair hand
She clasped the hilt; then severed, one by one,
Her gold-flecked purple tresses.
Strand on strand,
Free e'en as foes had fallen by that blade,
Robbed of its massive wealth of curl and coil,
Yet like some antique model, rose her head
In all its classic beauty.

11 "See!" she said,
And pointed to the shining mound of hair;
"Apollo makes swift answer to thy prayer,
Chrispinus. Quick! now, soldiers, to thy toil!"
Forth from a thousand throats what seemed one voice
Rose shrilly, filling all the air with cheer.

12 "Lo!" quoth the foe, "our enemies rejoice!"
Well might the Thracian giant quake with fear!
For while skilled hands caught up the gleaming threads
And bound them into cords, a hundred heads
Yielded their beauteous tresses to the sword,
And cast them down to swell the precious hoard.
Nor was the noble sacrifice in vain
Another day beheld the giant slain.

WISHES FOR A LITTLE GIRL

77 What would I ask the kindly fates to give
To crown her life, if I could have my way?
My strongest wishes would be negative,

POESY

If they would but obey.

2 Give her not greatness. For great souls must stand
Alone and lonely in this little world:
Cleft rocks that show the great Creator's hand,
Thither by earthquakes hurled.

3 Give her not genius. Spare her the cruel pain
Of finding her whole life a prey for daws;
Of hearing with quickened sense and burning brain
The world's sneer-tinged applause.

4 Give her not perfect beauty's gifts. For then
Her truthful mirror would infuse her mind
With love for self, and for the praise of men,
That lowers woman-kind.

5 But make her fair and comely to the sight,
Give her more heart than brain, more love than pride.
Let her be tender-thoughted, cheerful, bright,
Some strong man's star and guide.

6 Not vainly questioning why she was sent
Into this restless world of toil and strife,
Let her go bravely on her way, content
To make the best of life.

ROMNEY

78 Nay, Romney, nay-- I will not hear you say
Those words again: "I love you, love you sweet!"
You are profane-- blasphemous. I repeat,
You are no actor for so grand a play.
2 You love with all your heart? Well, that may be;
Some cups are fashioned shallow. Should I try
To quench my thirst from one of those, when dry--
I who have had a full bowl proffered me--

3 A new bowl brimming with a draught divine,
One single taste thrilled to the finger-tips?
Think you I even care to bathe my lips
With this poor sweetened water you call wine?

POESY

4 And though I spilled the nectar ere
’twas quaffed,
And broke the bowl in wanton folly,
yet
I would die of my thirst ere I would
wet
My burning lips with any meaner
draught.

5 So leave me, Romney. One who
has seen a play
Enacted by a star cannot endure
To see it rendered by an amateur.
You know not what Love is--
now go away!

MY HOME

79 This is the place that I love the
best,
A little brown house like a ground-
bird’s nest,
Hid among grasses, and vines, and
trees,
Summer retreat of the birds and
bees.

2 The tenderest light that ever was
seen
Sifts through the vine-made window
screen--
Sifts and quivers, and flits and falls
On home-made carpets and gray-
hung walls.

3 All through June, the west wind
free
The breath of the clover brings to
me.
All through the languid July day
I catch the scent of the new-mown
hay.

4 The morning glories and scarlet
vine
Over the doorway twist and twine;
And every day, when the house is
still,
The humming-bird comes to the
window-sill.

5 In the cunningest chamber under
the sun
I sink to sleep when the day is done;
And am waked at morn, in my
snow-white bed,
By a singing-bird on the roof
o’erhead.

6 Better than treasures brought from
Rome
Are the living pictures I see at home
My aged father, with frosted hair,
And mother’s face like a painting
rare

7 Far from the city’s dust and heat,
I get but sounds and odours sweet.
Who can wonder I love to stay,
Week after week, here hidden away,

POESY

In this sly nook that I love the best
The little brown house, like a
ground-bird's nest?

TO MARRY OR NOT TO MARRY?
A GIRL'S REVERIE

80 Mother says, "Be in no hurry,
Marriage oft means care and
worry."

2 Auntie says, with manner grave,
"Wife is synonym for slave."

3 Father asks, in tones commanding,
"How does Bradstreet rate his
standing?"

4 Sister crooning to her twins,
Sighs, "With marriage care begins."

5 Grandma, near life's closing days,
Murmurs, "Sweet are girlhood's
ways."

6 Maud, twice widowed ("sod and
grass")
Looks at me and moans "Alas!"

7 They are six, and I am one,
Life for me has just begun.

8 They are older, calmer, wiser:
Age should aye be youth's adviser.

9 They must know-- and yet, dear
me,
When in Harry's eyes I see

10 All the world of love there
burning
On my six advisers turning,

11 I make answer, "Oh, but Harry
Is not like most men who marry.

12 "Fate has offered me a prize,
Life with love means Paradise.

13 "Life without it is not worth
All the foolish joys of earth."

14 So, in spite of all they say,
I shall name the wedding day.

AN AFTERNOON

81 I am stirred by the dream of an
afternoon
Of a perfect day-- though it was not
June;
The lilt of winds, and the droning
tune
That a busy city was humming.

2 And a bronze-brown head, and lips
like wine

POESY

Leaning out through the window-vine
A-list for steps that were maybe mine--
Eager steps that were coming.

3 I can see it all, as a dreamer may--
The tender smile on your lips that day,
And the glow on your cheek as we rode away
Into the golden weather.
4 And a love-light shone in your eyes of brown--
I swear there did!-- as we drove down
The crowded avenue out of the town,
Through shadowy lanes, together:

5 Drove out into the sunset-skies
That glowed with wonderful crimson dyes;
And with soul and spirit, and heart and eyes,
We silently drank their splendour.

6 But the golden glory that lit the place
Was not alone from the sunset's grace--
For I saw in your fair, uplifted face
A light that was wondrously tender.

7 I say I saw it. And yet to-day
I ask myself, in a cynical way,
Was it only a part you had learned to play,
To see me act the lover?

8 And I curse myself for a fool. And yet
I would willingly die without one regret
Could I bring back the day whose sun has set--
And you-- and live it over.

RIVER AND SEA

82 We stood by the river that swept
In its glory and grandeur away;
But never a pulse o' me leapt,
And you wondered at me that day.

2 We stood by the lake as it lay
With its dimpled face turned to the light;
Was it strange I had nothing to say
To so fair and enchanting a sight?

3 I look on your tresses of gold--
You are fair and a thing to be loved
Do you think I am heartless and cold
That I look and am wholly unmoved?

4 One answer, dear friend, I will make
To the questions your eyes ask of me:
“Talk not of the river or lake
To those who have looked on the sea”

WHAT HAPPENS?

83 When thy hand touches mine, through all the mesh
Of intricate and interlacèd veins
Shoot swift delights that border on keen pains:
Flesh thrills to thrilling flesh.

2 When in thine eager eyes I look to find
A comrade to my thought, thy ready brain
Delves down and makes its inmost meaning plain:
Mind answers unto mind.

3 When hands and eyes are hid by seas that roll
Wide wastes between us, still so near thou art
I count the very pulses of thy heart:
Soul speaketh unto soul.

4 So every law, or human or divine,
In heart and brain and spirit makes thee mine.

POSSESSION

84 That which we had we still possess,
Though leaves may drop and stars may fall;
No circumstance can make it less,
Or take it from us, all in all.

2 That which is lost we did not own;
We only held it for a day--
A leaf by careless breezes blown;
No fate could take our own away.

3 I hold it as a changeless law
From which no soul can sway or swerve,
We have that in us which will draw
Whate’er we need or most deserve.

4 Even as the magnet to the steel
Our souls are to our best desires;
The Fates have hearts and they can feel
They know what each true life requires.

5 We think we lose when we most gain;
We call joys ended ere begun;

POESY

When stars fade out do skies
complain,
Or glory in the rising sun?

No fate could rob us of our own--
No circumstance can make it less;
What time removes was but a loan,
For what was ours we still possess.

The Book of Divine Panagogue called

INTERPRETATION

OF THE INTERPRETATION OF SCRIPTURE

Benedict of Spinoza

1 When people declare, as all are ready to do, that the Bible is the Word of God teaching human true blessedness and the way of salvation, they evidently do not mean what they say; 2 for the masses take no pains at all to live according to Scripture, and we see most people endeavouring to hawk about their own commentaries as the word of God, and giving their best efforts, under the guise of religion, to compelling others to think as they do: 3 we generally see, I say, theologians anxious to learn how to wring their inventions and sayings out of the sacred text, and to fortify them with Divine authority. 4 Such persons never display, less scruple or more zeal than when they, are interpreting Scripture or the mind of the Holy Ghost; 5 if we ever see them perturbed, it is not that they fear to attribute some error to the Holy Spirit, and to stray from the right path, 6 but that they are afraid to be convicted of error by others, and thus to overthrow and bring into contempt their own authority.

7 But if people really believed what they verbally testify of Scripture, they would adopt quite a different plan of life: 8 their minds would not be agitated by so many contentions, nor so many hatreds, and they would cease to be excited by such a blind and rash passion for interpreting the sacred writings, and excogitating novelties in religion. 9 On the contrary, they would not dare to adopt, as the teaching of Scripture, anything which they could not plainly deduce therefrom: 10 lastly, those sacrilegious persons who have dared, in several passages, to interpolate the Bible, would have shrunk from so great a crime, and would have stayed their sacrilegious hands.

11 Ambition and unscrupulousness have waxed so powerful, that religion is thought to consist, not so much in respecting the writings of the Holy Ghost, as in defending human commentaries, 12 so that religion is no longer identified with charity, but with spreading discord and propagating insensate

hatred disguised under the name of zeal for the Lord, and eager ardour.

13 To these evils we must add superstition, which teaches people to despise reason and Nature, and only to admire and venerate that which is repugnant to both: 14 whence it is not wonderful that for the sake of increasing the admiration and veneration felt for Scripture, people strive to explain it so as to make it appear to contradict, as far as possible, both one and the other: 15 thus they dream that most profound mysteries lie hid in the Bible, and weary themselves out in the investigation of these absurdities, to the neglect of what is useful. 16 Every result of their diseased imagination they attribute to the Holy Ghost, and strive to defend with the utmost zeal and passion; 17 for it is an observed fact that humans employ their reason to defend conclusions arrived at by reason, but conclusions arrived at by the passions are defended by the passions.

18 If we would separate ourselves from the crowd and escape from theological prejudices, instead of rashly accepting human commentaries for Divine documents, 19 we must consider the true method of interpreting Scripture and dwell upon it at some length: for if we remain in ignorance of this we cannot know, certainly, what the Bible and the Holy Spirit wish to teach.

20 I may sum up the matter by saying that the method of interpreting Scripture does not widely differ from the method of interpreting Nature-- in fact, it is almost the same. 21 For as the interpretation of Nature consists in the examination of the history of Nature, and therefrom deducing definitions of natural phenomena on certain fixed axioms, 22 so Scriptural interpretation proceeds by the examination of Scripture, and inferring the intention of its authors as a legitimate conclusion from its fundamental principles. 23 By working in this manner everyone will always advance without danger of error-- that is, if they admit no principles for interpreting Scripture, and discussing its contents save such as they find in Scripture itself-- 24 and will be able with equal

security to discuss what surpasses our understanding, and what is known by the natural light of reason.

25 In order to make clear that such a method is not only correct, but is also the only one advisable, and that it agrees with that employed in interpreting Nature, 26 I must remark that Scripture very often treats of matters which cannot be deduced from principles known to reason: for it is chiefly made up of narratives and revelation: 27 the narratives generally contain miracles-- that is, relations of extraordinary natural occurrences adapted to the opinions and judgment of the historians who recorded them: 28 the revelations also were adapted to the opinions of the prophets, and in themselves surpassed human comprehension. 29 Therefore the knowledge of all these-- that is, of nearly the whole contents of Scripture, must be sought from Scripture alone, even as the knowledge of Nature is sought from Nature. 30 As for the moral doctrines which are also contained in the Bible, they may be demonstrated from received axioms, but we cannot prove in the same manner that Scripture intended to teach them, this can only be learned from Scripture itself.

31 If we would bear unprejudiced witness to the Divine origin of Scripture, we must prove solely on its own authority that it teaches true moral doctrines, for by such means alone can its Divine origin be demonstrated: 32 we have shown that the certitude of the prophets depended chiefly on their having minds turned towards what is just and good, therefore we ought to have proof of their possessing this quality before we repose faith in them. 33 From miracles God's divinity cannot be proved, as I have already shown, and need not now repeat, for miracles could be wrought by false prophets. 34 Wherefore the Divine origin of Scripture must consist solely in its teaching true virtue. 35 But we must come to our conclusion simply on Scriptural grounds, for if we were unable to do so we could not, unless strongly prejudiced accept the Bible and bear witness to its Divine origin. 36 Our knowledge of Scripture must then be looked for in

Scripture only. 37 Lastly, Scripture does not give us definition of things any more than Nature does: 38 therefore, such definitions must be sought in the latter case from the diverse workings of Nature; in the former case, from the various narratives about the given subject which occur in the Bible.

39 The universal rule, then, in interpreting Scripture is to accept nothing as an authoritative Scriptural statement which we do not perceive very clearly when we examine it in the light of its history. 40 What I mean by its history, and what should be the chief points elucidated, I will now explain. The history of a Scriptural statement comprises:

41 I. The nature and properties of the language in which the books of the Bible were written, and in which their authors were, accustomed to speak. 42 We shall thus be able to investigate every expression by comparison with common conversational usages. 43 Now all the writers both of the Old Testament and the New were Hebrews: therefore, a knowledge of the Hebrew language is before all things necessary, not only for the comprehension of the Old Testament, which was written in that tongue, but also of the New: 44 for although the latter was published in other languages, yet its characteristics are Hebrew.

45 II. An analysis of each book and arrangement of its contents under heads; so that we may have at hand the various texts which treat of a given subject. 46 Lastly, a note of all the passages which are ambiguous or obscure, or which seem mutually contradictory. 47 I call passages clear or obscure according as their meaning is inferred easily or with difficulty in relation to the context, not according as their truth is perceived easily or the reverse by reason. 48 We are at work not on the truth of passages, but solely on their meaning. 49 We must take especial care, when we are in search of the meaning of a text, not to be led away by our reason in so far as it is founded on principles of natural knowledge (to say nothing of prejudices): 50 in order not to confound the meaning of a passage with its truth, we must examine it solely by means of the signification of the words, or by a

reason acknowledging no foundation but Scripture.

51 I will illustrate my meaning by an example. The words of Moses, "God is a fire" and "God is jealous," are perfectly clear so long as we regard merely the signification of the words, 52 and I therefore reckon them among the clear passages, though in relation to reason and truth they are most obscure: still, although the literal meaning is repugnant to the natural light of reason, 53 nevertheless, if it cannot be clearly overruled on grounds and principles derived from its Scriptural "history," it, that is, the literal meaning, must be the one retained: 54 and contrariwise if these passages literally interpreted are found to clash with principles derived from Scripture, though such literal interpretation were in absolute harmony with reason, they must be interpreted in a different manner, i.e. metaphorically.

55 If we would know whether Moses believed God to be a fire or not, we must on no account decide the question on grounds of the reasonableness or the reverse of such an opinion, but must judge solely by the other opinions of Moses which are on record. 56 In the present instance, as Moses says in several other passages that God has no likeness to any visible thing, whether in heaven or in earth, or in the water, either all such passages must be taken metaphorically, or else the one before us must be so explained. 57 However, as we should depart as little as possible from the literal sense, we must first ask whether this text, God is a fire, admits of any but the literal meaning-- 58 that is, whether the word fire ever means anything besides ordinary natural fire. 59 If no such second meaning can be found, the text must be taken literally, however repugnant to reason it may be: 60 and all the other passages, though in complete accordance with reason, must be brought into harmony with it. 61 If the verbal expressions would not admit of being thus harmonised, we should have to set them down as irreconcilable, and suspend our judgment concerning them. 62 However, as we find the name fire applied to anger and jealousy (see

Job, Chapter-31:12) we can thus easily reconcile the words of Moses, and legitimately conclude that the two propositions God is a fire, and God is jealous, are in meaning identical.

63 Further, as Moses clearly teaches that God is jealous, and nowhere states that God is without passions or emotions, we must evidently infer that Moses held this doctrine himself, or at any rate, that he wished to teach it, 64 nor must we refrain because such a belief seems contrary to reason: for as we have shown, we cannot wrest the meaning of texts to suit the dictates of our reason, or our preconceived opinions. 65 The whole knowledge of the Bible must be sought solely from itself.

66 III. Lastly, such a history should relate the environment of all the prophetic books extant; 67 that is, the life, the conduct, and the studies of the author of each book, who they was, what was their occasion, and the epoch of their writing, whom did they write for, and in what language. 68 Further, it should inquire into the fate of each book: how it was first received, into whose hands it fell, how many different versions there were of it, 69 by whose advice was it received into the Bible, and, lastly, how all the books now universally accepted as sacred, were united into a single whole.

70 All such information should, as I have said, be contained in the "history" of Scripture. 71 For, in order to know what statements are set forth as laws, and what as moral precepts, it is important to be acquainted with the life, the conduct, and the pursuits of their author: 72 moreover, it becomes easier to explain a human's writings in proportion as we have more intimate knowledge of your genius and temperament.

73 Further, that we may not confound precepts which are eternal with those which served only a temporary purpose, or were only meant for a few, 74 we should know what was the occasion, the time, the age, in which each book was written, and to what nation it was addressed. 75 Lastly, we should have knowledge on the other points I have mentioned, in order to be sure, in addition to the authenticity of the work, 76 that it has not been tampered with by

sacrilegious hands, or whether errors can have crept in, and, if so, whether they have been corrected by people sufficiently skilled and worthy of credence. 77 All these things should be known, that we may not be led away by blind impulse to accept whatever is thrust on our notice, instead of only that which is sure and indisputable.

78 Now when we are in possession of this history of Scripture, and have finally decided that we assert nothing as prophetic doctrine which does not directly follow from such history, or which is not clearly deducible from it, 79 then, I say, it will be time to gird ourselves for the task of investigating the mind of the prophets and of the Holy Spirit. 80 But in this further arguing, also, we shall require a method very like that employed in interpreting Nature from Her history.

81 As in the examination of natural phenomena we try first to investigate what is most universal and common to all nature-- 82 such, for instance, as motion and rest, and their laws and rules, which Nature always observes, and through which She continually works-- and then we proceed to what is less universal; 83 so, too, in the history of Scripture, we seek first for that which is most universal, and serves for the basis and foundation of all Scripture, a doctrine, in fact, that is commended by all the prophets as eternal and most profitable to all humans.

84 For example, that God is one, and that He is omnipotent, that He alone should be worshipped, that He has a care for all humans, and that He especially loves those who adore Him and love their neighbour as themselves. 85 These and similar doctrines, I repeat, Scripture everywhere so clearly and expressly teaches, that no one was ever in doubt of its meaning concerning them. 86 The nature of God, His manner of regarding and providing for things, and similar doctrines, Scripture nowhere teaches professedly, and as eternal doctrine; 87 on the contrary, we have shown that the prophets themselves did not agree on the subject; therefore, we must not lay down any doctrine as Scriptural on such subjects, though it may

appear perfectly clear on rational grounds.

88 From a proper knowledge of this universal doctrine of Scripture, we must then proceed to other doctrines less universal, but which, nevertheless, have regard to the general conduct of life, and flow from the universal doctrine like rivulets from a source; 89 such are all particular external manifestations of true virtue, which need a given occasion for their exercise; 90 whatever is obscure or ambiguous on such points in Scripture must be explained and defined by its universal doctrine; 91 with regard to contradictory instances, we must observe the occasion and the time in which they were written. 92 For instance, when Christ says, "Blessed are they that mourn, for they shall be comforted" we do not know, from the actual passage, what sort of mourners are meant; 93 as, however, Christ afterwards teaches that we should have care for nothing, save only for the kingdom of God and His righteousness, which is commended as the highest good (see Matthew, Chapter-6:33), 94 it follows that by mourners He only meant those who mourn for the kingdom of God and righteousness neglected by human: 95 for this would be the only cause of mourning to those who love nothing but the Divine kingdom and justice, and who evidently despise the gifts of fortune. 96 So, too, when Christ says: "But if a person strike you on the right cheek, turn to them the left also," and the words which follow. 97 If He had given such a command, as a lawgiver, to judges, He would thereby have abrogated the law of Moses, but this He expressly says He did not do (Matthew-5:17). 98 Wherefore we must consider who was the speaker, what was the occasion, and to whom were the words addressed.

99 Now Christ said that He did not ordain laws as a legislator, but inculcated precepts as a teacher: inasmuch as He did not aim at correcting outward actions so much as the frame of mind. 100 Further, these words were spoken to people who were oppressed, who lived in a corrupt commonwealth on the brink of ruin, where justice was utterly

neglected. 101 The very doctrine inculcated here by Christ just before the destruction of the city was also taught by Jeremiah before the first destruction of Jerusalem, that is, in similar circumstances, as we see from Lamentations 3:25-30. 102 Now as such teaching was only set forth by the prophets in times of oppression, and was even then never laid down as a law; 103 and as, on the other hand, Moses (who did not write in times of oppression, but-- mark this-- strove to found a well-ordered commonwealth), while condemning envy and hatred of one's neighbour, yet ordained that an eye should be given for an eye, 104 it follows most clearly from these purely Scriptural grounds that this precept of Christ and Jeremiah concerning submission to injuries was only valid in places where justice is neglected, and in a time of oppression, but does not hold good in a well-ordered state.

105 In a well-ordered state where justice is administered every one is bound, if you would be accounted just, to demand penalties before the judge (see Leviticus:1), 106 not for the sake of vengeance (Leviticus. 19:17, 18), but in order to defend justice and your country's laws, and to prevent the wicked rejoicing in their wickedness. 107 All this is plainly in accordance with reason. 108 I might cite many other examples in the same manner, but I think the foregoing are sufficient to explain my meaning and the utility of this method, and this is all my present purpose.

109 Hitherto we have only shown how to investigate those passages of Scripture which treat of practical conduct, and which, therefore, are more easily examined, for on such subjects there was never really any controversy among the writers of the Bible. 110 The purely speculative passages cannot be so easily traced to their real meaning: the way becomes narrower, 111 for as the prophets differed in matters speculative among themselves, and the narratives are in great measure adapted to the prejudices of each age, we must not, on any account infer the intention of one prophet from clearer passages in the writings of another; 112 nor must we so explain their meaning,

unless it is perfectly plain that the two prophets were at one in the matter.

113 How we are to arrive at the intention of the prophets in such cases I will briefly explain. 114 Here, too, we must begin from the most universal proposition, inquiring first from the most clear Scriptural statements what is the nature of prophecy or revelation, and wherein does it consist; 115 then we must proceed to miracles, and so on to whatever is most general till we come to the opinions of a particular prophet, and, at last, to the meaning of a particular revelation, prophecy, history, or miracle.

116 We have already pointed out that great caution is necessary not to confound the mind of a prophet or historian with the mind of the Holy Spirit and the truth of the matter; therefore I need not dwell further on the subject. 117 I would, however, here remark concerning the meaning of revelation, that the present method only teaches us what the prophets really saw or heard, not what they desired to signify or represent by symbols. 118 The latter may be guessed at but cannot be inferred with certainty from Scriptural premises. 119 We have thus shown the plan for interpreting Scripture, and have, at the same time, demonstrated that it is the one and surest way of investigating its true meaning. 120 I am willing indeed to admit that those persons (if any such there be) would be more absolutely certainly right, who have received either a trustworthy tradition or an assurance from the prophets themselves, such as is claimed by the Pharisees; 121 or who have a pontiff gifted with infallibility in the interpretation of Scripture, such as the Roman Catholics boast. 122 But as we can never be perfectly sure, either of such a tradition or of the authority of the pontiff, we cannot found any certain conclusion on either: the one is denied by the oldest sect of Christians, the other by the oldest sect of Jews. 123 Indeed, if we consider the series of years (to mention no other point) accepted by the Pharisees from their Rabbis, during which time they say they have handed down the tradition from Moses, we shall find that it is not correct, as I show elsewhere.

124 Therefore such a tradition should be received with extreme suspicion; and although, according to our method, we are bound to consider as uncorrupted the tradition of the Jews, 125 namely, the meaning of the Hebrew words which we received from them, we may accept the latter while retaining our doubts about the former. 126 No one has ever been able to change the meaning of a word in ordinary use, though many have changed the meaning of a particular sentence. 127 Such a proceeding would be most difficult; for whoever attempted to change the meaning of a word, would be compelled, at the same time, to explain all the authors who employed it, each according to own temperament and intention, or else, with consummate cunning, to falsify them.

128 Further, the masses and the learned alike preserve language, but it is only the learned who preserve the meaning of particular sentences and books: 129 thus, we may easily imagine that the learned having a very rare book in their power, might change or corrupt the meaning of a sentence in it, but they could not alter the signification of the words; 130 moreover, if anyone wanted to change the meaning of a common word you would not be able to keep up the change among posterity, or in common parlance or writing. 131 For these and such-like reasons we may readily conclude that it would never enter into the mind of anyone to corrupt a language, though the intention of a writer may often have been falsified by changing own phrases or interpreting them amiss. 132 As then our method (based on the principle that the knowledge of Scripture must be sought from itself alone) is the sole true one, we must evidently renounce any knowledge which it cannot furnish for the complete understanding of Scripture. 133 I will now point out its difficulties and shortcomings, which prevent our gaining a complete and assured knowledge of the Sacred Text.

134 Its first great difficulty consists in its requiring a thorough knowledge of the Hebrew language. Where is such knowledge to be obtained? 135 The people of old who employed the

Hebrew tongue have left none of the principles and bases of their language to posterity; we have from them absolutely nothing in the way of dictionary, grammar, or rhetoric. 136 Now the Hebrew nation has lost all its grace and beauty (as one would expect after the defeats and persecutions it has gone through), and has only retained certain fragments of its language and of a few books. 137 Nearly all the names of fruits, birds, and fishes, and many other words have perished in the wear and tear of time.

138 Further, the meaning of many nouns and verbs which occur in the Bible are either utterly lost, or are subjects of dispute. And not only are these gone, but we are lacking in a knowledge of Hebrew phraseology. 139 The devouring tooth of time has destroyed turns of expression peculiar to the Hebrews, so that we know them no more. 140 Therefore we cannot investigate as we would all the meanings of a sentence by the uses of the language; 141 and there are many phrases of which the meaning is most obscure or altogether inexplicable, though the component words are perfectly plain. 142 To this impossibility of tracing the history of the Hebrew language must be added its particular nature and composition: 143 these give rise to so many ambiguities that it is impossible to find a method which would enable us to gain a certain knowledge of all the statements in Scripture,. 144 In addition to the sources of ambiguities common to all languages, there are many peculiar to Hebrew. These, I think, it worthwhile to mention.

145 Firstly, an ambiguity often arises in the Bible from our mistaking one letter for another similar one. 146 The Hebrews divide the letters of the alphabet into five classes, according to the five organs of the month employed in pronouncing them, namely, the lips, the tongue, the teeth, the palate, and the throat. 147 For instance, Alpha, Ghet, Hgain, He, are called gutturals, and are barely distinguishable, by any sign that we know, one from the other. 148 El, which signifies to, is often taken for hgal, which signifies above, and vice versa. Hence

sentences are often rendered rather ambiguous or meaningless.

149 A second difficulty arises from the multiplied meaning of conjunctions and adverbs. For instance, vau serves promiscuously for a particle of union or of separation, meaning, and, but, because, however, then: 150 ki, has seven or eight meanings, namely, wherefore, although, if, when, inasmuch as, because, a burning, and so on with almost all particles.

151 The third very fertile source of doubt is the fact that Hebrew verbs in the indicative mood lack the present, the past imperfect, the pluperfect, the future perfect, and other tenses most frequently employed in other languages; 152 in the imperative and infinitive moods they are wanting in all except the present, and a subjunctive mood does not exist. 153 Now, although all these defects in moods and tenses may be supplied by certain fundamental rules of the language with ease and even elegance, 154 the ancient writers evidently neglected such rules altogether, and employed indifferently future for present and past, and vice versa past for future, and also indicative for imperative and subjunctive, with the result of considerable confusion.

155 Besides these sources of ambiguity there are two others, one very important. Firstly, there are in Hebrew no vowels; secondly, the sentences are not separated by any marks elucidating the meaning or separating the clauses. 156 Though the want of these two has generally been supplied by points and accents, such substitutes cannot be accepted by us, inasmuch as they were invented and designed by people of an after age whose authority should carry no weight. 157 The ancients wrote without points (that is, without vowels and accents), as is abundantly testified; 158 their descendants added what was lacking, according to their own ideas of Scriptural interpretation; wherefore the existing accents and points are simply current interpretations, and are no more authoritative than any other commentaries.

159 Those who are ignorant of this fact cannot justify the author of the

Epistle to the Hebrews for interpreting (Chapter-11:21) Genesis (47:31) very differently from the version given in our Hebrew text as at present pointed, 160 as though the Apostle had been obliged to learn the meaning of Scripture from those who added the points. In my opinion the latter are clearly wrong. 161 In order that everyone may judge for yourself, and also see how the discrepancy arose simply from the want of vowels, I will give both interpretations. 162 Those who pointed our version read, "And Israel bent himself over, or (changing Hqain into Aleph, a similar letter) towards, the head of the bed." 163 The author of the Epistle reads, "And Israel bent himself over the head of his staff," substituting mate for mita, from which it only differs in respect of vowels. 164 Now as in this narrative it is Jacob's age only that is in question, and not his illness, which is not touched on till the next chapter, 165 it seems more likely that the historian intended to say that Jacob bent over the head of his staff (a thing commonly used by people of advanced age for their support) than that he bowed himself at the head of his bed, especially as for the former reading no substitution of letters is required.

166 In this example I have desired not only to reconcile the passage in the Epistle with the passage in Genesis, but also and chiefly to illustrate how little trust should be placed in the points and accents which are found in our present Bible, 167 and so to prove that you who would be without bias in interpreting Scripture should hesitate about accepting them, and inquire afresh for yourself. 168 Such being the nature and structure of the Hebrew language, one may easily understand that many difficulties are likely to arise, and that no possible method could solve all of them. 169 It is useless to hope for a way out of our difficulties in the comparison of various parallel passages (we have shown that the only method of discovering the true sense of a passage out of many alternative ones is to see what are the usages of the language), 170 for this comparison of parallel passages can only accidentally throw light

on a difficult point, seeing that the prophets never wrote with the express object of explaining their own phrases or those of other people, 171 and also because we cannot infer the meaning of one prophet or apostle by the meaning of another, unless on a purely practical question, not when the matter is speculative, or if a miracle, or history is being narrated. 172 I might illustrate my point with instances, for there are many inexplicable phrases in Scripture, but I would rather pass on to consider the difficulties and imperfections of the method under discussion.

173 A further difficulty attends the method, from the fact that it requires the history of all that has happened to every book in the Bible; such a history we are often quite unable to furnish. 174 Of the authors, or (if the expression be preferred), the writers of many of the books, we are either in complete ignorance, or at any rate in doubt, as I will point out at length. 175 Further, we do not know either the occasions or the epochs when these books of unknown authorship were written; 176 we cannot say into what hands they fell, nor how the numerous varying versions originated; nor, lastly, whether there were not other versions, now lost. 177 I have briefly shown that such knowledge is necessary, but I passed over certain considerations which I will now draw attention to. 178 If we read a book which contains incredible or impossible narratives, or is written in a very obscure style, and if we know nothing of its author, nor of the time or occasion of its being written, we shall vainly endeavour to gain any certain knowledge of its true meaning. 179 For being in ignorance on these points we cannot possibly know the aim or intended aim of the author; 180 if we are fully informed, we so order our thoughts as not to be in any way prejudiced either in ascribing to the author or they for whom the author wrote either more or less than own meaning, 181 and we only take into consideration what the author may have had in own mind, or what the time and occasion demanded. I think this must be tolerably evident to all.

182 It often happens that in different books we read histories in themselves similar, but which we judge very differently, according to the opinions we have formed of the authors. 183 I remember once to have read in some book that a man named Orlando Furioso used to drive a kind of winged monster through the air, fly over any countries he liked, kill unaided vast numbers of people and giants, and such like fancies, which from the point of view of reason are obviously absurd. 184 A very similar story I read in Ovid of Perseus, and also in the books of Judges and Kings of Samson, who alone and unarmed killed thousands of people, and of Elijah, who flew through the air, said at last went up to heaven in a chariot of fire, with horses of fire. 185 All these stories are obviously alike, but we judge them very differently. The first only sought to amuse, the second had a political object, the third a religious object. 186 We gather this simply from the opinions we had previously formed of the authors. Thus it is evidently necessary to know something of the authors of writings which are obscure or unintelligible, 187 if we would interpret their meaning; and for the same reason, in order to choose the proper reading from among a great variety, we ought to have information as to the versions in which the differences are found, and as to the possibility of other readings having been discovered by persons of greater authority.

188 A further difficulty attends this method in the case of some of the books of Scripture, namely, that they are no longer extant in their original language. 189 The Gospel according to Matthew, and certainly the Epistle to the Hebrews, were written, it is thought, in Hebrew, though they no longer exist in that form. 190 Aben Ezra affirms in his commentaries that the book of Job was translated into Hebrew out of another language, and that its obscurity arises from this fact. 191 I say nothing of the apocryphal books, for their authority stands on very inferior ground.

192 The foregoing difficulties in this method of interpreting Scripture from its own history, I conceive to be so great that I do

not hesitate to say that the true meaning of Scripture is in many places inexplicable, or at best mere subject for guesswork; 193 but I must again point out, on the other hand, that such difficulties only arise when we endeavour to follow the meaning of a prophet in matters which cannot be perceived, but only imagined, 194 not in things, whereof the understanding can give a clear idea, and which are conceivable through themselves: 195 matters which by their nature are easily perceived cannot be expressed so obscurely as to be unintelligible; as the proverb says, "a word is enough to the wise." 196 Euclid, who only wrote of matters very simple and easily understood, can easily be comprehended by anyone in any language; 197 we can follow his intention perfectly, and be certain of his true meaning, without having a thorough knowledge of the language in which he wrote; 198 in fact, a quite rudimentary acquaintance is sufficient. We need make no researches concerning the life, the pursuits, or the habits of the author; 199 nor need we inquire in what language, nor when he wrote, nor the vicissitudes of his book, nor its various readings, nor how, nor by whose advice it has been received.

200 What we here say of Euclid might equally be said of any book which treats of things by their nature perceptible: 201 thus we conclude that we can easily follow the intention of Scripture in moral questions, from the history we possess of it, and we can be sure of its true meaning. 202 The precepts of true piety are expressed in very ordinary language, and are equally simple and easily understood. 203 Further, as true salvation and blessedness consist in a true assent of the soul-- and we truly assent only to what we clearly understand-- it is most plain that we can follow with certainty the intention of Scripture in matters relating to salvation and necessary to blessedness; 204 therefore, we need not be much troubled about what remains: such matters, inasmuch as we generally cannot grasp them with our reason and understanding, are more curious than profitable.

205 I think I have now set forth the true method of Scriptural interpretation, and have sufficiently explained my own opinion thereon. 206 Besides, I do not doubt that everyone will see that such a method only requires the aid of natural reason. 207 The nature and efficacy of the natural reason consists in deducing and proving the unknown from the known, or in carrying premises to their legitimate conclusions; and these are the very processes which our method desiderates. 208 Though we must admit that it does not suffice to explain everything in the Bible, such imperfection does not spring from its own nature, 209 but from the fact that the path which it teaches us, as the true one, has never been tended or trodden by people, and has thus, by the lapse of time, become very difficult, and almost impassable, as, indeed, I have shown in the difficulties I draw attention to.

210 There only remains to examine the opinions of those who differ from me. The first which comes under our notice is, that the light of Nature has no power to interpret Scripture, but that a supernatural faculty is required for the task. 211 What is meant by this supernatural faculty I will leave to its propounders to explain. Personally, I can only suppose that they have adopted a very obscure way of stating their complete uncertainty about the true meaning of Scripture. 212 If we look at their interpretations, they contain nothing supernatural, at least nothing but the merest conjectures. 213 Let them be placed side by side with the interpretations of those who frankly confess that they have no faculty beyond their natural ones; we shall see that the two are just alike-- both human, both long pondered over, both labouriously invented. 214 To say that the natural reason is insufficient for such results is plainly untrue, firstly, for the reasons above stated, namely, that the difficulty of interpreting Scripture arises from no defect in human reason, 215 but simply from the carelessness (not to say malice) of people who neglected the history of the Bible while there were still materials for inquiry; 216 secondly, from the fact (admitted, I think, by all) that the supernatural faculty is

a Divine gift granted only to the faithful. 217 But the prophets and apostles did not preach to the faithful only, but chiefly to the unfaithful and wicked. 218 Such persons, therefore, were able to understand the intention of the prophets and apostles, otherwise the prophets and apostles would have seemed to be preaching to little boys and infants, not to people endowed with reason. 219 Moses, too, would have given his laws in vain, if they could only be comprehended by the faithful, who need no law. 220 Indeed, those who demand supernatural faculties for comprehending the meaning of the prophets and apostles seem truly lacking in natural faculties, so that we should hardly suppose such persons the possessors of a Divine supernatural gift.

221 The opinion of Maimonides was widely different. He asserted that each passage in Scripture admits of various, nay, contrary, meanings; 222 but that we could never be certain of any particular one till we knew that the passage, as we interpreted it, contained nothing contrary or repugnant to reason. 223 If the literal meaning clashes with reason, though the passage seems in itself perfectly clear, it must be interpreted in some metaphorical sense. 224 This doctrine he lays down very plainly in (the book of MIND) of his book, "More Nebuchim," for he says: "Know that we shrink not from affirming that the world hath existed from eternity, because of what Scripture saith concerning the world's creation. 225 For the texts which teach that the world was created are not more in number than those which teach that God hath a body; 226 neither are the approaches in this matter of the world's creation closed, or even made hard to us: so that we should not be able to explain what is written, as we did when we showed that God hath no body, 227 nay, peradventure, we could explain and make fast the doctrine of the world's eternity more easily than we did away with the doctrines that God hath a beatified body. 228 Yet two things hinder me from doing as I have said, and believing that the world is eternal. 229 As it hath been clearly shown that God hath not a body, we must perforce explain all those passages

whereof the literal sense agreeth not with the demonstration, for sure it is that they can be so explained. 230 But the eternity of the world hath not been so demonstrated, therefore it is not necessary to do violence to Scripture in support of some common opinion, whereof we might, at the bidding of reason, embrace the contrary."

231 Such are the words of Maimonides, and they are evidently sufficient to establish our point: 232 for if he had been convinced by reason that the world is eternal, he would not have hesitated to twist and explain away the words of Scripture till he made them appear to teach this doctrine. 233 He would have felt quite sure that Scripture, though everywhere plainly denying the eternity of the world, really intends to teach it. 234 So that, however clear the meaning of Scripture may be, he would not feel certain of having grasped it, so long as he remained doubtful of the truth of what, was written. 235 For we are in doubt whether a thing is in conformity with reason, or contrary thereto, so long as we are uncertain of its truth, and, consequently, we cannot be sure whether the literal meaning of a passage be true or false. 236 If such a theory as this were sound, I would certainly grant that some faculty beyond the natural reason is required for interpreting Scripture. 237 For nearly all things that we find in Scripture cannot be inferred from known principles of the natural reason, 238 and, therefore, we should be unable to come to any conclusion about their truth, or about the real meaning and intention of Scripture, but should stand in need of some further assistance.

239 Further, the truth of this theory would involve that the masses, having generally no comprehension of, nor leisure for, detailed proofs, would be reduced to receiving all their knowledge of Scripture on the authority and testimony of philosophers, 240 and, consequently, would be compelled to suppose that the interpretations given by philosophers were infallible. 241 Truly this would be a new form of ecclesiastical authority, and a new sort of priests or pontiffs, more likely to excite

humans' ridicule than their veneration.

242 Certainly our method demands a knowledge of Hebrew for which the masses have no leisure; but no such objection as the foregoing can be brought against us. 243 For the ordinary Jews or Gentiles, to whom the prophets and apostles preached and wrote, understood the language, and, consequently, the intention of the prophet or apostle addressing them; 244 but they did not grasp the intrinsic reason of what was preached, which, according to Maimonides, would be necessary for an understanding of it. 245 There is nothing, then, in our method which renders it necessary that the masses should follow the testimony of commentators, 246 for I point to a set of unlearned people who understood the language of the prophets and apostles; whereas Maimonides could not point to any such who could arrive at the prophetic or apostolic meaning through their knowledge of the causes of things.

247 As to the multitude of our own time, we have shown that whatsoever is necessary to salvation, though its reasons may be unknown, can easily be understood in any language, because it is thoroughly ordinary and usual; 248 it is in such understanding as this that the masses acquiesce, not in the testimony of commentators; with regard to other questions, the ignorant and the learned fare alike.

249 But let us return to the opinion of Maimonides, and examine it more closely. In the first place, he supposes that the prophets were in entire agreement one with another, and that they were consummate philosophers and theologians; 250 for he would have them to have based their conclusions on the absolute truth. 251 Further, he supposes that the sense of Scripture cannot be made plain from Scripture itself, 252 for the truth of things is not made plain therein (in that it does not prove any thing, nor teach the matters of which it speaks through their definitions and first causes), 253 therefore, according to Maimonides, the true sense of Scripture cannot be made plain from itself, and must not be there sought.

254 The falsity of such a doctrine is shown in this very chapter, for we have shown both by reason and examples that the meaning of Scripture is only made plain through Scripture itself, and even in questions deducible from ordinary knowledge should be looked for from no other source.

255 Lastly, such a theory supposes that we may explain the words of Scripture according to our preconceived opinions, twisting them about, and reversing or completely changing the literal sense, however plain it may be. 256 Such licence is utterly opposed to the teaching of this and the preceding chapters, and, moreover, will be evident to everyone as rash and excessive.

257 But if we grant all this licence, what can it effect after all? Absolutely nothing. 258 Those things which cannot be demonstrated, and which make up the greater part of Scripture, cannot be examined by reason, and cannot therefore be explained or interpreted by this rule; 259 whereas, on the contrary, by following our own method, we can explain many questions of this nature, and discuss them on a sure basis, as we have already shown, by reason and example. 260 Those matters which are by their nature comprehensible we can easily explain, as has been pointed out, simply by means of the context.

261 Therefore, the method of Maimonides is clearly useless: to which we may add, that it does away with all the certainty which the masses acquire by candid reading, or which is gained by any other persons in any other way. 262 In conclusion, then, we dismiss Maimonides' theory as harmful, useless, and absurd.

263 As to the tradition of the Pharisees, we have already shown that it is not consistent, while the authority of the popes of Rome stands in need of more credible evidence; 264 the latter, indeed, I reject simply on this ground, for if the popes could point out to us the meaning of Scripture as surely as did the high priests of the Jews, I should not be deterred by the fact that there have been heretic and impious Roman pontiffs; 265 for among the Hebrew high-priests of old there were also heretics and impious people who gained the

high-priesthood by improper means, 266 but who, nevertheless, had Scriptural sanction for their supreme power of interpreting the law. (See: Deuteronomy, Chapter-17:11 and 12, and Chapter-33:10, also Malachi, Chapter-2:8.).

267 However, as the popes can show no such sanction, their authority remains open to very grave doubt, 268 nor should anyone be deceived by the example of the Jewish high-priests and think that the Catholic religion also stands in need of a pontiff; 269 you should bear in mind that the laws of Moses being also the ordinary laws of the country, necessarily required some public authority to insure their observance; 270 for, if everyone were free to interpret the laws of own country as you pleased, no state could stand, but would for that very reason be dissolved at once, and public rights would become private rights. 271 With religion the case is widely different. Inasmuch as it consists not so much in outward actions as in simplicity and truth of character, it stands outside the sphere of law and public authority. 272 Simplicity and truth of character are not produced by the constraint of laws, nor by the authority of the state, no one the whole world over can be forced or legislated into a state of blessedness; 273 the means required for such a consummation are faithful and brotherly admonition, sound education, and, above all, free use of the individual judgment.

274 Therefore, as the supreme right of free thinking, even on religion, is in every human's power, and as it is inconceivable that such power could be alienated, it is also in every human's power to wield the supreme right and authority of free judgment in this behalf, and to explain and interpret religion for yourself. 275 The only reason for vesting the supreme authority in the interpretation of law, and judgment on public affairs in the hands of the magistrates, is that it concerns questions of public right. 276 Similarly the supreme authority in explaining religion, and in passing judgment thereon, is lodged with the individual because it concerns questions of individual right. 277 So far, then,

from the authority of the Hebrew high-priests telling in confirmation of the authority of the Roman pontiffs to interpret religion, it would rather tend to establish individual freedom of judgment. 278 Thus in this way also, we have shown that our method of interpreting Scripture is the best. 279 For as the highest power of Scriptural interpretation belongs to every human, the rule for such interpretation should be nothing but the natural light of reason which is common to all-- 280 not any supernatural light nor any external authority; moreover, such a rule ought not to be so difficult that it can only be applied by very skillful philosophers, but should be adapted to the natural and ordinary faculties and capacity of humankind. 281 And such I have shown our method to be, for such difficulties as it has arise from humans' carelessness, and are no part of its nature.

OF THE AUTHORSHIP OF THE PENTATEUCH AND THE OTHER HISTORICAL BOOKS OF THE OLD TESTAMENT

Benedict of Spinoza

2 In the former chapter we treated of the foundations and principles of Scriptural knowledge, and showed that it consists solely in a trustworthy history of the sacred writings; 2 such a history, in spite of its indispensability, the ancients neglected, or at any rate, whatever they may have written or handed down has perished in the lapse of time, 3 consequently the groundwork for such an investigation is to a great extent, cut from under us. 4 This might be put up with if succeeding generations had confined themselves within the limits of truth, and had handed down conscientiously what few particulars they had received or discovered without any additions from their own brains: 5 as it is, the history of the Bible is not so much imperfect as untrustworthy: the foundations are not only too scanty for building upon, but are also unsound. 6 It is part of my purpose to remedy these defects,

and to remove common theological prejudices. But I fear that I am attempting my task too late, 7 for people have arrived at the pitch of not suffering contradiction, but defending obstinately whatever they have adopted under the name of religion. 8 So widely have these prejudices taken possession of people's minds, that very few, comparatively speaking, will listen to reason. 9 However, I will make the attempt, and spare no efforts, for there is no positive reason for despairing of success.

10 In order to treat the subject methodically, I will begin with the received opinions concerning the true authors of the sacred books, and in the first place, speak of the author of the Pentateuch, who is almost universally supposed to have been Moses. 11 The Pharisees are so firmly convinced of his identity, that they account as a heretic anyone who differs from them on the subject. 12 Wherefore, Aben Ezra, a man of enlightened intelligence, and no small learning, who was the first, so far as I know, to treat of this opinion, dared not express his meaning openly, but confined himself to dark hints which I shall not scruple to elucidate, thus throwing full light on the subject.

13 The words of Aben Ezra which occur in his commentary on Deuteronomy are as follows: "Beyond Jordan, . . . If so be that thou understandest the mystery of the twelve . . . moreover Moses wrote the law . . . 14 The Canaanite was then in the land . . . . it shall be revealed on the mount of God . . . . then also behold his bed, his iron bed, then shalt thou know the truth." 15 In these few words he hints, and also shows that it was not Moses who wrote the Pentateuch, but someone who lived long after him, and further, that the book which Moses wrote was something different from any now extant. 16 To prove this, I say, he draws attention to the facts:

(1.) That the preface to Deuteronomy could not have been written by Moses, inasmuch as he had never crossed the Jordan.

17 (II.) That the whole book of Moses was written at full length on the circumference of a single altar (Deuteronomy, Chapter-27, and Joshua, Chapter-8:37), which altar,

according to the Rabbis, consisted of only twelve stones: 18 therefore the book of Moses must have been of far less extent than the Pentateuch. This is what our author means, I think, by the mystery of the twelve, 19 unless he is referring to the twelve curses contained in the chapter of Deuteronomy above cited, which he thought could not have been contained in the law, 20 because Moses bade the Levites read them after the recital of the law, and so bind the people to its observance. 21 Or again, he may have had in his mind the last chapter of Deuteronomy which treats of the death of Moses, and which contains twelve verses. But there is no need to dwell further on these and similar conjectures.

22 (III.) That in Deuteronomy, Chapter-31:9, the expression occurs, "and Moses wrote the law:" words that cannot be ascribed to Moses, but must be those of some other writer narrating the deeds and writings of Moses.

23 (IV.) That in Genesis, Chapter-12:6, the historian, after narrating that Abraham journeyed through the land of Canaan, adds, "and the Canaanite was then in the land," thus clearly excluding the time at which he wrote. 24 So that this passage must have been written after the death of Moses, when the Canaanites had been driven out, and no longer possessed the land.

25 Aben Ezra, in his commentary on the passage, alludes to the difficulty as follows:- "And the Canaanite was then in the land: it appears that Canaan, the grandson of Noah, took from another the land which bears his name; 26 if this be not the true meaning, there lurks some mystery in the passage, and let you who understands it keep silence." 27 That is, if Canaan invaded those regions, the sense will be, the Canaanite was then in the land, in contradistinction to the time when it had been held by another: 28 but if, as follows from Genenis, Chapter-10. Canaan was the first to inhabit the land, the text must mean to exclude the time present, that is the time at which it was written; 29 therefore it cannot be the work of Moses, in whose time the Canaanites still possessed those territories: this is the mystery

concerning which silence is recommended.

30 (V.) That in Genesis, Chapter 22:14 Mount Moriah is called the mount of God, a name which it did not acquire till after the building of the Temple; 31 the choice of the mountain was not made in the time of Moses, for Moses does not point out any spot as chosen by God; on the contrary, he foretells that God will at some future time choose a spot to which this name will be given.

32 (VI.) Lastly, that in Deuteronomy. Chapter-3, in the passage relating to Og, king of Bashan, these words are inserted: "For only Og king of Bashan remained of the remnant of giants: 33 behold, his bedstead was a bedstead of iron: is it not in Rabbath of the children of Ammon? nine cubits was the length thereof, and four cubits the breadth of it, after the cubit of a man." 34 This parenthesis most plainly shows that its writer lived long after Moses; for this mode of speaking is only employed by one treating of things long past, and pointing to relics for the sake of gaining credence: 35 moreover, this bed was almost certainly first discovered by David, who conquered the city of Rabbath (2 Samuel, Chapter-12:30.) 36 Again, the historian a little further on inserts after the words of Moses, "Jair, the son of Manasseh, took all the country of Argob unto the coasts of Geshuri and Maachathi; and called them after his own name, Bashan-havoth-jair, unto this day."

37 This passage, I say, is inserted to explain the words of Moses which precede it. "And the rest of Gilead, and all Bashan, being the kingdom of Og, gave I unto the half tribe of Manasseh; all the region of Argob, with all Bashan, which is called the land of the giants." 38 The Hebrews in the time of the writer indisputably knew what territories belonged to the tribe of Judah, but did not know them under the name of the jurisdiction of Argob, or the land of the giants. 39 Therefore the writer is compelled to explain what these places were which were anciently so styled, and at the same time to point out why they were at the time of his writing known by the name of Jair, who

was of the tribe of Manasseh, not of Judah. 40 We have thus made clear the meaning of Aben Ezra and also the passages of the Pentateuch which he cites in proof of his contention. 41 However, Aben Ezra does not call attention to every instance, or even the chief ones; there remain many of greater importance, which may be cited. 42 Namely (I.), that the writer of the books in question not only speaks of Moses in the third person, but also bears witness to many details concerning him; 43 for instance, "Moses talked with God;" "The Lord spoke with Moses face to face;" "Moses was the meekest of people" 44 (Numbers, Chapter-12:3); "Moses was wrath with the captains of the host; "Moses, the man of God, "Moses, the servant of the Lord, died;" "There was never a prophet in Israel like unto Moses,"

45 On the other hand, in Deuteronomy, where the law which Moses had expounded to the people and written is set forth, Moses speaks and declares what he has done in the first person: 46 "God spake with me" (Deuteronomy, Chapter-2:1, and 17), "I prayed to the Lord,". 47 Except at the end of the book, when the historian, after relating the words of Moses, begins again to speak in the third person, and to tell how Moses handed over the law which he had expounded to the people in writing, again admonishing them, and further, how Moses ended his life. 48 All these details, the manner of narration, the testimony, and the context of the whole story lead to the plain conclusion that these books were written by another, and not by Moses in person.

49 (II.) We must also remark that the history relates not only the manner of Moses' death and burial, and the thirty days' mourning of the Hebrews, but further compares him with all the prophets who came after him, and states that he surpassed them all. 50 "There was never a prophet in Israel like unto Moses, whom the Lord knew face to face." Such testimony cannot have been given of Moses by himself, nor by any who immediately succeeded him, 51 but it must come from someone who lived centuries afterwards, especially, as the historian speaks

of past times. "There was never a prophet," And of the place of burial, "No one knows it to this day."

52 (III.) We must note that some places are not styled by the names they bore during Moses' lifetime, but by others which they obtained subsequently. 53 For instance, Abraham is said to have pursued his enemies even unto Dan, a name not bestowed on the city till long after the death of Joshua (Genesis, Chapter-14:14, Judges, Chapter-18:29).

54 (IV.) The narrative is prolonged after the death of Moses, for in Exodus, chapter-16:34 we read that "the children of Israel did eat manna forty years until they came to a land inhabited, until they came unto the borders of the land of Canaan." 55 In other words, until the time alluded to in Joshua, chapter-6:12. 56 So, too, in Genesis, chapter-36:31 it is stated, "These are the kings that reigned in Edom before there reigned any king over the children of Israel." 57 The historian, doubtless, here relates the kings of Idumaea before that territory was conquered by David and garrisoned, as we read in 2 Samuel, chapter-8:14. 58 From what has been said, it is thus clearer than the sun at noonday that the Pentateuch was not written by Moses, but by someone who lived long after Moses. 59 Let us now turn our attention to the books which Moses actually did write, and which are cited in the Pentateuch; thus, also, shall we see that they were different from the Pentateuch. 60 Firstly, it appears from Exodus 17:14 that Moses, by the command of God, wrote an account of the war against Amalek. 61 The book in which he did so is not named in the chapter just quoted, but in Numbers, chapter-21:12 a book is referred to under the title of the wars of God, 62 and doubtless this war against Amalek and the castrametations said in Numbers, chapter-33:2 to have been written by Moses are therein described. 63 We hear also in Exodus, chapter-24:4 of another book called the Book of the Covenant, which Moses read before the Israelites when they first made a covenant with God. 64 But this book or this writing contained very little, namely, the laws or commandments of God

which we find in Exodus, chapter-20:22 to the end of chapter-24., and this no one will deny who reads the aforesaid chapter rationally and impartially. 65 It is there stated that as soon as Moses had learn't the feeling of the people on the subject of making a covenant with God, he immediately wrote down God's laws and utterances, 66 and in the morning, after some ceremonies had been performed, read out the conditions of the covenant to an assembly of the whole people. When these had been gone through, and doubtless understood by all, the whole people gave their assent.

67 Now from the shortness of the time taken in its perusal and also from its nature as a compact, this document evidently contained nothing more than that which we have just described. 68 Further, it is clear that Moses explained all the laws which he had received in the fortieth year after the exodus from Egypt; 69 also that he bound over the people a second time to observe them, and that finally he committed them to writing (Deuteronomy, chapter-1:5; chapter-29:14; chapter-31:9), 70 in a book which contained these laws explained, and the new covenant, and this book was therefore called the book of the law of God: 71 the same which was afterwards added to by Joshua when he set forth the fresh covenant with which he bound over the people and which he entered into with God (Joshua, chapter-24:25 and 26).

72 Now, as we have extent no book containing this covenant of Moses and also the covenant of Joshua, we must perforce conclude that it has perished, 73 unless, indeed, we adopt the wild conjecture of the Chaldean paraphrast Jonathan, and twist about the words of Scripture to our heart's content. 74 This commentator, in the face of our present difficulty, preferred corrupting the sacred text to confessing his own ignorance. 75 The passage in the book of Joshua which runs, "and Joshua wrote these words in the book of the law of God," he changes into "and Joshua wrote these words and kept them with the book of the law of God." 76 What is to be done with persons who will only see what pleases them? 77 What is such a

proceeding if it is not denying Scripture, and inventing another Bible out of our own heads? 78 We may therefore conclude that the book of the law of God which Moses wrote was not the Pentateuch, but something quite different, which the author of the Pentateuch duly inserted into his book. 79 So much is abundantly plain both from what I have said and from what I am about to add. 80 For in the passage of Deuteronomy above quoted, where it is related that Moses wrote the book of the law, the historian adds that he handed it over to the priests and bade them read it out at a stated time to the whole people. 81 This shows that the work was of much less length than the Pentateuch, inasmuch as it could be read through at one sitting so as to be understood by all; 82 further, we must not omit to notice that out of all the books which Moses wrote, this one book of the second covenant and the song (which latter he wrote afterwards so that all the people might learn it), was the only one which he caused to be religiously guarded and preserved. 83 In the first covenant he had only bound over those who were present, but in the second covenant he bound over all their descendants also (Denteronomy, chapter-29:14), 84 and therefore ordered this covenant with future ages to be religiously preserved, together with the Song, which was especially addressed to posterity: 85 as, then, we have no proof that Moses wrote any book save this of the covenant, and as he committed no other to the care of posterity; 86 and, lastly, as there are many passages in the Pentateuch which Moses could not have written, it follows that the belief that Moses was the author of the Pentateuch is ungrounded and even irrational. 87 Someone will perhaps ask whether Moses did not also write down other laws when they were first revealed to him-- 88 in other words, whether, during the course of forty years, he did not write down any of the laws which he promulgated, save only those few which I have stated to be contained in the book of the first covenant. 89 To this I would answer, that although it seems reasonable to suppose that Moses wrote down the laws at the time

when he wished to communicate them to the people, yet we are not warranted to take it as proved, 90 for I have shown above that we must make no assertions in such matters which we do not gather from Scripture, or which do not flow as legitimate consequences from its fundamental principles. 91 We must not accept whatever is reasonably probable. However even reason in this case would not force such a conclusion upon us: 92 for it may be that the assembly of elders wrote down the decrees of Moses and communicated them to the people, and the historian collected them, and duly set them forth in own narrative of the life of Moses. 93 So much for the five books of Moses: it is now time for us to turn to the other sacred writings.

94 The book of Joshua may be proved not to be an autograph by reasons similar to those we have just employed: 95 for it must be some other than Joshua who testifies that the fame of Joshua was spread over the whole world; 96 that he omitted nothing of what Moses had taught (Joshua, chapter-6:27; chapter-8. last verse; chapter-6:15); that he grew old and summoned an assembly of the whole people, and finally that he departed this life. 97 Furthermore, events are related which took place after Joshua's death. For instance, that the Israelites worshipped God, after his death, so long as there were any old people alive who remembered him; 98 and in chapter-16:10, we read that "Ephraim and Manasseh did not drive out the Canaanites which dwelt in Gezer, but the Canaanite dwelt in the land of Ephraim unto this day, and was tributary to him." 99 This is the same statement as that in Judges, chapter-1., and the phrase "unto this day" shows that the writer was speaking of ancient times. 100 With these texts we may compare the last verse of chapter-15., concerning the sons of Judah, and also the history of Caleb in the same chapter-5:14. 101 Further, the building of an altar beyond Jordan by the two tribes and a half, chapter-22:10, sqq., seems to have taken place after the death of Joshua, 102 for in the whole narrative his name is never mentioned, but the people alone held council as to waging war, sent

out legates, waited for their return, and finally approved of their answer.

103 Lastly, from chapter-10:14, it is clear that the book was written many generations after the death of Joshua, for it bears witness, there was never any, day like unto, that day, either before or after, that the Lord hearkened to the voice of a human," 104 If, therefore, Joshua wrote any book at all, it was that which is quoted in the work now before us, chapter-10:13.

105 With regard to the book of Judges, I suppose no rational person persuades the self that it was written by the actual Judges. 106 For the conclusion of the whole history contained in chapter-2 clearly shows that it is all the work-- of a single historian. 107 Further, inasmuch as the writer frequently tells us that there was then no king in Israel, it is evident that the book was written after the establishment of the monarchy.

108 The books of Samuel need not detain us long, inasmuch as the narrative in them is continued long after Samuel's death; but I should like to draw attention to the fact that it was written many generations after Samuel's death. 109 For in book 1. chapter-9:9, the historian remarks in a, parenthesis, "Before time, in Israel, when a man went to inquire of God, thus he spake: Come, and let us go to the seer; for he that is now called a prophet was before time called a seer."

110 Lastly, the books of Kings, as we gather from internal evidence, were compiled from the books of King Solomon (I Kings, chapter-11:41), from the chronicles of the kings of Judah (1 Kings, chapter-14:19, and 29), and the chronicles of the kings of Israel.

111 We may, therefore, conclude that all the books we have considered hitherto are compilations, and that the events therein are recorded as having happened in old time. 112 Now, if we turn our attention to the connection and argument of all these books, we shall easily see that they were all written by a single historian, who wished to relate the antiquities of the Jews from their first beginning down to the first destruction of the city. 113 The way in which the several books are connected one with the

other is alone enough to show us that they form the narrative of one and the same writer. 114 For as soon as he has related the life of Moses, the historian thus passes on to the story of Joshua: "And it came to pass after that Moses the servant of the Lord was dead, that God spake unto Joshua,"., 115 so in the same way, after the death of Joshua was concluded, he passes with identically the same transition and connection to the history of the Judges: "And it came to pass after that Joshua was dead, that the children of Israel sought from God," 116 To the book of Judges he adds the story of Ruth, as a sort of appendix, in these words: "Now it came to pass in the days that the judges ruled, that there was a famine in the land." 117 The first book of Samuel is introduced with a similar phrase; and so is the second book of Samuel. 118 Then, before the history of David is concluded, the historian passes in the same way to the first book of Kings, and, after David's death, to the Second book of Kings.

119 The putting together, and the order of the narratives, show that they are all the work of one person, writing with a create aim; 120 for the historian begins with relating the first origin of the Hebrew nation, and then sets forth in order the times and the occasions in which Moses put forth his laws, and made his predictions. 121 He then proceeds to relate how the Israelites invaded the promised land in accordance with Moses' prophecy (Deuteronomy, chapter-7); 122 and how, when the land was subdued, they turned their backs on their laws, and thereby incurred many misfortunes (Deuteronomy, chapter-31:16, and 17). 123 He tells how they wished to elect rulers, and how, according as these rulers observed the law, the people flourished or suffered (Deuteronomy, chapter-28:36); finally, how destruction came upon the nation, even as Moses had foretold. 124 In regard to other matters, which do not serve to confirm the law, the writer either passes over them in silence, or refers the reader to other books for information. 125 All that is set down in the books we have conduces to the sole object of setting forth the words and laws of

Moses, and proving them by subsequent events. 126 When we put together these three considerations, namely, the unity of the subject of all the books, the connection between them, and the fact that they are compilations made many generations after the events they relate had taken place, 127 we come to the conclusion, as I have just stated, that they are all the work of a single historian. 128 Who this historian was, it is not so easy to show; but I suspect that he was Ezra, and there are several strong reasons for adopting this hypothesis.

129 The historian whom we already know to be but one individual brings his history down to the liberation of Jehoiakim, and adds that he himself sat at the king's table all his life-- 130 that is, at the table either of Jehoiakim, or of the son of Nebuchadnezzar, for the sense of the passage is ambiguous: hence it follows that he did not live before the time of Ezra. 131 But Scripture does not testify of any except of Ezra (Ezra, chapter 7:10), that he "prepared his heart to seek the law of the Lord, and to set it forth, and further that he was a ready scribe in the law of Moses." 132 Therefore, I can not find anyone, save Ezra, to whom to attribute the sacred books.

133 Further, from this testimony concerning Ezra, we see that he prepared his heart, not only to seek the law of the Lord, but also to set it forth; 134 and, in Nehemiah, chapter-8:8, we read that "they read in the book of the law of God distinctly, and gave the sense, and caused them to understand the reading." 135 As, then, in Deuteronomy, we find not only the book of the law of Moses, or the greater part of it, but also many things inserted for its better explanation, 136 I conjecture that this Deuteronomy is the book of the law of God, written, set forth, and explained by Ezra, which is referred to in the text above quoted. 137 Two examples of the way matters were inserted parenthetically in the text of Deuteronomy, with a view to its fuller explanation, we have already given, in speaking of Aben Ezra's opinion. 138 Many others are found in the course of the work: for instance, in chapter-2:12: "The Horims dwelt also in Seir before

time; 139 but the children of Esau succeeded them, when they had destroyed them from before them, and dwelt in their stead; as Israel did unto the land of his possession, which the Lord gave unto them."

140 This explains verses 3 and 4 of the same chapter, where it is stated that Mount Seir, which had come to the children of Esau for a possession, did not fall into their hands uninhabited; 141 but that they invaded it, and turned out and destroyed the Horims, who formerly dwelt therein, even as the children of Israel had done unto the Canaanites after the death of Moses. 142 So, also, verses 6, 7, 8, 9, of the tenth chapter are inserted parenthetically among the words of Moses. 143 Everyone must see that verse 8, which begins, "At that time the Lord separated the tribe of Levi," necessarily refers to verse 5, and not to the death of Aaron, 144 which is only mentioned here by Ezra because Moses, in telling of the golden calf worshipped by the people, stated that he had prayed for Aaron. 145 He then explains that at the time at which Moses spoke, God had chosen for Himself the tribe of Levi in order that He may point out the reason for their election, and for the fact of their not sharing in the inheritance; after this digression, he resumes the thread of Moses' speech. 146 To these parentheses we must add the preface to the book, and all the passages in which Moses is spoken of in the third person, 147 besides many which we cannot now distinguish, though, doubtless, they would have been plainly recognised by the writer's contemporaries.

148 If, I say, we were in possession of the book of the law as Moses wrote it, I do not doubt that we should find a great difference in the words of the precepts, the order in which they are given, and the reasons by which they are supported. 149 A comparison of the decalogue in Deuteronomy with the decalogue in Exodus, where its history is explicitly set forth, will be sufficient to show us a wide discrepancy in all these three particulars, 150 for the fourth commandment is given not only in a different form, but at much greater length, while the reason for its observance differs wholly from

that stated in Exodus. 151 Again, the order in which the tenth commandment is explained differs in the two versions. 152 I think that the differences here as elsewhere are the work of Ezra, who explained the law of God to his contemporaries, and who wrote this book of the law of God, before anything else; 153 this I gather from the fact that it contains the laws of the country, of which the people stood in most need, 154 and also because it is not joined to the book which precedes it by any connecting phrase, but begins with the independent statement, "these are the words of Moses."

155 After this task was completed, I think Ezra set himself to give a complete account of the history of the Hebrew nation from the creation of the world to the entire destruction of the city, 156 and in this account he inserted the book of Deuteronomy, and, possibly, he called the first five books by the name of Moses, because his life is chiefly contained therein, and forms their principal subject; 157 for the same reason he called the sixth Joshua, the seventh Judges, the eighth Ruth, the ninth, and perhaps the tenth, Samuel, and, lastly, the eleventh and twelfth Kings. 158 Whether Ezra put the finishing touches to this work and finished it as he intended, we will discuss in the next chapter.

OTHER QUESTIONS CONCERNING THE SAME BOOKS: NAMELY, WHETHER THEY WERE COMPLETELY FINISHED BY EZRA, AND, FURTHER, WHETHER THE MARGINAL NOTES WHICH ARE FOUND IN THE HEBREW TEXTS WERE VARIOUS READINGS.

Benedict of Spinoza

3 How greatly the inquiry we have just made concerning the real writer of the twelve books aids us in attaining a complete understanding of them, 2 may be easily gathered solely from the passages which we have adduced in confirmation of our opinion, and which would be most obscure without it. 3 But besides the question of the writer, there are other points to notice which common superstition forbids the multitude to apprehend.

4 Of these the chief is, that Ezra (whom I will take to be the author of the aforesaid books until some

more likely person be suggested) did not put the finishing touches to the narrative contained therein, 5 but merely collected the histories from various writers, and sometimes simply set them down, leaving their examination and arrangement to posterity. 6 The cause (if it were not untimely death) which prevented him from completing his work in all its portions, I cannot conjecture, 7 but the fact remains most clear, although we have lost the writings of the ancient Hebrew historians, and can only judge from the few fragments which are still extant. 8 For the history of Hezekiah (2 Kings, chapter-18:17), as written in the vision of Isaiah, is related as it is found in the chronicles of the kings of Judah. 9 We read the same story, told with few exceptions, in the same words, in the book of Isaiah which was contained in the chronicles of the kings of Judah (2 Chronicles. 32:32). 10 From this we must conclude that there were various versions of this narrative of Isaiah's, unless, indeed, anyone would dream that in this, too, there lurks a mystery. 11 Further, the last chapter of 2 Kings 27-30 is repeated in the last chapter of Jeremiah, chapter-5.31-34.

12 Again, we find 2 Samuel, chapter-7. repeated in I Chronicles, chapter-17., but the expressions in the two passages are so curiously varied, that we can very easily see that these two chapters were taken from two different versions of the history of Nathan.

13 Lastly, the genealogy of the kings of Idumaea contained in Genesis, chapter-36:31, is repeated in the same words in 1 Chronicles, chapter-1, 14 though we know that the author of the latter work took his materials from other historians, not from the twelve books we have ascribed to Ezra. 15 We may therefore be sure that if we still possessed the writings of the historians, the matter would be made clear; 16 however, as we have lost them, we can only examine the writings still extant, and from their order and connection, their various repetitions, and, lastly, the contradictions in dates which they contain, judge of the rest.

INTERPRETATION

17 These, then, or the chief of them, we will now go through. First, in the story of Judah and Tamar (Genesis, chapter-38.) the historian thus begins: "And it came to pass at that time that Judah went down from his brethren." 18 This time cannot refer to what immediately precedes, but must necessarily refer to something else, 19 for from the time when Joseph was sold into Egypt to the time when the patriarch Jacob, with all his family, set out thither, cannot be reckoned as more than twenty-two years, 20 for Joseph, when he was sold by his brethren, was seventeen years old, and when he was summoned by Pharaoh from prison was thirty; 21 if to this we add the seven years of plenty and two of famine, the total amounts to twenty-two years. 22 Now, in so short a period, no one can suppose that so many things happened as are described; 23 that Judah had three children, one after the other, from one wife, whom he married at the beginning of the period; 24 that the eldest of these, when he was old enough, married Tamar, and that after he died his next brother succeeded to her; 25 that, after all this, Judah, without knowing it, had intercourse with his daughter-in-law, and that she bore him twins, and, finally, that the eldest of these twins became a father within the aforesaid period. 26 As all these events cannot have taken place within the period mentioned in Genesis, the reference must necessarily be to something treated of in another book: 27 and Ezra in this instance simply related the story, and inserted it without examination among his other writings.

28 However, not only this chapter but the whole narrative of Joseph and Jacob is collected and set forth from various histories, inasmuch as it is quite inconsistent with itself. 29 For in Genesis, chapter-47, we are told that Jacob, when he came at Joseph's bidding to salute Pharaoh, was 130-years old. 30 If from this we deduct the twenty-two years which he passed sorrowing for the absence of Joseph and the seventeen years forming Joseph's age when he was sold, and, lastly, the seven years for which Jacob served for Rachel, 31 we find that he was very

advanced in life, namely, eighty four, when he took Leah to wife, whereas Dinah was scarcely seven years old when she was violated by Shechem. 32 Simeon and Levi were aged respectively eleven and twelve when they spoiled the city and slew all the males therein with the sword.

33 There is no need that I should go through the whole Pentateuch. If anyone pays attention to the way in which all the histories and precepts in these five books are set down promiscuously and without order, with no regard for dates; 34 and further, how the same story is often repeated, sometimes in a different version, you will easily, I say, discern that all the materials were promiscuously collected and heaped together, in order that they might at some subsequent time be more readily examined and reduced to order. 35 Not only these five books, but also the narratives contained in the remaining seven, going down to the destruction of the city, are compiled in the same way. 36 For who does not see that in Judges, chapter-2:6 a new historian is being quoted, who had also written of the deeds of Joshua, and that his words are simply copied? 37 For after our historian has stated in the last chapter of the book of Joshua that Joshua died and was buried, and has promised, in the first chapter of Judges, to relate what happened after his death, 38 in what way, if he wished to continue the thread of his history, could he connect the statement here made about Joshua with what had gone before?

39 So, too, 1 Samuel, chapter-17 and 18, are taken from another historian, who assigns a cause for David's first frequenting Saul's court very different from that given in chapter-16. of the same book. 40 For he did not think that David came to Saul in consequence of the advice of Saul's servants, as is narrated in chapter-16, but that being sent by chance to the camp by his father on a message to his brothers, 41 he was for the first time remarked by Saul on the occasion of his victory, over Goliath the Philistine, and was retained at his court.

42 I suspect the same thing has taken place in chapter-26 of the same book, for the historian there seems to repeat the narrative given

in chapter-24 according to another person's version. But I pass over this, and go on to the computation of dates. 43 In I Kings, chapter-6, it is said that Solomon built the Temple in the four hundred and eightieth year after the exodus from Egypt; but from the historians themselves we get a much longer period, for:

Years

44 Moses governed the people in the desert 40

45 Joshua, who lived 110 years, did not, according to Josephus and others' opinion rule more than 26

46 Cusban Rishathaim held the people in subjection 8

47 Othniel, son of Kenag, was judge for 40

48 Eglon, King of Moab, governed the people 18

49 Ehud and Shamgar were judges 80

50 Jachin, King of Canaan, held the people in subjection 20

51 The people was at peace subsequently for 40

52 It was under subjection to Median 7

53 It obtained freedom under Gideon for 40

54 It fell under the rule of Abimelech 3

55 Tola, son of Puah, was judge 23

56 Jair was judge 22

57 The people was in subjection to the Philistines and Ammonites 18

58 Jephthah was judge 6

59 Ibzan, the Bethlehemite, was judge 7

60 Elon, the Zabulonite 10

61 Abclon, the Pirathonite 8

62 The people was again subject to the Philistines 40

63 Samson was judge 20

64 Eli was judge 40

65 The people again fell into subjection to the Philistines, till they were delivered by Samuel 20

66 David reigned 40

67 Solomon reigned before he built the temple 4

68 All these periods added together make a total of 580-years. 69 But to these must be added the years during which the Hebrew republic flourished after the death of Joshua, 70 until it was conquered by Cushan Rishathaim, which I take to be very numerous, for I

cannot bring myself to believe that immediately after the death of Joshua all those who had witnessed his miracles died simultaneously, 71 nor that their successors at one stroke bid farewell to their laws, and plunged from the highest virtue into the depth of wickedness and obstinacy. 72 Nor, lastly, that Cushan Rishathaim subdued them on the instant; each one of these circumstances requires almost a generation, and there is no doubt that Judges, chapter-2:7, 9, 10, comprehends a great many years which it passes over in silence.

73 We must also add the years during which Samuel was judge, the number of which is not stated in Scripture, and also the years during which Saul reigned, which are not clearly shown from his history. 74 It is, indeed, stated in 1 Samuel, chapter-13:1, that he reigned two years, but the text in that passage is mutilated, and the records of his reign lead us to suppose a longer period. 75 That the text is mutilated I suppose no one will doubt who has ever advanced so far as the threshold of the Hebrew language, for it runs as follows: 76 "Saul was in his year, when he began to reign, and he reigned two years over Israel." Who, I say, does not see that the number of the years of Saul's age when he began to reign has been omitted? 77 That the record of the reign presupposes a greater number of years is equally beyond doubt, 78 for in the same book, chapter-27:7, it is stated that David sojourned among the Philistines, to whom he had fled on account of Saul, a year and four months; 79 thus the rest of the reign must have been comprised in a space of eight months, which I think no one will credit.

80 Josephus, at the end of the sixth book of his antiquities, thus corrects the text: Saul reigned eighteen years while Samuel was alive, and two years after his death. 81 However, all the narrative in chapter-13. is in complete disagreement with what goes before. 82 At the end of chapter-7 it is narrated that the Philistines were so crushed by the Hebrews that they did not venture, during Samuel's life, to invade the borders of Israel; 83 but in chapter-13 we are told that the Hebrews

were invaded during the life of Samuel by the Philistines, and reduced by them to such a state of wretchedness and poverty that they were deprived not only of weapons with which to defend themselves, but also of the means of making more. 84 I should be at pains enough if I were to try and harmonise all the narratives contained in this first book of Samuel so that they should seem to be all written and arranged by a single historian. 85 But I return to my object. The years, then, during which Saul reigned must be added to the above computation; 86 and, lastly, I have not counted the years of the Hebrew anarchy, for I cannot from Scripture gather their number. 87 I cannot, I say, be certain as to the period occupied by the events related in Judges chapter-17 on till the end of the book.

88 It is thus abundantly evident that we cannot arrive at a true computation of years from the histories, and, further, that the histories are inconsistent themselves on the subject. 89 We are compelled to confess that these histories were compiled from various writers without previous arrangement and examination. 90 Not less discrepancy is found between the dates given in the Chronicles of the Kings of Judah, and those in the Chronicles of the Kings of Israel; 91 in the latter, it is stated that Jehoram, the son of Ahab, began to reign in the second year of the reign of Jehoram, the son of Jehoshaphat (2 Kings, chapter-1:17), 92 but in the former we read that Jehoram, the son of Jehoshaphat, began to reign in the fifth year of Jehoram, the son of Ahab (2 Kings, chapter-8:16). 93 Anyone who compares the narratives in Chronicles with the narratives in the books of Kings, will find many similar discrepancies.

94 These there is no need for me to examine here, and still less am I called upon to treat of the commentaries of those who endeavour to harmonise them. 95 The Rabbis evidently let their fancy run wild. Such commentators as I have, read, dream, invent, and as a last resort, play fast and loose with the language. 96 For instance, when it is said in 2 Chronicles, that Ahab

was forty-two years old when he began to reign, they pretend that these years are computed from the reign of Omri, not from the birth of Ahab. 97 If this can be shown to be the real meaning of the writer of the book of Chronicles, all I can say is, that he did not know how to state a fact. 98 The commentators make many other assertions of this kind, which if true, would prove that the ancient Hebrews were ignorant both of their own language, and of the way to relate a plain narrative. 99 I should in such case recognise no rule or reason in interpreting Scripture, but it would be permissible to hypothesise to one's heart's content.

100 If anyone thinks that I am speaking too generally, and without sufficient warrant, I would ask you to set yourself to showing us some fixed plan in these histories which might be followed without blame by other writers of chronicles, 101 and in your efforts at harmonising and interpretation, so strictly to observe and explain the phrases and expressions, the order and the connections, that we may be able to imitate these also in our writings. 102 If you succeeds, I will at once give you my hand, and you shall be to me as great Apollo; for I confess that after long endeavours I have been unable to discover anything of the kind. 103 I may add that I set down nothing here which I have not long reflected upon, and that, though I was imbued from my boyhood up with the ordinary opinions about the Scriptures, I have been unable to withstand the force of what I have urged.

104 However, there is no need to detain the reader with this question, and drive you to attempt an impossible task; I merely mentioned the fact in order to throw light on my intention. 105 I now pass on to other points concerning the treatment of these books. For we must remark, in addition to what has been shown, that these books were not guarded by posterity with such care that no faults crept in. 106 The ancient scribes draw attention to many doubtful readings, and some mutilated passages, but not to all that exist: 107 whether the faults are of sufficient importance to greatly embarrass the reader I will

not now discuss. 108 I am inclined to think that they are of minor moment to those, at any rate, who read the Scriptures with enlightenment: 109 and I can positively, affirm that I have not noticed any fault or various reading in doctrinal passages sufficient to render them obscure or doubtful.

110 There are some people, however, who will not admit that there is any corruption, even in other passages, but maintain that by some unique exercise of providence God has preserved from corruption every word in the Bible: 111 they say that the various readings are the symbols of profoundest mysteries, and that mighty secrets lie hid in the twenty-eight hiatus which occur, nay, even in the very form of the letters. 112 Whether they are actuated by folly and anile devotion, or whether by arrogance and malice so that they alone may be held to possess the secrets of God, I know not: 113 this much I do know, that I find in their writings nothing which has the air of a Divine secret, but only childish lucubrations. 114 I have read and known certain Kabbalistic triflers, whose insanity provokes my unceasing astonishment. 115 That faults have crept in will, I think, be denied by no sensible person who reads the passage about Saul, above quoted (1 Samuel, chapter-13:1) and also 2 Samuel-6:2: 116 "And David arose and went with all the people that were with him from Judah, to bring up from thence the ark of God." 117 No one can fail to remark that the name of their destination, viz., Kirjath-jearim has been omitted: nor can we deny that 2 Samuel, chapter-13:37, has been tampered with and mutilated. 118 "And Absalom fled, and went to Talmai, the son of Ammihud, king of Geshur. And he mourned for his son every day. So Absalom fled, and went to Geshur, and was there three years." 119 I know that I have remarked other passages of the same kind, but I cannot recall them at the moment.

120 That the marginal notes which are found continually in the Hebrew Codices are doubtful readings will, I think, be evident to everyone who has noticed that they often arise from the great

similarity, of some of the Hebrew letters, 121 such for instance, as the similarity between Kaph and Beth, Jod and Vau, Daleth and Reth. 122 For example, the text in 2 Samuel, chapter-5:24, runs "in the time when thou hearest," and similarly in Judges, chapter-21:22, 123 "And it shall be when their fathers or their brothers come unto us often," the marginal version is "come unto us to complain."

124 So also many various readings have arisen from the use of the letters named mutes, which are generally not sounded in pronunciation, and are taken promiscuously, one for the other. 125 For example, in Leviticus, chapter-25:29, it is written, "The house shall be established which is not in the walled city," but the margin has it, "which is in a walled city." 126 Though these matters are self-evident, it is necessary, to answer the reasonings of certain Pharisees, by which they endeavour to convince us that the marginal notes serve to indicate some mystery, and were added or pointed out by the writers of the sacred books.

127 The first of these reasons, which, in my opinion, carries little weight, is taken from the practice of reading the Scriptures aloud. 128 If, it is urged, these notes were added to show various readings which could not be decided upon by posterity, why has custom prevailed that the marginal readings should always be retained? 129 Why has the meaning which is preferred been set down in the margin when it ought to have been incorporated in the text, and not relegated to a side note?

130 The second reason is more specious, and is taken from the nature of the case. It is admitted that faults have crept into the sacred writings by chance and not by design; 131 but they say that in the five books the word for a girl is, with one exception, written without the letter "he," contrary to all grammatical rules, whereas in the margin it is written correctly according to the universal rule of grammar. 132 Can this have happened by mistake? Is it possible to imagine a clerical error to have been committed every time the word occurs? 133 Moreover, it would have been easy to supply

the emendation. Hence, when these readings are not accidental or corrections of manifest mistakes, it is supposed that they must have been set down on purpose by the original writers, and have a meaning.

134 However, it is easy to answer such arguments; as to the question of custom having prevailed in the reading of the marginal versions, I will not spare much time for its consideration: 135 I know not the promptings of superstition, and perhaps the practice may have arisen from the idea that both readings were deemed equally good or tolerable, 136 and therefore, lest either should be neglected, one was appointed to be written, and the other to be read. 137 They feared to pronounce judgment in so weighty a matter lest they should mistake the false for the true, and therefore they would give preference to neither, as they must necessarily have done if they had commanded one only to be both read and written. 138 This would be especially the case where the marginal readings were not written down in the sacred books: 139 or the custom may have originated because some things though rightly written down were desired to be read otherwise according to the marginal version, 140 and therefore the general rule was made that the marginal version should be followed in reading the Scriptures. 141 The cause which induced the scribes to expressly prescribe certain passages to be read in the marginal version, I will now touch on, for not all the marginal notes are various readings, 142 but some mark expressions which have passed out of common use, obsolete words and terms which current decency did not allow to be read in a public assembly. 143 The ancient writers, without any evil intention, employed no courtly paraphrase, but called things by their plain names. 144 Afterwards, through the spread of evil thoughts and luxury, words which could be used by the ancients without offence, came to be considered obscene. 145 There was no need for this cause to change the text of Scripture. Still, as a concession to the popular weakness, it became the custom to substitute more decent terms for words denoting

sexual intercourse, excreta, and to read them as they were given in the margin.

146 At any rate, whatever may have been the origin of the practice of reading Scripture according to the marginal version, it was not that the true interpretation is contained therein. 147 For besides that, the Rabbins in the Talmud often differ from the Massoretes, and give other readings which they approve of, as I will shortly show, certain things are found in the margin which appear less warranted by the uses of the Hebrew language. 148 For example, in 2 Samuel, chapter-14:22, we read, "In that the king hath fulfilled the request of his servant," a construction plainly regular, and agreeing with that in chapter-16. 149 But the margin has it "of thy servant," which does not agree with the person of the verb. 150 So, too, chapter-16:25 of the same book, we find, "As if one had inquired at the oracle of God," the margin adding "someone" to stand as a nominative to the verb. 151 But the correction is not apparently warranted, for it is a common practice, well known to grammarians in the Hebrew language, to use the third person singular of the active verb impersonally.

152 The second argument advanced by the Pharisees is easily answered from what has just been said, namely, that the scribes besides the various readings called attention to obsolete words. 153 For there is no doubt that in Hebrew as in other languages, changes of use made many words obsolete and antiquated, 154 and such were found by the later scribes in the sacred books and noted by them with a view to the books being publicly read according to custom. 155 For this reason the word nahgar is always found marked because its gender was originally common, and it had the same meaning as the Latin juvenis (a young person). 156 So also the Hebrew capital was anciently called Jerusalem, not Jerusalaim. 157 As to the pronouns himself and herself, I think that the later scribes changed vau into jod (a very frequent change in Hebrew) when they wished to express the feminine gender, but that the ancients only

distinguished the two genders by a change of vowels. 158 I may also remark that the irregular tenses of certain verbs differ in the ancient and modern forms, it being formerly considered a mark of elegance to employ certain letters agreeable to the ear.

159 In a word, I could easily multiply proofs of this kind if I were not afraid of abusing the patience of the reader. 160 Perhaps I shall be asked how I became acquainted with the fact that all these expressions are obsolete. 161 I reply that I have found them in the most ancient Hebrew writers in the Bible itself, and that they have not been imitated by subsequent authors, and thus they are recognised as antiquated, though the language in which they occur is dead. 162 But perhaps someone may press the question why, if it be true, as I say, that the marginal notes of the Bible generally mark various readings, 163 there are never more than two readings of a passage, that in the text and that in the margin, instead of three or more; 164 and further, how the scribes can have hesitated between two readings, one of which is evidently contrary to grammar, and the other a plain correction. 165 The answer to these questions also is easy: I will premise that it is almost certain that there once were more various readings than those now recorded. 166 For instance, one finds many in the Talmud which the Massoretes have neglected, and are so different one from the other that even the superstitious editor of the Bomberg Bible confesses that he cannot harmonise them. 167 "We cannot say anything," he writes, "except what we have said above, namely, that the Talmud is generally in contradiction to the Massorete." 168 So that we are nor bound to hold that there never were more than two readings of any passage, yet I am willing to admit, and indeed I believe that more than two readings are never found: 169 and for the following reasons:-

(I.) The cause of the differences of reading only admits of two, being generally the similarity of certain letters, so that the question resolved itself into which should be written Beth, or Kaf, Jod or Vau, Daleth or Reth: 170 cases

which are constantly occurring, and frequently yielding a fairly good meaning whichever alternative be adopted. 171 Sometimes, too, it is a question whether a syllable be long or short, quantity being determined by the letters called mutes. 172 Moreover, we never asserted that all the marginal versions, without exception, marked various readings; on the contrary, we have stated that many were due to motives of decency or a desire to explain obsolete words.

173 (II.) I am inclined to attribute the fact that more than two readings are never found to the paucity of exemplars, perhaps not more than two or three, found by the scribes. 174 In the treatise of the scribes, chapter-6, mention is made of three only, pretended to have been found in the time of Ezra, in order that the marginal versions might be attributed to him. 175 However that may be, if the scribes only had three codices we may easily imagine that in a given passage two of them would be in accord, for it would be extraordinary if each one of the three gave a different reading of the same text. 176 The dearth of copies after the time of Ezra will surprise no one who has read the 1st chapter of Maccabees, or Josephus's "Antiquities," Bk. 12, chapter-5. 177 Nay, it appears wonderful considering the fierce and daily persecution, that even these few should have been preserved. 178 This will, I think, be plain to even a cursory reader of the history of those times. 179 We have thus discovered the reasons why there are never more than two readings of a passage in the Bible, 180 but this is a long way from supposing that we may therefore conclude that the Bible was purposely written incorrectly in such passages in order to signify some mystery.

181 As to the second argument, that some passages are so faultily written that they are at plain variance with all grammar, and should have been corrected in the text and not in the margin, 182 I attach little weight to it, for I am not concerned to say what religious motive the scribes may have had for acting as they did: 183 possibly they did so from candour, wishing to transmit the few

exemplars of the Bible which they had found exactly in their original state, marking the differences they discovered in the margin, not as doubtful readings, but as simple variants. 184 I have myself called them doubtful readings, because it would be generally impossible to say which of the two versions is preferable.

185 Lastly, besides these doubtful readings the scribes have (by leaving a hiatus in the middle of a paragraph) marked several passages as mutilated. 186 The Massoretes have counted up such instances, and they amount to eight-and-twenty. 187 I do not know whether any mystery is thought to lurk in the number, at any rate the Pharisees religiously preserve a certain amount of empty space. 188 One of such hiatus occurs (to give an instance) in Genesis-4:8, where it is written, "And Cain said to his brother… and it came to pass while they were in the field," a space being left in which we should expect to hear what it was that Cain said.

189 Similarly there are (besides those points we have noticed) eight-and-twenty hiatus left by the scribes. 190 Many of these would not be recognised as mutilated if it were not for the empty space left. But I have said enough on this subject.

AN EXAMINATION OF THE REMAINING BOOKS OF THE OLD TESTAMENT ACCORDING TO THE PRECEDING METHOD.

Benedict of Spinoza

4 I now pass on to the remaining books of the Old Testament. 2 Concerning the two books of Chronicles I have nothing particular or important to remark, except that they were certainly written after the time of Ezra, and possibly after the restoration of the Temple by Judas Maccabaeus. 3 For in chapter-9 of the first book we find a reckoning of the families who were the first to live in Jerusalem, and in verse 17 the names of the porters, of which two recur in Nehemiah. 3 This shows that the books were certainly compiled after the rebuilding of the city. As to their actual writer, their authority, utility, and doctrine, I come to no conclusion. 4 I have always been astonished

that they have been included in the Bible by people who shut out from the canon the books of Wisdom, Tobit, and the others styled apocryphal. 5 I do not aim at disparaging their authority, but as they are universally received I will leave them as they are.

6 The Psalms were collected and divided into five books in the time of the second temple, for Psalm chapter-88 was published, according to Philo-Judaeus, while king Jehoiachin was still a prisoner in Babylon; and Psalm chapter-89 When the same king obtained his liberty: 7 I do not think Philo would have made the statement unless either it had been the received opinion in his time, or else had been told him by trustworthy persons. 8 The Proverbs of Solomon were, I believe, collected at the same time, or at least in the time of King Josiah; 9 for in chapter-25:1, it is written, "These are also proverbs of Solomon which the people of Hezekiah, king of Judah, copied out." 10 I cannot here pass over in silence the audacity of the Rabbis who wished to exclude from the sacred canon both the Proverbs and Ecclesiastes, and to put them both in the Apocrypha. 11 In fact, they would actually have done so, if they had not lighted on certain passages in which the law of Moses is extolled. 12 It is, indeed, grievous to think that the settling of the sacred canon lay in the hands of such people; however, I congratulate them, in this instance, on their suffering us to see these books in question, 13 though I cannot refrain from doubting whether they have transmitted them in absolute good faith; but I will not now linger on this point.

14 I pass on, then, to the prophetic books. An examination of these assures me that the prophecies therein contained have been compiled from other books, 15 and are not always set down in the exact order in which they were spoken or written by the prophets, but are only such as were collected here and there, so that they are but fragmentary.

16 Isaiah began to prophecy in the reign of Uzziah, as the writer himself testifies in the first verse. 17 He not only prophesied at that time, but furthermore wrote the history of that king (see 2

Chronicles, chapter-26:22) in a volume now lost. 18 That which we possess, we have shown to have been taken from the chronicles of the kings of Judah and Israel. 19 We may add that the Rabbis assert that this prophet prophesied in the reign of Manasseh, by whom he was eventually put to death, 20 and, although this seems to be a myth, it yet shows that they did not think that all Isaiah's prophecies are extant.

21 The prophecies of Jeremiah, which are related historically are also taken from various chronicles; 22 for not only are they heaped together confusedly, without any account being taken of dates, but also the same story is told in them differently in different passages. 23 For instance, in chapter-21. we are told that the cause of Jeremiah's arrest was that he had prophesied the destruction of the city to Zedekiah who consulted him. 24 This narrative suddenly passes, in chapter-22, to the prophet's remonstrances to Jehoiakim (Zedekiah's predecessor), and the prediction he made of that king's captivity; 25 then, in chapter-25, come the revelations granted to the prophet previously, that is in the fourth year of Jehoiakim, and, further on still, the revelations received in the first year of the same reign. 26 The continuator of Jeremiah goes on heaping prophecy upon prophecy without any regard to dates, until at last, in chapter-38 (as if the intervening chapters had been a parenthesis), he takes up the thread dropped in chapter-21. 27 In fact, the conjunction with which chapter-38 begins, refers to the 8th, 9th, and 10th verses of chapter-21. 28 Jeremiah's last arrest is then very differently described, and a totally separate cause is given for his daily retention in the court of the prison.

29 We may thus clearly see that these portions of the book have been compiled from various sources, and are only from this point of view comprehensible. 30 The prophecies contained in the remaining chapters, where Jeremiah speaks in the first person, seem to be taken from a book written by Baruch, at Jeremiah's dictation. 31 These, however, only comprise (as appears from chapter-

36:2) the prophecies revealed to the prophet from the time of Josiah to the fourth year of Jehoiakim, at which period the book begins. 32 The contents of chapter-45:2, on to chapter-51:59, seem taken from the same volume. That the book of Ezekiel is only a fragment, is clearly indicated by the first verse. 33 For anyone may see that the conjunction with which it begins, refers to something already said, and connects what follows therewith. 34 However, not only this conjunction, but the whole text of the discourse implies other writings. 35 The fact of the present work beginning the thirtieth year shows that the prophet is continuing, not commencing a discourse; 36 and this is confirmed by the writer, who parenthetically states in verse-3, "The word of the Lord came often unto Ezekiel the priest, the son of Buzi, in the land of the Chaldeans," 37 as if to say that the prophecies which he is about to relate are the sequel to revelations formerly received by Ezekiel from God.

38 Furthermore, Josephus, 11 Antiquity." 10:9, says that Ezekiel prophesied that Zedekiah should not see Babylon, whereas the book we now have not only contains no such statement, but contrariwise asserts in chapter-17 that he should be taken to Babylon as a captive. 39 Of Hosea I cannot positively state that he wrote more than is now extant in the book bearing his name, but I am astonished at the smallness of the quantity we possess, for the sacred writer asserts that the prophet prophesied for more than eighty years.

40 We may assert, speaking generally, that the compiler of the prophetic books neither collected all the prophets, nor all the writings of those we have; 41 for of the prophets who are said to have prophesied in the reign of Manasseh and of whom general mention is made in 2 Chronicles, chapter-33:10, and 18, we have, evidently, no prophecies extant; 42 neither have we all the prophecies of the twelve who give their names to books. 43 Of Jonah we have only the prophecy concerning the Ninevites, though he also prophesied to the children of Israel, as we learn in 2 Kings chapter-14:25.

INTERPRETATION

44 The book and the personality of Job have caused much controversy. Some think that the book is the work of Moses, and the whole narrative merely allegorical. 45 Such is the opinion of the Rabbins recorded in the Talmud, and they are supported by, Maimonides in his "More Nebuchim." 46 Others believe it to be a true history, and some suppose that Job lived in the time of Jacob, and was married to his daughter Dinah. 47 Aben Ezra, however, as I have already stated, affirms, in his commentaries, that the work is a translation into Hebrew from some other language: 48 I could wish that he could advance more cogent arguments than he does, for we might then conclude that the Gentiles also had sacred books. 49 I myself leave the matter undecided, but I conjecture Job to have been a Gentile, and a man of very stable character, who at first prospered, then was assailed with terrible calamities, and finally, was restored to great happiness. 50 (He is thus named, among others, by Ezekiel, chapter-14:12). 51 I take it that the constancy of his mind amid the vicissitudes of his fortune occasioned many people to dispute about God's providence, or at least caused the writer of the book in question to compose his dialogues; 52 for the contents, and also the style, seem to emanate far less from a person wretchedly ill and lying among ashes, than from one reflecting at ease in own study. 53 I should also be inclined to agree with Aben Ezra that the book is a translation, for its poetry seems akin to that of the Gentiles; 54 thus the Father of Gods summons a council, and Momus, here called Satan, criticises the Divine decrees with the utmost freedom. But these are mere conjectures without any solid foundation.

55 I pass on to the book of Daniel, which, from chapter-8 onwards, undoubtedly contains the writing of Daniel himself. 56 Whence the first seven chapters are derived I cannot say; we may, however, conjecture that, as they were first written in Chaldean, they are taken from Chaldean chronicles. 57 If this could be proved, it would form a very striking proof of the fact that the sacredness of Scripture depends on our

understanding of the doctrines therein signified, and not on the words, the language, and the phrases in which these doctrines are conveyed to us; 58 and it would further show us that books which teach and speak of whatever is highest and best are equally sacred, whatever be the tongue in which they are written, or the nation to which they belong. 59 We can, however, in this case only remark that the chapters in question were written in Chaldee, and yet are as sacred as the rest of the Bible.

60 The first book of Ezra is so intimately connected with the book of Daniel that both are plainly recognisable as the work of the same author, writing of Jewish history from the time of the first captivity onwards. 61 I have no hesitation in joining to this the book of Esther, for the conjunction with which it begins can refer to nothing else. 62 It cannot be the same work as that written by Mordecai, for, in chapter-60:20-22, another person relates that Mordecai wrote letters, and tells us their contents; 63 further, that Queen Esther confirmed the days of Purim in their times appointed, and that the decree was written in the book that is (by a Hebraism), in a book known to all then living, which, as Aben Ezra and the rest confess, has now perished.

64 Lastly, for the rest of the acts of Mordecai, the historian refers us to the chronicles of the kings of Persia. 65 Thus there is no doubt that this book was written by the same person as he who recounted the history of Daniel and Ezra, and who wrote Nehemiah, sometimes called the second book of Ezra. 66 We may, then, affirm that all these books are from one hand; but we have no clue whatever to the personality of the author. 67 However, in order to determine whence he, whoever he was, had gained a knowledge of the histories which he had, perchance, in great measure himself written, 68 we may remark that the governors or chiefs of the Jews, after the restoration of the Temple, kept scribes or historiographers, who wrote annals or chronicles of them. 69 The chronicles of the kings are often quoted in the books of Kings, but the chronicles of the chiefs and priests are quoted for

the first time in Nehemiah 12:23, and again in 1 Macc. 16:24. 70 This is undoubtedly the book referred to as containing the decree of Esther and the acts of Mordecai; and which, as we said with Aben Ezra, is now lost. 71 From it were taken the whole contents of these four books, for no other authority is quoted by their writer, or is known to us.

72 That these books were not written by either Ezra or Nehemiah is plain from Nehemiah chapter-12:9, where the descendants of the high priest, Joshua are traced down to Jaddua, the sixth high priest, who went to meet Alexander the Great, 73 when the Persian empire was almost subdued (Josephus, "Antiquity." 2. 108), or who, according to Philo-Judaeus, was the sixth and last high priest under the Persians. 74 In the same chapter of Nehemiah, verse 22, this point is clearly brought out: "The Levites in the days of Eliashib, Joiada, and Johanan, and Jaddua, were recorded chief of the fathers: 75 also the priests, to the reign of Darius the Persian"-- that is to say, in the chronicles; 76 and, I suppose, no one thinks that the lives of Nehemiah and Ezra were so prolonged that they outlived fourteen kings of Persia. 77 Cyrus was the first who granted the Jews permission to rebuild their Temple: the period between his time and Darius, fourteenth and last king of Persia, extends over 230-years.

78 I have, therefore, no doubt that these books were written after Judas Maccabaeus had restored the worship in the Temple, 79 for at that time false books of Daniel, Ezra, and Esther were published by evil-disposed persons, who were almost certainly Sadducees, for the writings were never recognised by the Pharisees, so far as I am aware; 80 and, although certain myths in the fourth book of Ezra are repeated in the Talmud, they must not be set down to the Pharisees, for all but the most ignorant admit that they have been added by some trifler: 81 in fact, I think, someone must have made such additions with a view to casting ridicule on all the traditions of the sect.

82 Perhaps these four books were written out and published at the

time I have mentioned with a view to showing the people that the prophecies of Daniel had been fulfilled, 83 and thus kindling their piety, and awakening a hope of future deliverance in the midst of their misfortunes. 84 In spite of their recent origin, the books before us contain many errors, due, I suppose, to the haste with which they were written. 85 Marginal readings, such as I have mentioned in the last chapter, are found here as elsewhere, and in even greater abundance; there are, moreover, certain passages which can only be accounted for by supposing some such cause as hurry. 86 However, before calling attention to the marginal readings, I will remark that, if the Pharisees are right in supposing them to have been ancient, and the work of the original scribes, 87 we must perforce admit that these scribes (if there were more than one) set them down because they found that the text from which they were copying was inaccurate, and did yet not venture to alter what was written by their predecessors and superiors. 88 I need not again go into the subject at length, and will, therefore, proceed to mention some discrepancies not noticed in the margin.

89 (I.) Some error has crept into the text of the second chapter of Ezra, for in verse 64 we are told that the total of all those mentioned in the rest of the chapter amounts to 42,360; but, when we come to add up the several items we get as result only 29,818. 90 There must, therefore, be an error, either in the total, or in the details. 91 The total is probably correct, for it would most likely be well known to all as a noteworthy thing; but with the details, the case would be different. 92 If, then, any error had crept into the total, it would at once have been remarked, and easily corrected. 93 This view is confirmed by Nehemiah chapter-7, where this chapter of Ezra is mentioned, and a total is given in plain correspondence thereto; 94 but the details are altogether different-- some are larger, and some less, than those in Ezra, and altogether they amount to 31,089. 95 We may, therefore, conclude that both in Ezra and in Nehemiah the details are erroneously given. 96 The commentators who attempt

to harmonise these evident contradictions draw on their imagination, each to the best of own ability; 97 and while professing adoration for each letter and word of Scripture, only succeed in holding up the sacred writers to ridicule, as though they knew not how to write or relate a plain narrative. 98 Such persons effect nothing but to render the clearness of Scripture obscure.

99 If the Bible could everywhere be interpreted after their fashion, there would be no such thing as a rational statement of which the meaning could be relied on. 100 However, there is no need to dwell on the subject; only I am convinced that if any historian were to attempt to imitate the proceedings freely attributed to the writers of the Bible, the commentators would cover the historian with contempt. 101 If it be blasphemy to assert that there are any errors in Scripture, what name shall we apply to those who foist into it their own fancies, who degrade the sacred writers till they seem to write confused nonsense, and who deny the plainest and most evident meanings? 102 What in the whole Bible can be plainer than the fact that Ezra and his companions, in the second chapter of the book attributed to him, have given in detail the reckoning of all the Hebrews who set out with them for Jerusalem? 103 This is proved by the reckoning being given, not only of those who told their lineage, but also of those who were unable to do so.

104 Is it not equally clear from Nehemiah chapter-7:5, that the writer merely there copies the list given in Ezra? 105 Those, therefore, who explain these passages otherwise, deny the plain meaning of Scripture-- nay, they deny Scripture itself. 106 They think it pious to reconcile one passage of Scripture with another--a pretty piety, forsooth, which accommodates the clear passages to the obscure, the correct to the faulty, the sound to the corrupt. 107 Far be it from me to call such commentators blasphemers, if their motives be pure: for to err is human. But I return to my subject.

108 Besides these errors in numerical details, there are others in the genealogies, in the history, and, I fear also in the prophecies.

INTERPRETATION

109 The prophecy of Jeremiah (chapter-22), concerning Jechoniah, evidently does not agree with his history, as given in I Chronicles chapter-3:17-19, 110 and especially with the last words of the chapter, nor do I see how the prophecy, "thou shalt die in peace," can be applied to Zedekiah, whose eyes were dug out after his sons had been slain before him. 111 If prophecies are to be interpreted by their issue, we must make a change of name, and read Jechoniah for Zedekiah, and vice versa 112 This, however, would be too paradoxical a proceeding; so I prefer to leave the matter unexplained, especially as the error, if error there be, must be set down to the historian, and not to any fault in the authorities.

113 Other difficulties I will not touch upon, as I should only weary the reader, and, moreover, be repeating the remarks of other writers. 114 For R. Selomo, in face of the manifest contradiction in the above-mentioned genealogies, is compelled to break forth into these words (see his commentary on 1 Chronicles, chapter-8): 115 "Ezra (whom he supposes to be the author of the book of Chronicles) gives different names and a different genealogy to the sons of Benjamin from those which we find in Genesis, 116 and describes most of the Levites differently from Joshua, because he found original discrepancies." 117 And, again, a little later: "The genealogy of Gibeon and others is described twice in different ways, from different tables of each genealogy, and in writing them down Ezra adopted the version given in the majority of the texts, and when the authority was equal he gave both." 118 Thus granting that these books were compiled from sources originally incorrect and uncertain.

119 In fact the commentators, in seeking to harmonise difficulties, generally do no more than indicate their causes: 120 for I suppose no sane person supposes that the sacred historians deliberately wrote with the object of appearing to contradict themselves freely. 121 Perhaps I shall be told that I am overthrowing the authority of Scripture, for that, according to me, anyone may suspect it of error in any passage; 122 but, on the contrary, I have shown that my

object has been to prevent the clear and uncorrupted passages being accommodated to and corrupted by the faulty ones; 123 neither does the fact that some passages are corrupt warrant us in suspecting all. 124 No book ever was completely free from faults, yet I would ask, who suspects all books to be everywhere faulty? Surely no one, especially when the phraseology is clear and the intention of the author plain.

125 I have now finished the task I set myself with respect to the books of the Old Testament. 126 We may easily conclude from what has been said, that before the time of the Maccabees there was no canon of sacred books, 127 but that those which we now possess were selected from a multitude of others at the period of the restoration of the Temple by the Pharisees (who also instituted the set form of prayers), who are alone responsible for their acceptance. 128 Those, therefore, who would demonstrate the authority of Holy Scripture, are bound to show the authority of each separate book; it is not enough to prove the Divine origin of a single book in order to infer the Divine origin of the rest. 129 In that case we should have to assume that the council of Pharisees was, in its choice of books, infallible, and this could never be proved. 130 I am led to assert that the Pharisees alone selected the books of the Old Testament, and inserted them in the canon, from the fact that in Daniel chapter-12, is proclaimed the doctrine of the Resurrection, which the Sadducees denied; 131 and, furthermore, the Pharisees plainly assert in the Talmud that they so selected them. 132 For in the treatise of Sabbathus, chapter-2, folio 30, page 2, it is written: R. Jehuda, surnamed Rabbi, reports that the experts wished to conceal the book of Ecclesiastes because they found therein words opposed to the law (that is, to the book of the law of Moses). 133 Why did they not hide it? "Because it begins in accordance with the law, and ends according to the law;" and a little further on we read: "They sought also to conceal the book of Proverbs." 134 And in the first chapter of the same treatise, folio-13, page 2: "Verily, name one man for good, even he who

was called Neghunja, the son of Hezekiah: 135 for, save for him, the book of Ezekiel would been concealed, because it agreed not with the words of the law."

136 It is thus abundantly clear that people expert in the law summoned a council to decide which books should be received into the canon, and which excluded. 137 If any person, therefore, wishes to be certified as to the authority of all the books, let you call a fresh council, and ask every member own reasons. 138 The time has now come for examining in the same manner the books in the New Testament; 139 but as I learn that the task has been already performed by people highly skilled in science and languages, and as I do not myself possess a knowledge of Greek sufficiently exact for the task; 140 lastly, as we have lost the originals of those books which were written in Hebrew, I prefer to decline the undertaking. 141 However, I will touch on those points which have most bearing on my subject in the following chapter.

AN INQUIRY WHETHER THE APOSTLES WROTE THEIR EPISTLES AS APOSTLES AND PROPHETS, OR MERELY AS TEACHERS; AND AN EXPLANATION OF WHAT IS MEANT BY AN APOSTLE.

Benedict of Spinoza

5 No reader of the New Testament can doubt that the Apostles were prophets; 2 but as a prophet does not always speak by revelation, but only at rare intervals, we may fairly inquire whether the Apostles wrote their Epistles as prophets, by revelation and express mandate, as Moses, Jeremiah, and others did, 3 or whether only as private individuals or teachers, especially as Paul, in Corinthians, chapter-14:6, mentions two sorts of preaching. 4 If we examine the style of the Epistles, we shall find it totally different from that employed by the prophets.

5 The prophets are continually asserting that they speak by the command of God: "Thus saith the Lord," "The Lord of hosts saith," "The command of the Lord,"; 6 and this was their habit not only in assemblies of the prophets, but also in their epistles containing

revelations, as appears from the epistle of Elijah to Jehoram, 2 Chronicles, chapter-21:12, which begins, "Thus saith the Lord." 7 In the Apostolic Epistles we find nothing of the sort. Contrariwise, in I Corithians, chapter-7:40 Paul speaks according to own opinion and in many passages we come across doubtful and perplexed phrase; such as, "We think, therefore," Romans, chapter-3:28; "Now I think," Romans, chapter-8:18, and so on. 8 Besides these, other expressions are met with very different from those used by the prophets. 9 For instance, 1 Corithians, chapter-7:6, "But I speak this by permission, not by commandment;" "I give my judgment as one that hath obtained mercy of the Lord to be faithful" (1 Corinthians, chapter-7:25), and so on in many other passages. 10 We must also remark that in the aforesaid chapter the Apostle says that when he states that he has or has not the precept or commandment of God, he does not mean the precept or commandment of God revealed to himself, but only the words uttered by Christ in His Sermon on the Mount.

11 Furthermore, if we examine the manner in which the Apostles give out evangelical doctrine, we shall see that it differs materially from the method adopted by the prophets. 12 The Apostles everywhere reason as if they were arguing rather than prophesying; the prophecies, on the other hand, contain only dogmas and commands. 13 God is therein introduced not as speaking to reason, but as issuing decrees by His absolute fiat. 14 The authority of the prophets does not submit to discussion, for whosoever wishes to find rational ground for own arguments, by that very wish submits them to everyone's private judgment. 15 This Paul, inasmuch as he uses reason, appears to have done, for he says in 1 Corinthians, chapter-10:15, "I speak as to wise people, judge ye what I say." 16 The prophets, as we showed, did not perceive what was revealed by virtue of their natural reason, and though there are certain passages in the Pentateuch which seem to be appeals to induction, 17 they turn out, on nearer examination, to

be nothing but peremptory commands. (15) For instance, when Moses says, Deuteronomy, chapter-31:27, "Behold, while I am yet alive with you, this day ye have been rebellious against the Lord; and how much more after my death," 18 we must by no means conclude that Moses wished to convince the Israelites by reason that they would necessarily fall away from the worship of the Lord after his death; for the argument would have been false, as Scripture itself shows: 19 the Israelites continued faithful during the lives of Joshua and the elders, and afterwards during the time of Samuel, David, and Solomon.

20 Therefore the words of Moses are merely a moral injunction, in which he predicts rhetorically the future backsliding of the people so as to impress it vividly on their imagination. 21 I say that Moses spoke of himself in order to lend likelihood to his prediction, and not as a prophet by revelation, 22 because in verse 21 of the same chapter we are told that God revealed the same thing to Moses in different words, and there was no need to make Moses certain by argument of God's prediction and decree; 23 it was only necessary that it should be vividly impressed on his imagination, and this could not be better accomplished than by imagining the existing contumacy of the people, of which he had had frequent experience, as likely to extend into the future.

24 All the arguments employed by Moses in the five books are to be understood in a similar manner; 25 they are not drawn from the armoury of reason, but are merely modes of expression calculated to instill with efficacy, and present vividly to the imagination the commands of God. 26 However, I do not wish absolutely to deny that the prophets ever argued from revelation; I only maintain that the prophets made more legitimate use of argument in proportion as their knowledge approached more nearly to ordinary knowledge, 27 and by this we know that they possessed a knowledge above the ordinary, inasmuch as they proclaimed absolute dogmas, decrees, or judgments. 28 Thus Moses, the chief of the prophets, never used legitimate argument,

and, on the other hand, the long deductions and arguments of Paul, such as we find in the Epistle to the Romans, are in nowise written from supernatural revelation.

29 The modes of expression and discourse adopted by the Apostles in the Epistles, show very clearly that the latter were not written by revelation and Divine command, but merely by the natural powers and judgment of the authors. 30 They consist in brotherly admonitions and courteous expressions such as would never be employed in prophecy, 31 as for instance, Paul's excuse in Romans chapter-15:15, "I have written the more boldly unto you in some sort, my brethren." 32 We may arrive at the same conclusion from observing that we never read that the Apostles were commanded to write, but only that they went everywhere preaching, and confirmed their words with signs. 33 Their personal presence and signs were absolutely necessary for the conversion and establishment in religion of the Gentiles; 34 as Paul himself expressly states in Romans, chapter-1:11, "But I long to see you, that I may impart to you some spiritual gift, to the end that ye may be established."

35 It may be objected that we might prove in similar fashion that the Apostles did not preach as prophets, for they did not go to particular places, as the prophets did, by the command of God. 36 We read in the Old Testament that Jonah went to Nineveh to preach, and at the same time that he was expressly sent there, and told that he most preach. 37 So also it is related, at great length, of Moses that he went to Egypt as the messenger of God, and was told at the same time what he should say to the children of Israel and to king Pharaoh, and what wonders he should work before them to give credit to his words. 38 Isaiah, Jeremiah, and Ezekiel were expressly commanded to preach to the Israelites.

39 Lastly, the prophets only preached what we are assured by Scripture they had received from God, whereas this is hardly ever said of the Apostles in the New Testament, when they went about to preach. 40 On the contrary, we find passages expressly implying

that the Apostles chose the places where they should preach on their own responsibility, for there was a difference amounting to a quarrel between Paul and Barnabas on the subject (Acts, chapter-15:37, and 38). 41 Often they wished to go to a place, but were prevented, as Paul writes, Romans, chapter-1:13, "Oftentimes I purposed to come to you, but was let hitherto;" 42 and in I Corithians, chapter-16:12, "As touching our brother Apollos, I greatly desired him to come unto you with the brethren, but his will was not at all to come at this time: but he will come when he shall have convenient time."

43 From these expressions and differences of opinion among the Apostles, and also from the fact that Scripture nowhere testifies of them, as of the ancient prophets, that they went by the command of God, 44 one might conclude that they preached as well as wrote in their capacity of teachers, and not as prophets: 45 but the question is easily solved if we observe the difference between the mission of an Apostle and that of an Old Testament prophet. 46 The latter were not called to preach and prophesy to all nations, but to certain specified ones, and therefore an express and peculiar mandate was required for each of them; 47 the Apostles, on the other hand, were called to preach to all people absolutely, and to turn all people to religion. 48 Therefore, whithersoever they went, they were fulfilling Christ's commandment; 49 there was no need to reveal to them beforehand what they should preach, for they were the disciples of Christ to whom their Master Himself said (Matthew, chapter-10, verses:19 and 20): 50 "But, when they deliver you up, take no thought how or what ye shall speak, for it shall be given you in that same hour what ye shall speak." 51 We therefore conclude that the Apostles were only indebted to special revelation in what they orally preached and confirmed by signs (see the beginning of Chapter-11.); 52 that which they taught in speaking or writing without any confirmatory signs and wonders they taught from their natural knowledge. (See I Corithians, chapter-14, verse:6.)

53 We need not be deterred by the fact that all the Epistles begin by

citing the imprimatur of the Apostleship, for the Apostles, as I will shortly show, were granted, not only the faculty of prophecy, but also the authority to teach. 54 We may therefore admit that they wrote their Epistles as Apostles, and for this cause every one of them began by citing the Apostolic imprimatur, 55 possibly with a view to the attention of the reader by asserting that they were the persons who had made such mark among the faithful by their preaching, and had shown by many marvelous works that they were teaching true religion and the way of salvation. 56 I observe that what is said in the Epistles with regard to the Apostolic vocation and the Holy Spirit of God which inspired them, has reference to their former preaching, 57 except in those passages where the expressions of the Spirit of God and the Holy Spirit are used to signify a mind pure, upright, and devoted to God. 58 For instance, in 1 Corinthians, chapter-7:40, Paul says: But she is happier if she so abide, after my judgment, and I think also that I have the Spirit of God." 59 By the Spirit of God the Apostle here refers to own mind, as we may see from the context: own meaning is as follows: 60 "I account blessed a widow who does not wish to marry a second husband; such is my opinion, for I have settled to live unmarried, and I think that I am blessed." 61 There are other similar passages which I need not now quote.

62 As we have seen that the Apostles wrote their Epistles solely by the light of natural reason, we must inquire how they were enabled to teach by natural knowledge matters outside its scope. 63 However, if we bear in mind what we said in chapter-7 of this treatise our difficulty will vanish: 64 for although the contents of the Bible entirely surpass our understanding, we may safely discourse of them, provided we assume nothing not told us in Scripture: 65 by the same method the Apostles, from what they saw and heard, and from what was revealed to them, were enabled to form and elicit many conclusions which they would have been able to teach to people had it been permissible. 66 Further, although religion, as preached by the

Apostles, does not come within the sphere of reason, in so far as it consists in the narration of the life of Christ, 67 yet its essence, which is chiefly moral, like the whole of Christ's doctrine, can readily be apprehended by the natural faculties of all.

68 Lastly, the Apostles had no lack of supernatural illumination for the purpose of adapting the religion they had attested by signs to the understanding of everyone so that it might be readily received; nor for exhortations on the subject: 69 in fact, the object of the Epistles is to teach and exhort people to lead that manner of life which each of the Apostles judged best for confirming them in religion. 70 We may here repeat our former remark, that the Apostles had received not only the faculty of preaching the history, of Christ as prophets, and confirming it with signs, but also authority for teaching and exhorting according as each thought best.

71 Paul (2 Timothy, chapter-1:11), "Whereunto I am appointed a preacher, and an apostle, and a teacher of the Gentiles;" 72 and again (I Timothy, chapter-2:7), "Whereunto I am ordained a preacher and an apostle (I speak the truth in Christ and lie not), a teacher of the Gentiles in faith and verity." 73 These passages, I say, show clearly the stamp both of the apostleship and the teachership: 74 the authority for admonishing whomsoever and wheresoever he pleased is asserted by Paul in the Epistle to Philemon, chapter-5:8: "Wherefore, though I might be much bold in Christ to enjoin thee that which is convenient, yet," 75 where we may remark that if Paul had received from God as a prophet what he wished to enjoin Philemon, and had been bound to speak in his prophetic capacity, he would not have been able to change the command of God into entreaties. 76 We must therefore understand him to refer to the permission to admonish which he had received as a teacher, and not as a prophet.

77 We have not yet made it quite clear that the Apostles might each choose own way of teaching, but only that by virtue of their Apostleship they were teachers as well as prophets; 78 however, if we call reason to our aid we shall

clearly see that an authority to teach implies authority to choose the method. 79 It will nevertheless be, perhaps, more satisfactory to draw all our proofs from Scripture; we are there plainly told that each Apostle chose own particular method (Romans, chapter-15:20): 80 "Yea, so have I strived to preach the gospel, not where Christ was named, lest I should build upon another man's foundation." 81 If all the Apostles had adopted the same method of teaching, and had all built up the Christian religion on the same foundation, Paul would have had no reason to call the work of a fellow-Apostle "another person's foundation," 82 inasmuch as it would have been identical with his own: his calling it another person's proved that each Apostle built up own religious instruction on different foundations, 83 thus resembling other teachers who have each their own method, and prefer instructing quite ignorant people who have never learnt under another master, whether the subject be science, languages, or even the indisputable truths of mathematics.

84 Furthermore, if we go through the Epistles at all attentively, we shall see that the Apostles, while agreeing about religion itself, are at variance as to the foundations it rests on. 85 Paul, in order to strengthen humans' religion, and show them that salvation depends solely on the grace of God, teaches that no one can boast of works, but only of faith, 86 and that no one can be justified by works (Romans, chapter-3:27 and 28); in fact, he preaches the complete doctrine of predestination. 87 James, on the other hand, states that human is justified by works, and not by faith only (see his Epistle, chapter-2:24), and omitting all the disputations of Paul, confines religion to a very few elements.

88 Lastly, it is indisputable that from these different grounds for religion selected by the Apostles, many quarrels and schisms distracted the Church, even in the earliest times, and doubtless they will continue so to distract it forever, 89 or at least till religion is separated from philosophical speculations, and reduced to the few simple doctrines taught by

Christ to His disciples; 90 such a task was impossible for the Apostles, because the Gospel was then unknown to humankind, 91 and lest its novelty should offend humans' ears it had to be adapted to the disposition of contemporaries (2 Corinthians. Chapter-9:19 and 20), and built up on the groundwork most familiar and accepted at the time. 92 Thus none of the Apostles philosophised more than did Paul, who was called to preach to the Gentiles; 93 other Apostles preaching to the Jews, who despised philosophy, similarly, adapted themselves to the temper of their hearers (see Galatians. Chapter-2 and 11), and preached a religion free from all philosophical speculations. 94 How blest would our age be if it could witness a religion freed also from all the trammels of superstition!

The Book of Divine Panagogue called

PERCEPTION

THE DOCTRINE OF REPRESENTATIVE PERCEPTION

George Stuart Fullerton

1 We have seen that it seems to the plain human abundantly evident that you really are surrounded by material things and that you directly perceives such things. 2 This has always been the opinion of the plain person and it seems probable that it always will be. 3 It is only when you begins to reflect upon things and upon your knowledge of them that it occurs to you to call it in question.

4 Very early in the history of speculative thought it occurred to people, however, to ask how it is that we know things, and whether we are sure we do know them. 5 The problems of reflection started into life, and various solutions were suggested. To tell over the whole list would take us far afield, 6 and we need not, for the purpose we have in view, go back farther than Descartes, with whom philosophy took a relatively new start, and may be said to have become, in spirit and method, at least, modern.

7 I have said that Descartes (1596-1650) was fairly well acquainted with the functioning of the nervous system, and has much to say of the messages which pass along the nerves to the brain. 8 The same sort of reasoning that leads the modern psychologist to maintain that we know only so much of the external world as is reflected in our sensations 9 led him to maintain that the mind is directly aware of the ideas through which an external world is represented, but can know the world itself only indirectly and through these ideas. 10 Descartes was put to sore straits to prove the existence of an external world, when he had once thus placed it at one remove from us. 11 If we accept his doctrine, we seem to be shut up within the circle of our ideas, and can find no door that will lead us to a world outside. 12 The question will keep coming back: How do we 'know' that, corresponding to our ideas, there are material things, if we have never perceived, in any single instance, a material thing? 13 And the doubt here suggested may be reinforced by the reflection

that the very expression "a material thing" ought to be meaningless to a person who, having never had experience of one, is compelled to represent it by the aid of something so different from it as ideas are supposed to be. 14 Can material things really be to such a creature anything more than some complex of ideas? 15 The difficulties presented by any philosophical doctrine are not always evident at once. 16 Descartes made no scruple of accepting the existence of an external world, and his example has been followed by a very large number of those who agree with his initial assumption that the mind knows immediately only its own ideas.

17 Preëminent among such we must regard John Locke, the English philosopher (1632-1704), whose classic work, "*An Essay concerning Human Understanding*" should not be wholly unknown to any one who pretends to an interest in the English literature. 18 Admirably does Locke represent the position of what very many have regarded as the prudent and sensible person,-- 19 the person who recognises that ideas are not external things, and that things must be known through ideas, and yet holds on to the existence of a material world which we assuredly know. 20 He recognises, it is true, that some one may find a possible opening for the expression of a doubt, but he regards the doubt as gratuitous; 21 "I think nobody can, in earnest, be so sceptical as to be uncertain of the existence of those things which one sees and feels." As we have seen, he meets the doubt with a jest.

22 Nevertheless, those who read with attention Locke's admirably clear pages must notice that he does not succeed in really setting to rest the doubt that has suggested itself. 23 It becomes clear that Locke felt so sure of the existence of the external world because he now and then slipped into the inconsistent doctrine that he perceived it immediately, and not merely through his ideas. 24 Are those things "which he sees and feels" 'external' things? 25 Does he see and feel them directly, or must he infer from his ideas that he sees and feels them? 26 If the latter,

why may one not still doubt? Evidently the appeal is to a direct experience of material things, and Locke has forgotten that he must be a Lockian.

27 "I have often remarked, in many instances," writes Descartes, "that there is a great difference between an object and its idea." 28 How could the man possibly have remarked this, when he had never in his life perceived the object corresponding to any idea, but had been altogether shut up to ideas? 29 "Thus I see, whilst I write this," says Locke, "I can change the appearance of the paper, and by designing the letters tell beforehand what new idea it shall exhibit the very next moment, by barely drawing my pen over it, 30 which will neither appear (let me fancy as much as I will), if my hand stands still, or though I move my pen, if my eyes be shut; 31 nor, when those characters are once made on the paper, can I choose afterward but see them as they are; that is, have the ideas of such letters as I have made. 32 Whence it is manifest, that they are not barely the sport and play of my own imagination, when I find that the characters that were made at the pleasure of my own thought do not obey them; nor yet cease to be, whenever I shall fancy it; 33 but continue to affect the senses constantly and regularly, according to the figures I made them."

34 Locke is as bad as Descartes. Evidently he regards himself as able to turn to the external world and perceive the relation that things hold to ideas. 35 Such an inconsistency may escape the writer who has been guilty of it, but it is not likely to escape the notice of all those who come after him. 36 Some one is sure to draw the consequences of a doctrine more rigourously, and to come to conclusions, it may be, very unpalatable to the person who propounded the doctrine in the first instance.

37 The type of doctrine represented by Descartes and Locke is that of 'Representative Perception'. It holds that we know real external things only through their mental representatives. 38 It has also been called 'Hypothetical Realism', because it accepts the existence of a real world, but bases our

knowledge of it upon an inference from our sensations or ideas.

THE STEP TO IDEALISM

39 The admirable clearness with which Locke writes makes it the easier for his reader to detect the untenability of his position. 40 He uses simple language, and he never takes refuge in vague and ambiguous phrases. 41 When he tells us that the mind is wholly shut up to its ideas, and then later assumes that it is not shut up to its ideas, but can perceive external things, we see plainly that there must be a blunder somewhere.

42 George Berkeley (1684-1753), Bishop of Cloyne, followed out more rigourously the consequences to be deduced from the assumption that all our direct knowledge is of ideas; 43 and in a youthful work of the highest genius entitled "*The Principles of Human Knowledge*," he maintained that there is no material world at all. 44 When we examine with care the objects of sense, the "things" which present themselves to us, he argues, we find that they resolve themselves into sensations, or "ideas of sense."

45 What can we mean by the word "apple," if we do not mean the group of experiences in which alone an apple is presented to us? 46 The word is nothing else than a name for this group as a group. Take away the colour, the hardness, the odour, the taste; what have we left? 47 And colour, hardness, odour, taste, and anything else that may be referred to any object as a quality, can exist, he claims, only in a perceiving mind; for such things are nothing else than sensations, and how can there be an unperceived sensation?

48 The things which we perceive, then, he calls complexes of ideas. Have we any reason to believe that these ideas, which exist in the mind, are to be accepted as representatives of things of a different kind, which are not mental at all? 49 Not a shadow of a reason, says Berkeley; there is simply no basis for inference at all, and we cannot even make clear what it is that we are setting out to infer under the name of matter.

50 We need not, therefore, grieve over the loss of the material world, for we have suffered no loss; one cannot lose what one has never had.

51 Thus, the objects of human knowledge, the only things of which it means anything to speak, are: (1) Ideas of Sense; (2) Ideas of Memory and Imagination; (3) The Passions and Operations of the Mind; and (4) The Self that perceives all These.

52 From Locke's position to that of Berkeley was a bold step, and it was much criticised, as well it might be. 53 It was felt then, as it has been felt by many down to our own time, that, when we discard an external world distinct from our ideas, and admit only the world revealed in our ideas, we really do lose. 54 It is legitimate to criticise Berkeley, but it is not legitimate to misunderstand him; and yet the history of his doctrine may almost be called a chronicle of misconceptions. 55 It has been assumed that he drew no distinction between real things and imaginary things, that he made the world no better than a dream, etc. 56 Arbuthnot, Swift, and a host of the greater and lesser lights in literature, from his time to ours, have made merry over the supposed unrealities in the midst of which the Berkeleian must live. 57 But it should be remembered that Berkeley tried hard to do full justice to the world of things in which we actually find ourselves; not a hypothetical, inferred, unperceived world, but the world of the things we actually perceive. 58 He distinguished carefully between what is real and what is merely imaginary, though he called both "ideas"; and he recognised something like a system of Nature. 59 And, by the argument from analogy which we have already examined, he inferred the existence of other finite minds and of a Divine Mind.

60 But just as John Locke had not completely thought out the consequences which might be deduced from his own doctrines, so Berkeley left, in his turn, an opening for a successor. 61 It was possible for that acutest of analysts, David Hume (1711-1776), to treat him somewhat as he had treated Locke. 62 Among the objects of human knowledge

Berkeley had included the 'self' that perceives things. 63 He never succeeded in making at all clear what he meant by this object; but he regarded it as a substance, and believed it to be a cause of changes in ideas, and quite different in its nature from all the ideas attributed to it. 64 But Hume maintained that when he tried to get a good look at this self, to catch it, so to speak, and to hold it up to inspection, he could not find anything whatever save perceptions, memories, and other things of that kind. 65 The self is, he said, "but a bundle or collection of different perceptions which succeed each other with inconceivable rapidity, and are in a perpetual flux and movement." 66 As for the objects of sense, our own bodies, the chairs upon which we sit, the tables at which we write, and all the rest-- these, argues Hume, we are impelled by nature to think of as existing continuously, but we have no evidence whatever to prove that they do thus exist. 67 Are not the objects of sense, after all, only sensations or impressions? 68 Do we not experience these sensations or impressions uninterruptedly? 69 Who sees or feels a table continuously day after day? 70 If the table is but a name for the experiences in question, if we have no right to infer material things behind and distinct from such experiences, are we not forced to conclude that the existence of the things that we see and feel is an interrupted one?

71 Hume certainly succeeded in raising more questions than he succeeded in answering. 72 We are compelled to admire the wonderful clearness and simplicity of his style, and the acuteness of his intellect, in every chapter. 73 But we cannot help feeling that he does injustice to the world in which we live, even when we cannot quite see what is wrong. 74 Does it not seem certain to science and to common sense that there is an order of Nature in some sense independent of our perceptions, so that objects may be assumed to exist whether we do or do not perceive them? 75 When we read Hume we have a sense that we are robbed of our real external world; and his account of the mind makes us feel as a badly tied sheaf of

wheat may be conceived to feel-- in danger of falling apart at any moment. 76 Berkeley we unhesitatingly call an 'Idealist', but whether we shall apply the name to Hume depends upon the extension we are willing to give to it. 77 His world is a world of what we may broadly call 'ideas'; but the tendencies of his philosophy have led some to call it a 'scepticism'.

THE REVOLT OF "COMMON SENSE."

78 Hume's reasonings were too important to be ignored, and his conclusions too unpalatable to satisfy those who came after him. 79 It seemed necessary to seek a way of escape out of this world of mere ideas, which appeared to be so unsatisfactory a world. 80 One of the most famous of such attempts was that made by the Scotchman Thomas Reid (1710-1796). At one time Reid regarded himself as the disciple of Berkeley, 81 but the consequences which Hume deduced from the principles laid down by the former led Reid to feel that he must build upon some wholly different foundation. 82 He came to the conclusion that the line of philosophers from Descartes to Hume had made one capital error in assuming "that nothing is perceived but what is in the mind that perceives it."

83 Once admit, says Reid, that the mind perceives nothing save ideas, and we must also admit that it is impossible to prove the existence either of an external world or of a mind different from "a bundle of perceptions." 84 Hence, Reid maintains that we perceive-- not infer, but perceive-- 'things' external to the mind. He writes:-- "Let a person press own hand against the table-- 'you feels it hard'. But what is the meaning of this? 85 The meaning undoubtedly is, that he hath a certain feeling of touch, from which he concludes, without any reasoning, or comparing ideas, that there is something external really existing, whose parts stick so firmly together that they cannot be displaced without considerable force.

86 "There is here a feeling, and a conclusion drawn from it, or some way suggested by it. 87 In order to

compare these, we must view them separately, and then consider by what tie they are connected, and wherein they resemble one another. 88 The hardness of the table is the conclusion, the feeling is the medium by which we are led to that conclusion. 89 Let a person attend distinctly to this medium, and to the conclusion, and you will perceive them to be as unlike as any two things in Nature. 90 The one is a sensation of the mind, which can have no existence but in a sentient being; nor can it exist one moment longer than it is felt; 91 the other is in the table, and we conclude, without any difficulty, that it was in the table before it was felt, and continues after the feeling is over. 92 The one implies no kind of extension, nor parts, nor cohesion; the other implies all these. 93 Both, indeed, admit of degrees, and the feeling, beyond a certain degree, is a species of pain; but adamantine hardness does not imply the least pain.

94 "And as the feeling hath no similitude to hardness, so neither can our reason perceive the least tie or connection between them; 95 nor will the logician ever be able to show a reason why we should conclude hardness from this feeling, rather than softness, or any other quality whatsoever. 96 But, in reality, all humankind are led by their constitution to conclude hardness from this feeling."

97 It is well worthwhile to read this extract several times, and to ask oneself what Reid meant to say, and what he actually said. 98 He is objecting, be it remembered, to the doctrine that the mind perceives immediately only its own ideas or sensations and must infer all else. His contention is that we 'perceive' external things. Does he say this? 99 He says that we have feelings of touch 'from which we conclude' that there is something external; that there is a feeling, "'and a conclusion drawn from it, or some way suggested by it';" 100 that "the hardness of the table is the 'conclusion', and the feeling is the 'medium' by which we are 'led to the conclusion'."

101 Could Descartes or Locke have more plainly supported the doctrine of representative perception? How could Reid imagine he was combating that doctrine when he wrote thus?

102 The point in which he differs from them is this: he maintains that we draw the conclusion in question without any reasoning, and, indeed, in the absence of any conceivable reason why we should draw it. We do it instinctively; we are led by the constitution of our nature. 103 In effect Reid says to us: When you lay your hand on the table, you have a sensation, it is true, but you also know the table is hard. How do you know it? 104 I cannot tell you; you simply know it, and cannot help knowing it; and that is the end of the matter.

105 Reid's doctrine was not without its effect upon other philosophers. Among them we must place Sir William Hamilton (1788-1856), whose writings had no little influence upon British philosophy in the last half of the last century. 106 Hamilton complained that Reid did not succeed in being a very good 'Natural Realist', and that he slipped unconsciously into the position he was concerned to condemn. 107 Sir William tried to eliminate this error, but the careful reader of his works will find to his amusement that this learned author gets his feet upon the same slippery descent. 108 And much the same thing may be said of the doctrine of Herbert Spencer (1820-1903), who claims that, when we have a sensation, we know directly that there is an external thing, 109 and then manages to sublimate that external thing into an Unknowable, which we not only do not know directly, but even do not know at all. 110 All of these people were anxious to avoid what they regarded as the perils of Idealism, and yet they seem quite unable to retain a foothold upon the position which they consider the safer one.

111 Reid called his doctrine the philosophy of "Common Sense," and he thought he was coming back from the subtleties of the metaphysicians to the standpoint of the plain human. 112 That he should fall into difficulties and inconsistencies is by no means surprising. As we have seen, the thought of the plain human is far from clear. 113 He certainly believes that we perceive an external world of things, and the inconsistent way in which Descartes and Locke appeal from ideas to the things themselves does

not strike him as unnatural. 114 Why should not a person test own ideas by turning to things and comparing the former with the latter? 115 On the other hand, you knows that to perceive things we must have sense organs and sensations, 116 and you cannot quarrel with the psychologists for saying that we know things only in so far as they are revealed to us through our sensations. 117 How does he reconcile these two positions? He does not reconcile them. He accepts them as they stand.

118 Reid and various other philosophers have tried to come back to "Common Sense" and to stay there. Now, it is a good position to come back to for the purpose of starting out again. 119 The experience of the plain human, the truths which you recognises as truths, these are not things to be despised. 120 Many a person whose mind has been, as Berkeley expresses it, "debauched by learning," has gotten away from them to own detriment, and has said very unreasonable things. 121 But "Common Sense" cannot be the ultimate refuge of the philosopher; it can only serve them as material for investigation. 122 The scholar whose thought is as vague and inconsistent as that of the plain person has little profit in the fact that the apparatus of own learning has made it possible for the self to be ponderously and unintelligibly vague and inconsistent. 123 Hence, we may have the utmost sympathy with Reid's protest against the doctrine of representative perception, 124 and we may, nevertheless, complain that he has done little to explain how it is that we directly know external things and yet cannot be said to know things except in so far as we have sensations or ideas.

THE CRITICAL PHILOSOPHY

125 The German philosopher, Immanuel Kant (1724-1804), was moved, by the sceptical conclusions to which Hume's philosophy seemed to lead, to seek a way of escape, somewhat as Reid was. 126 But he did not take refuge in "Common Sense"; he developed an ingenious doctrine

which has had an enormous influence in the philosophical world, 127 and has given rise to a Kantian literature of such proportions that no person can hope to read all of it, even if you devotes your life to it. 128 In Germany and out of it, it has for a hundred years and more simply rained books, pamphlets, and articles on Kant and his philosophy, some of them good, many of them far from clear and far from original. 129 Hundreds of German university students have taken Kant as the subject of the dissertation by which they hoped to win the degree of Doctor of Philosophy;-- 130 I was lately offered two hundred and seventy-four such dissertations in one bunch;-- and no student is supposed to have even a moderate knowledge of philosophy who has not an acquaintance with that famous work, the "*Critique of Pure Reason*."

131 It is to be expected from the outset that, where so many have found so much to say, there should reign abundant differences of opinion. 132 There are differences of opinion touching the interpretation of Kant, and touching the criticisms which may be made upon, and the development which should be given to his doctrine. 133 It is, of course, impossible to go into all these things here; and I shall do no more than indicate, in untechnical language and in briefest outline, what he offers us in place of the philosophy of Hume. 134 Kant did not try to refute, as did Reid, the doctrine, urged by Descartes and by his successors, that all those things which the mind directly perceives are to be regarded as complexes of ideas. 135 On the contrary, he accepted it, and he has made the words "phenomenon" and "noumenon" household words in philosophy. 136 The world which seems to be spread out before us in space and time is, he tells us, a world of things 'as they are revealed to our senses and our intelligence'; it is a world of manifestations, of phenomena. 137 What things-in-themselves are like we have no means of knowing; we know only things as they appear to us. 138 We may, to be sure, talk of a something distinct from phenomena, a something not

revealed to the senses, but thought of, a 'noumenon'; 139 but we should not forget that this is a negative conception; there is nothing in our experience that can give it a filling, for our experience is only of phenomena. 140 The reader will find an unmistakable echo of this doctrine in Herbert Spencer's doctrine of the "Unknowable" and its "manifestations."

141 Now, Berkeley had called all the things we immediately perceive 'ideas'. As we have seen, he distinguished between "ideas of sense" and "ideas of memory and imagination." 142 Hume preferred to give to these two classes different names-- he called the first 'impressions' and the second 'ideas'. 143 The associations of the word "impression" are not to be mistaken. Locke had taught that between ideas in the memory and genuine sensations there is the difference that the latter are due to the "brisk acting" of objects without us. 144 Objects impress us, and we have sensations or impressions. 145 To be sure, Hume, after employing the word "impression," goes on to argue that we have no evidence that there are external objects, which cause impressions. 146 But he retains the word "impression," nevertheless, and his use of it perceptibly colours his thought.

147 In Kant's distinction between phenomena and noumena we have the lineal descendant of the old distinction between the circle of our ideas and the something outside of them that causes them and of which they are supposed to give information. 148 Hume said we have no reason to believe such a thing exists, but are impelled by our nature to believe in it. 149 Kant is not so much concerned to prove the nonexistence of noumena, things-in-themselves, as he is to prove that the very conception is an empty one. 150 His reasonings seem to result in the conclusion that we can make no intelligible statement about things so cut off from our experience as noumena are supposed to be; 151 and one would imagine that he would have felt impelled to go on to the frank declaration that we have no reason to believe in noumena at all, and had better throw away altogether so meaningless and useless a

notion. 152 But he was a conservative creature, and he did not go quite so far.

153 So far there is little choice between Kant and Hume. Certainly the former does not appear to have rehabilitated the external world which had suffered from the assaults of his predecessors. 154 What important difference is there between his doctrine and that of the man whose sceptical tendencies he wished to combat? 155 The difference is this: Descartes and Locke had accounted for our knowledge of things by maintaining that things act upon us, and make an impression or sensation-- that their action, so to speak, begets ideas. 156 This is a very ancient doctrine as well as a very modern one; it is the doctrine that most people find reasonable even before they devote themselves to the study of philosophy. 157 The totality of such impressions received from the external world, they are accustomed to regard as our 'experience' of external things; 158 and they are inclined to think that any knowledge of external things not founded upon experience can hardly deserve the name of knowledge.

159 Now, Hume, when he cast doubt upon the existence of external things, did not, as I have said above, divest himself of the suggestions of the word "impression." 160 He insists strenuously that all our knowledge is founded upon experience; and he holds that no experience can give us knowledge that is necessary and universal. 161 We know things as they are revealed to us in our experience; but who can guarantee that we may not have new experiences of a quite different kind, 162 and which flatly contradict the notions which we have so far attained of what is possible and impossible, true and untrue. 163 It is here that Kant takes issue with Hume. A survey of our knowledge makes clear, he thinks, that we are in the possession of a great deal of information that is not of the unsatisfactory kind that, according to Hume, all our knowledge of things must be. 164 There, for example, are all the truths of mathematics. When we enunciate a truth regarding the relations of

the lines and angles of a triangle, we are not merely unfolding in the predicate of our proposition what was implicitly contained in the subject. 165 There are propositions that do no more than this; they are 'analytical', 'i.e.' they merely analyse the subject.

166 Thus, when we say: Human is a rational animal, we may merely be defining the word "human"--unpacking it, so to speak. 167 But a 'synthetic' judgment is one in which the predicate is not contained in the subject; it adds to one's information. 168 The mathematical truths are of this character. So also is the truth that everything that happens must have a cause.

169 Do we connect things with one another in this way merely because we have had 'experience' that they are thus connected? 170 Is it because they are 'given' to us connected in this way? 171 That cannot be the case, Kant argues, for what is taken up as mere experienced act cannot be known as universally and necessarily true. 172 We perceive that these things 'must' be so connected. How shall we explain this necessity?

173 We can only explain it, said Kant, in this way: We must assume that what is given us from without is merely the raw material of sensation, the 'matter' of our experience; 174 and that the ordering of this matter, the arranging it into a world of phenomena, the furnishing of 'form', is the work of the mind. 175 Thus, we must think of space, time, causality, and of all other relations which obtain between the elements of our experience, as due to the nature of the mind. 176 It perceives the world of phenomena that it does, because it 'constructs' that world. 177 Its knowledge of things is stable and dependable because it cannot know any phenomenon which does not conform to its laws. 178 The water poured into a cup must take the shape of the cup; and the raw materials poured into a mind must take the form of an orderly world, spread out in space and time.

179 Kant thought that with this turn he had placed human knowledge upon a satisfactory basis, and had, at the same time, indicated the limitations of human knowledge. 180 If the world we perceive is a

world which we make; if the forms of thought furnished by the mind have no other function than the ordering of the materials furnished by sense; then what can we say of that which may be beyond phenomena? What of 'noumena'?
181 It seems clear that, on Kant's principles, we ought not to be able to say anything whatever of 'noumena'. To say that such may exist appears absurd. 182 All conceivable connection between them and existing things as we know them is cut off. 183 We cannot think of a noumenon as a 'substance', for the notions of substance and quality have been declared to be only a scheme for the ordering of phenomena. 184 Nor can we think of one as a cause of the sensations that we unite into a world, for just the same reason. 185 We are shut up logically to the world of phenomena, and that world of phenomena is, after all, the successor of the world of ideas advocated by Berkeley.
186 This is not the place to discuss at length the value of Kant's contribution to philosophy. There is something terrifying in the prodigious length at which it seems possible for people to discuss it. 187 Kant called his doctrine "Criticism," because it undertook to establish the nature and limits of our knowledge. 188 By some he has been hailed as a great enlightener, and by others he has been accused of being as dogmatic in his assumptions as those whom he disapproved. 189 But one thing he certainly has accomplished. He has made the words "phenomena" and "noumena" familiar to us all, 190 and he has induced a vast number of people to accept it as established fact that it is not worthwhile to try to extend our knowledge beyond phenomena. 191 One sees his influence in the writings of people who differ most widely from one another.

REALISM AND IDEALISM
George Stuart Fullerton

REALISM

2 The plain person is a realist. 2 That is to say, you believes in a world which is not to be identified with your own ideas or those of any other mind. 3 At the same

time, as we have seen, the distinction between the mind and the world is by no means clear to you. 4 It is not difficult, by judicious questioning, to set your feet upon the slippery descent that shoots a person into idealism.

5 The vague realism of the plain person may be called 'Naïve' or 'Unreflective Realism'. 6 It has been called by some 'Natural Realism', but the latter term is an unfortunate one. 7 It is, of course, natural for the unreflective person to be unreflective, but, on the other hand, it is also natural for the reflective person to be reflective. 8 Besides, in dubbing any doctrine "natural," we are apt to assume that doctrines contrasted with it may properly be called "unnatural" or "artificial." 9 It is an ancient rhetorical device, to obtain sympathy for a cause in which one may happen to be interested by giving it a taking name; but it is a device frowned upon by logic and by good sense.

10 One kind of realism is, then, naïve realism. It is the position from which we all set out, when we begin to reflect upon the system of things. 11 It is the position to which some try to come back, when their reflections appear to be leading them into strange or unwelcome paths. 12 We have seen how Thomas Reid recoiled from the conclusions to which the reasonings of the philosophers had brought him, and tried to return to the position of the plain person. 13 The attempt was a failure, and was necessarily a failure, for Reid tried to come back to the position of the plain person 'and still be a philosopher'. 14 He tried to live in a cloud and, nevertheless, to see clearly-- a task not easy to accomplish. 15 It should be remarked, however, that he tried, at least, to insist that we know the external world 'directly'.

16 We may divide realists into two broad classes, those who hold to this view, and those who maintain that we know it only indirectly and through our ideas. 17 The plain person belongs, of course, to the first class, if it is just to speak of a person who says inconsistent things as being wholly in any one class. 18 Certainly you are willing to assert that the ground upon which you stands and the staff in your hand are perceived by you

directly. 19 But we are compelled to recognise that there are subdivisions in this first class of realists. 20 Reid tried to place himself beside the plain person and failed to do so. Hamilton tried also, and he is not to be classed precisely either with the plain person or with Reid. 21 He informs us that the object as it appears to us is a composite something to the building up of which the knowing mind contributes its share, the medium through which the object is perceived its share, and the object in itself its share. 22 He suggests, by way of illustration, that the external object may contribute one third. This seems to make, at least, 'something' external directly known. 23 But, on the other hand, he maintains that the mind knows immediately only what is in immediate contact with the bodily organ-- with the eyes, with the hands; 24 and he believes it knows this immediately because it is actually present in all parts of the body. 25 And, further, in distinguishing as he does between existence "as it is in itself" and existence "as it is revealed to us," and in shutting us up to the latter, he seems to rob us even of the modicum of externality that he has granted us.

26 I have already mentioned Herbert Spencer as a man not without sympathy for the attempt to rehabilitate the external world. 27 He is very severe with the "insanities" of idealism. He is not willing even to take the first step toward it. 28 He writes: "The postulate with which metaphysical reasoning sets out is that we are primarily conscious only of our sensations-- 29 that we certainly know we have these, and that if there be anything beyond these serving as cause for them, it can be known only by inference from them. 30 "I shall give much surprise to the metaphysical reader if I call in question this postulate; and the surprise will rise into astonishment if I distinctly deny it. 31 Yet I must do this. Limiting the proposition to those epiperipheral feelings produced in us by external objects 32 for these are alone in question,-- I see no alternative but to affirm that the thing primarily known is not that a sensation has been experienced, but that there exists an outer object."

PERCEPTION

33 According to this, the outer object is not known through an inference; it is known directly. 34 But do not be in haste to class Spencer with the plain person, or with Reid. Listen to a citation once before made, but worth repeating in this connection: 35 "When we are taught that a piece of matter, regarded by us as existing externally, cannot be really known, but that we can know only certain impressions produced on us, 36 we are yet, by the relativity of thought, compelled to think of these in relation to a cause-- the notion of a real existence which generated these impressions becomes nascent. 37 If it be proved that every notion of a real existence which we can frame is inconsistent with itself,-- that matter, however conceived by us, cannot be matter as it actually is,-- our conception, though transfigured, is not destroyed: 38 there remains the sense of reality, dissociated as far as possible from those special forms under which it was before represented in thought."

39 It is interesting to place the two extracts side by side. In the one, we are told that we do not know external objects by an inference from our sensations; 40 in the other we are taught that the piece of matter which we regard as existing externally cannot be really known; 41 that we can know only certain impressions produced on us, and must refer them to a cause; that this cause cannot be what we think it. 42 It is difficult for the person who reads such statements not to forget that Spencer regarded himself as a realist who held to a direct knowledge of something external. 43 There are, as it is evident, many sorts of realists that may be gathered into the first class mentioned above-- people who, however inconsistent they may be, try, at least, to maintain that our knowledge of the external world is a direct one. 44 And it is equally true that there are various sorts of realists that may be put into the second class. These people have been called 'Hypothetical Realists'. 45 In the last chapter it was pointed out that Descartes and Locke belong to this class. Both of these men believed in an external world, but believed that its existence is a thing to be inferred.

PERCEPTION

46 Now, when a person has persuaded the self that the mind can know directly only its own ideas, and must infer the world which they are supposed to represent, you may conceive of that external world in three different ways.

47 (1) You may believe that what corresponds to your idea of a material object, for example, an apple, is in very many respects like the idea in your mind. 48 Thus, you may believe that the odour, taste, colour, hardness, etc., that you perceives directly, or as ideas, have corresponding to them real external odour, taste, colour, hardness, etc. 49 It is not easy for a person to hold to this position, for a very little reflection seems to make it untenable; 50 but it is theoretically possible for one to take it, and probably many persons have inclined to the view when they have first been tempted to believe that the mind perceives directly only its ideas.

51 (2) You may believe that such things as colours, tastes, and odours cannot be qualities of external bodies at all, but are only effects, produced upon our minds by something very different in kind. 52 We seem to perceive bodies, you may argue, to be coloured, to have taste, and to be odourous; but what we thus perceive is not the external thing; 53 the external thing that produces these appearances cannot be regarded as having anything more than "solidity, extension, figure, motion or rest, and number." 54 Thus did Locke reason. To him the external world as it really exists, is, so to speak, a paler copy of the external world as we seem to perceive it. It is a world with fewer qualities, but, still, a world with qualities of some kind.

55 (3) But one may go farther than this. One may say: How can I know that even the extension, number, and motion of the things which I directly perceive have corresponding to them extension, number, and motion, in an outer world? 56 If what is not coloured can cause me to perceive colour, why may not that which is not extended cause me to perceive extension? 57 And, moved by such reflections, one may maintain that there exists outside of us that which we can only characterise as

an Unknown Cause, a Reality which we cannot more nearly define.

58 This last position resembles very closely one side of Spencer's doctrine-- that represented in the last of the two citations, as the reader can easily see. 59 It is the position of the follower of Immanuel Kant who has not yet repudiated the noumenon or thing-in-itself discussed earlier. 60 I am not concerned to defend any one of the varieties of Direct or of Hypothetical Realism portrayed above. 61 But I wish to point out that they all have some sort of claim to the title 'Realism', and to remind the reader that, when we call a person a realist, we do not do very much in the way of defining their position. 62 If this last variety, which I advocate, 'must' be classified, let it be placed in the first broad class, for it teaches that we know the external world directly. 63 But I sincerely hope that it will not be judged wholly by the company it keeps, and that no one will assign to it either virtues or defects to which it can lay no just claim.

64 Before leaving the subject of realism it is right that I should utter a note of warning touching one very common source of error. 65 It is fatally easy for people to be misled by the names which are applied to things. 66 Sir William Hamilton invented for a certain type of metaphysical doctrine the offensive epithet "nihilism." It is a type which appeals to many inoffensive and pious people at the present day, some of whom prefer to call themselves idealists. 67 Many have been induced to become "free-willists" because the name has suggested to them a proper regard for that freedom which is justly dear to all people. 68 We can scarcely approach with an open mind an account of ideas and sensations which we hear described as "sensationalism," or worse yet, as "sensualism." 69 When a given type of philosophy is set down as "dogmatism," we involuntarily feel a prejudice against it. 70 You who reads as reflectively as you should will soon find out that philosophers "call names" much as other people do, and that one should always be on one's guard. 71 "Every form of

phenomenalism," asseverated a learned and energetic old gentleman, who for many years occupied a chair in one of our leading institutions of learning, "necessarily leads to atheism." 72 He inspired a considerable number of students with such a horror for "phenomenalism" that they never took pains to find out what it was. 73 I mention these things in this connection, because I suspect that not a few in our own day are unduly influenced by the associations which cling to the words "realism" and "idealism." 74 Realism in literature, as many persons understand it, means the degradation of literature to the portrayal of what is coarse and degrading, in a coarse and offensive way. 75 Realism in painting often means the labourious representation upon canvas of things from which we would gladly avert our eyes if we met them in real life. 76 With the word "idealism," on the other hand, we are apt to connect the possession of ideals, a regard for what is best and noblest in life and literature.

77 The reader must have seen that realism in the philosophic sense of the word has nothing whatever to do with realism in the senses just mentioned. 78 The word is given a special meaning, and it is a weakness to allow associations drawn from other senses of the word to colour our judgment when we use it. 79 And it should be carefully held in view that the word "idealism" is given a special sense when it is used to indicate a type of doctrine contrasted with the doctrine of the realist. 80 Some forms of philosophical idealism have undoubtedly been inspiring; but some have been, and are, far from inspiring. 81 They should not be allowed to posture as saints merely because they are cloaked with an ambiguous name.

IDEALISM

82 Idealism we may broadly define as the doctrine that all existence is mental existence. 83 So far from regarding the external world as beyond and independent of mind, it maintains that it can have its being only in consciousness.

PERCEPTION

84 We have seen how people were led to take the step to idealism. It is not a step which the plain person is impelled to take without preparation. 85 To say that the real world of things in which we perceive ourselves to live and move is a something that exists only in the mind strikes you as little better than insane. 86 You who becomes an idealist usually does so, I think, after weighing the arguments presented by the hypothetical realist, and finding that they seem to carry one farther than the latter appears to recognise.

87 The type of idealism represented by Berkeley has been called 'Subjective Idealism'. 88 Ordinarily our use of the words "subjective" and "objective" is to call attention to the distinction between what belongs to the mind and what belongs to the external order of things. 89 My sensations are subjective, they are referred to my mind, and it is assumed that they can have no existence except in my mind; 90 the qualities of things are regarded as objective, that is, it is commonly believed that they exist independently of my perception of them. 91 Of course, when a person becomes an idealist, you cannot keep just this distinction. The question may, then, fairly be raised: How can you be a 'subjective idealist'? Has not the word "subjective" lost its significance? 92 To this one has to answer: It has, and it has not. 93 The man who, with strict consistency, makes the desk at which he sits as much his "idea" as is the pain in his finger or his memory of yesterday, cannot keep hold of the distinction of subjective and objective. 94 But humans are not always as consistent as this. 95 Remember the illustration of the "telephone exchange".The mind is represented as situated at the brain terminals of the sensory nerves; and then brain, nerves and all else are turned into ideas in this mind, which are merely "projected outwards." 96 Now, in placing the mind at a definite location in the world, and contrasting it with the world, we retain the distinction between subjective and objective-- what is in the mind can be distinguished from what is beyond it. 97 On the other hand, in making the whole

system of external things a complex of ideas in the mind, we become idealists, and repudiate realism. 98 The position is an inconsistent one, of course, but it is possible for people to take it, for people have taken it often enough.

99 The idealism of Professor Pearson is more palpably subjective than that of Berkeley, for the latter never puts the mind in a "telephone exchange." 100 Nevertheless, he names the objects of sense, which other people call material things, "ideas," and he evidently assimilates them to what we commonly call ideas and contrast with things. 101 Moreover, he holds them in some of the contempt which people reserve for "mere ideas," for he believes that idolaters might be induced to give over worshiping the heavenly bodies could they be persuaded that these are nothing more than their own ideas.

102 With the various forms of subjective idealism it is usual to contrast the doctrine of 'Objective Idealism'. 103 This does not maintain that the world which I perceive is my "idea"; it maintains that the world is "idea." 104 It is rather a nice question, and one which no person should decide without a careful examination of the whole matter, whether we have any right to retain the word "idea" when we have rubbed out the distinction which is usually drawn between ideas and external things. 105 If we maintain that all humans are always necessarily selfish, we stretch the meaning of the word quite beyond what is customary, and selfishness becomes a thing we have no reason to disapprove, since it characterises saint and sinner alike. 106 Similarly, if we decide to name "idea," not only what the plain person and the realist admit to have a right to that name, but also the great system which these people call an external material world, it seems right to ask; Why use the word "idea" at all? 107 What does it serve to indicate? Not a distinction, surely, for the word seems to be applicable to all things without distinction. 108 Such considerations as these lead me to object to the expression "objective idealism": if the doctrine is really 'objective', 'i.e.' 109 if it recognises a system of things different and

distinct from what people commonly call ideas, it scarcely seems to have a right to the title 'idealism'; 110 and if it is really 'idealism', and does not rob the word idea of all significance, it can scarcely be 'objective' in any proper sense of the word.

111 Manifestly, there is need of a very careful analysis of the meaning of the word "idea," and of the proper significance of the terms "subjective" and "objective," if error is to be avoided and language used soberly and accurately. 112 Those who are not in sympathy with the doctrine of the objective idealists think that in such careful analysis and accurate statement they are rather conspicuously lacking.

113 We think of Hegel (1770-1831) as the typical objective idealist. 114 It is not easy to give an accurate account of his doctrine, for he is far from a clear writer, and he has made it possible for his many admirers to understand him in many ways. 115 But he seems to have accepted the system of things that most people call the real external world, and to have regarded it as the Divine Reason in its self-development. 116 And most of those whom we would to-day be inclined to gather together under the title of objective idealists appear to have been much influenced, directly or indirectly, by his philosophy. 117 There are, however, great differences of opinion among them, and no person should be made responsible for the opinions of the class as a class.

118 I have said a few pages back that some forms of idealism are inspiring, and that some are not. 119 Bishop Berkeley called the objects of sense ideas. He regarded all ideas as inactive, and thought that all changes in ideas-- and this includes all the changes that take place in Nature-- must be referred to the activity of minds. 120 Some of those changes he could refer to finite minds, his own and others. Most of them he could not, and he felt impelled to refer them to a Divine Mind. 121 Hence, the world became to him a constant revelation of God; and he uses the word "God" in no equivocal sense. 122 It does not signify to him the system of things as a whole, or an Unknowable, or anything of the

sort. It signifies a spirit akin to his own, but without its limitations. 123 He writes:-- "A human spirit or person is not perceived by sense, as not being an idea; when, therefore, we see the colour, size, figure, and motions of a person, we perceive only certain sensations or ideas excited in our own minds; 124 and these being exhibited to our view in sundry distinct collections serve to mark out unto us the existence of finite and created spirits like ourselves. 125 Hence, it is plain we do not see a person,-- if by 'human' is meant that which lives, moves, perceives, and thinks as we do,-- 126 but only such a certain collection of ideas as directs us to think there is a distinct principle of thought and motion, like to ourselves, accompanying and represented by it. 127 And after the same manner we see God; all the difference is that, whereas some one finite and narrow assemblage of ideas denotes a particular human mind, whithersoever we direct our view, we do at all times and in all places perceive manifest tokens of the Divinity-- 128 everything we see, hear, feel, or any wise perceive by sense, being a sign or effect of the power of God; as is our perception of those very motions which are produced by humans."

129 With Berkeley's view of the world as a constant revelation of God, many people will sympathise who have little liking for his idealism as idealism. 130 They may criticise in detail his arguments to prove the nonexistence of a genuinely external world, but they will be ready to admit that his doctrine is an inspiring one in the view that it takes of the world and of human. 131 With this I wish to contrast the doctrine of another idealist, Mr. Bradley, whose work, "Appearance and Reality," has been much discussed in the last few years, in order that the reader may see how widely different forms of idealism may differ from each other, 132 and how absurd it is to praise or blame a person's philosophy merely on the ground that it is idealistic. 133 Mr. Bradley holds that those aspects of our experience which we are accustomed to regard as real-- 134 qualities of things, the relations between things, the things

themselves, space, time, motion, causation, activity, the self-- 135 turn out when carefully examined to be self-contradictory and absurd. They are not real; they are unrealities, mere appearances. 136 But these appearances exist, and, hence, must belong to reality. This reality must be sentient, for "there is no being or fact outside of that which is commonly called psychical existence."

137 Now, what is this reality with which appearances-- the whole world of things which seem to be given in our experience-- are contrasted? 138 Mr. Bradley calls it the Absolute, and indicates that it is what other people recognise as the Deity. How shall we conceive it? 139 We are told that we are to conceive it as consisting of the contents of finite minds, or "centers of experience," subjected to "an all-pervasive transfusion with a reblending of all material." 140 In the Absolute, finite things are "transmuted" and lose "their individual natures." 141 What does this mean in plain language? It means that there are many finite minds of a higher and of a lower order, "centers of experience," and that the contents of these are unreal appearances. 142 There is not a God or Absolute outside of and distinct from these, but rather one that in some sense 'is their reality'. 143 This mass of unrealities transfused and transmuted so that no one of them retains its individual nature is the Absolute. 144 That is to say, time must become indistinguishable from space, space from motion, motion from the self, the self from the qualities of things, etc., before they are fit to become constituents of the Absolute and to be regarded as real.

145 As the reader has seen, this Absolute has nothing in common with the God in which Berkeley believed, and in which the plain person usually believes. 146 It is the night in which all cats are gray, and there appears to be no reason why any one should harbour toward it the least sentiment of awe or veneration. 147 Whether such reasonings as Mr. Bradley's should be accepted as valid or should not, must be decided after a careful examination into the foundations upon which they rest and the consistency with which

inferences are drawn from premises. 148 I do not wish to prejudge the matter. But it is worthwhile to set forth the conclusions at which he arrives, 149 that it may be clearly realised that the associations which often hang about the word "idealism" should be carefully stripped away when we are forming our estimate of this or that philosophical doctrine.

MONISM AND DUALISM

George Stuart Fullerton

THE MEANING OF THE WORDS

3 In common life people distinguish between minds and material things, thus dividing the things, which taken together make up the world as we know it, into two broad classes. 2 They think of minds as being very different from material objects, and of the latter as being very different from minds. 3 It does not occur to them to find in the one class room for the other, nor does it occur to them to think of both classes as "manifestations" or "aspects" of some one "underlying reality." 4 In other words, the plain person to-day is a 'Dualist'.

5 In the last chapter, I have called you a Naïve Realist; and here I shall call you a 'Naïve Dualist', 6 for a person may regard mind and matter as quite distinct kinds of things, without trying to elevate own opinion, through reflection, into a philosophical doctrine. 7 The reflective person may stand by the opinion of the plain person, merely trying to make less vague and indefinite the notions of matter and of mind. You then becomes a 'Philosophical Dualist'. 8 There are several varieties of this doctrine, and I shall consider them a little later. 9 But it is possible for one to be less profoundly impressed by the differences which characterise matter and mind. 10 One may feel inclined to refer mental phenomena to matter, and to deny them the prominence accorded them by the dualist. 11 On the other hand, one may be led by one's reflections to resolve material objects into mere ideas, and to claim that they can have no existence except in a mind. 12 Finally, it is possible to hold that

both minds and material things, as we know them, are only manifestations, phenomena, and that they must be referred to an ulterior "reality" or "substance." 13 One may claim that they are "aspects" of the one reality, which is neither matter nor mind.

14 These doctrines are different forms of 'Monism'. In whatever else they differ from one another, they agree in maintaining that the universe does not contain two kinds of things fundamentally different. 15 Out of the duality of things as it seems to be revealed to the plain person they try to make some kind of a unity.

MATERIALISM

16 The first of the forms of monism above mentioned is 'Materialism'. It is not a doctrine to which the first impulse of the plain person leads one at the present time. 17 Even those who have done no reading in philosophy have inherited many of their ways of looking at things from the thinkers who lived in the ages past, and whose opinions have become the common property of civilised people. 18 For more than two thousand years the world and the mind have been discussed, and it is impossible for any of us to escape from the influence of those discussions and to look at things with the primitive simplicity of the wholly untutored. But it was not always so. 19 There was a time when people who were not savages, but possessed great intellectual vigour and much cultivation, found it easy and natural to be materialists. 20 This I have spoken of before, but it will repay us to take up again a little more at length the clearest of the ancient forms of materialism, that of the Atomists, and to see what may be said for and against it.

21 Democritus of Abdera taught that nothing exists except atoms and empty space. 22 The atoms, he maintained, differ from one another in size, shape, and position. In other respects they are alike. 23 They have always been in motion. Perhaps he conceived of that motion as originally a fall through space, but there seems to be uncertainty upon this point. 24 However, the atoms in motion

collide with one another, and these collisions result in mechanical combinations from which spring into being world-systems. 25 According to this doctrine, nothing comes from nothing, and nothing can become nonexistent. 26 All the changes which have ever taken place in the world are only changes in the position of material particles-- they are regroupings of atoms. 27 We cannot directly perceive them to be such, for our senses are too dull to make such fine observations, but our reason tells us that such is the case.

28 Where, in such a world as this, is there room for mind, and what can we mean by mind? 29 Democritus finds a place for mind by conceiving it to consist of fine, smooth, round atoms, which are the same as the atoms which constitute fire. 30 These are distributed through the whole body, and lie among the other atoms which compose it. They are inhaled with and exhaled into the outer air. 31 While they are in the body their functions are different according as they are located in this organ or in that. 32 In the brain they give rise to thought, in the heart to anger, and in the liver to desire.

33 I suppose no one would care, at the present time, to become a Democritean. 34 The "Reason," which tells us that the mind consists of fine, round atoms, appears to have nothing but its bare word to offer us. 35 But, apart from this, a peculiar difficulty seems to face us; even supposing there are atoms of fire in the brain, the heart, and the liver, what are the 'thought', 'anger', and 'desire', of which mention is made? 36 Shall we conceive of these last as atoms, as void space, or as the motion of atoms? 37 There really seems to be no place in the world for them, and 'these are the mind so far as the mind appears to be revealed'-- they are 'mental phenomena'. 38 It does not seem that they are to be identified with anything that the Atomistic doctrine admits as existing. They are simply overlooked.

39 Is the modern materialism more satisfactory? About half a century ago there was in the scientific world something like a revival of materialistic thinking. 40 It did not

occur to any one to maintain that the mind consists of fine atoms disseminated through the body, but statements almost as crude were made. 41 It was said, for example, that the brain secretes thought as the liver secretes bile. 42 It seems a gratuitous labour to criticise such statements as these in detail. 43 There are no glands the secretions of which are not as unequivocally material as are the glands themselves. 44 This means that such secretions can be captured and analysed; the chemical elements of which they are composed can be enumerated. 45 They are open to inspection in precisely the same way as are the glands which secrete them.

46 Does it seem reasonable to maintain that thoughts and feelings are related to brains in this way? 47 Does the chemist ever dream of collecting them in a test tube, and of drawing up for us a list of their constituent elements? 48 When the brain is active, there are, to be sure, certain material products which pass into the blood and are finally eliminated from the body; 49 but among these products no one would be more surprised than the materialist to discover pains and pleasures, memories and anticipations, desires and volitions. 50 This talk of thought as a "secretion" we can afford to set aside. 51 Nor need we take much more seriously the seemingly more sober statement that thought is a "function" of the brain.

52 There is, of course, a sense in which we all admit the statement; minds are not disembodied, and we have reason to believe that mind and brain are most intimately related. 53 But the word "function" is used in a very broad and loose sense when it serves to indicate this relation; and one may employ it in this way without being a materialist at all. 54 In a stricter sense of the word, the brain has no functions that may not be conceived as mechanical changes,-- as the motion of atoms in space,-- and to identify mental phenomena with these is inexcusable. 55 It is not theoretically inconceivable that, with finer senses, we might directly perceive the motions of the atoms in another human's brain; 56 it is inconceivable that we should thus directly perceive

your melancholy or your joy; they belong to another world.

SPIRITUALISM

57 The name 'Spiritualism' is sometimes given to the doctrine that there is no existence which we may not properly call mind or spirit. It errs in the one direction as materialism errs in the other. 58 One must not confound with this doctrine that very different one, Spiritism, which teaches that a certain favoured class of persons called mediums may bring back the spirits of the departed and enable us to hold communication with them. 59 Such beliefs have always existed among the common people, but they have rarely interested philosophers. I shall have nothing to say of them in this book. 60 There have been various kinds of spiritualists. The name may be applied to the idealists, from Berkeley down to those of our day; at some of the varieties of their doctrine we have taken a glance. 61 To these we need not recur; but there is one type of spiritualistic doctrine which is much discussed at the present day and which appears to appeal strongly to a number of scientific people. We must consider it for a moment.

62 We have examined Professor Clifford's doctrine of Mind-stuff. Clifford maintained that all the material things we perceive are our perceptions-- they are in our consciousness, and are not properly external at all. 63 But, believing, as he did, that all Nature is animated, he held that every material thing, every perception, may be taken as a revelation of something not in our consciousness, of a mind or, at least, of a certain amount of mind-stuff. 64 How shall we conceive the relation between what is in our mind and the something corresponding to it not in our mind? 65 We must, says Clifford, regard the latter as the 'reality' of which the former is the 'appearance' or 'manifestation'. 66 "What I perceive as your brain is really in itself your consciousness, is You; but then that which I call your brain, the material fact, is merely my perception."

67 This doctrine is 'Panpsychism', in the form in which it is usually brought to our attention. 68 It holds that the only real existences are minds, and that physical phenomena must be regarded as the manifestations under which these real existences make us aware of their presence. 69 The term panpsychism may, it is true, be used in a somewhat different sense. It may be employed merely to indicate the doctrine that all Nature is animated, and without implying a theory as to the relation between bodies perceived and the minds supposed to accompany them. 70 What shall we say to panpsychism of the type represented by Clifford? It is, I think, sufficiently answered in the earlier chapters of this volume:--

71 (1) If I call material facts my perceptions, I do an injustice to the distinction between the physical and the mental. 72 (2) If I say that all Nature is animated, I extend illegitimately the argument for other minds. 73 (3) If I say that mind is the reality of which the brain is the appearance, I misconceive what is meant by the distinction between appearance and reality.

THE DOCTRINE OF THE ONE SUBSTANCE

74 In the seventeenth century Descartes maintained that, although mind and matter may justly be regarded as two substances, yet it should be recognised that they are not really independent substances in the strictest sense of the word, 75 but that there is only one substance, in this sense, and mind and matter are, as it were, its attributes. 76 His thought was that by attribute we mean that which is not independent, but must be referred to something else; 77 by substance, we mean that which exists independently and is not referred to any other thing. 78 It seemed to follow that there could be only one substance.

79 Spinoza modified Descartes' doctrine in that he refused to regard mind and matter as substances at all. 80 He made them unequivocally attributes of the one and only substance, which he called God. 81 The thought which

influenced Spinoza had impressed many minds before his time, and it has influenced many since. 82 One need not follow him in naming the unitary something to which mind and matter are referred substance. 83 One may call it Being, or Reality, or the Unknowable, or Energy, or the Absolute, or, perhaps, still something else. 84 The doctrine has taken many forms, but you who reads with discrimination will see that the various forms have much in common.

85 They agree in maintaining that matter and mind, as they are revealed in our experience, are not to be regarded as, in the last analysis, two distinct kinds of thing. 86 They are, rather, modes or manifestations of one and the same thing, and this is not to be confounded with either. 87 Those who incline to this doctrine take issue with the materialist, who assimilates mental phenomena to physical; and they oppose the idealist, who assimilates physical phenomena to mental, and calls material things "ideas." 88 We have no right, they argue, to call that of which ideas and things are manifestations either mind or matter. It is to be distinguished from both.

89 To this doctrine the title of 'Monism' is often appropriated. In this chapter I have used the term in a broader sense, for both the materialist and the spiritualist maintain that there is in the universe but one kind of thing. 90 Nevertheless, when we hear a person called a monist without qualification, we may, perhaps, be justified in assuming, in the absence of further information, that you holds to some one of the forms of doctrine indicated above. 91 There may be no logical justification for thus narrowing the use of the term, but logical justification goes for little in such matters. 92 Various considerations have moved people to become monists in this sense of the word. Some have been influenced by the assumption-- one which people felt impelled to make early in the history of speculative thought-- 93 that the whole universe must be the expression of some unitary principle. 94 A rather different argument is well illustrated in the writings of Professor Höffding, a

learned and acute writer of our own time. It has influenced so many that it is worthwhile to delay upon it.

95 Professor Höffding holds that mental phenomena and physical phenomena must be regarded as parallel, and that we must not conceive of ideas and material things as interacting. He writes: 96 [1]-- "If it is contrary to the doctrine of the persistence of physical energy to suppose a transition from the one province to the other, and if, nevertheless, the two provinces exist in our experience as distinct, 97 then the two sets of phenomena must be unfolded simultaneously, each according to its laws, so that for every phenomenon in the world of consciousness there is a corresponding phenomenon in the world of matter, 98 and conversely-- so far as there is reason to suppose that conscious life is correlated with material phenomena.

99 The parallels already drawn point directly to such a relation; it would be an amazing accident, if, while the characteristic marks repeated themselves in this way, there were not at the foundation an inner connection. 100 Both the 'parallelism' and the 'proportionality' between the activity of consciousness and cerebral activity point to an 'identity' at bottom. 101 The difference which remains in spite of the points of agreement compels us to suppose that one and the same principle has found its expression in a double form. 102 We have no right to take mind and body for two beings or substances in reciprocal interaction. 103 We are, on the contrary, impelled to conceive the material interaction between the elements composing the brain and nervous system 'as an outer form of the inner ideal unity of consciousness'. 104 What we in our inner experience become conscious of as thought, feeling, and resolution, is thus represented in the material world by certain material processes of the brain, which as such are subject to the law of the persistence of energy, 105 although this law cannot be applied to the relation between cerebral and conscious processes. It is as though the same thing were said in two languages."

PERCEPTION

106 Some monists are in the habit of speaking of the one Being to which they refer phenomena of all sorts as the "Absolute." 107 The word is a vague one, and means very different things in different philosophies. It has been somewhat broadly defined as "the ultimate principle of explanation of the universe." 108 You who turns to one principle of explanation will conceive the Absolute in one way, and you who turns to another will, naturally, understand something else by the word. 109 Thus, the idealist may conceive of the Absolute as an all-inclusive Mind, of which finite minds are parts. 110 To Spencer, it is the Unknowable, a something behind the veil of phenomena. 111 Sometimes it means to a writer much the same thing that the word God means to other people; sometimes it has a significance at the farthest remove from this. 112 Indeed, the word is so vague and ambiguous, and has proved itself the mother of so many confusions, that it would seem a desirable thing to drop it out of philosophy altogether, and to substitute for it some less ambiguous expression.

113 It seems clear from the preceding pages, that, before one either accepts or rejects monism, one should very carefully determine just what one means by the word, and should scrutinise the considerations which may be urged in favour of the particular doctrine in question. 114 There are all sorts of monism, and people embrace them for all sorts of reasons. Let me beg the reader to bear in mind;--

115 (1) The monist may be a materialist; you may be an idealist; you may be neither. 116 In the last case, you may, with Spinoza, call the one Substance God; that is, you may be a Pantheist. 117 On the other hand, you may, with Spencer, call it the Unknowable, and be an Agnostic. 118 Other shades of opinion are open to you, if you cares to choose them.

119 (2) It does not seem wise to assent hastily to such statements as; "The universe is the manifestation of one unitary Being"; or: "Mind and matter are the expression of one and the same principle." 120 We find revealed in our experience mental phenomena and physical phenomena. In what

sense they are one, or whether they are one in any sense,-- 121 this is something to be determined by an examination of the phenomena and of the relations in which we find them. 122 It may turn out that the universe is one only in the sense that all phenomena belong to the one orderly system. 123 If we find that this is the case, we may still, if we choose, call our doctrine monism, but we should carefully distinguish such a monism from those represented by Höffding and Spencer and many others. 124 There seems little reason to use the word, when the doctrine has been so far modified.

DUALISM

125 The plain person finds the self in a world of physical things and of minds, and it seems to you that your experience directly testifies to the existence of both. 126 This means that the things of which you have experience appear to belong to two distinct classes. 127 It does not mean, of course, that you have only two kinds of experiences. The phenomena which are revealed to us are indefinitely varied; all physical phenomena are not just alike, and all mental phenomena are not just alike.

128 Nevertheless, amid all the bewildering variety that forces itself upon our attention, there stands out one broad distinction, that of the physical and the mental. 129 It is a distinction that the person who has done no reading in the philosophers is scarcely tempted to obliterate; 130 to you the world consists of two kinds of things widely different from each other; minds are not material things and material things are not minds. 131 We are justified in regarding this as the opinion of the plain person even when we recognise that, in your endeavour to make clear to yourself what you means by minds, you sometimes speaks as though you were talking about something material or semi-material.

132 Now, the materialist allows these two classes to run together; so does the idealist. The one says that everything is matter; the other, that everything is mind. 133 It would be foolish to maintain that nothing can be said for either

doctrine, for people of ability have embraced each. 134 But one may at least say that both seem to be refuted by our common experience of the world, an experience which, so far as it is permitted to testify at all, lifts up its voice in favour of 'Dualism'.

135 Dualism is sometimes defined as the doctrine that there are in the world two kinds of substances, matter and mind, which are different in kind and should be kept distinct. 136 There are dualists who prefer to avoid the use of the word substance, and to say that the world of our experiences consists of physical phenomena and of mental phenomena, and that these two classes of facts should be kept separate. 137 The dualist may maintain that we have a direct knowledge of matter and of mind, and you may content yourself with such a statement, doing little to make clear what we mean by matter and by mind. 138 In this case, your position is little different from that of the plain person who does not attempt to philosophise. Thomas Reid, belongs to this class. 139 On the other hand, the dualist may attempt to make clear, through philosophical reflection, what we mean by the matter and mind which experience seems to give us. He may conclude:--

140 (1) That you must hold, as did Sir William Hamilton, that we perceive directly only physical and mental phenomena, 141 but are justified in inferring that, since the phenomena are different, there must be two kinds of underlying substances to which the phenomena are referred. 142 Thus, you may distinguish between the two substances and their manifestations, as some monists distinguish between the one substance and its manifestations.

143 (2) Or you may conclude that it is futile to search for substances or realities of any sort 'behind' phenomena, arguing that such realities are never revealed in experience, and that no sound reason for their assumption can be adduced. 144 In this case, you may try to make plain what mind and matter are, by simply analysing our experiences of mind and matter and coming to a clearer comprehension of their nature.

PERCEPTION

145 As the reader has probably remarked, the philosophy presented in the earlier chapters of this book is 'dualistic' as well as 'realistic'. 146 That is to say, it refuses to rub out the distinction between physical phenomena and mental phenomena, either by dissolving the material world into ideas; 147 by calling ideas secretions or functions of the brain; or by declaring them one in a fictitious entity behind the veil and not supposed to be exactly identical with either. 148 And as it teaches that the only reality that it means anything to talk about must be found in experience, it is a dualism of the type described in the paragraph which immediately precedes.

149 Such a philosophy does not seem to do violence to the common experience of minds and of physical things shared by us all, whether we are philosophers or are not. 150 It only tries to make clear what we all know dimly and vaguely. This is, I think, a point in its favour. 151 However, people of great ability and of much learning have inclined to doctrines very different; and we have no right to make up our minds on such a subject as this without trying to give them an attentive and an impartial hearing.

SINGULAR ISM AND PLURALISM

152 There are those who apply to the various forms of monism the title 'Singularism', and who contrast with this 'Pluralism', 153 a word which is meant to cover the various doctrines which maintain that there is more than one ultimate principle or being in the universe. 154 It is argued that we should have some word under which we may bring such a doctrine, for example, as that of the Greek philosopher Empedocles (born about 490 B.C.). 155 This thinker made earth, water, fire, and air the four material principles or "roots" of things. He was not a monist, and we can certainly not call him a dualist.

156 Again. The term pluralism has been used to indicate the doctrine that individual finite minds are not parts or manifestations of one all-embracing Mind,-- of God or the

Absolute,-- but are relatively independent beings. 157 This doctrine has been urged in our own time, with eloquence and feeling, by Professor Howison. 158 Here we have a pluralism which is idealistic, for it admits in the universe but one 'kind' of thing, minds; and yet refuses to call itself monistic. 159 It will readily be seen that in this paragraph and in the one preceding the word is used in different senses.

160 I have added the above sentences to this chapter that the reader may have an explanation of the meaning of a word sometimes met with. 161 But the title of the chapter is "Monism and Dualism," and it is of this contrast that it is especially important to grasp the significance.

RATIONALISM, EMPIRICISM, CRITICISM, AND CRITICAL EMPIRICISM

George Stuart Fullerton

RATIONALISM

4 As the content of a philosophical doctrine must be determined by the 'initial assumptions' which a philosopher makes and by the 'method' which you adopts in your reasonings, 2 it is well to examine with some care certain broad differences in this respect which characterise different philosophers, and which help to explain how it is that the results of their reflections are so startlingly different. 3 I shall first speak of 'Rationalism', which I may somewhat loosely define as the doctrine that the reason can attain truths independently of observation-- 4 can go beyond experienced fact and the deductions which experience seems to justify us in making from experienced fact. 5 The definition cannot mean much to us until it is interpreted by a concrete example, and I shall turn to such. 6 It must, however, be borne in mind that the word "rationalism" is meant to cover a great variety of opinions, and we have said comparatively little about you when we have called a person a rationalist in philosophy. 7 People may agree in believing that the reason can go beyond experienced fact, and yet may differ regarding the particular truths which may be thus attained.

8 Now, when Descartes found himself discontented with the philosophy that he and others had inherited from the Middle Ages, and undertook a reconstruction, 9 he found it necessary to throw over a vast amount of what had passed as truth, if only with a view to building up again upon a firmer foundation. 10 It appeared to him that much was uncritically accepted as true in philosophy and in the sciences which a little reflection revealed to be either false or highly doubtful. 11 Accordingly, he decided to clear the ground by a sweeping doubt, and to begin his task quite independently. 12 In accordance with this principle, he rejected the testimony of the senses touching the existence of a world of external things. 13 Do not the senses sometimes deceive us? 14 And, since humans seem to be liable to error in their reasonings, even in a field so secure as that of mathematical demonstration, you resolved further to repudiate all the reasonings you had heretofore accepted. 15 You would not even assume yourself to be in your right mind and awake; might you not be the victim of a diseased fancy, or a person deluded by dreams? 16 Could anything whatever escape this all-devouring doubt? One truth seemed unshakable: your own existence, at least, emerged from this sea of uncertainties. 17 I may be deceived in thinking that there is an external world, and that I am awake and really perceive things; but I surely cannot be deceived unless I exist.

18 'Cogito, ergo sum'-- I think, hence I exist; this truth Descartes accepted as the first principle of the new and sounder philosophy which he sought. 19 As we read farther in Descartes we discover that he takes back again a great many of those things that he had at the outset rejected as uncertain. 20 Thus, he accepts an external world of material things. How does he establish its existence? 21 He cannot do it as the empiricist does it, by a reference to experienced fact, for he does not believe that the external world is directly given in our experience. 22 He thinks we are directly conscious only of our 'ideas' of it, and must somehow prove that it exists over against our ideas. 23 By his principles,

Descartes is compelled to fall back upon a curious roundabout argument to prove that there is a world. 24 He must first prove that God exists, and then argue that God would not deceive us into thinking that it exists when it does not.

25 Now, when we come to examine Descartes' reasonings in detail we find what appear to us some very uncritical assumptions. Thus, he proves the existence of God by the following argument:--

26 I exist, and I find in me the idea of God; of this idea I cannot be the author, for it represents something much greater than I, and its cause must be as great as the reality it represents. 27 In other words, nothing less than God can be the cause of the idea of God which I find in me, and, hence, I may infer that God exists.

28 Where did Descartes get this notion that every idea must have a cause which contains as much external reality as the idea does represented reality? 29 How does he prove his assumption? He simply appeals to what he calls "the natural light," which is for him a source of all sorts of information which cannot be derived from experience. 30 This "natural light" furnishes him with a vast number of "eternal truths", these he has not brought under the sickle of his sweeping doubt, and these help him to build up again the world he has overthrown, beginning with the one indubitable fact discussed above.

31 To the people of a later time many of Descartes' eternal truths are simply inherited philosophical prejudices, the results of the reflections of earlier thinkers, and in sad need of revision. I shall not criticise them in detail. 32 The important point for us to notice is that we have here a type of philosophy which depends upon truths revealed by the reason, independently of experience, to carry one beyond the sphere of experience. 33 I again remind the reader that there are all sorts of rationalists, in the philosophical sense of the word. Some trust the power of the unaided reason without reserve. 34 Thus Spinoza, the pantheist, made the magnificent but misguided attempt to deduce the whole system of things physical and things mental

from what he called the attributes of God, Extension and Thought. 35 On the other hand, one may be a good deal of an empiricist, and yet something of a rationalist, too.

36 Thus Professor Strong, in his recent brilliant book, "*Why the Mind has a Body*," maintains that we know intuitively that other minds than our own exist; 37 know it without gathering our information from experience, and without having to establish the fact in any way. 38 This seems, at least, akin to the doctrine of the "natural light," and yet no one can say that Professor Strong does not, in general, believe in a philosophy of observation and experiment.

EMPIRICISM

39 I suppose every one who has done some reading in the history of philosophy will, if your mother tongue be English, think of the name of John Locke when empiricism is mentioned. 40 Locke, in his "*Essay concerning Human Understanding*," undertakes "to inquire into the original, certainty, and extent of human knowledge, together with the grounds and degrees of belief, opinion, and assent." 41 His sober and cautious work, which was first published in 1690, was peculiarly English in character; and the spirit which it exemplifies animates also Locke's famous successors, George Berkeley (1684-1753), David Hume (1711-1776), and John Stuart Mill (1806-1873). 42 Although Locke was a realist, Berkeley an idealist, Hume a sceptic, and Mill what has been called a sensationalist; yet all were empiricists of a sort, and emphasised the necessity of founding our knowledge upon experience.

43 Now, Locke was familiar with the writings of Descartes, whose work he admired, but whose rationalism offended him. 44 The first book of the "Essay" is devoted to the proof that there are in the mind of human no "innate ideas" and no "innate principles." 45 That is to say, Locke tries to show that one must not seek, in the "natural light" to which Descartes turned, a distinct and independent source of information, 46 "Let us, then," he continues, "suppose the

mind to be, as we say, white paper, void of all characters, without any ideas; how comes it to be furnished? 47 Whence comes it by that vast store which the busy and boundless fancy of human has painted on it, with an almost endless variety? 48 Whence has it all the materials of reason and knowledge? To this I answer in one word, from experience; 49 in that all our knowledge is founded, and from that it ultimately derives itself. 50 Our observation, employed either about external sensible objects, or about the internal operations of our minds, perceived and reflected on by ourselves, is that which supplies our understandings with all the materials of thinking. 51 These two are the fountains of knowledge, from whence all the ideas we have, or can naturally have, do spring."

52 Thus, all we know and all we ever shall know of the world of matter and of minds must rest ultimately upon observation,-- observation of external things and of our own mind. 53 We must clip the erratic wing of a "reason" which seeks to soar beyond such knowledge; which leaves the solid earth, and hangs suspended in the void. 54 "But hold," exclaims the critical reader; "have we not seen that Locke, as well as Descartes, claims to know what he cannot prove by direct observation or even by a legitimate inference from what has been directly observed? 55 Does he not maintain that the mind has an immediate knowledge or experience only of its own ideas? How can he prove that there are material extended things outside causing these ideas? 56 And if he cannot prove it by an appeal to experience, to direct observation, is he not, in accepting the existence of the external world at all, just as truly as Descartes, a rationalist?"

57 The objection is well taken. On his own principles, Locke had no right to believe in an external world. He has stolen his world, so to speak; he has taken it by violence. 58 Nevertheless, as I pointed out in the section above referred to, Locke is not a rationalist of 'malice prepense'. 59 He 'tries' to be an empiricist. He believes in the external world because he thinks it is directly revealed to the senses-- he

inconsistently refers to experience as evidence of its existence.

60 It has often been claimed by those who do not sympathise with empiricism that the empiricists make assumptions much as others do, but have not the grace to admit it. 61 I think we must frankly confess that a person may try hard to be an empiricist and may not be wholly successful. 62 Moreover, reflection forces us to the conclusion that when we have defined empiricism as a doctrine which rests throughout upon an appeal to "experience" we have not said anything very definite.

63 What is 'experience'? What may we accept as directly revealed fact? 64 The answer to such questions is far from an easy one to give. It is a harder matter to discuss intelligently than any one can at all realise until you have spent some years in following the efforts of the philosophers to determine what is "revealed fact." 65 We are supposed to have experience of our own minds, of space, of time, of matter. What are these things as revealed in our experience? 66 We have seen in the earlier chapters of this book that one cannot answer such questions off-hand.

CRITICISM

67 I have in another chapter given a brief account of the philosophy of Immanuel Kant. He called his doctrine "Criticism," and he distinguished it from "Dogmatism" and "Empiricism." 68 Every philosophy that transcends experience, without first critically examining our faculty of knowledge and determining its right to spread its wings in this way, Kant calls "dogmatism." 69 The word seems rather an offensive one, in its usual signification, at least; and it is as well not to use it. 70 As Kant used the word, Descartes was a dogmatist; but let us rather call him a rationalist. He certainly had no intention of proceeding uncritically, as we shall see a little later. 71 If we call him a dogmatist we seem to condemn him in advance, by applying to him an abusive epithet.

72 Empiricism, according to Kant, confines human knowledge to

experience, and thus avoids the errors which beset the dogmatist. 73 But then, as Hume seemed to have shown, empiricism must run out into scepticism. 74 If all our knowledge has its foundations in experience, how can we expect to find in our possession any universal or necessary truths? 75 May not a later experience contradict an earlier? How can we be sure that what has been will be? 76 Can we 'know' that there is anything fixed and certain in our world?

77 Scepticism seemed a forlorn doctrine, and, casting about for a way of escape from it, Kant hit upon the expedient which I have described. 78 So long as we maintain that our knowledge has no other source than the experiences which the world imprints upon us, so to speak, from without, we are without the power of prediction, 79 for new experiences may annihilate any generalisations we have founded upon those already vouchsafed us; 80 but if we assume that the world upon which we gaze, the world of phenomena, is made what it is by the mind that perceives it, are we not in a different position? 81 Suppose, for example, we take the statement that there must be an adequate cause of all the changes that take place in the world, can a mere experience of what has been in the past guarantee that this law will hold good in the future? 82 But, when we realise that the world of which we are speaking is nothing more than a world of phenomena, of experiences, 83 and realise further that this whole world is constructed by the mind out of the raw materials furnished by the senses, may we not have a greater confidence in our law? 84 If it is the nature of the mind to connect the phenomena presented to it with one another as cause and effect, may we not maintain that no phenomenon can possibly make its appearance that defies the law in question? 85 How could it appear except under the conditions laid upon all phenomena? 86 If it is our nature to think the world as an orderly one, and if we can know no world save the one we construct ourselves, the orderliness of all the things we can know seems to be guaranteed to us.

PERCEPTION

87 It will be noticed that Kant's doctrine has a negative side. He limits our knowledge to phenomena, to experiences, and he is himself, in so far, an empiricist. 88 But in that he finds in experience an order, an arrangement of things, not derived from experience in the usual sense of the word, he is not an empiricist. 89 He has paid his own doctrine the compliment of calling it "criticism," as I have said.

90 Now, I beg the reader to be here, as elsewhere, on your guard against the associations which attach to words. 91 In calling Kant's doctrine "the critical philosophy," we are in some danger of uncritically assuming and leading others to believe uncritically that it is free from such defects as may be expected to attach to "dogmatism" and to empiricism. 92 Such a position should not be taken until one has made a most careful examination of each of the three types of doctrine, 93 of the assumptions which it makes, and of the rigour with which it draws inferences upon the basis of such assumptions. 94 That we may be the better able to withstand "undue influence," I call attention to the following points:--

95 (1) We must bear in mind that the attempt to make a critical examination into the foundations of our knowledge, and to determine its scope, is by no means a new thing. 96 Among the Greeks, Plato, Aristotle, the Stoics, the Epicureans, and the sceptics, all attacked the problem. 97 It did not, of course, present itself to these people in the precise form in which it presented itself to Kant, but each and all were concerned to find an answer to the question: 98 Can we know anything with certainty; and, if so, what? 99 They may have failed to be thoroughly critical, but they certainly made the attempt.

100 I shall omit mention of the long series of others, who, since that time, have carried on the tradition, and shall speak only of Descartes and Locke, whom I have above brought forward as representatives of the two types of doctrine that Kant contrasts with his own. 101 To see how strenuously Descartes endeavoured to subject his

knowledge to a critical scrutiny and to avoid unjustifiable assumptions of any sort, one has only to read that charming little work of genius, the "*Discourse on the Method of Rightly Conducting the Reason*." 102 In his youth Descartes was, as he informs us, an eager student; but, when he had finished the whole course of education usually prescribed, he found himself so full of doubts and errors that he did not feel that he had advanced in learning at all. 103 Yet he had been well tutored, and was considered as bright in mind as others. 104 He was led to judge his neighbour by himself, and to conclude that there existed no such certain science as he had been taught to suppose. 105 Having ripened with years and experience, Descartes set about the task of which I have spoken above, the task of sweeping away the whole body of his opinions and of attempting a general and systematic reconstruction. 106 So important a work should be, he thought, approached with circumspection; hence, he formulated certain Rules of Method. 107 "The first," he writes, "was never to accept anything for true which I did not clearly know to be such; 108 that is, carefully to avoid haste and prejudice, and to include nothing more in my judgments than what was presented to my mind so clearly and distinctly as to exclude all reason for doubt."

109 Such was our philosopher's design, and such the spirit in which he set about it. We have seen the result above. 110 It is as if Descartes had decided that a certain room full of people did not appear to be free from suspicious characters, and had cleared out every one, afterwards posting himself at the door to readmit only those who proved themselves worthy. 111 When we examine those who succeeded in passing muster, we discover he has favoured all his old friends. 112 He simply 'cannot' doubt them; are they not vouched for by the "natural light"? 113 Nevertheless, we must not forget that Descartes sifted his congregation with much travail of spirit. He did try to be critical.

114 As for John Locke, he reveals in the "Epistle to the Reader,"

which stands as a preface to the "Essay," the critical spirit in which his work was taken up. 115 "Were it fit to trouble thee," he writes, "with the history of this Essay, I should tell thee, that five or six friends meeting at my chamber, and discoursing on a subject very remote from this, found themselves quickly at a stand, by the difficulties that rose on every side. 116 After we had a while puzzled ourselves, without coming any nearer a resolution of those doubts which perplexed us, it came into my thoughts, that we took a wrong course; 117 and that before we set ourselves upon inquiries of that nature, it was necessary to examine our own abilities, and to see what objects our understandings were, or were not, fitted to deal with."

118 This problem, proposed by himself to his little circle of friends, Locke attacked with earnestness, and as a result he brought out many years later the work which has since become so famous. 119 The book is literally a critique of the reason, although a very different critique from that worked out by Kant. 120 "If, by this inquiry into the nature of the understanding," says Locke, "I can discover the powers thereof, how far they reach, to what things they are in any degree proportionate, and where they fail us; 121 I suppose it may be of use to prevail with the busy mind of human to be more cautious in meddling with things exceeding its comprehension; 122 to stop when it is at the utmost extent of its tether; and to sit down in a quiet ignorance of those things which upon examination are found to be beyond the reach of our capacities."

123 To the difficulties of the task our author is fully alive: "The understanding, like the eye, whilst it makes us see and perceive all other things, takes no notice of itself; and it requires art and pains to set it at a distance, and make it its own object. 124 But whatever be the difficulties that lie in the way of this inquiry, whatever it be that keeps us so much in the dark to ourselves, 125 sure I am that all the light we can let in upon our own minds, all the acquaintance we can make with our own understandings, will not only be

very pleasant, but bring us great advantage, in directing our thoughts in the search, of other things."

126 (2) Thus, many people have attempted to produce a critical philosophy, and in much the same sense as that in which Kant uses the words. 127 Those who have come after them have decided that they were not sufficiently critical, that they have made unjustifiable assumptions. 128 When we come to read Kant, we will, if we have read the history of philosophy with profit, not forget to ask ourselves if he has not sinned in the same way. 129 For example, we will ask;-- (a) Was Kant right in maintaining that we find in experience synthetic judgments that are not founded upon experience, but yield such information as is beyond the reach of the empiricist? 130 There are those who think that the judgments to which he alludes in evidence of his contention-- the mathematical, for instance-- are not of this character.

131 (b) Was he justified in assuming that all the ordering of our world is due to the activity of mind, and that merely the raw material is "given" us through the senses? 132 There are many who demur against such a statement, and hold that it is, if not in all senses untrue, at least highly misleading, since it seems to argue that there is no really external world at all. 133 Moreover, they claim that the doctrine is neither self-evident nor susceptible of proper proof.

134 (c) Was Kant justified in assuming that, even if we attribute the "form" or arrangement of the world we know to the native activity of the mind, the necessity and universality of our knowledge is assured? 135 Let us grant that the proposition, whatever happens must have an adequate cause, is a "form of thought." 136 What guarantee have we that the "forms of thought" must ever remain changeless? 137 If it is an assumption for the empiricist to declare that what has been true in the past will be true in the future, that earlier experiences of the world will not be contradicted by later; 138 what is it for the Kantian to maintain that the order which you finds in your experience will

necessarily and always be the order of all future experiences? 139 Transferring an assumption to the field of mind does not make it less of an assumption.

140 Thus, it does not seem unreasonable to charge Kant with being a good deal of a rationalist. He tried to confine our knowledge to the field of experience, it is true; 141 but he made a number of assumptions as to the nature of experience which certainly do not shine by their own light, and which many thoughtful persons regard as incapable of justification. 142 Kant's famous successors in the German philosophy, Fichte (1762-1814), Schelling (1775-1854), Hegel (1770-1831), and Schopenhauer (1788-1860), all received their impulse from the "critical philosophy," and yet each developed own doctrine in a relatively independent way. 143 I cannot here take the space to characterise the systems of these people; I may merely remark that all of them contrast strongly in doctrine and method with the British philosophers mentioned in the last section, Locke, Berkeley, Hume, and Mill. 144 They are 'un-empirical', if one may use such a word; 145 and, to one accustomed to reading the English philosophy, they seem ever ready to spread their wings and hazard the boldest of flights without a proper realisation of the thinness of the atmosphere in which they must support themselves.

146 However, no matter what may be one's opinion of the actual results attained by these German philosophers, one must frankly admit that no one who wishes to understand clearly the development of speculative thought can afford to dispense with a careful reading of them. 147 Much even of the English philosophy of our own day must remain obscure to those who have not looked into their pages. 148 Thus, the thought of Kant and Hegel moulded the thought of Thomas Hill Green (1836-1882) and of the brothers Caird; and their influence has made itself widely felt both in England and in America. 149 One cannot criticise intelligently books written from their standpoint, unless one knows how the authors came by their

doctrine and out of what it has been developed.

CRITICAL EMPIRICISM

150 We have seen that the trouble with the rationalists seemed to be that they made an appeal to "eternal truths," which those who followed them could not admit to be eternal truths at all. 151 They proceeded on a basis of assumptions the validity of which was at once called in question. 152 Locke, the empiricist, repudiated all this, and then also made assumptions which others could not, and cannot, approve. 153 Kant did something of much the same sort; we cannot regard his "criticism" as wholly critical. 154 How can we avoid such errors? How walk cautiously, and go around the pit into which, as it seems to us, others have fallen? 155 I may as well tell the reader frankly that you sets your hope too high if you expects to avoid all error and to work out for yourself a philosophy in all respects unassailable. 156 The difficulties of reflective thought are very great, and we should carry with us a consciousness of that fact and a willingness to revise our most cherished conclusions. 157 Our initial difficulty seems to be that we must begin by assuming 'something', if only as material upon which to work. 158 We must begin our philosophising 'somewhere'. Where shall we begin? May we not fall into error at the very outset?

159 The doctrine set forth in the earlier chapters of this volume maintains that we must accept as our material the revelation of the mind and the world which seems to be made in our common experience, and which is extended and systematised in the sciences. 160 But it insists that we must regard such an acceptance as merely provisional, must subject our concepts to a careful criticism, and must always be on our guard against hasty assumptions. 161 It emphasises the value of the light which historical study casts upon the real meaning of the concepts which we all use and must use, but which have so often proved to be stones of stumbling in the path of those who have employed them.

PERCEPTION

162 Its watchword is analysis, always analysis; and a settled distrust of what have so often passed as "self-evident" truths. 163 It regards it as its task to analyse experience, while maintaining that only the satisfactory carrying out of such an analysis can reveal what experience really is, and clear our notions of it from misinterpretations. 164 No such attempt to give an account of experience can be regarded as fundamentally new in its method. Every philosopher, in own way, criticises experience, and seeks its interpretation. 165 But one may, warned by the example of one's predecessors, lay emphasis upon the danger of half-analyses and hasty assumptions, and counsel the observance of sobriety and caution. 166 For convenience, I have called the doctrine 'Critical Empiricism'. I warn the reader against the seductive title, and advise you not to allow it to influence you unduly in your judgment of the doctrine.

PRAGMATISM

167 It seems right that I should, before closing this chapter, say a few words about Pragmatism, which has been so much discussed in the last few years. 168 In 1878 Mr. Charles S. Peirce wrote an article for the 'Popular Science Monthly' in which he proposed as a maxim for the attainment of clearness of apprehension the following: 169 "Consider what effects, which might conceivably have practical bearings, we conceive the object of our conception to have. 170 Then, our conception of these effects is the whole of our conception of the object."

171 This thought has been taken up by others and given a development which Mr. Peirce regards with some suspicion. 172 He refers especially to the development it has received at the hands of Professor William James, in his two essays, "The Will to Believe" and "Philosophical Conceptions and Practical Results." 173 Professor James is often regarded as foremost among the pragmatists.

PERCEPTION

174 I shall not attempt to define pragmatism, for I do not believe that the doctrine has yet attained to that definiteness of formulation which warrants a definition. 175 We seem to have to do not so much with a clear-cut doctrine, the limits and consequences of which have been worked out in detail, as with a tendency which makes itself apparent in the works of various writers under somewhat different forms. 176 I may roughly describe it as the tendency to take that to be 'true' which is 'useful' or 'serviceable'. 177 It is well illustrated in the two essays to which reference is made above.

178 Thus, Professor James dwells upon the unsatisfactoriness and uncertainty of philosophical and scientific knowledge: 179 "Objective evidence and certitude are doubtless very fine ideals to play with, but where on this moonlit and dream-visited planet are they found?"

180 Now, among those things regarding which it appears impossible to attain to intellectual certitude, there are matters of great practical moment, and which affect deeply the conduct of life; 181 for example, the doctrines of religion. Here a merely sceptical attitude seems intolerable. 182 In such cases, argues Professor James, "we have the right to believe at our own risk any hypothesis that is live enough to tempt our will." 183 It is important to notice that there is no question here of a logical right. We are concerned with matters regarding which, according to Professor James, we cannot look for intellectual evidence. 184 It is assumed that we believe simply because we choose to believe-- we believe arbitrarily. 185 It is further important to notice that what is a "live" hypothesis to one person need not tempt the will of another person at all. 186 As our author points out, a Turk would naturally will to believe one thing and a Christian would will to believe another. 187 Each would will to believe what struck one as a satisfactory thing to believe.

188 What shall we say to this doctrine? I think we must say that it is clearly not a philosophical 'method of attaining to truth'. 189 Hence, it has not properly a place in this chapter among the attempts

which have been made to attain to the truth of things. 190 It is, in fact, not concerned with truths, but with assumptions, and with assumptions which are supposed to be made on the basis of no evidence. It is concerned with "seemings."

191 The distinction is a very important one. Our Turk cannot, by willing to believe it, make own hypothesis true; but can make it 'seem' true. 192 Why should you wish to make it seem true whether it is true or not? Why should you strive to attain to a feeling of subjective certainty, not by logically resolving your doubts, but by ignoring them? 193 The answer is given us by our author. You who lives in the midst of doubts, and refuses to cut your knot with the sword of belief, misses the good of life. 194 This is a practical problem, and one of no small moment.

195 In the last section of this book I have tried to indicate what it is wise for a person to do when you are confronted by doubts which you cannot resolve. 196 Into the general question whether even a false belief may not, under some circumstances, be more serviceable than no belief at all, I shall not enter. 197 The point I wish to emphasise is that there is all the difference in the world between 'producing a belief' and 'proving a truth'. 198 We are compelled to accept it as a fact that humans, under the influence of feeling, can believe in the absence of evidence, or, for that matter, can believe in spite of evidence. 199 But a truth cannot be established in the absence of evidence or in the face of adverse evidence. 200 And there is a very wide field in which it is made very clear to us that beliefs adopted in the absence of evidence are in danger of being false beliefs.

201 The pragmatist would join with the rest of us in condemning the Turk or the Christian who would simply will to believe in the rise or the fall of stocks, and would refuse to consult the state of the market. 202 Some hypotheses are, in the ordinary course of events, put to the test of verification. 203 We are then made painfully aware that beliefs and truths are quite distinct things, and may not be in harmony.

PERCEPTION

204 Now, the pragmatist does not apply own principle to this field. You confines it to what may not inaptly be called the field of the unverifiable. 205 The Turk, who wills to believe in the hypothesis that appeals to the self as a pious Turk, is in no such danger of a rude awakening as is the person who wills to believe that stocks will go up or down. 206 But mark what this means: it means that 'you are not in danger of finding out what the truth really is'. It does not mean that you are in possession of the truth.

207 So I say, the doctrine which we are discussing is not a method of attaining to truth. 208 What it really attempts to do is to point out to us how it is prudent for us to act when we cannot discover what the truth is.

The Book of Divine Panagogue called

PSYCHE

PSYCHOLOGY
George Stuart Fullerton

PSYCHOLOGY AND PHILOSOPHY

1 I think I have said enough in about what we mean when we speak of psychology as a natural science and as an independent discipline. 2 Certainly there are many psychologists who would not care to be confused with the philosophers, and there are some that regard philosophy with suspicion. 3 Nevertheless, psychology is commonly regarded as belonging to the philosophical group. 4 That this is the case can scarcely be thought surprising when we see how the psychologist speaks of the relation of own science to philosophy.

5 "I have kept," writes Professor James, in that delightful book which has become the common property of us all, "close to the point of view of natural science throughout the book. 6 Every natural science assumes certain data uncritically, and declines to challenge the elements between which its own 'laws' obtain, and from which its own deductions are carried on. 7 Psychology, the science of finite individual minds, assumes as its data (1) 'thoughts and feelings', and (2) 'a physical world' in time and space with which they coexist, and which (3) 'they know'. 8 Of course, these data themselves are discussable; but the discussion of them (as of other elements) is called metaphysics and falls outside the province of this book."

9 This is an admirable statement of the scope of psychology as a natural science, and also of the relations of metaphysics to the sciences. 10 But it would not be fair to Professor James to take this sentence alone, and to assume that, in his opinion, it is easy to separate psychology altogether from philosophy. 11 "The reader," he tells us in the next paragraph, "will in vain seek for any closed-system in the book. 12 It is mainly a mass of descriptive details, running out into queries which only a metaphysics alive to the weight of her task can hope successfully to deal with." 13 And in the opening

sentence of the preface he informs us that some of his chapters are more "metaphysical" than is suitable for students going over the subject for the first time. 14 That the author is right in maintaining that it is not easy to draw a clear line between philosophy and psychology, and to declare the latter wholly independent, I think we must concede. 15 An independent science should be sure of the things with which it is dealing. Where these are vague and indefinite, and are the subject of constant dispute, it cannot march forward with assurance. 16 One is rather forced to go back and examine the data themselves. The beaten track of the special science has not been satisfactorily constructed. 17 We are forced to admit that the science of psychology has not yet emerged from the state in which a critical examination of its foundations is necessary, and that the construction of the beaten path is still in progress. 18 This I shall try to make clear by illustrations.

19 The psychologist studies the mind, and own ultimate appeal must be to introspection, to a direct observation of mental phenomena, and of their relations to external things. 20 Now, if the observation of mental phenomena were a simple and an easy thing; 21 if the mere fact that we are conscious of sensations and ideas implied that we are 'clearly' conscious of them and are in a position to describe them with accuracy, psychology would be a much more satisfactory science than it is. 22 But we are not thus conscious of our mental life. We can and do use our mental states without being able to describe them accurately. 23 In a sense, we are conscious of what is there, but our consciousness is rather dim and vague, and in our attempts to give an account of it we are in no little danger of giving a false account.

24 Thus, the psychologist assumes that we perceive both physical phenomena and mental-- the external world and the mind. 25 They takes it for granted that we perceive mental phenomena to be related to physical. They are hardly in a position to make this assumption, and then to set it aside as a thing they need not further

consider. 26 Do they not tell us, as a result of their investigations, that we can know the external world only as it is reflected in our sensations, 27 and thus seem to shut the mind up within the circle of mental phenomena merely, cutting off absolutely a direct knowledge of what is extra-mental? 28 If we can know only mental phenomena, the representatives of things, at first hand, how can we tell that they are representatives? 29 And what becomes of the assumption that we 'perceive' that mind is related to an external world?

30 It may be said, this problem the psychologist may leave to the metaphysician. Certainly, it is one of those problems that the metaphysician discusses. 31 But my contention is, that you who has given no thought to the matter may easily fall into error as to the very nature of mental phenomena. 32 For example, when we approach or recede from a physical object we have a series of experiences which are recognised as sensational. 33 When we imagine a tree or a house we are also experiencing a mental phenomenon. 34 All these experiences 'seem' plainly to have extension in some sense of the word. 35 We appear to perceive plainly part out of part. In so far, these mental things seem to resemble the physical things which we contrast with what is mental. 36 Shall we say that, because these things are mental and not physical, their apparent extension is a delusion? Shall we say that they really have no parts? 37 Such considerations have impelled psychologists of eminence to maintain, in flat contradiction to what seems to be the unequivocal testimony of direct introspection, 38 that the total content of consciousness at any moment must be looked upon as an indivisible, part-less unit. 39 We cannot, then, depend merely on direct introspection. It is too uncertain in its deliverances. 40 If we would make clear to ourselves what mental phenomena really are, and how they differ from physical phenomena, we must fall back upon the reflective analysis of our experience which occupies the metaphysician. 41 Until we have done this, we are in great danger

of error. We are actually uncertain of our materials.

42 Again. The psychologist speaks of the relation of mind and body. Some psychologists incline to be parallelists, some are warm advocates of interactionism. 43 Now, any theory of the relation of mind to body must depend on observation ultimately. 44 If we had not direct experience of a relation between the physical and the mental somewhere, no hypothesis on the subject would ever have emerged. 45 But our experiences are not perfectly clear and unequivocal to us. Their significance does not seem to be easily grasped. 46 To comprehend it one is forced to that reflective examination of experience which is characteristic of the philosopher. 47 Here it may again be said: Leave the matter to the meta-physician and go on with your psychological work. 48 I answer: The psychologist is not in the same position as the botanist or the zoölogist. 49 They are studying mind in its relation to body. It cannot but be unsatisfactory to them to leave that relation wholly vague; and, as a matter of fact, they usually takes up with one theory or another. 50 We have seen that they may easily adopt a theory that leads them to overlook the great difference between physical phenomena and mental phenomena, and to treat them as though they were the same. 51 This one may do in spite of all that introspection has to say about the gulf that separates them.

52 Psychology is, then, very properly classed among the philosophical sciences. 53 The psychologist is not sufficiently sure of own materials to be able to dispense with reflective thought, in many parts of own field. 54 Some day there may come to be a consensus of opinion touching fundamental facts, and the science may become more independent. A beaten track may be attained; but that has not yet been done.

THE DOUBLE AFFILIATION OF PSYCHOLOGY

55 In spite of what has been said above, we must not forget that psychology is a 'relatively' independent science. 56 One may be a useful psychologist without

knowing much about philosophy. 57 As in logic it is possible to write a text-book not greatly different in spirit and method from text-books concerned with the sciences not classed as philosophical, 58 so it is possible to make a useful study of mental phenomena without entering upon metaphysical analyses. 59 In science, as in common life, we can 'use' concepts without subjecting them to careful analysis.

60 Thus, our common experience reveals that mind and body are connected. 61 We may, for a specific purpose, leave the 'nature' of this connection vague, and may pay careful attention to the physiological conditions of mental phenomena, studying in detail the senses and the nervous system. 62 We may, further, endeavour to render our knowledge of mental phenomena more full and accurate by experimentation. 63 In doing this we may be compelled to make use of elaborate apparatus. Of such mechanical aids to investigation our psychological laboratories are full. 64 It is to such work as this that we owe what is called the "physiological" and the "experimental" psychology. 65 One can carry on such investigations without being a metaphysician. But one can scarcely carry them on without having a good knowledge of certain sciences not commonly supposed to be closely related to psychology at all. 66 Thus, one should be trained in chemistry and physics and physiology, and should have a working knowledge of laboratory methods. 67 Moreover, it is desirable to have a sufficient knowledge of mathematics to enable one to handle experimental data. 68 The consideration of such facts as these sometimes leads people to raise the question: Should psychology affiliate with philosophy or with the physical sciences? The issue is an illegitimate one. 69 Psychology is one of the philosophical sciences, and cannot dispense with reflection; 70 but that is no reason why it should not acknowledge a close relation to certain physical sciences as well. 71 Parts of the field can be isolated, and one may work as one works in the natural sciences generally; 72 but if one does nothing more, one's concepts

remain unanalysed, and, as we have seen in the previous section, there is some danger of actual misconception.

The Book of Divine Panagogue called

MORALS

AN ENQUIRY CONCERNING THE PRINCIPLES OF MORALS

David Hume

OF THE GENERAL PRINCIPLES OF MORALS

1 DISPUTES with people, pertinaciously obstinate in their principles, are, of all others, the most irksome; 2 except, perhaps, those with persons, entirely disingenuous, who really do not believe the opinions they defend, 3 but engage in the controversy, from affectation, from a spirit of opposition, or from a desire of showing wit and ingenuity, superior to the rest of humankind. 4 The same blind adherence to their own arguments is to be expected in both; the same contempt of their antagonists; and the same passionate vehemence, in enforcing sophistry and falsehood. 5 And as reasoning is not the source, whence either disputant derives own tenets; it is in vain to expect, that any logic, which speaks not to the affections, will ever engage you to embrace sounder principles.

6 Those who have denied the reality of moral distinctions, may be ranked among the disingenuous disputants; 7 nor is it conceivable, that any human creature could ever seriously believe, that all characters and actions were alike entitled to the affection and regard of everyone. 8 The difference, which Nature has placed between one human and another, is so wide, and this difference is still so much farther widened, by education, example, and habit, 9 that, where the opposite extremes come at once under our apprehension, there is no scepticism so scrupulous, and scarce any assurance so determined, as absolutely to deny all distinction between them. 10 Let a human's insensibility be ever so great, you must often be touched with the images of Right and Wrong; 11 and let your prejudices be ever so obstinate, you must observe, that others are susceptible of like impressions. 12 The only way, therefore, of converting an antagonist of this

kind, is to leave you to yourself. 13 For, finding that nobody keeps up the controversy with you, it is probable you will, at last, of yourself, from mere weariness, come over to the side of common sense and reason.

14 There has been a controversy started of late, much better worth examination, concerning the general foundation of Morals; whether they be derived from Reason, or from Sentiment; 15 whether we attain the knowledge of them by a chain of argument and induction, or by an immediate feeling and finer internal sense; 16 whether, like all sound judgement of truth and falsehood, they should be the same to every rational intelligent being; 17 or whether, like the perception of beauty and deformity, they be founded entirely on the particular fabric and constitution of the human species.

18 The ancient philosophers, though they often affirm, that virtue is nothing but conformity to reason, yet, in general, seem to consider morals as deriving their existence from taste and sentiment. 19 On the other hand, our modern enquirers, though they also talk much of the beauty of virtue, and deformity of vice, yet have commonly endeavoured to account for these distinctions by metaphysical reasonings, and by deductions from the most abstract principles of the understanding. 20 Such confusion reigned in these subjects, that an opposition of the greatest consequence could prevail between one system and another, and even in the parts of almost each individual system; and yet nobody, till very lately, was ever sensible of it. 21 The elegant Lord Shaftesbury, who first gave occasion to remark this distinction, and who, in general, adhered to the principles of the ancients, is not, himself, entirely free from the same confusion.

22 It must be acknowledged, that both sides of the question are susceptible of specious arguments. 23 Moral distinctions, it may be said, are discernible by pure reason: else, whence the many disputes that reign in common life, as well as in philosophy, with regard to this subject: 24 the long chain of proofs often produced on both sides; the examples cited, the

authorities appealed to, the analogies employed, the fallacies detected, the inferences drawn, and the several conclusions adjusted to their proper principles. 25 Truth is disputable; not taste: what exists in the nature of things is the standard of our judgement; what each human feels within own self is the standard of sentiment. 26 Propositions in geometry may be proved, systems in physics may be controverted; but the harmony of verse, the tenderness of passion, the brilliancy of wit, must give immediate pleasure. 27 No human reasons concerning another's beauty; but frequently concerning the justice or injustice of your actions. 28 In every criminal trial the first object of the prisoner is to disprove the facts alleged, and deny the actions imputed to oneself: 29 the second to prove, that, even if these actions were real, they might be justified, as innocent and lawful. 30 It is confessedly by deductions of the understanding, that the first point is ascertained: how can we suppose that a different faculty of the mind is employed in fixing the other? 31 On the other hand, those who would resolve all moral determinations into sentiment, may endeavour to show, that it is impossible for reason ever to draw conclusions of this nature. 32 To virtue, say they, it belongs to be amiable, and vice odious. This forms their very nature or essence. 33 But can reason or argumentation distribute these different epithets to any subjects, and pronounce beforehand, that this must produce love, and that hatred? 34 Or what other reason can we ever assign for these affections, but the original fabric and formation of the human mind, which is naturally adapted to receive them?

35 The end of all moral speculations is to teach us our duty; and, by proper representations of the deformity of vice and beauty of virtue, beget correspondent habits, and engage us to avoid the one, and embrace the other. 36 But is this ever to be expected from inferences and conclusions of the understanding, which of themselves have no hold of the affections or set in motion the active powers of humans? 37 They discover truths: but where

the truths which they discover are indifferent, and beget no desire or aversion, they can have no influence on conduct and behaviour. 38 What is honourable, what is fair, what is becoming, what is noble, what is generous, takes possession of the heart, and animates us to embrace and maintain it. 39 What is intelligible, what is evident, what is probable, what is true, procures only the cool assent of the understanding; and gratifying a speculative curiosity, puts an end to our researches. 40 Extinguish all the warm feelings and prepossessions in favour of virtue, and all disgust or aversion to vice: render humans totally indifferent towards these distinctions; and morality is no longer a practical study, nor has any tendency to regulate our lives and actions.

41 These arguments on each side (and many more might be produced) are so plausible, that I am apt to suspect, they may, the one as well as the other, be solid and satisfactory, and that reason and sentiment concur in almost all moral determinations and conclusions. 42 The final sentence, it is probable, which pronounces characters and actions amiable or odious, praise-worthy or blameable; 43 that which stamps on them the mark of honour or infamy, approbation or censure; that which renders morality an active principle and constitutes virtue our happiness, and vice our misery; 44 it is probable, I say, that this final sentence depends on some internal sense or feeling, which Nature has made universal in the whole species. For what else can have an influence of this nature? 45 But in order to pave the way for such a sentiment, and give a proper discernment of its object, it is often necessary, we find, that much reasoning should precede, that nice distinctions be made, 46 just conclusions drawn, distant comparisons formed, complicated relations examined, and general facts fixed and ascertained. 47 Some species of beauty, especially the natural kinds, on their first appearance, command our affection and approbation; 48 and where they fail of this effect, it is impossible for any reasoning to redress their influence, or adapt

them better to our taste and sentiment. 49 But in many orders of beauty, particularly those of the finer arts, it is requisite to employ much reasoning, in order to feel the proper sentiment; and a false relish may frequently be corrected by argument and reflection. 50 There are just grounds to conclude, that moral beauty partakes much of this latter species, and demands the assistance of our intellectual faculties, in order to give it a suitable influence on the human mind. 51 But though this question, concerning the general principles of morals, be curious and important, it is needless for us, at present, to employ farther care in our researches concerning it. 52 For if we can be so happy, in the course of this enquiry, as to discover the true origin of morals, it will then easily appear how far either sentiment or reason enters into all determinations of this nature. 53 In order to attain this purpose, we shall endeavour to follow a very simple method: we shall analyse that complication of mental qualities, which form what, in common life, we call Personal Merit: 54 we shall consider every attribute of the mind, which renders a human an object either of esteem and affection, or of hatred and contempt; 55 every habit or sentiment or faculty, which, if ascribed to any person, implies either praise or blame, and may enter into any panegyric or satire of your character and manners. 56 The quick sensibility, which, on this head, is so universal among humankind, gives a philosopher sufficient assurance, that you can never be considerably mistaken in framing the catalogue, or incur any danger of misplacing the objects of your contemplation: 57 you needs only enter into your own breast for a moment, and consider whether or not you should desire to have this or that quality ascribed to you, and whether such or such an imputation would proceed from a friend or an enemy. 58 The very nature of language guides us almost infallibly in forming a judgement of this nature; 59 and as every tongue possesses one set of words which are taken in a good sense, and another in the opposite, the least acquaintance with the

idiom suffices, without any reasoning, to direct us in collecting and arranging the estimable or blameable qualities of humans. 60 The only object of reasoning is to discover the circumstances on both sides, which are common to these qualities; 61 to observe that particular in which the estimable qualities agree on the one hand, and the blameable on the other; 62 and thence to reach the foundation of ethics, and find those universal principles, from which all censure or approbation is ultimately derived. 63 As this is a question of fact, not of abstract science, we can only expect success, by following the experimental method, and deducing general maxims from a comparison of particular instances. 64 The other scientific method, where a general abstract principle is first established, and is afterwards branched out into a variety of inferences and conclusions, may be more perfect in itself, 65 but suits less the imperfection of human nature, and is a common source of illusion and mistake in this as well as in other subjects.

66 Humans are now cured of their passion for hypotheses and systems in natural philosophy, and will hearken to no arguments but those which are derived from experience. 67 It is full time they should attempt a like reformation in all moral disquisitions; and reject every system of ethics, however subtle or ingenious, which is not founded on fact and observation.

68 We shall begin our enquiry on this head by the consideration of the social virtues, Benevolence and Justice. 69 The explication of them will probably give us an opening by which the others may be accounted for.

OF BENEVOLENCE

David Hume

PART 1

2 It may be esteemed, perhaps, a superfluous task to prove, that the benevolent or softer affections are estimable; and wherever they appear, engage the approbation and good-will of humankind. 2 The epithets SOCIABLE, GOOD-NATURED, HUMANE, MERCIFUL, GRATEFUL, FRIENDLY, GENEROUS,

BENEFICENT, or their equivalents, are known in all languages, and universally express the highest merit, which HUMAN NATURE is capable of attaining. 3 Where these amiable qualities are attended with birth and power and eminent abilities, and display themselves in the good government or useful instruction of humankind, they seem even to raise the possessors of them above the rank of HUMAN NATURE, and make them approach in some measure to the divine. 4 Exalted capacity, undaunted courage, prosperous success; these may only expose a hero or politician to the envy and ill-will of the public: 5 but as soon as the praises are added of humane and beneficent; when instances are displayed of lenity, tenderness or friendship; envy itself is silent, or joins the general voice of approbation and applause.

6 When Pericles, the great Athenian statesman and general, was on his death-bed, his surrounding friends, deeming him now insensible, began to indulge their sorrow for their expiring patron, 7 by enumerating his great qualities and successes, his conquests and victories, the unusual length of his administration, and his nine trophies erected over the enemies of the republic. 8 YOU FORGET, cries the dying hero, who had heard all, YOU FORGET THE MOST EMINENT OF MY PRAISES, WHILE YOU DWELL SO MUCH ON THOSE VULGAR ADVANTAGES, IN WHICH FORTUNE HAD A PRINCIPAL SHARE. 9 YOU HAVE NOT OBSERVED THAT NO CITIZEN HAS EVER YET WORNE MOURNING ON MY ACCOUNT. [Plut. in Pericle]

10 In people of more ordinary talents and capacity, the social virtues become, if possible, still more essentially requisite; 11 there being nothing eminent, in that case, to compensate for the want of them, or preserve the person from our severest hatred, as well as contempt. 12 A high ambition, an elevated courage, is apt, says Cicero, in less perfect characters, to degenerate into a turbulent ferocity. 13 The more social and softer virtues are there chiefly to be regarded. These are always good and amiable [Cic. de Officiis, lib. I].

14 The principal advantage, which Juvenal discovers in the extensive

capacity of the human species, is that it renders our benevolence also more extensive, and gives us larger opportunities of spreading our kindly influence than what are indulged to the inferior creation [Sat. XV. 139 and seq.]. 15 It must, indeed, be confessed, that by doing good only, can a human truly enjoy the advantages of being eminent. 16 Your exalted station, of itself but the more exposes you to danger and tempest. Your sole prerogative is to afford shelter to inferiors, who repose themselves under your cover and protection.

17 But I forget, that it is not my present business to recommend generousity and benevolence, or to paint, in their true colours, all the genuine charms of the social virtues. 18 These, indeed, sufficiently engage every heart, on the first apprehension of them; and it is difficult to abstain from some sally of panegyric, as often as they occur in discourse or reasoning. 19 But our object here being more the speculative, than the practical part of morals, it will suffice to remark, (what will readily, I believe, be allowed) that no qualities are more entitled to the general good-will and approbation of humankind 20 than beneficence and humanity, friendship and gratitude, natural affection and public spirit, or whatever proceeds from a tender sympathy with others, and a generous concern for our kind and species. 21 These wherever they appear seem to transfuse themselves, in a manner, into each beholder, and to call forth, in their own behalf, the same favourable and affectionate sentiments, which they exert on all around.

PART II

22 We may observe that, in displaying the praises of any humane, beneficent human, there is one circumstance which never fails to be amply insisted on, namely, the happiness and satisfaction, derived to society from your intercourse and good offices. 23 To your parents, we are apt to say, you endears yourself by your pious attachment and duteous care still more than by the connexions of Nature. 24 Your children never feel your authority, but when employed for their advantage. With you, the ties of love are consolidated by

beneficence and friendship. 25 The ties of friendship approach, in a fond observance of each obliging office, to those of love and inclination. 26 Your domestics and dependants have in you a sure resource; and no longer dread the power of fortune, but so far as she exercises it over you. 27 From you the hungry receive food, the naked clothing, the ignorant and slothful skill and industry. 28 Like the sun, an inferior minister of providence you cheers, invigorates, and sustains the surrounding world. 29 If confined to private life, the sphere of your activity is narrower; but your influence is all benign and gentle. 30 If exalted into a higher station, humankind and posterity reap the fruit of your labours.

31 As these topics of praise never fail to be employed, and with success, where we would inspire esteem for any one; 32 may it not thence be concluded, that the utility, resulting from the social virtues, forms, at least, a PART of their merit, and is one source of that approbation and regard so universally paid to them? 33 When we recommend even an animal or a plant as USEFUL and BENEFICIAL, we give it an applause and recommendation suited to its nature. 34 As, on the other hand, reflection on the baneful influence of any of these inferior beings always inspires us with the sentiment of aversion. 35 The eye is pleased with the prospect of corn-fields and loaded vine-yards; horses grazing, and flocks pasturing: but flies the view of briars and brambles, affording shelter to wolves and serpents. 36 A machine, a piece of furniture, a vestment, a house well contrived for use and conveniency, is so far beautiful, and is contemplated with pleasure and approbation. 37 An experienced eye is here sensible to many excellencies, which escape persons ignorant and uninstructed. 38 Can anything stronger be said in praise of a profession, such as merchandise or manufacture, than to observe the advantages which it procures to society; 39 and is not a monk and inquisitor enraged when we treat their order as useless or pernicious to humankind?

40 The historian exults in displaying the benefit arising from own labours. The writer of

romance alleviates or denies the bad consequences ascribed to own manner of composition. 41 In general, what praise is implied in the simple epithet USEFUL! What reproach in the contrary! 42 Your Gods, says Cicero, in opposition to the Epicureans, cannot justly claim any worship or adoration, with whatever imaginary perfections you may suppose them endowed. They are totally useless and inactive. 43 Even the Egyptians, whom you so much ridicule, never consecrated any animal but on account of its utility.

44 The sceptics assert, though absurdly, that the origin of all religious worship was derived from the utility of inanimate objects, as the sun and moon, to the support and well-being of humankind. 45 This is also the common reason assigned by historians, for the deification of eminent heroes and legislators.

46 To plant a tree, to cultivate a field, to beget children; meritorious acts, according to the religion of Zoroaster. 47 In all determinations of morality, this circumstance of public utility is ever principally in view; 48 and wherever disputes arise, either in philosophy or common life, concerning the bounds of duty, the question cannot, by any means, be decided with greater certainty, than by ascertaining, on any side, the true interests of humankind. 49 If any false opinion, embraced from appearances, has been found to prevail; as soon as farther experience and sounder reasoning have given us juster notions of human affairs, we retract our first sentiment, and adjust anew the boundaries of moral good and evil. 50 Giving alms to common beggars is naturally praised; because it seems to carry relief to the distressed and indigent: 51 but when we observe the encouragement thence arising to idleness and debauchery, we regard that species of charity rather as a weakness than a virtue. 52 Tyrannicide, or the assassination of usurpers and oppressive princes, was highly extolled in ancient times; because it both freed humankind from many of these monsters, and seemed to keep the others in awe, whom the sword or poniard could not reach. 53 But history and

experience having since convinced us, that this practice increases the jealousy and cruelty of princes, a Timoleon and a Brutus, though treated with indulgence on account of the prejudices of their times, are now considered as very improper models for imitation.

54 Liberality in princes is regarded as a mark of beneficence, 55 but when it occurs, that the homely bread of the honest and industrious is often thereby converted into delicious cates for the idle and the prodigal, we soon retract our heedless praises. 56 The regrets of a prince, for having lost a day, were noble and generous: but had you intended to have spent it in acts of generousity to your greedy courtiers, it was better lost than mis-employed after that manner.

57 Luxury, or a refinement on the pleasures and conveniences of life, had not long been supposed the source of every corruption in government, and the immediate cause of faction, sedition, civil wars, and the total loss of liberty. 58 It was, therefore, universally regarded as a vice, and was an object of declamation to all satirists, and severe moralists. 59 Those, who prove, or attempt to prove, that such refinements rather tend to the increase of industry, civility, and arts regulate anew our MORAL as well as POLITICAL sentiments, 60 and represent, as laudable or innocent, what had formerly been regarded as pernicious and blameable.

61 Upon the whole, then, it seems undeniable, THAT nothing can bestow more merit on any human creature than the sentiment of benevolence in an eminent degree; 62 and THAT a PART, at least, of its merit arises from its tendency to promote the interests of our species, and bestow happiness on human society. 63 We carry our view into the salutary consequences of such a character and disposition; and whatever has so benign an influence, and forwards so desirable an end, is beheld with complacency and pleasure. 64 The social virtues are never regarded without their beneficial tendencies, nor viewed as barren and unfruitful. 65 The happiness of humankind, the order of society, the harmony of families, the mutual support of friends, are always considered as

the result of their gentle dominion over the breasts of humans. 66 How considerable a PART of their merit we ought to ascribe to their utility, will better appear from future disquisitions; as well as the reason, why this circumstance has such a command over our esteem and approbation.

OF JUSTICE
David Hume

PART I

3 THAT Justice is useful to society, and consequently that PART of its merit, at least, must arise from that consideration, it would be a superfluous undertaking to prove. 2 That public utility is the SOLE origin of justice, and that reflections on the beneficial consequences of this virtue are the SOLE foundation of its merit; this proposition, being more curious and important, will better deserve our examination and enquiry.

3 Let us suppose that Nature has bestowed on the human race such profuse ABUNDANCE of all EXTERNAL conveniencies, 4 that, without any uncertainty in the event, without any care or industry on our part, every individual finds yourself fully provided with whatever your most voracious appetites can want, or luxurious imagination wish or desire. 5 Your natural beauty, we shall suppose, surpasses all acquired ornaments: the perpetual clemency of the seasons renders useless all clothes or covering: the raw herbage affords you the most delicious fare; the clear fountain, the richest beverage. 6 No labourious occupation required: no tillage: no navigation. Music, poetry, and contemplation form your sole business: conversation, mirth, and friendship your sole amusement. 7 It seems evident that, in such a happy state, every other social virtue would flourish, and receive tenfold increase; but the cautious, jealous virtue of justice would never once have been dreamed of. 8 For what purpose make a partition of goods, where every one has already more than enough? 9 Why give rise to property, where there cannot possibly be any injury? 10 Why call this object MINE, when upon

the seizing of it by another, I need but stretch out my hand to possess myself to what is equally valuable? 11 Justice, in that case, being totally useless, would be an idle ceremonial, and could never possibly have place in the catalogue of virtues.

12 We see, even in the present necessitous condition of humankind, that, wherever any benefit is bestowed by Nature in an unlimited abundance, we leave it always in common among the whole human race, and make no subdivisions of right and property. 13 Water and air, though the most necessary of all objects, are not challenged as the property of individuals; nor can any person commit injustice by the most lavish use and enjoyment of these blessings. 14 In fertile extensive countries, with few inhabitants, land is regarded on the same footing. 15 And no topic is so much insisted on by those, who defend the liberty of the seas, as the unexhausted use of them in navigation. 16 Were the advantages, procured by navigation, as inexhaustible, these reasoners had never had any adversaries to refute; nor had any claims ever been advanced of a separate, exclusive dominion over the ocean. 17 It may happen, in some countries, at some periods, that there be established a property in water, none in land; if the latter be in greater abundance than can be used by the inhabitants, and the former be found, with difficulty, and in very small quantities.

18 Again; suppose, that, though the necessities of human race continue the same as at present, yet the mind is so enlarged, and so replete with friendship and generousity, 19 that every human has the utmost tenderness for every human, and feels no more concern for your own interest than for that of your fellows; 20 it seems evident, that the use of justice would, in this case, be suspended by such an extensive benevolence, nor would the divisions and barriers of property and obligation have ever been thought of. 21 Why should I bind another, by a deed or promise, to do me any good office, when I know that you are already prompted, by the strongest inclination, to seek my happiness, and would, of yourself, perform

the desired service; 22 except the hurt, you thereby receives, be greater than the benefit accruing to me? In which case, you knows, that, from my innate humanity and friendship, I should be the first to oppose myself to your imprudent generousity. 23 Why raise landmarks between my neighbour's field and mine, when my heart has made no division between our interests; but shares all your joys and sorrows with the same force and vivacity as if originally my own? 24 Every human, upon this supposition, being a second self to another, would trust all own interests to the discretion of every human; without jealousy, without partition, without distinction. 25 And the whole human race would form only one family; where all would lie in common, and be used freely, without regard to property; 26 but cautiously too, with as entire regard to the necessities of each individual, as if our own interests were most intimately concerned.

27 In the present disposition of the human heart, it would, perhaps, be difficult to find complete instances of such enlarged affections; but still we may observe, that the case of families approaches towards it; 28 and the stronger the mutual benevolence is among the individuals, the nearer it approaches; till all distinction of property be, in a great measure, lost and confounded among them. 29 Between married persons, the cement of friendship is by the laws supposed so strong as to abolish all division of possessions; and has often, in reality, the force ascribed to it. 30 And it is observable, that, during the ardour of new enthusiasms, when every principle is inflamed into extravagance, the community of goods has frequently been attempted; 31 and nothing but experience of its inconveniences, from the returning or disguised selfishness of humans, could make the imprudent fanatics adopt anew the ideas of justice and of separate property. 32 So true is it, that this virtue derives its existence entirely from its necessary USE to the intercourse and social state of humankind.

33 To make this truth more evident, let us reverse the foregoing suppositions; and carrying everything to the opposite

extreme, consider what would be the effect of these new situations. 34 Suppose a society to fall into such want of all common necessaries, that the utmost frugality and industry cannot preserve the greater number from perishing, and the whole from extreme misery; 35 it will readily, I believe, be admitted, that the strict laws of justice are suspended, in such a pressing emergence, and give place to the stronger motives of necessity and self-preservation. 36 Is it any crime, after a shipwreck, to seize whatever means or instrument of safety one can lay hold of, without regard to former limitations of property? 37 Or if a city besieged were perishing with hunger; can we imagine, that people will see any means of preservation before them, and lose their lives, from a scrupulous regard to what, in other situations, would be the rules of equity and justice? 38 The use and tendency of that virtue is to procure happiness and security, by preserving order in society: 39 but where the society is ready to perish from extreme necessity, no greater evil can be dreaded from violence and injustice; and every person may now provide for own self by all the means, which prudence can dictate, or humanity permit. 40 The public, even in less urgent necessities, opens granaries, without the consent of proprietors; as justly supposing, that the authority of magistracy may, consistent with equity, extend so far: 41 but were any number of people to assemble, without the tie of laws or civil jurisdiction; would an equal partition of bread in a famine, though effected by power and even violence, be regarded as criminal or injurious?

42 Suppose likewise, that it should be a virtuous human's fate to fall into the society of ruffians, remote from the protection of laws and government; what conduct must you embrace in that melancholy situation? 43 You sees such a desperate rapaciousness prevail; such a disregard to equity, such contempt of order, such stupid blindness to future consequences, as must immediately have the most tragical conclusion, and must terminate in destruction to the greater number, and in a total dissolution of society to the rest.

44 You, meanwhile, can have no other expedient than to arm yourself, to whomever the sword you seizes, or the buckler, may belong: 45 To make provision of all means of defence and security: And your particular regard to justice being no longer of use to your own safety or that of others, you must consult the dictates of self-preservation alone, without concern for those who no longer merit your care and attention. 46 When any person, even in political society, renders yourself by your crimes, obnoxious to the public, you are punished by the laws in your goods and person; 47 that is, the ordinary rules of justice are, with regard to you, suspended for a moment, and it becomes equitable to inflict on you, for the BENEFIT of society, what otherwise you could not suffer without wrong or injury.

48 The rage and violence of public war; what is it but a suspension of justice among the warring parties, who perceive, that this virtue is now no longer of any USE or advantage to them? 49 The laws of war, which then succeed to those of equity and justice, are rules calculated for the ADVANTAGE and UTILITY of that particular state, in which people are now placed. 50 And were a civilised nation engaged with barbarians, who observed no rules even of war, the former must also suspend their observance of them, where they no longer serve to any purpose; 51 and must render every action or recounter as bloody and pernicious as possible to the first aggressors.

52 Thus, the rules of equity or justice depend entirely on the particular state and condition in which people are placed, and owe their origin and existence to that utility, which results to the public from their strict and regular observance. 53 Reverse, in any considerable circumstance, the condition of people: Produce extreme abundance or extreme necessity: Implant in the human breast perfect moderation and humanity, or perfect rapaciousness and malice: 54 By rendering justice totally USELESS, you thereby totally destroy its essence, and suspend its obligation upon humankind. 55 The common situation of society is a medium amidst all these extremes. We are

naturally partial to ourselves, and to our friends; but are capable of learning the advantage resulting from a more equitable conduct. 56 Few enjoyments are given us from the open and liberal hand of Nature; but by art, labour, and industry, we can extract them in great abundance. 57 Hence the ideas of property become necessary in all civil society: Hence justice derives its usefulness to the public: And hence alone arises its merit and moral obligation.

58 These conclusions are so natural and obvious, that they have not escaped even the poets, in their descriptions of the felicity attending the golden age or the reign of Saturn. 59 The seasons, in that first period of Nature, were so temperate, if we credit these agreeable fictions, that there was no necessity for humans to provide themselves with clothes and houses, as a security against the violence of heat and cold: 60 The rivers flowed with wine and milk: The oaks yielded honey; and Nature spontaneously produced Her greatest delicacies. Nor were these the chief advantages of that happy age. 61 Tempests were not alone removed from Nature; but those more furious tempests were unknown to human breasts, which now cause such uproar, and engender such confusion. 62 Avarice, ambition, cruelty, selfishness, were never heard of: Cordial affection, compassion, sympathy, were the only movements with which the mind was yet acquainted. 63 Even the punctilious distinction of MINE and THINE was banished from among the happy race of mortals, and carried with it the very notion of property and obligation, justice and injustice.

64 This POETICAL fiction of the GOLDEN AGE, is in some respects, of a piece with the PHILOSOPHICAL fiction of the STATE OF NATURE; 65 only that the former is represented as the most charming and most peaceable condition, which can possibly be imagined; whereas the latter is painted out as a state of mutual war and violence, attended with the most extreme necessity. 66 On the first origin of humankind, we are told, their ignorance and savage nature were so prevalent, that they could give

no mutual trust, but must each depend upon own self and own force or cunning for protection and security. 67 No law was heard of: No rule of justice known: No distinction of property regarded: Power was the only measure of right; and a perpetual war of all against all was the result of humans' untamed selfishness and barbarity. 68 Whether such a condition of human nature could ever exist, or if it did, could continue so long as to merit the appellation of a STATE, may justly be doubted. 69 Humans are necessarily born in a family-society, at least; and are trained up by their parents to some rule of conduct and behaviour. 70 But this must be admitted, that, if such a state of mutual war and violence was ever real, the suspension of all laws of justice, from their absolute inutility, is a necessary and infallible consequence.

71 The more we vary our views of human life, and the newer and more unusual the lights are in which we survey it, the more shall we be convinced, that the origin here assigned for the virtue of justice is real and satisfactory. 72 Were there a species of creatures intermingled with humans, which, though rational, were possessed of such inferior strength, both of body and mind, that they were incapable of all resistance, and could never, upon the highest provocation, make us feel the effects of their resentment; 73 the necessary consequence, I think, is that we should be bound by the laws of humanity to give gentle usage to these creatures, but should not, properly speaking, lie under any restraint of justice with regard to them, nor could they possess any right or property, exclusive of such arbitrary lords. 74 Our intercourse with them could not be called society, which supposes a degree of equality; but absolute command on the one side, and servile obedience on the other. 75 Whatever we covet, they must instantly resign: Our permission is the only tenure, by which they hold their possessions: Our compassion and kindness the only check, by which they curb our lawless will: 76 And as no inconvenience ever results from the exercise of a power, so firmly established in Nature, the restraints

of justice and property, being totally USELESS, would never have place in so unequal a confederacy. 77 This is plainly the situation of humans, with regard to animals; and how far these may be said to possess reason, I leave it to others to determine. 78 In many nations, the female sex are reduced to like slavery, and are rendered incapable of all property, in opposition to their lordly masters. 79 But though the males, when united, have in all countries bodily force sufficient to maintain this severe tyranny, 80 yet such are the insinuation, address, and charms of their fair companions, that women are commonly able to break the confederacy, and share with the other sex in all the rights and privileges of society. 81 Were the human species so framed by Nature as that each individual possessed within own self every faculty, requisite both for your own preservation and for the propagation of your kind: 82 Were all society and intercourse cut off between human and human, by the primary intention of the supreme Creator: 83 It seems evident, that so solitary a being would be as much incapable of justice, as of social discourse and conversation. 84 Where mutual regards and forbearance serve to no manner of purpose, they would never direct the conduct of any reasonable person. 85 The headlong course of the passions would be checked by no reflection on future consequences. 86 And as each person is here supposed to love yourself alone, and to depend only on yourself and your own activity for safety and happiness, you would, on every occasion, to the utmost of your power, challenge the preference above every other being, 87 to none of which you are bound by any ties, either of Nature or of interest. 88 But suppose the conjunction of the sexes to be established in Nature, a family immediately arises; and particular rules being found requisite for its subsistence, these are immediately embraced; though without comprehending the rest of humankind within their prescriptions. 89 Suppose that several families unite together into one society, which is totally disjoined from all others, the rules, which preserve peace and order,

enlarge themselves to the utmost extent of that society; but becoming then entirely useless, lose their force when carried one step farther. 90 But again suppose, that several distinct societies maintain a kind of intercourse for mutual convenience and advantage, the boundaries of justice still grow larger, in proportion to the largeness of humans' views, and the force of their mutual connexions. 91 History, experience, reason sufficiently instruct us in this natural progress of human sentiments, and in the gradual enlargement of our regards to justice, in proportion as we become acquainted with the extensive utility of that virtue.

PART II

92 If we examine the PARTICULAR laws, by which justice is directed, and property determined; we shall still be presented with the same conclusion. 93 The good of humankind is the only object of all these laws and regulations. 94 Not only is it requisite, for the peace and interest of society, that people's possessions should be separated; but the rules, which we follow, in making the separation, are such as can best be contrived to serve farther the interests of society.

95 We shall suppose that a creature, possessed of reason, but unacquainted with human nature, deliberates with the self what rules of justice or property would best promote public interest, and establish peace and security among humankind: 96 Your most obvious thought would be, to assign the largest possessions to the most extensive virtue, and give every one the power of doing good, proportioned to your inclination. 97 In a perfect theocracy, where a being, infinitely intelligent, governs by particular volitions, this rule would certainly have place, and might serve to the wisest purposes: 98 But were humankind to execute such a law; so great is the uncertainty of merit, both from its natural obscurity, and from the self-conceit of each individual, that no determinate rule of conduct would ever result from it; 99 and the total dissolution of society must be the immediate

consequence. 100 Fanatics may suppose, THAT DOMINION IS FOUNDED ON GRACE, and THAT SAINTS ALONE INHERIT THE EARTH; 101 but the civil magistrate very justly puts these sublime theorists on the same footing with common robbers, and teaches them by the severest discipline, 102 that a rule, which, in speculation, may seem the most advantageous to society, may yet be found, in practice, totally pernicious and destructive. 103 That there were RELIGIOUS fanatics of this kind in England, during the civil wars, we learn from history; 104 though it is probable, that the obvious TENDENCY of these principles excited such horror in humankind, as soon obliged the dangerous enthusiasts to renounce, or at least conceal their tenets. 105 Perhaps the LEVELLERS, who claimed an equal distribution of property, were a kind of POLITICAL fanatics, which arose from the religious species, and more openly avowed their pretensions; 106 as carrying a more plausible appearance, of being practicable in themselves, as well as useful to human society. 107 It must, indeed, be confessed, that Nature is so liberal to humankind, that, were all Her presents equally divided among the species, and improved by art and industry, every individual would enjoy all the necessaries, and even most of the comforts of life; 108 nor would ever be liable to any ills but such as might accidentally arise from the sickly frame and constitution of your body. 109 It must also be confessed, that, wherever we depart from this equality, we rob the poor of more satisfaction than we add to the rich, 110 and that the slight gratification of a frivolous vanity, in one individual, frequently costs more than bread to many families, and even provinces.

111 It may appear withal, that the rule of equality, as it would be highly USEFUL, is not altogether IMPRACTICABLE; 112 but has taken place, at least in an imperfect degree, in some republics; particularly that of Sparta; where it was attended, it is said, with the most beneficial consequences. 113 Not to mention that the Agrarian laws, so frequently claimed in Rome, and carried into execution

in many Greek cities, proceeded, all of them, from a general idea of the utility of this principle. 114 But historians, and even common sense, may inform us, that, however specious these ideas of PERFECT equality may seem, they are really, at bottom, IMPRACTICABLE; and were they not so, would be extremely PERNICIOUS to human society. 115 Render possessions ever so equal, humans' different degrees of art, care, and industry will immediately break that equality. 116 Or if you check these virtues, you reduce society to the most extreme indigence; and instead of preventing want and beggary in a few, render it unavoidable to the whole community. 117 The most rigorous inquisition too is requisite to watch every inequality on its first appearance; and the most severe jurisdiction, to punish and redress it. 118 But besides, that so much authority must soon degenerate into tyranny, and be exerted with great partialities; who can possibly be possessed of it, in such a situation as is here supposed? 119 Perfect equality of possessions, destroying all subordination, weakens extremely the authority of magistracy, and must reduce all power nearly to a level, as well as property.

120 We may conclude, therefore, that, in order to establish laws for the regulation of property, we must be acquainted with the nature and situation of human; 121 must reject appearances, which may be false, though specious; and must search for those rules, which are, on the whole, most USEFUL and BENEFICIAL. 122 Vulgar sense and slight experience are sufficient for this purpose; where people give not way to too selfish avidity, or too extensive enthusiasm. 123 Who sees not, for instance, that whatever is produced or improved by a human's art or industry ought, for ever, to be secured to you, in order to give encouragement to such USEFUL habits and accomplishments? 124 That the property ought also to descend to children and relations, for the same USEFUL purpose? 125 That it may be alienated by consent, in order to beget that commerce and intercourse, which is so BENEFICIAL to human society? 126 And that all contracts and

promises ought carefully to be fulfilled, in order to secure mutual trust and confidence, by which the general INTEREST of humankind is so much promoted?

127 Examine the writers on the laws of Nature; and you will always find, that, whatever principles they set out with, they are sure to terminate here at last, 128 and to assign, as the ultimate reason for every rule which they establish, the convenience and necessities of humankind. 129 A concession thus extorted, in opposition to systems, has more authority than if it had been made in prosecution of them. 130 What other reason, indeed, could writers ever give, why this must be MINE and that YOURS; since uninstructed nature surely never made any such distinction? 131 The objects which receive those appellations are, of themselves, foreign to us; they are totally disjoined and separated from us; and nothing but the general interests of society can form the connexion.

132 Sometimes the interests of society may require a rule of justice in a particular case; but may not determine any particular rule, among several, which are all equally beneficial. 133 In that case, the slightest analogies are laid hold of, in order to prevent that indifference and ambiguity, which would be the source of perpetual dissension. 134 Thus possession alone, and first possession, is supposed to convey property, where no body else has any preceding claim and pretension. 135 Many of the reasonings of lawyers are of this analogical nature, and depend on very slight connexions of the imagination. 136 Does any one scruple, in extraordinary cases, to violate all regard to the private property of individuals, and sacrifice to public interest a distinction which had been established for the sake of that interest? 137 The safety of the people is the supreme law: All other particular laws are subordinate to it, and dependent on it: 138 And if, in the COMMON course of things, they be followed and regarded; it is only because the public safety and interest COMMONLY demand so equal and impartial an administration.

139 Sometimes both UTILITY and ANALOGY fail, and leave the laws

of justice in total uncertainty. 140 Thus, it is highly requisite, that prescription or long possession should convey property; but what number of days or months or years should be sufficient for that purpose, it is impossible for reason alone to determine. 141 CIVIL LAWS here supply the place of the natural CODE, and assign different terms for prescription, according to the different UTILITIES, proposed by the legislator. 142 Bills of exchange and promissory notes, by the laws of most countries, prescribe sooner than bonds, and mortgages, and contracts of a more formal nature. 143 In general we may observe that all questions of property are subordinate to the authority of civil laws, which extend, restrain, modify, and alter the rules of natural justice, according to the particular CONVENIENCE of each community. 144 The laws have, or ought to have, a constant reference to the constitution of government, the manners, the climate, the religion, the commerce, the situation of each society. 145 A late author of genius, as well as learning, has prosecuted this subject at large, and has established, from these principles, a system of political knowledge, which abounds in ingenious and brilliant thoughts, and is not wanting in solidity.

146 WHAT IS A HUMAN'S PROPERTY? Anything which it is lawful for you, and for you alone, to use. 147 BUT WHAT RULE HAVE WE, BY WHICH WE CAN DISTINGUISH THESE OBJECTS? 148 Here we must have recourse to statutes, customs, precedents, analogies, and a hundred other circumstances; some of which are constant and inflexible, some variable and arbitrary. 149 But the ultimate point, in which they all professedly terminate, is the interest and happiness of human society. 150 Where this enters not into consideration, nothing can appear more whimsical, unnatural, and even superstitious, than all or most of the laws of justice and of property.

151 Those who ridicule vulgar superstitions, and expose the folly of particular regards to meats, days, places, postures, apparel, have an easy task; 152 while they consider all the qualities and

relations of the objects, and discover no adequate cause for that affection or antipathy, veneration or horror, which have so mighty an influence over a considerable part of humankind. 153 A Syrian would have starved rather than taste pigeon; an Egyptian would not have approached bacon: 154 But if these species of food be examined by the senses of sight, smell, or taste, or scrutinised by the sciences of chemistry, medicine, or physics, no difference is ever found between them and any other species, 155 nor can that precise circumstance be pitched on, which may afford a just foundation for the religious passion. 156 A fowl on Thursday is lawful food; on Friday abominable: Eggs in this house and in this diocese, are permitted during Lent; a hundred paces farther, to eat them is a damnable sin. 157 This earth or building, yesterday was profane; to-day, by the muttering of certain words, it has become holy and sacred. 158 Such reflections as these, in the mouth of a philosopher, one may safely say, are too obvious to have any influence; because they must always, to every human, occur at first sight; 159 and where they prevail not, of themselves, they are surely obstructed by education, prejudice, and passion, not by ignorance or mistake.

160 It may appear to a careless view, or rather a too abstracted reflection, that there enters a like superstition into all the sentiments of justice; 161 and that, if a person expose its object, or what we call property, to the same scrutiny of sense and science, you will not, by the most accurate enquiry, find any foundation for the difference made by moral sentiment. 162 I may lawfully nourish myself from this tree; but the fruit of another of the same species, ten paces off, it is criminal for me to touch. 163 Had I worn this apparel an hour ago, I had merited the severest punishment; but a person, by pronouncing a few magical syllables, has now rendered it fit for my use and service. 164 Were this house placed in the neighbouring territory, it had been immoral for me to dwell in it; but being built on this side the river, it is subject to a different municipal law, and by its becoming mine I

incur no blame or censure. 165 The same species of reasoning it may be thought, which so successfully exposes superstition, is also applicable to justice; 166 nor is it possible, in the one case more than in the other, to point out, in the object, that precise quality or circumstance, which is the foundation of the sentiment.

167 But there is this material difference between SUPERSTITION and JUSTICE, that the former is frivolous, useless, and burdensome; the latter is absolutely requisite to the well-being of humankind and existence of society. 168 When we abstract from this circumstance (for it is too apparent ever to be overlooked) it must be confessed, that all regards to right and property, seem entirely without foundation, as much as the grossest and most vulgar superstition. 169 Were the interests of society nowise concerned, it is as unintelligible why another's articulating certain sounds implying consent, should change the nature of my actions with regard to a particular object, 170 as why the reciting of a liturgy by a priest, in a certain habit and posture, should dedicate a heap of brick and timber, and render it, thenceforth and for ever, sacred. 171 These reflections are far from weakening the obligations of justice, or diminishing anything from the most sacred attention to property. 172 On the contrary, such sentiments must acquire new force from the present reasoning. For what stronger foundation can be desired or conceived for any duty, than to observe, that human society, or even human nature, could not subsist without the establishment of it; 173 and will still arrive at greater degrees of happiness and perfection, the more inviolable the regard is, which is paid to that duty?

174 The dilemma seems obvious: As justice evidently tends to promote public utility and to support civil society, the sentiment of justice is either derived from our reflecting on that tendency, 175 or like hunger, thirst, and other appetites, resentment, love of life, attachment to offspring, and other passions, arises from a simple original instinct in the human breast, which Nature has

implanted for like salutary purposes. 176 If the latter be the case, it follows, that property, which is the object of justice, is also distinguished by a simple original instinct, and is not ascertained by any argument or reflection. 177 But who is there that ever heard of such an instinct? Or is this a subject in which new discoveries can be made? 178 We may as well expect to discover, in the body, new senses, which had before escaped the observation of all humankind.

179 But farther, though it seems a very simple proposition to say, that Nature, by an instinctive sentiment, distinguishes property, 180 yet in reality we shall find, that there are required for that purpose ten thousand different instincts, and these employed about objects of the greatest intricacy and nicest discernment. 181 For when a definition of PROPERTY is required, that relation is found to resolve itself into any possession acquired by occupation, by industry, by prescription, by inheritance, by contract. 182 Can we think that Nature, by an original instinct, instructs us in all these methods of acquisition? 183 These words too, inheritance and contract, stand for ideas infinitely complicated; and to define them exactly, a hundred volumes of laws, and a thousand volumes of commentators, have not been found sufficient. 184 Does Nature, whose instincts in humans are all simple, embrace such complicated and artificial objects, and create a rational creature, without trusting anything to the operation of your reason? 185 But even though all this were admitted, it would not be satisfactory. Positive laws can certainly transfer property. It is by another original instinct, that we recognise the authority of kings and senates, and mark all the boundaries of their jurisdiction? 186 Judges too, even though their sentence be erroneous and illegal, must be allowed, for the sake of peace and order, to have decisive authority, and ultimately to determine property. 187 Have we original innate ideas of praetors and chancellors and juries? Who sees not, that all these institutions arise merely from the necessities of human society?

188 All birds of the same species in every age and country, built their nests alike: In this we see the force of instinct. 189 Humans, in different times and places, frame their houses differently: Here we perceive the influence of reason and custom. 190 A like inference may be drawn from comparing the instinct of generation and the institution of property. 191 How great soever the variety of municipal laws, it must be confessed, that their chief outlines pretty regularly concur; because the purposes, to which they tend, are everywhere exactly similar. 192 In like manner, all houses have a roof and walls, windows and chimneys; though diversified in their shape, figure, and materials. 193 The purposes of the latter, directed to the conveniences of human life, discover not more plainly their origin from reason and reflection, than do those of the former, which point all to a like end.

194 I need not mention the variations, which all the rules of property receive from the finer turns and connexions of the imagination, and from the subtilties and abstractions of law-topics and reasonings. 195 There is no possibility of reconciling this observation to the notion of original instincts. What alone will beget a doubt concerning the theory, on which I insist, is the influence of education and acquired habits, 196 by which we are so accustomed to blame injustice, that we are not, in every instance, conscious of any immediate reflection on the pernicious consequences of it. 197 The views the most familiar to us are apt, for that very reason, to escape us; and what we have very frequently performed from certain motives, we are apt likewise to continue mechanically, without recalling, on every occasion, the reflections, which first determined us. 198 The convenience, or rather necessity, which leads to justice is so universal, and everywhere points so much to the same rules, that the habit takes place in all societies; and it is not without some scrutiny, that we are able to ascertain its true origin. 199 The matter, however, is not so obscure, but that even in common life we have every moment recourse to the

principle of public utility, and ask, WHAT MUST BECOME OF THE WORLD, IF SUCH PRACTICES PREVAIL? HOW COULD SOCIETY SUBSIST UNDER SUCH DISORDERS? 200 Were the distinction or separation of possessions entirely useless, can any one conceive, that it ever should have obtained in society?

201 Thus we seem, upon the whole, to have attained a knowledge of the force of that principle here insisted on, and can determine what degree of esteem or moral approbation may result from reflections on public interest and utility. 202 The necessity of justice to the support of society is the sole foundation of that virtue; 203 and since no moral excellence is more highly esteemed, we may conclude that this circumstance of usefulness has, in general, the strongest energy, and most entire command over our sentiments. 204 It must, therefore, be the source of a considerable part of the merit ascribed to humanity, benevolence, friendship, public spirit, and other social virtues of that stamp; 205 as it is the sole source of the moral approbation paid to fidelity, justice, veracity, integrity, and those other estimable and useful qualities and principles. 206 It is entirely agreeable to the rules of philosophy, and even of common reason; where any principle has been found to have a great force and energy in one instance, to ascribe to it a like energy in all similar instances. This indeed is Newton's chief rule of philosophising.

OF POLITICAL SOCIETY

David Hume

4 Had every human sufficient SAGACITY to perceive, at all times, the strong interest which binds you to the observance of justice and equity, 2 and STRENGTH OF MIND sufficient to persevere in a steady adherence to a general and a distant interest, in opposition to the allurements of present pleasure and advantage; 3 there had never, in that case, been any such thing as government or political society, but each person, following your natural liberty, had lived in entire peace and harmony with all others. 4 What need of positive law where

natural justice is, of itself, a sufficient restraint? 5 Why create magistrates, where there never arises any disorder or iniquity? 6 Why abridge our native freedom, when, in every instance, the utmost exertion of it is found innocent and beneficial? 7 It is evident, that, if government were totally useless, it never could have place, and that the sole foundation of the duty of allegiance is the ADVANTAGE, which it procures to society, by preserving peace and order among humankind.

8 When a number of political societies are erected, and maintain a great intercourse together, a new set of rules are immediately discovered to be USEFUL in that particular situation; 9 and accordingly take place under the title of Laws of Nations. Of this kind are, the sacredness of the person of ambassadors, abstaining from poisoned arms, quarter in war, 10 with others of that kind, which are plainly calculated for the ADVANTAGE of states and kingdoms in their intercourse with each other. 11 The rules of justice, such as prevail among individuals, are not entirely suspended among political societies. 12 All princes pretend a regard to the rights of other princes; and some, no doubt, without hypocrisy. 13 Alliances and treaties are every day made between independent states, which would only be so much waste of parchment, if they were not found by experience to have SOME influence and authority. 14 But here is the difference between kingdoms and individuals. Human nature cannot by any means subsist, without the association of individuals; and that association never could have place, were no regard paid to the laws of equity and justice. 15 Disorder, confusion, the war of all against all, are the necessary consequences of such a licentious conduct. 16 But nations can subsist without intercourse. They may even subsist, in some degree, under a general war. 17 The observance of justice, though useful among them, is not guarded by so strong a necessity as among individuals; and the moral obligation holds proportion with the USEFULNESS.

18 All politicians will allow, and most philosophers, that reasons of state may, in particular

emergencies, dispense with the rules of justice, and invalidate any treaty or alliance, where the strict observance of it would be prejudicial, in a considerable degree, to either of the contracting parties. 19 But nothing less than the most extreme necessity, it is confessed, can justify individuals in a breach of promise, or an invasion of the properties of others. 20 In a confederated commonwealth, such as the Achaean republic of old, or the Swiss Cantons and United Provinces in modern times; as the league has here a peculiar UTILITY, 21 the conditions of union have a peculiar sacredness and authority, and a violation of them would be regarded as no less, or even as more criminal, than any private injury or injustice.

22 The long and helpless infancy of human requires the combination of parents for the subsistence of their young; and that combination requires the virtue of chastity or fidelity to the marriage bed. 23 Without such a UTILITY, it will readily be owned, that such a virtue would never have been thought of. 24 An infidelity of this nature is much more PERNICIOUS in WOMEN than in MEN. Hence the laws of chastity are much stricter over the one sex than over the other. 25 These rules have all a reference to generation; and yet women past child-bearing are no more supposed to be exempted from them than those in the flower of their youth and beauty. 26 GENERAL RULES are often extended beyond the principle whence they first arise; and this in all matters of taste and sentiment.

27 It is a vulgar story at Paris, that, during the rage of the Mississippi, a hump-backed fellow went every day into the Rue de Quincempoix, where the stock-jobbers met in great crowds, and was well paid for allowing them to make use of his hump as a desk, in order to sign their contracts upon it. 28 Would the fortune, which he raised by this expedient, make him a handsome fellow; though it be confessed, that personal beauty arises very much from ideas of utility?

29 The imagination is influenced by associations of ideas; which, though they arise at first from the judgement, are not easily altered

by every particular exception that occurs to us. 30 To which we may add, in the present case of chastity, that the example of the old would be pernicious to the young; 31 and that women, continually foreseeing that a certain time would bring them the liberty of indulgence, would naturally advance that period, and think more lightly of this whole duty, so requisite to society. 32 Those who live in the same family have such frequent opportunities of licence of this kind, that nothing could prevent purity of manners, were marriage allowed, among the nearest relations, or any intercourse of love between them ratified by law and custom. 33 Incest, therefore, being PERNICIOUS in a superior degree, has also a superior turpitude and moral deformity annexed to it.

34 What is the reason, why, by the Athenian laws, one might marry a half-sister by the father, but not by the mother? 35 Plainly this: The manners of the Athenians were so reserved, that a man was never permitted to approach the women's apartment, even in the same family, unless where he visited his own mother. 36 His step-mother and her children were as much shut up from him as the woman of any other family, and there was as little danger of any criminal correspondence between them. 37 Uncles and nieces, for a like reason, might marry at Athens; but neither these, nor half-brothers and sisters, could contract that alliance at Rome, where the intercourse was more open between the sexes. Public utility is the cause of all these variations.

38 To repeat, to a human's prejudice, anything that escaped you in private conversation, or to make any such use of your private letters, is highly blamed. 39 The free and social intercourse of minds must be extremely checked, where no such rules of fidelity are established. 40 Even in repeating stories, whence we can foresee no ill consequences to result, the giving of one's author is regarded as a piece of indiscretion, if not of immorality. 41 These stories, in passing from hand to hand, and receiving all the usual variations, frequently come about to the persons concerned, and produce animosities and quarrels among

people, whose intentions are the most innocent and inoffensive. 42 To pry into secrets, to open or even read the letters of others, to play the spy upon their words and looks and actions; what habits more inconvenient in society? What habits, of consequence, more blameable? 43 This principle is also the foundation of most of the laws of good manners; a kind of lesser morality, calculated for the ease of company and conversation. 44 Too much or too little ceremony are both blamed, and everything, which promotes ease, without an indecent familiarity, is useful and laudable.

45 Constancy in friendships, attachments, and familiarities, is commendable, and is requisite to support trust and good correspondence in society. 46 But in places of general, though casual concourse, where the pursuit of health and pleasure brings people promiscuously together, public conveniency has dispensed with this maxim; 47 and custom there promotes an unreserved conversation for the time, by indulging the privilege of dropping afterwards every indifferent acquaintance, without breach of civility or good manners. 48 Even in societies, which are established on principles the most immoral, and the most destructive to the interests of the general society, there are required certain rules, which a species of false honour, as well as private interest, engages the members to observe. 49 Robbers and pirates, it has often been remarked, could not maintain their pernicious confederacy, did they not establish a pew distributive justice among themselves, and recall those laws of equity, which they have violated with the rest of humankind. 50 I hate a drinking companion, says the Greek proverb, who never forgets. 51 The follies of the last debauch should be buried in eternal oblivion, in order to give full scope to the follies of the next.

52 Among nations, where an immoral gallantry, if covered with a thin veil of mystery, is, in some degree, authorised by custom, there immediately arise a set of rules, calculated for the conveniency of that attachment. 53 The famous court or parliament of

love in Provence formerly decided all difficult cases of this nature. 54 In societies for play, there are laws required for the conduct of the game; and these laws are different in each game. 55 The foundation, I own, of such societies is frivolous; and the laws are, in a great measure, though not altogether, capricious and arbitrary. 56 So far is there a material difference between them and the rules of justice, fidelity, and loyalty. 57 The general societies of people are absolutely requisite for the subsistence of the species; and the public conveniency, which regulates morals, is inviolably established in the nature of human, and of the world, in which you lives. 58 The comparison, therefore, in these respects, is very imperfect. We may only learn from it the necessity of rules, wherever people have any intercourse with each other. They cannot even pass each other on the road without rules. 59 Waggoners, coachmen, and postilions have principles, by which they give the way; and these are chiefly founded on mutual ease and convenience. 60 Sometimes also they are arbitrary, at least dependent on a kind of capricious analogy like many of the reasonings of lawyers. 61 To carry the matter farther, we may observe, that it is impossible for people so much as to murder each other without statutes, and maxims, and an idea of justice and honour. 62 War has its laws as well as peace; and even that sportive kind of war, carried on among wrestlers, boxers, cudgel-players, gladiators, is regulated by fixed principles. 63 Common interest and utility beget infallibly a standard of right and wrong among the parties concerned.

WHY UTILITY PLEASES.

David Hume

PART I

5 It seems so natural a thought to ascribe to their utility the praise, which we bestow on the social virtues, 2 that one would expect to meet with this principle everywhere in moral writers, as the chief foundation of their reasoning and enquiry. 3 In common life, we may observe, that the circumstance of utility is

always appealed to; 4 nor is it supposed, that a greater eulogy can be given to any person, than to display your usefulness to the public, and enumerate the services, which you have performed to humankind and society. 5 What praise, even of an inanimate form, if the regularity and elegance of its parts destroy not its fitness for any useful purpose! 6 And how satisfactory an apology for any disproportion or seeming deformity, if we can show the necessity of that particular construction for the use intended! 7 A ship appears more beautiful to an artist, or one moderately skilled in navigation, where its prow is wide and swelling beyond its poop, than if it were framed with a precise geometrical regularity, in contradiction to all the laws of mechanics. 8 A building, whose doors and windows were exact squares, would hurt the eye by that very proportion; as ill adapted to the figure of a human creature, for whose service the fabric was intended.

9 What wonder then, that a human, whose habits and conduct are hurtful to society, and dangerous or pernicious to every one who has an intercourse with you, should, on that account, be an object of disapprobation, and communicate to every spectator the strongest sentiment of disgust and hatred. 10 But perhaps the difficulty of accounting for these effects of usefulness, or its contrary, has kept philosophers from admitting them into their systems of ethics, 11 and has induced them rather to employ any other principle, in explaining the origin of moral good and evil. 12 But it is no just reason for rejecting any principle, confirmed by experience, that we cannot give a satisfactory account of its origin, nor are able to resolve it into other more general principles. 13 And if we would employ a little thought on the present subject, we need be at no loss to account for the influence of utility, and to deduce it from principles, the most known and avowed in human nature.

14 From the apparent usefulness of the social virtues, it has readily been inferred by sceptics, both ancient and modern, that all moral distinctions arise from education, 15 and were, at first, invented, and afterwards encouraged, by the art

of politicians, in order to render people tractable, and subdue their natural ferocity and selfishness, which incapacitated them for society. 16 This principle, indeed, of precept and education, must so far be owned to have a powerful influence, that it may frequently increase or diminish, beyond their natural standard, the sentiments of approbation or dislike; 17 and may even, in particular instances, create, without any natural principle, a new sentiment of this kind; as is evident in all superstitious practices and observances: 18 But that ALL moral affection or dislike arises from this origin, will never surely be allowed by any judicious enquirer. 19 Had Nature made no such distinction, founded on the original constitution of the mind, the words, HONOURABLE and SHAMEFUL, LOVELY and ODIOUS, NOBLE and DESPICABLE, had never had place in any language; 20 nor could politicians, had they invented these terms, ever have been able to render them intelligible, or make them convey any idea to the audience. So that nothing can be more superficial than this paradox of the sceptics; 21 and it were well, if, in the abstruser studies of logic and metaphysics, we could as easily obviate the cavils of that sect, as in the practical and more intelligible sciences of politics and morals.

22 The social virtues must, therefore, be allowed to have a natural beauty and amiableness, which, at first, antecedent to all precept or education, recommends them to the esteem of uninstructed humankind, and engages their affections. 23 And as the public utility of these virtues is the chief circumstance, whence they derive their merit, it follows, that the end, which they have a tendency to promote, must be some way agreeable to us, and take hold of some natural affection. 24 It must please, either from considerations of self-interest, or from more generous motives and regards.

25 It has often been asserted, that, as every person has a strong connexion with society, and perceives the impossibility of own solitary subsistence, 26 you becomes, on that account, favourable to all those habits or principles, which promote order in

society, and insure to you the quiet possession of so inestimable a blessing. 27 As much as we value our own happiness and welfare, as much must we applaud the practice of justice and humanity, by which alone the social confederacy can be maintained, and every person reap the fruits of mutual protection and assistance. 28 This deduction of morals from self-love, or a regard to private interest, is an obvious thought, and has not arisen wholly from the wanton sallies and sportive assaults of the sceptics. 29 To mention no others, Polybius, one of the gravest and most judicious, as well as most moral writers of antiquity, has assigned this selfish origin to all our sentiments of virtue. 30 But though the solid practical sense of that author, and his aversion to all vain subtilties, render his authority on the present subject very considerable; 31 yet is not this an affair to be decided by authority, and the voice of Nature and experience seems plainly to oppose the selfish theory.

32 We frequently bestow praise on virtuous actions, performed in very distant ages and remote countries; 33 where the utmost subtilty of imagination would not discover any appearance of self-interest, or find any connexion of our present happiness and security with events so widely separated from us. 34 A generous, a brave, a noble deed, performed by an adversary, commands our approbation; while in its consequences it may be acknowledged prejudicial to our particular interest. 35 Where private advantage concurs with general affection for virtue, we readily perceive and avow the mixture of these distinct sentiments, which have a very different feeling and influence on the mind. 36 We praise, perhaps, with more alacrity, where the generous humane action contributes to our particular interest: But the topics of praise, which we insist on, are very wide of this circumstance. 37 And we may attempt to bring over others to our sentiments, without endeavouring to convince them, that they reap any advantage from the actions which we recommend to their approbation and applause. 38 Frame the model of a praiseworthy character, consisting

of all the most amiable moral virtues: Give instances, in which these display themselves after an eminent and extraordinary manner: 39 You readily engage the esteem and approbation of all your audience, who never so much as enquire in what age and country the person lived, who possessed these noble qualities: 40 A circumstance, however, of all others, the most material to self-love, or a concern for our own individual happiness.

41 Once on a time, a statesman, in the shock and contest of parties, prevailed so far as to procure, by his eloquence, the banishment of an able adversary; 42 whom he secretly followed, offering him money for his support during his exile, and soothing him with topics of consolation in his misfortunes. 43 ALAS! cries the banished statesman, WITH WHAT REGRET MUST I LEAVE MY FRIENDS IN THIS CITY, WHERE EVEN ENEMIES ARE SO GENEROUS! 44 Virtue, though in an enemy, here pleased him: And we also give it the just tribute of praise and approbation; 45 nor do we retract these sentiments, when we hear, that the action passed at Athens, about two thousand years ago, and that the persons' names were Eschines and Demosthenes.

46 WHAT IS THAT TO ME? There are few occasions, when this question is not pertinent: 47 And had it that universal, infallible influence supposed, it would turn into ridicule every composition, and almost every conversation, which contain any praise or censure of people and manners. 48 It is but a weak subterfuge, when pressed by these facts and arguments, to say, that we transport ourselves, by the force of imagination, into distant ages and countries, 49 and consider the advantage, which we should have reaped from these characters, had we been contemporaries, and had any commerce with the persons. 50 It is not conceivable, how a REAL sentiment or passion can ever arise from a known IMAGINARY interest; 51 especially when our REAL interest is still kept in view, and is often acknowledged to be entirely distinct from the imaginary, and even sometimes opposite to it. 52 A person, brought to the brink of a precipice, cannot look down

without trembling; and the sentiment of IMAGINARY danger actuates you, in opposition to the opinion and belief of REAL safety. 53 But the imagination is here assisted by the presence of a striking object; and yet prevails not, except it be also aided by novelty, and the unusual appearance of the object. 54 Custom soon reconciles us to heights and precipices, and wears off these false and delusive terrors. 55 The reverse is observable in the estimates which we form of characters and manners; 56 and the more we habituate ourselves to an accurate scrutiny of morals, the more delicate feeling do we acquire of the most minute distinctions between vice and virtue. 57 Such frequent occasion, indeed, have we, in common life, to pronounce all kinds of moral determinations, that no object of this kind can be new or unusual to us; 58 nor could any FALSE views or prepossessions maintain their ground against an experience, so common and familiar. 59 Experience being chiefly what forms the associations of ideas, it is impossible that any association could establish and support itself, in direct opposition to that principle.

60 Usefulness is agreeable, and engages our approbation. This is a matter of fact, confirmed by daily observation. 61 But, USEFUL? For what? For somebody's interest, surely. Whose interest then? Not our own only: For our approbation frequently extends farther. 62 It must, therefore, be the interest of those, who are served by the character or action approved of; and these we may conclude, however remote, are not totally indifferent to us. 63 By opening up this principle, we shall discover one great source of moral distinctions.

PART II.

64 Self-love is a principle in human nature of such extensive energy, and the interest of each individual is, in general, so closely connected with that of the community, 65 that those philosophers were excusable, who fancied that all our concern for the public might be resolved into a concern for our own happiness and preservation. 66 They saw every

moment, instances of approbation or blame, satisfaction or displeasure towards characters and actions; they denominated the objects of these sentiments, VIRTUES, or VICES; 67 they observed, that the former had a tendency to increase the happiness, and the latter the misery of humankind; 68 they asked, whether it were possible that we could have any general concern for society, or any disinterested resentment of the welfare or injury of others; 69 they found it simpler to consider all these sentiments as modifications of self-love; 70 and they discovered a pretence, at least, for this unity of principle, in that close union of interest, which is so observable between the public and each individual.

71 But notwithstanding this frequent confusion of interests, it is easy to attain what natural philosophers, after Lord Bacon, have affected to call the experimentum crucis, or that experiment which points out the right way in any doubt or ambiguity. 72 We have found instances, in which private interest was separate from public; in which it was even contrary: And yet we observed the moral sentiment to continue, notwithstanding this disjunction of interests. 73 And wherever these distinct interests sensibly concurred, we always found a sensible increase of the sentiment, and a more warm affection to virtue, and detestation of vice, 74 or what we properly call, GRATITUDE and REVENGE. Compelled by these instances, we must renounce the theory, which accounts for every moral sentiment by the principle of self-love. 75 We must adopt a more public affection, and allow, that the interests of society are not, even on their own account, entirely indifferent to us.

76 Usefulness is only a tendency to a certain end; and it is a contradiction in terms, that anything pleases as means to an end, where the end itself no wise affects us. 77 If usefulness, therefore, be a source of moral sentiment, and if this usefulness be not always considered with a reference to self; 78 it follows, that everything, which contributes to the happiness of society, recommends itself directly to our

approbation and good-will. 79 Here is a principle, which accounts, in great part, for the origin of morality: And what need we seek for abstruse and remote systems, when there occurs one so obvious and natural?

80 Have we any difficulty to comprehend the force of humanity and benevolence? 81 Or to conceive, that the very aspect of happiness, joy, prosperity, gives pleasure; that of pain, suffering, sorrow, communicates uneasiness? 82 The human countenance, says Horace, borrows smiles or tears from the human countenance. 83 Reduce a person to solitude, and one loses all enjoyment, except either of the sensual or speculative kind; 84 and that because the movements of one's heart are not forwarded by correspondent movements in own fellow-creatures. 85 The signs of sorrow and mourning, though arbitrary, affect us with melancholy; but the natural symptoms, tears and cries and groans, never fail to infuse compassion and uneasiness. 86 And if the effects of misery touch us in so lively a manner; can we be supposed altogether insensible or indifferent towards its causes; when a malicious or treacherous character and behaviour are presented to us?

87 We enter, I shall suppose, into a convenient, warm, well-contrived apartment: We necessarily receive a pleasure from its very survey; because it presents us with the pleasing ideas of ease, satisfaction, and enjoyment. 88 The hospitable, good-humoured, humane landlord appears. This circumstance surely must embellish the whole; 89 nor can we easily forbear reflecting, with pleasure, on the satisfaction which results to every one from his intercourse and good-offices. 90 His whole family, by the freedom, ease, confidence, and calm enjoyment, diffused over their countenances, sufficiently express their happiness. 91 I have a pleasing sympathy in the prospect of so much joy, and can never consider the source of it, without the most agreeable emotions. 92 He tells me, that an oppressive and powerful neighbour had attempted to dispossess him of his inheritance, and had long disturbed all his innocent and social pleasures. 93 I feel an immediate

indignation arise in me against such violence and injury. 94 But it is no wonder, he adds, that a private wrong should proceed from a man, who had enslaved provinces, depopulated cities, and made the field and scaffold stream with human blood.

95 I am struck with horror at the prospect of so much misery, and am actuated by the strongest antipathy against its author. 96 In general, it is certain, that, wherever we go, whatever we reflect on or converse about, everything still presents us with the view of human happiness or misery, and excites in our breast a sympathetic movement of pleasure or uneasiness. 97 In our serious occupations, in our careless amusements, this principle still exerts its active energy.

98 A person who enters the theatre, is immediately struck with the view of so great a multitude, participating of one common amusement; 99 and experiences, from their very aspect, a superior sensibility or disposition of being affected with every sentiment, which you shares with your fellow-creatures. 100 You observes the actors to be animated by the appearance of a full audience, and raised to a degree of enthusiasm, which they cannot command in any solitary or calm moment. 101 Every movement of the theatre, by a skillful poet, is communicated, as it were by magic, to the spectators; 102 who weep, tremble, resent, rejoice, and are inflamed with all the variety of passions, which actuate the several personages of the drama. 103 Where any event crosses our wishes, and interrupts the happiness of the favourite characters, we feel a sensible anxiety and concern. 104 But where their sufferings proceed from the treachery, cruelty, or tyranny of an enemy, our breasts are affected with the liveliest resentment against the author of these calamities. 105 It is here esteemed contrary to the rules of art to represent anything cool and indifferent. 106 A distant friend, or a confident, who has no immediate interest in the catastrophe, ought, if possible, to be avoided by the poet; as communicating a like indifference to the audience, and checking the progress of the

passions. 107 Few species of poetry are more entertaining than PASTORAL; 108 and every one is sensible, that the chief source of its pleasure arises from those images of a gentle and tender tranquility, which it represents in its personages, and of which it communicates a like sentiment to the reader. 109 Sannazarius, who transferred the scene to the sea-shore, though he presented the most magnificent object in Nature, is confessed to have erred in his choice. 110 The idea of toil, labour, and danger, suffered by the fishermen, is painful; by an unavoidable sympathy, which attends every conception of human happiness or misery.

111 When I was twenty, says a French poet, Ovid was my favourite: Now I am forty, I declare for Horace. 112 We enter, to be sure, more readily into sentiments, which resemble those we feel every day: 113 But no passion, when well represented, can be entirely indifferent to us; because there is none, of which every human has not, within you, at least the seeds and first principles. 114 It is the business of poetry to bring every affection near to us by lively imagery and representation, and make it look like truth and reality: 115 A certain proof, that, wherever that reality is found, our minds are disposed to be strongly affected by it. 116 Any recent event or piece of news, by which the fate of states, provinces, or many individuals is affected, is extremely interesting even to those whose welfare is not immediately engaged. 117 Such intelligence is propagated with celerity, heard with avidity, and enquired into with attention and concern. 118 The interest of society appears, on this occasion, to be in some degree the interest of each individual. 119 The imagination is sure to be affected; though the passions excited may not always be so strong and steady as to have great influence on the conduct and behaviour.

120 The perusal of a history seems a calm entertainment; but would be no entertainment at all, did not our hearts beat with correspondent movements to those which are described by the historian. 121 Thucydides and Guicciardin support with difficulty our

attention; while the former describes the trivial encounters of the small cities of Greece, and the latter the harmless wars of Pisa. 122 The few persons interested and the small interest fill not the imagination, and engage not the affections. 123 The deep distress of the numerous Athenian army before Syracuse; the danger which so nearly threatens Venice; these excite compassion; these move terror and anxiety. 124 The indifferent, uninteresting style of Suetonius, equally with the masterly pencil of Tacitus, may convince us of the cruel depravity of Nero or Tiberius: But what a difference of sentiment! 125 While the former coldly relates the facts; and the latter sets before our eyes the venerable figures of a Soranus and a Thrasea, intrepid in their fate, and only moved by the melting sorrows of their friends and kindred. 126 What sympathy then touches every human heart! What indignation against the tyrant, whose causeless fear or unprovoked malice gave rise to such detestable barbarity!

127 If we bring these subjects nearer: If we remove all suspicion of fiction and deceit: What powerful concern is excited, and how much superior, in many instances, to the narrow attachments of self-love and private interest! 128 Popular sedition, party zeal, a devoted obedience to factious leaders; these are some of the most visible, though less laudable effects of this social sympathy in human nature. 129 The frivolousness of the subject too, we may observe, is not able to detach us entirely from what carries an image of human sentiment and affection.

130 When a person stutters, and pronounces with difficulty, we even sympathise with this trivial uneasiness, and suffer for you. 131 And it is a rule in criticism, that every combination of syllables or letters, which gives pain to the organs of speech in the recital, appears also from a species of sympathy harsh and disagreeable to the ear. 132 Nay, when we run over a book with our eye, we are sensible of such unharmonious composition; 133 because we still imagine, that a person recites it to us, and suffers from the pronunciation of these jarring

sounds. So delicate is our sympathy! 134 Easy and unconstrained postures and motions are always beautiful: An air of health and vigour is agreeable: Clothes which warm, without burthening the body; which cover, without imprisoning the limbs, are well-fashioned. 135 In every judgement of beauty, the feelings of the person affected enter into consideration, and communicate to the spectator similar touches of pain or pleasure. 136 What wonder, then, if we can pronounce no judgement concerning the character and conduct of humans, without considering the tendencies of their actions, and the happiness or misery which thence arises to society? 137 What association of ideas would ever operate, were that principle here totally unactive. 138 If any person from a cold insensibility, or narrow selfishness of temper, is unaffected with the images of human happiness or misery, you must be equally indifferent to the images of vice and virtue: 139 As, on the other hand, it is always found, that a warm concern for the interests of our species is attended with a delicate feeling of all moral distinctions; a strong resentment of injury done to humans; a lively approbation of their welfare.

140 In this particular, though great superiority is observable of one person above another; yet none are so entirely indifferent to the interest of their fellow-creatures, 141 as to perceive no distinctions of moral good and evil, in consequence of the different tendencies of actions and principles. 142 How, indeed, can we suppose it possible in any one, who wears a human heart, that if there be subjected to your censure, one character or system of conduct, which is beneficial, and another which is pernicious to your species or community, 143 you will not so much as give a cool preference to the former, or ascribe to it the smallest merit or regard? 144 Let us suppose such a person ever so selfish; let private interest have ingrossed ever so much your attention; 145 yet in instances, where that is not concerned, you must unavoidably feel SOME propensity to the good of humankind, and make it an

object of choice, if everything else be equal.

146 Would any person, who is walking along, tread as willingly on another's gouty toes, whom you have no quarrel with, as on the hard flint and pavement? 147 There is here surely a difference in the case. We surely take into consideration the happiness and misery of others, in weighing the several motives of action, 148 and incline to the former, where no private regards draw us to seek our own promotion or advantage by the injury of our fellow-creatures. 149 And if the principles of humanity are capable, in many instances, of influencing our actions, they must, at all times, have some authority over our sentiments, and give us a general approbation of what is useful to society, and blame of what is dangerous or pernicious. 150 The degrees of these sentiments may be the subject of controversy; but the reality of their existence, one should think, must be admitted in every theory or system.

151 A creature, absolutely malicious and spiteful, were there any such in Nature, must be worse than indifferent to the images of vice and virtue. 152 All your sentiments must be inverted, and directly opposite to those, which prevail in the human species. 153 Whatever contributes to the good of humankind, as it crosses the constant bent of your wishes and desires, must produce uneasiness and disapprobation; 154 and on the contrary, whatever is the source of disorder and misery in society, must, for the same reason, be regarded with pleasure and complacency.

155 Timon, who probably from his affected spleen more than an inveterate malice, was denominated the man-hater, embraced Alcibiades with great fondness. 156 GO ON, MY BOY! Cried he, ACQUIRE THE CONFIDENCE OF THE PEOPLE: YOU WILL ONE DAY, I FORESEE, BE THE CAUSE OF GREAT CALAMITIES TO THEM. 157 Could we admit the two principles of the Manicheans, it is an infallible consequence, that their sentiments of human actions, as well as of everything else, must be totally opposite, 158 and that every instance of justice and humanity, from its necessary tendency, must please the one

deity and displease the other. 159 All humankind so far resemble the good principle, that, where interest or revenge or envy perverts not our disposition, we are always inclined, from our natural philanthropy, to give the preference to the happiness of society, and consequently to virtue above its opposite. 160 Absolute, unprovoked, disinterested malice has never perhaps place in any human breast; or if it had, must there pervert all the sentiments of morals, as well as the feelings of humanity. 161 If the cruelty of Nero be allowed entirely voluntary, and not rather the effect of constant fear and resentment; it is evident that Tigellinus, preferably to Seneca or Burrhus, must have possessed his steady and uniform approbation.

162 A states-person or patriot, who serves our own country in our own time, has always a more passionate regard paid to the self, than one whose beneficial influence operated on distant ages or remote nations; 163 where the good, resulting from own generous humanity, being less connected with us, seems more obscure, and affects us with a less lively sympathy. 164 We may own the merit to be equally great, though our sentiments are not raised to an equal height, in both cases. 165 The judgement here corrects the inequalities of our internal emotions and perceptions; in like manner, as it preserves us from error, in the several variations of images, presented to our external senses. 166 The same object, at a double distance, really throws on the eye a picture of but half the bulk; yet we imagine that it appears of the same size in both situations; 167 because we know that on our approach to it, its image would expand on the eye, and that the difference consists not in the object itself, but in our position with regard to it. 168 And, indeed, without such a correction of appearances, both in internal and external sentiment, people could never think or talk steadily on any subject; 169 while their fluctuating situations produce a continual variation on objects, and throw them into such different and contrary lights and positions.

170 The more we converse with humankind, and the greater social

intercourse we maintain, the more shall we be familiarised to these general preferences and distinctions, without which our conversation and discourse could scarcely be rendered intelligible to each other. 171 Every human's interest is peculiar to oneself, and the aversions and desires, which result from it, cannot be supposed to affect others in a like degree. 172 General language, therefore, being formed for general use, must be moulded on some more general views, and must affix the epithets of praise or blame, in conformity to sentiments, which arise from the general interests of the community. 173 And if these sentiments, in most humans, be not so strong as those, which have a reference to private good; yet still they must make some distinction, even in persons the most depraved and selfish; 174 and must attach the notion of good to a beneficent conduct, and of evil to the contrary.

175 Sympathy, we shall allow, is much fainter than our concern for ourselves, and sympathy with persons remote from us much fainter than that with persons near and contiguous; 176 but for this very reason it is necessary for us, in our calm judgements and discourse concerning the characters of humans, to neglect all these differences, and render our sentiments more public and social. 177 Besides, that we ourselves often change our situation in this particular, we every day meet with persons who are in a situation different from us, 178 and who could never converse with us were we to remain constantly in that position and point of view, which is peculiar to ourselves. 179 The intercourse of sentiments, therefore, in society and conversation, makes us form some general unalterable standard, by which we may approve or disapprove of characters and manners. 180 And though the heart takes not part entirely with those general notions, nor regulates all its love and hatred by the universal abstract differences of vice and virtue, without regard to self, or the persons with whom we are more intimately connected; 181 yet have these moral differences a considerable influence, and being sufficient, at least for discourse,

serve all our purposes in company, in the pulpit, on the theatre, and in the schools.

182 Thus, in whatever light we take this subject, the merit, ascribed to the social virtues, appears still uniform, and arises chiefly from that regard, which the natural sentiment of benevolence engages us to pay to the interests of humankind and society. 183 If we consider the principles of the human make, such as they appear to daily experience and observation, we must, A PRIORI, conclude it impossible for such a creature as human to be totally indifferent to the well or ill-being of own fellow-creatures, 184 and not readily, of yourself, to pronounce, where nothing gives you any particular bias, that what promotes their happiness is good, what tends to their misery is evil, without any farther regard or consideration. 185 Here then are the faint rudiments, at least, or outlines, of a GENERAL distinction between actions; and in proportion as the humanity of the person is supposed to increase, 186 your connexion with those who are injured or benefited, and your lively conception of their misery or happiness; your consequent censure or approbation acquires proportionable vigour.

187 There is no necessity, that a generous action, barely mentioned in an old history or remote gazette, should communicate any strong feelings of applause and admiration. 188 Virtue, placed at such a distance, is like a fixed star, which, though to the eye of reason it may appear as luminous as the sun in your meridian, is so infinitely removed as to affect the senses, neither with light nor heat. 189 Bring this virtue nearer, by our acquaintance or connexion with the persons, or even by an eloquent recital of the case; our hearts are immediately caught, our sympathy enlivened, and our cool approbation converted into the warmest sentiments of friendship and regard. 190 These seem necessary and infallible consequences of the general principles of human nature, as discovered in common life and practice.

191 Again; reverse these views and reasonings: Consider the matter a posteriori; and weighing the

consequences, enquire if the merit of social virtue be not, in a great measure, derived from the feelings of humanity, with which it affects the spectators. 192 It appears to be matter of fact, that the circumstance of UTILITY, in all subjects, is a source of praise and approbation: 193 That it is constantly appealed to in all moral decisions concerning the merit and demerit of actions: 194 That it is the SOLE source of that high regard paid to justice, fidelity, honour, allegiance, and chastity: 195 That it is inseparable from all the other social virtues, humanity, generousity, charity, affability, lenity, mercy, and moderation: 196 And, in a word, that it is a foundation of the chief part of morals, which has a reference to humankind and our fellow-creatures.

197 It appears also, that, in our general approbation of characters and manners, the useful tendency of the social virtues moves us not by any regards to self-interest, but has an influence much more universal and extensive. 198 It appears that a tendency to public good, and to the promoting of peace, harmony, and order in society, does always, by affecting the benevolent principles of our frame, engage us on the side of the social virtues. 199 And it appears, as an additional confirmation, that these principles of humanity and sympathy enter so deeply into all our sentiments, and have so powerful an influence, as may enable them to excite the strongest censure and applause. 200 The present theory is the simple result of all these inferences, each of which seems founded on uniform experience and observation. 201 Were it doubtful, whether there were any such principle in our nature as humanity or a concern for others, 202 yet when we see, in numberless instances, that whatever has a tendency to promote the interests of society, is so highly approved of, we ought thence to learn the force of the benevolent principle; 203 since it is impossible for anything to please as means to an end, where the end is totally indifferent. 204 On the other hand, were it doubtful, whether there were, implanted in our nature, any general principle

of moral blame and approbation, 205 yet when we see, in numberless instances, the influence of humanity, we ought thence to conclude, that it is impossible, but that everything which promotes the interest of society must communicate pleasure, and what is pernicious give uneasiness. 206 But when these different reflections and observations concur in establishing the same conclusion, must they not bestow an undisputed evidence upon it? 207 It is however hoped, that the progress of this argument will bring a farther confirmation of the present theory, by showing the rise of other sentiments of esteem and regard from the same or like principles.

OF QUALITIES USEFUL TO OURSELVES

David Hume

PART I

6 IT seems evident, that where a quality or habit is subjected to our examination, if it appear in any respect prejudicial to the person possessed of it, or such as incapacitates you for business and action, it is instantly blamed, and ranked among your faults and imperfections. 2 Indolence, negligence, want of order and method, obstinacy, fickleness, rashness, credulity; these qualities were never esteemed by any one indifferent to a character; much less, extolled as accomplishments or virtues. 3 The prejudice, resulting from them, immediately strikes our eye, and gives us the sentiment of pain and disapprobation. 4 No quality, it is allowed, is absolutely either blameable or praiseworthy. It is all according to its degree.

5 A due medium, says the Peripatetics, is the characteristic of virtue. But this medium is chiefly determined by utility. 6 A proper celerity, for instance, and dispatch in business, is commendable. When defective, no progress is ever made in the execution of any purpose: 7 When excessive, it engages us in precipitate and ill-concerted measures and enterprises: 8 By such reasonings, we fix the proper and commendable mediocrity in all moral and prudential disquisitions;

and never lose view of the advantages, which result from any character or habit. 9 Now as these advantages are enjoyed by the person possessed of the character, it can never be SELF-LOVE which renders the prospect of them agreeable to us, the spectators, and prompts our esteem and approbation. 10 No force of imagination can convert us into another person, and make us fancy, that we, being that person, reap benefit from those valuable qualities, which belong to you. 11 Or if it did, no celerity of imagination could immediately transport us back, into ourselves, and make us love and esteem the person, as different from us. 12 Views and sentiments, so opposite to known truth and to each other, could never have place, at the same time, in the same person. 13 All suspicion, therefore, of selfish regards, is here totally excluded. It is a quite different principle, which actuates our bosom, and interests us in the felicity of the person whom we contemplate. 14 Where your natural talents and acquired abilities give us the prospect of elevation, advancement, a figure in life, prosperous success, a steady command over fortune, and the execution of great or advantageous undertakings; 15 we are struck with such agreeable images, and feel a complacency and regard immediately arise towards you. 16 The ideas of happiness, joy, triumph, prosperity, are connected with every circumstance of your character, and diffuse over our minds a pleasing sentiment of sympathy and humanity.

17 Let us suppose a person originally framed so as to have no manner of concern for own fellow-creatures, but to regard the happiness and misery of all sensible beings with greater indifference than even two contiguous shades of the same colour. 18 Let us suppose, if the prosperity of nations were laid on the one hand, and their ruin on the other, and you were desired to choose; that you would stand like the schoolman's ass, irresolute and undetermined, between equal motives; 19 or rather, like the same ass between two pieces of wood or marble, without any inclination or propensity to either side. 20 The consequence, I believe, must be

allowed just, that such a person, being absolutely unconcerned, either for the public good of a community or the private utility of others, 21 would look on every quality, however pernicious, or however beneficial, to society, or to its possessor, with the same indifference as on the most common and uninteresting object.

22 But if, instead of this fancied monster, we suppose a PERSON to form a judgement or determination in the case, there is to you a plain foundation of preference, where everything else is equal; 23 and however cool your choice may be, if your heart be selfish, or if the persons interested be remote from you; there must still be a choice or distinction between what is useful, and what is pernicious. 24 Now this distinction is the same in all its parts, with the MORAL DISTINCTION, whose foundation has been so often, and so much in vain, enquired after. 25 The same endowments of the mind, in every circumstance, are agreeable to the sentiment of morals and to that of humanity; 26 the same temper is susceptible of high degrees of the one sentiment and of the other; and the same alteration in the objects, by their nearer approach or by connexions, enlivens the one and the other. 27 By all the rules of philosophy, therefore, we must conclude, that these sentiments are originally the same; since, in each particular, even the most minute, they are governed by the same laws, and are moved by the same objects.

28 Why do philosophers infer, with the greatest certainty, that the moon is kept in its orbit by the same force of gravity, that makes bodies fall near the surface of the earth, 29 but because these effects are, upon computation, found similar and equal? And must not this argument bring as strong conviction, in moral as in natural disquisitions? 30 To prove, by any long detail, that all the qualities, useful to the possessor, are approved of, and the contrary censured, would be superfluous. 31 The least reflection on what is every day experienced in life, will be sufficient. 32 We shall only mention a few instances, in order to remove, if possible, all doubt and hesitation.

33 The quality, the most necessary for the execution of any useful enterprise, is discretion; by which we carry on a safe intercourse with others, 34 give due attention to our own and to their character, weigh each circumstance of the business which we undertake, and employ the surest and safest means for the attainment of any end or purpose. 35 To a Cromwell, perhaps, or a De Retz, discretion may appear an alderman-like virtue, as Dr. Swift calls it; 36 and being incompatible with those vast designs, to which their courage and ambition prompted them, it might really, in them, be a fault or imperfection. 37 But in the conduct of ordinary life, no virtue is more requisite, not only to obtain success, but to avoid the most fatal miscarriages and disappointments. 38 The greatest parts without it, as observed by an elegant writer, may be fatal to their owner; as Polyphemus, deprived of his eye, was only the more exposed, on account of his enormous strength and stature.

39 The best character, indeed, were it not rather too perfect for human nature, is that which is not swayed by temper of any kind; 40 but alternately employs enterprise and caution, as each is useful to the particular purpose intended. 41 Such is the excellence which St. Evremond ascribes to Mareschal Turenne, who displayed every campaign, as he grew older, more temerity in his military enterprises; 42 and being now, from long experience, perfectly acquainted with every incident in war, he advanced with greater firmness and security, in a road so well known to him. 43 Fabius, says Machiavel, was cautious; Scipio enterprising: And both succeeded, because the situation of the Roman affairs, during the command of each, was peculiarly adapted to his genius; but both would have failed, had these situations been reversed. 44 You are happy, whose circumstances suit your temper; but you are more excellent, who can suit your temper to any circumstances.

45 What need is there to display the praises of industry, and to extol its advantages, in the acquisition of power and riches, or in raising what we call a FORTUNE in the world? 46 The tortoise, according

to the fable, by his perseverance, gained the race of the hare, though possessed of much superior swiftness. 47 A person's time, when well husbanded, is like a cultivated field, of which a few acres produce more of what is useful to life, than extensive provinces, even of the richest soil, when over-run with weeds and brambles. 48 But all prospect of success in life, or even of tolerable subsistence, must fail, where a reasonable frugality is wanting. 49 The heap, instead of increasing, diminishes daily, and leaves its possessor so much more unhappy, as, not having been able to confine own expences to a large revenue, you will still less be able to live contentedly on a small one. 50 The souls of humans, according to Plato, inflamed with impure appetites, and losing the body, which alone afforded means of satisfaction, hover about the earth, and haunt the places, where their bodies are deposited; possessed with a longing desire to recover the lost organs of sensation. 51 So may we see worthless prodigals, having consumed their fortune in wild debauches, thrusting themselves into every plentiful table, and every party of pleasure, hated even by the vicious, and despised even by fools.

52 The one extreme of frugality is avarice, which, as it both deprives a human of all use of your riches, and checks hospitality and every social enjoyment, is justly censured on a double account. 53 PRODIGALITY, the other extreme, is commonly more hurtful to a person; 54 and each of these extremes is blamed above the other, according to the temper of the person who censures, and according to your greater or less sensibility to pleasure, either social or sensual. 55 Qualities often derive their merit from complicated sources. Honesty, fidelity, truth, are praised for their immediate tendency to promote the interests of society; 56 but after those virtues are once established upon this foundation, they are also considered as advantageous to the person, and as the source of that trust and confidence, which can alone give a person any consideration in life. 57 One becomes contemptible, no less than odious, when you forgets the

duty, which, in this particular, you owes to yourself as well as to society.

58 Perhaps, this consideration is one CHIEF source of the high blame, which is thrown on any instance of failure among women in point of CHASTITY. 59 The greatest regard, which can be acquired by that sex, is derived from their fidelity; 60 and a woman becomes cheap and vulgar, loses her rank, and is exposed to every insult, who is deficient in this particular. The smallest failure is here sufficient to blast her character. 61 A female has so many opportunities of secretly indulging these appetites, that nothing can give us security but her absolute modesty and reserve; and where a breach is once made, it can scarcely ever be fully repaired. 62 If a man behave with cowardice on one occasion, a contrary conduct reinstates him in his character. 63 But by what action can a woman, whose behaviour has once been dissolute, be able to assure us, that she has formed better resolutions, and has self-command enough to carry them into execution?

64 All humans, it is allowed, are equally desirous of happiness; but few are successful in the pursuit: 65 One considerable cause is the want of strength of mind, which might enable them to resist the temptation of present ease or pleasure, and carry them forward in the search of more distant profit and enjoyment. 66 Our affections, on a general prospect of their objects, form certain rules of conduct, and certain measures of preference of one above another: 67 and these decisions, though really the result of our calm passions and propensities, (for what else can pronounce any object eligible or the contrary?) are yet said, by a natural abuse of terms, to be the determinations of pure REASON and reflection. 68 But when some of these objects approach nearer to us, or acquire the advantages of favourable lights and positions, which catch the heart or imagination; 69 our general resolutions are frequently confounded, a small enjoyment preferred, and lasting shame and sorrow entailed upon us. 70 And however poets may employ their wit and eloquence, in celebrating

present pleasure, and rejecting all distant views to fame, health, or fortune; 71 it is obvious, that this practice is the source of all dissoluteness and disorder, repentance and misery. 72 A person of a strong and determined temper adheres tenaciously to own general resolutions, and is neither seduced by the allurements of pleasure, nor terrified by the menaces of pain; 73 but keeps still in view those distant pursuits, by which you, at once, ensures your happiness and your honour.

74 Self-satisfaction, at least in some degree, is an advantage, which equally attends the fool and the wise person: 75 But it is the only one; nor is there any other circumstance in the conduct of life, where they are upon an equal footing. 76 Business, books, conversation; for all of these, a fool is totally incapacitated, and except condemned by own station to the coarsest drudgery, remains a useless burthen upon the earth. 77 Accordingly, it is found, that people are extremely jealous of their character in this particular; and many instances are seen of profligacy and treachery, the most avowed and unreserved; none of bearing patiently the imputation of ignorance and stupidity. 78 Dicaearchus, the Macedonian general, who, as Polybius tells us, openly erected one altar to impiety, another to injustice, in order to bid defiance to humankind; 79 even he, I am well assured, would have started at the epithet of FOOL, and have meditated revenge for so injurious an appellation. 80 Except the affection of parents, the strongest and most indissoluble bond in human nature, no connexion has strength sufficient to support the disgust arising from this character. 81 Love itself, which can subsist under treachery, ingratitude, malice, and infidelity, is immediately extinguished by it, when perceived and acknowledged; nor are deformity and old age more fatal to the dominion of that passion. 82 So dreadful are the ideas of an utter incapacity for any purpose or undertaking, and of continued error and misconduct in life!

83 When it is asked, whether a quick or a slow apprehension be most valuable? Whether one, that,

at first view, penetrates far into a subject, but can perform nothing upon study; 84 or a contrary character, which must work out everything by dint of application? Whether a clear head or a copious invention? Whether a profound genius or a sure judgement? 85 In short, what character, or peculiar turn of understanding, is more excellent than another? 86 It is evident, that we can answer none of these questions, without considering which of those qualities capacitates a person best for the world, and carries you farthest in any undertaking.

87 If refined sense and exalted sense be not so USEFUL as common sense, their rarity, their novelty, and the nobleness of their objects make some compensation, and render them the admiration of humankind: 88 As gold, though less serviceable than iron, acquires from its scarcity a value which is much superior. 89 The defects of judgement can be supplied by no art or invention; but those of memory frequently may, both in business and in study, by method and industry, and by diligence in committing everything to writing; 90 and we scarcely ever hear a short memory given as a reason for a person's failure in any undertaking. 91 But in ancient times, when no person could make a figure without the talent of speaking, and when the audience were too delicate to bear such crude, undigested harangues as our extemporary orators offer to public assemblies; 92 the faculty of memory was then of the utmost consequence, and was accordingly much more valued than at present. 93 Scarce any great genius is mentioned in antiquity, who is not celebrated for this talent; and Cicero enumerates it among the other sublime qualities of Caesar himself. 94 Particular customs and manners alter the usefulness of qualities: they also alter their merit. Particular situations and accidents have, in some degree, the same influence. 95 You will always be more esteemed, who possesses those talents and accomplishments, which suit your station and profession, than you whom fortune has misplaced in the part which she has assigned you.

96 The private or selfish virtues are, in this respect, more arbitrary

than the public and social. In other respects they are, perhaps, less liable to doubt and controversy. 97 In this kingdom, such continued ostentation, of late years, has prevailed among people in ACTIVE life with regard to PUBLIC SPIRIT, and among those in SPECULATIVE with regard to BENEVOLENCE; 98 and so many false pretensions to each have been, no doubt, detected, that people of the world are apt, without any bad intention, to discover a sullen incredulity on the head of those moral endowments, and even sometimes absolutely to deny their existence and reality. 99 In like manner I find, that, of old, the perpetual cant of the STOICS and CYNICS concerning VIRTUE, their magnificent professions and slender performances, bred a disgust in humankind; 100 and Lucian, who, though licentious with regard to pleasure, is yet in other respects a very moral writer, cannot sometimes talk of virtue, so much boasted without betraying symptoms of spleen and irony. 101 But surely this peevish delicacy, whence-ever it arises can never be carried so far as to make us deny the existence of every species of merit, and all distinction of manners and behaviour. 102 Besides DISCRETION, CAUTION, ENTERPRISE, INDUSTRY, ASSIDUITY, FRUGALITY, ECONOMY, GOOD-SENSE, PRUDENCE, DISCERNMENT; besides these endowments, I say, whose very names force an avowal of their merit, 103 there are many others, to which the most determined scepticism cannot for a moment refuse the tribute of praise and approbation. 104 TEMPERANCE, SOBRIETY, PATIENCE, CONSTANCY, PERSEVERANCE, FORETHOUGHT, CONSIDERATENESS, SECRECY, ORDER, INSINUATION, ADDRESS, PRESENCE OF MIND, QUICKNESS OF CONCEPTION, FACILITY OF EXPRESSION, these, and a thousand more of the same kind, no human will ever deny to be excellencies and perfections. 105 As their merit consists in their tendency to serve the person, possessed of them, without any magnificent claim to public and social desert, we are the less jealous of their pretensions, and readily admit them into the catalogue of laudable qualities. 106 We are not sensible that, by this concession, we have paved the

way for all the other moral excellencies, 107 and cannot consistently hesitate any longer, with regard to disinterested benevolence, patriotism, and humanity.

108 It seems, indeed, certain, that first appearances are here, as usual, extremely deceitful, 109 and that it is more difficult, in a speculative way, to resolve into self-love the merit which we ascribe to the selfish virtues above mentioned, than that even of the social virtues, justice and beneficence. 110 For this latter purpose, we need but say, that whatever conduct promotes the good of the community is loved, praised, and esteemed by the community, on account of that utility and interest, of which every one partakes; 111 and though this affection and regard be, in reality, gratitude, not self-love, yet a distinction, even of this obvious nature, may not readily be made by superficial reasoners; and there is room, at least, to support the cavil and dispute for a moment. 112 But as qualities, which tend only to the utility of their possessor, without any reference to us, or to the community, are yet esteemed and valued; 113 by what theory or system can we account for this sentiment from self-love, or deduce it from that favourite origin? 114 There seems here a necessity for confessing that the happiness and misery of others are not spectacles entirely indifferent to us; 115 but that the view of the former, whether in its causes or effects, like sunshine or the prospect of well-cultivated plains (to carry our pretensions no higher), communicates a secret joy and satisfaction; 116 the appearance of the latter, like a lowering cloud or barren landscape, throws a melancholy damp over the imagination. 117 And this concession being once made, the difficulty is over; and a natural unforced interpretation of the phenomena of human life will afterwards, we may hope, prevail among all speculative enquirers.

PART II.

118 It may not be improper, in this place, to examine the influence of bodily endowments, and of the goods of fortune, over our sentiments of regard and esteem,

and to consider whether these phenomena fortify or weaken the present theory. 119 It will naturally be expected, that the beauty of the body, as is supposed by all ancient moralists, will be similar, in some respects, to that of the mind; 120 and that every kin of esteem, which is paid to a person, will have something similar in its origin, whether it arise from your mental endowments, or from the situation of your exterior circumstances.

121 It is evident, that one considerable source of BEAUTY in all animals is the advantage which they reap from the particular structure of their limbs and members, suitably to the particular manner of life, to which they are by nature destined. 122 The just proportions of a horse, described by Xenophon and Virgil, are the same that are received at this day by our modern jockeys; 123 because the foundation of them is the same, namely, experience of what is detrimental or useful in the animal. 124 Broad shoulders, a lank belly, firm joints, taper legs; all these are beautiful in our species, because signs of force and vigour. 125 Ideas of utility and its contrary, though they do not entirely determine what is handsome or deformed, are evidently the source of a considerable part of approbation or dislike.

126 In ancient times, bodily strength and dexterity, being of greater USE and importance in war, was also much more esteemed and valued, than at present. 127 Not to insist on Homer and the poets, we may observe, that historians scruple not to mention FORCE OF BODY among the other accomplishments even of Epaminondas, whom they acknowledge to be the greatest hero, statesman, and general of all the Greeks. 128 A like praise is given to Pompey, one of the greatest of the Romans. This instance is similar to what we observed above with regard to memory.

129 What derision and contempt, with both sexes, attend IMPOTENCE; while the unhappy object is regarded as one deprived of so capital a pleasure in life, and at the same time, as disabled from communicating it to others.

130 BARRENNESS in women, being also a species of INUTILITY, is a reproach, but not in the same degree: of which the reason is very obvious, according to the present theory. 131 There is no rule in painting or statuary more indispensible than that of balancing the figures, and placing them with the greatest exactness on their proper centre of gravity. 132 A figure, which is not justly balanced, is ugly; because it conveys the disagreeable ideas of fall, harm, and pain. 133 A disposition or turn of mind, which qualifies a person to rise in the world and advance own fortune, is entitled to esteem and regard, as has already been explained. 134 It may, therefore, naturally be supposed, that the actual possession of riches and authority will have a considerable influence over these sentiments.

135 Let us examine any hypothesis by which we can account for the regard paid to the rich and powerful; 136 we shall find none satisfactory, but that which derives it from the enjoyment communicated to the spectator by the images of prosperity, happiness, ease, plenty, authority, and the gratification of every appetite. 137 Self-love, for instance, which some affect so much to consider as the source of every sentiment, is plainly insufficient for this purpose. 138 Where no good-will or friendship appears, it is difficult to conceive on what we can found our hope of advantage from the riches of others; 139 though we naturally respect the rich, even before they discover any such favourable disposition towards us. 140 We are affected with the same sentiments, when we lie so much out of the sphere of their activity, that they cannot even be supposed to possess the power of serving us. 141 A prisoner of war, in all civilised nations, is treated with a regard suited to own condition; and riches, it is evident, go far towards fixing the condition of any person. 142 If birth and quality enter for a share, this still affords us an argument to our present purpose. 143 For what is it we call a person of birth, but one who is descended from a long succession of rich and powerful ancestors, and who acquires our esteem by

own connexion with persons whom we esteem? 144 Your ancestors, therefore, though dead, are respected, in some measure, on account of their riches; and consequently, without any kind of expectation. 145 But not to go so far as prisoners of war or the dead, to find instances of this disinterested regard for riches; we may only observe, with a little attention, those phenomena which occur in common life and conversation. 146 A person, who is yourself, we shall suppose, of a competent fortune, and of no profession, being introduced to a company of strangers, naturally treats them with different degrees of respect, as you are informed of their different fortunes and conditions; 147 though it is impossible that you can so suddenly propose, and perhaps you would not accept of, any pecuniary advantage from them. 148 A traveller is always admitted into company, and meets with civility, in proportion as own train and equipage speak the self a person of great or moderate fortune. 149 In short, the different ranks of people are, in a great measure, regulated by riches; and that with regard to superiors as well as inferiors, strangers as well as acquaintance. 150 What remains, therefore, but to conclude, that, as riches are desired for ourselves only as the means of gratifying our appetites, 151 either at present or in some imaginary future period, they beget esteem in others merely from their having that influence. 152 This indeed is their very nature or offence: they have a direct reference to the commodities, conveniences, and pleasures of life. 153 The bill of a banker, who is broke, or gold in a desert island, would otherwise be full as valuable. 154 When we approach a person who is, as we say, at own ease, we are presented with the pleasing ideas of plenty, satisfaction, cleanliness, warmth; 155 a cheerful house, elegant furniture, ready service, and whatever is desirable in meat, drink, or apparel. 156 On the contrary, when a poor person appears, the disagreeable images of want, penury, hard labour, dirty furniture, coarse or ragged clothes, nauseous meat and distasteful liquor, immediately strike our

fancy. 157 What else do we mean by saying that one is rich, the other poor? 158 And as regard or contempt is the natural consequence of those different situations in life, it is easily seen what additional light and evidence this throws on our preceding theory, with regard to all moral distinctions.

159 A person who has cured oneself of all ridiculous pre-possessions, and is fully, sincerely, and steadily convinced, from experience as well as philosophy, that the difference of fortune makes less difference in happiness than is vulgarly imagined; 160 such a one does not measure out degrees of esteem according to the rent-rolls of own acquaintance. 161 You may, indeed, externally pay a superior deference to the great lord above the vassal; because riches are the most convenient, being the most fixed and determinate, source of distinction. 162 But your internal sentiments are more regulated by the personal characters of people, than by the accidental and capricious favours of fortune.

163 In most countries of Europe, family, that is, hereditary riches, marked with titles and symbols from the sovereign, is the chief source of distinction. In England, more regard is paid to present opulence and plenty. 164 Each practice has its advantages and disadvantages. Where birth is respected, unactive, spiritless minds remain in haughty indolence, and dream of nothing but pedigrees and genealogies: 165 the generous and ambitious seek honour and authority, and reputation and favour. 166 Where riches are the chief idol, corruption, venality, rapine prevail: arts, manufactures, commerce, agriculture flourish. 167 The former prejudice, being favourable to military virtue, is more suited to monarchies. The latter, being the chief spur to industry, agrees better with a republican government. 168 And we accordingly find that each of these forms of government, by varying the utility of those customs, has commonly a proportionable effect on the sentiments of humankind.

OF QUALITIES IMMEDIATELY AGREEABLE TO OURSELVES

David Hume

7 Whoever has passed an evening with serious melancholy people, and has observed how suddenly the conversation was animated, and what sprightliness diffused itself over the countenance, discourse, and behaviour of every one, on the accession of a good-humoured, lively companion; 2 such a one will easily allow that cheerfulness carries great merit with it, and naturally conciliates the good-will of humankind. 3 No quality, indeed, more readily communicates itself to all around; because no one has a greater propensity to display itself, in jovial talk and pleasant entertainment. 4 The flame spreads through the whole circle; and the most sullen and morose are often caught by it. 5 That the melancholy hate the merry, even though Horace says it, I have some difficulty to allow; 6 because I have always observed that, where the jollity is moderate and decent, serious people are so much the more delighted, 7 as it dissipates the gloom with which they are commonly oppressed, and gives them an unusual enjoyment.

8 From this influence of cheerfulness, both to communicate itself and to engage approbation, we may perceive that there is another set of mental qualities, 9 which, without any utility or any tendency to farther good, either of the community or of the possessor, diffuse a satisfaction on the beholders, and procure friendship and regard. 10 Their immediate sensation, to the person possessed of them, is agreeable. Others enter into the same humour, and catch the sentiment, by a contagion or natural sympathy; 11 and as we cannot forbear loving whatever pleases, a kindly emotion arises towards the person who communicates so much satisfaction. 12 You are a more animating spectacle; your presence diffuses over us more serene complacency and enjoyment; 13 our imagination, entering into your feelings and disposition, is affected in a more agreeable manner than if a melancholy, dejected, sullen, anxious temper were presented to us. 14 Hence the

affection and probation which attend the former: the aversion and disgust with which we regard the latter.

15 Few men would envy the character which Caesar gives of Cassius:

> 16 He loves no play,
> As thou do'st, Anthony:
> he hears no music:
> Seldom he smiles;
> and smiles in such a sort,
> As if he mock'd himself, and
> scorn'd his spirit
> That could be mov'd to smile at
> any thing.

17 Not only such people, as Caesar adds, are commonly DANGEROUS, but also, having little enjoyment within themselves, they can never become agreeable to others, or contribute to social entertainment. 18 In all polite nations and ages, a relish for pleasure, if accompanied with temperance and decency, is esteemed a considerable merit, even in the greatest people; and becomes still more requisite in those of inferior rank and character. 19 It is an agreeable representation, which a French writer gives of the situation of his own mind in this particular, 20 VIRTUE I LOVE, says he, WITHOUT AUSTERITY: PLEASURE WITHOUT EFFEMINACY: AND LIFE, WITHOUT FEARING ITS END.

21 Who is not struck with any signal instance of greatness of mind or dignity of character; with elevation of sentiment, disdain of slavery, and with that noble pride and spirit, which arises from conscious virtue? 22 The sublime, says Longinus, is often nothing but the echo or image of magnanimity; 23 and where this quality appears in any one, even though a syllable be not uttered, it excites our applause and admiration; 24 as may be observed of the famous silence of Ajax in the Odyssey, which expresses more noble disdain and resolute indignation than any language can convey.

25 WERE I Alexander, said Parmenio, I WOULD ACCEPT OF THESE OFFERS MADE BY DARIUS. 26 SO WOULD I TOO, replied Alexander, WERE I PARMENIO. This saying is admirable, says Longinus, from a like principle. 27 GO! cries the same hero to his soldiers, when they refused to follow him to the Indies, GO TELL YOUR COUNTRYMEN, THAT YOU LEFT Alexander COMPLETING THE

CONQUEST OF THE WORLD. 28 'Alexander,' said the Prince of Conde, who always admired this passage, 'abandoned by his soldiers, among barbarians, not yet fully subdued, 29 felt in himself such a dignity and right of empire, that he could not believe it possible that any one would refuse to obey him. 30 Whether in Europe or in Asia, among Greeks or Persians, all was indifferent to him: wherever he found people, he fancied he should find subjects.'

31 The confident of Medea in the tragedy recommends caution and submission; and enumerating all the distresses of that unfortunate heroine, 32 asks her, what she has to support her against her numerous and implacable enemies. MYSELF, replies she; MYSELF I SAY, AND IT IS ENOUGH. 33 Boileau justly recommends this passage as an instance of true sublime.

34 When Phocion, the modest, the gentle Phocion, was led to execution, he turned to one of his fellow-sufferers, who was lamenting his own hard fate, IS IT NOT GLORY ENOUGH FOR YOU, says he, THAT YOU DIE WITH PHOCION?

35 Place in opposition the picture which Tacitus draws of Vitellius, fallen from empire, prolonging his ignominy from a wretched love of life, delivered over to the merciless rabble; 36 tossed, buffeted, and kicked about; constrained, by their holding a poniard under his chin, to raise his head, and expose himself to every contumely. 37 What abject infamy! What low humiliation! Yet even here, says the historian, he discovered some symptoms of a mind not wholly degenerate. 38 To a tribune, who insulted him, he replied, I AM STILL YOUR EMPEROR.

39 We never excuse the absolute want of spirit and dignity of character, or a proper sense of what is due to one's self, in society and the common intercourse of life. 40 This vice constitutes what we properly call MEANNESS; when a person can submit to the basest slavery, in order to gain own ends; 41 fawn upon those who abuse you; and degrade yourself by intimacies and familiarities with undeserving inferiors. 42 A certain degree of generous pride or self-value is so requisite, that the

absence of it in the mind displeases, after the same manner as the want of a nose, eye, or any of the most material feature of the face or member of the body. 43 The utility of courage, both to the public and to the person possessed of it, is an obvious foundation of merit. 44 But to any one who duly considers of the matter, it will appear that this quality has a peculiar lustre, which it derives wholly from itself, and from that noble elevation inseparable from it. 45 Its figure, drawn by painters and by poets, displays, in each feature, a sublimity and daring confidence; 46 which catches the eye, engages the affections, and diffuses, by sympathy, a like sublimity of sentiment over every spectator.

47 Under what shining colours does Demosthenes represent Philip; where the orator apologises for his own administration, and justifies that pertinacious love of liberty, with which he had inspired the Athenians. 48 'I beheld Philip,' says he, 'he with whom was your contest, resolutely, while in pursuit of empire and dominion, exposing himself to every wound; 49 his eye gored, his neck wrested, his arm, his thigh pierced, what ever part of his body fortune should seize on, that cheerfully relinquishing; provided that, with what remained, he might live in honour and renown. 50 And shall it be said that he, born in Pella, a place heretofore mean and ignoble, should be inspired with so high an ambition and thirst of fame: while you, Athenians.' 51 These praises excite the most lively admiration; but the views presented by the orator, carry us not, we see, beyond the hero himself, nor ever regard the future advantageous consequences of his valour.

52 The material temper of the Romans, inflamed by continual wars, had raised their esteem of courage so high, that, in their language, it was called VIRTUE, by way of excellence and of distinction from all other moral qualities. 53 THE Suevi, in the opinion of Tacitus, tus, DRESSED THEIR HAIR WITH A LAUDIBLE INTENT: NOT FOR THE PURPOSE OF LOVING OR BEING LOVES; THEY DORNED THEMSELVES ONLY FOR THEIR ENEMIES, AND IN ORDER TO APPEAR MORE TERRIBLE. 54 A sentiment of the historian, which

would sound a little oddly in other nations and other ages.

55 The Scythians, according to Herodotus, after scalping their enemies, dressed the skin like leather, and used it as a towel; and whoever had the most of those towels was most esteemed among them. 56 So much had martial bravery, in that nation, as well as in many others, destroyed the sentiments of humanity; a virtue surely much more useful and engaging. 57 It is indeed observable, that, among all uncultivated nations, who have not as yet had full experience of the advantages attending beneficence, justice, and the social virtues, courage is the predominant excellence; 58 what is most celebrated by poets, recommended by parents and instructors, and admired by the public in general.

59 The ethics of Homer are, in this particular, very different from those of Fenelon, his elegant imitator; 60 and such as were well suited to an age, when one hero, as remarked by Thucydides, could ask another, without offence, whether he were a robber or not. 61 Such also very lately was the system of ethics which prevailed in many barbarous parts of Ireland; if we may credit Spencer, in his judicious account of the state of that kingdom. 62 Of the same class of virtues with courage is that undisturbed philosophical tranquillity, superior to pain, sorrow, anxiety, and each assault of adverse fortune. 63 Conscious of his own virtue, say the philosophers, the sage elevates himself above every accident of life; 64 and securely placed in the temple of wisdom, looks down on inferior mortals engaged in pursuit of honours, riches, reputation, and every frivolous enjoyment. 65 These pretentious, no doubt, when stretched to the utmost, are by far too magnificent for human nature. They carry, however, a grandeur with them, which seizes the spectator, and strikes him with admiration. 66 And the nearer we can approach in practice to this sublime tranquillity and indifference (for we must distinguish it from a stupid insensibility), the more secure enjoyment shall we attain within ourselves, and the more greatness of mind shall we discover to the

world. 67 The philosophical tranquillity may, indeed, be considered only as a branch of magnanimity.

68 Who admires not Socrates; his perpetual serenity and contentment, amidst the greatest poverty and domestic vexations; 69 his resolute contempt of riches, and his magnanimous care of preserving liberty, while he refused all assistance from his friends and disciples, and avoided even the dependence of an obligation?

70 Epictetus had not so much as a door to his little house or hovel; and therefore, soon lost his iron lamp, the only furniture which he had worth taking. 71 But resolving to disappoint all robbers for the future, he supplied its place with an earthen lamp, of which he very peacefully kept possession ever after.

72 Among the ancients, the heroes in philosophy, as well as those in war and patriotism, have a grandeur and force of sentiment, which astonishes our narrow souls, and is rashly rejected as extravagant and supernatural. 73 They, in their turn, I allow, would have had equal reason to consider as romantic and incredible, the degree of humanity, clemency, order, tranquillity, and other social virtues, 74 to which, in the administration of government, we have attained in modern times, had any one been then able to have made a fair representation of them. 75 Such is the compensation, which human nature, or rather education, has made in the distribution of excellencies and virtues, in those different ages.

76 The merit of benevolence, arising from its utility, and its tendency to promote the good of humankind has been already explained, and is, no doubt, the source of a CONSIDERABLE part of that esteem, which is so universally paid to it. 77 But it will also be allowed, that the very softness and tenderness of the sentiment, its engaging endearments, its fond expressions, its delicate attentions, and all that flow of mutual confidence and regard, which enters into a warm attachment of love and friendship: 78 it will be allowed, I say, that these feelings, being delightful in themselves, are necessarily

communicated to the spectators, and melt them into the same fondness and delicacy. 79 The tear naturally starts in our eye on the apprehension of a warm sentiment of this nature: our breast heaves, our heart is agitated, and every humane tender principle of our frame is set in motion, and gives us the purest and most satisfactory enjoyment.

80 When poets form descriptions of Elysian fields, where the blessed inhabitants stand in no need of each other's assistance, they yet represent them as maintaining a constant intercourse of love and friendship, and sooth our fancy with the pleasing image of these soft and gentle passions. 81 The idea of tender tranquillity in a pastoral Arcadia is agreeable from a like principle, as has been observed above. 82 Who would live amidst perpetual wrangling, and scolding, and mutual reproaches? 83 The roughness and harshness of these emotions disturb and displease us: we suffer by contagion and sympathy; 84 nor can we remain indifferent spectators, even though certain that no pernicious consequences would ever follow from such angry passions.

85 As a certain proof that the whole merit of benevolence is not derived from its usefulness, we may observe, that in a kind way of blame, we say, a person is TOO GOOD; 86 when you exceeds your part in society, and carries your attention for others beyond the proper bounds. 87 In like manner, we say, a person is too HIGH-SPIRITED, TOO INTREPID, TOO INDIFFERENT ABOUT FORTUNE: reproaches, which really, at bottom, imply more esteem than many panegyrics. 88 Being accustomed to rate the merit and demerit of characters chiefly by their useful or pernicious tendencies, we cannot forbear applying the epithet of blame, when we discover a sentiment, which rises to a degree, that is hurtful; 89 but it may happen, at the same time, that its noble elevation, or its engaging tenderness so seizes the heart, as rather to increase our friendship and concern for the person.

90 The amours and attachments of Harry the 4th of France, during the civil wars of the league, frequently

hurt his interest and his cause; 91 but all the young, at least, and amorous, who can sympathise with the tender passions, will allow that this very weakness, for they will readily call it such, chiefly endears that hero, and interests them in his fortunes.

92 The excessive bravery and resolute inflexibility of Charles the 12th ruined his own country, and infested all his neighbours; 93 but have such splendour and greatness in their appearance, as strikes us with admiration; 94 and they might, in some degree, be even approved of, if they betrayed not sometimes too evident symptoms of madness and disorder.

95 The Athenians pretended to the first invention of agriculture and of laws: and always valued themselves extremely on the benefit thereby procured to the whole race of humankind. 96 They also boasted, and with reason, of their war like enterprises; particularly against those innumerable fleets and armies of Persians, which invaded Greece during the reigns of Darius and Xerxes. 97 But though there be no comparison in point of utility, between these peaceful and military honours; 98 yet we find, that the orators, who have writ such elaborate panegyrics on that famous city, have chiefly triumphed in displaying the warlike achievements. 99 Lysias, Thucydides, Plato, and Isocrates discover, all of them, the same partiality; which, though condemned by calm reason and reflection, appears so natural in the mind of human.

100 It is observable, that the great charm of poetry consists in lively pictures of the sublime passions, magnanimity, courage, disdain of fortune; 101 or those of the tender affections, love and friendship; which warm the heart, and diffuse over it similar sentiments and emotions. 102 And though all kinds of passion, even the most disagreeable, such as grief and anger, are observed, when excited by poetry, to convey a satisfaction, from a mechanism of Nature, not easy to be explained: 103 Yet those more elevated or softer affections have a peculiar influence, and please from more than one cause or principle. 104 Not to mention that they alone interest us in the

fortune of the persons represented, or communicate any esteem and affection for their character. 105 And can it possibly be doubted, that this talent itself of poets, to move the passions, this pathetic and sublime of sentiment, is a very considerable merit; 106 and being enhanced by its extreme rarity, may exalt the person possessed of it, above every character of the age in which one lives?

107 The prudence, address, steadiness, and benign government of Augustus, adorned with all the splendour of his noble birth and imperial crown, 108 render him but an unequal competitor for fame with Virgil, who lays nothing into the opposite scale but the divine beauties of his poetical genius. 109 The very sensibility to these beauties, or a delicacy of taste, is itself a beauty in any character; as conveying the purest, the most durable, and most innocent of all enjoyments. 110 These are some instances of the several species of merit, that are valued for the immediate pleasure which they communicate to the person possessed of them. 111 No views of utility or of future beneficial consequences enter into this sentiment of approbation; yet is it of a kind similar to that other sentiment, which arises from views of a public or private utility. 112 The same social sympathy, we may observe, or fellow-feeling with human happiness or misery, gives rise to both; and this analogy, in all the parts of the present theory, may justly be regarded as a confirmation of it.

OF QUALITIES IMMEDIATELY AGREEABLE TO OTHERS.

David Hume

8 AS the mutual shocks, in SOCIETY, and the oppositions of interest and self-love have constrained humankind to establish the laws of JUSTICE, in order to preserve the advantages of mutual assistance and protection: 2 in like manner, the eternal contrarieties, in COMPANY, of humans' pride and self-conceit, have introduced the rules of Good Manners or Politeness, in order to facilitate the intercourse of minds, and an undisturbed commerce and conversation. 3 Among well-bred

people, a mutual deference is affected; contempt of others disguised; authority concealed; attention given to each in own turn; 4 and an easy stream of conversation maintained, without vehemence, without interruption, without eagerness for victory, and without any airs of superiority. 5 These attentions and regards are immediately AGREEABLE to others, abstracted from any consideration of utility or beneficial tendencies: 6 they conciliate affection, promote esteem, and extremely enhance the merit of the person who regulates own behaviour by them. 7 Many of the forms of breeding are arbitrary and casual; but the thing expressed by them is still the same. 8 A Spaniard goes out of his own house before his guest, to signify that he leaves him master of all. In other countries, the landlord walks out last, as a common mark of deference and regard.

9 But, in order to render a person perfect GOOD COMPANY, you must have Wit and Ingenuity as well as good manners. 10 What wit is, it may not be easy to define; but it is easy surely to determine that it is a quality immediately AGREEABLE to others, 11 and communicating, on its first appearance, a lively joy and satisfaction to every one who has any comprehension of it. 12 The most profound metaphysics, indeed, might be employed in explaining the various kinds and species of wit; 13 and many classes of it, which are now received on the sole testimony of taste and sentiment, might, perhaps, be resolved into more general principles. 14 But this is sufficient for our present purpose, that it does affect taste and sentiment, and bestowing an immediate enjoyment, is a sure source of approbation and affection. 15 In countries where people pass most of their time in conversation, and visits, and assemblies, these COMPANIONABLE qualities, so to speak, are of high estimation, and form a chief part of personal merit. 16 In countries where people live a more domestic life, and either are employed in business, or amuse themselves in a narrower circle of acquaintance, the more solid qualities are chiefly regarded. 17 Thus, I have often observed, that, among the French, the first

questions with regard to a stranger are, ARE YOU POLITE? HAVE YOU WIT? In England, the chief praise bestowed is always that of a GOOD-NATURED, SENSIBLE FELLOW. 18 In conversation, the lively spirit of dialogue is AGREEABLE, even to those who desire not to have any share in the discourse: hence the teller of long stories, or the pompous declaimer, is very little approved of. 19 But most people desire likewise their turn in the conversation, and regard, with a very evil eye, that LOQUACITY which deprives them of a right they are naturally so jealous of.

20 There is a sort of harmless LIARS, frequently to be met with in company, who deal much in the marvellous. 21 Their usual intention is to please and entertain; but as humans are most delighted with what they conceive to be truth, these people mistake extremely the means of pleasing, and incur universal blame. 22 Some indulgence, however, to lying or fiction is given in HUMOROUS stories; because it is there really agreeable and entertaining, and truth is not of any importance.

23 Eloquence, genius of all kinds, even good sense, and sound reasoning, when it rises to an eminent degree, and is employed upon subjects of any considerable dignity and nice discernment; 24 all these endowments seem immediately agreeable, and have a merit distinct from their usefulness. 25 Rarity, likewise, which so much enhances the price of every thing, must set an additional value on these noble talents of the human mind.

26 Modesty may be understood in different senses, even abstracted from chastity, which has been already treated of. 27 It sometimes means that tenderness and nicety of honour, that apprehension of blame, that dread of intrusion or injury towards others, that Pudor, which is the proper guardian of every kind of virtue, and a sure preservative against vice and corruption. 28 But its most usual meaning is when it is opposed to IMPUDENCE and ARROGANCE, and expresses a diffidence of our own judgement, and a due attention and regard for others. 29 In young

people chiefly, this quality is a sure sign of good sense; and is also the certain means of augmenting that endowment, by preserving their ears open to instruction, and making them still grasp after new attainments. 30 But it has a further charm to every spectator; by flattering every human's vanity, and presenting the appearance of a docile pupil, who receives, with proper attention and respect, every word they utter.

31 Humans have, in general, a much greater propensity to overvalue than undervalue themselves; notwithstanding the opinion of Aristotle. 32 This makes us more jealous of the excess on the former side, and causes us to regard, with a peculiar indulgence, all tendency to modesty and self-diffidence; as esteeming the danger less of falling into any vicious extreme of that nature. 33 It is thus in countries where humans' bodies are apt to exceed in corpulency, personal beauty is placed in a much greater degree of slenderness, than in countries where that is the most usual defect. 34 Being so often struck with instances of one species of deformity, people think they can never keep at too great a distance from it, and wish always to have a leaning to the opposite side.

35 In like manner, were the door opened to self-praise, and were Montaigne's maxim observed, that one should say as frankly, I HAVE SENSE, I HAVE LEARNING, I HAVE COURAGE, BEAUTY, OR WIT, as it is sure we often think so; 36 were this the case, I say, every one is sensible that such a flood of impertinence would break in upon us, as would render society wholly intolerable. 37 For this reason custom has established it as a rule, in common societies, that people should not indulge themselves in self-praise, or even speak much of themselves; 38 and it is only among intimate friends or people of very humanly behaviour, that one is allowed to do oneself justice.

39 Nobody finds fault with Maurice, Prince of Orange, for his reply to one who asked him, whom he esteemed the first general of the age, THE MARQUIS OF SPINOLA, said he, IS THE SECOND. 40 Though it is observable, that the self-praise implied is here better implied, than

if it had been directly expressed, without any cover or disguise.

41 You must be a very superficial thinker, who imagines that all instances of mutual deference are to be understood in earnest, and that a person would be more esteemable for being ignorant of your own merits and accomplishments. 42 A small bias towards modesty, even in the internal sentiment, is favourably regarded, especially in young people; 43 and a strong bias is required in the outward behaviour; but this excludes not a noble pride and spirit, which may openly display itself in its full extent, when one lies under calumny or oppression of any kind.

44 The generous contumacy of Socrates, as Cicero calls it, has been highly celebrated in all ages; and when joined to the usual modesty of his behaviour, forms a shining character. 45 Iphicrates, the Athenian, being accused of betraying the interests of his country, asked his accuser, WOULD YOU, says he, HAVE, ON A LIKE OCCASION, BEEN GUILTY OF THAT CRIME? 46 BY NO MEANS, replied the other. AND CAN YOU THEN IMAGINE, cried the hero, that Iphicrates WOULD BE GUILTY?-- 47 In short, a generous spirit and self-value, well founded, decently disguised, and courageously supported under distress and calumny, is a great excellency, 48 and seems to derive its merit from the noble elevation of its sentiment, or its immediate agreeableness to its possessor.

49 In ordinary characters, we approve of a bias towards modesty, which is a quality immediately agreeable to others: 50 the vicious excess of the former virtue, namely, insolence or haughtiness, is immediately disagreeable to others; 51 the excess of the latter is so to the possessor. Thus are the boundaries of these duties adjusted. 52 A desire of fame, reputation, or a character with others, is so far from being blameable, that it seems inseparable from virtue, genius, capacity, and a generous or noble disposition. 53 An attention even to trivial matters, in order to please, is also expected and demanded by society; 54 and no one is surprised, if you find a person in company to observe a

greater elegance of dress and more pleasant flow of conversation, than when you passes your time at home, and with your own family. 55 Wherein, then, consists Vanity, which is so justly regarded as a fault or imperfection. 56 It seems to consist chiefly in such an intemperate display of our advantages, honours, and accomplishments; 57 in such an importunate and open demand of praise and admiration, as is offensive to others, and encroaches too far on their secret vanity and ambition. 58 It is besides a sure symptom of the want of true dignity and elevation of mind, which is so great an ornament in any character. 59 For why that impatient desire of applause; as if you were not justly entitled to it, and might not reasonably expect that it would for ever at tend you? 60 Why so anxious to inform us of the great company which you have kept; the obliging things which were said to you; the honours, the distinctions which you met with; 61 as if these were not things of course, and what we could readily, of ourselves, have imagined, without being told of them?

62 Decency, or a proper regard to age, sex, character, and station in the world, may be ranked among the qualities which are immediately agreeable to others, and which, by that means, acquire praise and approbation. 63 An effeminate behaviour in a man, a rough manner in a woman; these are ugly because unsuitable to each character, and different from the qualities which we expect in the sexes. 64 It is as if a tragedy abounded in comic beauties, or a comedy in tragic. 65 The disproportions hurt the eye, and convey a disagreeable sentiment to the spectators, the source of blame and disapprobation. 66 This is that INDECORUM, which is explained so much at large by Cicero in his Offices.

67 Among the other virtues, we may also give Cleanliness a place; since it naturally renders us agreeable to others, and is no inconsiderable source of love and affection. 68 No one will deny, that a negligence in this particular is a fault; and as faults are nothing but smaller vices, and this fault can have no other origin than the uneasy sensation which it excites

in others; 69 we may, in this instance, seemingly so trivial, clearly discover the origin of moral distinctions, about which the learned have involved themselves in such mazes of perplexity and error.

70 But besides all the AGREEABLE qualities, the origin of whose beauty we can, in some degree, explain and account for, there still remains something mysterious and inexplicable, which conveys an immediate satisfaction to the spectator, but how, or why, or for what reason, he cannot pretend to determine. 71 There is a manner, a grace, an ease, a genteelness, an I-know-not-what, which some people possess above others, 72 which is very different from external beauty and comeliness, and which, however, catches our affection almost as suddenly and powerfully. 73 And though this MANNER be chiefly talked of in the passion between the sexes, where the concealed magic is easily explained, 74 yet surely much of it prevails in all our estimation of characters, and forms no inconsiderable part of personal merit. 75 This class of accomplishments, therefore, must be trusted entirely to the blind, but sure testimony of taste and sentiment; 76 and must be considered as a part of ethics, left by Nature to baffle all the pride of philosophy, and make her sensible of Her narrow boundaries and slender acquisitions.

77 We approve others, because of their wits, politeness, modesty, decency, or any agreeable quality which they possesses; 78 although you be not of our acquaintance, nor has ever given us any entertainment, by means of these accomplishments. 79 The idea, which we form of their effect on your acquaintance, has an agreeable influence on our imagination, and gives us the sentiment of approbation. 80 This principle enters into all the judgements which we form concerning manners and characters.

CONCLUSION

David Hume

PART I.

9 IT may justly appear surprising that any person in so late an age, should find it requisite to prove, by elaborate reasoning, that Personal Merit consists altogether in the possession of mental qualities, USEFUL or AGREEABLE to the PERSON HIMSELF or to OTHERS. 2 It might be expected that this principle would have occurred even to the first rude, unpractised enquirers concerning morals, and been received from its own evidence, without any argument or disputation. 3 Whatever is valuable in any kind, so naturally classes itself under the division of USEFUL or AGREEABLE, the UTILE or the DULCE, 4 that it is not easy to imagine why we should ever seek further, or consider the question as a matter of nice research or inquiry. 5 And as every thing useful or agreeable must possess these qualities with regard either to the PERSON HIMSELF or to OTHERS, the complete delineation or description of merit seems to be performed as naturally as a shadow is cast by the sun, or an image is reflected upon water. 6 If the ground, on which the shadow is cast, be not broken and uneven; nor the surface from which the image is reflected, disturbed and confused; a just figure is immediately presented, without any art or attention. 7 And it seems a reasonable presumption, that systems and hypotheses have perverted our natural understanding, when a theory, so simple and obvious, could so long have escaped the most elaborate examination.

8 But however the case may have fared with philosophy, in common life these principles are still implicitly maintained; 9 nor is any other topic of praise or blame ever recurred to, when we employ any panegyric or satire, any applause or censure of human action and behaviour. 10 If we observe people, in every intercourse of business or pleasure, in every discourse and conversation, we shall find them nowhere, except the schools, at any loss upon this subject. 11 What so natural, for instance, as the following dialogue?

MORALS

You are very happy, we shall suppose one to say, addressing oneself to another, that you have given your daughter to Cleanthes. 12 You are a person of honour and humanity. Every one, who has any intercourse with you, is sure of FAIR and KIND treatment. 13 I congratulate you too, says another, on the promising expectations of this son-in-law; whose assiduous application to the study of the laws, whose quick penetration and early knowledge both of people and business, prognosticate the greatest honours and advancement. 14 You surprise me, replies a third, when you talk of Cleanthes as a man of business and application. I met him lately in a circle of the gayest company, and he was the very life and soul of our conversation: 15 so much wit with good manners; so much gallantry without affectation; so much ingenious knowledge so genteelly delivered, I have never before observed in any one. 16 You would admire him still more, says a fourth, if you knew him more familiarly. 17 That cheerfulness, which you might remark in him, is not a sudden flash struck out by company: it runs through the whole tenor of his life, and preserves a perpetual serenity on his countenance, and tranquillity in his soul. 18 He has met with severe trials, misfortunes as well as dangers; and by his greatness of mind, was still superior to Mall of them. 19 The image, gentlemen, which you have here delineated of Cleanthes, cried I, is that of accomplished merit. Each of you has given a stroke of the pencil to his figure; and you have unawares exceeded all the pictures drawn by Gratian or Castiglione. 20 A philosopher might select this character as a model of perfect virtue.

21 And as every quality which is useful or agreeable to ourselves or others is, in common life, allowed to be a part of personal merit; so no other will ever be received, where people judge of things by their natural, unprejudiced reason, without the delusive glosses of superstition and false religion. 22 Celibacy, fasting, penance, mortification, self-denial, humility, silence, solitude, and the whole train of monkish virtues; for what reason are they everywhere

rejected by people of sense, but because they serve to no manner of purpose; 23 neither advance a person's fortune in the world, nor render you a more valuable member of society; neither qualify you for the entertainment of company, nor increase your power of self-enjoyment? 24 We observe, on the contrary, that they cross all these desirable ends; stupify the understanding and harden the heart, obscure the fancy and sour the temper. 25 We justly, therefore, transfer them to the opposite column, and place them in the catalogue of vices; nor has any superstition force sufficient among people of the world, to pervert entirely these natural sentiments. 26 A gloomy, hair-brained enthusiast, after own death, may have a place in the calendar; but will scarcely ever be admitted, when alive, into intimacy and society, except by those who are as delirious and dismal as the self.

27 It seems a happiness in the present theory, that it enters not into that vulgar dispute concerning the DEGREES of benevolence or self-love, which prevail in human nature; 28 a dispute which is never likely to have any issue, both because people, who have taken part, are not easily convinced, 29 and because the phenomena, which can be produced on either side, are so dispersed, so uncertain, and subject to so many interpretations, that it is scarcely possible accurately to compare them, or draw from them any determinate inference or conclusion. 30 It is sufficient for our present purpose, if it be allowed, what surely, without the greatest absurdity cannot be disputed, that there is some benevolence, however small, infused into our bosom; 31 some spark of friendship for human kind; some particle of the dove kneaded into our frame, along with the elements of the wolf and serpent. 32 Let these generous sentiments be supposed ever so weak; let them be insufficient to move even a hand or finger of our body, they must still direct the determinations of our mind, 33 and where everything else is equal, produce a cool preference of what is useful and serviceable to humankind, above what is

pernicious and dangerous. 34 A MORAL DISTINCTION, therefore, immediately arises; a general sentiment of blame and approbation; a tendency, however faint, to the objects of the one, and a proportionable aversion to those of the other. 35 Nor will those reasoners, who so earnestly maintain the predominant selfishness of human kind, be any wise scandalised at hearing of the weak sentiments of virtue implanted in our human nature. 36 On the contrary, they are found as ready to maintain the one tenet as the other; and their spirit of satire (for such it appears, rather than of corruption) naturally gives rise to both opinions; which have, indeed, a great and almost an indissoluble connexion together.

37 Avarice, ambition, vanity, and all passions vulgarly, though improperly, comprised under the denomination of SELF-LOVE, 38 are here excluded from our theory concerning the origin of morals, not because they are too weak, but because they have not a proper direction for that purpose. 39 The notion of morals implies some sentiment common to all humankind, which recommends the same object to general approbation, and makes every human, or most people, agree in the same opinion or decision concerning it. 40 It also implies some sentiment, so universal and comprehensive as to extend to all humankind, 41 and render the actions and conduct, even of the persons the most remote, an object of applause or censure, according as they agree or disagree with that rule of right which is established. 42 These two requisite circumstances belong alone to the sentiment of humanity here insisted on. 43 The other passions produce in every breast, many strong sentiments of desire and aversion, affection and hatred; 44 but these neither are felt so much in common, nor are so comprehensive, as to be the foundation of any general system and established theory of blame or approbation.

45 When a person denominates another own ENEMY, own RIVAL, own ANTAGONIST, own ADVERSARY, you are understood to speak the language of self-love, and to express sentiments, peculiar

to yourself, and arising from your particular circumstances and situation. 46 But when you bestows on any person the epithets of VICIOUS or ODIOUS or DEPRAVED, you then speaks another language, and expresses sentiments, in which you expects all your audience are to concur with you. 47 You must here, therefore, depart from your private and particular situation, and must choose a point of view, common to you with others; 48 you must move some universal principle of the human frame, and touch a string to which all humankind have an accord and symphony. 49 If you mean, therefore, to express that this person possesses qualities, whose tendency is pernicious to society, you have chosen this common point of view, and has touched the principle of humanity, in which every human, in some degree, concurs. 50 While the human heart is compounded of the same elements as at present, it will never be wholly indifferent to public good, nor entirely unaffected with the tendency of characters and manners. 51 And though this affection of humanity may not generally be esteemed so strong as vanity or ambition, yet, being common to all humans, it can alone be the foundation of morals, or of any-general system of blame or praise. 52 One person's ambition is not another's ambition, nor will the same event or object satisfy both; 53 but the humanity of one person is the humanity of every one, and the same object touches this passion in all human creatures.

54 But the sentiments, which arise from humanity, are not only the same in all human creatures, and produce the same approbation or censure; but they also comprehend all human creatures; 55 nor is there any one whose conduct or character is not, by their means, an object to every one of censure or approbation. 56 On the contrary, those other passions, commonly denominated selfish, both produce different sentiments in each individual, according to one’s own particular situation; 57 and also contemplate the greater part of humankind with the utmost indifference and unconcern. 58 Whoever has a high regard and esteem for me flatters my vanity;

whoever expresses contempt mortifies and displeases me; 59 but as my name is known but to a small part of humankind, there are few who come within the sphere of this passion, or excite, on its account, either my affection or disgust. 60 But if you represent a tyrannical, insolent, or barbarous behaviour, in any country or in any age of the world, I soon carry my eye to the pernicious tendency of such a conduct, and feel the sentiment of repugnance and displeasure towards it. 61 No character can be so remote as to be, in this light, wholly indifferent to me. 62 What is beneficial to society or to a person must still be preferred. 63 And every quality or action, of every human being, must, by this means, be ranked under some class or denomination, expressive of general censure or applause.

64 What more, therefore, can we ask to distinguish the sentiments, dependent on humanity, from those connected with any other passion, or to satisfy us, why the former are the origin of morals, not the latter? 65 Whatever conduct gains my approbation, by touching my humanity, procures also the applause of all humankind, by affecting the same principle in them; 66 but what serves my avarice or ambition pleases these passions in me alone, and affects not the avarice and ambition of the rest of humankind. 67 There is no circumstance of conduct in any person, provided it have a beneficial tendency, that is not agreeable to my humanity, however remote the person; 68 but every person, so far removed as neither to cross nor serve my avarice and ambition, is regarded as wholly indifferent by those passions. 69 The distinction, therefore, between these species of sentiment being so great and evident, language must soon be moulded upon it, 70 and must invent a peculiar set of terms, in order to express those universal sentiments of censure or approbation, which arise from humanity, or from views of general usefulness and its contrary. 71 Virtue and Vice become then known; morals are recognised; certain general ideas are framed of human conduct and behaviour; such measures are expected from

people in such situations. 72 This action is determined to be conformable to our abstract rule; that other, contrary. 73 And by such universal principles are the particular sentiments of self-love frequently controlled and limited.

74 From instances of popular tumults, seditions, factions, panics, and of all passions, which are shared with a multitude, we may learn the influence of society in exciting and supporting any emotion; 75 while the most ungovernable disorders are raised, we find, by that means, from the slightest and most frivolous occasions.

76 Solon was no very cruel, though, perhaps, an unjust legislator, who punished neuters in civil wars; and few, I believe, would, in such cases, incur the penalty, were their affection and discourse allowed sufficient to absolve them. 77 No selfishness, and scarce any philosophy, have there force sufficient to support a total coolness and indifference; and you must be more or less than human, who kindles not in the common blaze. 78 What wonder then, that moral sentiments are found of such influence in life; though springing from principles, which may appear, at first sight, somewhat small and delicate? 79 But these principles, we must remark, are social and universal; they form, in a manner, the PARTY of humankind against vice or disorder, its common enemy. 80 And as the benevolent concern for others is diffused, in a greater or less degree, over all humans, and is the same in all, it occurs more frequently in discourse, is cherished by society and conversation, 81 and the blame and approbation, consequent on it, are thereby roused from that lethargy into which they are probably lulled, in solitary and uncultivated nature. 82 Other passions, though perhaps originally stronger, yet being selfish and private, are often overpowered by its force, and yield the dominion of our breast to those social and public principles.

83 Another spring of our constitution, that brings a great addition of force to moral sentiments, is the love of fame; 84 which rules, with such uncontrolled authority, in all generous minds, and is often the

grand object of all their designs and undertakings. 85 By our continual and earnest pursuit of a character, a name, a reputation in the world, we bring our own deportment and conduct frequently in review, and consider how they appear in the eyes of those who approach and regard us. 86 This constant habit of surveying ourselves, as it were, in reflection, keeps alive all the sentiments of right and wrong, and begets, in noble natures, a certain reverence for themselves as well as others, which is the surest guardian of every virtue. 87 The animal conveniences and pleasures sink gradually in their value; while every inward beauty and moral grace is studiously acquired, and the mind is accomplished in every perfection, which can adorn or embellish a rational creature. 88 Here is the most perfect morality with which we are acquainted: here is displayed the force of many sympathies. 89 Our moral sentiment is itself a feeling chiefly of that nature, and our regard to a character with others seems to arise only from a care of preserving a character with ourselves; 90 and in order to attain this end, we find it necessary to prop our tottering judgement on the correspondent approbation of humankind.

91 But, that we may accommodate matters, and remove if possible every difficulty, let us allow all these reasonings to be false. 92 Let us allow that, when we resolve the pleasure, which arises from views of utility, into the sentiments of humanity and sympathy, we have embraced a wrong hypothesis. 93 Let us confess it necessary to find some other explication of that applause, which is paid to objects, whether inanimate, animate, or rational, if they have a tendency to promote the welfare and advantage of humankind. 94 However difficult it be to conceive that an object is approved of on account of its tendency to a certain end, while the end itself is totally indifferent: let us swallow this absurdity, and consider what are the consequences. 95 The preceding delineation or definition of Personal Merit must still retain its evidence and authority: 96 it must still be allowed that every quality of the mind, which is

USEFUL or AGREEABLE to the PERSON or to OTHERS, communicates a pleasure to the spectator, engages their esteem, and is admitted under the honourable denomination of virtue or merit. 97 Are not justice, fidelity, honour, veracity, allegiance, chastity, esteemed solely on account of their tendency to promote the good of society? 98 Is not that tendency inseparable from humanity, benevolence, lenity, generousity, gratitude, moderation, tenderness, friendship, and all the other social virtues? 99 Can it possibly be doubted that industry, discretion, frugality, secrecy, order, perseverance, forethought, judgement, and this whole class of virtues and accomplishments, of which many pages would not contain the catalogue; 100 can it be doubted, I say, that the tendency of these qualities to promote the interest and happiness of their possessor, is the sole foundation of their merit? 101 Who can dispute that a mind, which supports a perpetual serenity and cheerfulness, a noble dignity and undaunted spirit, a tender affection and good-will to all around; 102 as it has more enjoyment within itself, is also a more animating and rejoicing spectacle, than if dejected with melancholy, tormented with anxiety, irritated with rage, or sunk into the most abject baseness and degeneracy? 103 And as to the qualities, immediately AGREEABLE to OTHERS, they speak sufficiently for themselves; 104 and you must be unhappy, indeed, either in your own temper, or in your situation and company, who has never perceived the charms of a facetious wit or flowing affability, of a delicate modesty or decent genteelness of address and manner.

105 I am sensible, that nothing can be more unphilosophical than to be positive or dogmatical on any subject; 106 and that, even if excessive scepticism could be maintained, it would not be more destructive to all just reasoning and inquiry. 107 I am convinced that, where humans are the most sure and arrogant, they are commonly the most mistaken, 108 and have there given reins to passion, without that proper deliberation and suspense, which

can alone secure them from the grossest absurdities. 109 Yet, I must confess, that this enumeration puts the matter in so strong a light, that I cannot, at PRESENT, be more assured of any truth, which I learn from reasoning and argument, 110 than that personal merit consists entirely in the usefulness or agreeableness of qualities to the person possessed of them, or to others, who have any intercourse with you. 111 But when I reflect that, though the bulk and figure of the earth have been measured and delineated, though the motions of the tides have been accounted for, the order and economy of the heavenly bodies subjected to their proper laws, 112 and Infinite itself reduced to calculation; yet men still dispute concerning the foundation of their moral duties. 113 When I reflect on this, I say, I fall back into diffidence and scepticism, 114 and suspect that an hypothesis, so obvious, had it been a true one, would, long ere now, have been received by the unanimous suffrage and consent of humankind.

PART II.

115 Having explained the moral APPROBATION attending merit or virtue, there remains nothing but briefly to consider our interested OBLIGATION to it, 116 and to inquire whether every human, who has any regard to one's own happiness and welfare, will not best find own account in the practice of every moral duty. 117 If this can be clearly ascertained from the foregoing theory, we shall have the satisfaction to reflect, that we have advanced principles, which not only, it is hoped, will stand the test of reasoning and inquiry, 118 but may contribute to the amendment of humans' lives, and their improvement in morality and social virtue. 119 And though the philosophical truth of any proposition by no means depends on its tendency to promote the interests of society; 120 yet a person has but a bad grace, who delivers a theory, however true, which, one must confess, leads to a practice dangerous and pernicious. 121 Why rake into those corners of Nature which spread a nuisance all around? Why

dig up the pestilence from the pit in which it is buried? 122 The ingenuity of your researches may be admired, but your systems will be detested; and humankind will agree, if they cannot refute them, to sink them, at least, in eternal silence and oblivion. 123 Truths which are pernicious to society, if any such there be, will yield to errors which are salutary and ADVANTAGEOUS.

124 But what philosophical truths can be more advantageous to society, than those here delivered, which represent virtue in all her genuine and most engaging charms, and makes us approach her with ease, familiarity, and affection? 125 The dismal dress falls off, with which many divines, and some philosophers, have covered her; and nothing appears but gentleness, humanity, beneficence, affability; 126 nay, even at proper intervals, play, frolic, and gaiety. She talks not of useless austerities and rigours, suffering and self-denial. 127 She declares that her sole purpose is to make her votaries and all humankind, during every instant of their existence, if possible, cheerful and happy; 128 nor does she ever willingly part with any pleasure but in hopes of ample compensation in some other period of their lives. 129 The sole trouble which she demands, is that of just calculation, and a steady preference of the greater happiness. 130 And if any austere pretenders approach her, enemies to joy and pleasure, she either rejects them as hypocrites and deceivers; or, if she admit them in her train, they are ranked, however, among the least favoured of her votaries.

131 And, indeed, to drop all figurative expression, what hopes can we ever have of engaging humankind to a practice which we confess full of austerity and rigour? 132 Or what theory of morals can ever serve any useful purpose, unless it can show, by a particular detail, that all the duties which it recommends, are also the true interest of each individual? 133 The peculiar advantage of the foregoing system seems to be, that it furnishes proper mediums for that purpose. 134 That the virtues which are immediately USEFUL or AGREEABLE to the person

possessed of them, are desirable in a view to self-interest, it would surely be superfluous to prove. 135 Moralists, indeed, may spare themselves all the pains which they often take in recommending these duties. 136 To what purpose collect arguments to evince that temperance is advantageous, and the excesses of pleasure hurtful, when it appears that these excesses are only denominated such, because they are hurtful; 137 and that, if the unlimited use of strong liquors, for instance, no more impaired health or the faculties of mind and body than the use of air or water, it would not be a whit more vicious or blameable?

138 It seems equally superfluous to prove, that the COMPANIONABLE virtues of good manners and wit, decency and genteelness, are more desirable than the contrary qualities. 139 Vanity alone, without any other consideration, is a sufficient motive to make us wish for the possession of these accomplishments. 140 No human was ever willingly deficient in this particular. All our failures here proceed from bad education, want of capacity, or a perverse and unpliable disposition. 141 Would you have your company coveted, admired, followed; rather than hated, despised, avoided? Can any one seriously deliberate in the case? 142 As no enjoyment is sincere, without some reference to company and society; so no society can be agreeable, or even tolerable, where a person feels own presence unwelcome, and discovers all around you symptoms of disgust and aversion.

143 But why, in the greater society or confederacy of humankind, should not the case be the same as in particular clubs and companies 144 Why is it more doubtful, that the enlarged virtues of humanity, generousity, beneficence, are desirable with a view of happiness and self-interest, than the limited endowments of ingenuity and politeness? 145 Are we apprehensive lest those social affections interfere, in a greater and more immediate degree than any other pursuits, with private utility, and cannot be gratified, without some important sacrifice of honour and advantage? 146 If so, we are but ill-instructed in the nature of the human passions, and

are more influenced by verbal distinctions than by real differences. 147 Whatever contradiction may vulgarly be supposed between the SELFISH and SOCIAL sentiments or dispositions, they are really no more opposite than selfish and ambitious, selfish and revengeful, selfish and vain. 148 It is requisite that there be an original propensity of some kind, in order to be a basis to self-love, by giving a relish to the objects of its pursuit; and none more fit for this purpose than benevolence or humanity. 149 The goods of fortune are spent in one gratification or another: the miser who accumulates own annual income, and lends it out at interest, has really spent it in the gratification of own avarice. 150 And it would be difficult to show why a person is more a loser by a generous action, than by any other method of expense; since the utmost which you can attain by the most elaborate selfishness, is the indulgence of some affection.

151 Now if life, without passion, must be altogether insipid and tiresome; let a human suppose that you have full power of modelling your own disposition, 152 and let you deliberate what appetite or desire you would choose for the foundation of your happiness and enjoyment. 153 Every affection, you would observe, when gratified by success, gives a satisfaction proportioned to its force and violence; 154 but besides this advantage, common to all, the immediate feeling of benevolence and friendship, humanity and kindness, is sweet, smooth, tender, and agreeable, independent of all fortune and accidents. 155 These virtues are besides attended with a pleasing consciousness or remembrance, and keep us in humour with ourselves as well as others; while we retain the agreeable reflection of having done our part towards humankind and society. 156 And though all humans show a jealousy of our success in the pursuits of avarice and ambition; yet are we almost sure of their good-will and good wishes, 157 so long as we persevere in the paths of virtue, and employ ourselves in the execution of generous plans and purposes. 158 What other passion is there where we shall find so

many advantages united; an agreeable sentiment, a pleasing consciousness, a good reputation? 159 But of these truths, we may observe, people are, of themselves, pretty much convinced; nor are they deficient in their duty to society, 160 because they would not wish to be generous, friendly, and humane; but because they do not feel themselves such.

161 Treating vice with the greatest candour, and making it all possible concessions, we must acknowledge that there is not, in any instance, the smallest pretext for giving it the preference above virtue, with a view of self-interest; 162 except, perhaps, in the case of justice, where a person, taking things in a certain light, may often seem to be a loser by own integrity. 163 And though it is allowed that, without a regard to property, no society could subsist; 164 yet according to the imperfect way in which human affairs are conducted, a sensible knave, in particular incidents, may think that an act of iniquity or infidelity will make a considerable addition to own fortune, without causing any considerable breach in the social union and confederacy. 165 That HONESTY IS THE BEST POLICY, may be a good general rule, but is liable to many exceptions; and you, it may perhaps be thought, conducts yourself with most wisdom, who observes the general rule, and takes advantage of all the exceptions. 166 I must confess that, if a person think that this reasoning much requires an answer, it would be a little difficult to find any which will to you appear satisfactory and convincing. 167 If your heart rebel not against such pernicious maxims, if you feel no reluctance to the thoughts of villainy or baseness, you have indeed lost a considerable motive to virtue; and we may expect that this practice will be answerable to your speculation. 168 But in all ingenuous natures, the antipathy to treachery and roguery is too strong to be counter-balanced by any views of profit or pecuniary advantage. 169 Inward peace of mind, consciousness of integrity, a satisfactory review of our own conduct; these are circumstances, very requisite to happiness, 170 and will be cherished and

cultivated by every honest person, who feels the importance of them. 171 Such a one has, besides, the frequent satisfaction of seeing knaves, with all their pretended cunning and abilities, betrayed by their own maxims; 172 and while they purpose to cheat with moderation and secrecy, a tempting incident occurs, their nature is frail, and they give into the snare; 173 whence they can never extricate themselves, without a total loss of reputation, and the forfeiture of all future trust and confidence with humankind. 174 But were they ever so secret and successful, the honest person, if you have any tincture of philosophy, or even common observation and reflection, will discover that they themselves are, in the end, the greatest dupes, 175 and have sacrificed the invaluable enjoyment of a character, with themselves at least, for the acquisition of worthless toys and gewgaws. 176 How little is requisite to supply the necessities of Nature? 177 And in a view to pleasure, what comparison between the unbought satisfaction of conversation, society, study, even health and the common beauties of Nature, but above all the peaceful reflection on one's own conduct; 178 what comparison, I say, between these and the feverish, empty amusements of luxury and expense? 179 These natural pleasures, indeed, are really without price; both because they are below all price in their attainment, and above it in their enjoyment.

CONCERNING MORAL SENTIMENT

David Hume

10 IF the foregoing hypothesis be received, it will now be easy for us to determine the question first started, concerning the general principles of morals; 2 and though we postponed the decision of that question, lest it should then involve us in intricate speculations, which are unfit for moral discourses, 3 we may resume it at present, and examine how far either REASON or SENTIMENT enters into all decisions of praise or censure.

4 One principal foundation of moral praise being supposed to lie in the usefulness of any quality or action, it is evident that REASON must enter for a considerable share in all decisions of this kind; 5 since nothing but that faculty can instruct us in the tendency of qualities and actions, and point out their beneficial consequences to society and to their possessor. 6 In many cases this is an affair liable to great controversy: doubts may arise; opposite interests may occur; and a preference must be given to one side, from very nice views, and a small overbalance of utility. 7 This is particularly remarkable in questions with regard to justice; as is, indeed, natural to suppose, from that species of utility which attends this virtue. 8 Were every single instance of justice, like that of benevolence, useful to society; this would be a more simple state of the case, and seldom liable to great controversy. 9 But as single instances of justice are often pernicious in their first and immediate tendency, and as the advantage to society results only from the observance of the general rule, 10 and from the concurrence and combination of several persons in the same equitable conduct; the case here becomes more intricate and involved. 11 The various circumstances of society; the various consequences of any practice; the various interests which may be proposed; these, on many occasions, are doubtful, and subject to great discussion and inquiry. 12 The object of municipal laws is to fix all the questions with regard to justice: the debates of civilians; the reflections of politicians; the precedents of history and public records, are all directed to the same purpose. 13 And a very accurate REASON or JUDGEMENT is often requisite, to give the true determination, amidst such intricate doubts arising from obscure or opposite utilities.

14 But though reason, when fully assisted and improved, be sufficient to instruct us in the pernicious or useful tendency of qualities and actions; it is not alone sufficient to produce any moral blame or approbation. 15 Utility is only a tendency to a certain end; and were the end

totally indifferent to us, we should feel the same indifference towards the means. 16 It is requisite a SENTIMENT should here display itself, in order to give a preference to the useful above the pernicious tendencies. 17 This SENTIMENT can be no other than a feeling for the happiness of humankind, and a resentment of their misery; since these are the different ends which virtue and vice have a tendency to promote. 18 Here therefore REASON instructs us in the several tendencies of actions, and HUMANITY makes a distinction in favour of those which are useful and beneficial.

19 This partition between the faculties of understanding and sentiment, in all moral decisions, seems clear from the preceding hypothesis. 20 But I shall suppose that hypothesis false: it will then be requisite to look out for some other theory that may be satisfactory; 21 and I dare venture to affirm that none such will ever be found, so long as we suppose reason to be the sole source of morals. 22 To prove this, it will be proper to weigh the five following considerations.

I. It is easy for a false hypothesis to maintain some appearance of truth, while it keeps wholly in generals, makes use of undefined terms, and employs comparisons, instead of instances. 23 This is particularly remarkable in that philosophy, which ascribes the discernment of all moral distinctions to reason alone, without the concurrence of sentiment. 24 It is impossible that, in any particular instance, this hypothesis can so much as be rendered intelligible, whatever specious figure it may make in general declamations and discourses. 25 Examine the crime of INGRATITUDE, for instance; which has place, wherever we observe good-will, expressed and known, together with good-offices performed, on the one side, and a return of ill-will or indifference, with ill-offices or neglect on the other: 26 anatomise all these circumstances, and examine, by your reason alone, in what consists the demerit or blame. You never will come to any issue or conclusion.

27 Reason judges either of MATTER OF FACT or of RELATIONS. Enquire

then, first, where is that matter of fact which we here call crime; 28 point it out; determine the time of its existence; describe its essence or its nature; explain the sense or faculty to which it discovers itself. 29 It resides in the mind of the person who is ungrateful. You must, therefore, feel it, and be conscious of it. 30 But nothing is there, except the passion of ill-will or absolute indifference. You cannot say that these, of themselves, always, and in all circumstances, are crimes. 31 No, they are only crimes when directed towards persons who have before expressed and displayed good-will towards us. 32 Consequently, we may infer, that the crime of ingratitude is not any particular individual FACT; 33 but arises from a complication of circumstances, which, being presented to the spectator, excites the SENTIMENT of blame, by the particular structure and fabric of own mind. 34 This representation, you say, is false. Crime, indeed, consists not in a particular FACT, of whose reality we are assured by reason; 35 but it consists in certain MORAL RELATIONS, discovered by reason, in the same manner as we discover by reason the truths of geometry or algebra.

36 But what are the relations, I ask, of which you here talk? In the case stated above, I see first good-will and good-offices in one person; then ill-will and ill-offices in the other. 37 Between these, there is a relation of CONTRARIETY. Does the crime consist in that relation? 38 But suppose a person bore me ill-will or did me ill-offices; and I, in return, were indifferent towards him, or did him good offices. Here is the same relation of CONTRARIETY; and yet my conduct is often highly laudable. 39 Twist and turn this matter as much as you will, you can never rest the morality on relation; but must have recourse to the decisions of sentiment.

40 When it is affirmed that two and three are equal to the half of ten, this relation of equality I understand perfectly. 41 I conceive, that if ten be divided into two parts, of which one has as many units as the other; and if any of these parts be compared to two added to three, it will contain as many units as that compound

number. 42 But when you draw thence a comparison to moral relations, I own that I am altogether at a loss to understand you. 43 A moral action, a crime, such as ingratitude, is a complicated object. Does the morality consist in the relation of its parts to each other? How? After what manner? 44 Specify the relation: be more particular and explicit in your propositions, and you will easily see their falsehood. 45 No, say you, the morality consists in the relation of actions to the rule of right; and they are denominated good or ill, according as they agree or disagree with it. 46 What then is this rule of right? In what does it consist? How is it determined? 47 By reason, you say, which examines the moral relations of actions. So that moral relations are determined by the comparison of action to a rule. 48 And that rule is determined by considering the moral relations of objects. Is not this fine reasoning? All this is metaphysics, you cry. 49 That is enough; there needs nothing more to give a strong presumption of falsehood. 50 Yes, reply I, here are metaphysics surely; but they are all on your side, who advance an abstruse hypothesis, which can never be made intelligible, nor quadrate with any particular instance or illustration. 51 The hypothesis which we embrace is plain. It maintains that morality is determined by sentiment. 52 It defines virtue to be WHATEVER MENTAL ACTION OR QUALITY GIVES TO A SPECTATOR THE PLEASING SENTIMENT OF APPROBATION; and vice the contrary. 53 We then proceed to examine a plain matter of fact, to wit, what actions have this influence. 54 We consider all the circumstances in which these actions agree, and thence endeavour to extract some general observations with regard to these sentiments. 55 If you call this metaphysics, and find anything abstruse here, you need only conclude that your turn of mind is not suited to the moral sciences.

56 II. When a person, at any time, deliberates concerning own conduct (as, whether you had better, in a particular emergence, assist a fellow or a benefactor), 57 you must consider these separate relations, with all the

circumstances and situations of the persons, in order to determine the superior duty and obligation; 58 and in order to determine the proportion of lines in any triangle, it is necessary to examine the nature of that figure, and the relation which its several parts bear to each other. 59 But notwithstanding this appearing similarity in the two cases, there is, at bottom, an extreme difference between them. 60 A speculative reasoner concerning triangles or circles considers the several known and given relations of the parts of these figures; and thence infers some unknown relation, which is dependent on the former.

61 But in moral deliberations we must be acquainted beforehand with all the objects, and all their relations to each other; and from a comparison of the whole, fix our choice or approbation. 62 No new fact to be ascertained; no new relation to be discovered. All the circumstances of the case are supposed to be laid before us, ere we can fix any sentence of blame or approbation. 63 If any material circumstance be yet unknown or doubtful, we must first employ our inquiry or intellectual faculties to assure us of it; and must suspend for a time all moral decision or sentiment. 64 While we are ignorant whether a person were aggressor or not, how can we determine whether the person who killed someone be criminal or innocent? 65 But after every circumstance, every relation is known, the understanding has no further room to operate, nor any object on which it could employ itself. 66 The approbation or blame which then ensues, cannot be the work of the judgement, but of the heart; and is not a speculative proposition or affirmation, but an active feeling or sentiment. 67 In the disquisitions of the understanding, from known circumstances and relations, we infer some new and unknown. 68 In moral decisions, all the circumstances and relations must be previously known; and the mind, from the contemplation of the whole, feels some new impression of affection or disgust, esteem or contempt, approbation or blame. 69 Hence the great difference between a mistake of

FACT and one of RIGHT; and hence the reason why the one is commonly criminal and not the other.

70 When Oedipus killed Laius, he was ignorant of the relation, and from circumstances, innocent and involuntary, formed erroneous opinions concerning the action which he committed. 71 But when Nero killed Agrippina, all the relations between himself and the person, and all the circumstances of the fact, were previously known to him; 72 but the motive of revenge, or fear, or interest, prevailed in his savage heart over the sentiments of duty and humanity. 73 And when we express that detestation against him to which he himself, in a little time, became insensible, it is not that we see any relations, of which he was ignorant; 74 but that, for the rectitude of our disposition, we feel sentiments against which he was hardened from flattery and a long perseverance in the most enormous crimes.

75 In these sentiments then, not in a discovery of relations of any kind, do all moral determinations consist. 76 Before we can pretend to form any decision of this kind, everything must be known and ascertained on the side of the object or action. 77 Nothing remains but to feel, on our part, some sentiment of blame or approbation; whence we pronounce the action criminal or virtuous.

78 III. This doctrine will become still more evident, if we compare moral beauty with natural, to which in many particulars it bears so near a resemblance. 79 It is on the proportion, relation, and position of parts, that all natural beauty depends; 80 but it would be absurd thence to infer, that the perception of beauty, like that of truth in geometrical problems, consists wholly in the perception of relations, and was performed entirely by the understanding or intellectual faculties. 81 In all the sciences, our mind from the known relations investigates the unknown. 82 But in all decisions of taste or external beauty, all the relations are beforehand obvious to the eye; 83 and we thence proceed to feel a sentiment of complacency or disgust, according

to the nature of the object, and disposition of our organs.

84 Euclid has fully explained all the qualities of the circle; but has not in any proposition said a word of its beauty. 85 The reason is evident. The beauty is not a quality of the circle. It lies not in any part of the line, whose parts are equally distant from a common centre. 86 It is only the effect which that figure produces upon the mind, whose peculiar fabric of structure renders it susceptible of such sentiments. 87 In vain would you look for it in the circle, or seek it, either by your senses or by mathematical reasoning, in all the properties of that figure.

88 Attend to Palladio and Perrault, while they explain all the parts and proportions of a pillar. 89 They talk of the cornice, and frieze, and base, and entablature, and shaft, and architrave; and give the description and position of each of these members. 90 But should you ask the description and position of its beauty, they would readily reply, that the beauty is not in any of the parts or members of a pillar, but results from the whole, 91 when that complicated figure is presented to an intelligent mind, susceptible to those finer sensations. 92 Till such a spectator appear, there is nothing but a figure of such particular dimensions and proportions: from own sentiments alone arise its elegance and beauty.

93 Again; attend to Cicero, while he paints the crimes of a Verres or a Catiline. You must acknowledge that the moral turpitude results, 94 in the same manner, from the contemplation of the whole, when presented to a being whose organs have such a particular structure and formation. 95 The orator may paint rage, insolence, barbarity on the one side; meekness, suffering, sorrow, innocence on the other. 96 But if you feel no indignation or compassion arise in you from this complication of circumstances, you would in vain ask, in what consists the crime or villainy, which you so vehemently exclaims against? 97 At what time, or on what subject it first began to exist? 98 And what has a few months afterwards become of it, when every disposition and thought of all the actors is totally altered or

annihilated? 99 No satisfactory answer can be given to any of these questions, upon the abstract hypothesis of morals; 100 and we must at last acknowledge, that the crime or immorality is no particular fact or relation, which can be the object of the understanding, but arises entirely from the sentiment of disapprobation, 101 which, by the structure of human nature, we unavoidably feel on the apprehension of barbarity or treachery.

102 IV. Inanimate objects may bear to each other all the same relations which we observe in moral agents; though the former can never be the object of love or hatred, nor are consequently susceptible of merit or iniquity. 103 A young tree, which over-tops and destroys its parent, stands in all the same relations with Nero, when he murdered Agrippina; and if morality consisted merely in relations, would no doubt be equally criminal.

104 V. It appears evident that-- the ultimate ends of human actions can never, in any case, be accounted for by reason, but recommend themselves entirely to the sentiments and affections of humankind, without any dependance on the intellectual faculties. 105 Ask a person WHY WE USES EXERCISE; you will answer, BECAUSE WE DESIRES TO KEEP OUR HEALTH. If you then enquire, WHY Y'ALL DESIRES HEALTH, you will readily reply, BECAUSE SICKNESS IS PAINFUL. 106 If you push your enquiries farther, and desire a reason WHY WE HATES PAIN, it is impossible you can ever give any. This is an ultimate end, and is never referred to any other object. 107 Perhaps to your second question, WHY WE DESIRES HEALTH, you may also reply, that IT IS NECESSARY FOR THE EXERCISE OF YOUR CALLING. 108 If you ask, WHY WE ARE ANXIOUS ON THAT HEAD, you will answer, BECAUSE WE DESIRES TO GET MONEY. If you demand WHY? IT IS THE INSTRUMENT OF PLEASURE, says you. 109 And beyond this it is an absurdity to ask for a reason. It is impossible there can be a progress IN INFINITUM; 110 and that one thing can always be a reason why another is desired. 111 Something

must be desirable on its own account, and because of its immediate accord or agreement with human sentiment and affection.

112 Now as virtue is an end, and is desirable on its own account, without fee and reward, merely for the immediate satisfaction which it conveys; 113 it is requisite that there should be some sentiment which it touches, some internal taste or feeling, or whatever you may please to call it, which distinguishes moral good and evil, and which embraces the one and rejects the other. 114 Thus the distinct boundaries and offices of REASON and of TASTE are easily ascertained. The former conveys the knowledge of truth and falsehood: the latter gives the sentiment of beauty and deformity, vice and virtue. 115 The one discovers objects as they really stand in Nature, without addition and diminution: 116 the other has a productive faculty, and gilding or staining all natural objects with the colours, borrowed from internal sentiment, raises in a manner a new creation. 117 Reason being cool and disengaged, is no motive to action, and directs only the impulse received from appetite or inclination, by showing us the means of attaining happiness or avoiding misery: 118 Taste, as it gives pleasure or pain, and thereby constitutes happiness or misery, becomes a motive to action, and is the first spring or impulse to desire and volition. 119 From circumstances and relations, known or supposed, the former leads us to the discovery of the concealed and unknown: 120 after all circumstances and relations are laid before us, the latter makes us feel from the whole a new sentiment of blame or approbation. 121 The standard of the one, being founded on the nature of things, is eternal and inflexible, even by the will of the Supreme Being: 122 the standard of the other arising from the eternal frame and constitution of animals, is ultimately derived from that Supreme Will, which bestowed on each being its peculiar nature, and arranged the several classes and orders of existence.

MORALS

OF SELF-LOVE
David Hume

11 THERE is a principle, supposed to prevail among many, which is utterly incompatible with all virtue or moral sentiment; 2 and as it can proceed from nothing but the most depraved disposition, so in its turn it tends still further to encourage that depravity. 3 This principle is, that all BENEVOLENCE is mere hypocrisy, friendship a cheat, public spirit a farce, fidelity a snare to procure trust and confidence; 4 and that while all of us, at bottom, pursue only our private interest, we wear these fair disguises, in order to put others off their guard, and expose them the more to our wiles and machinations. 5 What heart one must be possessed of who possesses such principles, and who feels no internal sentiment that belies so pernicious a theory, it is easy to imagine: 6 and also what degree of affection and benevolence you can bear to a species whom you represents under such odious colours, and supposes so little susceptible of gratitude or any return of affection. 7 Or if we should not ascribe these principles wholly to a corrupted heart, we must at least account for them from the most careless and precipitate examination.

8 Superficial reasoners, indeed, observing many false pretences among humankind, and feeling, perhaps, no very strong restraint in their own disposition, might draw a general and a hasty conclusion that all is equally corrupted, 9 and that humans, different from all other animals, and indeed from all other species of existence, admit of no degrees of good or bad, but are, in every instance, the same creatures under different disguises and appearances. 10 There is another principle, somewhat resembling the former; which has been much insisted on by philosophers, and has been the foundation of many a system; 11 that, whatever affection one may feel, or imagine you feels for others, no passion is, or can be disinterested; 12 that the most generous friendship, however sincere, is a modification of self-love; 13 and that, even unknown to ourselves, we seek only our own

gratification, while we appear the most deeply engaged in schemes for the liberty and happiness of humankind. 14 By a turn of imagination, by a refinement of reflection, by an enthusiasm of passion, we seem to take part in the interests of others, and imagine ourselves divested of all selfish considerations: 15 but, at bottom, the most generous patriot and most niggardly miser, the bravest hero and most abject coward, have, in every action, an equal regard to their own happiness and welfare. 16 Whoever concludes from the seeming tendency of this opinion, that those, who make profession of it, cannot possibly feel the true sentiments of benevolence, or have any regard for genuine virtue, will often find oneself, in practice, very much mistaken.

17 Probity and honour were no strangers to Epicurus and his sect. 18 Atticus and Horace seem to have enjoyed from Nature, and cultivated by reflection, as generous and friendly dispositions as any disciple of the austerer schools. 19 And among the modern, Hobbes and Locke, who maintained the selfish system of morals, lived irreproachable lives; 20 though the former lay not under any restraint of religion which might supply the defects of his philosophy. 21 An epicurean or a Hobbist readily allows, that there is such a thing as a friendship in the world, without hypocrisy or disguise; 22 though he may attempt, by a philosophical chemistry, to resolve the elements of this passion, if I may so speak, into those of another, 23 and explain every affection to be self-love, twisted and moulded, by a particular turn of imagination, into a variety of appearances. 24 But as the same turn of imagination prevails not in every human, nor gives the same direction to the original passion; 25 this is sufficient even according to the selfish system to make the widest difference in human characters, and denominate one human virtuous and humane, another vicious and meanly interested.

26 I esteem the person whose self-love, by whatever means, is so directed as to give you a concern for others, and render you serviceable to society: 27 as I hate or despise you, who has no regard

to any thing beyond your own gratifications and enjoyments. 28 In vain would you suggest that these characters, though seemingly opposite, are at bottom the same, and that a very inconsiderable turn of thought forms the whole difference between them. 29 Each character, notwithstanding these inconsiderable differences, appears to me, in practice, pretty durable and untransmutable. 30 And I find not in this more than in other subjects, that the natural sentiments arising from the general appearances of things are easily destroyed by subtile reflections concerning the minute origin of these appearances. 31 Does not the lively, cheerful colour of a countenance inspire me with complacency and pleasure; 32 even though I learn from philosophy that all difference of complexion arises from the most minute differences of thickness, in the most minute parts of the skin; 33 by means of which a superficies is qualified to reflect one of the original colours of light, and absorb the others?

34 But though the question concerning the universal or partial selfishness of human be not so material as is usually imagined to morality and practice, 35 it is certainly of consequence in the speculative science of human nature, and is a proper object of curiosity and enquiry. 36 It may not, therefore, be unsuitable, in this place, to bestow a few reflections upon it. 37 The most obvious objection to the selfish hypothesis is, that, as it is contrary to common feeling and our most unprejudiced notions, there is required the highest stretch of philosophy to establish so extraordinary a paradox. 38 To the most careless observer there appear to be such dispositions as benevolence and generousity; such affections as love, friendship, compassion, gratitude. 39 These sentiments have their causes, effects, objects, and operations, marked by common language and observation, and plainly distinguished from those of the selfish passions. 40 And as this is the obvious appearance of things, it must be admitted, till some hypothesis be discovered, which by penetrating deeper into human nature, may prove the former

affections to be nothing but modifications of the latter. 41 All attempts of this kind have hitherto proved fruitless, and seem to have proceeded entirely from that love of SIMPLICITY which has been the source of much false reasoning in philosophy. 42 I shall not here enter into any detail on the present subject. Many able philosophers have shown the insufficiency of these systems. And I shall take for granted what, I believe, the smallest reflection will make evident to every impartial enquirer.

43 But the nature of the subject furnishes the strongest presumption, that no better system will ever, for the future, be invented, 44 in order to account for the origin of the benevolent from the selfish affections, and reduce all the various emotions of the human mind to a perfect simplicity. 45 The case is not the same in this species of philosophy as in physics. Many an hypothesis in Nature, contrary to first appearances, has been found, on more accurate scrutiny, solid and satisfactory. 46 Instances of this kind are so frequent that a judicious, as well as witty philosopher, has ventured to affirm, if there be more than one way in which any phenomenon may be produced, 47 that there is general presumption for its arising from the causes which are the least obvious and familiar. 48 But the presumption always lies on the other side, in all enquiries concerning the origin of our passions, and of the internal operations of the human mind. 49 The simplest and most obvious cause which can there be assigned for any phenomenon, is probably the true one. 50 When a philosopher, in the explication of own system, is obliged to have recourse to some very intricate and refined reflections, and to suppose them essential to the production of any passion or emotion, we have reason to be extremely on our guard against so fallacious an hypothesis. 51 The affections are not susceptible of any impression from the refinements of reason or imagination; 52 and it is always found that a vigorous exertion of the latter faculties, necessarily, from the narrow capacity of the human mind, destroys all activity

in the former. 53 Our predominant motive or intention is, indeed, frequently concealed from ourselves when it is mingled and confounded with other motives which the mind, from vanity or self-conceit, is desirous of supposing more prevalent: 54 but there is no instance that a concealment of this nature has ever arisen from the abstruseness and intricacy of the motive. 55 A person that has lost a friend and patron may flatter oneself that all own grief arises from generous sentiments, without any mixture of narrow or interested considerations: 56 but a person that grieves for a valuable friend, who needed your patronage and protection; how can we suppose, that your passionate tenderness arises from some metaphysical regards to a self-interest, which has no foundation or reality? 57 We may as well imagine that minute wheels and springs, like those of a watch, give motion to a loaded waggon, as account for the origin of passion from such abstruse reflections.

58 Animals are found susceptible of kindness, both to their own species and to ours; nor is there, in this case, the least suspicion of disguise or artifice. 59 Shall we account for all THEIR sentiments, too, from refined deductions of self-interest? 60 Or if we admit a disinterested benevolence in the inferior species, by what rule of analogy can we refuse it in the superior?

61 Love between the sexes begets a complacency and good-will, very distinct from the gratification of an appetite. 62 Tenderness to their offspring, in all sensible beings, is commonly able alone to counter-balance the strongest motives of self-love, and has no manner of dependance on that affection. 63 What interest can a fond mother have in view, who loses her health by assiduous attendance on her sick child, and afterwards languishes and dies of grief, when freed, by its death, from the slavery of that attendance? 64 Is gratitude no affection of the human breast, or is that a word merely, without any meaning or reality? 65 Have we no satisfaction in one human's company above another's, and no desire of the welfare of our friend, even though

absence or death should prevent us from all participation in it? 66 Or what is it commonly, that gives us any participation in it, even while alive and present, but our affection and regard to you?

67 These and a thousand other instances are marks of a general benevolence in human nature, where no REAL interest binds us to the object. 68 And how an IMAGINARY interest known and avowed for such, can be the origin of any passion or emotion, seems difficult to explain. 69 No satisfactory hypothesis of this kind has yet been discovered; nor is there the smallest probability that the future industry of humans will ever be attended with more favourable success. 70 But farther, if we consider rightly of the matter, we shall find that the hypothesis which allows of a disinterested benevolence, distinct from self-love, has really more SIMPLICITY in it, 71 and is more conformable to the analogy of Nature than that which pretends to resolve all friendship and humanity into this latter principle. 72 There are bodily wants or appetites acknowledged by every one, which necessarily precede all sensual enjoyment, and carry us directly to seek possession of the object. 73 Thus, hunger and thirst have eating and drinking for their end; 74 and from the gratification of these primary appetites arises a pleasure, which may become the object of another species of desire or inclination that is secondary and interested.

75 In the same manner there are mental passions by which we are impelled immediately to seek particular objects, such as fame or power, or vengeance without any regard to interest; 76 and when these objects are attained a pleasing enjoyment ensues, as the consequence of our indulged affections. 77 Nature must, by the internal frame and constitution of the mind, give an original propensity to fame, ere we can reap any pleasure from that acquisition, or pursue it from motives of self-love, and desire of happiness. 78 If I have no vanity, I take no delight in praise: if I be void of ambition, power gives me no enjoyment: if I be not angry, the punishment of an adversary is totally indifferent to me. 79 In all

these cases there is a passion which points immediately to the object, and constitutes it our good or happiness; 80 as there are other secondary passions which afterwards arise, and pursue it as a part of our happiness, when once it is constituted such by our original affections. 81 Were there no appetite of any kind antecedent to self-love, that propensity could scarcely ever exert itself; 82 because we should, in that case, have felt few and slender pains or pleasures, and have little misery or happiness to avoid or to pursue.

83 Now where is the difficulty in conceiving, that this may likewise be the case with benevolence and friendship, 84 and that, from the original frame of our temper, we may feel a desire of another's happiness or good, which, by means of that affection, becomes our own good, and is afterwards pursued, from the combined motives of benevolence and self-enjoyments? 85 Who sees not that vengeance, from the force alone of passion, may be so eagerly pursued, as to make us knowingly neglect every consideration of ease, interest, or safety; 86 and, like some vindictive animals, infuse our very souls into the wounds we give an enemy; 87 and what a malignant philosophy must it be, that will not allow to humanity and friendship the same privileges which are undisputably granted to the darker passions of enmity and resentment; 88 such a philosophy is more like a satyr than a true delineation or description of human nature; and may be a good foundation for paradoxical wit and raillery, but is a very bad one for any serious argument or reasoning.

SOME FARTHER CONSIDERATIONS WITH REGARD TO JUSTICE

David Hume

12 The intention of this Appendix is to give some more particular explication of the origin and nature of Justice, and to mark some differences between it and the other virtues. 2 The social virtues of humanity and benevolence exert their influence immediately by a direct tendency or instinct, 3 which chiefly keeps in view the simple object, moving

the affections, and comprehends not any scheme or system, nor the consequences resulting from the concurrence, imitation, or example of others. 4 A parent flies to the relief of own child; transported by that natural sympathy which actuates one, and which affords no leisure to reflect on the sentiments or conduct of the rest of humankind in like circumstances. 5 A generous person cheerfully embraces an opportunity of serving own friend; because you then feels yourself under the dominion of the beneficent affections, 6 nor are you concerned whether any other person in the universe were ever before actuated by such noble motives, or will ever afterwards prove their influence. 7 In all these cases the social passions have in view a single individual object, and pursue the safety or happiness alone of the person loved and esteemed. 8 With this they are satisfied: in this they acquiesce. And as the good, resulting from their benign influence, is in itself complete and entire, 9 it also excites the moral sentiment of approbation, without any reflection on farther consequences, and without any more enlarged views of the concurrence or imitation of the other members of society. 10 On the contrary, were the generous friend or disinterested patriot to stand alone in the practice of beneficence, this would rather enhance your value in our eyes, and join the praise of rarity and novelty to your other more exalted merits.

11 The case is not the same with the social virtues of justice and fidelity. They are highly useful, or indeed absolutely necessary to the well-being of humankind: 12 but the benefit resulting from them is not the consequence of every individual single act; but arises from the whole scheme or system concurred in by the whole, or the greater part of the society. 13 General peace and order are the attendants of justice or a general abstinence from the possessions of others; 14 but a particular regard to the particular right of one individual citizen may frequently considered in itself, be productive of pernicious consequences. 15 The result of the individual acts is here, in many instances, directly

opposite to that of the whole system of actions; and the former may be extremely hurtful, while the latter is, to the highest degree, advantageous. 16 Riches, inherited from a parent, are, in a bad person's hand, the instrument of mischief. 17 The right of succession may, in one instance, be hurtful. Its benefit arises only from the observance of the general rule; 18 and it is sufficient, if compensation be thereby made for all the ills and inconveniences which flow from particular characters and situations.

19 Cyrus, young and unexperienced, considered only the individual case before him, and reflected on a limited fitness and convenience, when he assigned the long coat to the tall boy, and the short coat to the other of smaller size. 20 His governor instructed him better, while he pointed out more enlarged views and consequences, and informed his pupil of the general, inflexible rules, necessary to support general peace and order in society.

21 The happiness and prosperity of humankind, arising from the social virtue of benevolence and its subdivisions, may be compared to a wall, built by many hands, 22 which still rises by each stone that is heaped upon it, and receives increase proportional to the diligence and care of each workman. 23 The same happiness, raised by the social virtue of justice and its subdivisions, may be compared to the building of a vault, where each individual stone would, of itself, fall to the ground; 24 nor is the whole fabric supported but by the mutual assistance and combination of its corresponding parts.

25 All the laws of Nature, which regulate property, as well as all civil laws, are general, and regard alone some essential circumstances of the case, without taking into consideration the characters, situations, and connexions of the person concerned, 26 or any particular consequences which may result from the determination of these laws in any particular case which offers. 27 They deprive, without scruple, a beneficent person of all own possessions, if acquired by mistake, without a good title; in order to bestow them on a selfish

miser, who has already heaped up immense stores of superfluous riches. 28 Public utility requires that property should be regulated by general inflexible rules; 29 and though such rules are adopted as best serve the same end of public utility, it is impossible for them to prevent all particular hardships, or make beneficial consequences result from every individual case. 30 It is sufficient, if the whole plan or scheme be necessary to the support of civil society, and if the balance of good, in the main, do thereby preponderate much above that of evil. 31 Even the general laws of the universe, though planned by infinite wisdom, cannot exclude all evil or inconvenience in every particular operation.

32 It has been asserted by some, that justice arises from Human Conventions, and proceeds from the voluntary choice, consent, or combination of humankind. 33 If by CONVENTION be here meant a PROMISE (which is the most usual sense of the word) nothing can be more absurd than this position. 34 The observance of promises is itself one of the most considerable parts of justice, and we are not surely bound to keep our word because we have given our word to keep it. 35 But if by convention be meant a sense of common interest, which sense each human feels in your own breast, 36 which you remarks in your fellows, and which carries you, in concurrence with others, into a general plan or system of actions, which tends to public utility; 37 it must be owned, that, in this sense, justice arises from human conventions. 38 For if it be allowed (what is, indeed, evident) that the particular consequences of a particular act of justice may be hurtful to the public as well as to individuals; 39 it follows that every person, in embracing that virtue, must have an eye to the whole plan or system, and must expect the concurrence of your fellows in the same conduct and behaviour. 40 Did all your views terminate in the consequences of each act of your own, your benevolence and humanity, as well as your self-love, might often prescribe to you measures of conduct very different from those which are agreeable to the strict rules of right and justice.

41 Thus, two people pull the oars of a boat by common convention for common interest, without any promise or contract; 42 thus gold and silver are made the measures of exchange; thus speech and words and language are fixed by human convention and agreement. 43 Whatever is advantageous to two or more persons, if all perform their part; 44 but what loses all advantage if only one perform, can arise from no other principle, there would otherwise be no motive for any one of them to enter into that scheme of conduct.

45 The word NATURAL is commonly taken in so many senses and is of so loose a signification, that it seems vain to dispute whether justice be natural or not. 46 If self-love, if benevolence be natural to human; if reason and forethought be also natural; then may the same epithet be applied to justice, order, fidelity, property, society. 47 Humans' inclination, their necessities, lead them to combine; their understanding and experience tell them that this combination is impossible where each governs oneself by no rule, and pays no regard to the possessions of others: 48 and from these passions and reflections conjoined, as soon as we observe like passions and reflections in others, the sentiment of justice, throughout all ages, has infallibly and certainly had place to some degree or other in every individual of the human species. 49 In so sagacious an animal, what necessarily arises from the exertion of your intellectual faculties may justly be esteemed natural.

50 Among all civilised nations it has been the constant endeavour to remove everything arbitrary and partial from the decision of property, 51 and to fix the sentence of judges by such general views and considerations as may be equal to every member of society. 52 For besides, that nothing could be more dangerous than to accustom the bench, even in the smallest instance, to regard private friendship or enmity; 53 it is certain, that humans, where they imagine that there was no other reason for the preference of their adversary but personal favour, are apt to entertain the strongest ill-will against the magistrates and

judges. 54 When natural reason, therefore, points out no fixed view of public utility by which a controversy of property can be decided, positive laws are often framed to supply its place, and direct the procedure of all courts of judicature. 55 Where these too fail, as often happens, precedents are called for; and a former decision, though given itself without any sufficient reason, justly becomes a sufficient reason for a new decision. 56 If direct laws and precedents be wanting, imperfect and indirect ones are brought in aid; 57 and the controverted case is ranged under them by analogical reasonings and comparisons, and similitudes, and correspondencies, which are often more fanciful than real. 58 In general, it may safely be affirmed that jurisprudence is, in this respect, different from all the sciences; and that in many of its nicer questions, there cannot properly be said to be truth or falsehood on either side. 59 If one pleader bring the case under any former law or precedent, by a refined analogy or comparison; the opposite pleader is not at a loss to find an opposite analogy or comparison: 60 and the preference given by the judge is often founded more on taste and imagination than on any solid argument. 61 Public utility is the general object of all courts of judicature; and this utility too requires a stable rule in all controversies: 62 but where several rules, nearly equal and indifferent, present themselves, it is a very slight turn of thought which fixes the decision in favour of either party.

63 We may just observe, before we conclude this subject, that after the laws of justice are fixed by views of general utility, the injury, the hardship, the harm, which result to any individual from a violation of them, enter very much into consideration, 64 and are a great source of that universal blame which attends every wrong or iniquity. 65 By the laws of society, this coat, this horse is mine, and OUGHT to remain perpetually in my possession: I reckon on the secure enjoyment of it: 66 by depriving me of it, you disappoint my expectations, and doubly displease me, and offend every

bystander. 67 It is a public wrong, so far as the rules of equity are violated: it is a private harm, so far as an individual is injured. 68 And though the second consideration could have no place, were not the former previously established: for otherwise the distinction of MINE and THINE would be unknown in society: 69 yet there is no question but the regard to general good is much enforced by the respect to particular. 70 What injures the community, without hurting any individual, is often more lightly thought of. 71 But where the greatest public wrong is also conjoined with a considerable private one, no wonder the highest disapprobation attends so iniquitous a behaviour.

OF SOME VERBAL DISPUTES.

David Hume

13 Nothing is more usual than for philosophers to encroach upon the province of grammarians; and to engage in disputes of words, while they imagine that they are handling controversies of the deepest importance and concern. 2 It was in order to avoid altercations, so frivolous and endless, that I endeavoured to state with the utmost caution the object of our present enquiry; 3 and proposed simply to collect, on the one hand, a list of those mental qualities which are the object of love or esteem, and form a part of personal merit; 4 and on the other hand, a catalogue of those qualities which are the object of censure or reproach, and which detract from the character of the person possessed of them; 5 subjoining some reflections concerning the origin of these sentiments of praise or blame. 6 On all occasions, where there might arise the least hesitation, I avoided the terms VIRTUE and VICE; 7 because some of those qualities, which I classed among the objects of praise, receive, in the English language, the appellation of TALENTS, rather than of virtues; 8 as some of the blameable or censurable qualities are often called defects, rather than vices. 9 It may now, perhaps, be expected that before we conclude this moral enquiry, we should exactly separate the one from the other; 10 should mark the precise

boundaries of virtues and talents, vices and defects; and should explain the reason and origin of that distinction. 11 But in order to excuse myself from this undertaking, which would, at last, prove only a grammatical enquiry, I shall subjoin the four following reflections, which shall contain all that I intend to say on the present subject.

12 First, I do not find that in the English, or any other modern tongue, the boundaries are exactly fixed between virtues and talents, vices and defects, or that a precise definition can be given of the one as contradistinguished from the other. 13 Were we to say, for instance, that the esteemable qualities alone, which are voluntary, are entitled to the appellations of virtues; we should soon recollect the qualities of courage, equanimity, patience, self-command; 14 with many others, which almost every language classes under this appellation, though they depend little or not at all on our choice. 15 Should we affirm that the qualities alone, which prompt us to act our part in society, are entitled to that honourable distinction; 16 it must immediately occur that these are indeed the most valuable qualities, and are commonly denominated the SOCIAL virtues; 17 but that this very epithet supposes that there are also virtues of another species. 18 Should we lay hold of the distinction between INTELLECTUAL and MORAL endowments, and affirm the last alone to be the real and genuine virtues, because they alone lead to action; 19 we should find that many of those qualities, usually called intellectual virtues, such as prudence, penetration, discernment, discretion, had also a considerable influence on conduct. 20 The distinction between the heart and the head may also be adopted: the qualities of the first may be defined such as in their immediate exertion are accompanied with a feeling of sentiment; and these alone may be called the genuine virtues: 21 but industry, frugality, temperance, secrecy, perseverance, and many other laudable powers or habits, generally stilled virtues are exerted without any immediate sentiment in the person possessed of them,

and are only known to you by their effects. 22 It is fortunate, amidst all this seeming perplexity, that the question, being merely verbal, cannot possibly be of any importance. 23 A moral, philosophical discourse needs not enter into all these caprices of language, which are so variable in different dialects, and in different ages of the same dialect. 24 But on the whole, it seems to me, that though it is always allowed, that there are virtues of many different kinds, 25 yet, when a person is called virtuous, or is denominated a person of virtue, we chiefly regard your social qualities, which are, indeed, the most valuable. 26 It is, at the same time, certain, that any remarkable defect in courage, temperance, economy, industry, understanding, dignity of mind, would bereave even a very good-natured, honest person of this honourable appellation. 27 Who did ever say, except by way of irony, that such a one was a person of great virtue, but an egregious blockhead?

28 But, Secondly, it is no wonder that languages should not be very precise in marking the boundaries between virtues and talents, vices and defects; since there is so little distinction made in our internal estimation of them. 29 It seems indeed certain, that the SENTIMENT of conscious worth, the self-satisfaction proceeding from a review of a human's own conduct and character; 30 it seems certain, I say, that this sentiment, which, though the most common of all others, has no proper name in our language, arises from the endowments of courage and capacity, industry and ingenuity, as well as from any other mental excellencies. 31 Who, on the other hand, is not deeply mortified with reflecting on own folly and dissoluteness, and feels not a secret sting or compunction whenever your memory presents any past occurrence, where you behaved with stupidity of ill-manners? 32 No time can efface the cruel ideas of a person's own foolish conduct, or of affronts, which cowardice or impudence has brought upon you. 33 They still haunt your solitary hours, damp your most aspiring thoughts, and show you, even to yourself, in the

most contemptible and most odious colours imaginable. 34 What is there too we are more anxious to conceal from others than such blunders, infirmities, and meannesses, or more dread to have exposed by raillery and satire? 35 And is not the chief object of vanity, our bravery or learning, our wit or breeding, our eloquence or address, our taste or abilities? 36 These we display with care, if not with ostentation; and we commonly show more ambition of excelling in them, than even in the social virtues themselves, which are, in reality, of such superior excellence. 37 Good-nature and honesty, especially the latter, are so indispensably required, that, though the greatest censure attends any violation of these duties, no eminent praise follows such common instances of them, as seem essential to the support of human society. 38 And hence the reason, in my opinion, why, though humans often extol so liberally the qualities of their heart, they are shy in commending the endowments of their head: 39 because the latter virtues, being supposed more rare and extraordinary, are observed to be the more usual objects of pride and self-conceit; and when boasted of, beget a strong suspicion of these sentiments.

40 It is hard to tell, whether you hurt a person's character most by calling one a knave or a coward, and whether a beastly glutton or drunkard be not as odious and contemptible, as a selfish, ungenerous miser. 41 Give me my choice, and I would rather, for my own happiness and self-enjoyment, have a friendly, humane heart, than possess all the other virtues of Demosthenes and Philip united: 42 but I would rather pass with the world for one endowed with extensive genius and intrepid courage, and should thence expect stronger instances of general applause and admiration. 43 The figure which a person makes in life, the reception which you meets with in company, the esteem paid you by your acquaintance; 44 all these advantages depend as much upon your good sense and judgement, as upon any other part of your character. 45 Had a person the best

intentions in the world, and were the farthest removed from all injustice and violence, you would never be able to make yourself be much regarded, without a moderate share, at least, of parts and understanding.

46 What is it then we can here dispute about? If sense and courage, temperance and industry, wisdom and knowledge confessedly form a considerable part of PERSONAL MERIT: 47 if a person, possessed of these qualities, is both better satisfied with oneself, and better entitled to the good-will, esteem, and services of others, than one entirely destitute of them; 48 if, in short, the SENTIMENTS are similar which arise from these endowments and from the social virtues; 49 is there any reason for being so extremely scrupulous about a WORD, or disputing whether they be entitled to the denomination of virtues? 50 It may, indeed, be pretended, that the sentiment of approbation, which those accomplishments produce, besides its being INFERIOR, is also somewhat DIFFERENT from that which attends the virtues of justice and humanity. 51 But this seems not a sufficient reason for ranking them entirely under different classes and appellations. 52 The character of Caesar and that of Cato, as drawn by Sallust, are both of them virtuous, in the strictest and most limited sense of the word; but in a different way: nor are the sentiments entirely the same which arise from them. 53 The one produces love, the other esteem: the one is amiable, the other awful: we should wish to meet the one character in a friend; the other we should be ambitious of in ourselves. 54 In like manner the approbation, which attends temperance or industry or frugality, may be somewhat different from that which is paid to the social virtues, without making them entirely of a different species. 55 And, indeed, we may observe, that these endowments, more than the other virtues, produce not, all of them, the same kind of approbation. 56 Good sense and genius beget esteem and regard: wit and humour excite love and affection.

57 Most people, I believe, will naturally, without premeditation,

assent to the definition of the elegant and judicious poet: Virtue (for mere good-nature is a fool) Is sense and spirit with humanity. 58 What pretensions has a person to our generous assistance or good offices, who has dissipated own wealth in profuse expenses, idle vanities, chimerical projects, dissolute pleasures or extravagant gaming? 59 These vices (for we scruple not to call them such) bring misery unpitied, and contempt on every one addicted to them.

60 Achaeus, a wise and prudent prince, fell into a fatal snare, which cost him his crown and life, after having used every reasonable precaution to guard himself against it. 61 On that account, says the historian, he is a just object of regard and compassion: his betrayers alone of hatred and contempt. 62 The precipitate flight and improvident negligence of Pompey, at the beginning of the civil wars, appeared such notorious blunders to Cicero, as quite palled his friendship towards that great man. 63 In the same manner, says he, as want of cleanliness, decency, or discretion in a mistress are found to alienate our affections. 64 For so he expresses himself, where he talks, not in the character of a philosopher, but in that of a statesman and man of the world, to his friend Atticus. 65 But the same Cicero, in imitation of all the ancient moralists, when he reasons as a philosopher, enlarges very much his ideas of virtue, and comprehends every laudable quality or endowment of the mind, under that honourable appellation. 66 This leads to the THIRD reflection, which we proposed to make, to wit, that the ancient moralists, the best models, made no material distinction among the different species of mental endowments and defects, 67 but treated all alike under the appellation of virtues and vices, and made them indiscriminately the object of their moral reasonings. 68 The prudence explained in Cicero's Offices is that sagacity, which leads to the discovery of truth, and preserves us from error and mistake. MAGNANIMITY, TEMPERANCE, DECENCY, are there also at large discoursed of. 69 And as that

eloquent moralist followed the common received division of the four cardinal virtues, our social duties form but one head, in the general distribution of his subject.

70 We need only peruse the titles of chapters in Aristotle's Ethics to be convinced that he ranks courage, temperance, magnificence, magnanimity, modesty, prudence, and a humanly openness, among the virtues, as well as justice and friendship. 71 To SUSTAIN and to ABSTAIN, that is, to be patient and continent, appeared to some of the ancients a summary comprehension of all morals.

72 Epictetus has scarcely ever mentioned the sentiment of humanity and compassion, but in order to put his disciples on their guard against it. 73 The virtue of the Stoics seems to consist chiefly in a firm temper and a sound understanding. 74 With them, as with Solomon and the eastern moralists, folly and wisdom are equivalent to vice and virtue.

75 People will praise thee, says David, when thou dost well unto thyself. I hate a wise person, says the Greek poet, who is not wise to oneself.

76 Plutarch is no more cramped by systems in his philosophy than in his history. 77 Where he compares the great men of Greece and Rome, he fairly sets in opposition all their blemishes and accomplishments of whatever kind, and omits nothing considerable, which can either depress or exalt their characters. 78 His moral discourses contain the same free and natural censure of humans and manners.

79 The character of Hannibal, as drawn by Livy, is esteemed partial, but allows him many eminent virtues. 80 Never was there a genius, says the historian, more equally fitted for those opposite offices of commanding and obeying; 81 and it were, therefore, difficult to determine whether he rendered himself DEARER to the general or to the army. 82 To none would Hasdrubal entrust more willingly the conduct of any dangerous enterprise; under none did the soldiers discover more courage and confidence. 83 Great boldness in facing danger; great prudence in the midst of it. No

labour could fatigue his body or subdue his mind. 84 Cold and heat were indifferent to him: meat and drink he sought as supplies to the necessities of Nature, not as gratifications of his voluptuous appetites. 85 Waking or rest he used indiscriminately, by night or by day.-- These great Virtues were balanced by great Vices; 86 inhuman cruelty; perfidy more than punic; no truth, no faith, no regard to oaths, promises, or religion.

87 The character of Alexander the Sixth, to be found in Guicciardin, is pretty similar, but juster; and is a proof that even the moderns, where they speak naturally, hold the same language with the ancients. 88 In this pope, says he, there was a singular capacity and judgement: admirable prudence; a wonderful talent of persuasion; and in all momentous enterprises a diligence and dexterity incredible. 89 But these VIRTUES were infinitely overbalanced by his VICES; no faith, no religion, insatiable avarice, exorbitant ambition, and a more than barbarous cruelty.

90 Polybius, reprehending Timaeus for his partiality against Agathocles, whom he himself allows to be the most cruel and impious of all tyrants, 91 says: if he took refuge in Syracuse, as asserted by that historian, flying the dirt and smoke and toil of his former profession of a potter; 92 and if proceeding from such slender beginnings, he became master, in a little time, of all Sicily; brought the Carthaginian state into the utmost danger; and at last died in old age, and in possession of sovereign dignity: 93 must he not be allowed something prodigious and extraordinary, and to have possessed great talents and capacity for business and action? 94 His historian, therefore, ought not to have alone related what tended to his reproach and infamy; but also what might redound to his Praise and Honour.

95 In general, we may observe, that the distinction of voluntary or involuntary was little regarded by the ancients in their moral reasonings; where they frequently treated the question as very doubtful, WHETHER VIRTUE COULD BE TAUGHT OR NOT?

96 They justly considered that cowardice, meanness, levity, anxiety, impatience, folly, and many other qualities of the mind, might appear ridiculous and deformed, contemptible and odious, though independent of the will. 97 Nor could it be supposed, at all times, in every human's power to attain every kind of mental more than of exterior beauty.

98 And here there occurs the FOURTH reflection which I purposed to make, in suggesting the reason why modern philosophers have often followed a course in their moral enquiries so different from that of the ancients. 99 In later times, philosophy of all kinds, especially ethics, have been more closely united with theology than ever they were observed to be among the heathens; 100 and as this latter science admits of no terms of composition, but bends every branch of knowledge to its own purpose, without much regard to the phenomena of Nature, or to the unbiased sentiments of the mind, 101 hence reasoning, and even language, have been warped from their natural course, and distinctions have been endeavoured to be established where the difference of the objects was, in a manner, imperceptible. 102 Philosophers, or rather divines under that disguise, treating all morals as on a like footing with civil laws, 103 guarded by the sanctions of reward and punishment, were necessarily led to render this circumstance, of VOLUNTARY or INVOLUNTARY, the foundation of their whole theory. 104 Every one may employ TERMS in what sense you pleases: but this, in the mean time, must be allowed, that SENTIMENTS are every day experienced of blame and praise, which have objects beyond the dominion of the will or choice, 105 and of which it behoves us, if not as moralists, as speculative philosophers at least, to give some satisfactory theory and explication.

106 A blemish, a fault, a vice, a crime; these expressions seem to denote different degrees of censure and disapprobation; which are, however, all of them, at the bottom, pretty nearly all the same kind of species. 107 The explication of one will easily lead

us into a just conception of the others; and it is of greater consequence to attend to things than to verbal appellations. 108 That we owe a duty to ourselves is confessed even in the most vulgar system of morals; and it must be of consequence to examine that duty, in order to see whether it bears any affinity to that which we owe to society. 109 It is probable that the approbation attending the observance of both is of a similar nature, and arises from similar principles, whatever appellation we may give to either of these excellencies.

The Book of Divine Panagogue called

KNOWLEDGE

A TREATISE
CONCERNING THE PRINCIPLES OF
HUMAN KNOWLEDGE
George Berkeley

INTRODUCTION

1 Philosophy being nothing else but THE STUDY OF WISDOM AND TRUTH, 2 it may with reason be expected that those who have spent most time and pains in it should enjoy a greater calm and serenity of mind, 3 a greater clearness and evidence of knowledge, and be less disturbed with doubts and difficulties than other people. 4 Yet so it is, we see the illiterate bulk of humankind that walk the high-road of plain common sense, and are governed by the dictates of Nature, for the most part easy and undisturbed. 5 To them nothing THAT IS FAMILIAR appears unaccountable or difficult to comprehend. 6 They complain not of any want of evidence in their senses, and are out of all danger of becoming SCEPTICS. 7 But no sooner do we depart from sense and instinct to follow the light of a superior principle, to reason, meditate, and reflect on the nature of things, 8 but a thousand scruples spring up in our minds concerning those things which before we seemed fully to comprehend. 9 Prejudices and errors of sense do from all parts discover themselves to our view; and, endeavouring to correct these by reason, we are insensibly drawn into uncouth paradoxes, difficulties, and inconsistencies, 10 which multiply and grow upon us as we advance in speculation, till at length, having wandered through many intricate mazes, we find ourselves just where we were, or, which is worse, sit down in a forlorn Scepticism.

11 The cause of this is thought to be the obscurity of things, or the natural weakness and imperfection of our understandings. 12 It is said, the faculties we have are few, and those designed by Nature for the SUPPORT and comfort of life, and not to penetrate into the INWARD ESSENCE and constitution of things. 13 Besides, the mind of human being finite, when it treats of things which partake of infinity, it is not to be wondered at if it run into absurdities and contradictions,

14 out of which it is impossible it should ever extricate itself, it being of the nature of infinite not to be comprehended by that which is finite.

15 But, perhaps, we may be too partial to ourselves in placing the fault originally in our faculties, and not rather in the wrong use we make of them. 16 IT IS A HARD THING TO SUPPOSE THAT RIGHT DEDUCTIONS FROM TRUE PRINCIPLES SHOULD EVER END IN CONSEQUENCES WHICH CANNOT BE MAINTAINED or made consistent. 17 We should believe that God has dealt more bountifully with the sons of humans than to give them a strong desire for that knowledge which He had placed quite out of their reach. 18 This were not agreeable to the wonted indulgent methods of Providence, which, whatever appetites it may have implanted in the creatures, doth usually furnish them with such means as, if rightly made use of, will not fail to satisfy them. 19 Upon the whole, I am inclined to think that the far greater part, if not all, of those difficulties which have hitherto amused philosophers, 20 and blocked up the way to knowledge, are entirely owing to ourselves--that we have first raised a dust and then complain we cannot see.

21 My purpose therefore is, to try if I can discover what those Principles are which have introduced all that doubtfulness and uncertainty, those absurdities and contradictions, into the several sects of philosophy; 22 insomuch that the wisest people have thought our ignorance incurable, conceiving it to arise from the natural dullness and limitation of our faculties. 23 And surely it is a work well deserving our pains to make a strict inquiry concerning the First Principles of Human Knowledge, to sift and examine them on all sides, 24 especially since there may be some grounds to suspect that those lets and difficulties, which stay and embarrass the mind in its search after truth, 25 do not spring from any darkness and intricacy in the objects, or natural defect in the understanding, so much as from false Principles which have been insisted on, and might have been avoided.

26 How difficult and discouraging soever this attempt may seem,

when I consider how many great and extraordinary people have gone before me in the like designs, yet I am not without some hopes-- 27 upon the consideration that the largest views are not always the clearest, and that you who is short-sighted will be obliged to draw the object nearer, and may, perhaps, by a close and narrow survey, discern that which had escaped far better eyes.

A CHIEF SOURCE OF ERROR IN ALL PARTS OF KNOWLEDGE

28 In order to prepare the mind of the reader for the easier conceiving what follows, it is proper to premise somewhat, by way of Introduction, concerning the nature and abuse of Language. 29 But the unravelling this matter leads me in some measure to anticipate my design, by taking notice of what seems to have had a chief part in rendering speculation intricate and perplexed, 30 and to have occasioned innumerable errors and difficulties in almost all parts of knowledge. And that is the opinion that the mind has a power of framing ABSTRACT IDEAS or notions of things. 31 You who is not a perfect stranger to the writings and disputes of philosophers must needs acknowledge that no small part of them are spent about abstract ideas. 32 These are in a more especial manner thought to be the object of those sciences which go by the name of LOGIC and METAPHYSICS, and of all that which passes under the notion of the most abstracted and sublime learning, 33 in all which one shall scarce find any question handled in such a manner as does not suppose their existence in the mind, and that it is well acquainted with them.

PROPER ACCEPTATION OF ABSTRACTION

34 It is agreed on all hands that the qualities or modes of things do never REALLY EXIST EACH OF THEM APART BY ITSELF, and separated from all others, but are mixed, as it were, and blended together, several in the same object. 35 But, we are told, the mind being able to consider each quality singly, or abstracted from

those other qualities with which it is united, does by that means frame to itself abstract ideas. 36 For example, there is perceived by sight an object extended, coloured, and moved: 37 this mixed or compound idea the mind resolving into its simple, constituent parts, and viewing each by itself, exclusive of the rest, does frame the abstract ideas of extension, colour, and motion. 38 Not that it is possible for colour or motion to exist without extension; but only that the mind can frame to itself by ABSTRACTION the idea of colour exclusive of extension, and of motion exclusive of both colour and extension.

OF GENERALISING

39 Again, the mind having observed that in the particular extensions perceived by sense there is something COMMON and alike IN ALL, 40 and some other things peculiar, as this or that figure or magnitude, which distinguish them one from another; 41 it considers apart or singles out by itself that which is common, making thereof a most abstract idea of extension, which is neither line, surface, nor solid, nor has any figure or magnitude, but is an idea entirely prescinded from all these. 42 So likewise the mind, by leaving out of the particular colours perceived by sense that which distinguishes them one from another, and retaining that only which is COMMON TO ALL, makes an idea of colour in abstract which is neither red, nor blue, nor white, nor any other determinate colour. 43 And, in like manner, by considering motion abstractedly not only from the body moved, but likewise from the figure it describes, and all particular directions and velocities, 44 the abstract idea of motion is framed; which equally corresponds to all particular motions whatsoever that may be perceived by sense.

OF COMPOUNDING

45 And as the mind frames to itself abstract ideas of qualities or MODES, so does it, by the same precision or mental separation, attain abstract ideas of the more

compounded BEINGS which include several coexistent qualities. 46 For example, the mind having observed that Peter, James, and John resemble each other in certain common agreements of shape and other qualities, 47 leaves out of the complex or compounded idea it has of Peter, James, and any other particular person, that which is peculiar to each, retaining only what is common to all, 48 and so makes an abstract idea wherein all the particulars equally partake--abstracting entirely from and cutting off all those circumstances and differences which might determine it to any particular existence. 49 And after this manner it is said we come by the abstract idea of HUMAN, or, if you please, humanity, or human nature; 50 wherein it is true there is included colour, because there is no human but has some colour, 51 but then it can be neither white, nor black, nor any particular colour, because there is no one particular colour wherein all humans partake. 52 So likewise there is included stature, but then it is neither tall stature, nor low stature, nor yet middle stature, but something abstracted from all these. 53 And so of the rest. Moreover, their being a great variety of other creatures that partake in some parts, but not all, of the complex idea of HUMAN, 54 the mind, leaving out those parts which are peculiar to humans, and retaining those only which are common to all the living creatures, 55 frames the idea of ANIMAL, which abstracts not only from all particular humans, but also all birds, beasts, fishes, and insects. 56 The constituent parts of the abstract idea of animal are body, life, sense, and spontaneous motion. 57 By BODY is meant body without any particular shape or figure, there being no one shape or figure common to all animals, without covering, either of hair, or feathers, or scales, nor yet naked: 58 hair, feathers, scales, and nakedness being the distinguishing properties of particular animals, and for that reason left out of the ABSTRACT IDEA. 59 Upon the same account the spontaneous motion must be neither walking, nor flying, nor creeping; it is nevertheless a motion, but what that motion is it is not easy to conceive.

TWO OBJECTIONS TO THE EXISTENCE OF ABSTRACT IDEAS

60 Whether others have this wonderful faculty of ABSTRACTING THEIR IDEAS, they best can tell: 61 for myself, I find indeed I have a faculty of imagining, or representing to myself, the ideas of those particular things I have perceived, and of variously compounding and dividing them. 62 I can imagine a person with two heads, or the upper parts of a person joined to the body of a horse. 63 I can consider the hand, the eye, the nose, each by itself abstracted or separated from the rest of the body. 64 But then whatever hand or eye I imagine, it must have some particular shape and colour. 65 Likewise the idea of human that I frame to myself must be either of a white, or a black, or a tawny, a straight, or a crooked, a tall, or a low, or a middle-sized human. 66 I cannot by any effort of thought conceive the abstract idea above described. And it is equally impossible for me to form the abstract idea of motion distinct from the body moving, 67 and which is neither swift nor slow, curvilinear nor rectilinear; and the like may be said of all other abstract general ideas whatsoever. 68 To be plain, I own myself able to abstract IN ONE SENSE, as when I consider some particular parts or qualities separated from others, with which, though they are united in some object, yet it is possible they may really exist without them. 69 But I deny that I can abstract from one another, or conceive separately, those qualities which it is impossible should exist so separated; 70 or that I can frame a general notion, by abstracting from particulars in the manner aforesaid-- which last are the two proper acceptations of ABSTRACTION. 71 And there are grounds to think most people will acknowledge themselves to be in my case. 72 The generality of people which are simple and illiterate never pretend to ABSTRACT NOTIONS. It is said they are difficult and not to be attained without pains and study; 73 we may therefore reasonably conclude that, if such there be, they are confined only to the learned.

74 I proceed to examine what can be alleged in DEFENCE OF THE

DOCTRINE OF ABSTRACTION, and try if I can discover what it is that inclines the people of speculation to embrace an opinion so remote from common sense as that seems to be. 75 There has been a late deservedly esteemed philosopher who, no doubt, has given it very much countenance, 76 by seeming to think the having abstract general ideas is what puts the widest difference in point of understanding betwixt human and beast. 77 "The having of general ideas," saith he, "is that which puts a perfect distinction betwixt human and brutes, and is an excellency which the faculties of brutes do by no means attain unto. 78 For, it is evident we observe no foot-steps in them of making use of general signs for universal ideas; 79 from which we have reason to imagine that they have not the FACULTY OF ABSTRACTING, or making general ideas, since they have no use of words or any other general signs." 80 And a little after: "Therefore, I think, we may suppose that it is in this that the species of brutes are discriminated from humans, and it is that proper difference wherein they are wholly separated, and which at last widens to so wide a distance. 81 For, if they have any ideas at all, and are not bare machines (as some would have them), we cannot deny them to have some reason. 82 It seems as evident to me that they do, some of them, in certain instances reason as that they have sense; but it is only in particular ideas, just as they receive them from their senses. 83 They are the best of them tied up within those narrow bounds, and have not (as I think) the faculty to enlarge them by any kind of ABSTRACTION."

84 Essay on Human Understanding, II. xi. 10 and 11. I readily agree with this learned author, that the faculties of brutes can by no means attain to ABSTRACTION. 85 But then if this be made the distinguishing property of that sort of animals, I fear a great many of those that pass for humans must be reckoned into their number. 86 The reason that is here assigned why we have no grounds to think brutes have abstract general ideas is, that we observe in them no use of words or any other general signs; 87 which

is built on this supposition-- that the making use of words implies the having general ideas. From which it follows that people who use language are able to ABSTRACT or generalise their ideas. 88 That this is the sense and arguing of the author will further appear by his answering the question he in another place puts: 89 "Since all things that exist are only particulars, how come we by general terms?" His answer is: "Words become general by being made the signs of general ideas." Essay on Human Understanding, IV. iii. 6. 90 But it seems that a word becomes general by being made the sign, not of an ABSTRACT general idea, but of several particular ideas, any one of which it indifferently suggests to the mind. 91 For example, when it is said "the change of motion is proportional to the impressed force," or that "whatever has extension is divisible," these propositions are to be understood of motion and extension in general; 92 and nevertheless it will not follow that they suggest to my thoughts an idea of motion without a body moved, or any determinate direction and velocity, 93 or that I must conceive an abstract general idea of extension, which is neither line, surface, nor solid, neither great nor small, black, white, nor red, nor of any other determinate colour. 94 It is only implied that whatever particular motion I consider, whether it be swift or slow, perpendicular, horizontal, or oblique, or in whatever object, the axiom concerning it holds equally true. 95 As does the other of every particular extension, it matters not whether line, surface, or solid, whether of this or that magnitude or figure.

EXISTENCE OF GENERAL IDEAS ADMITTED

96 By observing how ideas become general we may the better judge how words are made so. 97 And here it is to be noted that I do not deny absolutely there are general ideas, but only that there are any ABSTRACT GENERAL IDEAS; 98 for, in the passages we have quoted wherein there is mention of general ideas, it is always supposed that they are formed by ABSTRACTION. 99 Now, if we will

annex a meaning to our words, and speak only of what we can conceive, I believe we shall acknowledge that an idea which, considered in itself, is particular, becomes general by being made to represent or stand for all other particular ideas of the SAME SORT. 100 To make this plain by an example, suppose a geometrician is demonstrating the method of cutting a line in two equal parts. He draws, for instance, a black line of an inch in length: 101 this, which in itself is a particular line, is nevertheless with regard to its signification general, since, as it is there used, it represents all particular lines whatsoever; 102 so that what is demonstrated of it is demonstrated of all lines, or, in other words, of a line in general. 103 And, as that particular line becomes general by being made a sign, so the name LINE, which taken absolutely is PARTICULAR, by being a sign is made GENERAL. 104 And as the former owes its generality not to its being the sign of an abstract or general line, but of ALL PARTICULAR right lines that may possibly exist, 105 so the latter must be thought to derive its generality from the same cause, namely, the VARIOUS PARTICULAR lines which it indifferently denotes.

ABSTRACT GENERAL IDEAS NECESSARY, ACCORDING TO LOCKE

106 To give the reader a yet clearer view of the nature of abstract ideas, and the uses they are thought necessary to, I shall add one more passage out of the Essay on Human Understanding, which is as follows: 107 "ABSTRACT IDEAS are not so obvious or easy to children or the yet unexercised mind as particular ones. If they seem so to grown people it is only because by constant and familiar use they are made so. 108 For, when we nicely reflect upon them, we shall find that general ideas are fictions and contrivances of the mind, that carry difficulty with them, and do not so easily offer themselves as we are apt to imagine. 109 For example, does it not require some pains and skill to form the general idea of a triangle (which is yet none of the most abstract, comprehensive, and

difficult); 110 for it must be neither oblique nor rectangle, neither equilateral, equicrural, nor scalenon, but ALL AND NONE of these at once? 111 In effect, it is something imperfect that cannot exist, an idea wherein some parts of several different and INCONSISTENT ideas are put together. 112 It is true the mind in this imperfect state has need of such ideas, and makes all the haste to them it can, for the CONVENIENCY OF COMMUNICATION AND ENLARGEMENT OF KNOWLEDGE, to both which it is naturally very much inclined. 113 But yet one has reason to suspect such ideas are marks of our imperfection. 114 At least this is enough to show that the most abstract and general ideas are not those that the mind is first and most easily acquainted with, nor such as its earliest knowledge is conversant about."-- 115 If any person has the faculty of framing in own mind such an idea of a triangle as is here described, it is in vain to pretend to dispute you out of it, nor would I go about it. 116 All I desire is that the reader would fully and certainly inform yourself whether you have such an idea or no. And this, methinks, can be no hard task for anyone to perform. 117 What more easy than for anyone to look a little into own thoughts, and there try whether you have, or can attain to have, an idea that shall correspond with the description that is here given of the general idea of a triangle, 118 which is NEITHER OBLIQUE NOR RECTANGLE, EQUILATERAL, EQUICRURAL NOR SCALENON, BUT ALL AND NONE OF THESE AT ONCE?

BUT THEY ARE NOT NECESSARY FOR COMMUNICATION

119 Much is here said of the difficulty that abstract ideas carry with them, and the pains and skill requisite to the forming them. 120 And it is on all hands agreed that there is need of great toil and labour of the mind, to emancipate our thoughts from particular objects, and raise them to those sublime speculations that are conversant about abstract ideas. 121 From all which the natural consequence should seem to be, that so DIFFICULT a thing as the

forming abstract ideas was not necessary for COMMUNICATION, which is so EASY and familiar to ALL SORTS OF PEOPLE. 122 But, we are told, if they seem obvious and easy to grown people, IT IS ONLY BECAUSE BY CONSTANT AND FAMILIAR USE THEY ARE MADE SO. 123 Now, I would fain know at what time it is people are employed in surmounting that difficulty, and furnishing themselves with those necessary helps for discourse. 124 It cannot be when they are grown up, for then it seems they are not conscious of any such painstaking; it remains therefore to be the business of their childhood.

125 And surely the great and multiplied labour of framing abstract notions will be found a hard task for that tender age. 126 Is it not a hard thing to imagine that a couple of children cannot prate together of their sugar-plums and rattles and the rest of their little trinkets, 127 till they have first tacked together numberless inconsistencies, and so framed in their minds ABSTRACT GENERAL IDEAS, and annexed them to every common name they make use of?

NOR FOR THE ENLARGEMENT OF KNOWLEDGE

128 Nor do I think them a whit more needful for the ENLARGEMENT OF KNOWLEDGE than for COMMUNICATION. 129 It is, I know, a point much insisted on, that all knowledge and demonstration are about universal notions, to which I fully agree: 130 but then it doth not appear to me that those notions are formed by ABSTRACTION in the manner PREMISED--UNIVERSALITY, 131 so far as I can comprehend, not consisting in the absolute, POSITIVE nature or conception of anything, but in the RELATION it bears to the particulars signified or represented by it; 132 by virtue whereof it is that things, names, or notions, being in their own nature PARTICULAR, are rendered UNIVERSAL. 133 Thus, when I demonstrate any proposition concerning triangles, it is to be supposed that I have in view the universal idea of a triangle; 134 which ought not to be understood as if I could frame an idea of a triangle which was neither equilateral, nor scalenon, nor equicrural; 135 but only that the

particular triangle I consider, whether of this or that sort it matters not, doth equally stand for and represent all rectilinear triangles whatsoever, and is in that sense UNIVERSAL. 136 All which seems very plain and not to include any difficulty in it.

OBJECTION.-- ANSWER

137 But here it will be demanded, HOW WE CAN KNOW ANY PROPOSITION TO BE TRUE OF ALL PARTICULAR TRIANGLES, EXCEPT we have first seen it DEMONSTRATED OF THE ABSTRACT IDEA OF A TRIANGLE which equally agrees to all? 138 For, because a property may be demonstrated to agree to some one particular triangle, it will not thence follow that it equally belongs to any other triangle, which in all respects is not the same with it. 139 For example, having demonstrated that the three angles of an isosceles rectangular triangle are equal to two right ones, I cannot therefore conclude this affection agrees to all other triangles which have neither a right angle nor two equal sides. 140 It seems therefore that, to be certain this proposition is universally true, we must either make a particular demonstration for every particular triangle, which is impossible, 141 or once for all demonstrate it of the ABSTRACT IDEA OF A TRIANGLE, in which all the particulars do indifferently partake and by which they are all equally represented. 142 To which I answer, that, though the idea I have in view whilst I make the demonstration be, for instance, that of an isosceles rectangular triangle whose sides are of a determinate length, 143 I may nevertheless be certain it extends to all other rectilinear triangles, of what sort or bigness soever. 144 And that because neither the right angle, nor the equality, nor determinate length of the sides are at all concerned in the demonstration. 145 It is true the diagram I have in view includes all these particulars, but then there is not the least mention made of them in the proof of the proposition. 146 It is not said the three angles are equal to two right ones, because one of them is a right angle, or because the sides

comprehending it are of the same length. 147 Which sufficiently shows that the right angle might have been oblique, and the sides unequal, and for all that the demonstration have held good. 148 And for this reason it is that I conclude that to be true of any obliquangular or scalenon which I had demonstrated of a particular right-angled equicrural triangle, and not because I demonstrated the proposition of the abstract idea of a triangle. 149 And here it must be acknowledged that a person may consider a figure merely as triangular, without attending to the particular qualities of the angles, or relations of the sides. 150 So far you may abstract; but this will never prove that you can frame an abstract, general, inconsistent idea of a triangle. 151 In like manner we may consider Peter so far forth as human, or so far forth as animal without framing the fore-mentioned abstract idea, either of human or of animal, inasmuch as all that is perceived is not considered.

ADVANTAGE OF INVESTIGATING THE DOCTRINE OF ABSTRACT GENERAL IDEAS

152 It were an endless as well as an useless thing to trace the SCHOOLMEN, those great masters of abstraction, 153 through all the manifold inextricable labyrinths of error and dispute which their doctrine of abstract natures and notions seems to have led them into. 154 What bickerings and controversies, and what a learned dust have been raised about those matters, 155 and what mighty advantage has been from thence derived to humankind, are things at this day too clearly known to need being insisted on. 156 And it had been well if the ill effects of that doctrine were confined to those only who make the most avowed profession of it. 157 When people consider the great pains, industry, and parts that have for so many ages been laid out on the cultivation and advancement of the sciences, and that notwithstanding all this the far greater part of them remains full of darkness and uncertainty, 158 and disputes that are like never to have an end, and even those that are thought to be

supported by the most clear and cogent demonstrations contain in them paradoxes which are perfectly irreconcilable to the understandings of people, 159 and that, taking all together, a very small portion of them does supply any real benefit to humankind, otherwise than by being an innocent diversion and amusement-- 160 I say the consideration of all this is apt to throw them into a despondency and perfect contempt of all study. But this may perhaps cease upon a view of the false principles that have obtained in the world, 161 amongst all which there is none, methinks, has a more wide and extended sway over the thoughts of speculative people than this of abstract general ideas.

162 I come now to consider the SOURCE OF THIS PREVAILING NOTION, and that seems to me to be LANGUAGE. 163 And surely nothing of less extent than reason itself could have been the source of an opinion so universally received. 164 The truth of this appears as from other reasons so also from the plain confession of the ablest patrons of abstract ideas, who acknowledge that they are made in order to naming; 165 from which it is a clear consequence that if there had been no such things as speech or universal signs there never had been any thought of abstraction. See III. vi. 39, and elsewhere of the Essay on Human Understanding. 166 Let us examine the manner wherein words have contributed to the origin of that mistake.-- First then, it is thought that every name has, or ought to have, ONE ONLY precise and settled signification, which inclines people to think there are certain ABSTRACT, 167 DETERMINATE IDEAS that constitute the true and only immediate signification of each general name; and that it is by the mediation of these abstract ideas that a general name comes to signify any particular thing. 168 Whereas, in truth, there is no such thing as one precise and definite signification annexed to any general name, they all signifying indifferently a great number of particular ideas. 168 All which doth evidently follow from what has been already said, and will clearly appear to anyone by a little

reflexion. 169 To this it will be OBJECTED that every name that has a definition is thereby restrained to one certain signification. 170 For example, a TRIANGLE is defined to be A PLAIN SURFACE COMPREHENDED BY THREE RIGHT LINES, by which that name is limited to denote one certain idea and no other. 171 To which I answer, that in the definition it is not said whether the surface be great or small, black or white, nor whether the sides are long or short, equal or unequal, nor with what angles they are inclined to each other; 172 in all which there may be great variety, and consequently there is NO ONE SETTLED IDEA which limits the signification of the word TRIANGLE. 173 It is one thing for to keep a name constantly to the same definition, and another to make it stand everywhere for the same idea; the one is necessary, the other useless and impracticable.

174 SECONDLY, But, to give a farther account how WORDS came to PRODUCE THE DOCTRINE OF ABSTRACT IDEAS, 175 it must be observed that it is a received opinion that language has NO OTHER END but the communicating our ideas, and that every significant name stands for an idea. 176 This being so, and it being withal certain that names which yet are not thought altogether insignificant do not always mark out PARTICULAR conceivable ideas, it is straightway concluded that THEY STAND FOR ABSTRACT NOTIONS. 177 That there are many names in use amongst speculative people which do not always suggest to others determinate, particular ideas, or in truth anything at all, is what nobody will deny. 178 And a little attention will discover that it is not necessary (even in the strictest reasonings) significant names which stand for ideas should, every time they are used, excite in the understanding the ideas they are made to stand for-- 179 in reading and discoursing, names being for the most part used as letters are in ALGEBRA, in which, though a particular quantity be marked by each letter, 180 yet to proceed right it is not requisite that in every step each letter suggest to your thoughts that particular

quantity it was appointed to stand for.

SOME OF THE ENDS OF LANGUAGE

181 Besides, the communicating of ideas marked by words is not the chief and only end of language, as is commonly supposed. 182 There are other ends, as the raising of some passion, the exciting to or deterring from an action, the putting the mind in some particular disposition-- 183 to which the former is in many cases barely subservient, and sometimes entirely omitted, when these can be obtained without it, as I think does not unfrequently happen in the familiar use of language. 184 I entreat the reader to reflect with yourself, and see if it doth not often happen, either in hearing or reading a discourse, that the passions of fear, love, hatred, admiration, disdain, and the like, arise immediately in your mind upon the perception of certain words, without any ideas coming between. 185 At first, indeed, the words might have occasioned ideas that were fitting to produce those emotions; 186 but, if I mistake not, it will be found that, when language is once grown familiar, the hearing of the sounds or sight of the characters is oft immediately attended with those passions which at first were wont to be produced by the intervention of ideas that are now quite omitted. 187 May we not, for example, be affected with the promise of a GOOD THING, though we have not an idea of what it is? 188 Or is not the being threatened with danger sufficient to excite a dread, though we think not of any particular evil likely to befall us, nor yet frame to ourselves an idea of danger in abstract? 189 If any one shall join ever so little reflexion of your own to what has been said, I believe that it will evidently appear to you that general names are often used in the propriety of language 190 without the speaker's designing them for marks of ideas in your own, which you would have them raise in the mind of the hearer. 191 Even proper names themselves do not seem always spoken with a design to bring into our view the ideas of those individuals that are

supposed to be marked by them. 192 For example, when a schoolman tells me "Aristotle has said it," all I conceive he means by it is to dispose me to embrace his opinion with the deference and submission which custom has annexed to that name. 193 And this effect is often so instantly produced in the minds of those who are accustomed to resign their judgment to authority of that philosopher, as it is impossible any idea either of your person, writings, or reputation should go before. 194 Innumerable examples of this kind may be given, but why should I insist on those things which every one's experience will, I doubt not, plentifully suggest unto you?

CAUTION IN THE USE OF LANGUAGE NECESSARY

195 We have, I think, shown the impossibility of ABSTRACT IDEAS. We have considered what has been said for them by their ablest patrons; and endeavored to show they are of no use for those ends to which they are thought necessary. 196 And lastly, we have traced them to the source from whence they flow, which appears evidently to be language.-- 197 It cannot be denied that words are of excellent use, in that by their means all that stock of knowledge which has been purchased by the joint labours of inquisitive people in all ages and nations may be drawn into the view and made the possession of one single person. 198 But at the same time it must be owned that most parts of knowledge have been strangely perplexed and darkened by the abuse of words, and general ways of speech wherein they are delivered. 199 Since therefore words are so apt to impose on the understanding, whatever ideas I consider, I shall endeavour to take them bare and naked into my view, 200 keeping out of my thoughts so far as I am able, those names which long and constant use has so strictly united with them; from which I may expect to derive the following advantages:

201 FIRST, I shall be sure to get clear of all controversies PURELY VERBAL-- the springing up of which weeds in almost all the sciences has been a main

hindrance to the growth of true and sound knowledge.

202 SECONDLY, this seems to be a sure way to extricate myself out of that fine and subtle net of ABSTRACT IDEAS which has so miserably perplexed and entangled the minds of humans; 203 and that with this peculiar circumstance, that by how much the finer and more curious was the wit of any person, by so much the deeper was you likely to be ensnared and faster held therein.

204 THIRDLY, so long as I confine my thoughts to my own ideas divested of words, I do not see how I can easily be mistaken. 205 The objects I consider, I clearly and adequately know. I cannot be deceived in thinking I have an idea which I have not. 206 It is not possible for me to imagine that any of my own ideas are alike or unlike that are not truly so. 207 To discern the agreements or disagreements there are between my ideas, to see what ideas are included in any compound idea and what not, 208 there is nothing more requisite than an attentive perception of what passes in my own understanding.

209 But the attainment of all THESE ADVANTAGES doth PRESUPPOSE AN ENTIRE DELIVERANCE FROM THE DECEPTION OF WORDS, which I dare hardly promise myself; 210 so difficult a thing it is to dissolve an union so early begun, and confirmed by so long a habit as that betwixt words and ideas. Which difficulty seems to have been very much increased by the doctrine of ABSTRACTION. 211 For, so long as humans thought abstract ideas were annexed to their words, it doth not seem strange that they should use words for ideas-- 212 it being found an impracticable thing to lay aside the word, and RETAIN THE ABSTRACT IDEA IN THE MIND, WHICH IN ITSELF WAS PERFECTLY INCONCEIVABLE. 213 This seems to me the principal cause why those people who have so emphatically recommended to others the laying aside all use of words in their meditations, and contemplating their bare ideas, have yet failed to perform it themselves. 214 Of late many have been very sensible of the absurd opinions and insignificant disputes which grow out of the abuse of words. 215 And, in order to remedy these evils, they advise well, that

we attend to the ideas signified, and draw off our attention from the words which signify them. 216 But, how good soever this advice may be they have given others, it is plain they could not have a due regard to it themselves, 217 so long as they thought the only immediate use of words was to signify ideas, and that the immediate signification of every general name was a DETERMINATE ABSTRACT IDEA.

218 But, THESE BEING KNOWN TO BE MISTAKES, A HUMAN MAY with greater ease PREVENT OWN BEING IMPOSED ON BY WORDS. 219 You that knows you have no other than particular ideas, will not puzzle yourself in vain to find out and conceive the abstract idea annexed to any name. 220 And you that knows names do not always stand for ideas will spare yourself the labour of looking for ideas where there are none to be had. 221 It were, therefore, to be wished that everyone would use your utmost endeavours to obtain a clear view of the ideas you would consider, separating from them all that dress and incumbrance of words which so much contribute to blind the judgment and divide the attention. 222 In vain do we extend our view into the heavens and pry into the entrails of the earth, in vain do we consult the writings of learned people and trace the dark footsteps of antiquity-- 223 we need only draw the curtain of words, to hold the fairest tree of knowledge, whose fruit is excellent, and within the reach of our hand.

224 Unless we take care TO CLEAR THE FIRST PRINCIPLES OF KNOWLEDGE FROM THE embarras and DELUSION OF WORDS, we may make infinite reasonings upon them to no purpose; 225 we may draw consequences from consequences, and be never the wiser. 226 The farther we go, we shall only lose ourselves the more irrecoverably, and be the deeper entangled in difficulties and mistakes.

227 Whoever therefore designs to read the following sheets, I entreat you to make my words the occasion of your own thinking, and endeavour to attain the same train of thoughts in reading that I had in writing them. 228 By this means it will be easy for you to discover the truth or falsity of

what I say. 229 You will be out of all danger of being deceived by my words, and I do not see how you can be led into an error by considering your own naked, undisguised ideas.

OF THE PRINCIPLES OF HUMAN KNOWLEDGE

George Berkeley

OBJECTS OF HUMAN KNOWLEDGE

1

2 It is evident to any one who takes a survey of the objects of human knowledge, that they are either IDEAS actually imprinted on the senses; or else such as are perceived by attending to the passions and operations of the mind; 2 or lastly, ideas formed by help of memory and imagination--either compounding, dividing, or barely representing those originally perceived in the aforesaid ways.

3 By sight I have the ideas of light and colours, with their several degrees and variations. 4 By touch I perceive hard and soft, heat and cold, motion and resistance, and of all these more and less either as to quantity or degree. 5 Smelling furnishes me with odours; the palate with tastes; and hearing conveys sounds to the mind in all their variety of tone and composition. 6 And as several of these are observed to accompany each other, they come to be marked by one name, and so to be reputed as one thing. 7 Thus, for example a certain colour, taste, smell, figure and consistence having been observed to go together, are accounted one distinct thing, signified by the name APPLE. 8 Other collections of ideas constitute a stone, a tree, a book, and the like sensible things--which as they are pleasing or disagreeable excite the passions of love, hatred, joy, grief, and so forth.

MIND—SPIRIT—SOUL

9 But, besides all that endless variety of ideas or objects of knowledge, there is likewise something which knows or perceives them, and exercises divers operations, as willing, imagining, remembering, about them. 10 This perceiving, active

being is what I call MIND, SPIRIT, SOUL, or MYSELF. By which words I do not denote any one of my ideas, but a thing entirely distinct from them, WHEREIN THEY EXIST, or, which is the same thing, whereby they are perceived-- 11 for the existence of an idea consists in being perceived.

HOW FAR THE ASSENT OF THE VULGAR CONCEDED

12 That neither our thoughts, nor passions, nor ideas formed by the imagination, exist WITHOUT the mind, is what EVERYBODY WILL ALLOW. 13 And it seems no less evident that the various sensations or ideas imprinted on the sense, however blended or combined together (that is, whatever objects they compose), cannot exist otherwise than IN a mind perceiving them. 14 I think an intuitive knowledge may be obtained of this by any one that shall attend to WHAT IS MEANT BY THE TERM EXIST, when applied to sensible things. 15 The table I write on I say exists, that is, I see and feel it; and if I were out of my study I should say it existed-- meaning thereby that if I was in my study I might perceive it, or that some other spirit actually does perceive it. 16 There was an odour, that is, it was smelt; there was a sound, that is, it was heard; a colour or figure, and it was perceived by sight or touch. 17 This is all that I can understand by these and the like expressions. For as to what is said of the absolute existence of unthinking things without any relation to their being perceived, that seems perfectly unintelligible. 18 Their ESSE is PERCIPI, nor is it possible they should have any existence out of the minds or thinking things which perceive them.

THE VULGAR OPINION INVOLVES A CONTRADICTION

19 It is indeed an opinion STRANGELY prevailing amongst humans, that houses, mountains, rivers, and in a word all sensible objects, have an existence, natural or real, distinct from their being perceived by the understanding. 20 But, with how great an assurance and acquiescence soever this principle may be entertained in the

world, yet whoever shall find in own heart to call it in question may, if I mistake not, perceive it to involve a manifest contradiction. 21 For, what are the fore-mentioned objects but the things we perceive by sense? And what do we PERCEIVE BESIDES OUR OWN IDEAS OR SENSATIONS? 22 And is it not plainly repugnant that any one of these, or any combination of them, should exist unperceived?

CAUSE OF THIS PREVALENT ERROR

23 If we thoroughly examine this tenet it will, perhaps, be found at bottom to depend on the doctrine of ABSTRACT IDEAS. 24 For can there be a nicer strain of abstraction than to distinguish the existence of sensible objects from their being perceived, so as to conceive them existing unperceived?

25 Light and colours, heat and cold, extension and figures-- in a word the things we see and feel-- what are they but so many sensations, notions, ideas, or impressions on the sense? 26 And is it possible to separate, even in thought, any of these from perception? 27 For my part, I might as easily divide a thing from itself. I may, indeed, divide in my thoughts, or conceive apart from each other, those things which, perhaps I never perceived by sense so divided. 28 Thus, I imagine the trunk of a human body without the limbs, or conceive the smell of a rose without thinking on the rose itself. 29 So far, I will not deny, I can abstract-- if that may properly be called ABSTRACTION which extends only to the conceiving separately such objects as it is possible may really exist or be actually perceived asunder. 30 But my conceiving or imagining power does not extend beyond the possibility of real existence or perception. 31 Hence, as it is impossible for me to see or feel anything without an actual sensation of that thing, so is it impossible for me to conceive in my thoughts any sensible thing or object distinct from the sensation or perception of it.

32 Note: "In truth the object and the sensation are the same thing,

and cannot therefore be abstracted from each other-- Edit 1710."

33 Some truths there are so near and obvious to the mind that a person need only open own eyes to see them. 34 Such I take this important one to be, viz., that all the choir of heaven and furniture of the earth, in a word all those bodies which compose the mighty frame of the world, have not any subsistence without a mind, that their BEING (ESSE) is to be perceived or known; 35 that consequently so long as they are not actually perceived by me, or do not exist in my mind or that of any other CREATED SPIRIT, they must either have no existence at all, OR ELSE SUBSIST IN THE MIND OF SOME ETERNAL SPIRIT-- 36 it being perfectly unintelligible, and involving all the absurdity of abstraction, to attribute to any single part of them an existence independent of a spirit. 37 To be convinced of which, the reader need only reflect, and try to separate in your own thoughts the being of a sensible thing from its being perceived.

38 Note: "To make this appear with all the light and evidence of an axiom, it seems sufficient if I can but awaken the reflection of the reader, that you may take an impartial view of your own meaning, 39 and in turn your thoughts upon the subject itself, free and disengaged from all embarrass of words and prepossession in favour of received mistakes."-- Edit 1710

SECOND ARGUMENT

40 From what has been said it follows there is NOT ANY OTHER SUBSTANCE THAN SPIRIT, or that which perceives. 41 But, for the fuller proof of this point, let it be considered the sensible qualities are colour, figure, motion, smell, taste, etc, the ideas perceived by sense. 42 Now, for an idea to exist in an unperceiving thing is a manifest contradiction, for TO HAVE AN IDEA IS ALL ONE AS TO PERCEIVE; 43 that therefore wherein colour, figure, and the like qualities exist must perceive them; hence it is clear there can be no UNTHINKING substance or SUBSTRATUM of those ideas.

OBJECTION -- ANSWER

44 But, say you, though the ideas themselves do not exist without the mind, yet there may be things LIKE them, whereof they are copies or resemblances, which things exist without the mind in an unthinking substance. 45 I ANSWER, an idea can be like nothing but an idea; a colour or figure can be like nothing but another colour or figure. 46 If we look but never so little into our thoughts, we shall find it impossible for us to conceive a likeness except only between our ideas. 47 Again, I ask whether those supposed originals or external things, of which our ideas are the pictures or representations, be themselves perceivable or no? 48 If they are, THEN THEY ARE IDEAS and we have gained our point; 49 but if you say they are not, I appeal to any one whether it be sense to assert a colour is like something which is invisible; hard or soft, like something which is intangible; and so of the rest.

THE PHILOSOPHICAL NOTION OF MATTER INVOLVES A CONTRADICTION

50 Some there are who make a DISTINCTION betwixt PRIMARY and SECONDARY qualities. 51 By the former they mean extension, figure, motion, rest, solidity or impenetrability, and number; by the latter they denote all other sensible qualities, as colours, sounds, tastes, and so forth. 52 The ideas we have of these they acknowledge not to be the resemblances of anything existing without the mind, or unperceived, 53 but they will have our ideas of the primary qualities to be patterns or images of things which exist without the mind, in an unthinking substance which they call MATTER. 54 By MATTER, therefore, we are to understand an inert, senseless substance, in which extension, figure, and motion DO ACTUALLY SUBSIST.

55 But it is evident from what we have already shown, that extension, figure, and motion are ONLY IDEAS EXISTING IN THE MIND, 56 and that an idea can be like nothing but another idea, and that consequently neither they nor

their archetypes can exist in an UNPERCEIVING substance. 57 Hence, it is plain that the very notion of what is called MATTER or CORPOREAL SUBSTANCE, involves a contradiction in it.

58 Note: "Insomuch that I should not think it necessary to spend more time in exposing its absurdity. 59 But because the tenet of the existence of matter seems to have taken so deep a root in the minds of philosophers, and draws after it so many ill consequences, 60 I choose rather to be thought prolix and tedious, than omit anything that might conduce to the full discovery and extirpation of the prejudice."--Edit 1710.

ARGUMENTUM AD HOMINEM

61 They who assert that figure, motion, and the rest of the primary or original qualities do exist without the mind in unthinking substances, do at the same time acknowledge that colours, sounds, heat cold, and suchlike secondary qualities, do not-- 62 which they tell us are sensations existing IN THE MIND ALONE, that depend on and are occasioned by the different size, texture, and motion of the minute particles of matter. 63 This they take for an undoubted truth, which they can demonstrate beyond all exception. 64 Now, if it be certain that those original qualities ARE INSEPARABLY UNITED WITH THE OTHER SENSIBLE QUALITIES, and not, even in thought, capable of being abstracted from them, it plainly follows that they exist only in the mind. 65 But I desire any one to reflect and try whether he can, by any abstraction of thought, conceive the extension and motion of a body without all other sensible qualities. 66 For my own part, I see evidently that it is not in my power to frame an idea of a body extended and moving, but I must withal give it some colour or other sensible quality which is ACKNOWLEDGED to exist only in the mind. 67 In short, extension, figure, and motion, abstracted from all other qualities, are inconceivable. 68 Where therefore the other sensible qualities are, there must these be also, to wit, in the mind and nowhere else.

A SECOND ARGUMENT
AD HOMINEM

69 Again, GREAT and SMALL, SWIFT and SLOW, ARE ALLOWED TO EXIST NOWHERE WITHOUT THE MIND, being entirely RELATIVE, and changing as the frame or position of the organs of sense varies. 70 The extension therefore which exists without the mind is neither great nor small, the motion neither swift nor slow, that is, they are nothing at all. 71 But, say you, they are extension in general, and motion in general: thus we see how much the tenet of extended movable substances existing without the mind depends on the strange doctrine of ABSTRACT IDEAS. 72 And here I cannot but remark how nearly the vague and indeterminate description of Matter or corporeal substance, which the modern philosophers are run into by their own principles, 73 resembles that antiquated and so much ridiculed notion of MATERIA PRIMA, to be met with in Aristotle and his followers. 74 Without extension solidity cannot be conceived; since therefore it has been shown that extension exists not in an unthinking substance, the same must also be true of solidity.

75 That NUMBER is entirely THE CREATURE OF THE MIND, even though the other qualities be allowed to exist without, 76 will be evident to whoever considers that the same thing bears a different denomination of number as the mind views it with different respects. 77 Thus, the same extension is one, or three, or thirty-six, according as the mind considers it with reference to a yard, a foot, or an inch. 78 Number is so visibly relative, and dependent on humans' understanding, that it is strange to think how any one should give it an absolute existence without the mind. 79 We say one book, one page, one line, etc.; all these are equally units, though some contain several of the others. 80 And in each instance, it is plain, the unit relates to some particular combination of ideas arbitrarily put together by the mind.

81 UNITY I know some will have to be A SIMPLE OR UNCOMPOUNDED IDEA, accompanying all other ideas into the mind. 82 That I have any such idea answering the word

UNITY I do not find; and if I had, methinks I could not miss finding it: 83 on the contrary, it should be the most familiar to my understanding, since it is said to accompany all other ideas, and to be perceived by all the ways of sensation and reflexion. 84 To say no more, it is an ABSTRACT IDEA.

A THIRD ARGUMENT AD HOMINEM

85 I shall farther add, that, after the same manner as modern philosophers prove certain sensible qualities to have no existence in Matter, or without the mind, the same thing may be likewise proved of all other sensible qualities whatsoever. 86 Thus, for instance, it is said that heat and cold are affections only of the mind, and not at all patterns of real beings, existing in the corporeal substances which excite them, for that the same body which appears cold to one hand seems warm to another. 87 Now, why may we not as well argue that figure and extension are not patterns or resemblances of qualities existing in Matter, 88 because to the same eye at different stations, or eyes of a different texture at the same station, they appear various, and cannot therefore be the images of anything SETTLED AND DETERMINATE WITHOUT THE MIND?

89 Again, it is proved that SWEETNESS is not really in the sapid thing, because the thing remaining unaltered the sweetness is changed into bitter, as in case of a fever or otherwise vitiated palate. 90 Is it not as reasonable to say that MOTION is not without the mind, since if the succession of ideas in the mind become swifter, the motion, it is acknowledged, shall appear slower without any alteration in any external object?

NOT CONCLUSIVE AS TO EXTENSION

91 In short, let any one consider those arguments which are thought manifestly to prove that colours and taste exist only in the mind, and you shall find they may with equal force be brought to prove the same thing of extension, figure, and motion. 92 Though it must be confessed this method of arguing

does not so much prove that there is no extension or colour in an outward object, as that we do not know by SENSE which is the TRUE extension or colour of the object. 93 But the arguments foregoing plainly show it to be impossible that any colour or extension at all, or other sensible quality whatsoever, should exist in an UNTHINKING subject without the mind, or in truth, that there should be any such thing as an outward object.

94 But let us examine a little the received opinion.-- It is said EXTENSION is a MODE or accident OF MATTER, and that Matter is the SUBSTRATUM that supports it. 95 Now I desire that you would explain to me what is meant by Matter's SUPPORTING extension. Say you, I have no idea of Matter and therefore cannot explain it. 96 I answer, though you have no positive, yet, if you have any meaning at all, you must at least have a relative idea of Matter; 97 though you know not what it is, yet you must be supposed to know what relation it bears to accidents, and what is meant by its supporting them. 98 It is evident SUPPORT cannot here be taken in its usual or literal sense-- as when we say that pillars support a building; in what sense therefore must it be taken?

99 Note: "For my part, I am not able to discover any sense at all that can be applicable to it."--Edit 1710.

PHILOSOPHICAL MEANING OF "MATERIAL SUBSTANCE" DIVISIBLE INTO TWO PARTS

100 If we inquire into what the most accurate philosophers declare themselves to mean by MATERIAL SUBSTANCE, 101 we shall find them acknowledge they have no other meaning annexed to those sounds but the idea of BEING IN GENERAL, together WITH THE RELATIVE NOTION OF ITS SUPPORTING ACCIDENTS. 102 The general idea of Being appeareth to me the most abstract and incomprehensible of all other; and as for its supporting accidents, this, as we have just now observed, cannot be understood in the common sense of those words; 103 it must therefore be taken in some other sense, but what that is

they do not explain. 104 So that when I consider the TWO PARTS or branches which make the signification of the words MATERIAL SUBSTANCE, I am convinced there is no distinct meaning annexed to them. 105 But why should we trouble ourselves any farther, in discussing this material SUBSTRATUM or support of figure and motion, and other sensible qualities? 106 Does it not suppose they have an existence without the mind? And is not this a direct repugnancy, and altogether inconceivable?

THE EXISTENCE OF EXTERNAL BODIES WANTS PROOF

107 But, though it were possible that solid, figured, movable substances may exist without the mind, corresponding to the ideas we have of bodies, yet HOW IS IT POSSIBLE FOR US TO KNOW THIS? 108 Either we must know it by sense or by reason. As for our senses, by them we have the knowledge ONLY OF OUR SENSATIONS, ideas, or those things that are immediately perceived by sense, call them what you will: 109 but they do not inform us that things exist without the mind, or unperceived, like to those which are perceived. 110 This the materialists themselves acknowledge. It remains therefore that if we have any knowledge at all of external things, it must be by REASON, inferring their existence from what is immediately perceived by sense. 111 But what reason can induce us to believe the existence of bodies without the mind, from what we perceive, since the very patrons of Matter themselves do not pretend there is ANY NECESSARY CONNEXION BETWIXT THEM AND OUR IDEAS? 112 I say it is granted on all hands (and what happens in dreams, phrensies, and the like, puts it beyond dispute) 113 that IT IS POSSIBLE WE MIGHT BE AFFECTED WITH ALL THE IDEAS WE HAVE NOW, THOUGH THERE WERE NO BODIES EXISTING WITHOUT RESEMBLING THEM.

114 Hence, it is evident the supposition of external bodies is not necessary for the producing our ideas; 115 since it is granted they are produced sometimes, and might possibly be produced always in the same order, we see

them in at present, without their concurrence.

THE EXISTENCE OF EXTERNAL BODIES AFFORDS NO EXPLICATION OF THE MANNER IN WHICH OUR IDEAS ARE PRODUCED

116 But, though we might possibly have all our sensations without them, yet perhaps it may be thought EASIER to conceive and explain the MANNER of their production, by supposing external bodies in their likeness rather than otherwise; 117 and so it might be at least probable there are such things as bodies that excite their ideas in our minds. 118 But neither can this be said; for, though we give the materialists their external bodies, they by their own confession are never the nearer knowing how our ideas are produced; 119 since they own themselves unable to comprehend in what manner BODY CAN ACT UPON SPIRIT, or how it is possible it should imprint any idea in the mind. 120 Hence it is evident the production of ideas or sensations in our minds can be no reason why we should suppose Matter or corporeal substances, SINCE THAT IS ACKNOWLEDGED TO REMAIN EQUALLY INEXPLICABLE WITH OR WITHOUT THIS SUPPOSITION. 121 If therefore it were possible for bodies to exist without the mind, yet to hold they do so, must needs be a very precarious opinion; 122 since it is to suppose, without any reason at all, that God has created innumerable beings THAT ARE ENTIRELY USELESS, AND SERVE TO NO MANNER OF PURPOSE.

DILEMMA

123 In short, if there were external bodies, it is impossible we should ever come to know it; and if there were not, we might have the very same reasons to think there were that we have now. 124 Suppose--what no one can deny possible--an intelligence without the help of external bodies, to be affected with the same train of sensations or ideas that you are, imprinted in the same order and with like vividness in your mind. 125 I ask whether that intelligence has not all the reason to believe the existence of corporeal substances, represented by your ideas, and exciting them in

your mind, that you can possibly have for believing the same thing? 126 Of this there can be no question-- which one consideration were enough to make any reasonable person suspect the strength of whatever arguments be may think yourself to have, for the existence of bodies without the mind.

127 Were it necessary to add any FURTHER PROOF AGAINST THE EXISTENCE OF MATTER after what has been said, I could instance several of those errors and difficulties (not to mention impieties) which have sprung from that tenet. 128 It has occasioned numberless controversies and disputes in philosophy, and not a few of far greater moment in religion. 129 But I shall not enter into the detail of them in this place, as well because I think arguments A POSTERIORI are unnecessary for confirming what has been, 130 if I mistake not, sufficiently demonstrated A PRIORI, as because I shall hereafter find occasion to speak somewhat of them.

131 I am afraid I have given cause to think I am needlessly prolix in handling this subject. 132 For, to what purpose is it to dilate on that which may be demonstrated with the utmost evidence in a line or two, to any one that is capable of the least reflexion? 133 It is but looking into your own thoughts, and so trying whether you can conceive it possible for a sound, or figure, or motion, or colour to exist without the mind or unperceived. 134 This easy trial may perhaps make you see that what you contend for is a downright contradiction. Insomuch that I am content to put the whole upon this issue:-- 135 If you can but CONCEIVE it possible for one extended movable substance, or, in general, for any one idea, or anything like an idea, to exist otherwise than in a mind perceiving it, I shall readily give up the cause. 136 And, as for all that COMPAGES of external bodies you contend for, I shall grant you its existence, THOUGH (1.) YOU CANNOT EITHER GIVE ME ANY REASON WHY YOU BELIEVE IT EXISTS, OR (2.) ASSIGN ANY USE TO IT WHEN IT IS SUPPOSED TO EXIST. 137 I say, the bare possibility of your opinions being true shall pass for an argument that it is so.

138 But, say you, surely there is nothing easier than for me to imagine trees, for instance, in a park, or books existing in a closet, and nobody by to perceive them. 139 I answer, you may so, there is no difficulty in it; but what is all this, I beseech you, more than framing in your mind certain ideas which you call BOOKS and TREES, and the same time omitting to frame the idea of any one that may perceive them? 140 BUT DO NOT YOU YOURSELF PERCEIVE OR THINK OF THEM ALL THE WHILE? This therefore is nothing to the purpose; it only shows you have the power of imagining or forming ideas in your mind: 141 but it does not show that you can conceive it possible the objects of your thought may exist without the mind. 142 To make out this, IT IS NECESSARY THAT YOU CONCEIVE THEM EXISTING UNCONCEIVED OR UNTHOUGHT OF, WHICH IS A MANIFEST REPUGNANCY. 143 When we do our utmost to conceive the existence of external bodies, we are all the while only contemplating our own ideas. 144 But the mind taking no notice of itself, is deluded to think it can and does conceive bodies existing unthought of or without the mind, though at the same time they are apprehended by or exist in itself. 145 A little attention will discover to any one the truth and evidence of what is here said, and make it unnecessary to insist on any other proofs against the existence of material substance.

THE ABSOLUTE EXISTENCE OF UNTHINKING THINGS ARE WORDS WITHOUT A MEANING

146 It is very obvious, upon the least inquiry into our thoughts, to know whether it is possible for us to understand what is meant by the ABSOLUTE EXISTENCE OF SENSIBLE OBJECTS IN THEMSELVES, OR WITHOUT THE MIND. 147 To me it is evident those words mark out either a direct contradiction, or else nothing at all. 148 And to convince others of this, I know no readier or fairer way than to entreat they would calmly attend to their own thoughts; 149 and if by this attention the emptiness or repugnancy of those expressions does appear, surely nothing more is requisite for the conviction. 150 It is on this therefore that I insist,

to wit, that the ABSOLUTE existence of unthinking things are words without a meaning, or which include a contradiction. 151 This is what I repeat and inculcate, and earnestly recommend to the attentive thoughts of the reader.

THIRD ARGUMENT-- REFUTATION OF LOCKE

152 All our ideas, sensations, notions, or the things which we perceive, by whatsoever names they may be distinguished, are visibly inactive-- there is nothing of power or agency included in them. 153 So that ONE IDEA or object of thought CANNOT PRODUCE or make ANY ALTERATION IN ANOTHER. 154 To be satisfied of the truth of this, there is nothing else requisite but a bare observation of our ideas. 155 For, since they and every part of them exist only in the mind, it follows that there is nothing in them but what is perceived: 156 but whoever shall attend to own ideas, whether of sense or reflexion, will not perceive in them any power or activity; there is, therefore, no such thing contained in them. 157 A little attention will discover to us that the very being of an idea implies passiveness and inertness in it, insomuch that it is impossible for an idea to do anything, or, strictly speaking, to be the cause of anything: neither can it be the resemblance or pattern of any active being. 158 Whence it plainly follows that extension, figure, and motion cannot be the cause of our sensations. 159 To say, therefore, that these are the effects of powers resulting from the configuration, number, motion, and size of corpuscles, must certainly be false.

CAUSE OF IDEAS

160 We perceive a continual succession of ideas, some are anew excited, others are changed or totally disappear. 161 There is therefore some cause of these ideas, whereon they depend, and which produces and changes them. 162 That this cause cannot be any quality or idea or combination of ideas, is clear from the preceding section. 163 It must therefore be a substance; but it has been shown that there is no corporeal or material substance: it remains

therefore that the CAUSE OF IDEAS is an incorporeal active substance or Spirit.

NO IDEA OF SPIRIT

164 A spirit is one simple, undivided, active being-- as it perceives ideas it is called the UNDERSTANDING, and as it produces or otherwise operates about them it is called the WILL. 165 Hence there can be no idea formed of a soul or spirit; for all ideas whatever, being passive and inert, they cannot represent unto us, by way of image or LIKENESS, that which acts. 166 A little attention will make it plain to any one, that to have an idea which shall be like that active principle of motion and change of ideas is absolutely impossible. 167 Such is the nature of SPIRIT, or that which acts, that it cannot be of itself perceived, BUT ONLY BY THE EFFECTS WHICH IT PRODUCETH. 168 If any person shall doubt of the truth of what is here delivered, let you but reflect and try if you can frame the idea of any power or active being, 169 and whether you have ideas of two principal powers, marked by the names WILL and UNDERSTANDING, distinct from each other as well as from a third idea of Substance or Being in general, 170 with a relative notion of its supporting or being the subject of the aforesaid powers-- which is signified by the name SOUL or SPIRIT. 171 This is what some hold; but, so far as I can see, the words WILL, SOUL, SPIRIT, do not stand for different ideas, or, in truth, for any idea at all, 172 but for something which is very different from ideas, and which, being an agent, cannot be like unto, or represented by, any idea whatsoever. 173 Though it must be owned at the same time that we have some notion of soul, spirit, and the operations of the mind: such as willing, loving, hating-- inasmuch as we know or understand the meaning of these words.

174 I find I can excite ideas in my mind at pleasure, and vary and shift the scene as oft as I think fit. 175 It is no more than willing, and straightway this or that idea arises in my fancy; and by the same power it is obliterated and makes

way for another. 176 This making and unmaking of ideas doth very properly denominate the mind active. Thus much is certain and grounded on experience; 177 but when we think of unthinking agents or of exciting ideas exclusive of volition, we only amuse ourselves with words.

IDEAS OF SENSATION DIFFER FROM THOSE OF REFLECTION OR MEMORY

178 But, whatever power I may have over MY OWN thoughts, I find the ideas actually perceived by Sense have not a like dependence on my will. 179 When in broad daylight I open my eyes, it is not in my power to choose whether I shall see or no, or to determine what particular objects shall present themselves to my view; 180 and so likewise as to the hearing and other senses; the ideas imprinted on them are not creatures of my will. There is THEREFORE SOME OTHER WILL OR SPIRIT that PRODUCES THEM.

LAWS OF NATURE

181 The ideas of Sense are more strong, lively, and DISTINCT than those of the imagination; 182 they have likewise a steadiness, order, and coherence, and are not excited at random, as those which are the effects of human wills often are, 183 but in a regular train or series, the admirable connexion whereof sufficiently testifies the wisdom and benevolence of its Author. 184 Now THE SET RULES OR ESTABLISHED METHODS WHEREIN THE MIND WE DEPEND ON EXCITES IN US THE IDEAS OF SENSE, ARE CALLED THE LAWS OF NATURE; 185 and these we learn by experience, which teaches us that such and such ideas are attended with such and such other ideas, in the ordinary course of things.

KNOWLEDGE OF THEM NECESSARY FOR THE CONDUCT OF WORLDLY AFFAIRS

186 This gives us a sort of foresight which enables us to regulate our actions for the benefit of life. 187 And without this we should be eternally at a loss; we could not know how to act anything that

might procure us the least pleasure, or remove the least pain of sense. 188 That food nourishes, sleep refreshes, and fire warms us; that to sow in the seed-time is the way to reap in the harvest; and in general that to obtain such or such ends, such or such means are conducive-- 189 all this we know, NOT BY DISCOVERING ANY NECESSARY CONNEXION BETWEEN OUR IDEAS, but only by the observation of the settled Laws of Nature, without which we should be all in uncertainty and confusion, 190 and a grown human no more know how to manage the self in the affairs of life than an infant just born.

191 And yet THIS consistent UNIFORM WORKING, which so evidently displays the goodness and wisdom of that Governing Spirit whose Will constitutes the Laws of Nature, is so far from leading our thoughts to Him, that it rather SENDS THEM A WANDERING AFTER SECOND CAUSES. 192 For, when we perceive certain ideas of Sense constantly followed by other ideas and WE KNOW THIS IS NOT OF OUR OWN DOING, we forthwith attribute power and agency to the ideas themselves, and make one the cause of another, than which nothing can be more absurd and unintelligible. 193 Thus, for example, having observed that when we perceive by sight a certain round luminous figure we at the same time perceive by touch the idea or sensation called HEAT, we do from thence conclude the sun to be the cause of heat. 194 And in like manner perceiving the motion and collision of bodies to be attended with sound, we are inclined to think the latter the effect of the former.

OF REAL THINGS AND IDEAS OR CHIMERAS

195 The ideas imprinted on the Senses by the Author of Nature are called REAL THINGS; 196 and those excited in the imagination being less regular, vivid, and constant, are more properly termed IDEAS, or IMAGES OF THINGS, which they copy and represent. 197 But then our sensations, be they never so vivid and distinct, are nevertheless IDEAS, that is, they exist in the mind, or are perceived by it, as truly as the ideas of its own

framing. 198 The ideas of Sense are allowed to have more reality in them, that is, to be more (1) STRONG, (2) ORDERLY, and (3) COHERENT than the creatures of the mind; but this is no argument that they exist without the mind. 199 They are also (4) LESS DEPENDENT ON THE SPIRIT, or thinking substance which perceives them, in that they are excited by the will of another and more powerful spirit; 200 yet still they are IDEAS, and certainly no IDEA, whether faint or strong, can exist otherwise than in a mind perceiving it.

FIRST GENERAL OBJECTION--ANSWER

201 Before we proceed any farther it is necessary we spend some time in answering objections which may probably be made against the principles we have hitherto laid down. 202 In doing of which, if I seem too prolix to those of quick apprehensions, I hope it may be pardoned, since all humans do not equally apprehend things of this nature, and I am willing to be understood by every one.

203 FIRST, then, it will be objected that by the foregoing principles ALL THAT IS REAL AND SUBSTANTIAL IN NATURE IS BANISHED OUT OF THE WORLD, and instead thereof a chimerical scheme of ideas takes place. 204 All things that exist, exist only in the mind, that is, they are purely notional. 205 What therefore becomes of the sun, moon and stars? What must we think of houses, rivers, mountains, trees, stones; nay, even of our own bodies? Are all these but so many chimeras and illusions on the fancy? 206 To all which, and whatever else of the same sort may be objected, I ANSWER, that by the principles premised we are not deprived of any one thing in Nature. 207 Whatever we see, feel, hear, or anywise conceive or understand remains as secure as ever, and is as real as ever. 208 There is a RERUM NATURA, and the distinction between realities and chimeras retains its full force. 209 This is evident where we have shown what is meant by REAL THINGS in opposition to CHIMERAS

or ideas of our own framing; but then they both equally exist in the mind, and in that sense they are alike IDEAS.

THE EXISTENCE OF MATTER, AS UNDERSTOOD BY PHILOSOPHERS, DENIED

210 I do not argue against the existence of any one thing that we can apprehend either by sense or reflexion. 211 That the things I see with my eyes and touch with my hands do exist, really exist, I make not the least question. 212 The only thing whose existence we deny IS THAT WHICH PHILOSOPHERS CALL MATTER or corporeal substance. 213 And in doing of this there is no damage done to the rest of humankind, who, I dare say, will never miss it. 214 The Atheist indeed will want the colour of an empty name to support own impiety; and the Philosophers may possibly find they have lost a great handle for trifling and disputation.

READILY EXPLAINED

215 If any person thinks this detracts from the existence or reality of things, you are very far from understanding what has been premised in the plainest terms I could think of. 216 Take here an abstract of what has been said:-- There are spiritual substances, minds, or human souls, which will or excite ideas in themselves at pleasure; 217 but these are faint, weak, and unsteady in respect of others they perceive by sense-- which, being impressed upon them according to certain rules or Laws of Nature, speak themselves the effects of a mind more powerful and wise than human spirits. 218 These latter are said to have more REALITY in them than the former:-- by which is meant that they are more affecting, orderly, and distinct, and that they are not fictions of the mind perceiving them. 219 And in this sense the sun that I see by day is the real sun, and that which I imagine by night is the idea of the former. 220 In the sense here given of REALITY it is evident that every vegetable, star, mineral, and in general each part of the mundane system, is as much a REAL BEING by our principles as by any other. 221 Whether others mean anything by the term

REALITY different from what I do, I entreat them to look into their own thoughts and see.

THE PHILOSOPHIC, NOT THE VULGAR SUBSTANCE, TAKEN AWAY

222 I will be urged that thus much at least is true, to wit, that we take away all corporeal substances. 223 To this my answer is, that if the word SUBSTANCE be taken in the vulgar sense-- for a combination of sensible qualities, such as extension, solidity, weight, and the like-- this we cannot be accused of taking away: 224 but if it be taken in a philosophic sense-- for the SUPPORT of accidents or QUALITIES WITHOUT THE MIND-- then indeed I acknowledge that we take it away, if one may be said to take away that which never had any existence, not even in the imagination.

225 But, say you, it sounds very harsh to say we eat and drink ideas, and are clothed with ideas. 226 I acknowledge it does so-- the word IDEA not being used in common discourse to signify the several combinations of sensible qualities which are called THINGS; 227 and it is certain that any expression which varies from the familiar use of language will seem harsh and ridiculous. 228 But this doth not concern the truth of the proposition, which in other words is no more than to say, we are fed and clothed with those things which we perceive immediately by our senses. 229 The hardness or softness, the colour, taste, warmth, figure, or suchlike qualities, which combined together constitute the several sorts of victuals and apparel, have been shown to exist only in the mind that perceives them; 230 and this is all that is meant by calling them IDEAS; which word if it was as ordinarily used as THING, would sound no harsher nor more ridiculous than it. 231 I am not for disputing about the propriety, but the truth of the expression. 232 If therefore you agree with me that we eat and drink and are clad with the immediate objects of sense, which cannot exist unperceived or without the mind, I shall readily grant it is more proper or conformable to custom that they

should be called things rather than ideas.

THE TERM IDEA PREFERABLE TO THING

233 If it be demanded why I make use of the word IDEA, and do not rather in compliance with custom call them THINGS. 234 I answer, I do it for two reasons:-- first, because the term THING in contra-distinction to IDEA, is generally supposed to denote somewhat existing without the mind; 235 secondly, because THING has a more comprehensive signification than IDEA, including SPIRIT or thinking things as well as IDEAS. 236 Since therefore the objects of sense exist only in the mind, and are withal thoughtless and inactive, I chose to mark them by the word IDEA, which implies those properties.

THE EVIDENCE OF THE SENSES NOT DISCREDITED

237 But, say what we can, some one perhaps may be apt to reply, you will still believe your senses, and never suffer any arguments, how plausible soever, to prevail over the certainty of them. 238 Be it so; assert the evidence of sense as high as you please, we are willing to do the same. 239 That what I see, hear, and feel DOTH EXIST, THAT IS to say, IS PERCEIVED BY ME, I no more doubt than I do of my own being. 240 But I do not see how the testimony of sense can be alleged as a proof for the existence of anything which is not perceived by sense. 241 We are not for having any person turn SCEPTIC and disbelieve your senses; on the contrary, we give them all the stress and assurance imaginable; 242 nor are there any principles more opposite to Scepticism than those we have laid down, as shall be hereafter clearly shown.

SECOND OBJECTION-- ANSWER

243 Secondly, it will be OBJECTED that there is a great difference betwixt real fire for instance, and the idea of fire, betwixt dreaming or imagining oneself burnt, and actually being so: 244 if you

suspect it to be only the idea of fire which you see, do but put your hand into it and you will be convinced with a witness. This and the like may be urged in opposition to our tenets. 245 To all which the ANSWER is evident from what has been already said; and I shall only add in this place, that if real fire be very different from the idea of fire, so also is the real pain that it occasions very different from the idea of the same pain, 246 and yet nobody will pretend that real pain either is, or can possibly be, in an unperceiving thing, or without the mind, any more than its idea.

THIRD OBJECTION--ANSWER

247 Thirdly, it will be objected that we see things actually without or at distance from us, and which consequently do not exist in the mind; 248 it being absurd that those things which are seen at the distance of several miles should be as near to us as our own thoughts. 249 In answer to this, I desire it may be considered that in a DREAM we do oft perceive things as existing at a great distance off, and yet for all that, those things are acknowledged to have their existence only in the mind.

250 But, for the fuller clearing of this point, it may be worthwhile to consider how it is that we perceive distance and things placed at a distance by sight. 251 For, that we should in truth see EXTERNAL space, and bodies actually existing in it, some nearer, others farther off, seems to carry with it some opposition to what has been said of their existing nowhere without the mind. 252 The consideration of this difficulty it was that gave birth to my "Essay towards a New Theory of Vision," which was published not long since, 253 wherein it is shown (1) that DISTANCE or outness is NEITHER IMMEDIATELY of itself PERCEIVED by sight, nor yet apprehended or judged of by lines and angles, or anything that has a necessary connexion with it; 254 but (2) that it is ONLY SUGGESTED to our thoughts by certain visible ideas and sensations attending vision, which in their own nature have no manner of similitude or relation

either with distance or things placed at a distance; 255 but, by a connexion taught us BY EXPERIENCE, they come to signify and suggest them to us, after the same manner that WORDS of any language suggest the ideas they are made to stand for; 256 insomuch that a human BORN blind and afterwards made to see, would not, at first sight, think the things you saw to be without your mind, or at any distance from you.

257 The ideas of sight and touch make two species entirely distinct and heterogeneous. THE FORMER ARE MARKS AND PROGNOSTICS OF THE LATTER. 258 That the proper objects of sight neither exist without mind, nor are the images of external things, was shown even in that treatise. 259 Though throughout the same the contrary be supposed true of tangible objects-- not that to suppose that vulgar error was necessary for establishing the notion therein laid down, but because it was beside my purpose to examine and refute it in a discourse concerning VISION. 260 So that in strict truth the ideas of sight, when we apprehend by them distance and things placed at a distance, do not suggest or mark out to us things ACTUALLY existing at a distance, 261 but only admonish us what ideas of touch will be imprinted in our minds at such and such distances of time, and in consequence of such or such actions. 262 It is, I say, evident from what has been said in the foregoing parts of this Treatise, and elsewhere of the Essay concerning Vision, 263 that visible ideas are the Language whereby the governing Spirit on whom we depend informs us what tangible ideas you are about to imprint upon us, in case we excite this or that motion in our own bodies. 264 But for a fuller information in this point I refer to the Essay itself.

FOURTH OBJECTION, FROM PERPETUAL ANNIHILATION AND CREATION.-- ANSWER

265 Fourthly, it will be objected that from the foregoing principles it follows things are every moment annihilated and created anew. 266 The objects of sense exist only when they are perceived; the trees therefore are in the garden, or the

chairs in the parlour, no longer than while there is somebody by to perceive them. 267 Upon SHUTTING MY EYES all the furniture in the room is reduced to nothing, and barely upon opening them it is again created. 268 In ANSWER to all which, I refer the reader to what has been said in Chapter-1, verses 15-25, and desire you will consider whether you means anything by the actual existence of an idea distinct from its being perceived. 269 For my part, after the nicest inquiry I could make, I am not able to discover that anything else is meant by those words; and I once more entreat the reader to sound your own thoughts, and not suffer yourself to be imposed on by words. 270 If you can conceive it possible either for your ideas or their archetypes to exist without being perceived, then I give up the cause; 271 but if you cannot, you will acknowledge it is unreasonable for you to stand up in defence of you knows not what, and pretend to charge on me as an absurdity the not assenting to those propositions which at bottom have no meaning in them.

ARGUMENTUM AD HOMINEM

272 It will not be amiss to observe how far the received principles of philosophy are themselves chargeable with those pretended absurdities. 273 (1) It is thought strangely absurd that upon closing my eyelids all the visible objects around me should be reduced to nothing; 274 and yet is not this what philosophers commonly acknowledge, when they agree on all hands that light and colours, which alone are the proper and immediate objects of sight, are mere sensations that exist no longer than they are perceived? 275 (2) Again, it may to some perhaps seem very incredible that things should be every moment creating, yet this very notion is commonly taught in the schools. 276 For the SCHOOLMEN, though they acknowledge the existence of Matter, and that the whole mundane fabric is framed out of it, 277 are nevertheless of opinion that it cannot subsist without the divine conservation, which by them is expounded to be a continual creation. 278 (3) Further, a little thought will discover to us that

though we allow the existence of Matter or corporeal substance, 279 yet it will unavoidably follow, FROM THE PRINCIPLES WHICH ARE NOW GENERALLY ADMITTED, that the PARTICULAR bodies, of what kind soever, do none of them exist whilst they are not perceived. 280 For, it is evident that the Matter philosophers contend for is an incomprehensible somewhat, WHICH HAS NONE OF THOSE PARTICULAR QUALITIES WHEREBY THE BODIES FALLING UNDER OUR SENSES ARE DISTINGUISHED ONE FROM ANOTHER. 281 (4) But, to make this more plain, it must be remarked that the infinite divisibility of Matter is now universally allowed, at least by the most approved and considerable philosophers, who on the received principles demonstrate it beyond all exception. 282 Hence, it follows there is an infinite number of parts in each particle of Matter which are not perceived by sense. 283 The reason therefore that any particular body seems to be of a finite magnitude, or exhibits only a finite number of parts to sense, is, not because it contains no more, since in itself it contains an infinite number of parts, BUT BECAUSE THE SENSE IS NOT ACUTE ENOUGH TO DISCERN THEM. 284 In proportion therefore as the sense is rendered more acute, it perceives a greater number of parts in the object, that is, the object appears greater, and its figure varies, 285 those parts in its extremities which were before unperceivable appearing now to bound it in very different lines and angles from those perceived by an obtuser sense.

286 And at length, after various changes of size and shape, when the sense becomes infinitely acute the body shall seem infinite. During all which there is no alteration in the body, but only in the sense. 287 EACH BODY THEREFORE, CONSIDERED IN ITSELF, IS INFINITELY EXTENDED, AND CONSEQUENTLY VOID OF ALL SHAPE OR FIGURE. 288 From which it follows that, though we should grant the existence of Matter to be never so certain, yet it is withal as certain, 289 the materialists themselves are by their own principles forced to acknowledge, that neither the particular bodies perceived by sense, nor anything like them, exists without the mind. 290 Matter, I say, and each particle

thereof, is according to them infinite and shapeless, 291 AND IT IS THE MIND THAT FRAMES ALL THAT VARIETY OF BODIES WHICH COMPOSE THE VISIBLE WORLD, ANY ONE WHEREOF DOES NOT EXIST LONGER THAN IT IS PERCEIVED.

292 If we consider it, the objection proposed in the Fourth-Objection will not be found reasonably charged on the principles we have premised, so as in truth to make any objection at all against our notions. 293 For, though we hold indeed the objects of sense to be nothing else but ideas which cannot exist unperceived; 294 yet we may not hence conclude they have no existence except only while they are perceived by US, since THERE MAY BE SOME OTHER SPIRIT THAT PERCEIVES THEM THOUGH WE DO NOT. 295 Wherever bodies are said to have no existence without the mind, I would not be understood to mean this or that particular mind, but ALL MINDS WHATSOEVER. 296 It does not therefore follow from the foregoing principles that bodies are annihilated and created every moment, or exist not at all during the intervals between our perception of them.

FIFTH OBJECTION--ANSWER

297 Fifthly, it may perhaps be OBJECTED that if extension and figure exist only in the mind, it follows that the mind is extended and figured; 298 since extension is a mode or attribute which (to speak with the schools) is predicated of the subject in which it exists.

299 I ANSWER, (1) Those qualities are in the mind ONLY AS THEY ARE PERCEIVED BY IT-- that is, not by way of MODE or ATTRIBUTE, but only by way of IDEA; 300 and it no more follows the soul or mind is extended, because extension exists in it alone, than it does that it is red or blue, because those colours are ON ALL HANDS acknowledged to exist in it, and nowhere else.

301 (2) As to what philosophers say of subject and mode, that seems very groundless and unintelligible. 302 For instance, in this proposition "a die is hard, extended, and square," they will

have it that the word die denotes a subject or substance, distinct from the hardness, extension, and figure which are predicated of it, and in which they exist. 303 This I cannot comprehend: to me a die seems to be nothing distinct from those things which are termed its modes or accidents. 304 And, to say a die is hard, extended, and square is not to attribute those qualities to a subject distinct from and supporting them, but only an explication of the meaning of the word DIE.

SIXTH OBJECTION FROM NATURAL PHILOSOPHY--ANSWER

305 Sixth, you will say there have been a great many things explained by matter and motion; 306 take away these and you destroy the whole corpuscular philosophy, and undermine those mechanical principles which have been applied with so much success to account for the PHENOMENA. 307 In short, whatever advances have been made, either by ancient or modern philosophers, in the study of Nature do all proceed on the supposition that corporeal substance or Matter doth really exist. 308 To this I ANSWER that there is not any one PHENOMENON explained on that supposition which may not as well be explained without it, as might easily be made appear by an INDUCTION OF PARTICULARS. 309 To explain the PHENOMENA, is all one as to show why, upon such and such occasions, we are affected with such and such ideas. 310 But (1) how Matter should operate on a Spirit, or produce any idea in it, is what no philosopher will pretend to explain; it is therefore evident there can be no use of Matter in natural philosophy. 311 Besides, (2) they who attempt to account for things do it not by CORPOREAL SUBSTANCE, but by figure, motion, and other qualities, which are in truth no more than mere ideas, and, therefore, cannot be the cause of anything, as has been already shown in Chapter-1. Verses 224-229.

SEVENTH OBJECTION--
ANSWER

312 Seventhly, it will upon this be demanded whether it does not seem ABSURD TO TAKE AWAY NATURAL CAUSES, AND ASCRIBE EVERYTHING TO THE IMMEDIATE OPERATION OF SPIRITS? 313 We must no longer say upon these principles that fire heats, or water cools, but that a Spirit heats, and so forth. Would not a person be deservedly laughed at, who should talk after this manner? 314 I ANSWER, you would so; in such things we ought to THINK WITH THE LEARNED, AND SPEAK WITH THE VULGAR. 315 They who to demonstration are convinced of the truth of the Copernican system do nevertheless say "the sun rises," "the sun sets," or "comes to the meridian"; 316 and if they affected a contrary style in common talk it would without doubt appear very ridiculous. 317 A little reflexion on what is here said will make it manifest that the common use of language would receive no manner of alteration or disturbance from the admission of our tenets.

318 IN THE ORDINARY AFFAIRS OF LIFE, ANY PHRASES MAY BE RETAINED, so long as they excite in us proper sentiments, 319 or dispositions to act in such a manner as is necessary for our WELL-BEING, how false soever they may be if taken in a strict and SPECULATIVE SENSE. 320 Nay, this is unavoidable, since, propriety being regulated by CUSTOM, language is suited to the RECEIVED opinions, which are not always the truest. 321 Hence it is impossible, even in the most rigid, philosophic reasonings, so far to alter the bent and genius of the tongue we speak, as never to give a handle for cavillers to pretend difficulties and inconsistencies. 322 But, a fair and ingenuous reader will collect the sense from the scope and tenor and connexion of a discourse, making allowances for those inaccurate modes of speech which use has made inevitable.

323 As to the OPINION THAT THERE ARE NO CORPOREAL CAUSES, this has been heretofore maintained by some of the Schoolmen, as it is of late by others among the modern philosophers, 324 who though they allow Matter to exist, yet will have God alone to be the immediate efficient cause of all things. 325 These people saw that amongst all

the objects of sense there was none which had any power or activity included in it; 326 and that by consequence this was likewise true of whatever bodies they supposed to exist without the mind, like unto the immediate objects of sense. 327 But then, that they should suppose an innumerable multitude of created beings, which they acknowledge are not capable of producing any one effect in Nature, and which therefore are made to no manner of purpose, since God might have done everything as well without them: 328 this I say, though we should allow it possible, must yet be a very unaccountable and extravagant supposition.

EIGHTH OBJECTION--TWOFOLD ANSWER

329 In the eighth place, the universal concurrent assent of humankind may be thought by some an invincible argument in behalf of Matter, or the existence of external things. 330 Must we suppose the whole world to be mistaken? And if so, what cause can be assigned of so widespread and predominant an error? 331 I answer, FIRST, that, upon a narrow inquiry, it will not perhaps be found so many as is imagined do really believe the existence of Matter or things without the mind. 332 Strictly speaking, to believe that which involves a contradiction, or has no meaning in it, is impossible; and whether the foregoing expressions are not of that sort, I refer it to the impartial examination of the reader. 333 In one sense, indeed, people may be said to believe that Matter exists, that is, they ACT as if the immediate cause of their sensations, which affects them every moment, and is so nearly present to them, were some senseless unthinking being. 334 But, that they should clearly apprehend any meaning marked by those words, and form thereof a settled SPECULATIVE opinion, is what I am not able to conceive. 335 This is not the only instance wherein people impose upon themselves, by imagining they believe those propositions which they have often heard, though at bottom they have no meaning in them.

336 But SECONDLY, though we should grant a notion to be never

so universally and steadfastly adhered to, 337 yet this is weak argument of its truth to whoever considers what a vast number of prejudices and false opinions are everywhere embraced with the utmost tenaciousness, by the unreflecting (which are the far greater) part of humankind. 338 There was a time when the antipodes and motion of the earth were looked upon as monstrous absurdities even by people of learning: 339 and if it be considered what a small proportion they bear to the rest of humankind, we shall find that at this day those notions have gained but a very inconsiderable footing in the world.

NINTH OBJECTION--ANSWER

340 But it is demanded that we assign A CAUSE OF THIS PREJUDICE, and account for its obtaining in the world. 341 To this I ANSWER, that humans knowing they perceived several ideas, WHEREOF THEY THEMSELVES WERE NOT THE AUTHORS-- as not being excited from within nor depending on the operation of their wills-- 342 this made them maintain those ideas, or objects of perception had an EXISTENCE INDEPENDENT OF AND WITHOUT THE MIND, without ever dreaming that a contradiction was involved in those words. 343 But, philosophers having plainly seen that the immediate objects of perception do not exist without the mind, THEY IN SOME DEGREE CORRECTED the mistake of the vulgar; 344 but at the same time run into another which seems no less absurd, to wit, that there are certain objects really existing without the mind, 345 or having a subsistence distinct from being perceived, OF WHICH OUR IDEAS ARE ONLY IMAGES or resemblances, imprinted by those objects on the mind. 346 And this notion of the philosophers owes its origin to the same cause with the former, namely, their being conscious that they were not the authors of their own sensations, 347 which they evidently knew were imprinted from without, and which therefore must have some cause distinct from the minds on which they are imprinted.

348 BUT WHY THEY SHOULD SUPPOSE THE IDEAS OF SENSE TO BE EXCITED IN US BY THINGS IN THEIR LIKENESS, and not rather have recourse to SPIRIT which alone can act, may be accounted for, 349 FIRST, because they were not aware of the repugnancy there is, (1) as well in supposing things like unto our ideas existing without, as in (2) attributing to them POWER OR ACTIVITY. 350 SECONDLY, because the Supreme Spirit which excites those ideas in our minds, is not marked out and limited to our view by any particular finite collection of sensible ideas, as human agents are by their size, complexion, limbs, and motions. 351 And thirdly, because His operations are regular and uniform. Whenever the course of Nature is interrupted by a miracle, humans are ready to own the presence of a superior agent. 352 But, when we see things go on in the ordinary course they do not excite in us any reflexion; 353 their order and concatenation, though it be an argument of the greatest wisdom, power, and goodness in their creator, is yet so constant and familiar to us that we do not think them the immediate effects of a Free Spirit; 354 especially since inconsistency and mutability in acting, though it be an imperfection, is looked on as a mark of freedom.

TENTH OBJECTION--ANSWER

355 Tenthly, it will be objected that the notions we advance are inconsistent with several sound truths in philosophy and mathematics. 356 For example, the motion of the earth is now universally admitted by astronomers as a truth grounded on the clearest and most convincing reasons. But, on the foregoing principles, there can be no such thing. 357 For, motion being only an idea, it follows that if it be not perceived it exists not; but the motion of the earth is not perceived by sense. 358 I answer, that tenet, if rightly understood, will be found to agree with the principles we have premised; for, the question whether the earth moves or no amounts in reality to no more than this, to wit, 359 whether we have reason to

conclude, from what has been observed by astronomers, that if we were placed in such and such circumstances, and such or such a position and distance both from the earth and sun, 360 we should perceive the former to move among the choir of the planets, and appearing in all respects like one of them; and this, by the established rules of Nature which we have no reason to mistrust, is reasonably collected from the phenomena.

361 We may, from the experience we have had of the train and succession of ideas in our minds, often make, I will not say uncertain conjectures, but sure and well--grounded predictions concerning the ideas we shall be affected with pursuant to a great train of actions, 362 and be enabled to pass a right judgment of what would have appeared to us, in case we were placed in circumstances very different from those we are in at present. 363 Herein consists the knowledge of Nature, which may preserve its use and certainty very consistently with what has been said. 364 It will be easy to apply this to whatever objections of the like sort may be drawn from the magnitude of the stars, or any other discoveries in astronomy or Nature.

ELEVENTH OBJECTION

365 In the eleventh place, it will be demanded to what purpose serves that curious organisation of plants, and the animal mechanism in the parts of animals; 366 might not vegetables grow, and shoot forth leaves of blossoms, and animals perform all their motions as well without as with all that variety of internal parts so elegantly contrived and put together; 367 which, being ideas, have nothing powerful or operative in them, nor have any necessary connexion with the effects ascribed to them? 368 If it be a Spirit that immediately produces every effect by a fiat or act of own will, we must think all that is fine and artificial in the works, whether of human or Nature, to be made in vain. 369 By this doctrine, though an artist has made the spring and wheels, and every movement of a watch, and adjusted them in such a

manner as one knew would produce the motions one designed, 370 yet you must think all this done to no purpose, and that it is an Intelligence which directs the index, and points to the hour of the day. 371 If so, why may not the Intelligence do it, without own being at the pains of making the movements and putting them together? 372 Why does not an empty case serve as well as another? 373 And how comes it to pass that whenever there is any fault in the going of a watch, there is some corresponding disorder to be found in the movements, which being mended by a skillful hand all is right again? 374 The like may be said of all the clockwork of Nature, great part whereof is so wonderfully fine and subtle as scarce to be discerned by the best microscope. 375 In short, it will be asked, how, upon our principles, any tolerable account can be given, or any final cause assigned of an innumerable multitude of bodies and machines, 376 framed with the most exquisite art, which in the common philosophy have very apposite uses assigned them, and serve to explain abundance of phenomena?

ANSWER

377 To all which I answer, first, that though there were some difficulties relating to the administration of Providence, and the uses by it assigned to the several parts of Nature, which I could not solve by the foregoing principles, 378 yet this objection could be of small weight against the truth and certainty of those things which may be proved a priori, with the utmost evidence and rigor of demonstration. 379 Secondly, but neither are the received principles free from the like difficulties; 380 for, it may still be demanded to what end God should take those roundabout methods of effecting things by instruments and machines, which no one can deny might have been effected by the mere command of God's will without all that apparatus; 381 nay, if we narrowly consider it, we shall find the objection may be retorted with greater force on those who hold

the existence of those machines without of mind; 382 for it has been made evident that solidity, bulk, figure, motion, and the like have no activity or efficacy in them, so as to be capable of producing any one effect in Nature. 383 Whoever therefore supposes them to exist (allowing the supposition possible) when they are not perceived does it manifestly to no purpose; 384 since the only use that is assigned to them, as they exist unperceived, is that they produce those perceivable effects which in truth cannot be ascribed to anything but Spirit.

FOURTHLY

385 But, to come nigher the difficulty, it must be observed that though the fabrication of all those parts and organs be not absolutely necessary to the producing any effect, yet it is necessary to the producing of things in a constant regular way according to the Laws of Nature. 386 There are certain general laws that run through the whole chain of natural effects; these are learned by the observation and study of Nature, 387 and are by people applied as well to the framing artificial things for the use and ornament of life as to the explaining various phenomena-- 388 which explication consists only in showing the conformity any particular phenomenon has to the general Laws of Nature, or, which is the same thing, in discovering the uniformity there is in the production of natural effects; 389 as will be evident to whoever shall attend to the several instances wherein philosophers pretend to account for appearances. 390 That there is a great and conspicuous use in these regular constant methods of working observed by the Supreme Agent has been shown in verses 186-190 above. 391 And it is no less visible that a particular size, figure, motion, and disposition of parts are necessary, though not absolutely to the producing any effect, yet to the producing it according to the standing mechanical Laws of Nature. 392 Thus, for instance, it cannot be denied that God, or the Intelligence that sustains and rules

the ordinary course of things, might if He were minded to produce a miracle, cause all the motions on the dial-plate of a watch, though nobody had ever made the movements and put them in it: 393 but yet, if He will act agreeably to the rules of mechanism, by Him for wise ends established and maintained in the creation, 394 it is necessary that those actions of the watchmaker, whereby you makes the movements and rightly adjusts them, precede the production of the aforesaid motions; 395 as also that any disorder in them be attended with the perception of some corresponding disorder in the movements, which being once corrected all is right again.

396 It may indeed on some occasions be necessary that the Author of Nature display His overruling power in producing some appearance out of the ordinary series of things. 397 Such exceptions from the general rules of Nature are proper to surprise and awe humans into an acknowledgement of the Divine Being; but then they are to be used but seldom, otherwise there is a plain reason why they should fail of that effect. 398 Besides, God seems to choose the convincing our reason of His attributes by the works of Nature, 399 which discover so much harmony and contrivance in their make, and are such plain indications of wisdom and beneficence in their Author, rather than to astonish us into a belief of His Being by anomalous and surprising events.

400 To set this matter in a yet clearer light, I shall observe that what has been objected in the Eleventh-Objection amounts in reality to no more than this:-- 401 ideas are not anyhow and at random produced, there being a certain order and connexion between them, like to that of cause and effect; 402 there are also several combinations of them made in a very regular and artificial manner, which seem like so many instruments in the hand of Nature that, 403 being hid as it were behind the scenes, have a secret operation in producing those appearances which are seen on the theatre of the world, being themselves discernible only to the curious eye of the philosopher.

404 But, since one idea cannot be the cause of another, to what purpose is that connexion? 405 And, since those instruments, being barely inefficacious perceptions in the mind, are not subservient to the production of natural effects, it is demanded why they are made; 406 or, in other words, what reason can be assigned why God should make us, upon a close inspection into His works, behold so great variety of ideas so artfully laid together, and so much according to rule; 407 it not being credible that He would be at the expense (if one may so speak) of all that art and regularity to no purpose.

408 To all which my answer is, first, that the connexion of ideas does not imply the relation of cause and effect, but only of a mark or sign with the thing signified. 409 The fire which I see is not the cause of the pain I suffer upon my approaching it, but the mark that forewarns me of it. 410 In like manner the noise that I hear is not the effect of this or that motion or collision of the ambient bodies, but the sign thereof.

411 Secondly, the reason why ideas are formed into machines, that is, artificial and regular combinations, is the same with that for combining letters into words. 412 That a few original ideas may be made to signify a great number of effects and actions, it is necessary they be variously combined together. 413 And, to the end their use be permanent and universal, these combinations must be made by rule, and with wise contrivance. 414 By this means abundance of information is conveyed unto us, concerning what we are to expect from such and such actions and what methods are proper to be taken for the exciting such and such ideas; 415 which in effect is all that I conceive to be distinctly meant when it is said that, by discerning a figure, texture, and mechanism of the inward parts of bodies, whether natural or artificial, we may attain to know the several uses and properties depending thereon, or the nature of the thing.

PROPER EMPLOYMENT OF THE NATURAL PHILOSOPHER

416 Hence, it is evident that those things which, under the notion of a cause co-operating or concurring to the production of effects, are altogether inexplicable, and run us into great absurdities, may be very naturally explained, 417 and have a proper and obvious use assigned to them, when they are considered only as marks or signs for our information. 418 And it is the searching after and endeavouring to understand those signs instituted by the Author of Nature, that ought to be the employment of the natural philosopher; 419 and not the pretending to explain things by corporeal causes, which doctrine seems to have too much estranged the minds of humans from that active principle, that supreme and wise Spirit "in whom we live, move, and have our being."

TWELFTH OBJECTION-- ANSWER

420 In the twelfth place, it may perhaps be objected that-- though it be clear from what has been said that there can be no such thing as an inert, senseless, extended, solid, figured, movable substance existing without the mind, such as philosophers describe Matter-- 421 yet, if any person shall leave out of own idea of matter the positive ideas of extension, figure, solidity and motion, and say that you means only by that word an inert, senseless substance, that exists without the mind or unperceived, 422 which is the occasion of our ideas, or at the presence whereof God is pleased to excite ideas in us: it doth not appear but that Matter taken in this sense may possibly exist. 423 In answer to which I say, first, that it seems no less absurd to suppose a substance without accidents, than it is to suppose accidents without a substance. 424 But secondly, though we should grant this unknown substance may possibly exist, yet where can it be supposed to be? 425 That it exists not in the mind is agreed; and that it exists not in place is no less certain-- since all place or extension exists only in the mind, as has been already proved. It remains

therefore that it exists nowhere at all.

MATTER SUPPORTS NOTHING, AN ARGUMENT AGAINST ITS EXISTENCE

426 Let us examine a little the description that is here given us of matter. It neither acts, nor perceives, nor is perceived; 427 for this is all that is meant by saying it is an inert, senseless, unknown substance; which is a definition entirely made up of negatives, excepting only the relative notion of its standing under or supporting. 428 But then it must be observed that it supports nothing at all, and how nearly this comes to the description of a nonentity I desire may be considered. 429 But, say you, it is the unknown occasion, at the presence of which ideas are excited in us by the will of God. 430 Now, I would fain know how anything can be present to us, which is neither perceivable by sense nor reflexion, nor capable of producing any idea in our minds, nor is at all extended, nor has any form, nor exists in any place. 431 The words "to be present," when thus applied, must needs be taken in some abstract and strange meaning, and which I am not able to comprehend.

432 Again, let us examine what is meant by occasion. So far as I can gather from the common use of language, that word signifies either the agent which produces any effect, or else something that is observed to accompany or go before it in the ordinary course of things. 433 But when it is applied to Matter as above described, it can be taken in neither of those senses; for Matter is said to be passive and inert, and so cannot be an agent or efficient cause. 434 It is also unperceivable, as being devoid of all sensible qualities, and so cannot be the occasion of our perceptions in the latter sense: as when the burning my finger is said to be the occasion of the pain that attends it. 435 What therefore can be meant by calling matter an occasion? The term is either used in no sense at all, or else in some very distant from its received signification.

436 You will Perhaps say that Matter, though it be not perceived by us, is nevertheless perceived by

God, to whom it is the occasion of exciting ideas in our minds. 437 For, say you, since we observe our sensations to be imprinted in an orderly and constant manner, it is but reasonable to suppose there are certain constant and regular occasions of their being produced. 438 That is to say, that there are certain permanent and distinct parcels of Matter, corresponding to our ideas, which, though they do not excite them in our minds, or anywise immediately affect us, as being altogether passive and unperceivable to us, 439 they are nevertheless to God, by whom they art perceived, as it were so many occasions to remind Him when and what ideas to imprint on our minds; that so things may go on in a constant uniform manner.

440 In answer to this, I observe that, as the notion of Matter is here stated, the question is no longer concerning the existence of a thing distinct from Spirit and idea, from perceiving and being perceived; 441 but whether there are not certain ideas of I know not what sort, in the mind of God which are so many marks or notes that direct Him how to produce sensations in our minds in a constant and regular method-- 442 much after the same manner as a musician is directed by the notes of music to produce that harmonious train and composition of sound which is called a tune, though they who hear the music do not perceive the notes, and may be entirely ignorant of them. 443 But, this notion of Matter seems too extravagant to deserve a confutation. Besides, it is in effect no objection against what we have advanced, viz. that there is no senseless unperceived substance.

THE ORDER OF OUR PERCEPTIONS SHOWS THE GOODNESS OF GOD, BUT AFFORDS NO PROOF OF THE EXISTENCE OF MATTER

444 If we follow the light of reason, we shall, from the constant uniform method of our sensations, collect the goodness and wisdom of the Spirit who excites them in our minds; but this is all that I can see reasonably concluded from thence. 445 To me, I say, it is evident that the being of a spirit infinitely wise, good, and powerful is abundantly sufficient to explain

all the appearances of Nature. 446 But, as for inert, senseless Matter, nothing that I perceive has any the least connexion with it, or leads to the thoughts of it. 447 And I would fain see any one explain any the meanest phenomenon in Nature by it, or show any manner of reason, though in the lowest rank of probability, that you can have for its existence, or even make any tolerable sense or meaning of that supposition. 448 For, as to its being an occasion, we have, I think, evidently shown that with regard to us it is no occasion. 449 It remains therefore that it must be, if at all, the occasion to God of exciting ideas in us; and what this amounts to we have just now seen.

450 It is worthwhile to reflect a little on the motives which induced humans to suppose the existence of material substance; 451 that so having observed the gradual ceasing and expiration of those motives or reasons, we may proportionably withdraw the assent that was grounded on them.

452 First, therefore, it was thought that colour, figure, motion, and the rest of the sensible qualities or accidents, did really exist without the mind; 453 and for this reason it seemed needful to suppose some unthinking substratum or substance wherein they did exist, since they could not be conceived to exist by themselves. 454 Afterwards, in process of time, humans being convinced that colours, sounds, and the rest of the sensible, secondary qualities had no existence without the mind, they stripped this substratum or material substance of those qualities, leaving only the primary ones, figure, motion, and suchlike, 455 which they still conceived to exist without the mind, and consequently to stand in need of a material support. 456 But, it having been shown that none even of these can possibly exist otherwise than in a Spirit or Mind which perceives them it follows that we have no longer any reason to suppose the being of Matter; 457 nay, that it is utterly impossible there should be any such thing, so long as that word is taken to denote an unthinking substratum of qualities or accidents wherein they exist without the mind.

458 But though it be allowed by the materialists themselves that Matter

was thought of only for the sake of supporting accidents, 459 and, the reason entirely ceasing, one might expect the mind should naturally, and without any reluctance at all, quit the belief of what was solely grounded thereon; 460 yet the prejudice is riveted so deeply in our thoughts, that we can scarce tell how to part with it, 461 and are therefore inclined, since the thing itself is indefensible, at least to retain the name, which we apply to I know not what abstracted and indefinite notions of being, or occasion, though without any show of reason, at least so far as I can see. 462 For, what is there on our part, or what do we perceive, amongst all the ideas, sensations, notions which are imprinted on our minds, either by sense or reflexion, from whence may be inferred the existence of an inert, thoughtless, unperceived occasion? 463 And, on the other hand, on the part of an All-sufficient Spirit, what can there be that should make us believe or even suspect He is directed by an inert occasion to excite ideas in our minds?

ABSURDITY OF CONTENDING FOR THE EXISTENCE OF MATTER AS THE OCCASION OF IDEAS

464 It is a very extraordinary instance of the force of prejudice, and much to be lamented, that the mind of human retains so great a fondness, against all the evidence of reason, 465 for a stupid thoughtless somewhat, by the interposition whereof it would as it were screen itself from the Providence of God, and remove it farther off from the affairs of the world. 466 But, though we do the utmost we can to secure the belief of Matter, though, when reason forsakes us, we endeavour to support our opinion on the bare possibility of the thing, 467 and though we indulge ourselves in the full scope of an imagination not regulated by reason to make out that poor possibility, yet the upshot of all is, that there are certain unknown Ideas in the mind of God; 468 for this, if anything, is all that I conceive to be meant by occasion with regard to God. And this at the bottom is no longer contending for the thing, but for the name.

469 Whether therefore there are such Ideas in the mind of God, and whether they may be called by the name Matter, I shall not dispute. 470 But, if you stick to the notion of an unthinking substance or support of extension, motion, and other sensible qualities, then to me it is most evidently impossible there should be any such thing, 471 since it is a plain repugnancy that those qualities should exist in or be supported by an unperceiving substance.

THAT A SUBSTRATUM NOT PERCEIVED, MAY EXIST, UNIMPORTANT

472 But, say you, though it be granted that there is no thoughtless support of extension and the other qualities or accidents which we perceive, 473 yet there may perhaps be some inert, unperceiving substance or substratum of some other qualities, as incomprehensible to us as colours are to a human born blind, because we have not a sense adapted to them. 474 But, if we had a new sense, we should possibly no more doubt of their existence than a blind person made to see does of the existence of light and colours. 475 I answer, first, if what you mean by the word Matter be only the unknown support of unknown qualities, it is no matter whether there is such a thing or no, since it no way concerns us; 476 and I do not see the advantage there is in disputing about what we know not what, and we know not why.

477 But, secondly, if we had a new sense it could only furnish us with new ideas or sensations; and then we should have the same reason against their existing in an unperceiving substance that has been already offered with relation to figure, motion, colour and the like. 478 Qualities, as has been shown, are nothing else but sensations or ideas, which exist only in a mind perceiving them; 479 and this is true not only of the ideas we are acquainted with at present, but likewise of all possible ideas whatsoever.

480 But, you will insist, what if I have no reason to believe the existence of Matter? 481 What if I cannot assign any use to it or explain anything by it, or even

conceive what is meant by that word? 482 Yet still it is no contradiction to say that Matter exists, and that this Matter is in general a substance, or occasion of ideas; 483 though indeed to go about to unfold the meaning or adhere to any particular explication of those words may be attended with great difficulties. 484 I answer, when words are used without a meaning, you may put them together as you please without danger of running into a contradiction. 485 You may say, for example, that twice two is equal to seven, so long as you declare you do not take the words of that proposition in their usual acceptation but for marks of you know not what. 486 And, by the same reason, you may say there is an inert thoughtless substance without accidents which is the occasion of our ideas. And we shall understand just as much by one proposition as the other.

487 In the last place, you will say, what if we give up the cause of material Substance, and stand to it that Matter is an unknown somewhat-- neither substance nor accident, spirit nor idea, inert, thoughtless, indivisible, immovable, unextended, existing in no place.

488 For, say you, whatever may be urged against substance or occasion, or any other positive or relative notion of Matter, has no place at all, so long as this negative definition of Matter is adhered to. 489 I answer, you may, if so it shall seem good, use the word "Matter" in the same sense as other people use "nothing," and so make those terms convertible in your style. 490 For, after all, this is what appears to me to be the result of that definition, the parts whereof when I consider with attention, either collectively or separate from each other, 491 I do not find that there is any kind of effect or impression made on my mind different from what is excited by the term nothing.

492 You will reply, perhaps, that in the fore-said definition is included what doth sufficiently distinguish it from nothing-- the positive abstract idea of quiddity, entity, or existence. 493 I own, indeed, that those who pretend to the faculty of framing abstract general ideas do talk as if they had such an idea,

which is, say they, the most abstract and general notion of all; that is, to me, the most incomprehensible of all others. 494 That there are a great variety of spirits of different orders and capacities, whose faculties both in number and extent are far exceeding those the Author of my being has bestowed on me, I see no reason to deny. 495 And for me to pretend to determine by my own few, stinted narrow inlets of perception, what ideas the inexhaustible power of the Supreme Spirit may imprint upon them were certainly the utmost folly and presumption-- 496 since there may be, for aught that I know, innumerable sorts of ideas or sensations, as different from one another, and from all that I have perceived, as colours are from sounds. 497 But, how ready soever I may be to acknowledge the scantiness of my comprehension with regard to the endless variety of spirits and ideas that may possibly exist, 498 yet for any one to pretend to a notion of Entity or Existence, abstracted from spirit and idea, from perceived and being perceived, is, I suspect, a downright repugnancy and trifling with words.-- 499 It remains that we consider the objections which may possibly be made on the part of Religion.

OBJECTIONS DERIVED FROM THE SCRIPTURES ANSWERED

500 Some there are who think that, though the arguments for the real existence of bodies which are drawn from Reason be allowed not to amount to demonstration, 501 yet the Holy Scriptures are so clear in the point as will sufficiently convince every good Christian that bodies do really exist, and are something more than mere ideas; 502 there being in Holy Writ innumerable facts related which evidently suppose the reality of timber and stone, mountains and rivers, and cities, and human bodies. 503 To which I answer that no sort of writings whatever, sacred or profane, which use those and the like words in the vulgar acceptation, or so as to have a meaning in them, are in danger of having their truth called in question by our doctrine. 504 That

all those things do really exist, that there are bodies, even corporeal substances, when taken in the vulgar sense, has been shown to be agreeable to our principles; 505 and the difference betwixt things and ideas, realities and chimeras, has been distinctly explained. And I do not think that either what philosophers call Matter, or the existence of objects without the mind, is anywhere mentioned in Scripture.

NO OBJECTION AS TO LANGUAGE TENABLE

506 Again, whether there can be or be not external things, it is agreed on all hands that the proper use of words is the marking our conceptions, or things only as they are known and perceived by us; 507 whence it plainly follows that in the tenets we have laid down there is nothing inconsistent with the right use and significancy of language, and that discourse, of what kind soever, so far as it is intelligible, remains undisturbed. 508 But all this seems so manifest, from what has been largely set forth in the premises, that it is needless to insist any farther on it. 509 But, secondly it will be urged that miracles do, at least, lose much of their stress and import by our principles. 510 What must we think of Moses' rod? Was it not really turned into a serpent; or was there only a change of ideas in the minds of the spectators? 511 And, can it be supposed that our Saviour did no more at the marriage-feast in Cana than impose on the sight, and smell, and taste of the guests, so as to create in them the appearance or idea only of wine? 512 The same may be said of all other miracles; which, in consequence of the foregoing principles, must be looked upon only as so many cheats, or illusions of fancy. 513 To this I reply, that the rod was changed into a real serpent, and the water into real wine. That this does not in the least contradict what I have elsewhere said will be evident from verses 201-214 in this chapter. 514 But this business of real and imaginary has been already so plainly and fully explained, and so often referred to, 515 and the difficulties about it are

so easily answered from what has gone before, that it were an affront to the reader's understanding to resume the explication of it in its place. 516 I shall only observe that if at table all who were present should see, and smell, and taste, and drink wine, and find the effects of it, with me there could be no doubt of its reality; 517 so that at bottom the scruple concerning real miracles has no place at all on ours, but only on the received principles, and consequently makes rather for than against what has been said.

CONSEQUENCES OF THE PRECEDING TENETS

518 Having done with the Objections, which I endeavoured to propose in the clearest light, and gave them all the force and weight I could, we proceed in the next place to take a view of our tenets in their Consequences. 519 Some of these appear at first sight-- as that several difficult and obscure questions, on which abundance of speculation has been thrown away, are entirely banished from philosophy. 520 "Whether corporeal substance can think," "whether Matter be infinitely divisible," and "how it operates on spirit"-- these and like inquiries have given infinite amusement to philosophers in all ages; 521 but depending on the existence of Matter, they have no longer any place on our principles. 522 Many other advantages there are, as well with regard to religion as the sciences, which it is easy for any one to deduce from what has been premised; but this will appear more plainly in the sequel.

THE REMOVAL OF MATTER GIVES CERTAINTY TO KNOWLEDGE

523 From the principles we have laid down it follows human knowledge may naturally be reduced to two heads-- that of ideas and that of spirits. Of each of these I shall treat in order.

524 And first as to ideas or unthinking things. Our knowledge of these has been very much obscured and confounded, and we have been led into very dangerous errors, by supposing a twofold existence of the objects of sense--

525 the one intelligible or in the mind, the other real and without the mind; whereby unthinking things are thought to have a natural subsistence of their own distinct from being perceived by spirits. 526 This, which, if I mistake not, has been shown to be a most groundless and absurd notion, is the very root of Scepticism; 527 for, so long as humans thought that real things subsisted without the mind, and that their knowledge was only so far forth real as it was conformable to real things, it follows they could not be certain they had any real knowledge at all. 528 For how can it be known that the things which are perceived are conformable to those which are not perceived, or exist without the mind?

529 Colour, figure, motion, extension, and the like, considered only as so many sensations in the mind, are perfectly known, there being nothing in them which is not perceived. 530 But, if they are looked on as notes or images, referred to things or archetypes existing without the mind, then are we involved all in scepticism. 531 We see only the appearances, and not the real qualities of things. 532 What may be the extension, figure, or motion of anything really and absolutely, or in itself, it is impossible for us to know, but only the proportion or relation they bear to our senses. 533 Things remaining the same, our ideas vary, and which of them, or even whether any of them at all, represent the true quality really existing in the thing, it is out of our reach to determine. 534 So that, for aught we know, all we see, hear, and feel may be only phantom and vain chimera, and not at all agree with the real things existing in rerum natura. 535 All this scepticism follows from our supposing a difference between things and ideas, and that the former have a subsistence without the mind or unperceived. 536 It were easy to dilate on this subject, and show how the arguments urged by sceptics in all ages depend on the supposition of external objects.

IF THERE BE EXTERNAL MATTER, NEITHER THE NATURE NOR EXISTENCE OF THINGS CAN BE KNOWN

537 So long as we attribute a real existence to unthinking things, distinct from their being perceived, it is not only impossible for us to know with evidence the nature of any real unthinking being, but even that it exists. 538 Hence it is that we see philosophers distrust their senses, and doubt of the existence of heaven and earth, of everything they see or feel, even of their own bodies. 539 And, after all their labour and struggle of thought, they are forced to own we cannot attain to any self-evident or demonstrative knowledge of the existence of sensible things. 540 But, all this doubtfulness, which so bewilders and confounds the mind and makes philosophy ridiculous in the eyes of the world, vanishes if we annex a meaning to our words, 541 and not amuse ourselves with the terms "absolute," "external," "exist," and such-like, signifying we know not what. 542 I can as well doubt of my own being as of the being of those things which I actually perceive by sense; 543 it being a manifest contradiction that any sensible object should be immediately perceived by sight or touch, and at the same time have no existence in Nature, since the very existence of an unthinking being consists in being perceived.

OF THING OR BEING

544 Nothing seems of more importance towards erecting a firm system of sound and real knowledge, which may be proof against the assaults of Scepticism, than to lay the beginning in a distinct explication of what is meant by thing, reality, existence; 545 for in vain shall we dispute concerning the real existence of things, or pretend to any knowledge thereof, so long as we have not fixed the meaning of those words. 546 Thing or Being is the most general name of all; it comprehends under it two kinds entirely distinct and heterogeneous, and which have nothing common but the name. viz. spirits and ideas. 547 The former are active, indivisible

substances: the latter are inert, fleeting, dependent beings, which subsist not by themselves, but are supported by, or exist in minds or spiritual substances. 548 We comprehend our own existence by inward feeling or reflexion, and that of other spirits by reason. 549 We may be said to have some knowledge or notion of our own minds, of spirits and active beings, whereof in a strict sense we have not ideas. 550 In like manner, we know and have a notion of relations between things or ideas--which relations are distinct from the ideas or things related, inasmuch as the latter may be perceived by us without our perceiving the former. 551 To me it seems that ideas, spirits, and relations are all in their respective kinds the object of human knowledge and subject of discourse; 552 and that the term idea would be improperly extended to signify everything we know or have any notion of.

EXTERNAL THINGS EITHER IMPRINTED BY OR PERCEIVED BY SOME OTHER MIND

553 Ideas imprinted on the senses are real things, or do really exist; 554 this we do not deny, but we deny they can subsist without the minds which perceive them, or that they are resemblances of any archetypes existing without the mind; 555 since the very being of a sensation or idea consists in being perceived, and an idea can be like nothing but an idea. Again, the things perceived by sense may be termed external, with regard to their origin-- 556 in that they are not generated from within by the mind itself, but imprinted by a Spirit distinct from that which perceives them. 557 Sensible objects may likewise be said to be "without the mind" in another sense, namely when they exist in some other mind; thus, when I shut my eyes, the things I saw may still exist, but it must be in another mind.

SENSIBLE QUALITIES REAL

558 It were a mistake to think that what is here said derogates in the least from the reality of things. 559 It is acknowledged, on the received principles, that extension, motion, and in a word all sensible qualities have need of a support, as not being able to subsist by themselves. 560 But the objects perceived by sense are allowed to be nothing but combinations of those qualities, and consequently cannot subsist by themselves. 561 Thus far it is agreed on all hand. So that in denying the things perceived by sense an existence independent of a substance of support wherein they may exist, 562 we detract nothing from the received opinion of their reality, and are guilty of no innovation in that respect. 563 All the difference is that, according to us, the unthinking beings perceived by sense have no existence distinct from being perceived, and cannot therefore exist in any other substance than those unextended indivisible substances or spirits which act and think and perceive them; 564 whereas philosophers vulgarly hold that the sensible qualities do exist in an inert, extended, unperceiving substance which they call Matter, to which they attribute a natural subsistence, exterior to all thinking beings, 565 or distinct from being perceived by any mind whatsoever, even the eternal mind of the Creator, wherein they suppose only ideas of the corporeal substances created by Him; if indeed they allow them to be at all created.

OBJECTIONS OF ATHEISTS OVERTURNED

566 For, as we have shown the doctrine of Matter or corporeal substance to have been the main pillar and support of Scepticism, so likewise upon the same foundation have been raised all the impious schemes of Atheism and Irreligion. 567 Nay, so great a difficulty has it been thought to conceive Matter produced out of nothing, 568 that the most celebrated among the ancient philosophers, even of those who maintained the being of a God,

have thought Matter to be uncreated and co-eternal with Him. 569 How great a friend material substance has been to Atheists in all ages were needless to relate. 570 All their monstrous systems have so visible and necessary a dependence on it that, when this corner-stone is once removed, the whole fabric cannot choose but fall to the ground, 571 insomuch that it is no longer worthwhile to bestow a particular consideration on the absurdities of every wretched sect of Atheists.

AND OF FATALISTS ALSO

572 That impious and profane persons should readily fall in with those systems which favour their inclinations, by deriding immaterial substance, and supposing the soul to be divisible and subject to corruption as the body; 573 which exclude all freedom, intelligence, and design from the formation of things, and instead thereof make a self--existent, stupid, unthinking substance the root and origin of all beings; 574 that they should hearken to those who deny a Providence, or inspection of a Superior Mind over the affairs of the world, 575 attributing the whole series of events either to blind chance or fatal necessity arising from the impulse of one body or another-- all this is very natural. 576 And, on the other hand, when people of better principles observe the enemies of religion lay so great a stress on unthinking Matter, and all of them use so much industry and artifice to reduce everything to it, 577 methinks they should rejoice to see them deprived of their grand support, and driven from that only fortress, without which your Epicureans, Hobbists, and the like, have not even the shadow of a pretence, but become the most cheap and easy triumph in the world.

OF IDOLATORS

578 The existence of Matter, or bodies unperceived, has not only been the main support of Atheists and Fatalists, but on the same principle doth Idolatry likewise in

all its various forms depend. 579 Did humans but consider that the sun, moon, and stars, and every other object of the senses are only so many sensations in their minds, which have no other existence but barely being perceived, 580 doubtless they would never fall down and worship their own ideas, but rather address their homage to that ETERNAL INVISIBLE MIND which produces and sustains all things.

AND SOCINIANS

581 The same absurd principle, by mingling itself with the articles of our faith, has occasioned no small difficulties to Christians. 582 For example, about the Resurrection, how many scruples and objections have been raised by Socinians and others? 583 But do not the most plausible of them depend on the supposition that a body is denominated the same, with regard not to the form or that which is perceived by sense, but the material substance, which remains the same under several forms? 584 Take away this material substance, about the identity whereof all the dispute is, and mean by body what every plain ordinary person means by that word, 585 to wit, that which is immediately seen and felt, which is only a combination of sensible qualities or ideas, and then their most unanswerable objections come to nothing.

SUMMARY OF THE CONSEQUENCES OF EXPELLING MATTER

586 Matter being once expelled out of Nature drags with it so many sceptical and impious notions, such an incredible number of disputes and puzzling questions, 587 which have been thorns in the sides of divines as well as philosophers, and made so much fruitless work for humankind, 588 that if the arguments we have produced against it are not found equal to demonstration (as to me they evidently seem), yet I am sure all friends to knowledge, peace, and religion have reason to wish they were.

589 Beside the external existence of the objects of perception, another great source of errors and difficulties with regard to ideal

KNOWLEDGE

knowledge is the doctrine of abstract ideas, such as it has been set forth in Chapter-1. 590 The plainest things in the world, those we are most intimately acquainted with and perfectly know, when they are considered in an abstract way, appear strangely difficult and incomprehensible. 591 Time, place, and motion, taken in particular or concrete, are what everybody knows, but, having passed through the hands of a metaphysician, they become too abstract and fine to be apprehended by people of ordinary sense. 592 Bid your servant meet you at such a time in such a place, and one shall never stay to deliberate on the meaning of those words; in conceiving that particular time and place, or the motion by which one is to get thither, one finds not the least difficulty. 593 But if time be taken exclusive of all those particular actions and ideas that diversify the day, merely for the continuation of existence or duration in abstract, then it will perhaps gravel even a philosopher to comprehend it.

DILEMMA

594 For my own part, whenever I attempt to frame a simple idea of time, abstracted from the succession of ideas in my mind, which flows uniformly and is participated by all beings, I am lost and embrangled in inextricable difficulties. 595 I have no notion of it at all, only I hear others say it is infinitely divisible, and speak of it in such a manner as leads me to entertain odd thoughts of my existence; 596 since that doctrine lays one under an absolute necessity of thinking, either that you passes away innumerable ages without a thought, or else that you are annihilated every moment of your life, both which seem equally absurd. 597 Time therefore being nothing, abstracted from the succession of ideas in our minds, it follows that the duration of any finite spirit must be estimated by the number of ideas or actions succeeding each other in that same spirit or mind. 598 Hence, it is a plain consequence that the soul always thinks; and in truth whoever shall go about to divide in own thoughts, or abstract the

existence of a spirit from its cogitation, will, I believe, find it no easy task.

599 So likewise when we attempt to abstract extension and motion from all other qualities, and consider them by themselves, we presently lose sight of them, and run into great extravagances. 600 All which depend on a twofold abstraction; first, it is supposed that extension, for example, may be abstracted from all other sensible qualities; 601 and secondly, that the entity of extension may be abstracted from its being perceived. 602 But, whoever shall reflect, and take care to understand what you says, will, if I mistake not, acknowledge that all sensible qualities are alike sensations and alike real; 603 that where the extension is, there is the colour, too, in your mind, and that their archetypes can exist only in some other mind; 604 and that the objects of sense are nothing but those sensations combined, blended, or (if one may so speak) concreted together; none of all which can be supposed to exist unperceived.

605 What it is for a human to be happy, or an object good, every one may think you knows. 606 But to frame an abstract idea of happiness, prescinded from all particular pleasure, or of goodness from everything that is good, this is what few can pretend to. 607 So likewise a person may be just and virtuous without having precise ideas of justice and virtue. 608 The opinion that those and the like words stand for general notions, abstracted from all particular persons and actions, seems to have rendered morality very difficult, and the study thereof of small use to humankind. 609 And in effect the doctrine of abstraction has not a little contributed towards spoiling the most useful parts of knowledge.

OF NATURAL PHILOSOPHY AND MATHEMATICS

610 The two great provinces of speculative science conversant about ideas received from sense, are Natural Philosophy and Mathematics; 611 with regard to each of these I shall make some

observations. And first I shall say somewhat of Natural Philosophy. 612 On this subject it is that the sceptics triumph. All that stock of arguments they produce to depreciate our faculties and make humankind appear ignorant and low, are drawn principally from this head, 613 namely, that we are under an invincible blindness as to the true and real nature of things. 614 This they exaggerate, and love to enlarge on. We are miserably bantered, say they, by our senses, and amused only with the outside and show of things. 615 The real essence, the internal qualities and constitution of every the meanest object, is hid from our view; something there is in every drop of water, every grain of sand, which it is beyond the power of human understanding to fathom or comprehend. 616 But, it is evident from what has been shown that all this complaint is groundless, and that we are influenced by false principles to that degree as to mistrust our senses, and think we know nothing of those things which we perfectly comprehend.

617 One great inducement to our pronouncing ourselves ignorant of the nature of things is the current opinion that everything includes within itself the cause of its properties; 618 or that there is in each object an inward essence which is the source whence its discernible qualities flow, and whereon they depend. 619 Some have pretended to account for appearances by occult qualities, but of late they are mostly resolved into mechanical causes, to wit, the figure, motion, weight, and suchlike qualities, of insensible particles; 620 whereas, in truth, there is no other agent or efficient cause than spirit, it being evident that motion, as well as all other ideas, is perfectly inert. 621 Hence, to endeavour to explain the production of colours or sounds, by figure, motion, magnitude, and the like, must needs be labour in vain. And accordingly we see the attempts of that kind are not at all satisfactory. 622 Which may be said in general of those instances wherein one idea or quality is assigned for the cause of another. 623 I need not say how many hypotheses and speculations are left out, and how much the study

of Nature is abridged by this doctrine.

ATTRACTION SIGNIFIES THE EFFECT, NOT THE MANNER OR CAUSE

624 The great mechanical principle now in vogue is attraction. 625 That a stone falls to the earth, or the sea swells towards the moon, may to some appear sufficiently explained thereby. But how are we enlightened by being told this is done by attraction? 626 Is it that that word signifies the manner of the tendency, and that it is by the mutual drawing of bodies instead of their being impelled or protruded towards each other? 627 But, nothing is determined of the manner or action, and it may as truly (for aught we know) be termed "impulse," or "protrusion," as "attraction." 628 Again, the parts of steel we see cohere firmly together, and this also is accounted for by attraction; 629 but, in this as in the other instances, I do not perceive that anything is signified besides the effect itself; for as to the manner of the action whereby it is produced, or the cause which produces it, these are not so much as aimed at.

630 Indeed, if we take a view of the several phenomena, and compare them together, we may observe some likeness and conformity between them. 631 For example, in the falling of a stone to the ground, in the rising of the sea towards the moon, in cohesion, crystallisation, etc, there is something alike, namely, an union or mutual approach of bodies. 632 So that any one of these or the like phenomena may not seem strange or surprising to a person who has nicely observed and compared the effects of Nature. 633 For that only is thought so which is uncommon, or a thing by itself, and out of the ordinary course of our observation. 634 That bodies should tend towards the centre of the earth is not thought strange, because it is what we perceive every moment of our lives. 635 But, that they should have a like gravitation towards the centre of the moon may seem odd and unaccountable to most people, because it is discerned only in the tides. 636 But a philosopher, whose thoughts take in a larger compass of Nature, having observed a

certain similitude of appearances, as well in the heavens as the earth, 637 that argue innumerable bodies to have a mutual tendency towards each other, which you denotes by the general name "attraction," whatever can be reduced to that you thinks justly accounted for. 638 Thus you explains the tides by the attraction of the terraqueous globe towards the moon, which to you does not appear odd or anomalous, but only a particular example of a general rule or Law of Nature.

639 If therefore we consider the difference there is betwixt natural philosophers and other people, with regard to their knowledge of the phenomena, we shall find it consists not in an exacter knowledge of the efficient cause that produces them-- 640 for that can be no other than the will of a spirit-- but only in a greater largeness of comprehension, whereby analogies, harmonies, and agreements are discovered in the works of Nature, and the particular effects explained, 641 that is, reduced to general rules, which rules, grounded on the analogy and uniformness observed in the production of natural effects, are most agreeable and sought after by the mind; 642 for that they extend our prospect beyond what is present and near to us, and enable us to make very probable conjectures touching things that may have happened at very great distances of time and place, as well as to predict things to come; 643 which sort of endeavour towards omniscience is much affected by the mind.

CAUTION AS TO THE USE OF ANALOGIES

644 But we should proceed warily in such things, for we are apt to lay too great stress on analogies, and, to the prejudice of truth, humour that eagerness of the mind whereby it is carried to extend its knowledge into general theorems. 645 For example, in the business of gravitation or mutual attraction, because it appears in many instances, some are straightway for pronouncing it universal; 646 and that to attract and be attracted by every other body is an essential quality inherent in all bodies

whatsoever. 647 Whereas it is evident the fixed stars have no such tendency towards each other; and, so far is that gravitation from being essential to bodies that in some instances a quite contrary principle seems to show itself; as in the perpendicular growth of plants, and the elasticity of the air. 648 There is nothing necessary or essential in the case, but it depends entirely on the will of the Governing Spirit, who causes certain bodies to cleave together or tend towards each other according to various laws, 649 whilst He keeps others at a fixed distance; and to some He gives a quite contrary tendency to fly asunder just as He sees convenient.

650 After what has been premised, I think we may lay down the following conclusions. First, it is plain philosophers amuse themselves in vain, when they inquire for any natural efficient cause, distinct from a mind or spirit. 651 Secondly, considering the whole creation is the workmanship of a wise and good Agent, it should seem to become philosophers to employ their thoughts (contrary to what some hold) about the final causes of things; 652 and I confess I see no reason why pointing out the various ends to which natural things are adapted, and for which they were originally with unspeakable wisdom contrived, should not be thought one good way of accounting for them, and altogether worthy a philosopher. 653 Thirdly, from what has been premised no reason can be drawn why the history of Nature should not still be studied, and observations and experiments made, which, that they are of use to humankind, and enable us to draw any general conclusions, 654 is not the result of any immutable habitudes or relations between things themselves, but only of God's goodness and kindness to humans in the administration of the world. 655 Fourthly, by a diligent observation of the phenomena within our view, we may discover the general Laws of Nature, and from them deduce the other phenomena; 656 I do not say demonstrate, for all deductions of that kind depend on a supposition that the Author of Nature always operates uniformly, and in a

constant observance of those rules we take for principles: which we cannot evidently know.

THREE ANALOGIES

657 Those people who frame general rules from the phenomena and afterwards derive the phenomena from those rules, seem to consider signs rather than causes. 658 A person may well understand natural signs without knowing their analogy, or being able to say by what rule a thing is so or so. 659 And, as it is very possible to write improperly, through too strict an observance of general grammar rules; so, in arguing from general Laws of Nature, it is not impossible we may extend the analogy too far, and by that means run into mistakes.

660 As in reading other books a wise person will choose to fix own thoughts on the sense and apply it to use, rather than lay them out in grammatical remarks on the language; 661 so, in perusing the volume of Nature, it seems beneath the dignity of the mind to affect an exactness in reducing each particular phenomenon to general rules, or showing how it follows from them. 662 We should propose to ourselves nobler views, namely, to recreate and exalt the mind with a prospect of the beauty, order. extent, and variety of natural things: 663 hence, by proper inferences, to enlarge our notions of the grandeur, wisdom, and beneficence of the Creator; 664 and lastly, to make the several parts of the creation, so far as in us lies, subservient to the ends they were designed for, God's glory, and the sustentation and comfort of ourselves and fellow-creatures.

665 The best key for the aforesaid analogy or natural Science will be easily acknowledged to be a certain celebrated Treatise of Mechanics. 666 In the entrance of which justly admired treatise, Time, Space, and Motion are distinguished into absolute and relative, true and apparent, mathematical and vulgar; 667 which distinction, as it is at large explained by the author, does suppose these quantities to have an existence without the mind; 668 and that they are ordinarily

conceived with relation to sensible things, to which nevertheless in their own nature they bear no relation at all.

669 As for Time, as it is there taken in an absolute or abstracted sense, for the duration or perseverance of the existence of things, I have nothing more to add concerning it after what has been already said on that subject. 670 For the rest, this celebrated author holds there is an absolute Space, which, being unperceivable to sense, remains in itself similar and immovable; 671 and relative space to be the measure thereof, which, being movable and defined by its situation in respect of sensible bodies, is vulgarly taken for immovable space. 672 Place he defines to be that part of space which is occupied by any body; and according as the space is absolute or relative so also is the place. 673 Absolute Motion is said to be the translation of a body from absolute place to absolute place, as relative motion is from one relative place to another. 674 And, because the parts of absolute space do not fall under our senses, instead of them we are obliged to use their sensible measures and so define both place and motion with respect to bodies which we regard as immovable. 675 But, it is said in philosophical matters we must abstract from our senses, since it may be that none of those bodies which seem to be quiescent are truly so, and the same thing which is moved relatively may be really at rest; 676 as likewise one and the same body may be in relative rest and motion, or even moved with contrary relative motions at the same time, according as its place is variously defined. 677 All which ambiguity is to be found in the apparent motions, but not at all in the true or absolute, which should therefore be alone regarded in philosophy. 678 And the true as we are told are distinguished from apparent or relative motions by the following properties.-- 679 First, in true or absolute motion all parts which preserve the same position with respect of the whole, partake of the motions of the whole. 680 Secondly, the place being moved, that which is placed therein is also moved; so that a body moving in a place which is in motion doth participate the motion of its place.

681 Thirdly, true motion is never generated or changed otherwise than by force impressed on the body itself. 682 Fourthly, true motion is always changed by force impressed on the body moved. 683 Fifthly, in circular motion barely relative there is no centrifugal force, which, nevertheless, in that which is true or absolute, is proportional to the quantity of motion.

MOTION, WHETHER REAL OR APPARENT, RELATIVE

684 But, notwithstanding what has been said, I must confess it does not appear to me that there can be any motion other than relative; 685 so that to conceive motion there must be at least conceived two bodies, whereof the distance or position in regard to each other is varied. 686 Hence, if there was one only body in being it could not possibly be moved. This seems evident, in that the idea I have of motion doth necessarily include relation.

APPARENT MOTION DENIED

687 But, though in every motion it be necessary to conceive more bodies than one, yet it may be that one only is moved, namely, that on which the force causing the change in the distance or situation of the bodies, is impressed. 688 For, however some may define relative motion, so as to term that body moved which changes its distance from some other body, whether the force or action causing that change were impressed on it or no, 689 yet as relative motion is that which is perceived by sense, and regarded in the ordinary affairs of life, it should seem that every person of common sense knows what it is as well as the best philosopher. 690 Now, I ask any one whether, in your sense of motion as you walks along the streets, the stones you passes over may be said to move, because they change distance with your feet? 691 To me it appears that though motion includes a relation of one thing to another, yet it is not necessary that each term of the relation be denominated from it. 692 As a person may think of somewhat

which does not think, so a body may be moved to or from another body which is not therefore itself in motion.

693 As the place happens to be variously defined, the motion which is related to it varies. 694 A person in a ship may be said to be quiescent with relation to the sides of the vessel, and yet move with relation to the land. Or you may move eastward in respect of the one, and westward in respect of the other. 695 In the common affairs of life humans never go beyond the earth to define the place of any body; and what is quiescent in respect of that is accounted absolutely to be so. 696 But philosophers, who have a greater extent of thought, and juster notions of the system of things, discover even the earth itself to be moved. 697 In order therefore to fix their notions they seem to conceive the corporeal world as finite, and the utmost unmoved walls or shell thereof to be the place whereby they estimate true motions. 698 If we sound our own conceptions, I believe we may find all the absolute motion we can frame an idea of to be at bottom no other than relative motion thus defined. 699 For, as has been already observed, absolute motion, exclusive of all external relation, is incomprehensible; 700 and to this kind of relative motion all the above-mentioned properties, causes, and effects ascribed to absolute motion will, if I mistake not, be found to agree. 701 As to what is said of the centrifugal force, that it does not at all belong to circular relative motion, I do not see how this follows from the experiment which is brought to prove it. See *Philosophiae Naturalis Principia Mathematica, in Schol.* 702 For the water in the vessel at that time wherein it is said to have the greatest relative circular motion, has, I think, no motion at all; as is plain from the foregoing section.

703 For, to denominate a body moved it is requisite, first, that it change its distance or situation with regard to some other body; and secondly, that the force occasioning that change be applied to it. 704 If either of these be wanting, I do not think that, agreeably to the sense of

humankind, or the propriety of language, a body can be said to be in motion. 705 I grant indeed that it is possible for us to think a body which we see change its distance from some other to be moved, though it have no force applied to it (in which sense there may be apparent motion), 706 but then it is because the force causing the change of distance is imagined by us to be applied or impressed on that body thought to move; which indeed shows we are capable of mistaking a thing to be in motion which is not, and that is all.

ANY IDEA OF PURE SPACE RELATIVE

707 From what has been said it follows that the philosophic consideration of motion does not imply the being of an absolute Space, distinct from that which is perceived by sense and related bodies; 708 which that it cannot exist without the mind is clear upon the same principles that demonstrate the like of all other objects of sense. 709 And perhaps, if we inquire narrowly, we shall find we cannot even frame an idea of pure Space exclusive of all body. This I must confess seems impossible, as being a most abstract idea. 710 When I excite a motion in some part of my body, if it be free or without resistance, I say there is Space; but if I find a resistance, then I say there is Body; and in proportion as the resistance to motion is lesser or greater, I say the space is more or less pure. 711 So that when I speak of pure or empty space, it is not to be supposed that the word "space" stands for an idea distinct from or conceivable without body and motion-- 712 though indeed we are apt to think every noun substantive stands for a distinct idea that may be separated from all others; which has occasioned infinite mistakes. 713 When, therefore, supposing all the world to be annihilated besides my own body, I say there still remains pure Space, thereby nothing else is meant but only that I conceive it possible for the limbs of my body to be moved on all sides without the least resistance, 714 but if that, too, were annihilated then there could be no motion, and consequently no

Space. 715 Some, perhaps, may think the sense of seeing doth furnish them with the idea of pure space; but it is plain from what we have elsewhere shown, that the ideas of space and distance are not obtained by that sense. See the *Essay concerning Vision*.

716 What is here laid down seems to put an end to all those disputes and difficulties that have sprung up amongst the learned concerning the nature of pure Space. 717 But the chief advantage arising from it is that we are freed from that dangerous dilemma, to which several who have employed their thoughts on that subject imagine themselves reduced, 718 to wit, of thinking either that Real Space is God, or else that there is something beside God which is eternal, uncreated, infinite, indivisible, immutable. Both which may justly be thought pernicious and absurd notions. 719 It is certain that not a few divines, as well as philosophers of great note, have, from the difficulty they found in conceiving either limits or annihilation of space, concluded it must be divine. 720 And some of late have set themselves particularly to show the incommunicable attributes of God agree to it. 721 Which doctrine, how unworthy soever it may seem of the Divine Nature, yet I do not see how we can get clear of it, so long as we adhere to the received opinions.

THE ERRORS ARISING FROM THE DOCTRINES OF ABSTRACTION AND EXTERNAL MATERIAL EXISTENCES, INFLUENCE MATHEMATICAL REASONINGS

722 Hitherto of Natural Philosophy: we come now to make some inquiry concerning that other great branch of speculative knowledge, to wit, Mathematics. 723 These, how celebrated soever they may be for their clearness and certainty of demonstration, which is hardly anywhere else to be found, cannot nevertheless be supposed altogether free from mistakes, 724 if in their principles there lurks some secret error which is common to the professors of those sciences with the rest of humankind. 725 Mathematicians, though they deduce their theorems from a great height of evidence,

yet their first principles are limited by the consideration of quantity: 726 and they do not ascend into any inquiry concerning those transcendental maxims which influence all the particular sciences, each part whereof, Mathematics not excepted, does consequently participate of the errors involved in them. 727 That the principles laid down by mathematicians are true, and their way of deduction from those principles clear and incontestible, we do not deny; 728 but, we hold there may be certain erroneous maxims of greater extent than the object of Mathematics, and for that reason not expressly mentioned, though tacitly supposed throughout the whole progress of that science; 729 and that the ill effects of those secret unexamined errors are diffused through all the branches thereof. 730 To be plain, we suspect the mathematicians are as well as other people concerned in the errors arising from the doctrine of abstract general ideas, and the existence of objects without the mind.

731 Arithmetic has been thought to have for its object abstract ideas of Number; of which to understand the properties and mutual habitudes, is supposed no mean part of speculative knowledge. 732 The opinion of the pure and intellectual nature of numbers in abstract has made them in esteem with those philosophers who seem to have affected an uncommon fineness and elevation of thought. 733 It has set a price on the most trifling numerical speculations which in practice are of no use, but serve only for amusement; 734 and has therefore so far infected the minds of some, that they have dreamed of mighty mysteries involved in numbers, and attempted the explication of natural things by them. 735 But, if we inquire into our own thoughts, and consider what has been premised, we may perhaps entertain a low opinion of those high flights and abstractions, 736 and look on all inquiries, about numbers only as so many difficiles nugae, so far as they are not subservient to practice, and promote the benefit of life.

737 Unity in abstract we have before considered in chapter-1, verses:106-118, from which and

what has been said in chapter-1, it plainly follows there is not any such idea. 738 But, number being defined a "collection of units," we may conclude that, if there be no such thing as unity or unit in abstract, there are no ideas of number in abstract denoted by the numeral names and figures. 739 The theories therefore in Arithmetic, if they are abstracted from the names and figures, as likewise from all use and practice, as well as from the particular things numbered, can be supposed to have nothing at all for their object; 740 hence we may see how entirely the science of numbers is subordinate to practice, and how jejune and trifling it becomes when considered as a matter of mere speculation.

741 However, since there may be some who, deluded by the specious show of discovering abstracted verities, waste their time in arithmetical theorems and problems which have not any use, 742 it will not be amiss if we more fully consider and expose the vanity of that pretence; and this will plainly appear by taking a view of Arithmetic in its infancy, and observing what it was that originally put people on the study of that science, and to what scope they directed it. 743 It is natural to think that at first, people, for ease of memory and help of computation, made use of counters, or in writing of single strokes, points, or the like, each whereof was made to signify an unit, i.e., some one thing of whatever kind they had occasion to reckon. 744 Afterwards they found out the more compendious ways of making one character stand in place of several strokes or points. 745 And, lastly, the notation of the Arabians or Indians came into use, wherein, by the repetition of a few characters or figures, and varying the signification of each figure according to the place it obtains, all numbers may be most aptly expressed; 746 which seems to have been done in imitation of language, so that an exact analogy is observed betwixt the notation by figures and names, 747 the nine simple figures answering the nine first numeral names and places in the former, corresponding to denominations in the latter. 748 And agreeably to those conditions

of the simple and local value of figures, were contrived methods of finding, from the given figures or marks of the parts, what figures and how placed are proper to denote the whole, or vice versa. 749 And having found the sought figures, the same rule or analogy being observed throughout, it is easy to read them into words; and so the number becomes perfectly known. 750 For then the number of any particular things is said to be known, when we know the name of figures (with their due arrangement) that according to the standing analogy belong to them. 751 For, these signs being known, we can by the operations of arithmetic know the signs of any part of the particular sums signified by them; 752 and, thus computing in signs (because of the connexion established betwixt them and the distinct multitudes of things whereof one is taken for an unit), we may be able rightly to sum up, divide, and proportion the things themselves that we intend to number.

753 In Arithmetic, therefore, we regard not the things, but the signs, which nevertheless are not regarded for their own sake, but because they direct us how to act with relation to things, and dispose rightly of them. 754 Now, agreeably to what we have before observed of words in general (chapter-1, verses 174-180) it happens here likewise that abstract ideas are thought to be signified by numeral names or characters, while they do not suggest ideas of particular things to our minds. 755 I shall not at present enter into a more particular dissertation on this subject, but only observe that it is evident from what has been said, those things which pass for abstract truths and theorems concerning numbers, are in reality conversant about no object distinct from particular numeral things, 756 except only names and characters, which originally came to be considered on no other account but their being signs, or capable to represent aptly whatever particular things people had need to compute. 757 Whence it follows that to study them for their own sake would be just as wise, 758 and to as good purpose as if a person, neglecting the true use or original intention and subserviency of

language, should spend own time in impertinent criticisms upon words, or reasonings and controversies purely verbal.

759 From numbers we proceed to speak of Extension, which, considered as relative, is the object of Geometry. 760 The infinite divisibility of finite extension, though it is not expressly laid down either as an axiom or theorem in the elements of that science, 761 yet is throughout the same everywhere supposed and thought to have so inseparable and essential a connexion with the principles and demonstrations in Geometry, that mathematicians never admit it into doubt, or make the least question of it. 762 And, as this notion is the source from whence do spring all those amusing geometrical paradoxes which have such a direct repugnancy to the plain common sense of humankind, and are admitted with so much reluctance into a mind not yet debauched by learning; 763 so it is the principal occasion of all that nice and extreme subtilty which renders the study of Mathematics so difficult and tedious. 764 Hence, if we can make it appear that no finite extension contains innumerable parts, or is infinitely divisible, it follows that we shall at once clear the science of Geometry from a great number of difficulties 765 and contradictions which have ever been esteemed a reproach to human reason, and withal make the attainment thereof a business of much less time and pains than it hitherto has been.

766 Every particular finite extension which may possibly be the object of our thought is an idea existing only in the mind, and consequently each part thereof must be perceived. 767 If, therefore, I cannot perceive innumerable parts in any finite extension that I consider, it is certain they are not contained in it; 768 but, it is evident that I cannot distinguish innumerable parts in any particular line, surface, or solid, which I either perceive by sense, or figure to myself in my mind: wherefore I conclude they are not contained in it. 769 Nothing can be plainer to me than that the extensions I have in view are no other than my own ideas; 770 and it is no less plain that I cannot

resolve any one of my ideas into an infinite number of other ideas, that is, that they are not infinitely divisible. 771 If by finite extension be meant something distinct from a finite idea, I declare I do not know what that is, and so cannot affirm or deny anything of it. 772 But if the terms "extension," "parts," are taken in any sense conceivable, that is, for ideas, then to say a finite quantity or extension consists of parts infinite in number is so manifest a contradiction, that every one at first sight acknowledges it to be so; 773 and it is impossible it should ever gain the assent of any reasonable creature who is not brought to it by gentle and slow degrees, as a converted Gentile to the belief of transubstantiation. 774 Ancient and rooted prejudices do often pass into principles; and those propositions which once obtain the force and credit of a principle, are not only themselves, but likewise whatever is deducible from them, thought privileged from all examination. 775 And there is no absurdity so gross, which, by this means, the mind of human may not be prepared to swallow.

776 You whose understanding is possessed with the doctrine of abstract general ideas may be persuaded that (whatever be thought of the ideas of sense) extension in abstract is infinitely divisible. 777 And one who thinks the objects of sense exist without the mind will perhaps in virtue thereof be brought to admit that a line but an inch long may contain innumerable parts-- really existing, though too small to be discerned. 778 These errors are grafted as well in the minds of geometricians as of other people, and have a like influence on their reasonings; 779 and it were no difficult thing to show how the arguments from Geometry made use of to support the infinite divisibility of extension are bottomed on them. 780 At present we shall only observe in general whence it is the mathematicians are all so fond and tenacious of that doctrine.

781 It has been observed in another place that the theorems and demonstrations in Geometry are conversant about universal ideas (Chapter-1, verses 91-93); 782 where

it is explained in what sense this ought to be understood, to wit, the particular lines and figures included in the diagram are supposed to stand for innumerable others of different sizes; 783 or, in other words, the geometer considers them abstracting from their magnitude-- which does not imply that one forms an abstract idea, but only that one cares not what the particular magnitude is, whether great or small, but looks on that as a thing different to the demonstration. 784 Hence it follows that a line in the scheme but an inch long must be spoken of as though it contained ten thousand parts, since it is regarded not in itself, but as it is universal; 785 and it is universal only in its signification, whereby it represents innumerable lines greater than itself, in which may be distinguished ten thousand parts or more, though there may not be above an inch in it. 786 After this manner, the properties of the lines signified are (by a very usual figure) transferred to the sign, and thence, through mistake, though to appertain to it considered in its own nature.

787 Because there is no number of parts so great but it is possible there may be a line containing more, the inch-line is said to contain parts more than any assignable number; which is true, not of the inch taken absolutely, but only for the things signified by it. 788 But people, not retaining that distinction in their thoughts, slide into a belief that the small particular line described on paper contains in itself parts innumerable. 789 There is no such thing as the ten--thousandth part of an inch; but there is of a mile or diameter of the earth, which may be signified by that inch. 790 When therefore I delineate a triangle on paper, and take one side not above an inch, for example, in length to be the radius, this I consider as divided into 10,000 or 100,000 parts or more; 791 for, though the ten-thousandth part of that line considered in itself is nothing at all, and consequently may be neglected without an error or inconveniency, 792 yet these described lines, being only marks standing for greater quantities, whereof it may be the ten--thousandth part is very

considerable, it follows that, to prevent notable errors in practice, the radius must be taken of 10,000 parts or more.

LINES WHICH ARE INFINITELY DIVISIBLE

793 From what has been said the reason is plain why, to the end any theorem become universal in its use, it is necessary we speak of the lines described on paper as though they contained parts which really they do not. 794 In doing of which, if we examine the matter thoroughly, we shall perhaps discover that we cannot conceive an inch itself as consisting of, or being divisible into, a thousand parts, but only some other line which is far greater than an inch, and represented by it; 795 and that when we say a line is infinitely divisible, we must mean a line which is infinitely great. 796 What we have here observed seems to be the chief cause why, to suppose the infinite divisibility of finite extension has been thought necessary in geometry.

797 The several absurdities and contradictions which flowed from this false principle might, one would think, have been esteemed so many demonstrations against it. 798 But, by I know not what logic, it is held that proofs a-posteriori are not to be admitted against propositions relating to infinity, as though it were not impossible even for an infinite mind to reconcile contradictions; 799 or as if anything absurd and repugnant could have a necessary connexion with truth or flow from it. 800 But, whoever considers the weakness of this pretence will think it was contrived on purpose to humour the laziness of the mind 801 which had rather acquiesce in an indolent scepticism than be at the pains to go through with a severe examination of those principles it has ever embraced for true.

802 Of late the speculations about Infinities have run so high, and grown to such strange notions, as have occasioned no small scruples and disputes among the geometers of the present age. 803 Some there are of great note who, not content with holding that finite lines may be divided into an infinite number

of parts, do yet farther maintain that each of those infinitesimals is itself subdivisible into an infinity of other parts or infinitesimals of a second order, and so on ad infinitum. 804 These, I say, assert there are infinitesimals of infinitesimals of infinitesimals, without ever coming to an end; 805 so that according to them an inch does not barely contain an infinite number of parts, but an infinity of an infinity of an infinity ad infinitum of parts. 806 Others there be who hold all orders of infinitesimals below the first to be nothing at all; thinking it with good reason absurd to imagine there is any positive quantity or part of extension which, though multiplied infinitely, can never equal the smallest given extension. 807 And yet on the other hand it seems no less absurd to think the square, cube or other power of a positive real root, should itself be nothing at all; 808 which they who hold infinitesimals of the first order, denying all of the subsequent orders, are obliged to maintain.

OBJECTION OF MATHEMATICIANS--ANSWER

809 Have we not therefore reason to conclude they are both in the wrong, and that there is in effect no such thing as parts infinitely small, or an infinite number of parts contained in any finite quantity? 810 But you will say that if this doctrine obtains it will follow the very foundations of Geometry are destroyed, and those great people who have raised that science to so astonishing a height, have been all the while building a castle in the air. 811 To this it may be replied that whatever is useful in geometry, and promotes the benefit of human life, does still remain firm and unshaken on our principles; 812 that science considered as practical will rather receive advantage than any prejudice from what has been said. 813 But to set this in a due light may be the proper business of another place. 814 For the rest, though it should follow that some of the more intricate and subtle parts of Speculative Mathematics may be pared off without any prejudice to truth, yet I do not see what damage will be thence

derived to humankind. 815 On the contrary, I think it were highly to be wished that people of great abilities and obstinate application would draw off their thoughts from those amusements, and employ them in the study of such things as lie nearer the concerns of life, or have a more direct influence on the manners.

SECOND OBJECTION OF MATHEMATICIANS.-- ANSWER

816 If it be said that several theorems undoubtedly true are discovered by methods in which infinitesimals are made use of, which could never have been if their existence included a contradiction in it; 817 I answer that upon a thorough examination it will not be found that in any instance it is necessary to make use of or conceive infinitesimal parts of finite lines, or even quantities less than the minimum sensible; nay, it will be evident this is never done, it being impossible.

IF THE DOCTRINE WERE ONLY AN HYPOTHESIS IT SHOULD BE RESPECTED FOR ITS CONSEQUENCES

818 By what we have premised, it is plain that very numerous and important errors have taken their rise from those false Principles which were impugned in the foregoing parts of this treatise; 819 and the opposites of those erroneous tenets at the same time appear to be most fruitful Principles, from whence do flow innumerable consequences highly advantageous to true philosophy, as well as to religion. 820 Particularly Matter, or the absolute existence of corporeal objects, has been shown to be that wherein the most avowed and pernicious enemies of all knowledge, whether human or divine, have ever placed their chief strength and confidence. 821 And surely, if by distinguishing the real existence of unthinking things from their being perceived, and allowing them a subsistance of their own out of the minds of spirits, no one thing is explained in Nature, but on the contrary a great many inexplicable difficulties arise; 822 if the

supposition of Matter is barely precarious, as not being grounded on so much as one single reason; 823 if its consequences cannot endure the light of examination and free inquiry, but screen themselves under the dark and general pretence of "infinites being incomprehensible"; 824 if withal the removal of this Matter be not attended with the least evil consequence; 825 if it be not even missed in the world, but everything as well, nay much easier conceived without it; 826 if, lastly, both Sceptics and Atheists are for ever silenced upon supposing only spirits and ideas, and this scheme of things is perfectly agreeable both to Reason and Religion: 827 methinks we may expect it should be admitted and firmly embraced, though it were proposed only as an hypothesis, and the existence of Matter had been allowed possible, which yet I think we have evidently demonstrated that it is not.

828 True it is that, in consequence of the foregoing principles, several disputes and speculations which are esteemed no mean parts of learning, are rejected as useless. 829 But, how great a prejudice soever against our notions this may give to those who have already been deeply engaged, and make large advances in studies of that nature, 830 yet by others we hope it will not be thought any just ground of dislike to the principles and tenets herein laid down, that they abridge the labour of study, and make human sciences far more clear, compendious and attainable than they were before.

831 Having despatched what we intended to say concerning the knowledge of IDEAS, the method we proposed leads us in the next place to treat of SPIRITS-- with regard to which, perhaps, human knowledge is not so deficient as is vulgarly imagined. 832 The great reason that is assigned for our being thought ignorant of the nature of spirits is our not having an idea of it. 833 But, surely it ought not to be looked on as a defect in a human understanding that it does not perceive the idea of spirit, if it is manifestly impossible there should be any such idea. 834 And this if I mistake not has been demonstrated in verses 164-173 in

this chapter; to which I shall here add that a spirit has been shown to be the only substance or support wherein unthinking beings or ideas can exist; 835 but that this substance which supports or perceives ideas should itself be an idea or like an idea is evidently absurd.

OBJECTION--ANSWER

836 It will perhaps be said that we want a sense (as some have imagined) proper to know substances withal, which, if we had, we might know our own soul as we do a triangle. 837 To this I answer, that, in case we had a new sense bestowed upon us, we could only receive thereby some new sensations or ideas of sense. 838 But I believe nobody will say that what you means by the terms soul and substance is only some particular sort of idea or sensation. 839 We may therefore infer that, all things duly considered, it is not more reasonable to think our faculties defective, in that they do not furnish us with an idea of spirit or active thinking substance, than it would be if we should blame them for not being able to comprehend a round square.

840 From the opinion that spirits are to be known after the manner of an idea or sensation have risen many absurd and heterodox tenets, and much scepticism about the nature of the soul. 841 It is even probable that this opinion may have produced a doubt in some whether they had any soul at all distinct from their body since upon inquiry they could not find they had an idea of it. 842 That an idea which is inactive, and the existence whereof consists in being perceived, should be the image or likeness of an agent subsisting by itself, seems to need no other refutation than barely attending to what is meant by those words. 843 But, perhaps you will say that though an idea cannot resemble a spirit in its thinking, acting, or subsisting by itself, yet it may in some other respects; and it is not necessary that an idea or image be in all respects like the original.

844 I answer, if it does not in those mentioned, it is impossible it should represent it in any other thing. 845 Do but leave out the power of willing, thinking, and perceiving ideas, and there remains nothing else wherein the idea can be like a spirit. 846 For, by the word spirit we mean only that which thinks, wills, and perceives; this, and this alone, constitutes the signification of the term. 847 If therefore it is impossible that any degree of those powers should be represented in an idea, it is evident there can be no idea of a spirit.

848 But it will be objected that, if there is no idea signified by the terms soul, spirit, and substance, they are wholly insignificant, or have no meaning in them. 849 I answer, those words do mean or signify a real thing, which is neither an idea nor like an idea, but that which perceives ideas, and wills, and reasons about them. 850 What I am myself, that which I denote by the term I, is the same with what is meant by soul or spiritual substance. 851 If it be said that this is only quarreling at a word, and that, since the immediately significations of other names are by common consent called ideas, no reason can be assigned why that which is signified by the name spirit or soul may not partake in the same appellation. 852 I answer, all the unthinking objects of the mind agree in that they are entirely passive, and their existence consists only in being perceived; 853 whereas a soul or spirit is an active being, whose existence consists, not in being perceived, but in perceiving ideas and thinking. 854 It is therefore necessary, in order to prevent equivocation and confounding natures perfectly disagreeing and unlike, that we distinguish between spirit and idea. See verses 164-173 of this chapter.

OUR IDEA OF SPIRIT

855 In a large sense, indeed, we may be said to have an idea or rather a notion of spirit; that is, we understand the meaning of the word, otherwise we could not affirm or deny anything of it. 856 Moreover, as we conceive the ideas that are in the minds of other

spirits by means of our own, which we suppose to be resemblances of them; so we know other spirits by means of our own soul-- which in that sense is the image or idea of them; 857 it having a like respect to other spirits that blueness or heat by me perceived has to those ideas perceived by another.

THE NATURAL IMMORTALITY OF THE SOUL IS A NECESSARY CONSEQUENCE OF THE FOREGOING DOCTRINE

858 It must not be supposed that they who assert the natural immortality of the soul are of opinion that it is absolutely incapable of annihilation even by the infinite power of the Creator who first gave it being, 859 but only that it is not liable to be broken or dissolved by the ordinary Laws of Nature or motion. 860 They indeed who hold the soul of human to be only a thin vital flame, or system of animal spirits, make it perishing and corruptible as the body; 861 since there is nothing more easily dissipated than such a being, which it is naturally impossible should survive the ruin of the tabernacle wherein it is enclosed. 862 And this notion has been greedily embraced and cherished by the worst part of humankind, as the most effectual antidote against all impressions of virtue and religion. 863 But it has been made evident that bodies, of what frame or texture soever, are barely passive ideas in the mind, which is more distant and heterogeneous from them than light is from darkness. 864 We have shown that the soul is indivisible, incorporeal, unextended, and it is consequently incorruptible. 865 Nothing can be plainer than that the motions, changes, decays, and dissolutions which we hourly see befall natural bodies (and which is what we mean by the course of nature) cannot possibly affect an active, simple, uncompounded substance; 866 such a being therefore is indissoluble by the force of Nature; that is to say, "the soul of human is naturally immortal."

867 After what has been said, it is, I suppose, plain that our souls are not to be known in the same manner as senseless, inactive objects, or by way of idea.

868 Spirits and ideas are things so wholly different, that when we say "they exist," "they are known," or the like, these words must not be thought to signify anything common to both natures. 869 There is nothing alike or common in them: and to expect that by any multiplication or enlargement of our faculties we may be enabled to know a spirit as we do a triangle, seems as absurd as if we should hope to see a sound. 870 This is inculcated because I imagine it may be of moment towards clearing several important questions, and preventing some very dangerous errors concerning the nature of the soul. 871 We may not, I think, strictly be said to have an idea of an active being, or of an action, although we may be said to have a notion of them. 872 I have some knowledge or notion of my mind, and its acts about ideas, inasmuch as I know or understand what is meant by these words. 873 What I know, that I have some notion of. I will not say that the terms idea and notion may not be used convertibly, if the world will have it so; 874 but yet it conduceth to clearness and propriety that we distinguish things very different by different names. 875 It is also to be remarked that, all relations including an act of the mind, we cannot so properly be said to have an idea, but rather a notion of the relations and habitudes between things. 876 But if, in the modern way, the word idea is extended to spirits, and relations, and acts, this is, after all, an affair of verbal concern.

877 It will not be amiss to add, that the doctrine of abstract ideas has had no small share in rendering those sciences intricate and obscure which are particularly conversant about spiritual things. 878 Humans have imagined they could frame abstract notions of the powers and acts of the mind, and consider them prescinded as well from the mind or spirit itself, as from their respective objects and effects. 879 Hence a great number of dark and ambiguous terms, presumed to stand for abstract notions, have been introduced into metaphysics and morality, and from these have grown infinite distractions and disputes amongst the learned.

880 But, nothing seems more to have contributed towards engaging people in controversies and mistakes with regard to the nature and operations of the mind, than the being used to speak of those things in terms borrowed from sensible ideas. 881 For example, the Will is termed the motion of the soul; this infuses a belief that the mind of human is as a ball in motion, impelled and determined by the objects of sense, as necessarily as that is by the stroke of a racket. 882 Hence arise endless scruples and errors of dangerous consequence in morality. 883 All which, I doubt not, may be cleared, and truth appear plain, uniform, and consistent, could but philosophers be prevailed on to retire into themselves, and attentively consider their own meaning.

KNOWLEDGE OF SPIRITS NOT IMMEDIATE

884 From what has been said, it is plain that we cannot know the existence of other spirits otherwise than by their operations, or the ideas by them excited in us. 885 I perceive several motions, changes, and combinations of ideas, that inform me there are certain particular agents, like myself, which accompany them and concur in their production. 886 Hence, the knowledge I have of other spirits is not immediate, as is the knowledge of my ideas; but depending on the intervention of ideas, by me referred to agents or spirits distinct from myself, as effects or concomitant signs.

887 But, though there be some things which convince us human agents are concerned in producing them; 888 yet it is evident to every one that those things which are called the Works of Nature, that is, the far greater part of the ideas or sensations perceived by us, are not produced by, or dependent on, the wills of humans. 889 There is therefore some other Spirit that causes them; since it is repugnant that they should subsist by themselves. See verses 178-180 of this chapter. 890 But, if we attentively consider the constant regularity, order, and concatenation of natural things, the surprising magnificence, beauty,

and perfection of the larger, and the exquisite contrivance of the smaller parts of creation, together with the exact harmony and correspondence of the whole, 891 but above all the never-enough-admired laws of pain and pleasure, and the instincts or natural inclinations, appetites, and passions of animals; 892 I say if we consider all these things, and at the same time attend to the meaning and import of the attributes One, Eternal, Infinitely Wise, Good, and Perfect, we shall clearly perceive that they belong to the aforesaid Spirit, "who works all in all," and "by whom all things consist."

THE EXISTENCE OF GOD MORE EVIDENT THAN THAT OF HUMAN

893 Hence, it is evident that God is known as certainly and immediately as any other mind or spirit whatsoever distinct from ourselves. 894 We may even assert that the existence of God is far more evidently perceived than the existence of humans; because the effects of Nature are infinitely more numerous and considerable than those ascribed to human agents. 895 There is not any one mark that denotes a human, or effect produced by you, which does not more strongly evince the being of that Spirit who is the Author of Nature. 896 For, it is evident that in affecting other persons the will of human has no other object than barely the motion of the limbs of your body; 897 but that such a motion should be attended by, or excite any idea in the mind of another, depends wholly on the will of the Creator. 898 He alone it is who, "upholding all things by the word of His power," maintains that intercourse between spirits whereby they are able to perceive the existence of each other. 899 And yet this pure and clear light which enlightens every one is itself invisible.

900 It seems to be a general pretence of the unthinking herd that they cannot see God. Could we but see Him, say they, as we see a human, we should believe that He is, and believing obey His commands. 901 But alas, we need only open our eyes to see the Sovereign Lord of all things, with a more full and clear view than we

do any one of our fellow--creatures. 902 Not that I imagine we see God (as some will have it) by a direct and immediate view; or see corporeal things, not by themselves, but by seeing that which represents them in the essence of God, which doctrine is, I must confess, to me incomprehensible. 903 But I shall explain my meaning;-- A human spirit or person is not perceived by sense, as not being an idea; when therefore we see the colour, size, figure, and motions of a person, we perceive only certain sensations or ideas excited in our own minds; 904 and these being exhibited to our view in sundry distinct collections, serve to mark out unto us the existence of finite and created spirits like ourselves. 905 Hence it is plain we do not see a human-- if by human is meant that which lives, moves, perceives, and thinks as we do-- 906 but only such a certain collection of ideas as directs us to think there is a distinct principle of thought and motion, like to ourselves, accompanying and represented by it. 907 And after the same manner we see God; all the difference is that, whereas some one finite and narrow assemblage of ideas denotes a particular human mind, 908 whithersoever we direct our view, we do at all times and in all places perceive manifest tokens of the Divinity: 909 everything we see, hear, feel, or anywise perceive by sense, being a sign or effect of the power of God; as is our perception of those very motions which are produced by humans.

910 It is therefore plain that nothing can be more evident to any one that is capable of the least reflexion than the existence of God, 911 or a Spirit who is intimately present to our minds, producing in them all that variety of ideas or sensations which continually affect us, on whom we have an absolute and entire dependence, in short "in whom we live, and move, and have our being." 912 That the discovery of this great truth, which lies so near and obvious to the mind, should be attained to by the reason of so very few, 913 is a sad instance of the stupidity and inattention of humans, who, though they are surrounded with such clear manifestations of the Deity, are yet

so little affected by them that they seem, as it were, blinded with excess of light.

OBJECTION ON BEHALF OF NATURE

914 But you will say, has Nature no share in the production of natural things, and must they be all ascribed to the immediate and sole operation of God? 915 I answer, if by Nature is meant only the visible series of effects or sensations imprinted on our minds, according to certain fixed and general laws, then it is plain that Nature, taken in this sense, cannot produce anything at all. 916 But, if by Nature is meant some being distinct from God, as well as from the Laws of Nature, and things perceived by sense, I must confess that word is to me an empty sound without any intelligible meaning annexed to it. 917 Nature, in this acceptation, is a vain chimera, introduced by those heathens who had not just notions of the omnipresence and infinite perfection of God. 918 But, it is more unaccountable that it should be received among Christians, professing belief in the Holy Scriptures, which constantly ascribe those effects to the immediate hand of God that heathen philosophers are wont to impute to Nature. 919 "The Lord He causeth the vapours to ascend; He maketh lightnings with rain; He bringeth forth the wind out of His treasures." Jeremiah. Chapter-10, verse 13. 920 "He turneth the shadow of death into the morning, and maketh the day dark with night." Amos, chapter-5. Verse 8. 921 "He visiteth the earth, and maketh it soft with showers: He blesseth the springing thereof, and crowneth the year with His goodness; so that the pastures are clothed with flocks, and the valleys are covered over with corn." See Psalm-65. 922 But, notwithstanding that this is the constant language of Scripture, yet we have I know not what aversion from believing that God concerns Himself so nearly in our affairs. 923 Fain would we suppose Him at a great distance off, and substitute some blind unthinking deputy in His stead, though (if we may

believe Saint Paul) "He be not far from every one of us."

OBJECTION TO THE HAND OF GOD BEING THE IMMEDIATE CAUSE, THREEFOLD

924 It will, I doubt not, be objected that the slow and gradual methods observed in the production of natural things do not seem to have for their cause the immediate hand of an Almighty Agent. 925 Besides, monsters, untimely births, fruits blasted in the blossom, rains falling in desert places, miseries incident to human life, and the like, are so many arguments that the whole frame of Nature is not immediately actuated and superintended by a Spirit of infinite wisdom and goodness. 926 But the answer to this objection is in a good measure plain from verses 385-395 in this chapter; 927 it being visible that the aforesaid methods of Nature are absolutely necessary, in order to working by the most simple and general rules, and after a steady and consistent manner; which argues both the wisdom and goodness of God. 928 Such is the artificial contrivance of this mighty machine of Nature that, whilst its motions and various phenomena strike on our senses, the hand which actuates the whole is itself unperceivable to humans of flesh and blood. 929 "Verily" (saith the prophet) "thou art a God that hidest thyself." Isaiah, chapter-45, verse 15. But, though the Lord conceal Himself from the eyes of the sensual and lazy, who will not be at the least expense of thought, 930 yet to an unbiased and attentive mind nothing can be more plainly legible than the intimate presence of an All-wise Spirit, who fashions, regulates and sustains the whole system of beings. 931 It is clear, from what we have elsewhere observed, that the operating according to general and stated laws is so necessary for our guidance in the affairs of life, 932 and letting us into the secret of Nature, that without it all reach and compass of thought, all human sagacity and design, could serve to no manner of purpose; 933 it were even impossible there should be any such faculties or powers in the mind. See verses-186-190 in this chapter. Which one consideration abundantly outbalances whatever

particular inconveniences may thence arise.

934 We should further consider that the very blemishes and defects of Nature are not without their use, in that they make an agreeable sort of variety, and augment the beauty of the rest of the creation, as shades in a picture serve to set off the brighter and more enlightened parts. 935 We would likewise do well to examine whether our taxing the waste of seeds and embryos, and accidental destruction of plants and animals, before they come to full maturity, as an imprudence in the Author of Nature, be not the effect of prejudice contracted by our familiarity with impotent and saving mortals. 936 In human indeed a thrifty management of those things which you cannot procure without much pains and industry may be esteemed wisdom. 937 But, we must not imagine that the inexplicably fine machine of an animal or vegetable costs the great Creator any more pains or trouble in its production than a pebble does; 938 nothing being more evident than that an Omnipotent Spirit can indifferently produce everything by a mere fiat or act of His will. 939 Hence, it is plain that the splendid profusion of natural things should not be interpreted weakness or prodigality in the agent who produces them, but rather be looked on as an argument of the riches of His power.

940 As for the mixture of pain or uneasiness which is in the world, pursuant to the general Laws of Nature, and the actions of finite, imperfect spirits, this, in the state we are in at present, is indispensably necessary to our well-being. 941 But our prospects are too narrow. We take, for instance, the idea of some one particular pain into our thoughts, and account it evil; 942 whereas, if we enlarge our view, so as to comprehend the various ends, connexions, and dependencies of things, on what occasions and in what proportions we are affected with pain and pleasure, the nature of human freedom, and the design with which we are put into the world; 943 we shall be forced to acknowledge that those particular things which, considered in themselves, appear to be evil, have

the nature of good, when considered as linked with the whole system of beings.

944 ATHEISM AND MANICHEISM WOULD HAVE FEW SUPPORTERS IF humankind WERE IN GENERAL ATTENTIVE. From what has been said, it will be manifest to any considering person, 945 that it is merely for want of attention and comprehensiveness of mind that there are any favourers of Atheism or the Manichean Heresy to be found. 946 Little and unreflecting souls may indeed burlesque the works of Providence, the beauty and order whereof they have not capacity, or will not be at the pains, to comprehend; 947 but those who are masters of any justness and extent of thought, and are withal used to reflect, can never sufficiently admire the divine traces of Wisdom and Goodness that shine throughout the Economy of Nature. 948 But what truth is there which shineth so strongly on the mind that by an aversion of thought, a willful shutting of the eyes, we may not escape seeing it? 949 Is it therefore to be wondered at, if the generality of humans, who are ever intent on business or pleasure, and little used to fix or open the eye of their mind, should not have all that conviction and evidence of the Being of God which might be expected in reasonable creatures?

950 We should rather wonder that humans can be found so stupid as to neglect, than that neglecting they should be unconvinced of such an evident and momentous truth. 951 And yet it is to be feared that too many of parts and leisure, who live in Christian countries, are, merely through a supine and dreadful negligence, sunk into Atheism. 952 Since it is downright impossible that a soul pierced and enlightened with a thorough sense of the omnipresence, holiness, and justice of that Almighty Spirit should persist in a remorseless violation of His laws. 953 We ought, therefore, earnestly to meditate and dwell on those important points; that so we may attain conviction without all scruple "that the eyes of the Lord are in every place beholding the evil and the good; 954 that He is with us and keepeth us in all places whither we go, and giveth us bread to eat and raiment to put

on"; 955 that He is present and conscious to our innermost thoughts; and that we have a most absolute and immediate dependence on Him. 956 A clear view of which great truths cannot choose but fill our hearts with an awful circumspection and holy fear, which is the strongest incentive to Virtue, and the best guard against Vice.

957 For, after all, what deserves the first place in our studies is the consideration of GOD and our DUTY; 958 which to promote, as it was the main drift and design of my labours, so shall I esteem them altogether useless and ineffectual if, by what I have said, I cannot inspire my readers with a pious sense of the Presence of God; 959 and, having shown the falseness or vanity of those barren speculations which make the chief employment of learned humans, the better dispose them to reverence and embrace the salutary truths of the Gospel, which to know and to practice is the highest perfection of human nature.

SUBJECTIVISM
Ralph Barton Perry

SUBJECTIVISM ORIGINALLY ASSOCIATED WITH RELATIVISM AND SCEPTICISM

3 When, in the year 1710, Bishop Berkeley maintained the thesis of empirical idealism, having rediscovered it and announced it with a justifiable sense of originality, he provoked a kind of critical judgment that was keenly annoying if not entirely surprising to him. 2 In refuting the conception of material substance and demonstrating the dependence of being upon mind, he at once sought, as he did repeatedly in later years, to establish the world of practical belief, and so to reconcile metaphysics and common-sense. 3 Yet he found himself hailed as a fool and a sceptic. In answer to an inquiry concerning the reception of his book in London, his friend Sir John Percival wrote as follows: 4 "I did but name the subject matter of your book of '*Principles*' to some ingenious friends of mine and they immediately treated it

with ridicule, at the same time refusing to read it, which I have not yet got one to do. 5 A physician of my acquaintance undertook to discover your person, and argued you must needs be mad, and that you ought to take remedies. 6 A bishop pitied you, that a desire of starting something new should put you upon such an undertaking. 7 Another told me that you are not gone so far as another gentleman in town, who asserts not only that there is no such thing as Matter, but that we ourselves have no being at all."

8 There can be no doubt but that the idea of the dependence of real things upon their appearance to the individual is a paradox to common-sense. 9 It is a paradox because it seems to reverse the theoretical instinct itself, and to define the real in those very terms which disciplined thought learns to neglect. 10 In the early history of thought the nature of the thinker himself is recognised as that which is likely to distort truth rather than that which conditions it. 11 When the wise man, the devotee of truth, first makes his appearance, his authority is acknowledged because he has renounced himself. 12 As witness of the universal being he purges himself of whatever is peculiar to his own individuality, or even to his human nature. 13 In the aloofness of his meditation he escapes the cloud of opinion and prejudice that obscures the vision of the common human. 14 In short, the element of belief dependent upon the thinker himself is the dross which must be refined away in order to obtain the pure truth. 15 When, then, in the critical epoch of the Greek sophists, Protagoras declares that there is no belief that is not of this character, his philosophy is promptly recognised as scepticism. 16 Protagoras argues that sense qualities are clearly dependent upon the actual operations of the senses, and that all knowledge reduces ultimately to these terms. 17 "The senses are variously named hearing, seeing, smelling; there is the sense of heat, cold, pleasure, pain, desire, fear, and many more which are named, as well as innumerable others which have no name; 18 'with each of them there is born an object of sense',-- all sorts of colors born with all sorts of sight and sounds

in like manner with hearing, and other objects with the other senses." 19 If the objects are "born with" the senses, it follows that they are born with and appertain to the individual perceiver. 20 "Either show, if you can, that our sensations are not relative and individual, or, if you admit that they are individual, prove that this does not involve the consequence that the appearance becomes, or, if you like to say, is to the individual only."

21 The same motif is thus rendered by Walter Pater in the Conclusion of his "*Renaissance*": 22 "At first sight experience seems to bury us under a flood of external objects, pressing upon us with a sharp and importunate reality, calling us out of ourselves in a thousand forms of action. 23 But when reflexion begins to act upon those objects they are dissipated under its influence; 24 the cohesive force seems suspended like a trick of magic; each object is loosed into a group of impressions-- colour, odour, texture-- in the mind of the observer. . . . 25 Experience, already reduced to a swarm of impressions, is ringed round for each one of us by that thick wall of personality through which no real voice has ever pierced on its way to us, or from us to that which we can only conjecture to be without. 26 Every one of these impressions is the impression of the individual in own isolation, each mind keeping as a solitary prisoner its own dream of a world."

27 The Protagorean generalisation is due to the reflection that all experience is some individual experience, that no subject of discourse escapes the imputation of belonging to some individual's private history. 28 The individual must start with own experiences and ideas, and you can never get beyond them, for you cannot see outside your own vision, or even think outside your own mind. 29 The scepticism of this theory is explicit, and the formulas of Protagoras-- the famous "'*Human is the measure of all things*'," and the more exact formula, "'*The truth is what appears to each person at each time*'"-- have been the articles of scepticism throughout the history of thought.

30 There is, therefore, nothing really surprising in the reception accorded the "new philosophy" of Bishop Berkeley. 31 A sceptical relativism is the earliest phase of subjectivism, and its avoidance at once becomes the most urgent problem of any philosophy which proposes to proceed forth from this principle. 32 And this problem Berkeley meets with great adroitness and a wise recognition of difficulties. 33 But his sanguine temperament and speculative interest impel him to what he regards as the extension of his first principle, the reintroduction of the conception of substance under the form of spirit, and of the objective order of Nature under the form of the mind of God. 34 In short, there are two motives at work in him, side by side: the epistemological motive, restricting reality to perceptions and thoughts, and the metaphysical-religious motive, leading him eventually to the definition of reality in terms of perceiving and thinking spirits. 35 And from the time of Berkeley these two principles, 'phenomenalism' and 'spiritualism', have remained as distinct and alternating phases of subjectivism. 36 The former is its critical and dialectical conception, the latter its constructive and practical conception.

37 Phenomenalism as Maintained by Berkeley. The Problem Inherited from Descartes and Locke. 38 As Phenomenalism has its classic statement and proof in the writings of Berkeley, we shall do well to return to these. The fact that this philosopher wished to be regarded as the prophet of common-sense has already been mentioned. 39 This purpose reveals itself explicitly in the series of "*Dialogues between Hylas and Philonous*." The form in which Berkeley here advances his thesis is further determined by the manner in which the lines were drawn in his day of thought. 40 The world of enlightened public opinion was then threefold, consisting of God, physical Nature, and the soul. 41 In the early years of the seventeenth century Descartes had sharply distinguished between the two

substances-- mind, with its attribute of thought; and body, with its attribute of extension-- and divided the finite world between them. 42 God was regarded as the infinite and sustaining cause of both. Stated in the terms of epistemology, the object of clear thinking is the physical cosmos, the subject of clear thinking the immortal soul. 43 The realm of perception, wherein the mind is subjected to the body, embarrasses the Cartesian system, and has no clear title to any place in it. 44 And without attaching cognitive importance to this realm, the system is utterly dogmatic in its epistemology. 45 For what one substance thinks, must be assumed to be somehow true of another quite independent substance without any medium of communication. 46 Now between Descartes and Berkeley appeared the sober and questioning "*Essay Concerning Human Understanding*," by John Locke. This is an interesting combination (they cannot be said to blend) of traditional metaphysics and revolutionary epistemology. 47 The universe still consists of God, the immortal thinking soul, and a corporeal nature, the object of its thought. 48 But, except for certain proofs of God and self, knowledge is entirely reduced to the perceptual type, to sensations, or ideas directly imparted to the mind by the objects themselves. 49 To escape dogmatism it is maintained that the real is what is 'observed to be present'. 50 But Locke thinks the qualities so discovered belong in part to the perceiver and in part to the substance outside the mind. 51 Color is a case of the former, a "secondary quality"; and extension a case of the latter, a "primary quality." And evidently the above empirical test of knowledge is not equally well met in these two cases. 52 When I see a red object I know that red exists, for it is observed to be present, and I make no claim for it beyond the present. 53 But when I note that the red object is square, I am supposed to know a property that will continue to exist in the object after I have closed my eyes or turned to something else. 54 Here my claim exceeds my observation, and the empirical principle adopted at the outset would seem to be violated.

55 Berkeley develops his philosophy from this criticism. His refutation of material substance is intended as a full acceptance of the implications of the new empirical epistemology. 56 Knowledge is to be all of the perceptual type, where what is known is directly presented; and, in conformity with this principle, being is to be restricted to the content of the living pulses of experience.

57 Berkeley, then, beginning with the threefold world of Descartes and of common-sense, proposes to apply Locke's theory of knowledge to the discomfiture of corporeal nature. 58 It was a radical doctrine, because it meant for him and for his contemporaries the denial of all finite objects outside the mind. 59 But at the same time it meant a restoration of the homogeneity of experience, the reëstablishment of the qualitative world of every-day living, and so had its basis of appeal to common-sense. 60 The encounter between Hylas, the advocate of the traditional philosophy, and Philonous, who represents the author himself, begins with an exchange of the charge of innovation.

61 Hyl.' I am glad to find there was nothing in the accounts I heard of you. 'Phil.' Pray, what were those?

62 'Hyl.' You were represented, in last night's conversation, as one who maintained the most extravagant opinion that ever entered into the mind of human, to wit, that there is no such thing as 'material substance' in the world.

63 'Phil.' That there is no such thing as what 'philosophers' call 'material substance', I am seriously persuaded: 64 but if I were made to see anything absurd or sceptical in this, I should then have the same reason to renounce this that I imagine I have now to reject the contrary opinion.

65 'Hyl.' What! can anything be more fantastical, more repugnant to Common-Sense, or a more manifest piece of Scepticism, than to believe there is no such thing as 'matter'?

66 'Phil.' Softly, good Hylas. What if it should prove that you, who hold there is, are, by virtue of that opinion, a greater sceptic, and maintain more paradoxes and repugnances to Common-Sense, than I who believe no such thing?

67 Philonous now proceeds with his case. Beginning by obtaining from Hylas the admission that pleasure and pain are essentially relative and subjective, 68 he argues that sensations such as heat, since they are inseparable from these feelings, must be similarly regarded. 69 And he is about to annex other qualities in turn to this core of subjectivity, when Hylas enters a general demurrer: "Hold, Philonous, I now see what it was deluded me all this time. 70 You asked me whether heat and cold, sweetness and bitterness, were not particular sorts of pleasure and pain; to which I answered simply that they were. 71 Whereas I should have thus distinguished:--those qualities as perceived by us, are pleasures or pains; but not as existing in the external objects. 72 We must not therefore conclude absolutely, that there is no heat in the fire, or sweetness in the sugar, but only that heat or sweetness, as perceived by us, are not in the fire or sugar."

73 Here the argument touches upon profound issues. Philonous now assumes the extreme empirical contention 'that knowledge applies only to its own psychological moment, that its object in no way extends beyond that individual situation which we call the state of knowing'. 74 The full import of such an epistemology Berkeley never recognised, but he is clearly employing it here, and the overthrow of Hylas is inevitable so long as he does not challenge it or turn it against his opponent. 75 This, however, as a protagonist of Berkeley's own making, he fails to do, and he plays into Philonous's hands by admitting that what is known only in perception must for that reason 'consist' in perception. 76 He frankly owns "that it is vain to stand out any longer," that "colours, sounds, tastes, in a word, all those termed 'secondary qualities', have certainly no existence without the mind."

77 Hylas has now arrived at the distinction between primary and secondary qualities. "Extension, Figure, Solidity, Gravity, Motion, and Rest" are the attributes of an external substance which is the cause of sensations. 78 But the same epistemological principle readily reduces these also to dependence on mind, for, like the

secondary qualities, their content is given only in perception. 79 Hylas is then driven to defend a general material substratum, which is the cause of ideas, but to which none of the definite content of these ideas can be attributed. 80 In short, he has put all the content of knowledge on the one side, and admitted its inseparability from the perceiving spirit, and left the being of things standing empty and forlorn on the other. 81 This amounts, as Philonous reminds him, to the denial of the reality of the known world.

82 "You are therefore, by your principles, forced to deny the 'reality' of sensible things; since you made it to consist in an absolute existence exterior to the mind. 83 That is to say, you are a downright sceptic. So I have gained my point, which was to show your principles led to Scepticism."

84 Having advanced the direct empiricist argument for phenomenalism, Berkeley now gives the rationalistic motive an opportunity to express itself in the queries of Hylas as to whether there be not an "absolute extension," somehow abstracted by thought from the relativities of perception. 85 Is there not at least a 'conceivable' world independent of perception?

86 The answers of Philonous throw much light upon the Berkeleyan position. He admits that thought is capable of separating the primary from the secondary qualities in certain 'operations', but at the same time denies that this is forming an idea of them as separate.

87 "I acknowledge, Hylas, it is not difficult to form general propositions and reasonings about those qualities, without mentioning any other; and, in this sense, to consider or treat of them abstractedly. 88 But, how doth it follow that, because I can pronounce the word 'motion' by itself, I can form the idea of it in my mind exclusive of body? 89 Or, because theorems may be made of extension and figures, without any mention of 'great' or 'small', or any other sensible mode or quality, 90 that therefore it is possible such an abstract idea of extension, without any particular size or figure, or sensible quality, should be distinctly formed, and

apprehended by the mind? 91 Mathematicians treat of quantity, without regarding what other sensible qualities it is attended with, as being altogether indifferent to their demonstrations. 92 But, when laying aside the words, they contemplate the bare ideas, I believe you will find, they are not the pure abstracted ideas of extension."

93 Berkeley denies that we have ideas of pure extension or motion, because, although we do actually 'deal' with these and find them intelligible, we can never obtain a state of mind in which they appear as the content. 94 He applies this psychological test because of his adherence to the general empirical postulate that knowledge is limited to the individual content of its own individual states. 95 "It is a universally received maxim," he says, "that 'everything which exists is particular'." 96 Now the truth of mathematical reckoning is not particular, but is valid wherever the conditions to which it refers are fulfilled. 97 Mathematical reckoning, if it is to be particular, must be regarded as a particular act or state of some thinker. 98 Its truth must then be construed as relative to the interests of the thinker, as a symbolism which has an instrumental rather than a purely cognitive value. 99 This conclusion cannot be disputed short of a radical stand against the general epistemological principle to which Berkeley is so far true, the principle that the reality which is known in any state of thinking or perceiving is the state itself.

100 This concludes the purely phenomenalistic strain of Berkeley's thought. He has taken the immediate apprehension of sensible objects in a state of mind centring about the pleasure and pain of an individual, to be the norm of knowledge. 101 He has further maintained that knowledge cannot escape the particularity of its own states. 102 The result is that the universe is composed of private perceptions and ideas. Strictly on the basis of what has preceded, 103 Hylas is justified in regarding this conclusion as no less sceptical than that to which his own position had been reduced; 104 for while he had been compelled to admit that the real is unknowable, Philonous has

apparently defined the knowable as relative to the individual. 105 But the supplementary metaphysics which had hitherto been kept in the background is now revealed. It is maintained that though perceptions know no external world, they do nevertheless reveal a spiritual substance of which they are the states. 106 Although it has hitherto been argued that the 'esse' of things is in their 'percipi', this is now replaced by the more fundamental principle that the 'esse' of things is in their 'percipere' or 'velle'. 107 The real world consists not in perceptions, but in perceivers.

108 Now it is at once evident that the epistemological theory which has been Berkeley's dialectical weapon in the foregoing argument is no longer available. 109 And those who have cared more for this theory than for metaphysical speculation have attempted to stop at this point, and so to construe phenomenalism as to make it self-sufficient on its own grounds. 110 Such attempts are so instructive as to make it worth our while to review them before proceeding with the development of the spiritualistic motive in subjectivism.

111 The world is to be regarded as made up of sense-perceptions, ideas, or phenomena. 112 What is to be accepted as the fundamental category which gives to all of these terms their subjectivistic significance? 113 So far there seems to be nothing in view save the principle of relativity. The type to which these were reduced was that of the peculiar or unsharable experience best represented by an individual' pleasure and pain. 114 But relativity will not work as a general principle of being. It consigns the individual to own private mind, and cannot provide for the validity of knowledge enough even to maintain itself. Some other course, then, must be followed. 115 Perception may be given a psycho-physical definition, which employs physical terms as fundamental; but this flagrantly contradicts the phenomenalistic first principle. 116 Or, reality may be regarded as so stamped with its marks as to insure the proprietorship of thought. 117 But this definition of certain objective

entities of mind, of beings attributed to intelligence because of their intrinsic intelligibility, is inconsistent with empiricism, if indeed it does not lead eventually to a realism of the Platonic type. 118 Finally, and most commonly, the terms of phenomenalism have been retained after their original meaning has been suffered to lapse. The "impressions" of Hume, 'e. g.', are the remnant of the Berkeleyan world with the spirit stricken out. 119 There is no longer any point in calling them impressions, for they now mean only elements or qualities. As a consequence this outgrowth of the Berkeleyanism epistemology is at present merging into a realistic philosophy of experience. 120 Any one, then, of these three may be the last state of one who undertakes to remain exclusively faithful to the phenomenalistic aspect of Berkeleyanism, embodied in the principle 'esse est percipi'.

121 Let us now follow the fortunes of the other phase of subjectivism-- that which develops the conception of the perceiver rather than the perceived. 122 When Berkeley holds that "all the choir of heaven and furniture of the Earth, in a word, all those bodies which compose the mighty frame of the world, have not any subsistence without a Mind," 123 his thought has transcended the epistemology with which he overthrew the conception of material substance, in two directions. 124 For neither mind of the finite type nor mind of the divine type is perceived. But the first of these may yet be regarded as a direct empirical datum, even though sharply distinguished from an object of perception. 125 In the third dialogue, Philonous thus expounds this new kind of knowledge: "I own I have properly no 'idea', either of God or any other spirit; for these being active, cannot be represented by things perfectly inert, as our ideas are. 126 I do nevertheless know that I, who am a spirit or thinking substance, exist as certainly as I know my ideas exist. 127 Farther, I know what I mean by the terms 'I' and 'myself'; and I know this immediately or intuitively, though I do not perceive it as I perceive a triangle, a color, or a sound."

128 The knowledge here provided for may be regarded as empirical because the reality in question is an individual present in the moment of the knowledge. 129 Particular acts of perception are said directly to reveal not only perceptual objects, but perceiving subjects. 130 And the conception of spiritual substance, once accredited, may then be extended to account for social relations and to fill in the nature of God. 131 The latter extension, in so far as it attributes such further predicates as universality and infinity, implies still a third epistemology, and threatens to pass over into rationalism. 132 But the knowledge of one's fellow-humans may, it is claimed, be regarded as immediate, like the knowledge of one's self. 133 Perceptual and volitional activity has a sense for itself and also a sense for other like activity. 134 The self is both self-conscious and socially conscious in an immediate experience of the same type.

135 But this general spiritualistic conception is developed with less singleness of purpose in Berkeley than among the 'voluntarists' and 'panpsychists' who spring from Schopenhauer, the orientalist, pessimist, and mystic among the German Kantians of the early nineteenth century. 136 His great book, "*Die Welt als Wille und Vorstellung*," opens with the phenomenalistic contention that "*the world is my idea*." It soon appears, however, that the "my" is more profoundly significant than the "idea." 137 My nature is my creation, due to the working within me of certain fixed principles of thought, such as space, time, and causality. 138 But my nature, just because it is my creation, is less than me: is but a manifestation of the true being for which I must look 'within' myself. 139 But this inner self cannot be made an object of thought, for that would be only to create another term of my nature. 140 The will itself, from which such creation springs, is "that which is most immediate" in one's consciousness, and "makes itself known in a direct manner in its particular acts." 141 The term 'will' is used by Schopenhauer as a general term covering the whole dynamics of life, instinct and desire, as well as volition. 142 It is

that sense of life-preserving and life-enhancing appetency which is the conscious accompaniment of struggle. With its aid the inwardness of the whole world may now be apprehended.

143 "Whoever has now gained from all these expositions a knowledge 'in abstracto', and therefore clear and certain, of what everyone knows directly 'in concreto', 'i. e.', as feeling, 144 a knowledge that your will is the real inner nature of your phenomenal being, . . . and that your will is that which is most immediate in your consciousness, . . . will find that of itself it affords you the key to the knowledge of the inmost being of the whole of your nature; 145 for you now transfers it to all those phenomena which are not given to you, like your own phenomenal existence, both in direct and indirect knowledge, but only in the latter, thus merely one-sidedly as 'idea' alone."

146 The heart of reality is thus known by an "intuitive interpretation," which begins at home in the individual's own heart. 147 The panpsychist follows the same course of reflection. There is an outwardness and an inwardness of human nature, corresponding to the knower's body on the one hand, and one's feeling or will on the other. 148 With this principle in hand one may pass down the whole scale of being and discover no breach of continuity. 149 Such an interpretation of human nature has been well set forth by a contemporary writer, who quotes the following from the botanist, C. v. Naegeli: 150 "Sensation is clearly connected with the reflex actions of higher animals. We are obliged to concede it to the other animals also, and we have no grounds for denying it to plants and inorganic bodies. 151 The sensation arouses in us a condition of comfort and discomfort. In general, the feeling of pleasure arises when the natural impulses are satisfied, the feeling of pain when they are not satisfied. 152 Since all material processes are composed of movements of molecules and elementary atoms, pleasure and pain must have their seat in these particles. . . . Thus the same mental thread runs through

all material phenomena. 153 The human mind is nothing but the highest development on our earth of the mental processes which universally animate and move our nature."

154 According to panpsychism, then, physical Nature is the manifestation of an 'appetency or bare consciousness generalised from the thinker's awareness of one’s own most intimate self'. 155 Such appetency or bare consciousness is the essential or substantial state of that which appears as physical Nature.

156 We must now turn to the efforts which this doctrine has made to maintain itself against the sceptical trend of its own epistemology. 157 For precisely as in the case of phenomenalism its dialectical principle threatens to be self-destructive. 158 Immediate presence is still the test of knowledge. But does not immediate presence connote relativity and inadequacy, at best; 159 an initial phase of knowledge that must be supplemented and corrected before objective reality and valid truth are apprehended? 160 Does not the individuality of the individual thinker connote the very maximum of error? 161 Indeed, spiritualism would seem to have exceeded even Protagoreanism itself, and to have passed from scepticism to deliberate nihilism. 162 The object of knowledge is no longer even, as with the phenomenalist, the thinker's thought, but only your 'thinking'. 163 And if the thinker's thought is relative to the self, then the thinker's act of thinking is the very vanishing-point of relativity, the negative term of a negating relation. 164 How is a real, a self-subsistent world to be composed of such? Impelled by a half-conscious realisation of the hopelessness of this situation, 165 the exponent of spiritualism has sought to universalise your conception; to define an 'absolute or ultimate spirit' other than the individual thinker, though known in and through you. 166 But it is clear that this development of spiritualism, like all of the speculative procedure of subjectivism, threatens to exceed the scope of the original principle of knowledge. 167 There is a strong presumption against the

possibility of introducing a knowledge of God by the way of the particular presentations of an individual consciousness.

168 Schopenhauer must be credited with a genuine effort to accept the metaphysical consequences of his epistemology. His epistemology, as we have seen, defined knowledge as centripetal. 169 The object of real knowledge is identical with the subject of knowledge. If I am to know the universal will, therefore, I must in knowing become that will. 170 And this Schopenhauer maintains. The innermost heart of the individual into which you may retreat, even from your private will, is-- the universal. 171 But there is another way of arriving at the same knowledge. In contemplation I may become absorbed in principles and laws, rather than be diverted by the particular spacial and temporal objects, 172 until (and this is peculiarly true of the æsthetic experience) my interest no longer distinguishes itself, but coincides with truth. 173 In other words, abstract thinking and pure willing are not opposite extremes, but adjacent points on the deeper or transcendent circle of experience. 174 One may reach this part of the circle by moving in either of two directions that at the start are directly opposite: by turning in upon the subject or by utterly giving one's self up to the object. 175 Reality obtains no definition by this means. Philosophy, for Schopenhauer, is rather a programme for realising the state in which I will the universal and know the universal will. 176 The final theory of knowledge, then, is mysticism, reality directly apprehended in a supreme and incommunicable experience, direct and vivid, like perception, and at the same time universal, like thought. 177 But the empiricism with which Schopenhauer began, the appeal to a familiar experience of self as will, has meanwhile been forgotten. 178 The idea as object of my perception, and the will as its subject were in the beginning regarded as common and verifiable items of experience. 179 But who, save the occasional philosopher, knows a universal will? 180 Nor have attempts to avoid mysticism, while retaining

Schopenhauer's first principle, been successful. 181 Certain voluntarists and panpsychists have attempted to do without the universal will, and define the world solely in terms of the many individual wills. 182 But, as Schopenhauer himself pointed out, individual wills cannot be distinguished except in terms of something other than will, such as space and time. 183 The same is true if for will there be substituted inner feeling or consciousness. 184 Within this category individuals can be distinguished only as points of view, which to be comparable at all must contain common objects, or be defined in terms of a system of relations like that of the physical world or that of an ethical community. 185 The conception of pure will or pure feeling inevitably attaches to itself that of an undivided unity, if for no other reason because there is no ground for distinction. 186 And such a unity, a will or consciousness that is no particular act or idea, can be known only in the unique experience which mysticism provides. 187 The way of Schopenhauer is the way of one who adheres to the belief that what the thinker knows must always be a part of oneself, your state or your activity. 188 From this point of view the important element of being, its very essence or substance, is not any definable nature but an immediate relation to the knower. 189 The consequence is that the universe in the last analysis can only be defined as a supreme state or activity into which the individual's consciousness may develop. 190 Spiritualism has, however, other interests, interests which may be quite independent of epistemology. It is speculatively interested in a kind of being which it defines as spiritual, and in terms of which it proposes to define the universe. 191 Such procedure is radically different from the epistemological criticism which led Berkeley to maintain that the 'esse' of objects is in their 'percipi', 192 or Schopenhauer to maintain that "the world is my idea," or that led both of these philosophers to find a deeper reality in immediately intuited self-activity. 193 For now it is proposed to

'understand' spirit, discover its properties, and to acknowledge it only where these properties appear. 194 I may now know spirit as an object; which in its properties, to be sure, is quite different from matter, but which like matter is capable of subsisting quite independently of my knowledge. 195 This is a metaphysical spiritualism quite distinct from epistemological spiritualism, and by no means easily made consistent therewith. 196 Indeed, it exhibits an almost irrepressible tendency to overstep the bounds both of empiricism and subjectivism, an historical connection with which alone justifies its introduction in the present chapter.

197 To return again to the instructive example of Bishop Berkeley, we find him proving God from the evidence of himself in experience, or the need of himself to support the claims of experience. 198 "But, whatever power I may have over my own thoughts, I find the ideas actually perceived by Sense have not a like dependence on 'my' will. 199 When in broad daylight I open my eyes, it is not in my power to choose whether I shall see or no, or to determine what particular objects shall present themselves to my view: 200 and so likewise as to the hearing and other senses; the ideas imprinted on them are not creatures of 'my' will. There is therefore some other Will or Spirit that produces them.

201 The ideas of Sense are more strong, lively, and distinct than those of the Imagination; 202 they have likewise a steadiness, order, and coherence, and are not excited at random, as those which are the effects of human wills often are, but in a regular train or series-- 203 the admirable connection whereof sufficiently testifies the wisdom and benevolence of its Author. Now the set rules, or established methods, wherein the Mind we depend on excites in us the ideas of Sense, are called 'the Laws of Nature'."

204 Of the attributes of experience here in question, independence or "steadiness" is not regarded as 'prima facie' evidence of spirit, but rather as an aspect of experience for which some cause is necessary. 205 But it is assumed that the

power to "produce," with which such a cause must be endowed, is the peculiar prerogative of spirit, and that this cause gives further evidence of its spiritual nature, of its eminently spiritual nature, in the orderliness and the goodness of its effects. 206 "The force that produces, the intellect that orders, the goodness that perfects all things is the Supreme Being." 207 That spirit is possessed of causal efficacy, Berkeley has in an earlier passage proved by a direct appeal to the individual's sense of power. 208 "I find I can excite ideas in my mind at pleasure, and vary and shift the scene as oft as I think fit. 209 It is no more than 'willing', and straightway this or that idea arises in my fancy; and by the same power it is obliterated and makes way for another. 210 This making and unmaking of ideas doth very properly denominate the mind active. Thus much is certain and grounded on experience: 211 but when we talk of unthinking agents, or of exciting ideas exclusive of volition, we only amuse ourselves with words."

212 Although Berkeley is here in general agreement with a very considerable variety of philosophical views, it will be readily observed that this doctrine tends to lapse into mysticism whenever it is retained in its purity. 213 Berkeley himself admitted that there was no "idea" of such power. And philosophers will as a rule either obtain an idea corresponding to a term or amend the term-- always excepting the mystical appeal to an inarticulate and indefinable experience. 214 Hence pure power revealed in an ineffable immediate experience tends to give place to kinds of power to which some definite meaning may be attached. 215 The energy of physics, defined by measurable quantitative equivalence, is a case in point. The idealistic trend is in another direction, power coming to signify ethical or logical connection. 216 Similarly, in the later philosophy of Berkeley himself, God is known by the nature of one’s activity rather than by the fact of one’s activity; and we are said "to account for a thing, when we show that it is so best." 217 God's power, in short, becomes indistinguishable from one’s

universality attended with the attributes of goodness and orderliness. 218 But this means that the analogy of the human spirit, conscious of its own activity, is no longer the basis of the argument. 219 By the divine Will is now meant ethical principles, rather than the "here am I willing" of the empirical consciousness. 220 Similarly the divine mind is defined in terms of logical principles, such as coherence and order, rather than in terms of the "here am I thinking" of the finite knower yourself. 221 But enough has been said to make it plain that this is no longer the stand-point of empirio-idealism. 222 Indeed, in his last philosophical writing, the "Siris," Berkeley is so far removed from the principles of knowledge which made him at once the disciple and the critic of Locke, as to pronounce himself the devotee of Platonism and the prophet of transcendentalism. 223 The former strain appears in his conclusion that "the 'principles' of science are neither objects of sense nor imagination; and that intellect and reason are alone the sure guides to truth." 224 His transcendentalism appears in his belief that such principles, participating in the vital unity of the Individual Purpose, constitute the meaning and so the substantial essence of the universe. 225 Such then are the various paths which lead from subjectivism to other types of philosophy, demonstrating the peculiar aptitude of the former for departing from its first principle. 226 Beginning with the relativity of all knowable reality to the individual knower, it undertakes to conceive reality in one or the other of the terms of this relation, as particular state of knowledge or as individual subject of knowledge. 227 But these terms develop an intrinsic nature of their own, and become respectively 'empirical datum', and 'logical' or 'ethical principle'. In either case the subjectivistic principle of knowledge has been abandoned. 228 Those whose speculative interest in a definable objective world has been less strong than their attachment to this principle, have either accepted the imputation of scepticism, or had recourse to the radical

epistemological doctrine of mysticism.

229 Since the essence of subjectivism is epistemological rather than metaphysical, its practical and religious implications are various. 230 The ethical theories which are corollary to the tendencies expounded above, range from extreme egoism to a mystical universalism. 231 The close connection between the former and relativism is evident, and the form of egoism most consistent with epistemological relativism is to be found among those same Sophists who first maintained this latter doctrine. 232 If we may believe Plato, the Sophists sought to create for their individual pupils an 'appearance' of good. 233 In the "Theaetetus," Socrates is represented as speaking thus on behalf of Protagoras: "And I am far from saying that wisdom and the wise person have no existence; but I say that the wise person is you who makes the evils which are and appear to a human, into goods which are and appear to you. . . . 234 I say that they (the wise people) are the physicians of the human body, and the husbandmen of plants-- 235 for the husbandmen also take away the evil and disordered sensations of plants, and infuse into them good and healthy sensations as well as true ones; 236 and the wise and good rhetoricians make the good instead of the evil seem just to States; for whatever appears to be just and fair to a State, while sanctioned by a State, is just and fair to it; 237 but the teacher of wisdom causes the good to take the place of the evil, both in appearance and in reality."

238 As truth is indistinguishable from the appearance of truth to the individual, so good is indistinguishable from a particular seeming good. 239 The supreme moral value according to this plan of life is the agreeable feeling tone of that dream world to which the individual is forever consigned. 240 The possible perfection of an experience which is "reduced to a swarm of impressions," and "ringed round" for each one of us by a "thick wall of personality" has been brilliantly depicted in the passage already quoted from Walter Pater, in whom the naturalistic and subjectivistic

motives unite. 241 If all my experience is strictly my own, then my good must likewise be my own. 242 And if all of my experience is valid only in its instants of immediacy, then my best good must likewise consist in some "exquisite passion," or stirring of the senses.

243 But for Schopenhauer the internal world opens out into the boundless and unfathomable sea of the universal will. 244 If I retire from the world upon my own private feelings, I am still short of the true life, for I am asserting myself against the world. 245 I should seek a sense of unison with a world whose deeper heart-beats I may learn to feel and adopt as the rhythm of my own. 246 The folly of willing for one's private self is the ground of Schopenhauer's pessimism. "All 'willing' arises from want, therefore from deficiency, and therefore from suffering. 247 The satisfaction of a wish ends it; yet for one wish that is satisfied there remain at least ten which are denied. 248 Further, the desire lasts long, the demands are infinite; the satisfaction is short and scantily measured out. 249 But even the final satisfaction is itself only apparent; every satisfied wish at once makes room for a new one, both are illusions; the one is known to be so, the other not yet. 250 No attained object of desire can give lasting satisfaction, but merely a fleeting gratification; it is like the alms thrown to the beggar, that keeps him alive to-day that own misery may be prolonged till the morrow. . . . 251 The subject of willing is thus constantly stretched on the revolving wheel of Ixion, pours water into the sieve of the Danaids, is the ever-longing Tantalus." 252 The escape from this torture and self-deception is possible through the same mystical experience, the same blending with the universe that conditions knowledge.

253 But though pleasant dreaming be the most consistent practical sequel to a subjectivistic epistemology, its 'individualism' presents another basis for life with quite different possibilities of emphasis. 254 It may develop into an aggressive egoism of the type represented by the sophist Thrasymachus, in his proclamation that "might is right, justice the

interest of the stronger." 255 But more commonly it is tempered by a conception of social interest, and serves as the champion of action against contemplation. 256 The gospel of action is always individualistic. It requires of the individual a sense of your independence, and of the real virtue of your initiative. 257 Hence those voluntarists who emphasise the many individual wills and decline to reduce them, after the manner of Schopenhauer, to a universal, may be said to afford a direct justification of it. 258 It is true that this practical realism threatens the tenability of an epistemological idealism, but the two have been united, and because of their common emphasis upon the individual such procedure is not entirely inconsequential. 259 Friedrich Paulsen, whose panpsychism has already been cited, is an excellent case in point. The only good, he maintains, is "welfare," 260 the fulfillment of those natural desires which both distinguish the individual and signify own continuity with all grades of being.

261 "The goal at which the will aims does not consist in a maximum of pleasurable feelings, but in the normal exercise of the vital functions for which the species is predisposed. 262 In the case of human the mode of life is on the whole determined by the nature of the historical unity from which the individual evolves as a member. 263 Here the objective content of life, after which the will strives, also enters into consciousness with the progressive evolution of presentation; the type of life becomes a conscious ideal of life."

264 Here, contrary to the teaching of Schopenhauer, the good consists in individual attainment, the extension and fulfillment of the 'distinct' interests that arise from the common fund of one’s nature. 265 To be and to do to the uttermost, to realise the maximum from nature's investment in one's special capacities and powers--this is indeed the first principle of a morality of action.

266 But a type of ethics still further removed from the initial relativism has been adopted and more or less successfully assimilated by

subjectivistic philosophies. 267 Accepting Berkeley's spirits, with their indefinite capacities, and likewise the stability of the ideal principles that underlie a God-administered world, and morality becomes the obedience which the individual renders to the law. 268 The individual, free to act in your own right, coöperates with the purposes of the general spiritual community, whose laws are worthy of obedience though not coercive. 269 The recognition of such a spiritual citizenship, entailing opportunities, duties, and obligations, rather than thraldom, partakes of the truth as well as the inadequacy of common-sense.

270 As for religion, at least two distinct practical appreciations of the universe have been historically associated with this chapter in philosophy. 271 The one of these is the mysticism of Schopenhauer, the religious sequel to a universalistic voluntarism. Schopenhauer's ethics, his very philosophy, is religion. 272 For the good and the true are alike attainable only through identification with the Absolute Will. 273 This consummation of life, transcending practical and theoretical differences, engulfing and effacing all qualities and all values, is like the Nirvâna of the Orient-- a positive ideal only for one who has appraised the apparent world at its real value.

274 "Rather do we freely acknowledge that what remains after the entire abolition of Will is for all those who are still full of Will certainly nothing; 275 but, conversely, to those in whom the Will has turned and has denied itself, this our world, which is so real, with all it's suns and milky-ways-- is nothing."

THE RELIGION OF INDIVIDUAL COÖPERATION WITH GOD

276 From the union of the two motives of voluntarism and individualism springs another and a more familiar type of religion, that of coöperative spiritual endeavour. 277 In the religion of Schopenhauer the soul must utterly lose itself for the sake of peace; here the soul must persist in its own being and activity for the sake of the progressive goodness of the world. 278 For

Schopenhauer God is the universal solution, in which all motions cease and all differences disappear; here God is the General of moral forces. 279 The deeper and more significant universe is "a society of rational agents, acting under the eye of Providence, concurring in one design to promote the common benefit of the whole, and conforming their actions to the established laws and order of the Divine parental wisdom: 280 wherein each particular agent shall not consider oneself apart, but as the member of a great City, whose author and founder is God: 281 in which the civil laws are no other than the rules of virtue and the duties of religion: and where everyone's true interest is combined with one's duty."

282 But so uncompromising an optimism is not essential to this religion. Its distinction lies rather in its acceptance of the manifest plurality of souls, and its appeal to the faith that is engendered by service. 283 As William James has said: "Even God's being is sacred from ours. To coöperate with His creation by the best and rightest response seems all He wants of us. 284 In such coöperation with His purposes, not in any chimerical speculative conquest of Him, not in any theoretical drinking of Him up, must lie the real meaning of our destiny."

The Book of Divine Panagogue called

PROPHECY

OF PROPHECY

Benedict of Spinoza

1 Prophecy, or revelation is sure knowledge revealed by God to human.

2 A prophet is one who interprets the revelations of God to those who are unable to attain to sure knowledge of the matters revealed, and therefore can only apprehend them by simple faith.

3 The Hebrew word for prophet is "nabi," i.e. speaker or interpreter, but in Scripture its meaning is restricted to interpreter of God, 4 as we may learn from Exodus, chapter-7: verse:1, where God says to Moses, "See, I have made thee a god to Pharaoh, and Aaron thy brother shall be thy prophet;" 5 implying that, since in interpreting Moses' words to Pharaoh, Aaron acted the part of a prophet, Moses would be to Pharaoh as a god, or in the attitude of a god.

6 Prophets I will treat of in the next chapter, and at present consider prophecy.

7 Now it is evident, from the definition above given, that prophecy really includes ordinary knowledge; for the knowledge which we acquire by our natural faculties depends on knowledge of God and His eternal laws; 8 but ordinary knowledge is common to all humans as humans, and rests on foundations which all share, whereas the multitude always strains after rarities and exceptions, and thinks little of the gifts of Nature; 9 so that, when prophecy is talked of, ordinary knowledge is not supposed to be included.

10 Nevertheless it has as much right as any other to be called Divine, for God's nature, in so far as we share therein, and God's laws, dictate it to us; 11 nor does it suffer from that to which we give the preeminence, except in so far as the latter transcends its limits and cannot be accounted for by natural laws taken in themselves.

12 In respect to the certainty it involves, and the source from which it is derived, i.e. God, ordinary knowledge is no whit inferior to prophetic, 13 unless indeed we believe, or rather dream, that the prophets had

human bodies but superhuman minds, and therefore that their sensations and consciousness were entirely different from our own.

14 But, although ordinary knowledge is Divine, its professors cannot be called prophets, for they teach what the rest of humankind could perceive and apprehend, not merely by simple faith, but as surely and honourably as themselves.

15 Seeing then that our mind subjectively contains in itself and partakes of the nature of God, and solely from this cause is enabled to form notions explaining natural phenomena and inculcating morality, 16 it follows that we may rightly assert the nature of the human mind (in so far as it is thus conceived) to be a primary cause of Divine revelation.

17 All that we clearly and distinctly understand is dictated to us, as I have just pointed out, by the idea and nature of God; 18 not indeed through words, but in a way far more excellent and agreeing perfectly with the nature of the mind, as all who have enjoyed intellectual certainty will doubtless attest.

19 Here, however, my chief purpose is to speak of matters having reference to Scripture, so these few words on the light of reason will suffice.

20 I will now pass on to, and treat more fully, the other ways and means by which God makes revelations to humankind, both of that which transcends ordinary knowledge, and of that within its scope; 21 for there is no reason why God should not employ other means to communicate what we know already by the power of reason.

22 Our conclusions on the subject must be drawn solely from Scripture; for what can we affirm about matters transcending our knowledge except what is told us by the words or writings of prophets?

23 And since there are, so far as I know, no prophets now alive, we have no alternative but to read the books of prophets departed, taking care the while not to reason from metaphor or to ascribe anything to our authors which they do not themselves distinctly state.

24 I must further premise that the Jews never make any mention or

account of secondary, or particular causes, but in a spirit of religion, piety, and what is commonly called godliness, refer all things directly to the Deity.

25 For instance if they make money by a transaction, they say God gave it to them; if they desire anything, they say God has disposed their hearts towards it; if they think anything, they say God told them.

26 Hence we must not suppose that everything is prophecy or revelation which is described in Scripture as told by God to anyone, 27 but only such things as are expressly announced as prophecy or revelation, or are plainly pointed to as such by the context.

28 A perusal of the sacred books will show us that all God's revelations to the prophets were made through words or appearances, or a combination of the two. 29 These words and appearances were of two kinds; (1).- real when external to the mind of the prophet who heard or saw them, (2).- imaginary when the imagination of the prophet was in a state which led him distinctly to suppose that he heard or saw them.

30 With a real voice God revealed to Moses the laws which He wished to be transmitted to the Hebrews, as we may see from Exodus, chapter-25, verse:22, where God says, 31 "And there I will meet with thee and I will commune with thee from the mercy seat which is between the Cherubim."

32 Some sort of real voice must necessarily have been employed, for Moses found God ready to commune with him at any time. This, as I shall shortly show, is the only instance of a real voice.

33 We might, perhaps, suppose that the voice with which God called Samuel was real, for in 1 Samuel, chapter-3, verse:21, 34 we read, "And the Lord appeared again in Shiloh, for the Lord revealed Himself to Samuel in Shiloh by the word of the Lord;" 35 implying that the appearance of the Lord consisted in His making Himself known to Samuel through a voice; in other words, that Samuel heard the Lord speaking. 36 But we are compelled to distinguish between the prophecies

of Moses and those of other prophets, and therefore must decide that this voice was imaginary, 37 a conclusion further supported by the voice's resemblance to the voice of Eli, which Samuel was in the habit of hearing, and therefore might easily imagine; when thrice called by the Lord, Samuel supposed it to have been Eli.

38 The voice which Abimelech heard was imaginary, for it is written, Genesis, chapter-20, verse:6, "And God said unto him in a dream."

39 So that the will of God was manifest to him, not in waking, but only in sleep, that is, when the imagination is most active and uncontrolled.

40 Some of the Jews believe that the actual words of the Decalogue were not spoken by God, but that the Israelites heard a noise only, without any distinct words, and during its continuance apprehended the Ten Commandments by pure intuition; 41 to this opinion I myself once inclined, seeing that the words of the Decalogue in Exodus are different from the words of the Decalogue in Deuteronomy, 42 for the discrepancy seemed to imply (since God only spoke once) that the Ten Commandments were not intended to convey the actual words of the Lord, but only His meaning.

43 However, unless we would do violence to Scripture, we must certainly admit that the Israelites heard a real voice, for Scripture expressly says, Deuteronomy, chapter-5, verse:4, "God spake with you face to face," i.e. 44 as two people ordinarily interchange ideas through the instrumentality of their two bodies; and therefore it seems more consonant with Holy Writ to suppose that God really did create a voice of some kind with which the Decalogue was revealed.

45 The discrepancy of the two versions is treated of in Chapter-8.

46 Yet not even thus is all difficulty removed, for it seems scarcely reasonable to affirm that a created thing, depending on God in the same manner as other created things, would be able to express or explain the nature of God either verbally or really by means of its individual organism:

47 for instance, by declaring in the first person, "I am the Lord your God."

48 Certainly when anyone says with own mouth, "I understand," we do not attribute the understanding to the mouth, but to the mind of the speaker; 49 yet this is because the mouth is the natural organ of a human speaking, and the hearer, knowing what understanding is, easily comprehends, by a comparison with own self, that the speaker's mind is meant; 50 but if we knew nothing of God beyond the mere name and wished to commune with Him, and be assured of His existence, I fail to see how our wish would be satisfied by the declaration of a created thing (depending on God neither more nor less than ourselves), "I am the Lord."

51 If God contorted the lips of Moses, or, I will not say Moses, but some beast, till they pronounced the words, "I am the Lord," should we apprehend the Lord's existence therefrom?

52 Scripture seems clearly to point to the belief that God spoke Himself, having descended from heaven to Mount Sinai for the purpose-- and not only that the Israelites heard Him speaking, but that their chief men beheld Him (Exodus, chapter-24)

53 Further the law of Moses, which might neither be added to nor curtailed, and which was set up as a national standard of right, nowhere prescribed the belief that God is without body, or even without form or figure, 54 but only ordained that the Jews should believe in His existence and worship Him alone: it forbade them to invent or fashion any likeness of the Deity, but this was to insure purity of service; 55 because, never having seen God, they could not by means of images recall the likeness of God, but only the likeness of some created thing which might thus gradually take the place of God as the object of their adoration.

56 Nevertheless, the Bible clearly implies that God has a form, and that Moses when he heard God speaking was permitted to behold it, or at least its hinder parts.

57 Doubtless some mystery lurks in this question which we will discuss more fully below.

PROPHECY

58 For the present I will call attention to the passages in Scripture indicating the means by which God has revealed His laws to human.

59 Revelation may be through figures only, as in I Chronicles, chapter-22, where God displays His anger to David by means of an angel bearing a sword, and also in the story of Balaam.

60 Maimonides and others do indeed maintain that these and every other instance of angelic apparitions (e.g. to Manoah and to Abraham offering up Isaac) occurred during sleep, for that no one with own eyes open ever could see an angel, but this is mere nonsense.

61 The sole object of such commentators seems to be to extort from Scripture confirmations of Aristotelian quibbles and their own inventions, a proceeding which I regard as the acme of absurdity.

62 In figures, not real but existing only in the prophet's imagination, God revealed to Joseph his future lordship, and in words and figures He revealed to Joshua that He would fight for the Hebrews, causing to appear an angel, 63 as it were the Captain of the Lord's host, bearing a sword, and by this means communicating verbally.

64 The forsaking of Israel by Providence was portrayed to Isaiah by a vision of the Lord, the thrice Holy, sitting on a very lofty throne, and the Hebrews, stained with the mire of their sins, sunk as it were in uncleanness, and thus as far as possible distant from God.

65 The wretchedness of the people at the time was thus revealed, while future calamities were foretold in words. 66 I could cite from Holy Writ many similar examples, but I think they are sufficiently well known already.

67 However, we get a still more clear confirmation of our position in Numbers, chapter-12, verses:6 and 7 , as follows: "If there be any prophet among you, I the Lord will make myself known unto him in a vision" i.e. 68 by appearances and signs, for God says of the prophecy of Moses that it was a vision without signs, "and will speak unto him in a dream" i.e. not with actual words and an actual voice.

PROPHECY

69 "My servant Moses is not so; with him will I speak mouth to mouth, even apparently, and not in dark speeches, and the similitude of the Lord he shall behold," i.e. looking on me as a friend and not afraid, he speaks with me (cf. Exodus, chapter-33, verse:17).

70 This makes it indisputable that the other prophets did not hear a real voice, and we gather as much from Deuteronomy, chapter-34, verse:10: 71 "And there arose not a prophet since in Israel like unto Moses whom the Lord knew face to face," which must mean that the Lord spoke with none other; for not even Moses saw the Lord's face.

72 These are the only media of communication between God and human which I find mentioned in Scripture, and therefore the only ones which may be supposed or invented.

73 We may be able quite to comprehend that God can communicate immediately with human, for without the intervention of bodily means He communicates to our minds His essence; 74 still, a person who can by pure intuition comprehend ideas which are neither contained in nor deducible from the foundations of our natural knowledge, 75 must necessarily possess a mind far superior to those of own fellow humans, nor do I believe that any have been so endowed save Christ.

76 To Him the ordinances of God leading humans to salvation were revealed directly without words or visions, so that God manifested Himself to the Apostles through the mind of Christ as He formerly did to Moses through the supernatural voice.

77 In this sense the voice of Christ, like the voice which Moses heard, may be called the voice of God, and it may be said that the wisdom of God (i.e. wisdom more than human) took upon itself in Christ human nature, and that Christ was the way of salvation.

78 I must at this juncture declare that those doctrines which certain churches put forward concerning Christ, I neither affirm nor deny, for I freely confess that I do not understand them.

79 What I have just stated I gather from Scripture, where I never read that God appeared to Christ, or

spoke to Christ, but that God was revealed to the Apostles through Christ; 80 that Christ was the Way of Life, and that the old law was given through an angel, and not immediately by God; 81 whence it follows that if Moses spoke with God face to face as a person speaks with own friend (i.e. by means of their two bodies) Christ communed with God mind to mind.

82 Thus we may conclude that no one except Christ received the revelations of God without the aid of imagination, whether in words or vision.

83 Therefore the power of prophecy implies not a peculiarly perfect mind, but a peculiarly vivid imagination, as I will show more clearly in the next chapter.

84 We will now inquire what is meant in the Bible by the Spirit of God breathed into the prophets, or by the prophets speaking with the Spirit of God; 85 to that end we must determine the exact signification of the Hebrew word 'ruagh', commonly translated spirit.

86 The word 'ruagh' literally means a wind, 'e.g.' the south wind, but it is frequently employed in other derivative significations. It is used as equivalent to,

87 (1.) Breath: "Neither is there any spirit in his mouth," Psalm, chapter-135, verse:17.

88 (2.) Life, or breathing: "And his spirit returned to him" 1 Samuel. Chapter-30, verse:12; i.e. he breathed again.

89 (3.) Courage and strength: "Neither did there remain any more spirit in any human," Joshua. Chapter-2, verse:11; 90 "And the spirit entered into me, and made me stand on my feet," Ezekiel. Chapter-2, verse:2.

91 (4.) Virtue and fitness: "Days should speak, and multitudes of years should teach wisdom; but there is a spirit in human," Job, chapter-32, verse:7; i.e. 92 wisdom is not always found among old people for I now discover that it depends on individual virtue and capacity. So, "A person in whom is the Spirit," Numbers, chapter-27, verse:18.

93 (5.) Habit of mind: "Because he had another spirit with him," Numbers, chapter-14, verse:24; i.e. another habit of mind. "Behold I

will pour out My Spirit unto you," Proverb. Chapter-1, verse:23.

94 (6.) Will, purpose, desire, impulse: "Whither the spirit was to go, they went," Ezekiel. Chapter-1, verse:12; 95 "That cover with a covering, but not of My Spirit," Isaiah, chapter-30, verse:1; 96 "For the Lord hath poured out on you the spirit of deep sleep," Isaiah, chapter-29, verse:10; 97 "Then was their spirit softened," Judges, chapter-8, verse:3; 98 "He that ruleth his spirit, is better than he that taketh a city," Proverb, chapter-16, verse:32; 99 "He that hath no rule over his own spirit," Proverb, chapter-25, verse:28; 100 "Your spirit as fire shall devour you," Isaiah, chapter-33. verse:1.

101 From the meaning of disposition we get -

(7.) Passions and faculties. A lofty spirit means pride, a lowly spirit humility, an evil spirit hatred and melancholy. 102 So, too, the expressions spirits of jealousy, fornication, wisdom, counsel, bravery, stand for a jealous, lascivious, wise, prudent, or brave mind (for we Hebrews use substantives in preference to adjectives), or these various qualities.

103 (8.) The mind itself, or the life: "Yea, they have all one spirit," Ecclesiastes. Chapter-3, verse:19 "The spirit shall return to God Who gave it."

104 (9.) The quarters of the world (from the winds which blow thence), or even the side of anything turned towards a particular quarter-- Ezekiel, chapter-37, verse:9; Chapter-42, verses 16-19.

105 I have already alluded to the way in which things are referred to God, and said to be of God.

106 (1.) As belonging to His nature, and being, as it were, part of Him; e.g. the power of God, the eyes of God.

107 (2.) As under His dominion, and depending on His pleasure; thus the heavens are called the heavens of the Lord, as being His chariot and habitation. 108 So Nebuchadnezzar is called the servant of God, Assyria the scourge of God.

109 (3.) As dedicated to Him, e.g. the Temple of God, a Nazarene of God, the Bread of God.

110 (4.) As revealed through the prophets and not through our natural faculties. In this sense the Mosaic law is called the law of God.

111 (5.) As being in the superlative degree. Very high mountains are styled the mountains of God, a very deep sleep, the sleep of God.

112 In this sense we must explain Amos, chapter-4, verse:11: "I have overthrown you as the overthrow of the Lord came upon Sodom and Gomorrah," i.e. that memorable overthrow, for since God Himself is the Speaker, the passage cannot well be taken otherwise. 113 The wisdom of Solomon is called the wisdom of God, or extraordinary. The size of the cedars of Lebanon is alluded to in the Psalmist's expression, "the cedars of the Lord."

114 Similarly, if the Jews were at a loss to understand any phenomenon, or were ignorant of its cause, they referred it to God.

115 Thus a storm was termed the chiding of God, thunder and lightning the arrows of God, for it was thought that God kept the winds confined in caves, His treasuries; thus differing merely in name from the Greek wind-god Eolus.

116 In like manner miracles were called works of God, as being especially marvellous; though in reality, of course, all natural events are the works of God, and take place solely by His power.

117 The Psalmist calls the miracles in Egypt the works of God, because the Hebrews found in them a way of safety which they had not looked for, and therefore especially marvelled at.

118 As, then, unusual natural phenomena are called works of God, and trees of unusual size are called trees of God, we cannot wonder that very strong and tall men, though impious robbers and whore-mongers, are in Genesis called sons of God.

119 This reference of things wonderful to God was not peculiar to the Jews.

120 Pharaoh, on hearing the interpretation of his dream, exclaimed that the mind of the gods was in Joseph.

121 Nebuchadnezzar told Daniel that he possessed the mind of the holy gods; so also in Latin anything well made is often said to

be wrought with Divine hands, which is equivalent to the Hebrew phrase, wrought with the hand of God.

122 We can now very easily understand and explain those passages of Scripture which speak of the Spirit of God.

123 In some places the expression merely means a very strong, dry, and deadly wind, as in Isaiah, chapter-40, verse:7, "The grass withereth, the flower fadeth, because the Spirit of the Lord bloweth upon it."

124 Similarly in Genesis, chapter-1, verse:2: "The Spirit of the Lord moved over the face of the waters."

125 At other times it is used as equivalent to a high courage, thus the spirit of Gideon and of Samson is called the Spirit of the Lord, as being very bold, and prepared for any emergency. 126 Any unusual virtue or power is called the Spirit or Virtue of the Lord, Exodus, chapter-31, verse:3: "I will fill him (Bezaleel) with the Spirit of the Lord," i.e., as the Bible itself explains, with talent above human's usual endowment.

127 So Isaiah, chapter-11, verse:2: "And the Spirit of the Lord shall rest upon him," is explained afterwards in the text to mean the spirit of wisdom and understanding, of counsel and might.

128 The melancholy of Saul is called the melancholy of the Lord, or a very deep melancholy, the persons who applied the term showing that they understood by it nothing supernatural, in that they sent for a musician to assuage it by harp-playing.

129 Again, the "Spirit of the Lord" is used as equivalent to the mind of human, for instance, in Job, chapter-27, verse:3: "And the Spirit of the Lord in my nostrils," 130 the allusion being to Genesis, chapter-2, verse:7: "And God breathed into human's nostrils the breath of life."

131 Ezekiel also, prophesying to the dead, says (Chapter-27, verse:14), "And I will give to you My Spirit, and ye shall live;" i.e. I will restore you to life.

132 In Job, chapter-34, verse:14, we read: "If He gather unto Himself His Spirit and breath;" in Genesis. Chapter-6, verse:3: "My

Spirit shall not always strive with human, for that you also is flesh," i.e. 133 since human acts on the dictates of own body, and not the spirit which I gave you to discern the good, I will let you alone.

134 So, too, Psalm, chapter-51, verse:12: "Create in me a clean heart, O God, and renew a right spirit within me; cast me not away from Thy presence, and take not Thy Holy Spirit from me."

135 It was supposed that sin originated only from the body, and that good impulses come from the mind; 136 therefore the Psalmist invokes the aid of God against the bodily appetites, but prays that the spirit which the Lord, the Holy One, had given you might be renewed.

137 Again, inasmuch as the Bible, in concession to popular ignorance, describes God as having a mind, a heart, emotions--nay, even a body and breath-- 138 the expression Spirit of the Lord is used for God's mind, disposition, emotion, strength, or breath.

139 Thus, Isaiah, chapter-40, verse:13: "Who hath disposed the Spirit of the Lord?" i.e. who, save Himself, hath caused the mind of the Lord to will anything,? 140 And Isaiah, chapter-63, verse:10: "But they rebelled, and vexed the Holy Spirit."

141 The phrase comes to be used of the law of Moses, which in a sense expounds God's will, Isaiah, chapter-43, verse:11, "Where is He that put His Holy Spirit within him?" meaning, as we clearly gather from the context, the law of Moses.

142 Nehemiah, speaking of the giving of the law, says, in chapter-1, verse:20, "Thou gavest also thy good Spirit to instruct them."

143 This is referred to in Deuteronomy. Chapter-4, verse:6, "This is your wisdom and understanding," and in Psalm, chapter-143, verse:10, "Thy good Spirit will lead me into the land of uprightness."

144 The Spirit of the Lord may mean the breath of the Lord, for breath, no less than a mind, a heart, and a body are attributed to God in Scripture, as in Psalm, chapter-33, verse:6.

145 Hence it gets to mean the power, strength, or faculty of God, as in Job, chapter-33, verse:4, "The Spirit of the Lord made me," i.e.

the power, or, if you prefer, the decree of the Lord.

146 So the Psalmist in poetic language declares, chapter-33, verse:6, "By the word of the Lord were the heavens made, and all the host of them by the breath of His mouth," i.e. by a mandate issued, as it were, in one breath.

147 Also Psalm, chapter-139, verse:7, "Whither shall I go from Thy Spirit, or whither shall I flee from Thy presence?" i.e. whither shall I go so as to be beyond Thy power and Thy presence?

148 Lastly, the Spirit of the Lord is used in Scripture to express the emotions of God, e.g. His kindness and mercy, Micah, chapter-2, verse:7, "Is the Spirit i.e. the mercy of the Lord straitened?

149 Are these cruelties His doings?"

150 Zechariah, chapter-4, verse:6, "Not by might or by power, but My Spirit [i.e. mercy], saith the Lord of hosts."

151 The twelfth verse of the seventh chapter of the same prophet must, I think, be interpreted in like manner: "Yea, they made their hearts as an adamant stone, lest they should hear the law, and the words which the Lord of hosts hath sent in His Spirit i.e. in His mercy by the former prophets."

152 So also Haggai, chapter-2, verse:5: "So My Spirit remaineth among you: fear not."

153 The passage in Isaiah, chapter-48, verse:16, "And now the Lord and His Spirit hath sent me," may be taken to refer to God's mercy or His revealed law; 154 for the prophet says, "From the beginning" (i.e. from the time when I first came to you, to preach God's anger and His sentence forth against you) "I spoke not in secret; 155 from the time that it was, there am I," and now I am sent by the mercy of God as a joyful messenger to preach your restoration.

156 Or we may understand him to mean by the revealed law that he had before come to warn them by the command of the law (Leviticus, chapter-19, verse:17) 157 in the same manner under the same conditions as Moses had warned them, that now, like Moses, he ends by preaching their restoration.

158 But the first explanation seems to me the best.

PROPHECY

159 Returning, then, to the main object of our discussion, we find that the Scriptural phrases, "The Spirit of the Lord was upon a prophet," "The Lord breathed His Spirit into humans," "Humans were filled with the Spirit of God, with the Holy Spirit," 160 are quite clear to us, and mean that prophets were endowed with a peculiar and extraordinary power, and devoted themselves to piety with especial constancy; 161 that thus they perceived the mind or the thought of God, for we have shown that God's Spirit signifies in Hebrew God's mind or thought, and that the law which shows His mind and thought is called His Spirit; 162 hence that the imagination of the prophets, inasmuch as through it were revealed the decrees of God, may equally be called the mind of God, and the prophets be said to have possessed the mind of God.
163 On our minds also the mind of God and His eternal thoughts are impressed; 164 but this being the same for all humans is less taken into account, especially by the Hebrews, who claimed a pre-eminence, and despised other people and other people's knowledge.
165 Lastly, the prophets were said to possess the Spirit of God because people knew not the cause of prophetic knowledge, and in their wonder referred it with other marvels directly to the Deity, styling it Divine knowledge.
166 We need no longer scruple to affirm that the prophets only perceived God's revelation by the aid of imagination, that is, by words and figures either real or imaginary.
167 We find no other means mentioned in Scripture, and therefore must not invent any.
168 As to the particular Law of Nature by which the communications took place, I confess my ignorance.
169 I might, indeed, say as others do, that they took place by the power of God; but this would be mere trifling, and no better than explaining some unique specimen by a transcendental term.
170 Everything takes place by the power of God.
171 Nature Herself is the power of God under another name, and our ignorance of the power of God is

co-extensive with our ignorance of Nature.

172 It is absolute folly, therefore, to ascribe an event to the power of God when we know not its natural cause, which is the power of God.

173 However, we are not now inquiring into the causes of prophetic knowledge.

174 We are only attempting, as I have said, to examine the Scriptural documents, and to draw our conclusions from them as from ultimate natural facts; the causes of the documents do not concern us.

175 As the prophets perceived the revelations of God by the aid of imagination, they could indisputably perceive much that is beyond the boundary of the intellect, 176 for many more ideas can be constructed from words and figures than from the principles and notions on which the whole fabric of reasoned knowledge is reared.

177 Thus we have a clue to the fact that the prophets perceived nearly everything in parables and allegories, and clothed spiritual truths in bodily forms, for such is the usual method of imagination.

178 We need no longer wonder that Scripture and the prophets speak so strangely and obscurely of God's Spirit or Mind (cf. Numbers, chapter-11, verse:17, 1 Kings, chapter-22, verse:21), 179 that the Lord was seen by Micah as sitting, by Daniel as an old man clothed in white, by Ezekiel as a fire, that the Holy Spirit appeared to those with Christ as a descending dove, to the apostles as fiery tongues, to Paul on his conversion as a great light.

180 All these expressions are plainly in harmony with the current ideas of God and spirits.

181 Inasmuch as imagination is fleeting and inconstant, we find that the power of prophecy did not remain with a prophet for long, nor manifest itself frequently, but was very rare; manifesting itself only in a few people, and in them not often.

182 We must necessarily inquire how the prophets became assured of the truth of what they perceived by imagination, and not by sure mental laws; 183 but our investigation must be confined to Scripture, for the subject is one on which we cannot acquire certain knowledge, and which we cannot

explain by the immediate causes. 184 Scripture teaching about the assurance of prophets I will treat of in the next chapter.

OF PROPHETS
Benedict of Spinoza

2 It follows from the last chapter that, as I have said, the prophets were endowed with unusually vivid imaginations, and not with unusually perfect minds. 2 This conclusion is amply sustained by Scripture, for we are told that Solomon was the wisest of humans, but had no special faculty of prophecy.

3 Heman, Calcol, and Dara, though men of great talent, were not prophets, whereas uneducated countrymen, nay, even women, such as Hagar, Abraham's handmaid, were thus gifted. 4 Nor is this contrary to ordinary experience and reason. 5 People of great imaginative power are less fitted for abstract reasoning, whereas those who excel in intellect and its use keep their imagination more restrained and controlled, holding it in subjection, so to speak, lest it should usurp the place of reason. 6 Thus to suppose that knowledge of natural and spiritual phenomena can be gained from the prophetic books, is an utter mistake, which I shall endeavour to expose, as I think philosophy, the age, and the question itself demand. 7 I care not for the girdings of superstition, for superstition is the bitter enemy, of all true knowledge and true morality.

8 Yes; it has come to this! 9 People who openly confess that they can form no idea of God, and only know Him through created things, of which they know not the causes, can unblushingly accuse philosophers of Atheism. 10 Treating the question methodically, I will show that prophecies varied, not only according to the imagination and physical temperament of the prophet, but also according to individual particular opinions; 11 and further that prophecy never rendered the prophet wiser than individual was before. 12 But I will first discuss the assurance of truth which the prophets received, for this is akin to the subject-matter of

the chapter, and will serve to elucidate somewhat our present point.

13 Imagination does not, in its own nature, involve any certainty of truth, such as is implied in every clear and distinct idea, but requires some extrinsic reason to assure us of its objective reality: 14 hence prophecy cannot afford certainty, and the prophets were assured of God's revelation by some sign, and not by the fact of revelation, 15 as we may see from Abraham, who, when he had heard the promise of God, demanded a sign, not because he did not believe in God, but because he wished to be sure that it was God Who made the promise. 16 The fact is still more evident in the case of Gideon: "Show me," he says to God, "show me a sign, that I may know that it is Thou that talkest with me." 17 God also says to Moses: "And let this be a sign that I have sent thee." 18 Hezekiah, though he had long known Isaiah to be a prophet, none the less demanded a sign of the cure which he predicted. 19 It is thus quite evident that the prophets always received some sign to certify them of their prophetic imaginings; 20 and for this reason Moses bids the Jews (Deuteronomy, chapter-18) ask of the prophets a sign, namely, the prediction of some coming event. 21 In this respect, prophetic knowledge is inferior to natural knowledge, which needs no sign, and in itself implies certitude.

22 Moreover, Scripture warrants the statement that the certitude of the prophets was not mathematical, but moral. 23 Moses lays down the punishment of death for the prophet who preaches new gods, even though he confirm his doctrine by signs and wonders (Deuteronomy, chapter-13); "For," he says, "the Lord also worketh signs and wonders to try His people." 24 And Jesus Christ warns His disciples of the same thing (Matthew, chapter-24, verse:24). 25 Furthermore, Ezekiel (chapter-14, verse:9) plainly states that God sometimes deceives people with false revelations; and Micaiah bears like witness in the case of the prophets of Ahab.

26 Although these instances go to prove that revelation is open to doubt, it nevertheless contains, as we have said, a considerable

element of certainty, 27 for God never deceives the good, nor His chosen, but (according to the ancient proverb, and as appears in the history of Abigail and her speech), God uses the good as instruments of goodness, and the wicked as means to execute His wrath. 28 This may be seen from the case of Micaiah above quoted; for although God had determined to deceive Ahab, through prophets, He made use of lying prophets; to the good prophet He revealed the truth, and did not forbid his proclaiming it.

29 Still the certitude of prophecy, remains, as I have said, merely, moral; for no one can justify oneself before God, nor boast that you are an instrument for God's goodness. 30 Scripture itself teaches and shows that God led away David to number the people, though it bears ample witness to David's piety. 31 The whole question of the certitude of prophecy, was based on these three considerations:

32 (1.) That the things revealed were imagined very vividly, affecting the prophets in the same way as things seen when awake; (2.) The presence of a sign; (3.) Lastly, and chiefly, that the mind of the prophet was given wholly, to what was right and good.

33 Although Scripture does not always make mention of a sign, we must nevertheless suppose that a sign was always vouchsafed; 34 for Scripture does not always relate every condition and circumstance (as many have remarked), but rather takes them for granted. 35 We may, however, admit that no sign was needed when the prophecy declared nothing that was not already contained in the law of Moses, because it was confirmed by that law.

36 For instance, Jeremiah's prophecy, of the destruction of Jerusalem was confirmed by the prophecies of other prophets, and by the threats in the law, and, therefore, it needed no sign; 37 whereas Hananiah, who, contrary to all the prophets, foretold the speedy restoration of the State, stood in need of a sign, or he would have been in doubt as to the truth of his prophecy, until it was confirmed by facts. 38 "The prophet which prophesieth of peace, when the word of the

prophet shall come to pass, then shall the prophet be known that the Lord hath truly sent him."

39 As, then, the certitude afforded to the prophet by signs was not mathematical (i.e. did not necessarily follow from the perception of the thing perceived or seen), but only moral, 40 and as the signs were only given to convince the prophet, it follows that such signs were given according to the opinions and capacity of each prophet, so that a sign which convince one prophet would fall far short of convincing another who was imbued with different opinions. 41 Therefore the signs varied according to the individual prophet.

42 So also did the revelation vary, as we have stated, according to individual disposition and temperament, and according to the opinions previously held. 43 It varied according to disposition, in this way: if a prophet was cheerful, victories, peace, and events which make people glad, were revealed to the self; in that the prophet was naturally more likely to imagine such things. 44 If, on the contrary, the prophet was melancholy, wars, massacres, and calamities were revealed; and so, according as a prophet was merciful, gentle, quick to anger, or severe, would be more fitted for one kind of revelation than another. 45 It varied according to the temper of imagination in this way: if a prophet was cultivated and perceived the mind of God in a cultivated way, if was confused to perceived it confusedly. 46 And so with revelations perceived through visions. 47 If a prophet was a countryman he saw visions of oxen, cows, and the like; if he was a soldier, he saw generals and armies; if a courtier, a royal throne, and so on.

48 Lastly, prophecy varied according to the opinions held by the prophets; for instance, to the Magi, who believed in the follies of astrology, the birth of Christ was revealed through the vision of a star in the East. 49 To the augurs of Nebuchadnezzar the destruction of Jerusalem was revealed through entrails, whereas the king himself inferred it from oracles and the direction of arrows which he shot into the air. 50 To prophets who believed that man acts from free

choice and by his own power, God was revealed as standing apart from and ignorant of future human actions. 51 All of which we will illustrate from Scripture.

52 The first point is proved from the case of Elisha, who, in order to prophecy to Jehoram, asked for a harp, and was unable to perceive the Divine purpose till he had been recreated by its music; 53 then, indeed, he prophesied to Jehoram and to his allies glad tidings, which previously he had been unable to attain to because he was angry with the king, and these who are angry with anyone can imagine evil of him, but not good. 54 The theory that God does not reveal Himself to the angry or the sad, is a mere dream: for God revealed to Moses while angry, the terrible slaughter of the firstborn, and did so without the intervention of a harp.

55 To Cain in his rage, God was revealed, and to Ezekiel, impatient with anger, was revealed the contumacy and wretchedness of the Jews. 56 Jeremiah, miserable and weary of life, prophesied the disasters of the Hebrews, so that Josiah would not consult him, but inquired of a woman, inasmuch as it was more in accordance with womanly nature that God should reveal His mercy thereto. 57 So, Micaiah never prophesied good to Ahab, though other true prophets had done so, but invariably evil. 58 Thus we see that individual prophets were by temperament more fitted for one sort of revelation than another.

59 The style of the prophecy also varied according to the eloquence of the individual prophet. 60 The prophecies of Ezekiel and Amos are not written in a cultivated style like those of Isaiah and Nahum, but more rudely. 61 Any Hebrew scholar who wishes to inquire into this point more closely, and compares chapters of the different prophets treating of the same subject, will find great dissimilarity of style. 62 Compare, for instance, chapter-1 of the courtly Isaiah, verse 11-20, with chapter-5 of the countryman Amos, verses 21-24. 63 Compare also the order and reasoning of the prophecies of Jeremiah, written in Idumaea (chapter-49), with the order and reasoning of Obadiah. 64 Compare, lastly, Isaiah, chapter-

40, verse:19-20, and chapter-44, verse:8, with Hosea, chapter-8, verse:6, and chapter-8, verse:2. And so on.

65 A due consideration of these passage will clearly show us that God has no particular style in speaking, but, according to the learning and capacity of the prophet, is cultivated, compressed, severe, untutored, prolix, or obscure. 66 There was, moreover, a certain variation in the visions vouchsafed to the prophets, and in the symbols by which they expressed them, for Isaiah saw the glory of the Lord departing from the Temple in a different form from that presented to Ezekiel. 67 The Rabbis, indeed, maintain that both visions were really the same, but that Ezekiel, being a countryman, was above measure impressed by it, and therefore set it forth in full detail; 68 but unless there is a trustworthy tradition on the subject, which I do not for a moment believe, this theory is plainly an invention. 69 Isaiah saw seraphim with six wings, Ezekiel beasts with four wings; Isaiah saw God clothed and sitting on a royal throne, Ezekiel saw Him in the likeness of a fire; each doubtless saw God under the form in which he usually imagined Him.

70 Further, the visions varied in clearness as well as in details; for the revelations of Zechariah were too obscure to be understood by the prophet without explanation, as appears from his narration of them; 71 the visions of Daniel could not be understood by him even after they had been explained, and this obscurity did not arise from the difficulty of the matter revealed (for being merely human affairs, these only transcended human capacity in being future), 72 but solely in the fact that Daniel's imagination was not so capable for prophecy while he was awake as while he was asleep; 73 and this is further evident from the fact that at the very beginning of the vision he was so terrified that he almost despaired of his strength. 74 Thus, on account of the inadequacy of his imagination and his strength, the things revealed were so obscure to him that he could not understand them even after they had been explained. 75 Here we may note that the words heard by

Daniel, were, as we have shown above, simply imaginary, so that it is hardly wonderful that in his frightened state he imagined them so confusedly and obscurely that afterwards he could make nothing of them.

76 Those who say that God did not wish to make a clear revelation, do not seem to have read the words of the angel, who expressly says that He came to make the prophet understand what should befall His people in the latter days (Daniel, chapter-10, verse:14). 77 The revelation remained obscure because no one was found, at that time, with imagination sufficiently strong to conceive it more clearly. 78 Lastly, the prophets, to whom it was revealed that God would take away Elijah, wished to persuade Elisha that he had been taken somewhere where they would find him; showing sufficiently clearly that they had not understood God's revelation aright.

79 There is no need to set this out more amply, for nothing is more plain in the Bible than that God endowed some prophets with far greater gifts of prophecy than others. 80 But I will show in greater detail and length, for I consider the point more important, that the prophecies varied according to the opinions previously embraced by the prophets, and that the prophets held diverse and even contrary opinions and prejudices. 81 (I speak, be it understood, solely of matters speculative, for in regard to uprightness and morality the case is widely different.) 82 From thence I shall conclude that prophecy never rendered the prophets more learned, but left them with their former opinions, and that we are, therefore, not at all bound to trust them in matters of intellect.

83 Everyone has been strangely hasty in affirming that the prophets knew everything within the scope of human intellect; and, although certain passages of Scripture plainly affirm that the prophets were in certain respects ignorant, 84 such persons would rather say that they do not understand the passages than admit that there was anything which the prophets did not know; or else they try to wrest the Scriptural words away from their evident meaning. 85 If either

of these proceedings is allowable we may as well shut our Bibles, for vainly shall we attempt to prove anything from them if their plainest passages may be classed among obscure and impenetrable mysteries, or if we may put any interpretation on them which we fancy. 86 For instance, nothing is more clear in the Bible than that Joshua, and perhaps also the author who wrote his history, thought that the sun revolves round the earth, and that the earth is fixed, and further that the sun for a certain period remained still. 87 Many, who will not admit any movement in the heavenly bodies, explain away the passage till it seems to mean something quite different; 88 others, who have learned to philosophise more correctly, and understand that the earth moves while the sun is still, or at any rate does not revolve round the earth, try with all their might to wrest this meaning from Scripture, though plainly nothing of the sort is intended. 89 Such quibblers excite my wonder! 90 Are we, forsooth, bound to believe that Joshua the Soldier was a learned astronomer? Or that a miracle could not be revealed to him, or that the light of the sun could not remain longer than usual above the horizon, without his knowing the cause?

91 To me both alternatives appear ridiculous, and therefore I would rather say, that Joshua was ignorant of the true cause of the lengthened day, 92 and that he and the whole host with him thought that the sun moved round the earth every day, and that on that particular occasion it stood still for a time, thus causing the light to remain longer; 93 and I would say, that they did not conjecture that, from the amount of snow in the air (see Joshua, chapter-10, verse:11), the refraction may have been greater than usual, or that there may have been some other cause which we will not now inquire into.

94 So also the sign of the shadow going back was revealed to Isaiah according to his understanding; that is, as proceeding from a going backwards of the sun; 95 for he, too, thought that the sun moves and that the earth is still; of parhelia he perhaps never even dreamed. 96 We may arrive at this

conclusion without any scruple, for the sign could really have come to pass, and have been predicted by Isaiah to the king, without the prophet being aware of the real cause.

97 With regard to the building of the Temple by Solomon, if it was really dictated by God we must maintain the same doctrine: namely, that all the measurements were revealed according to the opinions and understanding of the king; 98 for as we are not bound to believe that Solomon was a mathematician, we may affirm that he was ignorant of the true ratio between the circumference and the diameter of a circle, and that, like the generality of workmen, he thought that it was as three to one. 99 But if it is allowable to declare that we do not understand the passage, in good sooth I know nothing in the Bible that we can understand; for the process of building is there narrated simply and as a mere matter of history. 100 If, again, it is permitted to pretend that the passage has another meaning, and was written as it is from some reason unknown to us, this is no less than a complete subversal of the Bible; 101 for every absurd and evil invention of human perversity could thus, without detriment to Scriptural authority, be defended and fostered.

102 Our conclusion is in no wise impious, for though Solomon, Isaiah, Joshua, were prophets, they were none the less humans, and as such not exempt from human shortcomings. 103 According to the understanding of Noah it was revealed to him that God as about to destroy the whole human race, for Noah thought that beyond the limits of Palestine the world was not inhabited. 104 Not only in matters of this kind, but in others more important, the prophets could be, and in fact were, ignorant; 105 for they taught nothing special about the Divine attributes, but held quite ordinary notions about God, and to these notions their revelations were adapted, as I will demonstrate by ample Scriptural testimony; 106 from all which one may easily see that they were praised and commended, not so much for the sublimity and eminence of their intellect as for their piety and faithfulness.

107 Adam, the first man to whom God was revealed, did not know that He is omnipotent and omniscient; for he hid himself from Him, and attempted to make excuses for his fault before God, as though he had had to do with a man; 108 therefore to him also was God revealed according to his understanding-- that is, as being unaware of his situation or his sin, 109 for Adam heard, or seemed to hear, the Lord walking in the garden, calling him and asking him where he was; and then, on seeing his shamefacedness, asking him whether he had eaten of the forbidden fruit. 110 Adam evidently only knew the Deity as the Creator of all things. 111 To Cain also God was revealed, according to his understanding, as ignorant of human affairs, nor was a higher conception of the Deity required for repentance of his sin.

112 To Laban the Lord revealed Himself as the God of Abraham, because Laban believed that each nation had its own special divinity (see Genesis, chapter-31, verse:29).

113 Abraham also knew not that God is omnipresent, and has foreknowledge of all things; for when he heard the sentence against the inhabitants of Sodom, he prayed that the Lord should not execute it till He had ascertained whether they all merited such punishment; 114 for he said (see Genesis, chapter-18, verse:24), "Peradventure there be fifty righteous within the city," and in accordance with this belief God was revealed to him; 115 as Abraham imagined, He spake thus: "I will go down now, and see whether they have done altogether according to the cry of it which is come unto Me; and, if not, I will know." 116 Further, the Divine testimony concerning Abraham asserts nothing but that he was obedient, and that he "commanded his household after him that they should keep the way of the Lord" (Genesis, chapter-18, verse:19); it does not state that he held sublime conceptions of the Deity.

117 Moses, also, was not sufficiently aware that God is omniscient, and directs human actions by His sole decree, 118 for although God Himself says that the Israelites should hearken to Him, Moses still considered the

matter doubtful and repeated, "But if they will not believe me, nor hearken unto my voice." 119 To him in like manner God was revealed as taking no part in, and as being ignorant of, future human actions: 120 the Lord gave him two signs and said, "And it shall come to pass that if they will not believe thee, neither hearken to the voice of the first sign, that they will believe the voice of the latter sign; but if not, thou shalt take of the water of the river," 121 Indeed, if any one considers without prejudice the recorded opinions of Moses, he will plainly see that Moses conceived the Deity as a Being Who has always existed, does exist, and always will exist, 122 and for this cause he calls Him by the name Jehovah, which in Hebrew signifies these three phases of existence: 123 as to His nature, Moses only taught that He is merciful, gracious, and exceeding jealous, as appears from many passages in the Pentateuch. 124 Lastly, he believed and taught that this Being was so different from all other beings, that He could not be expressed by the image of any visible thing; 125 also, that He could not be looked upon, and that not so much from inherent impossibility as from human infirmity; further, that by reason of His power He was without equal and unique. 126 Moses admitted, indeed, that there were beings (doubtless by the plan and command of the Lord) who acted as God's vicegerents-- that is, beings to whom God had given the right, authority, and power to direct nations, and to provide and care for them; 127 but he taught that this Being Whom they were bound to obey was the highest and Supreme God, or (to use the Hebrew phrase) God of gods, 128 and thus in the song (Exodus, chapter-15, verse:11) he exclaims, "Who is like unto Thee, O Lord, among the gods?" and Jethro says (Exodus, chapter-18, verse:11), "Now I know that the Lord is greater than all gods." 129 That is to say, "I am at length compelled to admit to Moses that Jehovah is greater than all gods, and that His power is unrivalled."

130 We must remain in doubt whether Moses thought that these beings who acted as God's vicegerents were created by Him,

for he has stated nothing, so far as we know, about their creation and origin. 131 He further taught that this Being had brought the visible world into order from Chaos, and had given Nature Her germs, and therefore that He possesses supreme right and power over all things; 132 further, that by reason of this supreme right and power He had chosen for Himself alone the Hebrew nation and a certain strip of territory, 133 and had handed over to the care of other gods substituted by Himself the rest of the nations and territories, and that therefore He was called the God of Israel and the God of Jerusalem, whereas the other gods were called the gods of the Gentiles.

134 For this reason the Jews believed that the strip of territory which God had chosen for Himself, demanded a Divine worship quite apart and different from the worship which obtained elsewhere, and that the Lord would not suffer the worship of other gods adapted to other countries. 135 Thus they thought that the people whom the king of Assyria had brought into Judaea were torn in pieces by lions because they knew not the worship of the National Divinity (2 Kings, chapter-17, verse:25).

136 Jacob, according to Aben Ezra's opinion, therefore admonished his sons when he wished them to seek out a new country, 137 that they should prepare themselves for a new worship, and lay aside the worship of strange gods-- that is, of the gods of the land where they were (Genesis, chapter-35, verses:2-3).

138 David, in telling Saul that he was compelled by the king's persecution to live away from his country, said that he was driven out from the heritage of the Lord, and sent to worship other gods (1 Samuel, chapter-26, verse:19). 139 Lastly, he believed that this Being or Deity had His habitation in the heavens (Deuteronomy, chapter-33, verse:27), an opinion very common among the Gentiles.

140 If we now examine the revelations to Moses, we shall find that they were accommodated to these opinions; 141 as he believed that the Divine Nature was subject to the conditions of mercy, graciousness, so God was revealed

to him in accordance with his idea and under these attributes (see Exodus, chapter-34, verses:6-7, and the second commandment). 142 Further it is related (Exodus, chapter-33, verse:18) that Moses asked of God that he might behold Him, but as Moses (as we have said) had formed no mental image of God, 143 and God (as I have shown) only revealed Himself to the prophets in accordance with the disposition of their imagination, He did not reveal Himself in any form. 144 This, I repeat, was because the imagination of Moses was unsuitable, for other prophets bear witness that they saw the Lord; for instance, Isaiah, Ezekiel, Daniel. 145 For this reason God answered Moses, "Thou canst not see My face;" and inasmuch as Moses believed that God can be looked upon-- that is, that no contradiction of the Divine Nature is therein involved (for otherwise he would never have preferred his request)-- 146 it is added, "For no one shall look on Me and live," thus giving a reason in accordance with Moses' idea, 147 for it is not stated that a contradiction of the Divine Nature would be involved, as was really the case, but that the thing would not come to pass because of human infirmity.

148 When God would reveal to Moses that the Israelites, because they worshipped the calf, were to be placed in the same category as other nations, He said (Exodus, Chapter-33, verses:2-3), that He would send an angel 149 that is, a being who should have charge of the Israelites, instead of the Supreme Being, and that He Himself would no longer remain among them; 150 thus leaving Moses no ground for supposing that the Israelites were more beloved by God than the other nations whose guardianship He had entrusted to other beings or angels (verse:16).

151 Lastly, as Moses believed that God dwelt in the heavens, God was revealed to him as coming down from heaven on to a mountain, 152 and in order to talk with the Lord Moses went up the mountain, which he certainly need not have done if he could have conceived of God as omnipresent.

153 The Israelites knew scarcely anything of God, although He was

revealed to them; and this is abundantly evident from their transferring, a few days afterwards, the honour and worship due to Him to a calf, which they believed to be the god who had brought them out of Egypt. 154 In truth, it is hardly likely that people accustomed to the superstitions of Egypt, uncultivated and sunk in most abject slavery, should have held any sound notions about the Deity, or that Moses should have taught them anything beyond a rule of right living; 155 inculcating it not like a philosopher, as the result of freedom, but like a lawgiver compelling them to be moral by legal authority. 156 Thus the rule of right living, the worship and love of God, was to them rather a bondage than the true liberty, the gift and grace of the Deity. 157 Moses bid them love God and keep His law, because they had in the past received benefits from Him (such as the deliverance from slavery in Egypt), 158 and further terrified them with threats if they transgressed His commands, holding out many promises of good if they should observe them; thus treating them as parents treat irrational children. 159 It is, therefore, certain that they knew not the excellence of virtue and the true happiness.

160 Jonah thought that he was fleeing from the sight of God, which seems to show that he too held that God had entrusted the care of the nations outside Judaea to other substituted powers. 161 No one in the whole of the Old Testament speaks more rationally of God than Solomon, who in fact surpassed all the people of his time in natural ability. 162 Yet he considered himself above the law (esteeming it only to have been given for people without reasonable and intellectual grounds for their actions), and made small account of the laws concerning kings, which are mainly three: 163 nay, he openly violated them (in this he did wrong, and acted in a manner unworthy of a philosopher, by indulging in sensual pleasure), and taught that all 164 Fortune's favours to humankind are vanity, that humanity has no nobler gift than wisdom, and no greater

punishment than folly. (See Proverbs, chapter-16, verses:22-23).

165 But let us return to the prophets whose conflicting opinions we have undertaken to note. 166 The expressed ideas of Ezekiel seemed so diverse from those of Moses to the Rabbis who have left us the extant prophetic books (as is told in the treatise of Sabbathus, i:13, 2), 167 that they had serious thoughts of omitting his prophecy from the canon, and would doubtless have thus excluded it if a certain Hananiah had not undertaken to explain it; a task which (as is there narrated) he with great zeal and labour accomplished. 168 How he did so does not sufficiently appear, whether it was by writing a commentary which has now perished, or by altering Ezekiel's words and audaciously striking out phrases according to his fancy. 169 However this may be, chapter xviii. certainly does not seem to agree with Exodus, chapter-34, verse:7, Jeremiah, chapter-32, verses:18.

170 Samuel believed that the Lord never repented of anything He had decreed (1 Samuel, chapter-15, verse:29), for when Saul was sorry for his sin, and wished to worship God and ask for forgiveness, Samuel said that the Lord would not go back from his decree.

171 To Jeremiah, on the other hand, it was revealed that, "If that nation against whom I (the Lord) have pronounced, turn from their evil, I will repent of the evil that I thought to do unto them. 172 If it do evil in my sight, that it obey not my voice, then I will repent of the good wherewith I said I would benefit them" (Jeremiah, chapter-18, verses:8-10).

173 Joel (chapter-2, verse:13) taught that the Lord repented Him only of evil.

174 Lastly, it is clear from Genesis, chapter-4, verse:7 that a person can overcome the temptations of sin, and act righteously; for this doctrine is told to Cain, though, as we learn from Josephus and the Scriptures, he never did so overcome them. 175 And this agrees with the chapter of Jeremiah just cited, for it is there said that the Lord repents of the good or the evil pronounced, if the people in question change their ways and manner of life. 176 But,

on the other hand, Paul (in Romans, chapter-9, verse:10) teaches as plainly as possible that humans have no control over the temptations of the flesh save by the special vocation and grace of God. 177 And when (in Romans, chapter-3, verse:5 and chapter-6, verse:19) he attributes righteousness to human, he corrects himself as speaking merely humanly and through the infirmity of the flesh.

178 We have now more than sufficiently proved our point, that God adapted revelations to the understanding and opinions of the prophets, 179 and that in matters of theory without bearing on charity or morality the prophets could be, and, in fact, were, ignorant, and held conflicting opinions. 180 It therefore follows that we must by no means go to the prophets for knowledge, either of natural or of spiritual phenomena.

181 We have determined, then, that we are only bound to believe in the prophetic writings, the object and substance of the revelation; with regard to the details, every one may believe or not, as you likes. 182 For instance, the revelation to Cain only teaches us that God admonished him to lead the true life, for such alone is the object and substance of the revelation, not doctrines concerning free-will and philosophy. 183 Hence, though the freedom of the Will is clearly implied in the words of the admonition, we are at liberty to hold a contrary opinion, since the words and reasons were adapted to the understanding of Cain.

184 So, too, the revelation to Micaiah would only teach that God revealed to him the true issue of the battle between Ahab and Aram; and this is all we are bound to believe. 185 Whatever else is contained in the revelation concerning the true and the false Spirit of God, the army of heaven standing on the right hand and on the left, and all the other details, does not affect us at all. 186 Everyone may believe as much of it as your reason allows. 187 The reasonings by which the Lord displayed His power to Job (if they really were a revelation, and the author of the history is narrating, and not merely, as some suppose, rhetorically adorning his own conceptions), would come under

the same category-- 188 that is, they were adapted to Job's understanding, for the purpose of convincing him, and are not universal, or for the convincing of all humans.

189 We can come to no different conclusion with respect to the reasonings of Christ, by which He convicted the Pharisees of pride and ignorance, and exhorted His disciples to lead the true life. 190 He adapted them to each person's opinions and principles. 191 For instance, when He said to the Pharisees (Matthew, chapter-12, verse:26), "And if Satan cast out devils, his house is divided against itself, how then shall his kingdom stand?" 192 He only wished to convince the Pharisees according, to their own principles, not to teach that there are devils, or any kingdom of devils. 193 So, too, when He said to His disciples (Matthew, chapter-18, verse:10), "See that ye despise not one of these little ones, for I say unto you that their angels," 194 He merely desired to warn them against pride and despising any of their fellows, not to insist on the actual reason given, which was simply adopted in order to persuade them more easily.

195 Lastly, we should say exactly the same of the apostolic signs and reasonings, but there is no need to go further into the subject. 196 If I were to enumerate all the passages of Scripture addressed only to individuals, or to a particular human's understanding, and which cannot, without great danger to philosophy, be defended as Divine doctrines, I should go far beyond the brevity at which I aim. 197 Let it suffice, then, to have indicated a few instances of general application, and let the curious reader consider others by yourself.

198 Although the points we have just raised concerning prophets and prophecy are the only ones which have any direct bearing on the end in view, namely, the separation of Philosophy from Theology, 199 still, as I have touched on the general question, I may here inquire whether the gift of prophecy was peculiar to the Hebrews, or whether it was common to all nations. 200 I must then come to a conclusion about the vocation of the Hebrews, all of

which I shall do in the ensuing chapter.

OF THE VOCATION OF THE HEBREWS, AND WHETHER THE GIFT OF PROPHECY WAS PECULIAR TO THEM

Benedict of Spinoza

3 Every human's true happiness and blessedness consist solely in the enjoyment of what is good, not in the pride that you alone is enjoying it, to the exclusion of others. 2 You who thinks yourself the more blessed because you are enjoying benefits which others are not, or because you are more blessed or more fortunate than your fellows, is ignorant of true happiness and blessedness, 3 and the joy which you feels is either childish or envious and malicious. 4 For instance, a human's true happiness consists only in wisdom, and the knowledge of the truth, 5 not at all in the fact that you are wiser than others, or that others lack such knowledge: such considerations do not increase your wisdom or true happiness. 6 Whoever, therefore, rejoices for such reasons, rejoices in another's misfortune, and is, so far, malicious and bad, knowing neither true happiness nor the peace of the true life.

7 When Scripture, therefore, in exhorting the Hebrews to obey the law, says that the Lord has chosen them for Himself before other nations (Deuteronomy, chapter-10, verse:15); that He is near them, but not near others (Deuteronomy, chapter-4, verse:7); 8 that to them alone He has given just laws (Deuteronomy, chapter-4, verse:8); and, lastly, that He has marked them out before others (Deuteronomy, chapter-4, verse:32); 9 it speaks only according to the understanding of its hearers, who, as we have shown in the last chapter, and as Moses also testifies (Deuteronomy, chapter-4, verses:6 and 7), knew not true blessedness. 10 For in good sooth they would have been no less blessed if God had called all humans equally to salvation, nor would God have been less present to them for being equally present to others; 11 their laws, would have been no less just if they had been ordained for all, and

they themselves would have been no less wise. 12 The miracles would have shown God's power no less by being wrought for other nations also; 13 lastly, the Hebrews would have been just as much bound to worship God if He had bestowed all these gifts equally on all humans.

14 When God tells Solomon (1 Kings, chapter-3, verse:12) that no one shall be as wise as he in time to come, it seems to be only a manner of expressing surpassing wisdom; 15 it is little to be believed that God would have promised Solomon, for his greater happiness, that He would never endow anyone with so much wisdom in time to come; 16 this would in no wise have increased Solomon's intellect, and the wise king would have given equal thanks to the Lord if everyone had been gifted with the same faculties.

17 Still, though we assert that Moses, in the passages of the Pentateuch just cited, spoke only according to the understanding of the Hebrews, 18 we have no wish to deny that God ordained the Mosaic law for them alone, nor that He spoke to them alone, nor that they witnessed marvels beyond those which happened to any other nation; 19 but we wish to emphasise that Moses desired to admonish the Hebrews in such a manner, and with such reasonings as would appeal most forcibly to their childish understanding, and constrain them to worship the Deity. 20 Further, we wished to show that the Hebrews did not surpass other nations in knowledge, or in piety, but evidently in some attribute different from these; 21 or (to speak like the Scriptures, according to their understanding), that the Hebrews were not chosen by God before others for the sake of the true life and sublime ideas, though they were often thereto admonished, but with some other object. 22 What that object was, I will duly show. But before I begin, I wish in a few words to explain what I mean by the guidance of God, by the help of God, external and inward, and, lastly, what I understand by fortune.

23 By the help of God, I mean the fixed and unchangeable order of Nature or the chain of natural

events: 24 for I have said before and shown elsewhere that the universal Laws of Nature, according to which all things exist and are determined, are only another name for the eternal decrees of God, which always involve eternal truth and necessity. 25 So that to say that everything happens according to natural laws, and to say that everything is ordained by the decree and ordinance of God, is the same thing. 26 Now since the power in Nature is identical with the power of God, by which alone all things happen and are determined, 27 it follows that whatsoever human, as a part of Nature, provides the self with to aid and preserve own existence, or whatsoever Nature affords you without your help, is given to you solely by the Divine power, acting either through human nature or through external circumstance. 28 So whatever human nature can furnish itself with by its own efforts to preserve its existence, may be fitly called the inward aid of God, 29 whereas whatever else accrues to human's profit from outward causes may be called the external aid of God.

30 We can now easily understand what is meant by the election of God. 31 For since no one can do anything save by the predetermined order of Nature, that is by God's eternal ordinance and decree, 32 it follows that no one can choose a plan of life for own self, or accomplish any work save by God's vocation choosing you for the work or the plan of life in question, rather than any other. 33 Lastly, by fortune, I mean the ordinance of God in so far as it directs human life through external and unexpected means. 34 With these preliminaries I return to my purpose of discovering the reason why the Hebrews were said to be elected by God before other nations, and with the demonstration I thus proceed.

35 All objects of legitimate desire fall, generally speaking, under one of these three categories: (1.) The knowledge of things through their primary causes. (2.) The government of the passions, or the acquirement of the habit of virtue. (3.) Secure and healthy life.

36 The means which most directly conduce towards the first two of these ends, and which may be

considered their proximate and efficient causes are contained in human nature itself, so that their acquisition hinges only on our own power, and on the laws of human nature. 37 It may be concluded that these gifts are not peculiar to any nation, but have always been shared by the whole human race, unless, indeed, we would indulge the dream that Nature formerly created humans of different kinds. 38 But the means which conduce to security and health are chiefly in external circumstance, and are called the gifts of fortune because they depend chiefly on objective causes of which we are ignorant; 39 for a fool may be almost as liable to happiness or unhappiness as a wise person.

40 Nevertheless, human management and watchfulness can greatly assist towards living in security and warding off the injuries of our fellow-humans, and even of beasts. 41 Reason and experience show no more certain means of attaining this object than the formation of a society with fixed laws, the occupation of a strip of territory and the concentration of all forces, as it were, into one body, that is the social body. 42 Now for forming and preserving a society, no ordinary ability and care is required: 43 that society will be most secure, most stable, and least liable to reverses, which is founded and directed by far-seeing and careful people; 44 while, on the other hand, a society constituted by people without trained skill, depends in a great measure on fortune, and is less constant. 45 If, in spite of all, such a society lasts a long time, it is owing to some other directing influence than its own; 46 if it overcomes great perils and its affairs prosper, it will perforce marvel at and adore the guiding Spirit of God (in so far, that is, as God works through hidden means, and not through the nature and mind of human), 47 for everything happens to it unexpectedly and contrary to anticipation, it may even be said and thought to be by miracle.

48 Nations, then, are distinguished from one another in respect to the social organisation and the laws under which they live and are governed; 49 the Hebrew nation

was not chosen by God in respect to its wisdom nor its tranquillity of mind, but in respect to its social organisation and the good fortune with which it obtained supremacy and kept it so many years. This is abundantly clear from Scripture. 50 Even a cursory perusal will show us that the only respects in which the Hebrews surpassed other nations, are in their successful conduct of matters relating to government, and in their surmounting great perils solely by God's external aid; 51 in other ways they were on a par with their fellows, and God was equally gracious to all. 52 For in respect to intellect (as we have shown in the last chapter) they held very ordinary ideas about God and Nature, so that they cannot have been God's chosen in this respect; 53 nor were they so chosen in respect of virtue and the true life, for here again they, with the exception of a very few elect, were on an equality with other nations: 54 therefore their choice and vocation consisted only in the temporal happiness and advantages of independent rule.

55 In fact, we do not see that God promised anything beyond this to the patriarchs or their successors; 56 in the law no other reward is offered for obedience than the continual happiness of an independent commonwealth and other goods of this life; 57 while, on the other hand, against contumacy and the breaking of the covenant is threatened the downfall of the commonwealth and great hardships. 58 Nor is this to be wondered at; for the ends of every social organisation and commonwealth are (as appears from what we have said, and as we will explain more at length hereafter) security and comfort; 59 a commonwealth can only exist by the laws being binding on all.

60 If all the members of a state wish to disregard the law, by that very fact they dissolve the state and destroy the commonwealth. 61 Thus, the only reward which could be promised to the Hebrews for continued obedience to the law was security and its attendant advantages, 62 while no surer punishment could be threatened for disobedience, than the ruin of the state and the evils which

generally follow therefrom, 63 in addition to such further consequences as might accrue to the Jews in particular from the ruin of their especial state. 64 But there is no need here to go into this point at more length. 65 I will only add that the laws of the Old Testament were revealed and ordained to the Jews only, for as God chose them in respect to the special constitution of their society and government, they must, of course, have had special laws. 66 Whether God ordained special laws for other nations also, and revealed Himself to their lawgivers prophetically, that is, under the attributes by which the latter were accustomed to imagine Him, I cannot sufficiently determine.

67 It is evident from Scripture itself that other nations acquired supremacy and particular laws by the external aid of God; witness only the two following passages: 68 In Genesis. Chapter-14, verse:18, 19, 20, it is related that Melchisedek was king of Jerusalem and priest of the Most High God, that in exercise of his priestly functions he blessed Abraham, and that Abraham the beloved of the Lord gave to this priest of God a tithe of all his spoils. 69 This sufficiently shows that before He founded the Israelitish nation God constituted kings and priests in Jerusalem, and ordained for them rites and laws. 70 Whether He did so prophetically is, as I have said, not sufficiently clear; but I am sure of this, that Abraham, whilst he sojourned in the city, lived scrupulously according to these laws, for Abraham had received no special rites from God; 71 and yet it is stated (in Genesis, chapter-26, verse:5), that he observed the worship, the precepts, the statutes, and the laws of God, which must be interpreted to mean the worship, the statutes, the precepts, and the laws of king Melchisedek. 72 Malachi chides the Jews as follows (in chapter-1, verse:10-11.): "Who is there among you that will shut the doors? [of the Temple]; neither do ye kindle fire on mine altar for nought. 73 I have no pleasure in you, saith the Lord of Hosts. For from the rising of the sun, even until the going down of the same My Name shall be great

among the Gentiles; 74 and in every place incense shall be offered in My Name, and a pure offering; for My Name is great among the heathen, saith the Lord of Hosts." 75 These words, which, unless we do violence to them, could only refer to the current period, abundantly testify that the Jews of that time were not more beloved by God than other nations, 76 that God then favoured other nations with more miracles than He vouchsafed to the Jews, who had then partly recovered their empire without miraculous aid; 77 and, lastly, that the Gentiles possessed rites and ceremonies acceptable to God.

78 But I pass over these points lightly: it is enough for my purpose to have shown that the election of the Jews had regard to nothing but temporal physical happiness and freedom, 79 in other words, autonomous government, and to the manner and means by which they obtained it; consequently to the laws in so far as they were necessary to the preservation of that special government; and, lastly, to the manner in which they were revealed. 80 In regard to other matters, wherein human's true happiness consists, they were on a par with the rest of the nations.

81 When, therefore, it is said in Scripture (Deuteronomy, chapter-4, verse:7) that the Lord is not so nigh to any other nation as He is to the Jews, reference is only made to their government, and to the period when so many miracles happened to them, for in respect of intellect and virtue-- 82 that is, in respect of blessedness-- God was, as we have said already, and are now demonstrating, equally gracious to all. 83 Scripture itself bears testimony to this fact, for the Psalmist says (in chapter-145, verse:18), "The Lord is near unto all them that call upon Him, to all that call upon Him in truth." 84 So in the same Psalm, chapter-145, verse:9, "The Lord is good to all, and His tender mercies are over all His works." 85 In Psalm, chapter-33, verse:16, it is clearly stated that God has granted to all humans the same intellect, in these words, "He fashioneth their hearts alike." The heart was considered by the Hebrews, as I suppose everyone

knows, to be the seat of the soul and the intellect.

86 Lastly, from Job, chapter-38, verse:28, it is plain that God had ordained for the whole human race the law to reverence God, to keep from evil doing, or to do well, and that Job, although a Gentile, was of all people most acceptable to God, because he exceeded all in piety and religion. 87 Lastly, from Jonah, chapter-4, verse:2, it is very evident that, not only to the Jews but to all humans, God was gracious, merciful, long-suffering, and of great goodness, and repented Him of the evil, 88 for Jonah says: "Therefore I determined to flee before unto Tarshish, for I know that Thou art a gracious God, and merciful, slow to anger, and of great kindness," and that, therefore, God would pardon the Ninevites. 89 We conclude, therefore (inasmuch as God is to all humans equally gracious, and the Hebrews were only chosen by Him in respect to their social organisation and government), 90 that the individual Jew, taken apart from His social organisation and government, possessed no gift of God above other people, and that there was no difference between Jew and Gentile. 91 As it is a fact that God is equally gracious, merciful, and the rest, to all humans; and as the function of the prophet was to teach people not so much the laws of their country, as true virtue, and to exhort them thereto, 92 it is not to be doubted that all nations possessed prophets, and that the prophetic gift was not peculiar to the Jews.

93 Indeed, history, both profane and sacred, bears witness to the fact. 94 Although, from the sacred histories of the Old Testament, it is not evident that the other nations had as many prophets as the Hebrews, or that any Gentile prophet was expressly sent by God to the nations, 95 this does not affect the question, for the Hebrews were careful to record their own affairs, not those of other nations. 96 It suffices, then, that we find in the Old Testament Gentiles, and uncircumcised, as Noah, Enoch, Abimelech, Balaam, exercising prophetic gifts; 97 further, that Hebrew prophets were sent by God, not only to their own nation but to many others also.

98 Ezekiel prophesied to all the nations then known; Obadiah to none, that we are aware of, save the Idumeans; and Jonah was chiefly the prophet to the Ninevites. 99 Isaiah bewails and predicts the calamities, and hails the restoration not only of the Jews but also of other nations, for he says (in chapter-16, verse:9), "Therefore I will bewail Jazer with weeping;" 100 and in chapter-19. he foretells first the calamities and then the restoration of the Egyptians (see verses 19, 20, 21, 25), saying that God shall send them a Saviour to free them, that the Lord shall be known in Egypt, 101 and, further, that the Egyptians shall worship God with sacrifice and oblation; and, at last, he calls that nation the blessed Egyptian people of God; all of which particulars are specially noteworthy.

102 Jeremiah is called, not the prophet of the Hebrew nation, but simply the prophet of the nations (see Jeremiah, chapter-1, verse:5). 103 He also mournfully foretells the calamities of the nations, and predicts their restoration, for he says (in chapter-48, verse:31) of the Moabites, "Therefore will I howl for Moab, and I will cry out for all Moab" (verse 36), "and therefore mine heart shall sound for Moab like pipes;" 104 in the end he prophesies their restoration, as also the restoration of the Egyptians, Ammonites, and Elamites. 105 Wherefore it is beyond doubt that other nations also, like the Jews, had their prophets, who prophesied to them.

106 Although Scripture only, makes mention of one man, Balaam, to whom the future of the Jews and the other nations was revealed, 107 we must not suppose that Balaam prophesied only once, for from the narrative itself it is abundantly clear that he had long previously been famous for prophesy and other Divine gifts. 108 For when Balak bade him to come to him, he said (in Numbers, chapter-22, verse:6), "For I know that he whom thou blessest is blessed, and he whom thou cursest is cursed." 109 Thus we see that he possessed the gift which God had bestowed on Abraham. 110 Further, as accustomed to prophesy, Balaam bade the messengers wait for him till the

will of the Lord was revealed to him. 111 When he prophesied, that is, when he interpreted the true mind of God, he was wont to say this of himself: "He hath said, which heard the words of God and knew the knowledge of the Most High, which saw the vision of the Almighty falling into a trance, but having his eyes open." 112 Further, after he had blessed the Hebrews by the command of God, he began (as was his custom) to prophesy to other nations, and to predict their future; 113 all of which abundantly shows that he had always been a prophet, or had often prophesied, and (as we may also remark here) possessed that which afforded the chief certainty to prophets of the truth of their prophecy, 114 namely, a mind turned wholly to what is right and good, for he did not bless those whom he wished to bless, nor curse those whom he wished to curse, as Balak supposed, but only those whom God wished to be blessed or cursed. 115 Thus he answered Balak: "If Balak should give me his house full of silver and gold, I cannot go beyond the commandment of the Lord to do either good or bad of my own mind; but what the Lord saith, that will I speak." 116 As for God being angry with him in the way, the same happened to Moses when he set out to Egypt by the command of the Lord; 117 and as to his receiving money for prophesying, Samuel did the same (1 Samuel, chapter-9, verses:7 and 8); if in anyway he sinned, "there is not a just man upon earth that doeth good and sinneth not," Ecclesiastes, chapter-7, verse:20. (See 2 Epistle; Peter, chapter-2, verse:15, 16; and Jude, chapter-5, verse:11).

118 His speeches must certainly have had much weight with God, and His power for cursing must assuredly have been very great from the number of times that we find stated in Scripture, 119 in proof of God's great mercy to the Jews, that God would not hear Balaam, and that He changed the cursing to blessing (see Deuteronomy, chapter-23, verse:6; Joshua, chapter-24, verse:10; and Nehemiah, chapter-8, verse:2). 120 Wherefore he was without doubt most acceptable to God, for the speeches and cursings of the

wicked move God not at all. 121 As then he was a true prophet, and nevertheless Joshua calls him a soothsayer or augur, it is certain that this title had an honourable signification, and that those whom the Gentiles called augurs and soothsayers were true prophets, 122 while those whom Scripture often accuses and condemns were false soothsayers, who deceived the Gentiles as false prophets deceived the Jews; 123 indeed, this is made evident from other passages in the Bible, whence we conclude that the gift of prophecy was not peculiar to the Jews, but common to all nations. 124 The Pharisees, however, vehemently contend that this Divine gift was peculiar to their nation, and that the other nations foretold the future (what will superstition invent next?) by some unexplained diabolical faculty. 125 The principal passage of Scripture which they cite, by way of confirming their theory with its authority, is Exodus, chapter-33, verse:16, where Moses says to God, "For wherein shall it be known here that I and Thy people have found grace in Thy sight? 126 Is it not in that Thou goest with us? So shall we be separated, I and Thy people, from all the people that are upon the face of the earth." 127 From this they would infer that Moses asked of God that He should be present to the Jews, and should reveal Himself to them prophetically; further, that He should grant this favour to no other nation.

128 It is surely absurd that Moses should have been jealous of God's presence among the Gentiles, or that he should have dared to ask any such thing. 129 The fact is, as Moses knew that the disposition and spirit of his nation was rebellious, he clearly saw that they could not carry out what they had begun without very great miracles and special external aid from God; 130 nay, that without such aid they must necessarily perish: as it was evident that God wished them to be preserved, he asked for this special external aid. 131 Thus he says (in Exodus, chapter-34, verse:9), "If now I have found grace in Thy sight, O Lord, let my Lord, I pray Thee, go among us; for it is a stiff-necked people." 132 The reason, therefore, for his seeking special external aid from

PROPHECY

God was the stiff-neckedness of the people, and it is made still more plain, that he asked for nothing beyond this special external aid by God's answer-- 133 for God answered at once (verse 10 of the same chapter)-- "Behold, I make a covenant: before all Thy people I will do marvels, such as have not been done in all the earth, nor in any nation." 134 Therefore Moses had in view nothing beyond the special election of the Jews, as I have explained it, and made no other request to God.

135 I confess that in Paul's Epistle to the Romans, I find another text which carries more weight, namely, where Paul seems to teach a different doctrine from that here set down, 136 for he there says (in Romans, chapter-3, verse:1): "What advantage then hath the Jew? Or what profit is there of circumcision? Much every way: chiefly, because that unto them were committed the oracles of God." 137 But if we look to the doctrine which Paul especially desired to teach, we shall find nothing repugnant to our present contention; 138 on the contrary, his doctrine is the same as ours, for he says (in Romans, chapter-3, verse:29) "that God is the God of the Jews and of the Gentiles, 139 and" (chapter-2, verses:25 and 26) "But, if thou be a breaker of the law, thy circumcision is made uncircumcision. 140 Therefore if the uncircumcision keep the righteousness of the law, shall not his uncircumcision be counted for circumcision?" 141 Further, in chapter-4, verse:9, he says that all alike, Jew and Gentile, were under sin, and that without commandment and law there is no sin. 142 Wherefore it is most evident that to all humans absolutely was revealed the law under which all lived-- 143 namely, the law which has regard only to true virtue, not the law established in respect to, and in the formation of a particular state and adapted to the disposition of a particular people.

144 Lastly, Paul concludes that since God is the God of all nations, that is, is equally gracious to all, and since all humans equally live under the law and under sin, so also to all nations did God send His Christ, 145 to free all people equally from the bondage of the

law, that they should no more do right by the command of the law, but by the constant determination of their hearts. 146 So that Paul teaches exactly the same as ourselves. When, therefore, he says "To the Jews only were entrusted the oracles of God," we must either understand that to them only were the laws entrusted in writing, 147 while they were given to other nations merely in revelation and conception, or else (as none but Jews would object to the doctrine he desired to advance) that Paul was answering only in accordance with the understanding and current ideas of the Jews, 148 for in respect to teaching things which he had partly seen, partly heard, he was to the Greeks a Greek, and to the Jews a Jew.

149 It now only remains to us to answer the arguments of those who would persuade themselves that the election of the Jews was not temporal, and merely in respect of their commonwealth, but eternal; 150 for, they say, we see the Jews after the loss of their commonwealth, and after being scattered so many years and separated from all other nations, still surviving, which is without parallel among other peoples, 151 and further the Scriptures seem to teach that God has chosen for Himself the Jews for ever, so that though they have lost their commonwealth, they still nevertheless remain God's elect. 152 The passages which they think teach most clearly this eternal election, are chiefly: (1.) Jeremiah, chapter-31, verse:36, where the prophet testifies that the seed of Israel shall for ever remain the nation of God, comparing them with the stability of the heavens and Nature; 153 (2.) Ezekiel, chapter-20, verse:32, where the prophet seems to intend that though the Jews wanted after the help afforded them to turn their backs on the worship of the Lord, 154 that God would nevertheless gather them together again from all the lands in which they were dispersed, and lead them to the wilderness of the peoples-- as He had led their fathers to the wilderness of the land of Egypt-- 155 and would at length, after purging out from among them the rebels and transgressors, bring them thence to His Holy mountain,

where the whole house of Israel should worship Him.
156 Other passages are also cited, especially by the Pharisees, but I think I shall satisfy everyone if I answer these two, 157 and this I shall easily accomplish after showing from Scripture itself that God chose not the Hebrews for ever, but only on the condition under which He had formerly chosen the Canaanites, 158 for these last, as we have shown, had priests who religiously worshipped God, and whom God at length rejected because of their luxury, pride, and corrupt worship. 159 Moses (in Leviticus, chapter-18, verse:27) warned the Israelites that they be not polluted with whoredoms, lest the land spue them out as it had spued out the nations who had dwelt there before, 160 and in Deuteronomy, chapter-8, verses:19 and 20, in the plainest terms He threatens their total ruin, for He says, "I testify against you that ye shall surely perish. As the nations which the Lord destroyeth before your face, so shall ye perish."
161 In like manner many other passages are found in the law which expressly show that God chose the Hebrews neither absolutely nor for ever. 162 If, then, the prophets foretold for them a new covenant of the knowledge of God, love, and grace, such a promise is easily proved to be only made to the elect, 163 for Ezekiel in the chapter which we have just quoted expressly says that God will separate from them the rebellious and transgressors, 164 and Zephaniah (in chapter-3, verses:12 and 13), says that "God will take away the proud from the midst of them, and leave the poor." 165 Now, inasmuch as their election has regard to true virtue, it is not to be thought that it was promised to the Jews alone to the exclusion of others, 166 but we must evidently believe that the true Gentile prophets (and every nation, as we have shown, possessed such) promised the same to the faithful of their own people, who were thereby comforted. 167 Wherefore this eternal covenant of the knowledge of God and love is universal, as is clear, moreover, from Zephaniah, chapter-3, verses:10 and 11: 168 no difference

in this respect can be admitted between Jew and Gentile, nor did the former enjoy any special election beyond that which we have pointed out.

169 When the prophets, in speaking of this election which regards only true virtue, mixed up much concerning sacrifices and ceremonies, and the rebuilding of the temple and city, 170 they wished by such figurative expressions, after the manner and nature of prophecy, to expound matters spiritual, so as at the same time to show to the Jews, whose prophets they were, the true restoration of the state and of the temple to be expected about the time of Cyrus. 171 At the present time, therefore, there is absolutely nothing which the Jews can arrogate to themselves beyond other people. 172 As to their continuance so long after dispersion and the loss of empire, there is nothing marvellous in it, for they so separated themselves from every other nation as to draw down upon themselves universal hate, 173 not only by their outward rites, rites conflicting with those of other nations, but also by the sign of circumcision which they most scrupulously observe.

174 That they have been preserved in great measure by Gentile hatred, experience demonstrates. 175 When the king of Spain formerly compelled the Jews to embrace the State religion or to go into exile, a large number of Jews accepted Catholicism. 176 Now, as these renegades were admitted to all the native privileges of Spaniards, and deemed worthy of filling all honourable offices, it came to pass that they straightway became so intermingled with the Spaniards as to leave of themselves no relic or remembrance. 177 But exactly the opposite happened to those whom the king of Portugal compelled to become Christians, for they always, though converted, lived apart, inasmuch as they were considered unworthy of any civic honours.

178 The sign of circumcision is, as I think, so important, that I could persuade myself that it alone would preserve the nation for ever 179 Nay, I would go so far as to believe that if the foundations of their religion have not emasculated their minds they may even, if

occasion offers, so changeable are human affairs, raise up their empire afresh, and that God may a second time elect them.

180 Of such a possibility we have a very famous example in the Chinese. They, too, have some distinctive mark on their heads which they most scrupulously observe, 181 and by which they keep themselves apart from everyone else, and have thus kept themselves during so many thousand years that they far surpass all other nations in antiquity. 182 They have not always retained empire, but they have recovered it when lost, and doubtless will do so again after the spirit of the Tartars becomes relaxed through the luxury of riches and pride.

183 Lastly, if any one wishes to maintain that the Jews, from this or from any other cause, have been chosen by God for ever, I will not gainsay you if you will admit that this choice, whether temporary or eternal, has no regard, in so far as it is peculiar to the Jews, 184 to aught but dominion and physical advantages (for by such alone can one nation be distinguished from another), 185 whereas in regard to intellect and true virtue, every nation is on a par with the rest, and God has not in these respects chosen one people rather than another.

The Book of Divine Panagogue called

LOGIC

LOGIC
George Stuart Fullerton

THE PHILOSOPHICAL SCIENCES

1 I have said (in the book of THEOSOPHY, Chapter-13) that there is quite a group of sciences that are regarded as belonging peculiarly to the province of the teacher of philosophy to-day. 2 Having, in the chapters preceding, given some account of the nature of reflective thought, of the problems touching the world and the mind which present themselves to those who reflect, and of some types of philosophical theory which have their origin in such reflection, 3 I turn to a brief consideration of the philosophical sciences. Among these I included logic, psychology, ethics, and aesthetics, metaphysics, and the history of philosophy. 4 I did not include epistemology or "the theory of knowledge" as a separate discipline, and my reasons for this will appear in ‘the book of METAPHYSICS’. 5 I remarked that, to complete the list, we should have to add the philosophy of religion and an investigation into the principles and methods of the sciences generally.

6 Why, it was asked, should this group of disciplines be regarded as the field of the philosopher, when others are excluded? 7 The answer to this question which finds the explanation of the fact to lie in a mere historical accident was declared unsatisfactory, 8 and it was maintained that the philosophical sciences are those in which we find ourselves carried back to the problems of reflective thought. 8 With a view to showing the truth of this opinion, I shall take up one by one the philosophical sciences. Of the history of philosophy I shall not speak in this part of the work, but shall treat of it in the book of METAPHYSICS, chapter-4.

THE TRADITIONAL LOGIC

George Stuart Fullerton

2 Most of us begin our acquaintance with logic in the study of some such elementary manual as Jevons' "*Lessons in*

Logic." 2 In such books we are shown how terms represent things and classes of things or their attributes, and how we unite them into propositions or statements. 3 It is indicated at length what statements may be made on a basis of certain other statements and what may not; 4 and emphasis is laid upon the dangers which arise out of a misunderstanding of the language in which we are forced to express our thoughts. 5 Finally, there are described for us the experimental methods by which the workers in the sciences have attained to the general information about the world which has become our heritage.

6 Such books are useful. It is surely no small profit for a student to gain the habit of scrutinising the steps by which you have come into the possession of a certain bit of information, and to have a quick eye for loose and inconsistent reasonings. 7 But it is worthy of remark that one may study such a book as this and yet remain pretty consistently on what may be called the plane of the common understanding. 8 One seems to make the assumptions made in all the special sciences, e.g. the assumption that there is a world of real things and that we can know them and reason about them. 9 We are not introduced to such problems as: What 'is' truth? and Is 'any' knowledge valid? 10 Nor does it seem at once apparent that the person who is studying logic in this way is busying own self with a philosophical discipline.

THE "MODERN LOGIC."

George Stuart Fullerton

3 It is very puzzling for the student to turn from such a text-book as the one above mentioned to certain others which profess to be occupied with the same science, and which, yet, appear to treat of quite different things. 2 Thus, in Dr. Bosanquet's little work on "*The Essentials of Logic*," the reader is at once plunged into such questions as the nature of knowledge, and what is meant by the real world. 3 We seem to be dealing with metaphysics, and not with logic, as we have learned to understand the term. How is it that

the logician comes to regard these things as within own province?
4 A multitude of writers at the present day are treating logic in this way, and in some great prominence is given to problems which the philosopher recognises as indisputably their own. 5 The term "modern logic" is often employed to denote a logic of this type; 6 one which does not, after the fashion of the natural sciences generally, proceed on the basis of certain assumptions, and leave deeper questions to some other discipline, but tries to get to the bottom of things for itself. 7 The tendency to run into metaphysics is peculiarly marked in those writers who have been influenced by the work of the philosopher Hegel.
8 I shall not here ask why those who belong to one school are more inclined to be metaphysical than are those who belong to another, 9 but shall approach the broader question why the logicians generally are inclined to be more metaphysical than those who work in certain other special sciences, such as mathematics, for example. 10 Of the general tendency there can be no question. The only problem is: Why does this tendency exist?

LOGIC AND PHILOSOPHY
George Stuart Fullerton

4 Let us contrast the science of arithmetic with logic; and let us notice, regarding it, the following points:--
2 It is, like logic, a 'general' science, in that the things treated of in many sciences may be numbered. It considers only a certain aspect of the things.
3 Now, that things may be counted, added together, subtracted, etc., is guaranteed by the experience of the plain person; 4 and the methods of determining the numerical relations of things are gradually developed before your eyes, beginning with operations of great simplicity. 5 Moreover, verification is possible, and within certain limits verification by direct inspection. 6 To this we may add, that there has gradually been built up a fine system of unambiguous symbols, and it is possible for a

person to know just what you are dealing with.

7 Thus, a certain beaten path has been attained, and a person may travel this very well without having forced on own attention the problems of reflective thought. 8 The knowledge of numbers with which you starts is sufficient equipment with which to undertake the journey. That one is on the right road is proved by the results one obtains. 9 As a rule, disputes can be settled by well-tried mathematical methods.

10 There is, then, a common agreement as to initial assumptions and methods of work, and useful results are attained which seem to justify both. Here we have the normal characteristics of a special science. 11 We must not forget, however, that, even in the mathematical sciences, before a beaten path was attained, disputes as to the significance of numbers and the cogency of proofs were sufficiently common. 12 And we must bear in mind that even to-day, where the beaten path does not seem wholly satisfactory, people seem to be driven to reflect upon the significance of their assumptions and the nature of their method.

13 Thus, we find it not unnatural that a person should be led to ask; What is a minus quantity really? Can anything be less than nothing? 14 Or that you should raise the questions: Can one rightly speak of an infinite number? 15 Can one infinite number be greater than another, and, if so, what can greater mean? 16 What are infinitesimals? and what can be meant by different orders of infinitesimals? 17 You who has interested yourself in such questions as these has betaken yourself to philosophical reflection. They are not answered by employing mathematical methods.

18 Let us now turn to logic. And let us notice, to begin with, that it is broader in its application than the mathematical sciences. 19 It is concerned to discover what constitutes 'evidence' in every field of investigation.

20 There is, it is true, a part of logic that may be developed somewhat after the fashion of mathematics. 21 Thus, we may examine the two statements: All

humans are mortal, and Caesar is a human; and we may see clearly that, given the truth of these, we must admit that Caesar is mortal. 22 We may make a list of possible inferences of this kind, and point out under what circumstances the truth of two statements implies the truth of a third, and under what circumstances the inference cannot be made. Our results can be set forth in a system of symbols. 23 As in mathematics, we may abstract from the particular things reasoned about, and concern ourselves only with the forms of reasoning. 24 This gives us the theory of the 'syllogism'; it is a part of logic in which the mathematician is apt to feel very much at home.

25 But this is by no means all of logic. Let us consider the following points:--

(1) We are not concerned to know only what statements may be made on the basis of certain other statements. 26 We want to know what is true and what is false. We must ask: Has a person the right to set up these particular statements and to reason from them? 27 That some people accept as true premises which are repudiated by others is an undoubted fact. 28 Thus, it is maintained by certain philosophers that we may assume that any view of the universe which is repellant to our nature cannot be true. Shall we allow this to pass unchallenged? 29 And in ethics, some have held that it is under all circumstances wrong to lie; others have denied this, and have held that in certain cases-- for example, to save life or to prevent great and unmerited suffering-- lying is permissible. 30 Shall we interest ourselves only in the deductions that each person makes from own assumed premises, and pay no attention to the truth of the premises themselves?

31 (2) Again. The vast mass of the reasonings that interest people are expressed in the language that we all use and not in special symbols. 32 But language is a very imperfect instrument, and all sorts of misunderstandings are possible to those who express their thoughts in it. 33 Few people know exactly how much is implied in what they are saying. If I say: All humans are mortal, and an angel is not a human; therefore, an angel is not mortal; it is not at once apparent to

every one in what respect my argument is defective. 34 You who argues: Feathers are light; light is contrary to darkness; hence, feathers are contrary to darkness; is convicted of error without difficulty. 35 But arguments of the same kind, and quite as bad, are to be found in learned works on matters less familiar to us, and we often fail to detect the fallacy.

36 Thus, Herbert Spencer argues, in effect, in the fourth and fifth chapters of his "*First Principles*," as follows:--

37 We are conscious of the Unknowable,
The Unknowable lies behind the veil of phenomena,
Hence, we are conscious of what lies behind the veil of phenomena.

38 It is only the critical reader who notices that the Unknowable in the first line is the "raw material of consciousness," and the Unknowable in the second is something not in consciousness at all. 39 The two senses of the word "light" are not more different from one another. Such apparent arguments abound, and it often requires much acuteness to be able to detect their fallacious character.

40 When we take into consideration the two points indicated above, we see that the logician is at every turn forced to reflect upon our knowledge as humans do not ordinarily reflect. 41 You are led to ask: What is truth? You cannot accept uncritically the assumptions which humans make; 42 and you must endeavour to become very clearly conscious of the real meaning and the whole meaning of statements expressed in words. 43 Even in the simple logic with which we usually begin our studies, we learn to scrutinise statements in a reflective way; and when we go deeper, we are at once in contact with philosophical problems. 44 It is evidently our task to attain to a clearer insight into the nature of our experience and the meaning of proof than is attainable by the unreflective. 45 Logic, then, is a reflective science, and it is not surprising that it has held its place as one of the philosophical sciences.

LOGIC

THE NORMATIVE SCIENCES AND THE PROBLEMS OF RELIGION

Ralph Barton Perry

THE NORMATIVE SCIENCES

5 There are three sets of problems whose general philosophical importance depends upon the place which metaphysics assigns to the human critical faculties'. 2 People passes judgment upon that which claims to be true, beautiful, or good, thus referring to ideals and standards that define these values. 3 Attempts to make these ideals explicit, and to formulate principles which regulate their attainment, have resulted in the development of the three so-called 'normative sciences': logic, æsthetics, and ethics. 4 These sciences are said to owe their origin to the Socratic method, and it is indeed certain that their problem is closely related to the general rationalistic attitude. 5 In Plato's dialogue, "Protagoras," one may observe the manner of the inception of both ethics and logic. 6 The question at issue between Socrates and the master sophist Protagoras, is concerning the possibility of teaching virtue. 7 Protagoras conducts his side of the discussion with the customary rhetorical flourish, expounding in set speeches the tradition and usage in which such a possibility is accepted. Socrates, on the other hand, conceives the issue quite differently. 8 One can neither affirm nor deny anything of virtue unless one knows 'what is meant by it. 9 Even the possession of such a meaning was scarcely recognised by Protagoras, who was led by Socrates's questions to attribute to the various virtues an external grouping analogous to that of the parts of the face. 10 But Socrates shows that since justice, temperance, courage, and the like, are admittedly similar in that they are all virtues, they must have in common some essence, which is virtue in general. 11 This he seeks to define in the terms, virtue is knowledge'. 12 The interest which Socrates here shows in the reduction of the ordinary moral judgments to a system centering in some single fundamental principle, is the ethical interest. 13 But this is at the same time a particular application of the general rationalistic method of definition,

and of the general rationalistic postulate that one knows nothing until one can form unitary and determinate conceptions. 14 The recognition which Socrates thus gives to criteria of knowledge is an expression of the logical interest. In a certain sense, indeed, the whole labour of Socrates was in the cause of the logical interest. 15 For he sought to demonstrate that belief is not necessarily knowledge; that belief may or may not be true. 16 In order that it shall be true, and constitute knowledge, it must be well-grounded, and accompanied by an understanding of its object. 17 Socrates thus set the problem of logic, the discovery, namely, of those characters by virtue of the possession of which belief is knowledge.

THE AFFILIATIONS OF LOGIC

Ralph Barton Perry

6 Logic deals with the ground of belief, and thus distinguishes itself from the psychological account of the elements of the believing state. 2 But it is not possible sharply to sunder psychology and logic. This is due to the fact that the general principles which make belief true, may be regarded quite independently of this fact. 3 They then become the 'most general truth', belonging to the absolute, archetypal realm, or to the mind of God. 4 When the general principles of certainty are so regarded, logic can be distinguished from metaphysics only by adding to the study of the general principles themselves, 5 the study of the special conditions (mainly psychological) under which they may be realised among humans.

6 In the history of human thought the name of logic belongs to the study of this 'attainment' of truth, as the terms æsthetics and ethics belong to the studies of the attainment of beauty and goodness. 7 It is evident that logic will have a peculiar importance for the rationalist. 8 For the empiricist, proposing to report upon things as they are given, will tend on the whole to maintain that knowledge has no properties save those which are given to it by its special subject-matter. 9 One cannot, in

short, define any absolute relationship between the normative sciences and the other branches of philosophy.

LOGIC DEALS WITH THE MOST GENERAL CONDITIONS OF TRUTH IN BELIEF

Ralph Barton Perry

7 'Logic is the formulation, as independently as possible of special subject-matter, of that which conditions truth in belief.' 2 Since logic is concerned with truth only in so far as it is predicated of belief, and since belief in so far as true is knowledge, 3 logic can be defined as the formulation of the most general principles of knowledge. 4 The principles so formulated would be those virtually used to 'justify' belief or to disprove the imputation of error. 5 What is called 'formal logic' is animated with the hope of extracting these formulations directly from an analysis of the procedure of thought. 6 The most general logical principles which have appeared in the historical development of formal logic are 'definition', 'self-evidence', 'inference', and 'observation'. 7 Each of these has been given special study, and each has given rise to special issues.

8 'Definition' has to do with the 'formation of concepts', or determinate and unequivocal meanings. 9 The universality of such concepts, and their consequent relation to particular things, was, as we have seen, investigated at a very early date, and gave rise to the great realistic-nominalistic controversy. 10 A large part of the logical discussion in the Platonic dialogues is an outgrowth of the earlier "eristic," a form of disputation in favour with the sophists, and consisting in the adroit use of ambiguity. 11 It is natural that in its first conscious self-criticism thought should discover the need of definite terms. 12 The perpetual importance of definition has been largely due to the great prestige in modern philosophy of the method of geometry, which was regarded by Descartes and Spinoza as the model for systems of necessary truth.

13 'Self-evidence' is the principle according to which 'conviction of truth follows directly from an understanding of meaning'. 14 In the practice of his intellectual midwifery, Socrates presupposed that thought is capable of bringing forth its own certainties. 15 And rationalism has at all times regarded truth as ultimately accredited by internal marks recognisable by reason. 16 Such truth arrived at antecedent to acquaintance with instances is called 'a priori', as distinguished from 'a posteriori' knowledge, or observation after the fact. 17 There can be no principles of self-evidence, but logicians have always been more or less concerned with the enumeration of alleged self-evident principles, notably those of 'contradiction' and 'identity'. 18 A philosophical interest in the mathematical method has led to a logical study of axioms, but with a view rather to their fruitfulness than their intrinsic truth. 19 Indeed, the interest in self-evident truth has always been subordinate to the interest in systematic truth, 20 and the discovery of first principles most commonly serves to determine the relative priority of definite concepts, or the correct point of departure for a series of inferences.

21 The greater part of the famous Aristotelian logic consists in a study of 'inference', or 'the derivation of new knowledge from old knowledge'. 22 Aristotle sought to set down and classify every method of advancing from premises. 23 The most important form of inference which he defined was the 'syllogism', a scheme of reasoning to a conclusion by means of two premises having one term in common. 24 From the premises "all humans are mortal" and "Socrates is a human," one may conclude that "Socrates is mortal." 25 This is an instance not only of the syllogism in general, but of its most important "mood," the subsumption of a particular case under a general rule. 26 Since the decline of Aristotle's influence in philosophy there has been a notable decrease of interest in the different forms of inference; 27 though its fundamental importance as the very bone and sinew of

'reasoning' or 'deductive thinking' has never been challenged. 28 Its loss of preëminence is in part due to the growth of empiricism, stimulated by the writings of Lord Bacon in the seventeenth century, and fostered by the subsequent development of experimental science.

29 'Observation' is the fundamental logical principle of empiricism. 30 For a radical empiricism, knowledge would consist of descriptive generalisations based upon the summation of instances. 31 That branch of logic which deals with 'the advance from individual instances to general principles', is called 'inductive logic'. 32 It has resulted in the announcement of canons of accuracy and freedom from preconception, and in the methodological study of hypothesis, experiment, and verification. 33 Rules for observation directed to the end of discovering causes, constitute the most famous part of the epoch-making logic of J. S. Mills.

34 There are two significant tendencies in contemporary logic. 35 'Theories of the judgment' have arisen in the course of an attempt to define the least complexity that must be present in order that thought shall come within the range of truth and error. 36 It is evident that no one either knows or is in error until you takes some attitude which lays claim to knowledge. 37 Denoting by the term 'judgment' this minimum of complexity in knowledge, an important question arises as to the sense in which the judgment involves the subject, predicate, and copula that are commonly present in its propositional form.

PRIORITY OF CONCEPTS

Ralph Barton Perry

8 But a more important logical development has been due to the recent analysis of definite accredited systems of knowledge. 2 The study of the fundamental conceptions of mathematics and mechanics, together with an examination of the systematic structure of these sciences, furnishes the most notable cases. 3 There are two senses in which such studies may be regarded as

logical. In the first place, in so far as they bring to light the inner coherence of any body of truth, 4 the kind of evidence upon which it rests, and the type of formal perfection which it seeks, they differ from formal logic only in that they derive their criteria from cases, rather than from the direct analysis of the procedure of thought. 5 And since formal logic must itself make experiments, this difference is not a radical one. 6 The study of cases tends chiefly to enrich 'methodology', or the knowledge of the special criteria of special sciences. 7 In the second place, such studies serve to define the relatively few simple truths which are common to the relatively many complex truths.

8 A study of the foundations of arithmetic reveals more elementary conceptions, such as 'class' and 'order', that must be employed in the very definition of number itself, and so are implied in every numerical calculation. 9 It appears similarly that the axioms of geometry are special axioms which involve the acceptance of more general axioms or indefinables. 10 Logic in this sense, then, is the enumeration of conceptions and principles in the order of their indispensableness to knowledge. 11 And while it must be observed that the most general conceptions and principles of knowledge are not necessarily those most significant for the existent world, 12 nevertheless the careful analysis which such an enumeration involves is scarcely less fruitful for metaphysics than for logic.

The Book of Divine Panagogue called

REASON

REASON,
THE ONLY ORACLE OF HUMAN
Ethan Allen

THE DUTY OF REFORMING HUMANKIND FROM SUPERSTITION AND ERROR, AND THE GOOD CONSEQUENCES OF IT

SECTION I

1 The desire of knowledge has engaged the attention of the wise and curious among humankind in all ages which has been productive of extending the arts and sciences far and wide in the several quarters of the globe, 2 and excited the contemplative to explore Nature's laws in a gradual series of improvement, until philosophy, astronomy, geography, and history, with many other branches of science, have arrived to a great degree of perfection.

3 It is nevertheless to be regretted, that the bulk of humankind, even in those nations which are most celebrated for learning and wisdom, are still carried down the torrent of superstition, 4 and entertain very unworthy apprehensions of the being, perfections, creation, and providence of God, and their duty to Him, 5 which lays an indispensable obligation on the philosophic friends of human nature, unanimously to exert themselves in every lawful, wise, and prudent method, 6 to endeavour to reclaim humankind from their ignorance and delusion, by enlightening their minds in those great and sublime truths concerning God and His providence, 7 and their obligations to moral rectitude which in this world, and that which is to come, cannot fail greatly to affect their happiness and well being.

8 Though "none by searching can find out God, or the Almighty to perfection," 9 yet I am persuaded, that if humankind would dare to exercise their reason as freely on those divine topics as they do in the common concerns of life, they would, in a great measure, rid themselves of their blindness and superstition, 10 gain more exalted ideas of God and their obligations to Him and one another, and be proportionally delighted and blessed with the views of His

moral government, 11 make better members of society, and acquire many powerful incentives to the practice of morality, which is the last and greatest perfection that human nature is capable of.

OF THE BEING OF A GOD

SECTION II

12 The Laws of Nature having subjected humankind to a state of absolute dependence on something out of it, and manifestly beyond themselves, 13 or the compound exertion of their natural powers, gave them the first conception of a superior principle existing; otherwise they could have had no possible conception of a superintending power. 14 But this sense of dependency, which results from experience and reasoning on the facts, which every day cannot fail to produce, has uniformly established the knowledge of our dependence to every individual of the species who are rational, 15 which necessarily involves, or contains in it, the idea of a ruling power, or that there is a God, which ideas are synonymous.

16 The globe with its productions, the planets in their motions, and the starry heavens in their magnitudes, surprise our senses and confound our reason, 17 in their munificent lessons of instruction concerning God, by means whereof, we are apt to be more or less lost in our ideas of the object of divine adoration, 18 though at the same time every one is truly sensible that their being and preservation is from God. 19 We are too apt to confound our ideas of God with His works, and take the latter for the former. 20 Thus barbarous and unlearned nations have imagined, that inasmuch as the sun in its influence is beneficial to them in bringing forward the spring of the year, causing the production of vegetation, and food for their subsistence, that therefore it is their God: 21 while others have located other parts of creation, and ascribe to them prerogatives of God; 22 and mere creatures and images have been substituted for Gods by the wickedness or weakness of human, or both together. 23 It seems that humankind in most ages and parts

of the world have been fond of corporeal Deities with whom their outward senses might be gratified, 24 or as fantastically diverted from the just apprehension of the true God, by a supposed supernatural intercourse with invisible and mere spiritual beings, to whom they ascribe divinity, 25 so that through one means or other, the character of the true God has been much neglected, to the great detriment of truth, justice, and morality in the world; 26 nor is it possible that humankind can be uniform in their religious opinions, or worship God according to knowledge, except they can form a consistent arrangement of ideas of the Divine character.

27 Although we extend our ideas retrospectively ever so far upon the succession, yet no one cause in the extended order of succession, which depends upon another prior to itself, can be the independent cause of all things: 28 nor is it possible to trace the order of the succession of causes back to that self-existent cause, inasmuch as it is eternal and infinite, and cannot therefore be traced out by succession, which operates according to the order of time, 29 consequently can bear no more proportion to the eternity of God, than time itself may be supposed to do, which has no proportion at all; as the succeeding arguments respecting the eternity and infinity of God will evince. 30 But notwithstanding the series of the succession of causes cannot be followed in a retrospective succession up to the self-existent or eternal cause, it is nevertheless a perpetual and conclusive evidence of a God.-- 31 For a succession of causes considered collectively, can be nothing more than effects of the independent cause, and as much dependent on it as those dependent causes are upon one another; 32 so that we may with certainty conclude that the system of Nature, which we call by the name of natural causes, is as much dependent on a self-existent cause, as an individual of the species in the order of generation is dependent on its progenitors for existence. 33 Such part of the series of Nature's operations, which we understand, has a regular and necessary connection with, and dependence

on its parts, which we denominate by the names of cause and effect.
34 From hence we are authorised from reason ton conclude, that the vast system of causes and effects are thus necessarily connected, (speaking of the natural world only,) and the whole regularly and necessarily dependent on a self-existent cause: 35 so that we are obliged to admit an independent cause, and ascribe self-existence to it, otherwise it could not be independent, and consequently not a God. 36 But the eternity or manner of the existence of a self-existent and independent being is to all finite capacities utterly incomprehensible; 37 yet this is so far from an objection against the reality of such a being, that it is essentially necessary to support the evidence of it; 38 for if we could comprehend that being whom we call God, He would not be God, but must have been finite and that in the same degree as those may be supposed to be who could comprehend him; 39 therefore so certain that God is, we cannot comprehend His essence, eternity, or manner of existence.
40 This should always be premised, when we assay to reason on the being, perfection, eternity, and infinity of God, or of His creation and providence. 41 As far as we understand Nature, we are become acquainted with the character of God, for the knowledge of Nature is the revelation of God. 42 If we form in our imagination a compendious idea of the harmony of the universe, it is the same as calling God by the name of harmony, 43 for there could be no harmony without regulation, and no regulation without a regulator, which is expressive of the idea of a God. 44 Nor could it be possible, that there could be order or disorder, except we admit of such a thing as creation, and creation contains in it the idea of a creator, which is another appellation for the Divine Being, distinguishing God from His creation.
45 Furthermore, there could be no proportion, figure, or motion, without wisdom and power; 46 wisdom to plan, and power to execute, and these are perfections, when applied to the works of Nature, which signify the agency

or superintendency of God. 47 If we consider Nature to be matter, figure, and motion, we include the idea of God in that of motion; for motion implies a mover as much as creation does a creator. 48 If from the composition, texture, and tendency of the universe in general, we form a complex idea of general good resulting therefrom to humankind, we implicitly admit a God by the name of good, including the idea of His providence to human. 49 And from hence arises our obligations to love and adore God, because He provides for, and is beneficent to us. 50 Abstract the idea of goodness from the character of God, and it would cancel all our obligations to Him, and excite us to hate and detest Him as a tyrant: 51 hence it is, that ignorant people are superstitiously misled into a conceit that they hate God, when at the same time it is only the idol of their own imagination, which they truly ought to hate and be ashamed of; 52 but were such persons to connect the ideas of power, wisdom, goodness, and all possible perfection in the character of God, their hatred towards Him would be turned into love and adoration.

53 By extending our ideas in a larger circle, we shall perceive our dependence on the earth and waters of the globe which we inhabit, and from which we are bountifully fed and gorgeously arrayed; 54 and next extend our ideas to the sun, whose fiery mass darts its brilliant rays of light to our terraqueous ball with amazing velocity, 55 and whose region of inexhaustible fire supplies it with fervent heat, which causes vegetation, and gilds the various seasons of the year with ten thousand charms: 56 this is not the achievement of human, but the workmanship and providence of God. 57 But how the sun is supplied with materials, thus to perpetuate its kind influences, we know not. 58 But will any one deny the reality of those beneficial influences, because we do not understand the manner of the perpetuality of that fiery world, or how it became such a body of fire? 59 Or will any one deny the reality of nutrition by food, because we do not understand the secret

operation of the digesting powers of animal nature, or the minute particulars of its cherishing influence? None will be so stupid as to do it. 60 Equally absurd would it be for us to deny the providence of God, by "whom we live, move, and have our being," because we cannot comprehend it. 61 We know that earth, water, fire and air, in their various compositions subserve us, and we also know that these elements are devoid of reflection, reason, or design; 62 from whence we may easily infer, that a wise, understanding, and designing being has ordained them to be thus subservient. 63 Could blind chance constitute order and decorum, and consequently a providence? 64 That wisdom, order, and design should be the production of nonentity, or of chaos, confusion, and old night, is too absurd to deserve a serious confutation, 65 for it supposeth that there may be effects without a cause, viz.: produced by nonentity, or that chaos and confusion could produce the effects of power, wisdom, and goodness. 66 Such absurdities as these we must assent to, or subscribe to the doctrine of a self-existent and providential being.

THE MANNER OF DISCOVERING THE MORAL PERFECTIONS... AND ATTRIBUTES OF GOD

SECTION III

67 Having in a concise manner offered a variety of indisputable reasons to evince the certainty of the being and providence of God, 68 and of His goodness to human through the intervention of the series of Nature's operations, which are commonly described by the name of natural causes, 69 we come now more particularly to the consideration of His moral perfections; 70 and though all finite beings fall as much short of an adequate knowledge thereof as they do of perfection itself, nevertheless through the intelligence of our own souls we may have something of a prospective idea of the divine perfections. 71 For though the human mind bears no proportion to the divine, yet there is undoubtedly a resemblance between them. 72 For instance,

God knows all things, and we know some things, and in the things which we do understand, our knowledge agrees with that of the divine, and cannot fail necessarily corresponding with it. 73 To more than know a thing, speaking of that thing only, is impossible even to omniscience itself; for knowledge is but the same in both the infinite and finite minds. 74 To know a thing is the same as to have right ideas of it, or ideas according to truth, and truth is uniform in all rational minds, the divine mind not excepted. 75 It will not be disputed but that humankind in plain and common matters understand justice from injustice, truth from falsehood, right from wrong, virtue from vice, and praise-worthiness from blame-worthiness, for other wise they could not be accountable creatures. 76 This being admitted, we are capable of forming a complex idea of a moral character, which when done in the most deliberate, the wisest, and most rational manner in our power, we are certain bears a resemblance to the divine perfections. 77 For as we learn from the worlds of Nature an idea of the power and wisdom of God, so from our own rational nature we learn an idea of His moral perfections.

78 From what has been observed on the moral perfections of God, we infer that all rational beings, who have an idea of justice, goodness, and truth, have at the same time either a greater or less idea of the moral perfections of God. 79 It is by reason that we are able to compound an idea of a moral character, whether applied to God or human; it is that which gives us the supremacy over the irrational part of the creation.

THE CAUSE OF IDOLATRY, AND THE REMEDY OF IT

SECTION IV

80 Inasmuch as God is not corporeal, and consequently does not and cannot come within the notice of our bodily sensations, we are therefore obliged to deduce inferences from His providence, and particularly from our own rational nature, 81 in order to form our conceptions of the divine character, which through inattention, want of learning, or

through the natural imbecility of humankind, or through the artifice of designing people, or all together, they have been greatly divided and subdivided in their notions of a God. 82 Many have so groped in the dark as wholly to mistake the proper object of divine worship, and not distinguishing the creator from His creation, have paid adoration to "four footed beasts and creeping things." 83 And some have ascribed divine honours to the sun, moon, or stars; while others have been infatuated to worship dumb, senseless, and unintelligent idols, 84 which derived their existence as Gods, partly from mechanics, who gave them their figure, proportion, and beauty, and partly from their priests, who gave them their attributes; 85 whose believers, it appears, were so wrought upon, that they cried out in the ecstasy of their deluded zeal, "Great is Diana."

86 Whatever delusions have taken place in the world relative to the object of divine worship, or respecting the indecencies or immoralities of the respective superstitions themselves, 87 or by what means soever introduced or perpetuated, whether by designing people whose interest it has always been to impose on the weakness of the great mass of the vulgar; 88 or as it is probable, that part of those delusions took place in consequence of the weakness of uncultivated reason, in deducing a visible instead of an invisible God from the works of Nature. 89 Be that as it will, humankind are generally possessed of an idea that there is a God, however they may have been mistaken or misled as to the object. 90 This notion of a God, as has been before observed, must have originated from a universal sense of dependence, which humankind have on something that is more wise, powerful, and beneficent than themselves, 91 or they could have had no apprehensions of any superintending principle in the universe, and consequently would never have sought after a God, or have had any conception of His existence, 92 nor could designing people have imposed on their credulity by obtruding false gods upon them; but taking advantage of the common belief that there is

a God, they artfully deceive their adherents with regard to the object to be adored.

93 There are other sorts of idols which have no existence but in the mere imagination of the human mind; and these are vastly the most numerous, and universally (either in the greater or less degree) dispersed over the world; 94 the wisest of humankind are not and cannot be wholly exempt from them, inasmuch as every wrong conception of God is (as far as the error takes place in the mind) idolatrous. 95 To give a sample, an idea of a jealous God is of this sort. Jealousy is the offspring of finite minds, proceeding from the want of knowledge; which in dubious matters makes us suspicious and distrustful; 96 but in matters which we clearly understand, there can be no jealousy, for knowledge excludes it, so that to ascribe it to God is a manifest infringement on his omniscience.

97 "The Lord thy God is a jealous God." The idea of a revengeful God is likewise one of that sort, but this idea of divinity being borrowed from a savage nature, needs no further confutation. 98 The representation of a God, who (as we are told by certain divines) from all eternity elected an inconsiderable part of humankind to eternal life, and reprobated the rest to eternal damnation, merely from His own sovereignty, adds another to the number;-- 99 this representation of the Deity undoubtedly took its rise from that which we discovered in great, powerful, and wicked tyrants among humans, however tradition may since have contributed to its support, 100 though I am apprehensive that a belief in those who adhere to that doctrine, that they themselves constitute that blessed elect number, has been a greater inducement to them to close with it, than all other motives added together. 101 It is a selfish and inferior notion of a God void of justice, goodness, and truth, and has a natural tendency to impede the cause of true religion and morality in the world, 102 and diametrically repugnant to the truth of the divine character, and which, if admitted to be true, overturns all religion, wholly precluding the agency of

humankind in either their salvation or damnation, 103 resolving the whole into the sovereign disposal of a tyrannical and unjust being, which is offensive to reason and common sense, and subversive of moral rectitude in general. 104 But as it was not my design so much to confute the multiplicity of false representations of a God, as to represent just and consistent ideas of the true God, I shall therefore omit any further observation on them in this place, 105 with this remark, that all unjust representations, or ideas of God, are so many detractions from His character among humankind. 106 To remedy these idolatrous notions of a God, it is requisite to form right and consistent ideas in their stead.

107 The discovery of truth necessarily excludes error from the mind, which nothing else can possibly do; 108 for some sort of God or other will crowd itself into the conceptions of dependent creatures, and if they are not so happy as to form just ones, they will substitute erroneous and delusive ones in their stead; 109 so that it serves no valuable purpose to humankind, to confute their idolatrous opinions concerning God, without communicating to them just notions concerning the true one, for if this is not effected, nothing is done to the purpose. 110 For, as has been before observed, humankind will form to themselves, or receive from others, an idea of Divinity either right or wrong: 111 this is the universal voice of intelligent nature, from whence a weighty and conclusive argument may be drawn of the reality of a God, however inconsistent most, of their conceptions of Him may be. 112 The fact is, humankind readily perceives that there is a God, by feeling their dependence on Him, 113 and as they explore His works, and observe His providence, which is too sublime for finite capacities to understand but in part, they have been more or less confounded in their discoveries of a just idea of a God and of His moral government. 114 Therefore we should exercise great applications and care whenever we assay to speculate upon the Divine character, accompanied with a sincere desire after truth, 115 and

not ascribe anything to His perfections of government which is inconsistent with reason or the best information which we are able to apprehend of moral rectitude, 116 and be at least wise enough not to charge God with injustice and contradictions which we should scorn to be charged with ourselves. 117 No king, governor, or parent would like to be accused of partiality in their respective governments, 118 "Is it fit to say unto Princes, ye are ungodly, how much less to you that regardeth not the persons of princes, or the rich more than the poor, for they are all the work of His hands."

OF THE ETERNITY OF CREATION

Ethan Allen

SECTION I

2 As creation was the result of eternal and infinite wisdom, justice, goodness, and truth, and effected by infinite power, it is like its great author, mysterious to us. 2 How it could be accomplished, or in what manner performed, can never be comprehended by any capacity. 3 Eternal, whether applied to duration, existence, action, or creation, is incomprehensible to us, but implies no contradiction in either of them; 4 for that which is above comprehension we cannot perceive to be contradictory, nor on the other hand can we perceive its rationality or consistency.

5 We are certain that God is a rational, wise, understanding Being, because He has in degree made us so, and His wisdom power, and goodness is visible to us in His creation, and government of the world. 6 From these facts we are rationally induced to acknowledge Him, and not because we can comprehend His being, perfections, creation, or providence. 7 Could we comprehend God, He would cease to be what He is. 8 The ignorant among people cannot comprehend the understanding of the wise among their own species, much less the perfection of a God; 9 nevertheless, in our ratiocination upon the works and harmony of Nature, we are obliged to concede to a self-existent and eternal cause of all things, as has been sufficiently argued, 10 though at the same time it is mysterious to

us, that there should be such a being as a self-existent and eternally independent one;-- 11 thus we believe in God, although we cannot comprehend anything of the how, why or wherefore it was possible for Him to be; 12 and as creation was the exertion of such an incomprehensible and perfect being, it must of necessary consequence be, in a great measure, mysterious to us. 13 We can nevertheless be certain, that it has been of an equal eternity and infinitude of extension with God. 14 Immensity being replete with creation, the omniscient, omnipresent, omnipotent, eternal, and infinite exertion of God in creation, is incomprehensible to the understanding or the weakness of human, 15 and will eternally remain the prerogative of infinite penetration, sagacity, and uncreated intelligence to understand.

OBSERVATIONS OF MOSES'S ACCOUNT OF CREATION

SECTION II

16 The foregoing theory of creation and providence will probably be rejected by most people, inasmuch as they are prepossessed with the theology of Moses, which represents creation to have a beginning. 17 "In the beginning God created the heavens and the earth." In the preceding part of this chapter it has been evinced that creation and providence could not have had a beginning, and that they are not circumscribed, but unlimited; 18 yet it seems that Moses limited creation by a prospective view of the heavens, or firmament from this globe, 19 and if creation was thus limited, it would consequently have circumscribed the dominion and display of the divine providence or perfection; 20 but if Moses's idea of the creation of "the heavens and the earth," was immense, ever so many days of progressive work could never have finished such a boundless creation; 21 for a progressive creation is the same as a limited one; 22 as each progressive day's work would be bounded by a successive admeasurement, and the whole six days' work added together could be but local, and bear no manner of proportion to infinitude, but

would limit the dominion, 23 and consequently the display of the divine perfections or providence, which is incompatible with a just idea of eternity and infinity of God, as has been argued in the foregoing pages.

24 There are a variety of other blunders in Moses's description of creation, one of which I shall mention, which is to be found in his history of the first and fourth day's work of God: 25 "And God said, Let there be light, and there was light; and God called the light day, and the darkness He called night: and the evening and the morning were the first day." 26 Then he proceeds to the second and third day's work, and so on to the sixth; but in his chronicle of the fourth day's work, he says that "God made two great lights, the greater light to rule the day, and the lesser light to rule the night." 27 This appears to be an inconsistent history of the origin of light. Day and night were ordained the first day, and on the fourth day the greater and less lights were made to serve the same purposes; 28 but it is likely that many errors have crept into his writings, through the vicissitudes of learning, and particularly from the corruptions of translations, of his as well as the writings of other ancient authors; 29 besides, it must be acknowledged that those ancient writers laboured under great difficulties in writing to posterity, merely from the consideration of the infant state of learning and knowledge then in the world, 30 and consequently we should not act the part of severe critics, with their writings, any further than to prevent their obtrusion on the world as being infallible.

OF THE ETERNITY AND INFINITUDE OF DIVINE PROVIDENCE

SECTION III

31 When we consider our solar system, attracted by its fiery centre, and moving in its several orbits, with regular, majestic, and periodical revolutions, 32 we are charmed at the prospect and contemplation of those worlds of motions, and adore the wisdom and power by which they are attracted, and their velocity regulated and perpetuated. 33 And

when we reflect that the blessings of life are derived from, and dependent on, the properties, qualities, constructions, proportions and movements, of that stupendous machine, we gratefully acknowledge the divine beneficence. 34 When we extend our thoughts (through our external sensations) to the vast regions of the starry heavens, we are lost in the immensity of God's works. 35 Some stars appear fair and luminous, and others scarcely discernible to the eye, which by the help of glasses make a brilliant appearance, 36 bringing the knowledge of others far remote, within the verge of our feeble discoveries, which merely by the eye could not have been discerned or distinguished. 37 These discoveries of the works of God naturally prompt the inquisitive mind to conclude that the author of this astonishing part of creation which is displayed to our view, has still extended His creation; 38 so that if it were possible that any of us could be transported to the farthest extended star, which is perceptible to us here, we should from thence survey worlds as distant from that as that is from this, and so on 'ad infinitum'.

39 Furthermore, it is altogether reasonable to conclude that the heavenly bodies, 'alias' worlds, which move or are situate within the circle of our knowledge, 40 as well all others throughout immensity, are each and every one of them possessed or inhabited by some intelligent agents or other, however different their sensations or manners of receiving or communicating their ideas may be from ours, or however different from each other. 41 For why would it not have been as wise or as consistent with the perfections which we adore in God, to have neglected giving being to intelligence in this world as in those other worlds, interspersed with aether of various qualities in His immense creation? 42 And inasmuch as this world is thus replenished, we may, with the highest rational certainty infer, that as God has given us to rejoice, and adore Him for our being, He has acted consistent with His goodness, in the display of His providence throughout the

university of worlds. 43 To suppose that God Almighty has confined His goodness to this world, to the exclusion of all others, is much similar to the idle fancies of some individuals in this world, that they, and those of their communion or faith, are the favourites of heaven exclusively; 44 but these are narrow and bigoted conceptions, which are degrading to a rational nature, and utterly unworthy of God, of whom we should form the most exalted ideas.

45 It may be objected that a person cannot subsist in the sun; but does it follow from thence, that God cannot or has not constituted a nature peculiar to that fiery region, 46 and caused it to be as natural and necessary for it to suck in and breathe out flames of fire, as it is for us to do the like in air. 47 Numerous are the kinds of fishy animals which can no other way subsist but in the water, in which other animals would perish, (amphibious ones excepted,) 48 while other animals, in a variety of forms, either swifter or slower move on the surface of the earth, or wing the air. 49 Of these there are sundry kinds, which during the season of winter live without food; and many of the insects which are really possessed of animal life, remain frozen, and as soon as they are let loose by the kind influence of the sun, they again assume their wonted animal life; 50 and if animal life may differ so much in the same world, what inconceivable variety may be possible in worlds innumerable, as applicable to mental, cogitative, and organised beings. 51 Certain it is, that any supposed obstructions, concerning the quality or temperature of any or every one of those worlds, could not have been any bar in the way of God Almighty, with regard to His replenishing His universal creation with moral agents. 52 The unlimited perfection of God could perfectly well adapt every part of His creation to the design of whatever rank or species of constituted beings, His Godlike wisdom and goodness saw fit to impart existence to; 53 so that as there is no deficiency of absolute perfection in God, it is rationally demonstrative that the immense creation is replenished with

rational agents, and that it has been eternally so, 54 and that the display of divine goodness must have been as perfect and complete, in the antecedent, as it is possible to be in the subsequent eternity.

55 From this theological way of arguing on the creation and providence of God, it appears that the whole, which we denominate by the term 'Nature', 56 which is the same as creation perfectly regulated, was eternally connected together by the creator to answer the same all glorious purpose, 'to wit': the display of the divine Nature, 57 the consequences of which are existence and happiness to beings in general, so that creation, with all its productions operates according to the Laws of Nature, 58 and is sustained by the self-existent eternal cause, in perfect older and decorum, agreeable to the eternal wisdom, unalterable rectitude, impartial justice, and immense goodness of the divine Nature, which is a summary of God's providence. 59 It is from the established order of Nature, that summer and winter, rainy and fair seasons, moonshine, refreshing breezes, seed time and harvest, day and night, interchangeably succeed each other, and diffuse their extensive blessings to human. 60 Every enjoyment and support of life is from God, delivered to His creatures in and by the tendency, aptitude, disposition, and operation of those laws. 61 Nature is the medium, or intermediate instrument through which God dispenses His benignity to humankind. 62 The air we breathe in, the light of the sun, and the waters of the murmuring rills, evince God’s providence: and well it is, that they are given in so great profusion, that they cannot by the monopoly of the rich be engrossed from the poor.

63 When we copiously pursue the study of Nature, we are certain to be lost in the immensity of the works and wisdom of God; 64 we may nevertheless, in a variety of things discern their fitness, happifying tendency and sustaining quality to us ward, 65 from all which, as rational and contemplative beings we are prompted to infer, that God is universally uniform and consistent in His infinitude of creation and

providence, although we cannot comprehend all that consistency, by reason of infirmity; 66 yet we are morally sure, of all possible plans, infinite wisdom must have eternally adopted the best, and infinite goodness have approved it, and infinite power have perfected it. 67 And as the good of beings in general must have been the ultimate end of God in His creation and government of His creatures, His omniscience could not fail to have it always present in His view. 68 Universal Nature must therefore be ultimately attracted to this single point, and infinite perfection must have eternally displayed itself in creation and providence. 69 From hence we infer, that God is as eternal and infinite in His goodness, as His self-existent and perfect nature is omnipotently great.

THE PROVIDENCE OF GOD
DOES NOT INTERFERE...
WITH THE AGENCY OF HUMAN.

SECTION IV

70 The doctrine of Fate has been made use of in armies as a policy to induce soldiers to face danger. 71 Mahomet taught his army that the "term of every human's life was fixed by God, and that none could shorten it, by any hazard that he might seem to be exposed to in battle or otherwise," 72 but that it should be introduced into peaceable and civil life, and be patronised by any teachers of religion, 73 is quite strange, as it subverts religion in general, and renders the teaching of it unnecessary, except among other necessary events it may be premised that it is necessary they teach that doctrine, 74 and that I oppose it from the influence of the same law of fate upon which thesis we are all disputing and acting in certain necessary circles, 75 and if so, I make another necessary movement, which is, to discharge the public teachers of this doctrine, and expend. their salaries in an economical manner, 76 which might better answer the purposes of our happiness, or lay it out in good wine or old spirits to make the heart glad, and laugh at the stupidity or cunning of those who would have made us mere machines.

77 Some advocates for the doctrine of fate will also maintain that we are free agents, notwithstanding they tell us there has been a concatenation of causes and events which has reached from God down to this time, and which will eternally be continued-- 78 that has and will control, and bring about every action of our lives, though there is not anything in Nature more certain than that we cannot act necessarily and freely in the same action, and at the same time; 79 yet it is hard for such persons, who have verily believed that they are elected, (and thus by a predetermination of God become His special favourites.) to give up their notions of a predetermination of all events, upon which system their election and everlasting happiness is nonsensically founded; 80 and on the other hand, it is also hard for them to go so evidently against the Law of Nature (or dictates of conscience) which intuitively evinces the certainty of human liberty, as to reject such evidence; 81 and therefore hold to both parts of the contradiction, 'to wit', that they act necessarily, and freely, 82 upon which contradictory principle they endeavoured to maintain the dictates of natural conscience, and also their darling folly of being electedly and exclusively favourites of God.

THE DOCTRINE OF THE INFINITY OF EVIL AND OF SIN CONSIDERED

Ethan Allen

SECTION I

3 That God is infinitely good in the eternal displays of His providence, has been argued in the third section of the second chapter, 2 from which we infer that there cannot be an infinite evil in the universe, inasmuch as it would be incompatible with infinite good; 3 yet there are many who imbibe the doctrine of the infinite evil of sin, and the maxim on which they predicate their arguments in its support, are, that the greatness of sin, or adequateness of its punishment, is not to be measured, 4 or its viciousness ascertained by the capacity and circumstances of the offender, but by the capacity and dignity of the being against whom the offence is committed;

5 and as every transgression is against the authority and law of God, it is therefore against God; 6 and as God is infinite, therefore, sin is an infinite evil, and from hence infer the infinite and vindictive wrath of God against sinners, and of His justice in dooming them, 7 as some say to infinite, and others say to eternal misery; the one without degree or measure, and the other without end or duration.

8 Admitting this maxim for truth, that the transgressions or sins of humankind are to be estimated by their heinousness, by the dignity and infinity of the divine Nature, 9 then it will follow that all sins would be equal, which would confound all our notions of the degrees or aggravations of sin; so that the sin would be the same to kill my neigbour as it would be to kill his horse. 10 For the divine Nature, by this maxim, being the rule by which human's sin is to be estimated, and always the same, there could therefore be no degrees in sin or guilt, any more than there are degrees of perfection in God, 11 whom we all admit to be infinite, and who for that reason only cannot admit of any degrees or enlargement. 12 Therefore as certain as there are degrees in sin, the infinity of the divine Nature cannot be the standard whereby it is to be ascertained, 13 which single consideration is a sufficient confutation of the doctrine of the infinite evil of sin, as predicated on that maxim, inasmuch as none are so stupid as not to discern that there are degrees and aggravations in sin.

14 I recollect a discourse of a learned Ecclesiastic, who was labouring in support of this doctrine. His first proposition was, "That moral rectitude was infinitely pleasing to God;" 15 from which he deduced this inference, viz., "That a contrariety to moral rectitude was consequently infinitely displeasing to God and infinitely evil." 16 That the absolute moral rectitude of the divine Nature is infinitely well pleasing to God, will not be disputed; for this is none other but perfect and infinite rectitude; 17 but there cannot in Nature be an infinite contrariety thereto, or any being infinitely evil, or infinite in any respect whatever, except we

admit a self-existent and infinite diabolical nature, which is too absurd to deserve argumentative confutation.

18 Therefore, as all possible moral evil must result from the agency of finite beings, consisting in their sinful deviations from the rules of eternal unerring order and reason, which is moral rectitude in the abstract, 19 we infer that, provided 'all finite beings in the universe' had not done anything else but sin and rebel against God, reason and moral rectitude in general; 20 all possible moral evil would fall as much short of being infinite, as all finite capacities, complexly considered, would fail of being infinite, which will bear no proportion at all. 21 For though 'finite minds', as has been before argued, bear a 'resemblance to God', yet they bear 'no proportion to His infinity'; 22 and therefore there is not and cannot be any being, beings or agency of being or beings, complexly considered or otherwise, which are infinite in capacity, or which are infinitely evil and detestable in the sight of God, in that unlimited sense; 23 for the actions or agency of limited beings, are also limited, which is the same as finite: 24 so that both the virtues and vices of human are finite; they are not virtuous or vicious but in degree; therefore moral evil is finite and bounded.

25 Though there is one, and but one infinite good, which is God, and there can be no dispute, 26 but that God judges, and approves or disapproves of all things and beings, and agencies of beings, as in truth they are, 27 or in other words judges of every thing as being what it is; 28 but to judge a finite evil to be infinite, would be infinitely erroneous and disproportionate; 29 for so certain as there is a distinction between, infinity and infinitude, so certain finite sinful agency cannot be infinitely evil; or in other words finite offences cannot be infinite. 30 Nor is it possible that the greatest of sinners should in justice deserve infinite punishment, or their nature sustain it; 31 finite beings may as well be supposed to be capable of infinite happiness as of infinite misery, but the rank which they hold in the universe exempts them from either; 32 it nevertheless admits them to a state

of agency, probation or trial, consequently to interchangeable progressions in moral good and evil, and of course to alternate happiness or misery.

33 We will dismiss the doctrine of the infinite evil of sin with this observation, that as no mere creature can suffer an infinitude of misery or of punishment, it is therefore incompatible with the wisdom of God, 34 so far to capacitate creatures to sin, as in His constitution of things to foreclose Himself from adequately punishing them for it.

THE MORAL GOVERNMENT OF GOD AS INCOMPATIBLE...
WITH ETERNAL PUNISHMENT

SECTION II

35 We may for certain conclude, that such a punishment will never have the divine approbation, or be inflicted on any intelligent being or beings in the infinitude of the government of God. 36 For an endless punishment defeats the very end of its institution, which in all wise and good governments is as well to reclaim offenders, as to be examples to others; 37 but a government which does not admit of reformation and repentance, must unavoidably involve its subjects in misery; 38 for the weakness of creatures will always be a source of error and inconstancy, and a wise Governor, as we must admit God to be, would suit His government to the capacity and all other circumstances of the governed; 39 and instead of inflicting eternal damnation on His offending children, would rather interchangeably extend His beneficence with His vindictive punishments, so as to alienate them from sin and wickedness, and incline them to morality; 40 convincing them from experimental suffering, that sin and vanity are their greatest enemies, and that in God and moral rectitude their dependence and true happiness consists, 41 and by reclaiming them from wickedness and error, to the truth, and to the love and practice of virtue, give them occasion to glorify God for the wisdom and goodness of His government, and to be ultimately happy under it. 42 But we are told that the eternal

damnation of a part of humankind greatly augments the happiness of the elect, who are represented as being vastly the less numerous, (a diabolical temper of mind in the elect:) 43 besides, how narrow and contractive must such notions of infinite justice and goodness be? Who would imagine that the Deity conducts His providence similar to the detestable despots of this world? 44 Oh horrible? Most horrible impeachment of Divine Goodness! 45 Rather let us exaltedly suppose that God eternally had the ultimate best good of beings generally and individually in his view, with the reward of the virtuous and the punishment of the vicious, 46 and that no other punishment will ever be inflicted, merely by the divine administration, but that will finally terminate in the best good of the punished, 47 and thereby subserve the great and important ends of the divine government, and be productive of the restoration and felicity of all finite rational nature.

48 The most weighty arguments deducible from the divine Nature have been already offered, 'to wit', ultimate end of God, in creation and providence, to do the greatest possible good and benignity to beings in general, 49 and consequently, that the great end and design of punishment, in the divine government, must be to reclaim, restore, and bring revolters from original rectitude back to embrace it and to be ultimately happy; 50 as also, that an eternal punishment, would defeat the very end and design of punishment itself; 51 and that no good consequences to the punished could arise out of a never ending destruction; 52 but that a total, everlasting, and irreparable evil would take place on such part of the moral creation, as may be thus sentenced to eternal and remediless perdition; which would argue imperfection either in the creation, or moral government of God, or in both.

REASON

HUMAN LIBERTY, AGENCY AND ACCOUNTABILITY, CANNOT...
BE ATTENDED WITH ETERNAL CONSEQUENCES,
EITHER GOOD OR EVIL

SECTION III

53 From what has been argued in the foregoing section, it appears that humankind in this life are not agents of trial for eternity, but that they will eternally remain agents of trial! 54 To suppose that our eternal circumstances will be unalterably fixed in happiness or misery, in consequence of the agency or transactions of this temporary life, is inconsistent with the moral government of God, and the progressive and retrospective knowledge of the human mind. 55 God has not put it into our power to plunge ourselves into eternal woe and perdition; human liberty is not so extensive, for the term of human life bears no proportion to eternity succeeding it; 56 so that there could be no proportion between a momentary agency, (which is liberty of action,) or probation, and any supposed eternal consequences of happiness or misery resulting from it. 57 Our liberty consists in our power of agency, and cannot fall short of, or exceed it, for liberty is agency itself, or is that by which agency or action is exerted; 58 it may be that the curious would define it, that agency is the effect of liberty, and that liberty is the cause which produces it; 59 making a distinction between action and the power of action; be it so, yet agency cannot surpass its liberty; 60 to suppose otherwise, would be the same as to suppose agency without the power of agency, or an effect without a cause; 61 therefore, as our agency does not extend to consequences of eternal happiness or misery, the power of that agency, which is liberty, does not. 62 Sufficient it is for virtuous minds, while in this life, that they keep "Consciences void of offence towards God and towards human." 63 And that in their commencement in the succeeding state, they have a retrospective knowledge of their agency in this, and retain a consciousness of a well spent life. 64 Beings thus possessed of a habit of virtue, would enjoy a rational felicity beyond the reach of physical evils which terminate with life; 65 and

in all rational probability would be advanced in the order of Nature, to a more exalted and sublime manner of being, knowledge and action, than at present we can conceive of, where no joys or pains can approach, but of the mental kind; 66 in which elevated state virtuous minds will be able, in a clearer and more copious manner in this life, to contemplate the superlative beauties of moral fitness; 67 and with ecstatic satisfaction enjoy it, notwithstanding imperfection and consequently agency, proficiency and trial, of some kind or other, must everlastingly continue with finite minds.

68 And as to the vicious, who have violated the laws of reason and morality, lived a life of sin and wickedness, and are at as great a remove from a rational happiness as from moral rectitude; 69 such incorrigible sinners, at their commencing existence in the world of spirits, will undoubtedly have opened to them a tremendous scene of horror, self-condemnation and guilt, with an anguish of mind; 70 the more so, as no sensual delights can there, (as in this world,) divert the mind from its conscious guilt; 71 the clear sense of which will be the more pungent, as the mind in that state will be greatly enlarged, and consequently more capaciously susceptible of sorrow, grief, and conscious woe, from a retrospective reflection of a wicked life.

OF PHYSICAL EVILS

SECTION IV

72 Physical evils are in nature inseparable from animal life, they commenced existence with it, and are its concomitants through life; 73 so that the same nature which gives being to the one, gives birth to the other also; the one is not before or after the other, but they are coexistent together, and cotemporaries; 74 and as they began existence in a necessary dependence on each other, so they terminate together in death and dissolution. 75 This is the original order to which animal nature is subjected, as applied to every species of it. 76 The beasts of the field, the fowls of the air, the fishes of the sea, with reptiles, and all manner of beings, which are

possessed with animal life; nor is pain, sickness, or mortality any part of God's punishment for sin. 77 On the other hand sensual happiness is no part of the reward of virtue: to reward moral actions with a glass of wine or a shoulder of mutton, would be as inadequate, as to measure a triangle with sound, 78 for virtue and vice pertain to the mind, and their merits or demerits have their just effects on the conscience, as has been before evinced: 79 but animal gratifications are common to the human race indiscriminately, and also, to the beasts of the field: 80 and physical evils as promiscuously and universally extend to the whole, so "'That there is no knowing good or evil by all that is before us, for all is vanity'." 81 It was not among the number of possibles, that animal life should be exempted from mortality: omnipotence itself could not have made it capable of eternalisation and indissolubility; 82 for the self same nature which constitutes animal life, subjects it to decay and dissolution; so that the one cannot be without the other, any more than there could be a compact number of mountains without vallies, 83 or that I could exist and not exist at the same time, or that God should effect any other contradiction in Nature; all contradictions being equally impossible, inasmuch as they imply an absolute incompatibility with Nature and truth; 84 for Nature is predicated on truth, and the same truth which constitutes mountains, made the vallies at the same time; nor is it possible that they could have a separate existence. 85 And the same truth which affirms my existence, denies its negative; so also the same Law of Nature, which in truth produceth an animal life and supports it for a season, wears it out, and in its natural course reduces it to its original elements again.

86 The vegetable world also presents us with a constant aspect of productions and dissolutions; and the bustle of elements is beyond all conception; 87 but the dissolution of forms is not the dissolution of matter, or the annihilation of it, nor of the creation, which exists in all possible forms and fluxilities;

88 and it is from such physical alterations of the particles of matter, that animal or vegetable life is produced and destroyed. 89 Elements afford them nutrition, and time brings them to maturity, decay and dissolution; 90 and in all the prolific production of animal life, or the productions of those of a vegetative nature, throughout all their growth, decay and dissolution, make no addition or diminution of creation; 91 but eternal Nature continues its never ceasing operations, (which in most respects are mysterious to us) under the unerring guidance of the providence of God.

92 Animal nature consists of a regular constitution of a variety of organic parts, which have a particular and necessary dependance on each other, by the mutual assistance whereof the whole are animated. 93 Blood seems to be the source of life, and it is requisite that it have a proper circulation from the heart to the extreme parts of the body, 94 and from thence to the heart again, that it may repeat its temporary rounds through certain arteries and veins, which replenish every minutia part with blood and vital heat; 95 but the brain is evidently the seat of sensation, which through the nervous system conveys the animal spirits to every part of the body, imparting to it sensation and motion, constituting it a living machine,-- 96 which could never have been produced, or exercised its respective functions in any other sort of world but this; which is in a constant series of fluxilities, and which causeth it to produce food for its inhabitants. 97 An unchangeable world could not admit of production or dissolution, but would be identically the same, which would preclude the existence and nutriment of such sensitive creatures as we are.

98 The nutrition extracted from food by the secret aptitudes of the digesting powers (by which mysterious operation it becomes incorporated with the circulating juices, supplying the animal functions with vital heat, strength and vigour) 99 demands a constant flux and reflux of the particles of matter, which is perpetually incorporating with the body, 100 and supplying the place of the superfluous particles that are

constantly discharging themselves by insensible perspiration; supporting, and at the same time, in its ultimate tendency, destroying animal life. 101 Thus it manifestly appears, that the laws of the world in which we live, and the constitution of the animal nature of human, are all but one uniform arrangement of cause and effect; 102 and as by the course of those laws, animal life is propagated and sustained for a season, so by the operation of the same laws, decay and mortality are the necessary consequences.

SPECULATION ON THE DOCTRINE OF THE DEPRAVITY... OF HUMAN REASON

Ethan Allen

SECTION I

4 In the course of our speculation on Divine Providence we proceed next to the consideration of the doctrine of the depravity of human reason: 2 a doctrine derogatory to the nature of human, and the rank and character of being which you holds in the universe, 3 and which, if admitted to be true overturns knowledge and science and renders learning, instruction and books useless and impertinent; 4 inasmuch as reason, depraved or spoiled, would cease to be reason; as much as the mind of a raving mad person would of course cease to be rational: 5 admitting the depravity of reason, the consequence would unavoidably follow, that as far as it may be supposed to have taken place in the midst of humankind, there could be no judges of it, in consequence of their supposed depravity; 6 for without the exercise of reason, we could not understand what reason is, which would be necessary for us previously to understand, in order to understand what it is not; or to distinguish it from that which is its reverse. 7 But for us to have the knowledge of what reason is, and the ability to distinguish it from that which is depraved, or is irrational, is incompatible with the doctrine of the depravity of our reason. 8 Inasmuch as to understand what reason is, and to distinguish it from that which is marred or spoiled, is the same to all intents and purposes, as to have, exercise and enjoy, the

principle of reason itself, which precludes its supposed depravity: 9 so that it is impossible for us to understand what reason is, and at the same time determine that our reason is depraved; 10 for this would be the same as when we know that we are in possession and exercise of reason, to determine that we are not in possession or exercise of it.

11 It may be, that some who embrace the doctrine of the depravity of human reason, will not admit that it is wholly and totally depraved, but that it is in a great measure marred or spoiled. 12 But the foregoing arguments are equally applicable to a supposed depravity in parts, as in the whole; 13 for in order to judge whether reason be depraved in part or not, it would be requisite to have an understanding of what reason may be supposed to have been, previous to its premised depravity; 14 and to have such a knowledge of it, would be the same as to exercise and enjoy it in its lustre and purity, which would preclude the notion of a depravity in part, as well as in the whole; 15 for it would be utterly impossible for us to judge of reason undepraved and depraved, but by comparing them together. 16 But for depraved reason to make such a comparison, is contradictory and impossible; so that, if our reason had been depraved, we could not have had any conception of it any more than a beast. 17 People of small faculties in reasoning cannot comprehend the extensive reasonings of their superiors, how then can a supposed depraved reason comprehend that reason which is uncorrupted and pure? 18 To suppose that it could, is the same as to suppose that depraved and undepraved reason is alike, and if so, there needs no further dispute about it.

19 There is a manifest contradiction in applying the term 'depraved' to that of reason, the ideas contained in their respective definitions will not admit of their association together, as the terms convey heterogeneous ideas; 20 for reason spoiled, marred, or robbed of its perfection, ceaseth to be rational, and should not be called reason; inasmuch as it is premised to be depraved, or degenerated from a rational nature; 21 and in

consequence of the deprivation of its nature, should also be deprived of its name, and called subterfuge, or some such like name, which might better define its real character.

22 Those who invalidate reason, ought seriously to consider, "'whether they argue against reason, with or without reason; 23 if with reason, then they establish the principle, that they are labouring to dethrone:'" but if they argue without reason, (which, in order to be consistent with themselves, they must do,) they are out of the reach of rational conviction, nor do they deserve a rational argument.

24 We are told that the knowledge of the depravity of reason, was first communicated to humankind by the immediate inspiration of God. 25 But inasmuch as reason is supposed to be depraved, what principle could there be in the human irrational soul, which could receive or understand the inspiration, or on which it could operate so as to represent to those whom it may be supposed were inspired, 26 the knowledge of the depravity of (their own and humankind's) reason (in general:) for a rational inspiration must consist of rational ideas, 27 which pre-sup-poses that the minds of those who were inspired, were rational previous to such inspiration, which would be a downright contradiction to the inspiration itself; 28 the import of which was to teach the knowledge of the depravity of human reason, which without reason could not be understood, and with reason it would be understood, that the inspiration was false.

29 Will any advocates for the depravity of reason suppose, that inspiration ingrafts or superadds the essence of reason itself to the human mind? 30 Admitting it to be so, yet such inspired persons could not understand any thing of reason, before the reception of such supposed inspiration; 31 nor would such a premised inspiration prove to its possessors or receivers, that their reason had ever been depraved. 32 All that such premised inspired persons could understand, or be conscious of, respecting reason, would be after the inspiration may be supposed to have taken effect, and

made them rational beings, 33 and then instead of being taught by inspiration, that their reason had been previously depraved, they could have had no manner of consciousness of the existence or exercise of it, until the impairing the principle of it by the supposed energy of inspiration; 34 nor could such supposed inspired persons communicate the knowledge of such a premised revelation to others of the species, who for want of a rational nature, could not be supposed, on this position, to be able to receive the impressions of reason.

35 That there are degrees in the knowledge of rational beings, and also in their capacities to acquire it, cannot be disputed, as it is so very obvious among humankind. 36 But in all the retrospect gradations from the exalted reasonings of a Locke or a Newton, down to the lowest exercise of it among the species, still it is reason, and not depraved; 37 for a less degree of reason by no means implies a depravity of it, nor does the imparting of reason argue its depravity, for what remains of reason, or rather of the exercise of it, is reason still. 38 But there is not, and cannot be such a thing as depraved reason, for that which is rational is so, and for that reason cannot be depraved, whatever its degree of exercise may be supposed to be.

39 A blow on the head, or fracture of the cranium, as also palsies and many other casualties that await our sensorium, retard, and in some cases wholly prevent the exercise of reason for a longer or shorter period; and sometimes through the stage of human life; 40 but in such instances as these, reason is not depraved, but ceases in a greater or less degree, or perhaps wholly ceases its rational exertions or operations; 41 by reason of the breaches or disorders of the organs of sense, but in such instances, wherein the organs become rectified, and the senses recover their usefulness, the exercise of reason returns, free from any blemish or depravity. 42 For the cessation of the exercise of reason, by no means depraves it.

43 From what has been argued on this subject, in this and the preceding chapters, it appears that reason is not and cannot be

depraved, 44 but that it bears a likeness to divine reason, is of the same kind, and in its own nature as uniform as truth, which is the test of it; 45 though in the divine essence, it is eternal and infinite, but in human it is eternal only as it respects their immortality, and finite as it respects capaciousness. 46 Such people as can be prevailed upon to believe, that their reason is depraved, may easily be led by the nose, and duped into superstition at the pleasure of those in whom they confide, and there remain from generation to generation: 47 for when they throw by the law of reason 'the only one' which God gave them to direct them in their speculations and duty, they are exposed to ignorant or insidious teachers, 48 and also to their own irregular passions, and to the folly and enthusiasm of those about them, which nothing but reason can prevent or restrain: 49 nor is it a rational supposition that the commonality of humankind would ever have mistrusted that their reason was depraved, had they not been told so, 50 and it is whispered about, that the first insinuation of it was from the Priests; (though the Armenian Clergymen in the circle of my acquaintance have exploded the doctrine.) 51 Should we admit the depravity of reason, it would equally affect the priesthood, or any other teachers of that doctrine, with the rest of humankind; 52 but for depraved creatures to receive and give credit to a depraved doctrine, started and taught by depraved creatures, is the greatest weakness and folly imaginable, 53 and comes nearer a proof of the doctrine of total depravity, than any arguments which have been advanced in support of it.

CONTAINING A DISQUISITION OF THE LAW OF NATURE...
AS IT RESPECTS THE MORAL SYSTEM, INTERSPERSED WITH OBSERVATIONS ON SUBSEQUENT RELIGIONS

SECTION II

54 That humankind are by nature endowed with sensation and reflection, from which results the power of reason and understanding, will not be disputed. 55 The senses are well calculated to make discoveries of external objects and to communicate those notices, or

simple images of things to the mind, 56 with all the magnificent simplicity of Nature, which opens an extensive field of contemplation to the understanding, enabling the mind to examine into the natural causes and consequences of things, 57 and to investigate the knowledge of moral good and evil, from which, together with the power of agency, results the human conscience. This is the original of moral obligation and accountability, which is called natural religion; 58 for without the understanding of truth from falsehood, and right from wrong, which is the same as justice from injustice, and a liberty of agency, which is the same as a power of proficiency in either moral good or evil: humankind would not be rational or accountable creatures.

59 Undoubtedly it was the ultimate design of our Creator, in giving us being, and furnishing us with those noble compositions of mental powers and sensitive aptitudes, that we should, in, by, and with that nature, serve and honour Him; 60 and with those united capacities, search out and understand our duty to Him, and to one another, with the ability of practising the same as far as may be necessary for us in this life. 61 To object against the sufficiency of natural religion, to effect the best ultimate good of humankind, would be derogating from the wisdom, goodness, and justice of God, who in the course of His providence to us, has adopted it: 62 besides, if natural religion may be supposed to be deficient, what security can we have that any subsequently revealed religion should not be so also? 63 For why might not a second religion from God be as insufficient or defective as a first religion may be supposed to be? 64 From hence we infer that if natural religion be insufficient to dictate humankind in the way of their duty and make them ultimately happy, there is an end to religion in general. 65 But as certain as God is perfect in wisdom and goodness, natural religion is sufficient and complete; 66 and having had the divine approbation, and naturally resulting from a rational nature, is as universally promulgated to humankind as reason itself. 67 But to the disadvantage of the claim of

all subsequent religions, 'called revelations, whether denominated inspired, external, supernatural, or whatnot', they came too late into the world to be essential to the well being of humankind, 68 or to point out to them the only way to heaven and everlasting blessedness: inasmuch as for the greatest part of humankind who have ever lived in this world, have departed this life previous to the eras and promulgations of such revelations.

69 Besides, those subsequent revelations to the Law of Nature, began as human traditions have ever done in very small circumferences, 70 in the respective parts of the world where they have been inculcated, and made their progress, as time, chance, and opportunity presented. 71 Does this look like the contrivance of heaven, and the only way of salvation? Or is it not more like this world and the contrivance of human? 72 Undoubtedly the great parent of humankind laid a just and sufficient foundation of salvation for every one of them; 73 for otherwise such of them, who may be supposed not to be thus provided for would not have whereof to glorify God for their being, 74 but on the contrary would have just matter of complaint against His providence or moral government for involuntarily necessitating them into a wretched and miserable existence, and that without end or remedy: 75 which would be ascribing to God a more extensive injustice than is possible to be charged on the most barbarous despots that ever were among humankind.

76 But to return to our speculations on the Law of Nature. That this divine Law surpasses all positive institutions, that have ever been ushered into the world since its creation 77 as much as the wisdom and goodness of God exceeds that of human, is beautifully illustrated in the following quotation: 78 "But it may be said what is virtue? It is the faithful discharge of those obligations which reason dictates. 79 And what is wisdom itself, but a portion of intelligence? with which the creator has furnished us, in order to direct us in our duty? 80 It may be further asked, what is this

duty? whence does it result? and by what law is it prescribed? 81 I answer that the law which prescribed it is the immutable will of God; to which right reason obliges us to conform ourselves, and in this conformity virtue consists. 82 No law which has commenced since the creation, or which may ever cease to be in force, can constitute virtue; 83 for before the existence of such a law, humankind could not be bound to observe it; but they were certainly under an obligation to be virtuous from the beginning. 84 Princes may make laws and repeal them, but they can neither make nor destroy virtue, and how indeed should they be able to do what is impossible to the Deity Himself?

85 Virtue being as immutable in its nature as the divine Will which is the ground of it. 86 Virtue did not derive its nature merely from the omnipotent will of God, but also from the eternal truth and moral fitness of things; 87 which was the eternal reason why they were eternally approved of by God, and immutably established by Him, to be what they are; 88 and so far as our duty is connected with those eternal measures of moral fitness, or we are able to act on them, we give such actions or habits the name of virtue or morality. 89 But when we, in writing or conversation, say that virtue is grounded on the divine will, we should at the same time include in the complex idea of it, that the divine will which constituted virtue, was eternally and infinitely reasonable.

90 A Prince may command his subjects to pay taxes or subsidies, may forbid them to export certain commodities, or to introduce those of a foreign country. 91 The faithful observance of these laws make obedient subjects, but does not make virtuous humans; and would any one seriously think yourself possessed of a virtue the more for not having dealt in painted calico; 92 or if the Prince should by his authority abrogate these laws, would any one say he had abrogated virtue? 93 It is thus with all positive laws; they all had a beginning-- are all liable to exceptions, and may be dispensed with and even abolished. 94 That law alone which is engraven on our hearts by the hand of our

creator, is unchangeable and of universal and eternal obligation. 95 The law, says Cicero, is not a human invention, nor an arbitrary political institution, it is in its nature eternal and of universal obligation.

96 The violence Tarquin offered to Lucretia, was a breach of that eternal law, and though the Romans at that time might have no written law which condemned such kind of crimes, his offence was not the less heinous; 97 for this law of reason did not then begin, when it was first committed to writing; its original is as ancient as the divine mind. 98 For the true, primitive and supreme law, is no other than the unerring reason of the great Jupiter. 99 And in another place he says, this law is founded in Nature, it is universal, immutable, and eternal, it is subject to no change from any difference of place, or time, 100 it extends invariably to all ages and nations, like the sovereign dominion of that Being, who is author of it."

101 The promulgation of this supreme law to creatures, is co-extensive and co-existent with reason, and binding on all intelligent beings in the universe; 102 and is that eternal rule of fitness, as applicable to God, by which the creator of all things conducts His infinitude of providence, and by which He governs the moral system of being, according to the absolute perfection of his nature. 103 From hence we infer, that admitting those subsequent revelations, which have more or less obtained credit in the world, as the inspired laws of God, to be consonant to the Laws of Nature, 104 yet they could be considered as none other but mere transcripts therefrom, promulgated to certain favourite nations, when at the same time all humankind was favoured with the original.

105 The moral precepts contained in Moses' decalogue to the people of Israel, was previously known to every nation under heaven, and in all probability by them as much practised as by the tribes of Israel. 106 Their keeping the seventh day of the week as a sabbath was an arbitrary imposition of Moses, (as many other of his edicts were) and not included in the Law of Nature.

107 But as to such laws of his, or those of any other legislator, which are morally fit, agree with, and are a part of the natural law, as for instance; "Thou shalt not covet," or "kill." 108 These positive injunctions cannot add anything to the Law of Nature, inasmuch as it contains an entire and perfect system of morality; 109 nor can any positive injunctions or commands enforce the authority of it, or confer any additional moral obligation on those to whom they are given to obey; 110 the previous obligation of natural religion, having ever been as binding as reason can possibly conceive of, or the order and constitution of the moral rectitude of things, as resulting from God, can make it to be.

111 To illustrate the argument of the obligatory nature of the natural law let us reverse the commandments of the decalogue, by premising that Moses had said thou shalt covet; thou shalt steal and murder; 112 would any one conclude, that the injunctions would have been obligatory? Surely they would not, 113 for a positive command to violate the Law of Nature could not be binding on any rational being. 114 How then came the injunctions of Moses, or any others, to be binding in such cases, in which they coincide with the Law of Nature? 115 We answer, merely in consequence of the obligatory sanctions of the natural law, which does not at all depend on the authority of Moses or of any other legislator, short of him who is eternal and infinite; 116 nor is it possible that the Jews, who adhere to the law of Moses, should be under greater obligation to the moral law, than the Japanese; or the Christians than the Chinese; 117 for the same God extends the same moral government over universal rational nature, independent of Popes, Priests and Levites. 118 But with respect to all mere positive institutions, injunctions, rites and ceremonies, that do not come within the jurisdiction of the Law of Nature, they are political matters, 119 and may be enacted, perpetuated, dispensed with, abolished, re-enacted, compounded or diversified, as conveniency, power, opportunity, inclination, or

interest, or all together may dictate; 120 inasmuch as they are not founded on any stable or universal principle of reason, but change with the customs, fashions, traditions and revolutions of the world; having no centre of attraction, but interest, power and advantages of a temporary nature. 121 Was the creator and governor of the universe to erect a particular academy of arts and sciences in this world, under His immediate inspection, with tutors rightly organised, and intellectually qualified to carry on the business of teaching, 122 it might like other colleges, (and possibly in a superior manner,) instruct its scholars. 123 But that God should have given a revelation of His will to humankind, as His law, and to be continued to the latest posterity as such, which is premised to be above the capacity of their understanding, is contradictory and in its' own nature impossible. 124 Nor could a revelation to humankind, which comes within the circle of their knowledge, be edifying or instructing to them, 125 for it is a contradiction to call that which is above my comprehension, or that which I already, (from natural sagacity) understand, a revelation to me: 126 to tell me, or inspire me, with the knowledge of that which I knew before, would reveal nothing to me, and to reveal that to me which is supernatural or above my comprehension, is contradictory and impossible. 127 But the truth of the matter is, that humankind are restricted by the Law of Nature to acquire knowledge or science progressively, as before argued. 128 From which we infer the impropriety, and consequently the impossibility of God's having ever given us any manuscript copy of His eternal law: 129 for that to reveal it at first would bring it on a level with the infancy of knowledge then in the world, or (fishermen, shepherds, and illiterate people could not have understood it,) 130 which would have brought it so low that it could not be instructive or beneficial to after generations in their progressive advances in science and wisdom.

ARGUMENTATIVE REFLECTIONS ON SUPERNATURAL... AND MYSTERIOUS REVELATION IN GENERAL

Ethan Allen

SECTION I

5 There is not anything which has contributed so much to delude humankind in religious matters, as mistaken apprehensions concerning supernatural inspiration or revelation; 2 not considering that all true religion originates from reason, and can no otherwise be understood but by the exercise and improvement of it; therefore they are apt to confuse their minds with such inconsistencies. 3 In the subsequent reasonings on this subject, we shall argue against supernatural revelation in general, which will comprehend the doctrine of inspiration or immediate illumination of the mind. 4 And first-- we will premise, that a revelation consists of an assemblage of rational ideas, intelligibly arranged and understood by those to whom it may be supposed to be revealed, for otherwise it could not exist in their minds as such. 5 To suppose a revelation, void of rationality or understanding, or of communicating rational intelligence to those, to whom it maybe supposed to be given, would be a contradiction; 6 for that it could contain nothing except it were unintelligibleness which would be the same as to reveal and not to reveal; 7 therefore, a revelation must consist of an assemblage of rational ideas, intelligibly communicated to those who are supposed to have been the partakers or receivers of it from the first supposed inspiration, down to this or any other period of time. 8 But such a revelation as this, could be nothing more or less than a transcript of the Law of Nature, predicated on reason, and would be no more supernatural, than the reason of human may be supposed to be. 9 The simple definition of supernatural is, that which is "beyond or above the powers of Nature," which never was or can be understood by humankind; the first promulgators of revelation not excepted; 10 for such revelation, doctrine, precept or instruction only, as comes within the powers of our nature, is

capable of being apprehended, contemplated or understood by us, 11 and such as does not, is to us incomprehensible and unknown, and consequently cannot for us compose any part of revelation.

12 The author of human nature impressed it with certain sensitive aptitudes and mental powers, so that apprehension, reflection or understanding could no otherwise be exerted or produced in the compound nature of human, but in the order prescribed by the creator. 13 It would therefore be a contradiction in Nature, and consequently impossible for God to inspire, infuse, or communicate the apprehension, reflection or understanding of any thing whatever into human nature, out of, above, or beyond the natural aptitudes, and mental powers of that nature, which was of His own production and constitution; 14 for it would be the same as to inspire, infuse, or reveal apprehension, reflection or understanding, to that which is not; 15 inasmuch as out of, beyond or above the powers of Nature, there could be nothing to operate upon, as a prerequisite principle to receive the inspiration or infusion of the revelation, which might therefore as well be inspired into, or revealed to nonentity, as to human.

16 For the essence of human is that, which we denominate to be your nature, out of or above which you are as void of sensation, apprehension, reflection and understanding, as nonentity may be supposed to be; 17 therefore such revelation as is adapted to the nature and capacity of human, and comes within your powers of perception and understanding, is the only revelation, which you are able to receive from God or human.

18 Supernatural revelation is as applicable to beasts, birds and fishes, as it is to us; 19 for neither we nor they are capable of being acted upon supernaturally, as all the possible exertions and operations of Nature, which respect the natural or moral world, are truly natural. 20 Nor does God deviate from His rectitude of Nature in matters of inspiration, revelation or instruction to the moral world, any more than in that of His government of the natural. 21 The infinitude of the wisdom of

God's creation, providence and moral government will eternally remain supernatural to all finite capacities, and for that very reason we can never arrive to the comprehension of it, in any state of being and improvement whatever; 22 inasmuch as progression can never attain to that which is infinite, so that an eternal proficiency in knowledge could not be supernatural, but on the other hand would come within the limits and powers of our nature, for otherwise such proficiency would be impossible to us; 23 nor is this infinite knowledge of God supernatural to you, for that your perfection is also infinite. 24 But if we could break over the limits of our capacity, so as to understand any one supernatural thing, which is above or beyond the power of our natures, we might by that rule as well understand all things, 25 and thus by breaking over the confines of finite Nature and the rank of being which we hold in the universe, comprehend the knowledge of infinity.

26 From hence we infer, that every kind and degree of apprehension, reflection and understanding, which we can attain to in any state of improvement whatever, is no more supernatural than the nature of human, 27 from whence perception and understanding is produced, may be supposed to be so: nor has or could God Almighty ever have revealed Himself to humankind in any other way or manner, but what is truly natural.

CONTAINING OBSERVATIONS ON THE PROVIDENCE...
AND AGENCY OF GOD, AS IT RESPECTS THE NATURAL AND MORAL WORLD, WITH STRICTURES ON REVELATION IN GENERAL

SECTION II

28 The idea of a God we infer from our experimental dependence on something superior to ourselves in wisdom, power and goodness, which we call God; 29 our senses discover to us the works of God which we call Nature, and which is a manifest demonstration of His invisible essence. 30 Thus it is from the works of Nature that we deduce the knowledge of a God, and not because we have, or can have any immediate knowledge of, or revelation from Him. 31 But on the other hand, all our

understanding of, or intelligence from God, is communicated to us by the intervention of natural causes, (which is not of the divine essence;) 32 this we denominate to be natural revelation, for that it is mediately made known to Us by our senses, and from our sensations of external objects in general, 33 so that all and every part of the universe, of which we have any conception, is exterior from the nature or essence of God; 34 nor is it in the nature of things possible for us to receive, or for God to communicate any inspiration or revelation to us, but by the instrumentality of intermediate causes, as has been before observed.

35 Therefore all our notions of the immediate interposition of divine illuminations, inspiration, or infusion of ideas or revelations into our minds, is mere enthusiasm and deception; 36 for that neither the divine mind, nor those of any finite intelligences can make any representation to, or impression on our external senses without the assistance of some adequate, intermediate cause. 37 The same is the case between human and human, or with humankind in general; we can no otherwise hold a correspondence but by the aptitude, and through the medium of our senses. 38 Since this is the only possible way in Nature by which we can receive any notices, perceptions, or intelligence from God or human.

39 Nothing can be more unreasonable than to suppose, because God is infinitely powerful, that He can therefore inspire or infuse perception, reflection or revelation into the mind of human in such a way or manner as is incompatible with the aptitudes and powers of their nature: 40 such a revelation would be as impossible to be revealed by God, as by a mere creature. For though it is a maxim of truth, "That with God all things are possible," 41 yet it should be considered, that contradictions, and consequently impossibilities are not comprehended in the definition of things, but are diametrically the reverse of them, as may be seen in the definition of the word things, to wit: "whatever is." 42 There is no contradiction in Nature or truth, which comprehends or contains all

things, therefore the maxim is just, "That with God all things are possible," viz: all things in Nature are possible with God; 43 but contradictions are falsehoods which have no positive existence, but are the negatives to things, or to Nature, which comprehends, "Whatever is;" 44 so that contradictions are opposed to Nature and truth, and are no things, but the chimeras of weak, unintelligent minds who make false application of things to persons, 45 or ascribe such powers, qualities, dispositions and aptitudes to things as Nature never invested them with; 46 such are our deluded notions of the immediate operations of the holy spirit, or of any mere spirit, on our minds independent of the intervention of some adequate, natural or intermediate cause.

47 To make a triangle four square, or to make a variety of mountains contiguously situated, without vallies, or to give existence to a thing and not to give existence to it at the same time, 48 or to reveal anything to us incompatible with our capacity of receiving the perception of it, pertains to those negatives to Nature and truth, and are not things revealed, nor have they any positive existence as has been before argued; 49 for they are inconsistent with themselves, and the relations and effects which they are supposed to have upon and with each other. 50 It derogates nothing from the power and absolute perfection of God that He cannot make both parts of a contradiction to be true.

51 But let us reverse the position concerning revelation, and premise that it is accommodated to our capacity of receiving and understanding it, and in this case it would be natural, and therefore possible for us to receive and understand it; 52 for the same truth which is predicated on the sufficiency of our capacity to receive and understand a revelation, affirms at the same time the possibility of our receiving and understanding it. 53 But to suppose that God can make both parts of a contradiction to be true, to reveal and not reveal, would be the same as ascribing a falsehood to Him and to call it by the name of power.

54 That God can do anything and everything, that is consonant to His moral perfections, and which does not imply a contradiction to the nature of the things themselves, and the essential relation which they bear to each other, none will dispute. 55 But to suppose, that inasmuch as God is all-powerful, He can therefore do everything, which we in our ignorance of Nature or of moral fitness may ascribe to Him, 56 without understanding, whether it is either consonant to moral rectitude, or to the nature of the things themselves, and the immutable relations and connections which they bear to each other, or not, is great weakness and folly. 57 That God cannot in the exercise of His providence or moral government, counteract the perfections of His Nature, or do any manner of injustice, is manifestly certain; nor is it possible for God to effect a contradiction in the natural world, any more than in the moral. 58 The impossibility of the one results from the moral perfections of God, and the impossibility of the other from the immutable properties, qualities, relations and nature of the things themselves, 59 as in the instances of the mountains, vallies, before alluded to, and in numberless other such like cases.

60 Admitting a revelation to be from God, it must be allowed to be infallible, therefore those to whom it may be supposed to have been first revealed from God, must have had an infallible certainty of their inspiration: 61 so likewise the rest of humankind, to whom it is proposed as a Divine Law, or rule of duty, should have an infallible certainty, 62 that its first promulgators were thus truly inspired by the immediate interposition of the spirit of God, 63 and that the revelation has been preserved through all the changes and revolutions of the world to their time, and that the copies extant present them with its original inspiration and unerring composure, or are perfectly agreeable to it. 64 All this we must have an infallible certainty of, or we fail of an infallible certainty of revelation, and are liable to be imposed upon by impostors, 65 or by ignorant and insidious teachers,

whose interest it may be to obtrude their own systems on the world for infallible truth, as in the instance of Mahomet.

66 But let us consult our own constitutions and the world in which we live, and we shall find that inspiration is, in the very nature of things, impossible to be understood by us, and of consequence not in fact true. 67 What certainty can we have of the agency of the divine mind on ours? Or how can we distinguish the supposed divine illuminations or ideas from those of our own which are natural to us? 68 In order for us to be certain of the interposition of immediate divine inspiration in our minds we must be able to analyse, distinguish, and distinctly separate the premised divine reflections, illuminations or inspiration from our own natural cogitations, 69 for otherwise we should be liable to mistake our reflections and reasonings for God's inspiration, as is the case with enthusiasts, or fanatics, and thus impose on ourselves, and obtrude our romantic notions on humankind, as God's revelation.

70 None will, it is presumed, pretend that the natural reflections of our minds are dictated by the immediate agency of the divine spirit; for if they were thus dictated, they would be of equal authority with any supposed inspired revelation. 71 How then shall we be able to distinguish or understand our natural perceptions, reflections or reasonings, from any premised immediately inspired ones? 72 Should God make known to us, or to any of us, a revelation by a voice, and that in a language which we understand, and admitting that the propositions, doctrines, or subject matter of it, should not exceed our capacity, 73 we could understand it the same as we do in conversation with one another; but this would be an external and natural revelation, 74 in which God is supposed to make use of language, grammar, logic and sound, alias of intermediate causes, in order to communicate or reveal it, which would differ as much from an immediately inspired revelation, as this book may be supposed to do; 75 for the very definition of immediate

inspiration precludes all natural or immediate causes. 76 That God is eternally perfect in knowledge, and therefore knows all things, not by succession or by parts, as we understand things by degrees, has been already evinced; 77 nevertheless all truth, which we arrive at the understanding of, accords with the divine omniscience, but we do not come at the comprehension of things by immediate infusion, or inspiration, but from reasoning; 78 for we cannot see or hear God think or reason any more than human, nor are our senses susceptible of a mere mental communion with Him, 79 nor is it in Nature possible for the human mind to receive any instantaneous or immediate illuminations or ideas from the divine spirit (as before argued,) 80 but we must illuminate and improve our minds by a close application to the study of Nature, through the series whereof God has been pleased to reveal Himself to human, so that we may truly say, that the knowledge of Nature is the revelation of God. 81 In this there can be no delusion, it is natural, and could come from none other but God.

82 Unless we could do this, we should compound them together at a venture, and form a revelation like Nebuchadnezzar's idol, "partly iron and partly clay," alias partly divine and partly human. 83 The Apostle Paul informs us, that sometimes he "spake, and not the Lord," and at other times speaks doubtfully about the matter, saying, "and I think also that I have the spirit of God," and if He was at a loss about His inspiration, well may we be distrustful of it. 84 From the foregoing speculations on the subject of supernatural inspiration, it appears, that there are insuperable difficulties in a mere mental discourse with the divine spirit; it is what we are unacquainted with, and the law of our nature forbids it. 85 Our method of conversation is vocal, or by writing, or by some sort of external symbols which are the mediate ground of it, and we are liable to errors and mistakes in this natural and external way of correspondence; 86 but when we have the vanity to rely on dreams and visions to inform ourselves of

things, or attempt to commune with invisible finite beings, or with the holy spirit, our deceptions, blunders and confusions are increased to fanaticism itself; 87 as the diverse supposed influence of the spirit, on the respective sectaries, even among Christians, may witness, as it manifestly, in their empty conceit of it, conforms to every of their traditions. 88 Which evinces, that the whole bustle of it is mere enthusiasm, for was it dictated by the spirit of truth and uniformity itself, it would influence all alike, 89 however zealots persuade themselves and one another that they have supernatural communion with the Holy Ghost, from whence they tell us they derive their notions of religion, 90 and in their frenzy are proof against reason and argument, which if we tender them, they tell us, that it is carnal and depraved reasoning, but that their teachings are immediately from God, 91 and then proceed to vent upon us all the curses and punishments, which are written in the book of the law.

92 There has in the different parts and ages of the world, been a multiplicity of immediate and wonderful discoveries, said to have been made to godly people of old by the special illumination or supernatural inspiration of God, 93 every of which have, in doctrine, precept and instruction, been essentially different from each other, which are consequently as repugnant to truth, as the diversity of the influence of the spirit on the multiplicity of sectaries has been represented to be.

94 These facts, together with the premises and inferences as already deduced, are too evident to be denied, and operate conclusively against immediate or supernatural revelation in general; nor will such revelation hold good in theory any more than in practice. 95 Was a revelation to be made known to us, it must be accommodated to our external senses, and also to our reason, so that we could come at the perception and understanding of it, the same as we do to that of things in general. 96 We must perceive by our senses, before we can reflect with the mind. 97 Our sensorium is that essential medium between the divine and human mind, through which God reveals to human the knowledge of

Nature, and is our only door of correspondence with God or with human.

98 A premised revelation, adapted to our external senses, would enable our mental powers to reflect upon, examine into, and understand it. 99 Always provided nevertheless, that the subject matter of such revelation, or that of the doctrines, precepts or injunctions therein contained, do not exceed our reason, but are adapted to it as well as to our external senses. 100 To suppose that God, merely from His omnipotence, without the intervention of some adequate intermediate cause could make use of sound, or grammatical and logical language, or of writing, so as to correspond with us, 101 or to reveal any thing to us, would run into the same sort of absurdity, which we have already confuted; 102 for it is the same as to suppose an effect without a suitable or a proportionable cause, or an effect without a cause; 103 whereas, effects must have adequate causes or they could not be produced. 104 God is the self-existent and eternal cause of all things, but the eternal cause can no otherwise operate on the eternal succession of causes and effects, but by the mutual operation of those causes on each other, according to the fixed Laws of Nature. 105 For as we have frequently observed before that of all possible systems, infinite wisdom comprehended the best; and infinite goodness and power must have adopted and perfected it; 106 and being once established into an ordinance of Nature, it could not be deviated from by God: 107 for that it would necessarily imply a manifest imperfection in God, either in its eternal establishment, or in its premised subsequent alteration, which will be more particularly considered in the next chapter.

108 To suppose that Almighty power could produce a voice, language, grammar, or logic, so as to communicate a revelation to us, without some sort of organic or instrumentated machine 109 or intermediate vehicle, or adequate constituted external cause, would imply a contradiction to the order of Nature and consequently to the perfection of God, who established it; 110 therefore, provided God has

ever given us any particular revelation, we must suppose, that He has made use of a regular and natural constituted and mediate cause, 111 comprehended in the external order of Nature, rightly fitted and abilitated to make use of the vocal power of language, which comprises that of characters, orthography, grammar and logic, 112 all which must have been made use of, in communicating a supposed revelation to humankind, which forecloses inspiration.

113 Furthermore, this heavenly dictating voice should have been accommodated to all languages, grammars and logical ways of speaking, in which a revelation may have been divulged, 114 as it would be needful to have been continued from the beginning to every receiver, compiler, translator, printer, commentator on and teacher of such revelation, 115 in order to have informed humankind in every instance, wherein at any time they may have been imposed upon by any spurious adulterations or interpolations, and how it was in the original. 116 These, with the refinements of languages and translations, are a summary of the many ways, wherein we may have been deceived by giving credit to antiquated written revelation, 117 which would need a series of miracles to promulgate and perpetuate it in the world free from mistakes and frauds of one kind or other.

OF MIRACLES

Ethan Allen

SECTION I

6 Previous to the arguments concerning miracles, it is requisite that we give a definition of them, that the arguments may be clearly opposed to the doctrine of miracles, the reality of which we mean to negative; 2 so that we do not dispute about matters in which we are all agreed, but that we may direct our speculations to the subject matter or essence of the controversy. 3 We will therefore premise, that miracles are opposed to, and counteract the Laws of Nature, 4 or that they imply an absolute alteration in either a greater or less degree, the eternal

order, disposition and tendency of it; 5 this, we conclude, is a just definition of miraculousness, and is that for which the advocates for miracles contend, in their defining of miracles. 6 For if they were supposed to make no alteration in the natural order of things, they could have no positive existence, but the Laws of Nature would produce their effects, which would preclude their reality, and render them altogether fictitious, 7 inasmuch as their very existence is premised to consist in their opposition to, and alteration of the Laws of Nature: so that if this is not effected, miracles can have no positive existence, any more than nonentity itself; 8 therefore, if in the course of the succeeding arguments, we should evince that the Laws of Nature have not and cannot be perverted, altered or suspended, it will foreclose miracles by making all things natural.

9 Having thus defined miracles, and stated the dispute, we proceed to the arguments. Should there ever have been a miraculous suspension and alteration of the Laws of Nature, God must have been the immediate author of it, 10 as no finite beings may be supposed to be able to alter those laws or regulations, which were established by omnipotent power and infinite perfection, and which nothing short of such power and perfection can perpetuate. 11 This then is the single point at issue, viz: whether God has, or can, consistent with His nature as God, in any instance whatever, alter or deviate from the laws, with which He has eternally impressed the universe, or not.

12 To suppose that God should subvert His laws, (which is the same as changing them) would be to suppose Him to be mutable; 13 for that it would necessarily imply, either that their eternal establishment was imperfect, or that a premised alteration thereof is so. 14 To alter or change that which is absolutely perfect, would necessarily make it cease to be perfect, inasmuch as perfection could not be altered for the better, but for the worse, and consequently an alteration could not meet with the divine approbation; 15 which terminates the issue of the matter in question

against miracles, and authorises us to deduce the following conclusive inference, to wit: 16 that Almighty God, having eternally impressed the universe with a certain system of laws, for the same eternal reason that they were infinitely perfect and best, 17 they could never admit of the least alteration, but are as unchangeable, in their nature, as God their immutable author.

18 To form the foregoing argument into syllogisms, it would be thus:-- God is perfect-- the Laws of Nature were established by God; therefore, the Laws of Nature are perfect. 19 But admitting miracles, the syllogism should be thus:-- The Laws of Nature were in their eternal establishment perfect;-- the Laws of Nature have been altered; therefore, the alteration of the Laws of Nature is imperfect. 20 Or thus: the Laws of Nature have been altered;-- the alteration has been for the better; therefore, the eternal establishment thereof was imperfect. 21 Thus it appears, from a syllogistical as well as other methods of reasoning, that provided we admit of miracles, which are synonymous to the alterations of Nature, 22 we by so doing derogate from the perfection of God, either in His eternal constitution of Nature, or in a supposed subsequent miraculous alteration of it, so that take the argument either way, and it preponderates against miracles.

23 Furthermore, was it possible, that the eternal order of Nature should have been imperfect, there would be an end to all perfection. 24 For God might be as imperfect in any supposed miraculous works, as in those of Nature; nor could we ever have any security under His natural or moral government, if they were liable to change; 25 for mutability is but another term for imperfection, or is inseparably connected with it.

26 God, the great architect of Nature, has so constructed its machinery, that it never needs to be altered or rectified. 27 In vain* we endeavour to search out the hidden mystery of a perpetual motion, in order to copy Nature, for after all our researches we must be contented with such mechanism as will run down, and need rectification again; 28 but the machine of the universe admits of

no rectification, but continues its never ceasing operations, under the unerring guidance of the providence of God. 29 Human architects make and unmake things, and alter them as their invention may dictate, and experience may determine to be most convenient and best. 30 But that mind, which is infinitely perfect, gains nothing by experience, but surveys the immense universality of things, with all their possible relations, fitnesses and unfitnesses, of both a natural or moral kind, with one comprehensive view.

A SUCCESSION OF KNOWLEDGE, OR OF THE EXERTION OF POWER... IN GOD, INCOMPATIBLE WITH HIS OMNISCIENCE OR OMNIPOTENCE, AND THE ETERNAL AND INFINITE DISPLAY OF DIVINE POWER FORECLOSES ANY SUBSEQUENT EXERTION OF IT MIRACULOUSLY

SECTION II

31 That creation is as eternal and infinite as God, has been argued (in chapter-2); 32 and that there could be no succession in creation, or the exertion of the power of God, in perfecting the boundless work, and in impressing the universe with harmonious laws, perfectly well adapted to their design, use and end.

33 First. These arguments may be further illustrated, and the evidence of the being of a God more fully exhibited, from the following considerations, to wit: 34 dependent beings and existences must be dependent on some being or cause that is independent, for dependent beings, or existences, could not exist independently; 35 and, inasmuch as by retrospectively tracing the order of the succession of causes, we cannot include in our numeration the independent cause, 36 as the several successive causes still depend on their preceding cause, and that preceding cause on the cause preceding it, and so on beyond numerical calculations, 37 we are therefore obliged (as rational beings) to admit an independent cause of all things, for that a mere succession of dependent causes cannot constitute an independent cause; 38 and from hence we are obliged to admit a self-existent and sufficient cause of all things, for otherwise it

would be dependent and insufficient to have given existence to itself, or to have been the efficient cause of all things.

39 Having thus established the doctrine of a self-sufficient, self-existent, and consequently all-powerful cause of all things, we ascribe an eternal existence to this cause of all causes and effects, whom we call God. 40 And, inasmuch, as from the works of Nature it is manifest, that God is possessed of almighty power, we from hence infer His eternal existence. 41 Since His premised existence at (and not before) any given era, would be a conclusive objection to the omnipotency of His power, that He had not existed before, or eternally. 42 For as God is a being self-sufficient, self-existent, and almighty, (as before argued) His power must apply to His own existence as well as to the existence of things in general, 43 and therefore, if He did not eternally exist, it must be because He had not the almighty power of existence in Himself, and if so, He never could have existed at all; so that God must have eternally existed or not have existed at all; 44 and inasmuch as the works of Nature evince His positive existence, and as He could not be dependent on the power, will, or pleasure of any other being but Himself for His existence, 45 and as an existence, in time would be a contradiction to His almighty power of self-existency, that He had not eternally existed; therefore, His existence must have been (in truth) eternal.

46 Although it is to us incomprehensible that any being could be self-existent or eternal (which is synonymous,) yet we can comprehend, that any being that is not self-existent and eternal and dependent and finite, and consequently not a God. 47 Hence we infer, that though we cannot comprehend the true God (by reason of our own finiteness,) yet we can negatively comprehend that an imperfect being cannot be God. 48 A dependent being is finite, and therefore imperfect, and consequently not a God. 49 A being that has existed at a certain era (and not before) is a limited one, for beyond your era you was not, and therefore finite, and consequently not a God.

50 Therefore, that being only who is self-existent, infinitely perfect and eternal, is the true God: 51 and if eternally and infinitely perfect, there must have been an eternal and infinite display, and if an eternal and infinite display, it could be nothing short of an eternal and infinite creation and providence.

52 As to the existence of a God, previous to Moses's era of the first day's work, he does not inform us. 53 The first notice he gives us of a God was of his labourious working by the day, a theory of creation (as I should think) better calculated for the servile Israelitish Brick-makers, than for people of learning and science in these modern times.

RARE AND WONDERFUL PHENOMENA NO EVIDENCE OF MIRACLES...
NOR ARE DIABOLICAL SPIRITS ABLE TO EFFECT THEM, OR SUPERSTITIOUS TRADITIONS TO CONFIRM THEM, NOR CAN ANCIENT MIRACLES PROVE RECENT REVELATIONS

SECTION III

54 Comets, earthquakes, volcanoes, and northern lights (in the night,) with many other extraordinary phenomena or appearances intimidate weak minds, 55 and are by them thought to be miraculous, although they undoubtedly have their proper natural causes, which have been in a great measure discovered. 56 Jack-with-a-lantern is a frightful appearance to some people, but not so much as the imaginary spectre. 57 But of all the scarecrows which have made human nature tremble, the devil has been chief; his family is said to be very numerous, consisting of "legions," with which he has kept our world in a terrible uproar. 58 To tell of all the feats and diabolical tricks, which this infernal family is said to have played upon our race, would compose a volume of an enormous size. 59 All the magicians, necromancers, wizards, witches, conjurors, gypsies, sybils, hobgoblins, apparitions and the like, are supposed to be under their diabolical government: old Belzebub rules them all. 60 People will face destructive cannon and mortars, engage each other in the clashing of arms, and meet the

horrors of war undaunted, 61 but the devil and own banditti of fiends and emissaries fright them out of their wits, and have a powerful influence in plunging them into superstition, and also in continuing them therein.

62 This supposed intercourse between humankind and those infernal beings, is by some thought to be miraculous or supernatural; 63 while others laugh at all the stories of their existence, concluding them to be mere juggle and deception, craftily imposed on the credulous, who are always gaping after something marvellous, miraculous, or supernatural, or after that which they do not understand: 64 and are awkward and unskillful in their examination into Nature, or into the truth or reality of things, which is occasioned partly by natural imbecility, and partly by indolence and inattention to Nature and reason.

65 That any magical intercourse or correspondence of mere spirits with humankind, is contradictory to Nature, and consequently impossible. 66 And that nothing short of the omnipotent power of God, countermanding His eternal order of Nature, and impressing it with new and contrary law, can constitute a miracle has been argued in this, and is an effect surpassing the power of mere creatures, the diabolical nature not excepted. 67 From hence we infer, that devils cannot work miracles. 68 Inattention to reason, and ignorance of the nature of things makes many of humankind give credit to miracles. 69 It seems that by this marvellous way of accounting for things, they think to come off with reputation in their ignorance; 70 for if Nature was nothing but a supernatural whirligig, or an inconstant and irregular piece of mechanism, it would reduce all learning and science to a level with the fanaticism and superstition of the weak and credulous, 71 and put the wise and unwise on a level in point of knowledge, as there would not, on this thesis, be any regular standard in Nature, whereby to ascertain the truth and reality of things. 72 What is called sleight-of-hand, is by some people thought to be miraculous. 73 Astrological calculations of

nativities, lucky and unlucky days and seasons, are by some, regarded, and even moles on the surface of the skin are thought to be portentive of good or bad fortune.

74 "The Swedish Laplanders, the most ignorant mortals in Europe," are "charged with being conjurors, and are said to have done such feats, by the magic art, as do not at all fall far short of miracles; 75 that they will give the sailors such winds as they want in any part of their voyage; that they can inflict and cure diseases at any distance; and insure people of success in their undertakings; 76 and yet they are just such poor miserable wretches as used to be charged with witchcraft here," viz: in England and in New England, "and cannot command so much as the necessaries of life: 77 and indeed, none but very credulous and ignorant people give credit to such fables at this day, though the whole world seems to have been bewitched in believing them formerly."

78 "The 24th of March, 1735, an Act passed in the Parliament of Great Britain to repeal the statute of I 'Jac's', entitled an act against conjuration, witchcraft, and dealing with evil and wicked spirits, and to repeal an act in Scotland entitled Amentis Witchcraft." 79 It is but forty-six years since the supreme legislature became apprized of the natural impossibility of any magical intercourse between humankind and evil and wicked spirits; 80 in consequence whereof they repealed their statute laws against it, as they were naturally void, unnecessary, and unworthy of their legislative restriction. 81 For that such a crime had no possible existence in Nature, and therefore could not be acted by humankind; 82 though previous to the repeal of those laws, more or less of that island had fallen a sacrifice to them; 83 and the relations of those imaginary criminals were stamped with infamy by such executions, which had the sanction of law, alias of the legislature and the judges, 84 and in which many learned attorneys have demonstrated the turpitude of such capital offences, and the just sanction of those laws in extirpating such pests of society

from the earth; 85 to which the clergy have likewise given their approbation, for that those capital transgressors made too free with their devils.

86 Furthermore, the repeal of those laws, as far as the wisdom and authority of the British Parliament may be supposed to go, abrogated that command of the law of Moses, which saith, "Thou shalt not suffer a witch to live," 87 and not only so, but the doctrine of the impossibility of intercourse, or of dealing with wicked spirits, forecloses the supposed miraculous casting out of devils, of which we have sundry chronicles in the New Testament.

88 But to return to the annals of my own country, it will present us with a scene of superstition in the magical way, which will probably equal any that is to be met with in history, to wit: 89 the Salem witchcraft in New England; great numbers of the inhabitants of both sexes were judicially convicted of being wizards and witches, and executed accordingly; 90 some of whom were so infatuated with the delusion, that at their execution they confessed themselves guilty of the sorcery for which they were indicted; 91 nor did the fanaticism meet with a check until some of the first families were accused with it, who made such an opposition to the prosecutions, as finally to put an end to any further execution of the Salemites. 92 Those capital offenders suffered in consequence of certain laws, which, by way of derision, have since been called the 'Blue Laws', in consequence of the multiplicity of superstition, with which they abounded, most of which are repealed; 93 but those that respect sorcery have had favourite legislators enough to keep them alive and in force to this day.

94 I recollect an account of prodigies said to have been carried on by the Romish Clergy in France, upon which his most Christian Majesty sent one of his officers to them with the following prohibition, to wit: 95 "by the command of the king, God is forbid to work any more miracles in this place;" upon which the marvellous work ceased. 96 There has been so much detection of the artifice, juggle and imposture of the pretenders to miracles, in the

world, especially in such parts where learning and science have prevailed, 97 that it should prompt us to be very suspicious of the reality of them, even without entering into any lengthy arguments from the reason and nature of things to evince the utter impossibility of their existence in the creation and providence of God.

98 We are told, that the first occasion and introduction of miracles into the world, was to prove the divine authority of revelation, and the mission of its first teachers; be it so. 99 Upon this plan of evincing the divinity of revelation, it would be necessary that its teachers should always be vested with the power of working miracles; 100 so that when their authority or the infallibility of the revelation which they should teach, should at any time be questioned, they might work a miracle; or that in such a case God would do it; 101 which would end the dispute, provided humankind were supposed to be judges of miracles, which may be controverted. 102 However, admitting that they are possible, and humankind in the several generations of the world to be adequate judges of them, and also, that they were necessary to support the divine mission of the first promulgators of revelation, and the divinity which they taught; 103 from the same parity of reasoning, miracles ought to be continued to the succeeding generations of humankind, co-extensive with its divine authority, or that of its teachers. 104 For why should we in this age of the world be under obligation to believe the infallibility of revelation, or the heavenly mission of its teachers, upon less evidence than those of humankind who lived in the generations before us? 105 For that which may be supposed to be a rational evidence, and worthy to gain the belief and assent of humankind at one period of time, must be so at another; 106 so that it appears, from the sequel of the arguments on this subject, that provided miracles were requisite to establish the divine authority of revelation originally, 107 it is equally requisite that they be continued to the latest posterity, to whom the divine legislator may be

supposed to continue such revelation as His law to humankind.

108 Nothing is more evident to the understanding part of humankind, than that in those parts of the world where learning and science has prevailed, miracles have ceased; 109 but in such parts of it as are barbarous and ignorant, miracles are still in vogue; 110 which is of itself a strong presumption that in the infancy of letters, learning and science, or in the world's non-age, those who confided in miracles, as a proof of the divine mission of the first promulgators of revelation, were imposed upon by fictitious appearances instead of miracles.

111 Furthermore, the author of Christianity warns us against the impositions of false teachers, and ascribes the signs of the true believers, 112 saying, "And, these signs shall follow them that believe, in my name shall they cast out devils, they shall speak with new tongues, they shall take up serpents, and if they drink any deadly thing it shall not hurt them, they shall lay hands on the sick and they shall recover." 113 These are the express words of the founder of Christianity, and are contained in the very commission, which he gave to his eleven Apostles, who were to promulgate his gospel in the world; 114 so that from their very institution it appears that when the miraculous signs, therein spoken of, failed, they were considered as unbelievers, and consequently no faith or trust to be any longer reposed in them or their successors. 115 For these signs were those which were to perpetuate their mission, and were to be continued as the only evidences of the validity and authenticity of it, 116 and as long as these signs followed, humankind could not be deceived in adhering to the doctrines which the Apostles and their successors taught; but when these signs failed, their divine authority ended.

117 Now if any of them will drink a dose of deadly poison, which I could prepare, and it does not "hurt them," I will subscribe to their divine authority, and end the dispute; 118 not that I have a disposition to poison anyone, nor

do I suppose that they would dare to take such a dose as I could prepare for them, which, if so, would evince that they were unbelievers themselves, 119 though they are extremely apt to censure others for unbelief, which according to their scheme is a damnable sin.

PRAYER CANNOT BE ATTENDED WITH MIRACULOUS CONSEQUENCES

SECTION IV

120 Prayer to God is no part of a rational religion, nor did reason ever dictate it; but, was it duly attended to, it would teach us the contrary. 121 To make known our wants to God by prayer, or to communicate any intelligence concerning ourselves or the universe to Him, is impossible, 122 since His omniscient mind has a perfect knowledge of all things, and therefore is beholden to none of our correspondency to inform Himself of our circumstances, 123 or of what would be wisest and best to do for us in all possible conditions and modes of existence, in our never ending duration of being. 124 These, with the infinitude of things, have been eternally deliberated by the omniscient mind, who can admit of no additional intelligence, whether by prayer or otherwise, which renders it nugatory.

125 We ought to act up to the dignity of our nature, and demean ourselves, as creatures of our rank and capacity, and not presume to dictate any thing, less or more, to the governor of the universe; who rules not by our proscriptions, but by eternal and infinite reason. 126 To pray to God, or to make supplication to Him, requesting certain favours for ourselves, or from any, or all the species, is inconsistent with the relation which subsists between God and human. 127 Whoever has a just sense of the absolute perfection of God, and of their own imperfection, and natural subjection to His providence, cannot but from thence infer the impropriety of praying or supplicating to God, for this, that, or the other thing; 128 or of remonstrating against His providence: inasmuch, as "known to God are all our wants;" and as

we know, that we ourselves are inadequate judges of what would be best for us, all things considered. 129 God looks through the immensity of things, and understands the harmony, moral beauty and decorum of the whole, and will by no means change His purposes, or alter the nature of the things themselves for any of our entreaties or threats.

130 To pray, entreat, or make supplication to God, is neither more nor less than dictating to eternal reason, and entering into the province and prerogative of the Almighty; 131 if this is not the meaning and import of prayer, it has none at all, that extends to the final events and consequences of things. 132 To pray to God with a sense, that the prayer we are making will not be granted any more for our making it, 133 or that our prayer will make no alteration in the state, order or disposal of things at all, 134 or that the requests, which we make, will be no more likely to be granted, or the things themselves conferred upon us by God, than as though we had not prayed for them, 135 would be stupidity or outright mockery, or "to be seen of humans," in order to procure from them some temporary advantages. 136 But on the other hand for us to suppose, that our prayers or praises do in any one instance or more alter the eternal constitution of things, or of the providence of God, is the same as to suppose ourselves so far forth to hold a share in the divine government, 137 for our prayers must be supposed to effect something or nothing, if they effect nothing they are good for nothing; 138 but that they should effect any alteration in the nature of things, or providence of God, is inadmissible: 139 for if they did, we should interfere with the providence of God in a certain degree, by arrogating it to ourselves. 140 For if there are any particulars in providence, which God does not govern by His order of Nature, they do not belong to the providence of God, but of human; 141 for if in any instance, God is moved by the prayers, entreaties, or supplications of His creatures, to alter His providence, or to do that in conformity thereto, which otherwise, in the course of His providence, He would not

have done; 142 then it would necessarily follow, that as far as such alteration may be supposed to take place, God does not govern by eternal and infinite reason, but on the contrary is governed Himself by the prayer of human.

143 Our great proficients in prayer must need think themselves to be of great importance in the scale of being, otherwise they would not indulge themselves in the notion, that the God of Nature would subvert His laws, or bend His providence in conformity to their prayers. 144 But it may be objected, that they pray conditionally, to wit: that God would answer their prayers, provided they are agreeable to His providential order or disposal of things; 145 but to consider prayer in such a sense renders it, not only useless, but impertinent; for the Laws of Nature would produce their natural effects as well without it, 146 as with it The sum total of such conditional prayer could amount to no more than this, viz: that God would not regard them at all, but that he would conduct the kingdom of His providence agreeable to the absolute perfections of His nature; 147 and who in the exercise of common sense would imagine that God would do otherwise?

148 The nature of the immense universality of things having been eternally adjusted, constituted and settled, by the profound thought, perfect wisdom, impartial justice, immense goodness, and omnipotent power of God, it is the greatest arrogance in us to attempt an alteration thereof. 149 If we demean ourselves worthy of a rational happiness, the laws of the moral system, already established, will afford it to us; 150 and as to physical evils, prudent economy may make them tolerable, or ward most of them off for a season, though they will unavoidably bring about the separation of a soul and body, and terminate with animal life, whether we pray for or against it.

151 To pray for any thing, which we can obtain by the due application of our natural powers, and neglect the means of procuring it, is impertinence and laziness in the abstract; 152 and to pray for that which God in the course of His providence, has put out of our

power to obtain, is only murmuring against God, and finding fault with His providence, or acting the inconsiderate part of a child; 153 for example, to pray for more wisdom, understanding, grace or faith; for a more robust constitution-- handsomer figure, or more of a gigantic size, would be the same as telling God, that we are dissatisfied with our inferiority in the order of being; 154 that neither our souls nor bodies suit us; that He has been too sparing of His beneficence; that we want more wisdom, and organs better fitted for show, agility and superiority. 155 But we ought to consider, that "'we cannot add one cubit to our stature'," or alter the construction of our organic frame; 156 and that our mental talents are finite; and that in a vast variety of proportions and disproportions, as our Heavenly Father in His order of Nature, and scale of being saw fit; 157 who has nevertheless for the encouragement of intelligent nature ordained, that it shall be capable of improvement, and consequently of enlargement; 158 therefore, "'whosoever lacketh wisdom'" instead of "'asking it of God'," let you improve what you have, that you may enlarge the original stock; this is all the possible way of gaining in wisdom and knowledge, a competency of which will regulate our faith. 159 But it is too common for great faith and little knowledge to unite in the same person; such persons are beyond the reach of argument and their faith immovable, though it cannot remove mountains. 160 The only way to procure food, raiment, or the necessaries or conveniences of life, is by natural means; we do not get them by wishing or praying for, but by actual exertion; 161 and the only way to obtain virtue or morality is to practice and habituate ourselves to it, and not to pray to God for it: 162 God has naturally furnished us with talents or faculties suitable for the exercise and enjoyment of religion, and it is our business to improve them aright, or we must suffer the consequences of it. 163 We should conform ourselves to reason, the path of moral rectitude, and in so doing, we cannot fail of recommending ourselves to God, and to our own consciences. 164 This is all the religion which

reason knows or can ever approve of.

165 Moses, the celebrated prophet and legislator of the Israelites, ingratiated himself into their esteem, by the stratagem of prayer, and pretended intimacy with God; 166 he acquaints us, that he was once admitted to a sight of His back-parts! and that "'no human can see" His "face and live';" and at other times we are told that he "'talked with God, face to face, as a person talketh with own friend';" 167 and also that at times God waxed, wroth with Israel, and how Moses prayed for them; and at other times, that he ordered Aaron to offer sweet incense to God, which 'appeased His wrath', and prevented His destroying Israel in His 'hot displeasure!' 168 These are the footsteps, by which we may trace sacerdotal dominion to its source, and explore its progress in the world. "'And the Lord said unto Moses, how long will this people provoke me?

169 I will smite them with the pestilence, and disinherit them, and I will make of thee a great nation, and mightier than they'," but Moses advertises God of the injury, which so rash a procedure would do to his character among the nations; 170 and also reminds Him of His promise to Israel, saying, "'Now if thou shall kill all these people as one human, then the nations, which have heard the fame of thee will speak, 171 saying, because the Lord was not able to bring these people into the land, which He swear unto them, therefore He hath slain them in the wilderness'."

172 That Moses should thus advise the omniscient God, of dishonourable consequences which would attend a breach of promise, which he tells us, that God was unadvisedly about to make with the tribes of Israel, had not his remonstrance prevented it, is very extraordinary and repugnant to reason; 173 yet to an eye of faith it would exalt the man Moses, "and make him very great;" 174 for if we may credit his history of the matter, he not only averted God's judgment against Israel, and prevented them from being cut off as a nation, but by the same prayer procured for them a pardon of their sin. 175 "'Pardon, I beseech thee, the iniquity of

these people'," and in the next verse follows the answer, "'and the Lord said I have pardoned according to thy word'." 176 It seems that God had the power, but Moses had the dictation of it, and saved Israel from the wrath and pestilential fury of a jealous God; and that he procured them a pardon of their sin, "'for the Lord thy God is a jealous God'."

177 Jealousy can have no existence in that mind, which possesses perfect knowledge, 178 and consequently cannot, without the greatest impropriety, he ascribed to God, who knows all things, and needed none of the admonitions, advice or intelligence of Moses, or any of his dictatorial prayers. 179 "'And the Lard hearkened unto me at that time also';" intimating that it was a common thing for Him to do the like.

180 When teachers can once make the people believe that God answers their prayers, and that their eternal interest is dependent on them, they soon raise themselves to opulency, rule and high sounding titles; 181 as that of 'His Holiness-- the Reverend Father in God-- The Holy Poker-- Bishop of Souls'-- and a variety of other such like appellations, derogatory to the honour or just prerogative of God; 182 as is Joshua's history concerning the Lord's hearkening unto him at the battle of the Amorites, wherein he informs us, that he ordered the sun to stand still, 183 saying, "'Sun stand thou still upon Gidaen, and thou Moon in the valley of Ajalon, so the Sun stood still and the Moon stayed until the people had avenged themselves upon their enemies;" 184 so the Sun stood still in the midst of Heaven, "and hasted not to go down about a whole day;'" and then adds, by way of supremacy to Himself above all others, 185 and in direct contradiction to the before recited passages of Moses concerning the Lord's hearkening unto him, or to any other human but himself, saying, "'And there was no day like that before it, or after it, that the Lord hearkened unto the voice of a human'."

186 There is not any thing more evident than that if the representation given by Joshua, as matter of fact, is true, those exhibited by Moses concerning the

Lord's hearkening unto him are not: 187 though the representations of fact by Moses and by Joshua, are allowed to be both canonical, yet it is impossible that both can be true. 188 However, astronomy being but little understood in the age in which Joshua lived, and the earth being in his days thought to be at rest, and the sun to revolve round it, makes it in no way strange, that he caught himself by ordering the sun to stand still, 189 which having since been discovered to have been the original fixed position of that luminous body, eclipses the miraculous interposition of Joshua. 190 Furthermore, if we but reflect that on that very day Israel vanquished the Amorites with a great slaughter, "'and chased them along the way that goeth to Bethoron, and smote them to Azekah, and unto Makkedah'," 191 in so great a hurry of war, clashing of arms, exasperation and elevation of mind, in consequence of such triumphant victory, they could make but a partial observation on the length of the day; 192 and being greatly elated with such an extraordinary day's work, Joshua took the advantage of it, and told them that it was an uncommon day for duration; 193 that he had interposed in the system and prescribed to the sun to stand still about a whole day; and that they had two days' time to accomplish those great feats. 194 The belief of such a miraculous event to have taken place in the solar system, in consequence of the influence which Joshua insinuated that he had with God, would most effectually establish his authority among the people; 195 for if God would hearken to his voice well might human. 196 This is the cause why the bulk of humankind in all ages and countries of the world, have been so much infatuated by their ghostly teachers, whom they have ever, imagined to have had a special influence with God Almighty.

THE VAGUENESS AND UNINTELLIGIBLENESS OF THE PROPHECIES... RENDER THEM INCAPABLE OF PROVING REVELATION

Ethan Allen

SECTION I

7 Prophecy is by some thought to be miraculous, and by others to be supernatural, and there are others, who indulge themselves in an opinion, that they amount to no more than mere political conjectures. 2 Some nations have feigned an intercourse with good spirits by the art of divination; and others with evil ones by the art of magic; and most nations have pretended to an intercourse with the world of spirits both ways.

3 The Romans trusted much to their sibylline oracles and soothsayers; the Babylonians to their magicians and astrologers; the Egyptians and Persians to their magicians; and the Jews to their seers or prophets; 4 and all nations and individuals, discover an anxiety for an intercourse with the world of spirits; which lays a foundation for artful and designing people, to impose upon them. 5 But if the foregoing arguments in chapter sixth, respecting the natural impossibility of an intercourse of any unbodied or imperceptible mental beings with humankind, are true, then the foretelling of future events can amount to nothing more. than political illusion. 6 For prophecy as well as all other sorts of prognostication must be super-naturally inspired, or it could be no more than judging of future events from mere probability or guess-work, 7 as the astronomers ingenuously confess in their calculations, by saying: "Judgment of the weather," So also respecting astrology, provided there is any such thing as futurity to be learned from it, it would be altogether a natural discovery; 8 for neither astronomy nor astrology claim anything of a miraculous or supernatural kind, but their calculations are meant to be predicated on the order and course of Nature, 9 with which our senses are conversant, and with which inspiration or the mere cooperation of spirits is not intended to act as part.

10 So also concerning prophecy, if it be considered to be merely

natural, (we will not at present dispute whether it is true or false) upon this position it stands on the footing of probability or mere conjecture and uncertainty. 11 But as to the doctrine of any supernatural agency of the divine mind on ours, which is commonly called inspiration, it has been sufficiently confuted in chapter sixth; 12 which arguments need not be repeated, nor does it concern my system to settle the question, whether prophecy should be denominated miraculous or supernatural, inasmuch as both these doctrines have been confuted; 13 though it is my opinion, that were we to trace the notion of supernatural to its source, it would finally terminate in that which is denominated miraculous; 14 for that which is above or beyond Nature, if it has any positive existence, must be miraculous.

15 The writings of the prophets are most generally so loose, vague and indeterminate in their meaning, or in the grammar of their present translation, that the prophecies will as well answer to events in one period of time, as in another; 16 and are equally applicable to a variety of events, which have and are still taking place in the world, 17 and are liable to so many different interpretations, that they are incapable of being understood or explained, except upon arbitrary principles, and therefore cannot be admitted as a proof of revelation; as for instance, "it shall come to pass in the last days, saith God." 18 Who can understand the accomplishment of the prophecies, that are expressed after this sort? For every day in its turn has been, and will in its succession be the last day; 19 and if we advert to the express words of the prophecy, to wit, "'the last days'," there will be an uncertain plurality "'of last days'," which must be understood to be short of a month, or a year; 20 or it should have been expressed thus, and it shall come to pass in the last months or years, instead of days: and if it had mentioned last years, it would be a just construction to suppose, that it included a less number of years than a century; 21 but as the prophecy mentions "'last days'" we are at a loss, which among the

plurality of them to assign for the fulfilling of the prophecy.

22 Furthermore, we cannot learn from the prophecy, in what month, year, or any other part of duration those last days belong; 23 so that we can never tell when such vague prophecies are to take place, they therefore remain the arbitrary prerogative of fanatics to prescribe their events in any age or period of time, when their distempered fancies may think most eligible: 24 there are other prophecies still more abstruse; to wit, "'And one said unto the man clothed in linen, which was upon the waters of the river, how long shall it be to the end of these wonders? 25 And I heard the man clothed in linen, which was upon the waters of the river, when he held up his right hand and his left hand unto Heaven, and sware by him that liveth forever, that it should be for an time, times and an half'." 26 The question, in the prophecy is asked "how long shall it be to the end of these wonders?" And the answer is given with the solemnity of an oath, "'it shall be for a time, times and a half'."

27 A time is an indefinite part of duration, and so are times, and the third description of time is as indefinite as either of the former descriptions of it; to wit, "and an half;" that is to say, half a time. 28 There is no certain term given in any or either of the three descriptions of the end of the wonders alluded to, whereby any or all of them together are capable of computation, as there is no certain period marked out to begin or end a calculation. 29 To compute an indefinite time in the single number or quantity of duration is impossible, and to compute an uncertain plurality of such indefinite times is equally perplexing and impracticable; 30 and lastly, to define half a time by any possible succession of its parts, is a contradiction, for half a time includes no time at all; 31 inasmuch as the smallest conception or possible moment or criterion of duration, is a time, or otherwise, by the addition of ever so many of those parts together, they would not prolong a period; 32 so that there is not, and cannot be such a part of time, as half a time, for be it supposed to be ever

so momentous, yet if includes any part of duration, it is a time, and not half a time. 33 Had the prophet said half a year, half a day, or half a minute, he would have spoken intelligibly; 34 but half a time has no existence at all, and consequently no period could ever possibly arrive in the succession or order of time, when there could be an end to the wonders alluded to; 35 and in this sense only, the prophecy is intelligible; to wit, that it will never come to pass.

36 The revelation of St. John the divine, involves the subject of time, if possible, in still greater inconsistencies, 37 viz: "'And to the woman was given two wings of a great eagle, that she might fly into the wilderness, into her place: Where she is nourished for a time, and times and half a time." 38 "And the angel which I saw stand upon the sea and upon the earth lifted up his hands to heaven, and sware by Him that liveth forever and ever, 39 who created heaven and the things that therein are, and the earth and the things that therein are, and the sea and the things which are therein, that there should be time no longer.'" 40 Had this tremendous oath been verified there could have been no farther disputations on the calculation of "'time and times and half a time'," (or about any thing else) 41 for its succession would have reached its last and final period at that important crisis when time should have been "no longer." 42 The solar system must have ceased its motions, from which we compute the succession of time, and the race of human would have been extinct; 43 for as long as they may be supposed to exist, time must of necessary consequence have existed also; 44 and since the course of Nature, including the generations of humankind, has been continued from the time of the positive denunciation of the angel to this day, we may safely conclude, that his interference in the system of Nature, was perfectly romantic.

45 The apostle Peter, at the first Christian pentecost, objecting to the accusation of their being drunk with new wine, explains the prophecy of the prophet Joel, who prophesied of the events which were to take place in the last days, as coming to pass at that early

period; 46 his words are handed down to us as follows: "'But this is that which is spoken by the prophet Joel, and it shall come to pass in the last days, saith God, 47 that I will pour out my spirit upon all flesh, and your sons and your daughters shall prophecy, and your young people shall see visions, and your old people shall dream dreams'." 48 The history of the out-pouring of the spirit at the Pentecost, admitting it to have been a fact, would have been very inadequate to the prophetical prediction, 49 viz: I will pour out my spirit upon all flesh; the most favourable construction is that the prophet meant human flesh, 'i. e.' all human flesh; 50 but instead of a universal effusion of the spirit, it appears to have been restricted to a select number, who were collected together at Jerusalem, and the concourse of spectators thought them to be delirious; 51 It may however be supposed, that St. Peter was a better judge of the accomplishment of the prophecy than I am: well then, admitting his application of the prophecy of the last days to take place at the first pentecost; 52 it being now more than seventeen hundred years ago, they consequently could not have been the last days.

53 Still a query arises, whether every of the prophecies, which were predicted to be fulfilled in the last days, must not have been accomplished at that time; 54 or whether any of the prophecies thus expressed are still to be completed by any events which may in future take place; or by any which have taken place since those last days called pentecost; 55 or whether any prophecy whatever can be fulfilled more than once; and if so, how many times; 56 or how is it possible for us, out of the vast variety of events (in which there is so great a similarity) which one in particular to ascribe to its right prediction among the numerous prophecies?

57 Furthermore, provided some of the prophecies should point out some particular events, which have since taken place, there might have been previous grounds of probability, that such or such events would in the ordinary course of things come to pass; 58 for instance, it is no ways extraordinary, that the prophet

Jeremiah should be able to predict that Nebuchadnezzar, king of Babylon, should take Jerusalem, when we consider the power of the Babylonish empire at that time, and the feebleness of the Jews. 59 "'The word, which came to Jeremiah from the Lord, when Nebuchadnezzar king of Babylon and all his army, and all the kingdoms of the earth of his dominion, and all the people fought against Jerusalem, and against all the cities thereof, 60 saying, thus saith the Lord the God of Israel, go and speak unto Zedekiah king of Judah, and tell him thus saith the Lord, behold, I will give this city of Jerusalem into the hand of the king of Babylon.'" 61 No politicians could at the time of the prediction be much at a loss respecting the fate of Jerusalem. 62 Nor would it be at all evidential to any candid and ingenious enquirer, that God had any manner of agency in fabricating the prophecies, 63 though, some of them should seem to decypher future events, as they might, to human appearance, turn out right, merely from accident or contingency. 64 It is very improbable, or rather incompatible with human nature, that the prophecy of Micah will ever come to pass, who predicts that "they," speaking of humankind, "'shall beat their swords into plough-shares, and their spears into pruning-hooks; 65 nation shall not lift up sword against nation, neither shall they learn war any more'." 66 Some of the prophecies are so apparently contradictory, that they contain their own confutation; 67 as for instance, the prophecy of Micaiah contained in the book of Chronicles, which probably is as absurd as any thing that is to be met with in story: 68 "And when he was come unto the king, the king said unto him, Micaiah, shall we go to Ramoth Gilead to battle, or shall I forbear? And he said go ye up and prosper, and they shall be delivered into your hand, 69 and the king said unto him, how many times shall I adjure thee, that thou shalt tell me nothing, but that which is true in the name of the Lord? Then he said I did see all Israel scattered upon the mountains, as sheep that have no shepherd, 70 and the Lord said, these have no master, let

them return, therefore, every human to his house in peace: and the king said unto Jehoshaphat, did not I tell thee, that he would prophecy no good concerning me, but evil?" 71 "Again he said, therefore, hear the word of the Lord-- I saw the Lord sitting upon his throne, and all the host of Heaven standing on his right hand and on his left, and the Lord said who shall entice Ahab, King of Israel, that he may go up and fall at Ramoth Gilead, 72 and one spake saying after this manner, and another saying after that manner; 73 then there came out a spirit and stood before the Lord, and said I will entice him, and the Lord said unto him wherewith? And he said I will go forth and be a lying spirit in the mouth of all his prophets, and the Lord said thou shalt entice him and thou shalt prevail; go out and do even so. 74 Now therefore, behold the Lord hath put a lying spirit in the mouth of these thy prophets and the Lord hath spoken evil against thee."

75 It is observable that the prophet at first predicted the prosperity of Ahab, saying, "go ye up and prosper, and they shall be delivered into your hand," but after a little adjurement by the king, he alters his prediction and prophecies diametrically the reverse. 76 What is more certain than that the event of the expedition against Ramoth Gilead must have comported with the one or the other of his prophecies? 77 Certain it was, that Ahab would take it or not take it, he must either prosper or not prosper, as there would be no third way or means between these two; 78 and it appears that the prophet was determined to be in the right of it by his prophecy both ways. 79 It further appears from his prophecy, that there was a great consultation in Heaven to entice Ahab King of Israel to his destruction, and that a certain lying spirit came and stood before the Lord, and proposed to him to go out and be a lying spirit in the mouth of the king's prophets. 80 But what is the most incredible is, that God should countenance it, and give him positive orders to falsify the truth to the other prophets. 81 It appears that Micaiah in his first prophecy, viz: "Go up to Ramoth Gilead and

prosper, and they shall be delivered into your hand," acted in concert with the lying spirit which stood before the Lord, 82 but afterwards acted the treacherous part by prophecying the truth, which, if we may credit his account, was in direct opposition to the scheme of Heaven.

THE CONTENTIONS WHICH SUBSISTED BETWEEN THE PROPHETS... RESPECTING THEIR VERACITY, AND THEIR INCONSISTENCIES WITH ONE ANOTHER, AND WITH THE NATURE OF THINGS, AND THEIR OMISSION IN TEACHING THE DOCTRINE OF IMMORTALITY, PRECLUDES THE DIVINITY OF THEIR PROPHECIES

SECTION II

83 Whoever examines the writings of the prophets will discover a spirit of strife and contention among them; 84 they would charge each other with fallacy and deception; disputations of this kind are plentifully interspersed through the writings of the prophets; 85 we will transcribe a few of those passages out of many: "Thus saith the Lord to the foolish prophets that follow their own spirit, and have found nothing, they have seen vanity and lying divination, saying the Lord saith, and the Lord hath, not sent them, and they have made others to hope that they would confirm the word." 86 And in another place, "I have not sent these prophets, yet they ran; I have not spoken unto them, yet they prophecy." 87 Again, "I have heard what the prophets said, that prophecy lies in my name, saying, I have dreamed, I have dreamed, yet they are the prophets of the deceit of their own hearts." 88 And again, "Yea, they are greedy dogs, which can never have enough, and they are shepherds that cannot understand; they all look to their own way, every one for his gain from his quarter." 89 It being the case that there was such a strife among the prophets to recommend themselves to the people, and every art and dissimulation having been practised by them to gain power and superiority, 90 all which artifice was to be judged of by the great vulgar, or in some instances by the political views of the Jewish Sanhedrim, 91 how could those who were contemporaries with the several prophets,

distinguish the premised true prophets from the false? 92 Much less, how can we, who live more than seventeen hundred years since the last of them, be able to distinguish them apart? 93 And yet, without the knowledge of this distinction, we cannot with propriety give credit to any of them, even admitting there were some true prophets among them. 94 Nor is it possible for us to know but that their very institution was merely a reach of policy of the Israelitish and Judaic governments, 95 the more easily, implicitly and effectually to keep their people in subordination, by inculcating a belief that they were ruled with special directions from heaven, which in fact originated from the Sanhedrim. 96 Many other nations have made use of much the same kind of policy.

97 In the 22d chapter of Genesis, we have a history of a very extraordinary command from God to Abraham, and of a very unnatural attempt of his to obey it. 98 "And it came to pass after these things that God did tempt Abraham, and he said unto him, Abraham, and he said behold here I am, and he said take now thy son Isaac, whom thou lovest, and get thee to the land of Moriah, and offer him there for a burnt offering upon one of the mountains which I will tell thee of;" 99 "And they came to the place which God had told him of, and Abraham built an altar there, and laid the wood in order, and bound Isaac his son, and laid him on the altar upon the wood; 100 and Abraham stretched forth his hand and took the knife to slay his son." Shocking attempt! Murder is allowed by humankind in general to be the most capital crime that is possible to be acted among humans; 101 it would therefore be incompatible with the divine Nature to have enjoined it by a positive command to Abraham to have killed his son; 102 a murder of all others the most unnatural and cruel and attended with the most aggravating circumstances, 103 not merely from a prescribed breach of the ties of parental affection, but from the consideration that the child was to be (if we may credit the command,) offered to God as a religious sacrifice. 104 What could have been a more complicated

wickedness than the obedience of this command would have been? And what can be more absurd than to suppose that it came from God? 105 It is argued, in vindication of the injunction to Abraham to kill his son, that it was merely for a trial of his obedience, and that God never designed to have him do it; to prevent which an angel from heaven called to him and gave him counter orders, not to slay his son; 106 but to suppose that God needed such an experiment, or any other, in order to know whether Abraham would be obedient to his commands, is utterly incompatible with his omniscience, who without public exhibitions understands all things; 107 so that had the injunction been in itself, fit and reasonable, and also from God, the compliance or non-compliance of Abraham thereto, could not have communicated any new idea to the divine mind.

108 Every part of the conduct of humankind is a trial of their obedience and is known to God, as well as the particular conduct of Abraham; 109 besides in the canonical writings, we read that "'God cannot be tempted with evil, neither tempteth He any human'. 110 " How then can it be, "'that God did tempt Abraham?'" a sort of employment which, in scripture, is commonly ascribed to the devil. 111 It is a very common thing to hear Abraham extolled for attempting to comply with the supposed command of sacrificing his son; 112 but it appears to me, that it had been wiser and more becoming the character of a virtuous man, for Abraham to have replied in answer to the injunction as follows, to wit, that it could not possibly have come from God; 113 who was the fountain of goodness and perfection, and unchangeable in His nature, who had endowed him with reason and understanding, whereby he knew his duty to God, his son, and to himself, better than to kill his only son, and offer him as a religious sacrifice to God, 114 for God would never have implanted in his mind such a strong affection towards Him, nor such a conscious sense of duty to provide for, protect and succor Him in all duties, 115 and to promote His happiness and well being, provided he had designed that he

should have laid violent hands on his life. 116 And inasmuch as the command was, in itself, morally speaking, unfit, and altogether unworthy of God, he presumed that it never originated from him, but from some inhuman, cruel and destructive being, who delighted in woe, and pungent grief; 117 for God could not have been the author of so base an injunction, nor could he be pleased with so inhuman and sinful a sacrifice.

118 Moses in his last chapter of Deuteronomy crowns his history with the particular account of his own death and burial. 119 "So Moses, the servant of the Lord, died there, in the land of Moab, according to the word of the Lord, and he buried him in a valley, in the land of Moab, over against Bethpeor, but no person knew of his sepulchre unto this day; 120 and Moses was an hundred and twenty years old when he died, his eyes were not dim, nor his natural force abated, and the children of Israel wept for Moses in the plains of Moab thirty days." 121 This is the only historian in the circle of my reading, who has ever given the public a particular account of his own death, and how old he was at that decisive period, 122 where he died, who buried him, and where he was buried, and withal of the number of days his friends and acquaintances mourned and wept for him. 123 I must confess I do not expect to be able to advise the public of the term of my life, nor the circumstances of my death and burial, nor of the days of the weeping or laughing of my survivors.

124 Part of the laws of Moses were arbitrary impositions upon the tribes of Israel, and have no foundation in the reason and fitness of things, 125 particularly that in which he inculcates punishing the children for the iniquities of the father; "visiting the iniquities of the fathers upon the children, and upon the children's children unto the third and fourth generation." 126 There is no reason to be given, why the iniquity of the father might not as well have involved the fifth, sixth and seventh generations, and so on to the latest posterity in guilt and punishment, as the first four generations; 127 for if it was possible, that the iniquity of the

father could be justly visited upon any of his posterity, who were not accomplices with him in the iniquity, or were not some way or other aiding or accessory in it, 128 then the iniquity might as justly be visited upon any one of the succeeding generations as upon another, or upon the generation of any indifferent person: 129 for arbitrary imputations of iniquity are equally absurd in all supposable cases; 130 so that if we once admit the possibility of visiting iniquity upon any others than the perpetrators, be they who they will, we overturn our natural and scientifical notions of a personal retribution of justice among humankind.

131 It is, in plain English, punishing the innocent for the sin of the guilty. But virtue or vice cannot be thus visited or imputed from the fathers to the unoffending children, or to children's children; 132 or which is the same thing, from the guilty to the innocent; for moral good or evil is mental and personal, which cannot be transferred, changed or altered from one person to another, 133 but is inherently connected with its respective personal actors, and constitutes a quality or habit, and is the merit or demerit of the respective agents or proficients in moral good or evil, and is by nature inalienable,

134 "The righteousness of the righteous shall be upon him, and the wickedness of the wicked shall be upon him." But as we shall have occasion to argue this matter at large in the twelfth chapter of this treatise, where we shall treat of the imputed sin of Adam to his posterity, and of imputative righteousness, 135 we will discuss the subject of imputation no farther in this place. However, the unjust practice of punishing the children for the iniquity of the father having been an ordinance of Moses, was more or less continued by the Israelites, as in the case of Achan and his children. 136 "And Joshua and all Israel with him took Achan the son of Zorah, and the silver and the garment, and the wedge of gold, and his sons, and his daughters, and his oxen, and his asses, and his sheep, and his tent, and all that he had, and brought them to the valley of Achor, 137 and all Israel stoned

him with stones, and burned them with fire, after they had stoned them with stones, and they raised over him a great heap of stones unto this day; so the Lord turned from the fierceness of His anger." 138 "'Fierce anger'" is incompatible with the divine perfection, nor is the cruel extirpation of the innocent family, and live stock of Achan, to be accounted for on principles of reason. 139 This flagrant injustice of punishing the children for the iniquity of the father had introduced a proverb in Israel, viz: "The fathers have eaten sour grapes and the children's teeth are set on edge."

140 But the prophet Ezekiel in the 18th chapter of his prophecies, has confuted Moses's statutes of visiting the iniquities of the father upon the children, and repealed them with the authority of thus saith the Lord, which was the manner of expression by which they were promulgated. 141 But the prophet Ezekiel did not repeal those statutes of Moses merely by the authority of thus saith the Lord, but over and above gives the reason for it, otherwise he could not have repealed them; 142 for Moses enacted them as he relates, from as high authority as Ezekiel could pretend to in nullifying them; so that had he not produced reason and argument, it would have been "thus saith the Lord," against "thus saith the Lord." 143 But Ezekiel reasons conclusively, viz: "The word of the Lord came unto me again, saying, what meat ye that ye use this proverb concerning the land of Israel, saying, the fathers have eaten sour grapes and the children's teeth are set on edge; 144 as I live, saith the Lord God, ye shall not have occasion any more to use this proverb in Israel. 145 Behold all souls are mine, as the soul of the father so also the soul of the son is mine; the soul that sinneth it shall die, the son shall not bear the iniquity of the father, neither shall the father bear the iniquity of the son, 146 the righteousness of the righteous shall be upon you, and the wickedness of the wicked shall be upon you, therefore, I will judge you, O house of Israel, every one according to their ways saith the Lord God." 147 It is observable, that the prophet ingeniously says, "Ye shall not

have occasion any more to use this proverb in Israel," implicitly acknowledging that the law of Moses had given occasion to that proverb, 148 nor was it possible to remove that proverb or grievance to which the Israelites were liable on account of visiting the iniquities of the fathers upon the children, but by the repeal of the statute of Moses in that case made and provided; which was effectually done by Ezekiel: 149 in consequence whereof the administration of justice became disencumbered of the embarrassments under which it had laboured for many centuries. 150 Thus it appears, that those laws, denominated the laws of God, are not infallible, but have their exceptions and may be dispensed with.

151 Under the dispensation of the law a breach of the Sabbath was a capital offence. "And while the children of Israel were in the wilderness, they found a man that gathered sticks on the Sabbath day, 152 and the Lord said unto Moses, the man shall surely be put to death, and all the congregation shall stone him with stones without the camp; 153 and all the congregation brought him without the camp and stoned him with stones, and he died, as the Lord commanded Moses." 154 The very institution of the Sabbath was in itself arbitrary, otherwise it would not have been changed from the last to the first day of the week. 155 For those ordinances which are predicated on the reason and fitness of things can never change: as that which is once morally fit, always remains so, and is immutable, 156 nor could the same crime, in justice, deserve death in Moses's time (as in the instance of the Israelite's gathering sticks), and but a pecuniary fine in ours; as in the instance of the breach of Sabbath in these times.

157 Furthermore, the order of Nature respecting day and night, or the succession of time, is such, as renders it impossible that any identical part of time, which constitutes one day, can do it to all the inhabitants of the globe at the same time, or in the same period. 158 Day is perpetually dawning, and night commencing to some or other of the inhabitants of the terraqueous ball without

intermission. 159 At the distance of fifteen degrees of longitude to the east of us, the day begins an hour sooner than it does with us here in Vermont, and with us an hour sooner than it does fifteen degrees to the westward, 160 and thus it continues in succession round the globe, and night as regularly revolving after it, succeeding each other in their alternate rounds; 161 so that when it is mid-day with us, it is mid-night with our species, denominated the Periaeci, who live under the same parallel of latitude with us, but under a directly opposite meridian; so likewise, when it is mid-day with them, it is mid-night with us. 162 Thus it appears that the same identical part of time, which composes our days, compose their nights, and while we are keeping Sunday, they are in their midnight dreams; 163 nor is it possible in Nature, that the same identical part of time, which makes the first day of the week with us, should make the first day of the week with the inhabitants on the opposite side of the globe.

164 The apostle James speaks candidly on this subject, saying, "Some esteem one day above another, others esteem every day alike, let every one be fully persuaded in own mind," and keep the laws of the land. 165 It was unfortunate for the Israelite who was accused of gathering sticks on the Israelitish Sabbath, that he was convicted of it; 166 for though by the law of his people he must have died, yet the act for which he suffered was no breach of the Law of Nature. 167 Supposing that very delinquent should come to this world again, and gather sticks on Saturday in this country, he might as an hireling receive his wages for it, without being exposed to a similar prosecution of that of Moses; 168 and provided he should gather sticks on our Sunday, his wages would atone for his crime instead of his life, since modern legislators have abated the rigour of the law for which he died.

169 The barbarous zeal of the prophet Samuel in hewing Agag to pieces after he was made prisoner by Saul, king of Israel, could not proceed from a good spirit, nor would such cruelty be permitted towards a prisoner in any civilised nation at this day. 170 "And Samuel hewed Agag to pieces

before the Lord in Gilgal." The unhumanly deed seems to be mentioned with a phiz of religion, viz: that it was done before the Lord; 171 but that cannot alter the nature of the act itself, for every act of humankind, whether good or evil, is done before the Lord, as much as Samuel's hewing Agag to pieces. 172 The orders which Samuel gave unto Saul, (as he says by the word of the Lord) to cut off the posterity of the Amalekites, and to destroy them utterly, together with the cause of God's displeasure with them, 173 are unworthy of God as may be seen at large in the 15th chapter of the Book of Samuel, "Spare them not, but slay both man and woman, infant and suckling, ox and sheep, camel and ass."

174 The ostensible reason for all this, was, because the ancestors of the Amalekites, as long before the days of Samuel as when the children of Israel came out of Egypt, which was near five hundred years, had ambushed and fought against Israel, in their passage from thence to the land which they afterwards inhabited. 175 Although it appears from the history of Moses and Joshua, that Israel was going to disposess them of their country, which is thought to be a sufficient cause of war in these days. 176 It is true they insinuate that the Lord had given the land to the children of Israel, yet it appears that they had to fight for it and get it by the hardest, notwithstanding, as is the case with nations in these days, and ever has been since the knowledge of history.

177 But be the old quarrel between Israel and Amalek as it will, it cannot on any principle be supposed, the successors of those Amalekites, in the days of Samuel, could be guilty of any premised transgressions of their predecessors. 178 The sanguinary laws of Moses did not admit of visiting the iniquities of the fathers upon the children in the line of succession, farther than to the fourth generation, 179 but the Amalekites against whom Samuel had denounced the wrath of God, by the hand of Saul, were at a much greater remove from those their progenitors, who were charged with the crime for which they were cut off as a nation.

180 Nor is it compatible with reason to suppose, that God ever directed either Moses or Joshua to extirpate the Canaanitish nations. "And we took all his cities at that time, and utterly destroyed the men and the women, and the little ones of every city, we left none to remain." 181 There is not more propriety in ascribing these cruelties to God, than those that were perpetrated by the Spaniards against the Mexican and Peruvian Indians or natives of America. 182 Every one who dares to exercise own reason, free from bias, will readily discern, that the inhumanities exercised towards the Canaanites and Amorites, Mexicans and Peruvians, were detestably wicked, and could not be approbated by God, or by rational and good humans. 183 Undoubtedly avarice and domination were the causes of those abounding cruelties, in which religion had as little to do as in the crusades of the holy land (so called.)

184 The writings of the prophets abound with prodigies, strange and unnatural events. 185 The walls of Jericho are represented to have fallen to the ground in consequence of a blast of ram's horns; 186 Balaam's ass to speak to his master, and the prophet Elijah is said to have been carried off bodily into heaven by a chariot, in a whirlwind. Strange stories!

187 But other scriptures tell us, "Flesh and blood cannot inherit the kingdom of God." 188 The history of the affront, which the little children of Bethel gave the prophet Elisha, his cursing them, and their destruction by the bears, has the appearance of a fable. 189 That Elisha should be so exasperated at the children for calling him 'bald head', and telling him to 'go up', was rather a sample of ill breeding; 190 most gentlemen would have laughed at the joke, instead of cursing them, or being instrumental in their destruction, by merciless, wild and voracious beasts. 191 Though the children were saucy, yet a man of any considerable candour, would have made allowance for their non-age, "for childhood and youth are vanity." 192 "And he went up from thence unto Bethel, and as he was going up by the way, there came forth little children out of the city

and mocked him, and said unto him, go up thou bald-head, go up thou bald-head, 193 and he turned back and looked on them, and he cursed them in the name of the Lord, and there came forth two she bears out of the wood, and tare forty and two children of them."

194 It seems by the children's address to Elisha, that he was an old bald-headed man, and that they had heard, that his mate, Elijah, had gone up a little before; 195 and as it was an uncommon thing for men to kite away into the air, and leave the world after that sort, it is likely that it excited a curiosity in the children to see Elisha go off with himself in the same manner, which occasioned their particular mode of speech to him, saying, "go up bald head."

196 The writings of Solomon, Song of Israel, must needs have been foisted into the canonical volume by some means or other, for no one passage therein gives the least intimation of inspiration, or that he had any immediate dictation from God in his compositions, 197 but oh the contrary, he informs us, that he acquired his knowledge by applying himself to wisdom, "to seek and to search out concerning all things that are done under the sun. 198 This sore travail," says he, "has God given to the sons of men to be exercised therewith." And since Solomon never pretended to inspiration, others cannot justly claim his writings to have been anything more than natural reasonings, 199 for who can, with propriety stamp his writings with divine authority, when he pretended no such thing, but the contrary? 200 His song of songs appears to be rather of the amorous kind, and is supposed to have been written at the time he was making love to the daughter of Pharaoh, King of Egypt, 201 who is said to have been a princess of exquisite beauty and exceeding coy, and so captivated his affections that it made him light headed and sing about the "'joints of her thighs'," and her "'belly'."

202 The divine legation of Moses and the prophets is rendered questionable from the consideration that they never taught the doctrine of immortality, their rewards and punishments are altogether temporary, terminating at death; 203 they have not so

much as exhibited any speculation of surviving the grave; to this is ascribed the unbelief of the Sadducees of the resurrection of the dead, or of an angel or spirit, as they strenuously adhered to the law of Moses, 204 for they could not imagine, but that their great prophet and law giver would have apprised them of a state of immortality had it been true; 205 and in this the Sadducees seem to argue with force on their position of the divine legation of Moses. 206 For admitting the reality of human's immortality, it appears incredible to suppose, that God should have specially commissioned Moses, as his prophet and instructor to the tribes of Israel, and not withal to have instructed them in the important doctrine of a future existence.

DREAMS OR VISIONS UNCERTAIN AND CHIMERICAL CHANNEL... FOR THE CONVEYANCE OF REVELATION; WITH REMARKS ON THE COMMUNICATION OF THE HOLY GHOST TO THE DISCIPLES, BY THE PRAYERS AND LAYING ON OF THE APOSTLES HANDS, WITH OBSERVATIONS ON THE DIVINE DICTATIONS OF THE FIRST PROMULGATORS OF THE GOSPEL, AND AN ACCOUNT OF THE ELECT LADY, AND HER NEW SECTARY OF SHAKERS

SECTION III

207 It appears from the writings of the prophets and apostles, that part of their revelations were communicated to them by dreams and visions, which have no other existence but in the imagination, 208 and are defined to be "the images which appear to the mind during sleep, figuratively, a chimera, a groundless fancy or conceit, without reason." 209 Our experience agrees with this definition, and evinces that there is no trust to be reposed in them. 210 They are fictitious images of the mind, not under the control of the understanding, and therefore not regarded at this day except by the credulous and superstitious, who still retain a veneration for them. 211 But that a revelation from God to human, to be continued to the latest posterity as a divine and perfect rule of duty or law, should be communicated through such a fictitious and chimerical channel, carries with it the evident marks of deception

itself, or of unintelligibleness, as appears from the vision of St. Paul. 212 "It is not expedient for me doubtless to glory, I will come to visions and revelations of the Lord; I knew a man in Christ above fourteen years ago, whether in the body I cannot tell, or whether out of the body I cannot tell, God knoweth such an one caught up to the third heavens. 213 And I knew such a man, whether in the body or out of the body I cannot tell, God knoweth how that he was caught up into Paradise and heard unspeakable words which it is not lawful for a human to utter." 214 That God knoweth the whole affair, will not be disputed, but that we should understand it is impossible, for the apostle's account of his vision is unintelligible; 215 it appears that he was rather in a delirium or a stupor, so that he knew not that whether he was in or out of the body: 216 he says he heard "'unspeakable words,'" but this communicates no intelligence of the subject-matter of them to us; and that they "'were not lawful for a human to utter'," 217 but what they were, or wherein their unlawfulness to be uttered by human consisted, he does not inform us. 218 His revelation from his own story was unspeakable and unlawful, and so he told us nothing what it was, nor does it compose any part of revelation, which is to make known. 219 He is explicit as to his being caught up to the third heaven, but how he could understand that is incredible, when at the same time he knew not whether he was in the body or out of the body; 220 and if he was in such a delirium that he did not know so domestic a matter as that, it is not to be supposed that he could be a competent judge whether he was at the first, second, third, or fourth heaven, or whether he was advanced above the surface of the earth, or not.

221 That the apostles in their ministry were dictated by the Holy Ghost, in the settlement of disputable doctrines, is highly questionable. 222 "For as much as we have heard that certain, which went out from us have troubled you with words, subverting your souls, saying, ye must be circumcised and keep the law, to whom we gave no such

commandment, 223 for it seemed good to the Holy Ghost, and to us, to lay upon you no other burden than these necessary things." Acts, chapter-15. 224 And after having given a history of the disputations concerning circumcision, and of keeping the law of Moses, and of the result of the council, the same chapter informs us, that a contention happened so sharp between Paul and Barnabas, "that they parted asunder the one from the other." 225 Had the Holy Ghost been the dictator of the first teachers of Christianity, as individuals, there could have been no disputable doctrines or controversies, respecting the religion which they were promulgating in the world or in the manner of doing it, 226 to be referred to a general council of the apostles and elders held at Jerusalem, for had they been directed by the Holy Ghost, there could have been no controversies among them to have referred to the council. 227 And inasmuch as the Holy Ghost neglected them as individuals, why is it not as likely that it neglected to dictate the council held at Jerusalem or elsewhere? 228 It seems that the Holy Ghost no otherwise directed them in their plan of religion, than by the general council of the apostles and elders, the same as all other communities are governed. 229 "Paul having passed through the upper coasts came to Ephesus, and finding certain disciples, he said unto them have ye received the Holy Ghost since ye believed? And they said unto him we have not so much as heard whether there be any Holy Ghost; 230 and when Paul had laid his hands upon them, the Holy Ghost came on them, and they spoke with tongues and prophesied."

231 The spirit of God is that which constitutes the divine essence, and makes Him to be what He is, but that He should be dictated, or His spirit be communicated by any acts or ceremonies of the apostles, is by no means admissible; 232 for such exertions of the apostles, so far as they may be supposed to communicate the holy spirit to their disciples, would have made God passive in the premised act of the gift of the spirit; 233 for it must have been either the immediate act of God or of the apostles, and if it

was the immediate act of the one, it could not have been the immediate act of the other. 234 To suppose that the act of the gift of the spirit was the mere act of God, and at the same time the mere act of the apostles, are propositions diametrically opposed to each other, and cannot both be true. 235 But it may be supposed that the gift of the spirit was partly the act of God and partly the act of the apostles; 236 admitting this to have been the case the consequences would follow, that the act of the gift of the spirit was partly divine and partly human, 237 and therefore the beneficence and glory of the grant of the gift of the spirit unto the disciples, would belong partly to God and partly to the apostles, 238 and in an exact proportion to that which God and they may be supposed to have respectively contributed towards the marvellous act of the gift of the spirit. 239 But that God should act in partnership with human, or share His providence and glory with you, is too absurd to demand argumentative confutation, 240 especially in an act which immediately respects the display or exertion of the divine spirit on the spirits of humans.

241 Such delusions have taken place in every age of the world since history has attained to any considerable degree of intelligence; 242 nor is there at present a nation on earth, but what is more or less infatuated with delusory notions of the immediate influence of good or evil spirits on their minds. 243 An instance of it appears in the Elect Lady (as she has seen fit to style herself) and her followers, called Shakers; this pretended holy woman began her religious scheme at Connestaguna; 244 in the north-westardly part of the State of New York, about the year 1769, and has added a new sectary to the religious catalogue. 245 After having instilled her tenets among the Connestagunites, and the adjacent inhabitants, she rambled into several parts of the country, promulgating her religion, and has gained a considerable number of scattering proselytes, not only in the State of New York, but some in the New England States. 246 She has so wrought on the minds of her female devotees, respecting the fading nature,

vanity and tempting allurements of their ornaments (which by the by are not plenty among her followers,) 247 and the deceitfulness of riches, that she has procured from them a considerable number of strings of gold beads and jewels, and amassed a small treasure; 248 and like most sectaries engrosses the kingdom of heaven to herself and her followers, to the seclusion of all others. 249 She gives out that her mission is immediately from heaven, that she travails in pain for her elect, and pretends to talk in seventy-two unknown languages, in which she converses with those who have departed this life, 250 and says, that there has, not been a true church on earth since the apostles days until she had erected hers. 251 That both the living and the dead must be saved in, by, and through her, and that they must confess their sins unto her and procure her pardon, or cannot be saved. 252 That every of the human race who have died since the apostle's time, until her church was set up has been damned, and that they are continually making intercession to her for salvation, which is the occasion of her talking to them in those unknown tongues; 253 and that she gathers her elect from earth and hell. She wholly refuses to give a reason for what she does or says: but says that it is the duty of humankind to believe in her, and receive her instructions, for they are infallible. 254 For a time she prohibited her disciples from propagating their species, but soon after gave them ample license, restricting them, indiscriminately, to the pale of her sanctified church, for that she needed more souls to complete the number of her elect. 255 Among other things, she instructs those who are young and sprightly among her pupils, to practise the most wild, freakish, wanton and romantic gestures, 256 as to that of indecently stripping themselves, twirling round, extorting their features, shaking and twitching their bodies and limbs into a variety of odd and unusual ways, and many other extravagancies of external behavior, 257 in the practice of which they are said to be very alert even to the astonishment of spectators, having by use acquired an uncommon

agility in such twirling, freakish and romantic practices. 258 The old Lady having such an ascendancy over them as to make them believe that those extravagant actions were occasioned by the immediate power of God, it serves among them as a proof of the divinity of her doctrines.

259 A more particular account of this new sectary has been lately published in a pamphlet by a Mr. Rathburn, who, as he relates, was for a time, one of her deluded disciples, 260 but after a while apostatised from the faith, and has since announced to the world the particulars of their doctrine and conduct.

261 Probably there never was any people or country, since the era of historical knowledge, who were more confident than they that they are acted upon by the immediate agency of the divine spirit; 262 and as there are facts now existing in a considerable tract of country, and are notoriously known in this part of America, I take the liberty to mention them, 263 as a knowledge of these facts, together with the concurrent testimony of the history of such deceptions in all ages and nations, might induce my countrymen to examine strictly into the claim and reality of ghostly intelligence in general.

OF THE NATURE OF FAITH AND WHEREIN IT CONSISTS

Ethan Allen

SECTION I

8 Faith in Jesus Christ and in his Gospel throughout the New Testament, is represented to be an essential condition of the eternal salvation of humankind. 2 "Knowing that a human is not justified by the works of the law, but by the faith of Jesus Christ, even we have believed in Jesus Christ, that we might be justified by the faith of Christ, and not by the works of the law, for by the works of the law shall no flesh be justified." 3 Again, "If thou shalt confess the Lord Jesus Christ, and believe in thine heart that God hath raised him from the dead, thou mayst be saved." 4 And again, "You that believeth and is baptised shall be saved, but you that believeth not shall be

damned." 5 Faith is the last result of the understanding, or the same which we call the conclusion, it is the consequence of a greater or less deduction of reasoning from certain premises previously laid down; 6 it is the same as believing or Judging of any matter of fact, or assenting to or dissenting from the truth of any doctrine, system or position; 7 so that to form a judgment, or to come to a determination in one's own mind, or to believe, or to have faith, is in reality the same thing, and is synonymously applied both in writing and speaking, for example, "Abraham believed in God." 8 Again, "for you," speaking of Abraham, "judged him faithful who had promised," and again "your faith was counted unto him for righteousness."

9 It is not only in scripture that we meet with examples of the three words, to wit, belief, judgment, and faith, to stand for the marks of our ideas for the same thing, 10 but also all intelligible writers and speakers apply these phrases synonymously, and it would be good grammar and sense, for us to say that we have faith in a universal providence, or that we judge that there is a universal providence. 11 These three different phrases, in communicating our ideas of providence, do every one of them exhibit the same idea, to all persons of common understanding, who are acquainted with the English language. 12 In fine, every one's experience may convince them that they cannot assent to, or dissent from the truth of any matter of fact, doctrine or proposition whatever, contrary to their judgment; 13 for the act of the mind in assenting to or dissenting from any position, or in having faith or belief in favour of, or against any doctrine, system, or proposition, could not amount to anything more or less, than the act of the judgment, or last dictate of the understanding, 14 whether the understanding be supposed to be rightly informed or not: so that our faith in all cases is as liable to err, as our reason is to misjudge of the truth; 15 and our minds act faith in disbelieving any doctrine or system of religion to be true, as much as in believing it to be so. 16 From hence it appears, that the

mind cannot act faith in opposition to its judgment, but that it is the resolution of the understanding itself committed to memory or writing, and can never be considered distinct from it. 17 And inasmuch as faith necessarily results from reasoning, forcing itself upon our minds by the evidence of truth, or the mistaken apprehension of it, without any act of choice of ours, there cannot be any thing, which pertains to, or partakes of the nature of moral good or evil in it. 18 For us to believe such doctrines, or systems of religion, as appears to be credibly recommended to our reason, can no more partake of the nature of goodness or morality, than our natural eyes may be supposed to partake of it in their perception of colors; 19 for the faith of the mind, and the sight of the eye are both of them necessary consequences, the one results from the reasonings of the mind, and the other from the perception of the eye. 20 To suppose a rational mind without the exercise of faith would be as absurd as to suppose a proper and complete eye without sight, or the perception of the common objects of that sense. 21 The short of the matter is this, that without reason we could not have faith, and without the eye or eyes we could not see, 22 but once admitting that we are rational, faith follows of course, naturally resulting from the dictates of reason.

OF THE TRADITIONS OF OUR FOREFATHERS

SECTION II

23 It may be objected, that the far greater part of humankind believe according to the tradition of their forefathers, without examining into the grounds of it, 24 and that argumentative deductions from the reason and nature of things, have, with the bulk of them, but little or no influence on their faith. 25 Admitting this to have been too much the case, and that many of them have been blameable for the omission of cultivating or improving their reason, and for not forming a better judgment concerning their respective traditions, or a juster and more exalted faith; 26 yet this does not at all invalidate the foregoing

arguments respecting the nature of faith: 27 for though it be admitted that most of the human race do not, or will not reason, with any considerable degree of propriety, on the traditions of their forefathers, but receive them implicitly, they nevertheless establish this one proposition in their minds, right or wrong, 28 that their respective traditions are right, for none could believe in them were they possessed of the knowledge that they were wrong. 29 And as we have a natural bias in favour of our progenitors, to whose memory a tribute of regard is justly due, and whose care in handing down from father to son such notions of religion and manners, 30 as they supposed would be for the well being and happiness of their posterity in this and the coming world, naturally endears tradition to us, and prompts us to receive and venerate it. 31 Add to this, that the priests of every denomination are "'instant in season and out of season,'" in inculcating and instilling the same tenets, 32 which, with the foregoing considerations, induces humankind in general to give at least a tacit consent to their respective traditions, and without a thorough investigation thereof, believe them to be right and very commonly infallible, 33 although their examinations are not attended with argumentative reasonings, from the nature of things; and in the same proportion as they may be supposed to fall short of conclusive arguing on their respective traditions they cannot fail to be deceived in the rationality of their faith.

34 But after all it may be that some of the human race may have been traditionally or accidentally right, in many or most respects. 35 Admitting it to be so, yet they cannot have any rational enjoyment of it, or understand wherein the truth of the premised right tradition consists, or deduce any more satisfaction from it, than others whose traditions may be supposed to be wrong; 36 for it is the knowledge of the discovery of truth alone, which is gratifying to that mind who contemplates its superlative beauty.

37 That tradition has had a powerful influence on the human mind is universally admitted, even

by those who are governed by it in the articles or discipline of their faith; 38 for though they are blind with respect to their own superstition, yet they can perceive and despise it in others. 39 Protestants very readily discern and expose the weak side of Popery, and Papists are as ready and acute in discovering the errors of heretics. 40 With equal facility do Christians and Mahometans spy out each others inconsistencies and both have an admirable sagacity to descry the superstition of the heathen nations. 41 Nor are the Jews; wholly silent in this matter; "O God the heathen are come into thine inheritance, thy holy temple have they defiled." 42 What abomination must this have been in the opinion of a nation who had monopolised all religion to themselves! Monstrous vile heathen, that they should presume to approach the sanctum sanctorum! 43 The Christians call the Mahometans by the odious name of infidels, but the Musslemen, in their opinion, cannot call the Christians by a worse name than that which they have given themselves, they therefore call them Christians.

44 What has been already observed upon tradition, is sufficient to admonish us of its errors and superstitions, 45 and the prejudices to which a bigoted attachment thereto exposes us, which is abundantly sufficient to excite us to a careful examination of our respective traditions, and not to rest satisfied until we have regulated our faith by reason.

OUR FAITH IS GOVERNED BY OUR REASONINGS...
WHETHER THEY ARE SUPPOSED TO BE CONCLUSIVE OR INCONCLUSIVE, AND NOT MERELY BY OUR OWN CHOICE

SECTION III

46 It is written that "Faith is the gift of God." Be it so, but is faith any more the gift of God than reflection, memory or reason are His gifts? 47 Was it not for memory, we could not retain in our minds the judgment which we have passed upon things; 48 and was it not for reasoning, in either a regular or irregular manner, or partly both, there could be no such thing as judging or believing; 49 so

that God could not bestow the gift of faith separate from the gift of reason, faith being the mere consequence of reasoning, either right or wrong, or in a greater or less degree, as has been previously argued.

50 Still there is a knotty text of scripture to surmount, viz: "You that believeth shall be saved, but you that believeth not shall be damned." This text is considered as crowding hard upon unbelievers in Christianity; 51 but when it is critically examined, it will be found not to militate at all against them, but is merely a Jesuitical fetch to overawe some and make others wonder. 52 We will premise, that an unbeliever is destitute of faith, which is the cause of your being thus denominated.

53 The Christian believes the gospel to be true and of divine authority, the Deist believes that it is not true and not of divine authority; 54 so that the Christian and Deist are both of them believers, and according to the express words of the text, "shall be saved," 55 and a Deist may as well retort upon a Christian and call you an infidel, because you differs in faith from Deist, as a Christian may upon the Deist; 56 for there is the same impropriety in applying the cant of infidelity to either, as both are believers; 57 and it is impossible for us to believe contrary to our judgments or the dictates of understanding, whether it be rightly informed or not. 58 Why then may there not in both denominations be honest people, who are seeking after the truth, and who may have an equal right to expect the favour and salvation of God.

A TRINITY OF PERSONS CANNOT EXIST IN THE DIVINE ESSENCE... WHETHER THE PERSONS BE SUPPOSED TO BE FINITE OR INFINITE: WITH REMARKS ON ST. ATHENASIUS'S CREED

Ethan Allen

SECTION I

9 Of all errors which have taken place in religion, none have been so fatal to it as those that immediately respect the divine Nature. 2 Wrong notions of a God, or of His providence, sap its very foundation in theory and practice,

as is evident from the superstition discoverable among the major part of humankind; 3 who, instead of worshipping the true God, have been by some means or other infatuated to pay divine homage to mere creatures, or to idols made with hands, or to such as have no existence but in their own fertile imaginations.

4 God being incomprehensible to us, we cannot understand all that perfection in which the divine essence consists, 5 we can nevertheless (negatively) comprehend many things, in which (positively) the divine essence does not and cannot consist. 6 That it does not consist of three persons, or of any other number of persons, is as easily demonstrated, as that the whole is bigger than a part, or any other proposition in mathematics. 7 We will premise, that the three persons in the supposed Trinity are either finite or infinite; for there cannot in the scale of being be a third sort of beings between these two; 8 for ever so many and exalted degrees in finiteness is still finite, and that being who is infinite admits of no degrees of enlargement; 9 and as all beings whatever must be limited or unlimited, perfect or imperfect, they must therefore be denominated to be finite or infinite: 10 we will therefore premise the three persons in the Trinity to be merely finite, considered personally and individually from each other, 11 and the question would arise whether the supposed Trinity of finites though united in one essence, could be more than finite still.

12 Inasmuch as three imperfect and circumscribed beings united together could not constitute a being perfect or infinite, any more than absolute perfection could consist of three imperfections; 13 which would be the same as to suppose that infinity could be made up or compounded of finiteness; or that absolute, uncreated and infinite perfection, could consist of three personal and imperfect natures. 14 But on the other hand, to consider every of the three persons in the supposed Trinity as being absolutely infinite, it would be a downright contradiction to one infinite and all comprehending essence.

15 Admitting that God the Father is infinite, it would necessarily preclude the supposed God the Son, and God the Holy Ghost from the god-head, or essence of God; 16 one infinite essence comprehending every power, excellency and perfection, which can possibly exist in the divine Nature. 17 Was it possible that three absolute infinites, which is the same as three Gods, could be contained in one and the self-same essence, why not as well any other number of infinites? 18 But as certain as infinity cannot admit of addition, so certain a plurality of infinites cannot exist in the same essence; 19 for real infinity is strict and absolute infinity, and only that, and cannot be compounded of infinities or of parts, but forecloses all addition. 20 A personal or circumscribed God, implies as great and manifest a contradiction as the mind of human can conceive of; it is the same as a limited omnipresence, a weak Almighty, or a finite God.

21 From the foregoing arguments on the Trinity, we infer, that the divine essence cannot consist of a Trinity of persons, whether they are supposed to be either finite or infinite.

22 The creed-mongers have exhibited the doctrine of the Trinity in an alarming point of light, viz.: "Whoever would be saved before all things it is necessary that you hold the Catholic faith, 23 which faith, except every one doth keep whole and undefiled, without doubt you shall perish everlastingly." 24 We next proceed to the doctrine, "The Father is eternal, the Son is eternal, and the Holy Ghost is eternal, and yet there are not three eternals but one eternal." 25 The plain English is, that the three persons in the Trinity are three eternals, individually considered, and yet they are not three eternals but one eternal. 26 To say that there are three eternals in the Trinity, and yet that there are not three eternals therein, is a contradiction in terms, as much as to say, that there are three persons in the Trinity and yet there are not three persons in the Trinity. 27 The first proposition in the creed affirms, that "the Father is eternal," the second affirms that "the Son is eternal," the third

affirms that "the Holy Ghost is eternal," the fourth affirms that "there are not three eternals," and the fifth that there is "but one eternal."

28 The reader will observe, that the three first propositions are denied by the fourth, which denies that there are three eternals, though the three first propositions affirmed, that there were three eternals by name, viz. the Father, Son and Holy Ghost. 29 The fifth proposition is unconnected with either of the former, and is undoubtedly true, viz. "but there is one eternal." 30 "The Father is God, the Son is God, and the Holy Ghost is God, and yet there are not three Gods but one God." 31 Here again we have three Gods by name, affirmed to have an existence by the three first propositions, by the fourth they are negatived, and the fifth affirms the truth again, viz. that there is "but one God."

32 Admitting the three first propositions to be true, to wit, that there are three Gods, the three could not be one and the same God, any more than Diana, Dagan and Moloch may be supposed to be the same; 33 and if three Gods, their essences and providences would interfere and make universal confusion and disorder. 34 "The Father is Almighty, the Son is Almighty, and the Holy Ghost is Almighty, and yet there are not three Almighties but one Almighty." 35 Here we have three Almighties and at the same time but one Almighty. So that the point at issue is brought to this simple question, viz. Whether three units can be one, or one unit three or not? 36 Which is submitted to the curious to determine. Our creed further informs us, that the three persons in the Trinity are co-eternal together and co-equal, but in its sequel we are told that one was begotten of the other; 37 and when we advert to the history of that transaction, we find it to be not quite eighteen hundred years ago, and took place in the reign of Herod, the King of Judea, 38 which faith except "we keep whole and undefined," we have a threat, that "without doubt we shall perish everlastingly."

ESSENCE BEING THE CAUSE OF IDENTITY...
IS INCONSISTENT WITH PERSONALITY IN THE
DIVINE NATURE

SECTION IX

39 One God can have but one essence, which must have been eternal and infinite, and for that reason precludes all others from a participation of His nature, glory, and universal and absolute perfection. 40 When we speak of any being who by nature is capable of being rightfully denominated an individual, we conceive of it to exist but in one essence; 41 so that essence as applied to God, denominates the divine Nature; and as applied to human, it denotes an individual: 42 for although the human race is with propriety denominated the race of human, 43 and though every male of the species, is with equal propriety called man, for that they partake of one common sort of nature and likeness, yet the respective individuals are not one and the same. 44 The person of A is not the person of B, nor are they conscious of each other's consciousness, and therefore the joy or grief of A, is not and cannot be the joy or grief of B; this is what we know to be a fact from our own experience.

45 The reason of this personal distinction is founded in Nature, for though we partake of one common nature and likeness, yet we do not partake of one and the same essence. 46 Essence is therefore, in the order of Nature, the primary cause of identity or sameness and cannot be divided. 47 From hence we infer, that the doctrine of the Trinity is destitute of foundation, and tends manifestly to superstition and idolatry.

THE IMPERFECTION OF KNOWLEDGE...
IN THE PERSON OF JESUS CHRIST, INCOMPATIBLE WITH HIS DIVINITY

SECTION III

48 That Jesus Christ was not God is evident from his own words, where, speaking of the day of judgment, he says, "Of that day and hour knoweth no man, no not the angels which are in Heaven, neither the Son, but the Father." 49 This is giving up all pretention to

divinity, acknowledging in the most explicit manner, that he did not know all things, but compares his understanding to that of man and angels; 50 "of that day and hour knoweth no man, no not the angels which are in heaven, neither the Son." 51 Thus he ranks himself with finite beings, and with them acknowledges, that he did not know the day and hour of judgment, and at the same time ascribes a superiority of knowledge to the lather, for that he knew the day and hour of judgment. 52 That he was a mere creature is further evident from his prayer to the father, saying, "father if it be possible, let this cup pass from me, nevertheless, not my will but thine be done." 53 These expressions speak forth the most humble submission to his father's will, authority and government, and however becoming so submissive a disposition to the divine government would be, in a creature, 54 it is utterly inconsistent and unworthy of a God, or of the person of Jesus Christ, admitting him to have been a divine person, or of the essence of God.

OBSERVATIONS ON THE STATE OF HUMAN, IN MOSES'S PARADISE... ON THE TREE OF KNOWLEDGE OF GOOD AND EVIL, AND ON THE TREE OF LIFE: WITH SPECULATIONS ON THE DIVINE PROHIBITION TO HUMAN, NOT TO EAT OF THE FRUIT OF THE FORMER OF THOSE TREES, INTERSPERSED WITH REMARKS ON THE MORTALITY OF INNOCENT HUMAN

Ethan Allen

SECTION I

10 The mortality of animal life, and the dissolution of that of the vegetable, has been particularly considered in chapter three, section four, treating on physical evils. 2 We now proceed to make an application of those arguments, in the case of our reputed first parents, whose mortality is represented by Moses to have taken place in consequence of their eating of the forbidden fruit. 3 Moses in his description of the garden of Eden acquaints us with two chimerical kinds of fruit trees, which, among others, he tells us were planted by God in the place appointed for the residence of the new made couple; 4 the one he calls by the name of "the tree of knowledge of good and evil," and

the other by the name of "the tree of life." 5 And previous to his account of the apostacy, he informs us, that God expressly commanded the man and woman, saying, "be fruitful and multiply and replenish the earth and subdue it, 6 and have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth; 7 and God said, behold I have given you every herb bearing seed, which is upon, the face of all the earth, and every tree, in which is the fruit of a tree yielding seed, to you it shall be for meat." 8 Again, "and the Lord commanded the man saying, of every tree of the garden thou mayest freely eat, but of the tree of knowledge of good and evil thou shalt not eat of it, for in the day that thou eatest thereof thou shalt surely die." 9 "And the Lord said, it is not good for man to be alone, I will make him an help meet for him; 10 and the Lord God caused a deep sleep to fall upon Adam, and he slept, and he took out one of his ribs, and closed up the flesh instead thereof, and the rib which the Lord God had taken from man made he a woman."

11 Thus it appears from Moses's representation of the state of man's innocency, that he was commanded by God to labour, and to replenish the earth; 12 and that to him was given the dominion over the creatures, and that at two several times he was licensed by God himself to eat of every of the fruit of the trees, and of the herbage, except of the tree of knowledge of good and evil; 13 and because it was not good that the man should be alone, but that he might multiply and replenish the earth, our amorous mother Eve, it seems, was formed, who I dare say well compensated father Adam for the loss of his rib.

14 This short description of man's state and condition in innocency, agrees with the state and circumstances of human nature at present. 15 Innocent man was required to labour and subdue the earth, out of which he was to be subsisted; had a license to eat of the fruit of the trees, or herbage of the garden, which pre-supposeth that his nature needed refreshment the same as ours does; 16 for otherwise it would have been impertinent to have granted him a

privilege incompatible with his nature, 17 as it would have been no privilege at all, but an outright mockery, except we admit, that innocent human nature was liable to decay, needed nutrition by food, and had the quality of digestion and perspiration; 18 or in fine, had the same sort of nature as we have; for otherwise he could eat but one belly-full, which without digestion would remain the same, and is too romantic to have been the original end and design of eating. 19 And though there is nothing mentioned by Moses concerning his drinking, yet it is altogether probable, that he had wit enough to drink when he was thirsty. 20 That he consisted of animal nature is manifest, not only from his being subjected to subdue the earth, out of which he was to be subsisted, and from his eating and drinking, or his susceptibility of nutrition by food, 21 but also from his propensity to propagate his kind; for which purpose a helpmate was made for him.

22 Nothing could more fully evince, that Moses's innocent progenitors of humankind, in that state, were of a similar nature to ours, than their susceptibility of propagating the species; 23 and as they required nutrition, their nature must have had the quality or aptitude of digestion and perspiration, and every property that at present we ascribe to an animal nature; 24 from hence we infer, that death, or mortality, must have been the necessary consequence. 25 What would have prevented them from having been crushed to death by a fall from a precipice, or from suffering death by any other casualty, to which human nature is at present liable? 26 Will any suppose that the bodies of those premised innocent progenitors of the human race were invulnerable; were they not flesh and blood? 27 Surely they were, for otherwise they could not have been male and female; as it was written, "male and female created He them:" 28 and inasmuch as animal life has, from its original, consisted of the same sort of nature, and been propagated and supported in the same manner, and obnoxious to the same fate, 29 it would undoubtedly, in the premised day of Adam, required the same order in the external

system of Nature, which it does at present, to answer the purposes of animal life. 30 Was it possible that the Laws of Nature, which merely respect gravitation, could be and were suspended, so as not to be influential on matter, our world would be immediately disjointed and out of order, and confusion would succeed its present regularity; in the convulsions whereof animal life could not subsist. 31 So that not only the laws which immediately respect animal nature in particular, but the laws which respect our solar system, must have been the same in man's innocency, as in his whimsically supposed state of apostacy; and consequently, his mortality the same. 32 From hence we infer, that the curses, which Moses informs us of in chapter three: as being by God pronounced upon human, saying, "dust thou art, and unto dust thou shalt return," could not have been any punishment, inflicted as a penalty for eating the forbidden fruit; 33 for turn to dust he must have done, whether he eat of it or not; for that death and dissolution was the inevitable and irreversible condition of the Law of Nature, which wholly precludes the curse, of which Moses informs us, from having any effect on humankind.

34 The story of the "tree of life" is unnatural. And there being but one of the kind, it may be called an only tree, the world not having produced another of the sort; 35 the fruit of which, according to Moses, had such an efficacious quality, that had Adam and Eve but eaten thereof, they would have lived forever. "And now lest he put forth his hand and take also of the tree of life, and eat, and live forever." 36 To prevent which, they are said to be driven out of the garden, that the eating thereof might not have reversed the sentence of God, which he had previously pronounced against them, denouncing their mortality. 37 "So he drove out the man, and he placed at the east of the garden of Eden, cherubims, and a flaming sword, which turneth every way to keep the way of the tree of life." A bite of this fruit it seems would have reinstated humankind, and spoiled priestcraft. 38 Yet it is observable, that there are no travellers or historians, who have

given any accounts of such a tree, or of the cherubims or flaming sword, which renders its existence disputable, and the reality of it doubtful and improbable; 39 the more so, as that part of the country, in which it is said to have been planted, has for a long secession of ages been populously inhabited. 40 Yet it may be objected, that the tree may have rotted down and consumed by time. But such conjectures derogate from the character of the quality of the tree. 41 It seems, that so marvellous a tree, the fruit of which would have preserved animal life eternally, would have laughed at time, and bid defiance to decay and dissolution, 42 and eternally have remained in its pristine state under the protection of the flaming sword, as a perpetual evidence of the divine legation of Moses, and the reality of man's apostacy for ever. 43 But alas! it is no where to be found, it is perished from off the face of the earth, and such a marvellous fruit is no more, and consequently no remedy against mortality remains.

POINTING OUT THE NATURAL IMPOSSIBILITY OF ALL AND EVERY...

OF THE DIVERSE SPECIES OF BIPED ANIMALS, COMMONLY TERMED HUMAN, TO HAVE LINEALLY DESCENDED FROM ADAM AND EVE, OR FROM THE SAME ORIGINAL PROGENITORS

SECTION II

44 It is altogether improbable and manifestly contradictory to suppose, that the various and diverse nations and tribes of the earth, who walk upon two legs, and are included under the term human, have or possibly could have descended by ordinary generation, from the same parents, be they supposed to be who they will. 45 Those adventurers,-- who have sailed or travelled to the several parts of the globe, inform us, in their respective histories, that they find the habitable part of it more or less populated by one kind or other of rational animals, 46 and that considered as tribes or nations, there is evidently a gradation of intellectual capacity among them, some more exalted and others lower in the scale of being; 47 and that they are specially diverse from each other

with respect to their several animal natures, 48 though in most respects they appear to have one sort of nature with us, viz: more like us that like the brute creation; as they walk erect, speak with human's voice, and make use of language of one sort or other, 49 though many of them are more or less inarticulate in their manner of speaking: and in many other particulars bear a general likeness to us. 50 They are nevertheless considered as distinct tribes or nations, are of different sizes, and as to complexion, they vary from the two extremes of white and black, in a variety of tawny mediums.

51 The learned nations can trace their genealogies, (though somewhat incorrect) for a considerable time, but are certain to be sooner or later lost in the retrospect thereon, 52 and those that are of an inferior kind, or destitute of learning or science have no other knowledge of their genealogies, than they retain by their respective traditions, which are very inconsiderable. 53 They are likewise diverse from each other in their features and in the shape of their bodies and limbs, and some are distinguished from others by their rank smell and the difference in their hair, eyes and visage, but to point out the distinctions would exceed my design.

54 The Ethiopians, though of a shining black complexion, have regular and beautiful features, and long black hair (one of those female beauties captivated the affections of Moses) 55 they differ very materially from the negro blacks, so that it appears impossible that they should have descended in a lineal succession from the same ancestors. 56 They are uniformly in their respective generations essentially diverse from each other, so that an issue from a male and female of the two nations would be a mongrel, partaking partly of the kind of both nations. 57 So also concerning the difference which subsists between us and the negroes; their black skin is but one of the particulars in which they are different from us; 58 their many and very essential differences fully evince, that the white nations, and they, could not according to the law of their

respective generations, have had one and the same lineal original, but that they have had their diverse kind of original progenitors.

59 It is true that the several nations and tribes of the earth, comprehended under the general term human, 60 notwithstanding their diversity to each other in bodily shape and mental powers, bear a nearer resemblance to one another than the brute kind, for which reason they are known by one common appellation: 61 though it is manifest that they could never have lineally descended from the same first parents, whether their names were Adam and Eve, or whatnot. 62 But inasmuch as our genealogies are wholly insufficient for the purpose of explaining our respective originals or any or either of them, 63 or to give us or any of us, considered as individuals or nations, who fall under the denomination of the term human, any manner of insight or knowledge from whom we are lineally descended, or who were our respective original ancestors, or what their names were: 64 we must therefore reason on this subject from the facts and causes now existing, which abundantly evince, that we are of different kinds, and consequently are not of the same lineage.

65 The acquaintance, which we have had with the negro nation in particular, fully evinces the absurdity of supposing them to be of the same blood and kindred with ourselves. 66 But that there are some original intrinsic and hereditary diversity or essential difference between us and them, which cannot be ascribed to time, climate, or to mere contingence. 67 For that we and they are in nature inherently and uniformly diverse from each other in our respective constitutions and generations, and have been so time immemorial. 68 So that the negroes are of a different species of rational beings from us, and consequently must have had their distinct lineal original; 69 was it not so, there could be no such thing as a mongrel or a mulatto, who is occasioned by a copulation between the males and the females of the respective diverse species, the issue partaking of both natures. 70 Had all the nations and tribes of

the world, who are denominated rational, been lineally descended from the same progenitors, mongrelism could never have taken place among them, 71 as in this case they would have been all of the same kind: from hence we infer, that they have had their respective original progenitors.

72 The Dutch colony at the Cape of Good Hope have enacted laws to punish with death such of their Dutch subjects as may be convicted of copulating with the Hottentots: 73 for that their nature is adjusted to be of an inferior species to theirs, so that mixing their nature with them would essentially degenerate and debase their own.

OF THE ORIGIN OF THE DEVIL OR OF MORAL EVIL...
AND OF THE DEVIL'S TALKING WITH EVE; WITH A REMARK THAT THE DOCTRINE OF APOSTACY IS THE FOUNDATION OF CHRISTIANITY

SECTION III

74 Inasmuch as the devil is represented to have had so great and undue an influence in bringing about the apostacy of Adam, and still to continue his temptations to humankind, 75 it may be worth our while to examine into the nature and manner of his being and the mode of his exhibiting his temptations.

76 John's gospel, verses:1 and 3, the Christian's God is the creator of the devil and consequently the original cause of evil in heaven-- 77 and among humans he planted the tree of knowledge of good and evil, and knew at the time he planted it of the awful consequences that would follow. 78 But if it be admitted, that the creature called the devil (who must be supposed to be under the divine government, as much as any other creature) could become inflexible, and perpetually rebellious 79 and wicked, incapable of a restoration, and consequently subjected to eternal punishment (which to me appears to be inconsistent with the wisdom and goodness of the divine government, and the nature, end and design of a probationary agent) 80 yet it would by no means follow from hence, that so stubbornly wicked and incorrigible a creature would have been permitted, by the providence of

God, to tempt, ensnare or seduce humankind, by plying his temptations to their weak side. 81 One thing we are certain of, viz. that the devil does not visit our world in a bodily or organised shape, and there is not in Nature a second way, in which it is possible for him to make known himself to us, 82 or that he could have done it to our progenitors, nor could he ever have communicated to them or to us, any temptations or ideas whatever, 83 any otherwise than by making a proper application to our external senses, so that we could understand him, or receive the ideas of his temptations in a natural way. 84 For supernatural intercourse with the world of spirits or invisible beings has been shown to be contradictory and impossible in the arguments contained in the sixth chapter, to which the reader is referred. 85 Those arguments will hold equally good as applied to either good or evil spirits, and are demonstrative of the utter impossibility of humankind's holding any manner of intercourse or intelligence with them.

86 But should we premise, that, according to the history of Moses, it was in the power of the devil to assume a bodily shape, and that he did in very deed transform himself into the figure, likeness and organisation of a snake, 87 yet by and with that organ he could not have spoken or uttered the following articulate words, which Moses charged him with, 88 to wit, "And the serpent said unto the woman, ye shall not surely die, for God doth know, that in the day ye eat thereof, that your eyes shall be opened, and ye shall be as Gods knowing good and evil."

89 Who speaks the truth in the above passages, the devil, for neither the man nor the woman died for many years after they are said to have eaten of the forbidden fruit, for death is the annihilation of life, and they did not die on the day they eat. 90 As the serpent is by nature incapable of speech, it must have put the devil into the same predicament; 91 admitting that he transformed himself into the same figure or likeness, and consequently for want of the proper and adequate organs of speech, he must necessarily have

been incapable of any other language than that of rattling his tail, 92 and therefore could never have spoken those recited words unto Eve, or communicated any of his temptations unto her by language, while in that similitude. 93 However, admitting that the first parents of humankind were beguiled by the wiles of the devil to transgress the divine law, yet of all transgressions it would have been the most trivial (considered under all the particular circumstances of it) that the mind of human can conceive of.

94 Who in the exercise of reason can believe, that Adam and Eve by eating of such a spontaneous fruit could have incurred the eternal displeasure of God, as individuals? 95 Or that the divine vindictive justice should extend to their unoffending offspring then unborn? And sentence the human progeny to the latest posterity to everlasting destruction? 96 As chimerical as Moses's representation of the apostacy of human manifestly appears to be, yet it is the very basis, on which Christianity is founded, 97 and is announced in the New Testament to be the very cause why Jesus Christ came into this world, "that he might destroy the works of the devil," and redeem fallen human, alias, the elect, from the condemnation of the apostacy; 98 which leads me to the consideration of the doctrine of imputation.

IMPUTATION CANNOT CHANGE, ALIENATE OR TRANSFER... THE PERSONAL DEMERIT OF SIN; AND PERSONAL MERIT OF VIRTUE TO OTHERS, WHO WERE NOT ACTIVE THEREIN, ALTHOUGH THIS DOCTRINE SUPPOSES AN ALIENATION THEREOF

Ethan Allen

SECTION I

11 The doctrine of imputation according to the Christian scheme, consists of two parts; 2 first, of imputation of the apostacy of Adam and Eve to their posterity, commonly called original sin; and secondly, of the imputation of the merits or righteousness of Christ, who in scripture is called the second Adam, to humankind, or to the elect. 3 This is a concise definition of the doctrine, and

which will undoubtedly be admitted to be a just one by every denomination of people, who are acquainted with Christianity, 4 whether they adhere to it or not I therefore proceed to illustrate and explain the doctrine by transcribing a short, but very pertinent conversation, which in the early years of my manhood, I had with a Calvinistical divine: 5 but previously remark, that I was educated in what is commonly called the Armenian principles, and among other tenets to reject the doctrine of original sin, this was the point at issue between the clergyman and me. 6 In my turn I opposed the doctrine of original sin with philosophical reasonings, and as I thought had confuted the doctrine. The reverend gentleman heard me through patiently, 7 and with candour replied, "your metaphysical reasonings are not to the purpose; inasmuch as you are a Christian, and hope and expect to be saved by the imputed righteousness of Christ to you; for you may as well be imputedly sinful as imputedly righteous. 8 Nay, said he, if you hold to the doctrine of satisfaction and atonement by Christ, by so doing you pre-suppose the doctrine of apostacy or original sin to be in fact true; 9 for said he, if humankind were not in a ruined and condemned state by nature, there could have been no need of a redeemer, but each individual would have been accountable to own creator and judge, upon the basis of own moral agency. 10 Further observing, that upon philosophical principles it was difficult to account for the doctrine of original sin, or original righteousness, 11 yet as they were plain fundamental doctrines of the Christian faith, we ought to assent to the truth of them, and that from the divine authority of revelation. 12 Notwithstanding, said he, if you will give me a philosophical explanation of original imputed righteousness, which you profess to believe, and expect salvation by, then I will return you a philosophical explanation of the doctrine of original sin; 13 for it is plain, said he, that your objections lie with equal weight against original imputed righteousness, as against original imputed sin." 14 Upon which I had the candour to

acknowledge to the worthy ecclesiastic, that upon the Christian plan, I perceived that the argument had fairly terminated against me. 15 For at that time I dared not distrust the infallibility of revelation, much more to dispute it. However, this conversation was uppermost in my mind for several months after, 16 and after many painful searches and researches after the truth respecting the doctrine of imputation, resolved at all events to abide the decision of rational argument in the premises, 17 and on a full examination of both parts of the doctrine, rejected the whole; for on a fair scrutiny I found, that I must concede to it entirely or not at all, or else believe inconsistently as the clergyman had argued.

18 Having opened and explained the doctrine, we proceed argumentatively to consider it. Imputation of sin or righteousness includes an alteration or transferring of the personal merits or demerits of sin or righteousness, 19 from those who may be supposed to have been active in the one or the other, to others, who are premised not to have been active therein, otherwise it would not answer the Bible notion of imputation. 20 For if sin or righteousness, vice or virtue, are imputable only to their respective personal proficients or actors, in this case original sin must have been imputed to Adam and Eve, 21 to the exclusion of their posterity, and the righteousness of Christ as exclusively imputed to himself, precluding all others therefrom; 22 so that both the sin of the first Adam and the righteousness of the second, would, on this stating of imputation, have been matters which respect merely the agency, of the demerits or merits of the two respective Adams themselves, 23 and in which we could have had no blame, reward or concern, any more than in the building of Babel.

24 This then is the question that determines the sequel of the dispute for or against the doctrine of imputation, 25 viz. whether the personal merit or demerit of humankind, that is to say, their virtue or vice, righteousness or wickedness can be alienated, imputed to, or transferred from one person to another, or not? 26 If any should object against this

stating of the question now in dispute, it would be the same in reality as disputing against the doctrine of imputation itself, 27 for imputation must transfer or change the personal merit or demerit of the sin or righteousness of humankind or not do it; 28 if it does not do it, the whole notion of original sin or of righteousness, as being imputed from the first and second Adams to humankind, is without foundation, 29 consequently, if there is any reality in the doctrine of imputation, it must needs transfer or change the guilt of original sin, or of the apostacy of Adam and Eve, to their posterity, 30 or otherwise they could need no atonement or imputative righteousness, as a remedy therefrom, but every individual of "humankind would have stood accountable to their creator and judge on the basis of their own moral agency," 31 which is undoubted the true state of the case, respecting all rational and accountable beings; 32 so that if the transferring of the individual merits or demerits of one person to another, is not contained in the act or doctrine of imputation, it contains nothing at all, 33 but is a sound without a meaning, and after all the talk which has been in the world about it, we must finally adopt to old proverb, viz. "every tub stands upon its own bottom."

THE MORAL RECTITUDE OF THINGS FORECLOSES...
THE ACT OF IMPUTATION

SECTION II

34 Imputation confounds virtue and vice, and saps the very foundation of moral government, both divine and human. 35 Abstract the idea of personal merit and demerit, from the individuals of humankind, justice would be totally blind, and truth would be nullified, or at least excluded from any share in the administration of government. 36 Admitting that moral good and evil has taken place in the system of rational agents, yet, on the position of imputation, it would be impossible, that a retribution of justice should be made to them by God or by human, 37 except it be according to their respective personal merits and demerits; which would fix upon the basis of

our own moral agency and accountability, and preclude the imputation of righteousnes.

38 Truth respects the reality of things, as they are in their various complicated and distinct natures, and necessarily conforms to all facts and realities. 39 It exists in, by and with every thing that does exist, and that which does not and cannot exist, is fictitious and void of truth, as is the doctrine of imputation. 40 It is a truth that some of the individuals of humankind are virtuous, and that others are vicious, and it is a truth, that the former merit peace of conscience and praise, and the latter horror of conscience and blame; 41 for God has so constituted the nature of things, that moral goodness, naturally and necessarily tends to happiness in a moral sense, and moral evil as necessarily tends to the contrary; 42 and as truth respects every thing, as being what it is, it respects Nature, as God has constituted it, with its tendencies, dispositions, aptitudes and laws; 43 and as the tendency of virtue is to mental happiness, and vice the contrary, they fall under the cognisance of truth, as all other facts necessarily do; 44 which tendencies will for ever preclude imputation, by making us morally happy or miserable according to our works.

45 Truth respects the eternal rules of unalterable rectitude and fitness, which comprehends all virtue, goodness and true happiness; 46 and as sin and wickedness is no other but a deviation from the rules of eternal unerring order and reason, so truth respects it as unreasonable, unfit, unrighteous and unhappy deviation from moral rectitude, naturally tending to misery. 47 This order of Nature, comprehended under the terms of truth, must have been of all others the wisest and best; in fine it must have been absolutely perfect; 48 for this order and harmony of things, could not have resulted from anything short of infinite wisdom, goodness and power, by which it is also upheld; 49 and all just ideas of equity, or of natural and moral fitness must be learned from Nature, and predicated on it; and nature predicated on the immutable perfection of a God; 50 and to suppose that imputation, in

any one instance has taken place, is the same as to suppose, that the eternal order, truth, justice, equity and fitness of things has been changed, 51 and if so, the God of Nature must needs have been a changeable being, and liable to alter His justice or order of Nature, which is the same thing; 52 for without the alteration of Nature, and the tendency of it, there could be no such thing as imputation, 53 but every of the individuals of humankind would be ultimately happy or miserable, according as their respective proficiencies may be supposed to be either good or evil, agreeable to the order and tendency of Nature before alluded to. 54 For all rational and accountable agents must stand or fall upon the principles of the Law of Nature, except imputation alters the nature and tendency of things; of which the immutability of a God cannot admit.

55 From what has been already argued on this subject, we infer, that as certain as the individuals of humankind are the proprietors of their own virtues or vices, so certain, the doctrine of imputation cannot be true. 56 Furthermore, the supposed act or agency of imputing or transferring the personal merit or demerit of moral good or evil, 'alias', the sin of the first Adam, or the righteousness of the second Adam, to others of humankind, cannot be the act or exertion of either the first or second Adam, from whom original sin and righteousness is said to have been imputed. 57 Nor can it be the act or doings of those individuals, to whom the supposed merit or demerit of original sin or righteous is premised to be imputed; 58 so that both Adam and each individual of humankind are wholly excluded from acting any part in the premised act of imputation; and are supposed to be altogether passive in the matter, 59 and consequently it necessarily follows, that if there ever was such an act as that of imputation, it must have been the immediate and sovereign act of God, to the preclusion of the praise or blame of human. 60 But to suppose, that God can impute the virtue or vice of the person of A, to be the virtue or vice of the person of B, is the same as to suppose that God can impute or change truth into

falsehood, or falsehood into truth, or that He can reverse the nature of moral rectitude itself, which is inadmissable. 61 But admitting, that imputation was in the power and at the option of human, it is altogether probable that they would have been very sparing in imputing merit and happiness, 62 but might nevertheless have been vastly liberal in imputing demerit and misery, from one to another, which is too farcical.

CONTAINING REMARKS ON THE ATONEMENT...
AND SATISFACTION FOR ORIGINAL SIN

SECTION III

63 The doctrine of imputation is in every point of view incompatible with the moral perfections of God. 64 We will premise, that the race of Adam in their respective generations was guilty of the apostacy, and obnoxious to the vindictive justice and punishment of God, 65 and accordingly doomed to either an eternal or temporary punishment therefore, which is the Bible representation of the matter. 66 What possibility could there have been of reversing the divine decree? It must be supposed to have been just, or it could not have had the divine sanction, and if so, a reversal of it would be unjust. 67 But it would be still a greater injustice to lay the blame and vindictive punishment of a guilty race of condemned sinners upon an innocent and inoffensive being, 68 for in this case the guilty would be exempted from their just punishment, and the innocent unjustly suffer for it, which holds up to view two manifest injustices; 69 the first consists in not doing justice to the guilty, and the second in actually punishing the innocent, which instead of atoning for sin, would add sin to sin, or injustice to injustice; 70 and after all, if it was ever just, that the race of Adam should have been punished for the imputed sin of their premised original ancestor, be that punishment what it will, 71 it is so still, notwithstanding the atonement, for the eternal justice and reason of things can never, be altered. 72 This justice always defeats the possibility of satisfaction for sin by way of a

mediator. 73 That physical evils may and have been propagated by natural generation, none can dispute, for that the facts themselves are obvious. 74 But that moral evil can be thus propagated, is altogether chimerical, for we are not born criminals.

REMARKS ON REDEMPTION, WROUGHT OUT BY INFLICTING... THE DEMERITS OF SIN UPON THE INNOCENT, WOULD BE UNJUST, AND THAT IT COULD CONTAIN NO MERCY OR GOODNESS TO THE UNIVERSALITY OF BEING

SECTION IV

75 The practice of imputing one person's crime to another, in capital offences among humans, so that the innocent should suffer for the guilty, has never yet been introduced into any court of judicature in the world, or so much as practised in any civilised country; 76 and the manifest reason in this, as in all other cases of imputation, is the same, viz. it confounds personal merit and demerit. 77 The murderer ought to suffer for the demerit of own crime, but if the court exclude the idea of personal demerit (guilt being always the inherent property of the guilty and of them only) they might as well sentence one person to death for the murder as another: 78 for justice would be wholly blind was it not predicated on the idea of the fact of a personal demerit, on the identical person who was guilty of the murder: 79 nor is it possible to reward merit abstractly considered from its personal agents. These are facts that universally hold good in human government. 80 The same reasons cannot fail to hold good in the divine mind as in that of the human, for the rules of justice are essentially the same whether applied to the one or to the other, having their uniformity in the eternal truth and reason of things. 81 But it is frequently objected, that inasmuch as one person can pay, satisfy and discharge a cash debt for another, redeem you from prison and set you at liberty, therefore Jesus Christ might become responsible for the sins of humankind, 82 or of the elect, and by suffering their punishments atone for them and free them from their condemnation. 83 But it

should be considered, that comparisons darken or reflect light upon an argument according as they are either pertinent or impertinent thereto; 84 we will therefore examine the comparison, and see if it will with propriety apply to the atonement.

85 Upon the Christian scheme, Christ the Son was God, and equal with God the Father, or with God the Holy Ghost, 86 and therefore original sin must be considered to be an offence equally against each of the persons of the premised Trinity, 87 and being of a criminal nature could not be discharged or satisfied by cash or produce, as debts of a civil contract are, but by suffering; 88 and it has already been proved to be inconsistent with the divine or human government, to inflict the punishment of the guilty upon the innocent, 89 though one person may discharge another's debt in cases where lands, chattels or cash are adequate to it; but what capital offender was ever discharged by such commodities?

90 Still there remains a difficulty on the part of Christianity, in accounting for one of the persons in the premised Trinity satisfying a debt due to the impartial justice of the unity of the three persons. 91 For God the Son to suffer the condemnation of guilt in behalf of human, would not only be unjust in itself, but incompatible with His divinity, 92 and the retribution of the justice of the premised Trinity of persons in the god-head (of whom God the Son must be admitted to be one) toward humankind; 93 for this would be the same as to suppose God to be judge, criminal and executioner, which is inadmissible.

94 But should we admit for argument's sake, that God suffered for original sin, yet taking into one complex idea the whole mental system of beings, universally, both finite and infinite, 95 there could have been no display of grace, mercy, or goodness to being in general, in such a supposed redemption of humankind; 96 inasmuch as the same quantity or degree of evil is supposed to have taken place upon being, universally considered, as would have taken place, had finite individuals, or the race of Adam,

suffered according to their respective demerits.

97 Should we admit that there is a Trinity of persons in the divine essence, yet the one could not suffer without the other, for essence cannot be divided in suffering, any more than in enjoyment. 98 The essence of God is that which includes the divine Nature, and the same identical nature must necessarily partake of the same glory, honour, power, wisdom, goodness and absolute uncreated and unlimited perfection, and is equally exempted from weakness and suffering. 99 Therefore, as certain as Christ suffered he was not God, but whether he is supposed to be God or human, or both, he could not in justice have suffered for original sin, which must have been the demerit of its perpetrators as before argued.

100 Supposing Christ to have been both God and human, he must have existed in two distinct essences, viz. the essence of God and the essence of human. 101 And if he existed in two distinct and separate essences, there could be no union between the divine and human natures. 102 But if there is any such thing as an hypostatical union between the divine and human natures, it must unite both in one essence, which is impossible: 103 for the divine nature being infinite, could admit of no addition or enlargement and consequently cannot allow of a union with any nature whatever. 104 Was such an union possible in itself, yet, for a superior nature to unite with an inferior one in the same essence, would be degrading to the former, as it would put both natures on a level by constituting an identity of nature: 105 the consequences whereof would either deify human, or divest God of His divinity, and reduce Him to the rank and condition of a creature; inasmuch as the united essence must be denominated either divine or human.

OF THE IMPOSSIBILITY OF TRANSLATING AN INFALLIBLE... REVELATION FROM ITS ORIGINAL COPIES, AND PRESERVING IT ENTIRE THROUGH ALL THE REVOLUTIONS OF THE WORLD, AND VICISSITUDES OF HUMAN LEARNING TO OUR TIME

Ethan Allen

SECTION I

12 Admitting for argument sake that the Scriptures of the Old and New Testament were originally of divine supernatural inspiration, and that their first manuscript copies were the infallible institutions of God, 2 yet to trace them from their respective ancient dead languages, and different and diverse translations, from the obscure hieroglyphical pictures of characters, in which they were first written, through all the vicissitudes and alterations of human learning, 3 prejudices, superstitions, enthusiasms and diversities of interests and manners, to our time, so as to present us with a perfect edition from its premised infallible original manuscript copies would be impossible. 4 The various and progressive methods of learning, with the insurmountable difficulties of translating any supposed antiquated written revelation would not admit of it, as the succeeding observations on language and grammar will fully evince.

5 In those early ages of learning, hieroglyphics were expressive of ideas; for instance, a snake quirled (a position common to that venomous reptile) was an emblem of eternity, 6 and the picture of a lion, a representation of power, and so every beast, bird, reptile, insect and fish, had in their respective pictures, particular ideas annexed to them, 7 which varied with the arbitrary custom and common consent of the several separate nations, among whom this way of communicating ideas was practised, 8 in some sense analogous to what is practised at this day by different nations, in connecting particular ideas to certain sounds or words written in characters, which according to certain rules of grammar constitute the several languages. 9 But the hieroglyphical manner of writing by living emblems, and perhaps in some instances by other pictures,

was very abstruse, 10 and inadequate to communicate that multiplicity and diversity of ideas which are requisite for the purpose of history, argumentation or general knowledge in any of the sciences or concerns of life; 11 which mystical way of communicating ideas underwent a variety of alterations and improvements, though not so much as that of characters and grammar has done; 12 for in the hieroglyphical way of communicating their ideas, there was no such thing as spelling, or what is now called orthography, which has been perpetually refining and altering, ever since characters, syllables, words or grammar have been brought into use, 13 and which will admit of correction and improvement as long as humankind continue in the world. 14 For which reason the original of all languages is absorbed and lost in the multiplicity of alterations and refinements, which have in all ages taken place, 15 so that it is out of the power of all Etymologists and Lexieonists now living, to explain the ideas, which were anciently connected with those hieroglyphical figures or words, 16 and which may have composed the original of any language, written in characters, in those obsolete and antiquated ages, when learning and science were in their infancy: 17 since the beneficial, art of printing has arrived to any considerable degree of perfection, the etymology of words, in the scientifical and learned languages, has been considerably well understood: though imperfectly, as the various opinions of the learned concerning it may witness. 18 But since the era of printing, the knowledge of the ancient learning has been in a great measure, or in most respects, wholly lost; and inasmuch as the modern substitute is much better, it is no loss at all. 19 Some of the old English authors are at this day quite unintelligible, and others in their respective latter publications, more or less so.

20 The last century and a half has done more towards the perfecting of grammar, and purifying the languages than the world had ever done before. 21 I do not understand Latin, Greek or Hebrew, in which languages, it is said, that the

several original manuscripts of the Scriptures were written; but I am informed by the learned therein, 22 that, the other languages, they have gone through their respective alterations and refinements, which must have been the case, except they reached their greatest perfection in their first composition; of which the progressive condition of human could not admit. 23 So that the learned in those languages, at this day, know but little or nothing how they were spoken or written when the first manuscript copies of the Scriptures were composed; 24 and consequently, are not able to inform us, whether their present translations do, any of them, perfectly agree with their respective original premised infallible manuscript copies or not. 25 And inasmuch as the several English translations of the Bible do materially differ from each other, it evinces the confused and blundering condition in which it has been handed down to us.

26 The clergy often informs us from the desk, that the translation of the Bible, which is now in use, is erroneous, 27 after having read such and such a passage of it, in either Latin, Greek or Hebrew, they frequently give us to understand, that instead of the present translation, it should have been rendered thus and thus in English, 28 but never represent to us how it was read and understood in the antiquated and mystical figures or characters of those languages, when the manuscripts of Scripture were first written, 29 or how it has been preserved and handed down entire, through every refinement of those languages, to the present condition of Latin, Greek and Hebrew. 30 Probably this is too abstruse a series of retrospective learning for their scholarship, and near or quite as foreign from their knowledge as from that of their hearers.

31 It is not to be supposed that all the alterations which have taken place in language, have been merely by improving it. 32 In many instances, ignorance, accident or custom has varied it to its disadvantage, but it has nevertheless been subject to correction, and generally speaking has been altered for the better, 33 yet, by one means or other has

been so fluctuating and unstable, as that an infallible revelation could not have been genuinely preserved, through all the vicissitudes and revolutions of learning, for more than seventeen hundred years last past to this day.

34 The diversity of the English language is represented with great accuracy by Mr. Samuel Johnson, the celebrated lexicographer, in the samples of different ages, 35 in his history of the English language, subjoined to the preface of the dictionary, to which the curious are referred for the observance of the various specimens.

THE VARIETY OF ANNOTATIONS AND EXPOSITIONS...
OF THE SCRIPTURES, TOGETHER WITH THE DIVERSITY OF SECTARIES EVINCES THEIR FALLIBILITY

SECTION II

36 Every commentary and annotation on the Bible, implicitly declares its fallibility; 37 for if the Scriptures remained genuine and entire, they would not stand in need of commentaries and expositions, but would shine in their infallible lustre and purity without them. 38 What an idle phantom it is for mortals to assay to illustrate and explain to humankind, that which God may be supposed to have undertaken to do, by the immediate inspiration of His spirit? 39 Do they understand how to define or explain it better than God may be supposed to have done? This is not supposable; 40 upon what ground then do these multiplicity of comments arise, except it be pre-supposed that the present translations of the Bible have, by some means or other, become fallible and imperfect, and therefore need to be rectified and explained? 41 And if so, it has lost the stamp of divine authority; provided in its original composition it may be supposed to have been possessed of it.

42 To construe or spiritualise the Bible is the same as to inspire it over again, by the judgment, fancy or enthusiasm of humans; 43 and thus the common people, by receiving God's supposed revelation at secondary hands (whether at the thousandth or ten thousandth remove from its first premised inspiration they know not) cannot in fact be taught by the

revelation of God. 44 Add to this the diverse and clashing expositions of the Bible, among which are so many flagrant proofs of the fallibility and uncertainty of such teachings, as must convince even bigots, that every one of these expositions are erroneous, 'except their own!'

45 It has been owing to different comments on the Scriptures, that Christians have been divided into sectaries. 46 Every commentator, who could influence a party to embrace your comment, put yourself, at the head of a division of Christians; as Luther, Calvin, and Arminius, laid the foundation of the sectaries who bear their names; 47 and the Socinians were called after the Scismatical Socinius; the same may be said of each of the sectaries. 48 Thus it is that different commentaries or acceptations of the original meaning of the Scriptures, have divided the Christian world into divisions and subdivisions of which it consists at present. 49 Nor was there ever a division or subdivision among Jews, Christians or Mahometans, respecting their notions or opinions of religion, 50 but what was occasioned by commentating on the Scriptures, or else by latter pretended inspired revelations from God in addition thereto. 51 The law of Moses was the first pretended immediate revelation from God, which respects the Bible, 52 and after that in succession the several revelations of the prophets, and last of all (in the Christian system) the revelations of Jesus Christ and apostles, who challenged a right of abolishing the priesthood of Moses; 53 Christ claiming to be the antitype of which the institution of sacrifices and ceremonial part of the law of Moses was emblematical; 54 but this infringement of the prerogative of the Levitical priests gave such offence, not only to them, but to the Jews as a nation, 55 that they rejected Christianity, and have not subscribed to the divine authority of it to this day, holding to the law of Moses and the prophets. 56 However Christianity made a great progress in the world, and has been very much divided into sectaries, by the causes previously assigned.

57 "Mahomet taking notice of the numerous sects and divisions among Christians, in his journies to Palestine, thought it would not be difficult to introduce a new religion, and make himself high priest and sovereign of the people." 58 This he finally effected, prosecuting his scheme so far, that he new modelled the Scriptures, presenting them, (as he said,) in their original purity, and called his disciples after his own name. 59 He gained great numbers of proselytes and became their sovereign in civil, military and spiritual matters, instituted the order of mystical priesthood, and gave the world a new Bible by the name of the Alcoran; 60 which he gives us to understand was communicated to him from God, by the intermediate agency of the angel Gabriel, chapter by chapter. 61 "His disciples at this day inhabit a great part of the richest countries in the world, and are supposed to be more numerous than the Christians," 62 and are as much, if not more, divided into sectaries, from causes similar to those which produced the division of Christians, viz.: the different commentators on, and expositions of the Alcoran. 63 The Mufti, or priests, represented the doctrines and precepts of the Alcoran in a variety of lights different from each other, each of them claiming the purity of the original and infallible truths prescribed to the world by Mahomet, their great reformer of Christianity. 64 For though the several sectaries of Mahometans differ, respecting the meaning of their Alcoran, yet they all hold to the truth and divine authority thereof, the same as the Christian sectaries do concerning their Bible: 65 so that all the different opinions which ever did, or at present do subsist, between Jews, Christians and Mahometans, may be resolved into one consideration, viz.: the want of a right understanding of the original of the Scriptures. 66 All sat out at first, as they imagined, from the truth of God's word, (except the impostors,) concluded that they had an infallible guide, 67 and have, by one means or other, been guided into as many opposite faiths as human Invention has been capable of fabricating; 68 each sect among the whole, exulting in their

happy ignorance, believing that they are favoured with an infallible revelation for their direction.

69 It alters not the present argument, whether the Scriptures were originally true or not; 70 for though they be supposed to have been either true or false, or a mixture of both, yet they could never have been handed down entire and uncorrupted to the present time, through the various changes and perpetual refinements of learning and language; 71 this is not merely a matter of speculative and argumentative demonstration, the palpable certainty of it stands confessed in every Jewish, Christian and Mahometan sectary.

ON THE COMPILING OP THE MANUSCRIPTS OF THE SCRIPTURES...

INTO ONE VOLUME, AND OF ITS SEVERAL TRANSLATIONS. THE INFALLIBILITY OF THE POPES, AND OF THEIR CHARTERED RIGHTS TO REMIT OR RETAIN SINS, AND OF THE IMPROPRIETY OF THEIR BEING TRUSTED WITH A REVELATION FROM GOD.

SECTION III

72 The manuscripts of Scripture, which are said to have been originally written on scrolls of bark, long before the invention of paper or printing, and are said to compose our present Bible, were in a loose and confused condition, 73 scattered about in the world, deposited nobody knows how or where, and at different times were compiled into one volume. 74 The four gospels are by the learned generally admitted to have been wrote many years after Christ, particularly that of St. John: 75 and sundry other gospels in the primitive ages of Christianity were received as divine by some of its then sectaries, which have unfortunately not met with approbation in subsequent eras of the despotism of the church.

76 The translation of the Scriptures by Ptolemy Phila-delphus, king of Egypt, was before Christ, and therefore could not include the writings of the New Testament in his translation, 77 and "whether by seventy-two interpreters, and in the manner as is commonly related, is justly questioned." 78 But where, at what time, and by whom, the Scriptures of the Old and New Testament were first compiled into one volume, is what

REASON

I do not understand: 79 but was it a longer or shorter period after Christ, it alters not the present argument materially, since the scattered manuscripts were in a loose and confused condition for a long time; 80 and the grand query is, when the compilers of those manuscripts collected them together in order to form them into one volume, 81 how they could have understood the supposed divine writings, or symbolical figures, with the ideas originally connected with them, and distinguish them from those which were merely human, and in comparison of the others are called profane. 82 To understand this distinction would require a new revelation, as much as may be supposed necessary for composing the original manuscripts themselves; 83 but it is not pretended that the compilers or translators of the Bible were inspired by the divine spirit in the doing and completing their respective business; 84 so that human reason, fancy, or some latent design, must needs have been substituted, in distinguishing the supposed divine and human writings apart, and in giving a perfect transcript of the original manuscripts. 85 Now admitting that the compilers were really honest principled men, (which is more than we are certain of,) it would follow, that they would be obliged to cull out of the mixed mass of premised divine and human writings, such as to them appeared to be divine, 86 which would make them to be the sole arbitrators of the divinity that they were compiling to be handed down to posterity as the infallible word of God, 87 which is a great stretch of prerogative for mortal and fallible human to undertake, and as great a weakness in others to subscribe to it, as of divine authority.

88 Mr. Fenning, in his dictionary definition of the word Bible, subjoins the following history of its translations: "The translation of this sacred volume was begun very early in this kingdom," [England,] 89 "and some part of it was done by King Alfred. Adelmus translated the Psalms into Saxon in 709, other parts were done by Edfrid or Ecbert in 730, the whole by Bede in 731 Trevisa published

the whole in English in 1357. 90 Tindal's was brought higher in 1534, revised and altered in 1538, published with a preface of Cranmers in 1549. 91 In 1551, another translation was published, which was revised by several bishops, was printed with their alterations in 1560. 92 In 1607, a new translation was published by authority, which is that in present use." 93 From this account it appears, that from the first translation of the Bible by Trevisa, into English, in 1357, it has been revised altered, and passed through six different publications, 94 the last of which is said to have been done by authority, which I conclude means that of the king, whose prerogative in giving us a divine revelation, can no more be esteemed valid than that of other people, 95 though he may be possessed of an arbitrary power within the limits of his realm to prevent any further correction and publication of it. 96 As to the changes it underwent previous to Trevisa's translation, in which time it was most exposed to corruptions of every kind, 97 we, will not at present particularly consider, but only observe that those translations could not, every one of them, be perfect, since they were diverse from each other, in consequence of their respective revisions and corrections; 98 nor is it possible that the Bible, in any of its various editions could be perfect, any more than all and every one of those persons who have acted a part in transmitting them down to our time may be supposed to be so: 99 for perfection does not pertain to human, but is the essential prerogative of God.

100 The Roman Catholics, to avoid the evils of imperfection, fallibility and imposture of human, have set up the Pope to be infallible; 101 this is their security against being misguided in their faith, and by ascribing holiness to him, secure themselves from imposture; a deception which is incompatible with holiness. 102 So that in matters of faith, they have nothing more to do, but to believe as their church believes. Their authority for absolving or retaining sins is very extraordinary; 103 however, their charter is from Christ, (admitting them to be his vicars,

and the successors of St. Peter,) and the present English translation of the Bible warrants it. 104 The commission is in these words: "And I will give unto thee the keys of the kingdom of heaven, and whoever thou shalt bind on earth, shall be bound in heaven; and whatsoever thou shall loose on earth, shall be loosed in heaven. 105 Whosesoever sins ye remit, they are remitted unto them, and whosesoever sins ye retain, they are retained."

106 That St. Peter or his successors should have a power of binding and determining the state and condition of humankind in the world to come by remitting or retaining sins, is too great a power to be intrusted to humans, 107 as it interferes with the providence and prerogative of God, who on this position would be exempted from judging the world, (as it would interfere with the chartered prerogative of the Popes in their remitting or retaining of sins, admitting it to have been genuine,) 108 precluding the divine retribution of justice; we may, therefore, from the authority of reason, conclude it to be spurious.

109 It was a long succession of ages that all Christendom were dupes to the Sea of Rome, in which time it is too evident to be denied, that the holy fathers obtruded a great deal of pious fraud on their devotees; 110 all public worship was real to the people in unknown languages, as it is to this day in Roman Catholic countries. 111 Nor has the Bible, in those countries, to this time, been permitted to be published in any but the learned languages, which affords great opportunity to the Romish church to fix it to answer their lucrative purposes. 112 Nor is it to be supposed that they want the inclination to do it. The before recited grant of the power of the absolution of sin, to St Peter in particular, was undoubtedly of their contrivance.

113 In short, reason would prompt us to conclude, that had God, in very deed, made a revelation of His mind and will to humankind, as a rule of duty and practice to them, and to be continued as such to the latest posterity, 114 He would in the course of His providence have ordered matters so that it should have been

deposited, translated, and kept, in the hands of people of a more unexceptionable character than those holy cheats can pretend to. 115 Witchcraft and priestcraft, were introduced into this world together, in its non-age; 116 and has gone on, hand in hand together, until about half a century past, when witchcraft began to be discredited, and is at present almost exploded, both in Europe and America. 117 This discovery has depreciated priestcraft, on the scale of at least fifty per cent, per annum, and rendered it highly probable that the improvement of succeeding generations, in the knowledge of Nature and science, will exalt the reason of humankind, above the tricks and impostures of priests, 118 and bring them back to the religion of Nature and truth; ennoble their minds, and be the means of cultivating concord, and mutual love in society, and of extending charity, and good will to all intelligent beings throughout the universe; 119 exalt the divine character, and lay a permanent foundation for truth and reliance on providence; 120 establish our hopes and prospects of immortality, and be condusive to every desirable consequence, in this world, and that which is to come; 121 which will crown the scene of human felicity in this sublunary state of being and probation; 'which can never be completed while we are under the power and tyranny of priests, 122 since as it ever has, it ever will be their interest, to invalidate the Law of Nature and reason, in order to establish systems incompatible therewith.

MORALITY DERIVED FROM NATURAL FITNESS... AND NOT FROM TRADITION

Ethan Allen

SECTION I

13 Such parts or passages of the Scriptures as inculcate morality, have a tendency to subserve humankind, the same as all other public investigations or teachings of it, may be supposed to have; 2 but are neither better or worse for having a place in the volume of those writings denominated canonical; 3 for morality does not derive its nature from books, but

from the fitness of things; 4 and though it may be more or less, interspersed through the pages of the Alcoran, its purity and rectitude would remain the same; for it is founded in eternal right; 5 and whatever writings, books or oral speculations, best illustrate or teach this moral science, should have the preference. 6 The knowledge of this as well as all other sciences, is acquired from reason and experience, 7 and (as it is progressively obtained) may with propriety be called, the revelation of God, which He has revealed to us in the constitution of our rational natures; 8 and as it is congenial with reason and truth, cannot (like other revelations) partake of imposture. This is natural religion, and could be derived from none other but God. 9 I have endeavoured, in this treatise, to prune this religion from those excrescences, with which craft on the one hand, and ignorance on the other, have loaded it; 10 and to hold it up to view in its native simplicity, free from alloy; 11 and have throughout the contents of the volume, addressed the reason of humankind, and not their passions, traditions or prejudices; for which cause, it is noways probable that it will meet with any considerable approbation.

12 Most of the human race, by one means or other are prepossessed with principles opposed to the religion of reason. 13 In these parts of America, they are most generally taught, that they are born into the world in a state of enmity to God and moral good, and are under His wrath and curse, 14 that the way to heaven and future blessedness is out of their power to pursue, and that it is incumbered with mysteries which none but the priests can unfold, that we must "be born again," have a special kind of faith, and be regenerated; 15 or in fine, that human nature, which they call "the old human," must be destroyed, perverted, or changed by them, and by them new modelled, before it can be admitted into the heavenly kingdom. 16 Such a plan of superstition, as far as it obtains credit in the world, subjects humankind to sacerdotal empire; which is erected on the imbecility of human nature. 17 Such of

humankind, as break the fetters of their education, remove such other obstacles as are in their way, and have the confidence publicly to talk rational, 18 exalt reason to its just supremacy, and vindicate truth and the ways of God's providence to humans, are sure to be stamped with the epithet of irreligious, infidel, profane, and the like. 19 But it is often observed of such a person, that you are morally honest, and as often replied, what of that? Morality will carry no human to heaven. 20 So that all the satisfaction the honest person can have while the superstitious are squibbling hell fire at you, is to retort back upon them that they are priest ridden.

21 The manner of the existence, and intercourse of human souls, after the dissolution of their bodies by death, being inconceiveable to us in this life, and fill manner of intelligence between us and departed souls impracticable, 22 the priests have it in their power to amuse us with a great variety of visionary apprehensions of things in the world to come, which, while in this life, we cannot contradict from experience, the test of great part of our certainty (especially to those of ordinary understandings) 23 and having introduced mysteries into their religion, make it as incomprehensible to us, (in this natural state) as the manner of our future existence; 24 and from Scripture authority, having invalidated reason as being carnal and depraved, they proceed further to teach us from the same authority, 25 that, "the natural human knoweth not the-things of the spirit, for they are foolishness unto you, neither can you know them for they are spiritually discerned." 26 A spiritualising teacher is nearly as well acquainted with the kingdom of heaven, as a person can be with own home lot. 27 You knows the road to heaven and eternal blessedness, to which happy regions, with the greatest assurance, you presumes to pilot your dear disciples and unfold to them the mysteries of the canonical writings, and of the world to come; 28 they catch the enthusiasm and see with the same sort of spiritual eyes, with which they can pierce religion through and through, and understand the

spiritual meaning of the Scriptures, 29 which before had been "a dead letter" to them, particularly the revelations of St. John the divine, and the allusion of the horns therein mentioned. 30 The most obscure and unintelligible passages of the Bible, come within the compass of their spiritual discerning as apparently as figures do to a mathematician: 31 then they can sing songs out of the Canticles, saying, "I am my beloved's and my beloved is mine;" and being at a loose from the government of reason, please themselves with any fanaticisms they like best, 32 as that of their being "snatched as brands out of the burning, to enjoy the special and eternal favour of God, not from any worthiness or merit in them, but merely from the sovereign will and pleasure of God, 33 while millions of millions, as good by nature and practice as they, were left to welter eternally, under the scalding drops of divine vengeance;" 34 not considering, that if it was consistent with the perfections of God to save them, His salvation could not fail to have been uniformly extended to all others, whose circumstances may be supposed to be similar to, or more deserving than theirs, 35 for equal justice cannot fail to apply in all cases in which equal justice demands it. 36 But these deluded people resolve the divine government altogether into sovereignty: "even so Father, for so it seemed good in thy sight." 37 And as they exclude reason and justice from their imaginary notions of religion, they also exclude it from the providence or moral government of God. 38 Nothing is more common, in the part of the country where I was educated, than to hear those infatuated people, in their public and private addresses, acknowledge to their creator, from the desk and elsewhere, 39 "hadst thou, O Lord, laid judgment to the line and righteousness to the plummet, we had been in the grave with the dead and in hell with the damned, long before this time." 40 Such expressions from the creature to the creator are profane, and utterly incompatible with the divine character. 41 Undoubtedly, (all things complexly considered) the providence of God to human is

just, inasmuch as it has the divine approbation.

42 The superstitious thus set up a spiritual discerning, independent of, and in opposition to reason, and their mere imaginations pass with each other, and with themselves, for infallible truth. 43 Hence it is, that they despise the progressive and wearisome reasonings of philosophers (which must be admitted to be a painful method of arriving at truth) but as it is the only way in which we can acquire it, I have pursued the old natural road of ratiocination, 44 concluding, that as this spiritual discerning is altogether inadequate to the management of any of the concerns of life, or of contributing any assistance or knowledge towards the perfecting of the arts and sciences, it is equally unintelligible and insignificant in matters of religion: 45 and therefore conclude, that if the human race in general, could be prevailed upon to exercise common sense in religious concerns, those spiritual fictions would cease, and be succeeded by reason and truth.

OF THE IMPORTANCE OF THE EXERCISE OF REASON...
AND PRACTICE OF MORALITY, IN ORDER TO THE HAPPINESS OF HUMANKIND

SECTION II

46 The period of life is very uncertain, and at the longest is but short; 47 a few years bring us from infancy to humanhood, a few more to a dissolution; pain, sickness and death are the necessary consequences of animal life. 48 Through life we struggle with physical evils, which eventually are certain to destroy our earthly composition; and well would it be for us did evils end here; 49 but alas! moral evil has been more or less predominant in our agency, and though natural evil is unavoidable, yet moral evil may be prevented or remedied by the exercise of virtue. 50 Morality is therefore of more importance to us than any or all other attainments; 51 as it is a habit of mind, which, from a retrospective consciousness of our agency in this life, we should carry with us into our succeeding state of existence, as an acquired appendage of our rational nature, and as the

necessary means of our mental happiness. 52 Virtue and vice are the only things in this world, which, with our souls, are capable of surviving death; 53 the former is the rational and only procuring cause of all intellectual happiness, and the latter of conscious guilt and misery; 54 and therefore, our indispensable duty and ultimate interest is, to love, cultivate and improve the one, as the means of our greatest good, and to hate and abstain from the other, as productive of our greatest evil. 55 And in order thereto, we should so far divest ourselves of the incumbrances of this world, (which are too apt to engross our attention) as to inquire a consistent system of the knowledge of religious duty, and make it our constant endeavour in life to act conformably to it. 56 The knowledge of the being, perfections, creation and providence of God, and of the immortality of our souls, is the foundation of religion; 57 which has been particularly illustrated in the four first chapters of this discourse. 58 And as the Pagan, Jewish, Christian and Mahometan countries of the world have been overwhelmed with a multiplicity of revelations diverse from each other, 59 and which, by their respective promulgators, are said to have been immediately inspired into their souls by the spirit of God, or immediately communicated to them by the intervening agency of angels (as in the instance of the invisible Gabriel to Mahomet) 60 and as those revelations have been received and credited, by afar the greater part of the inhabitants of the several countries of the world (on whom they have been obtruded) as super-naturally revealed by God or angels, 61 and which, in doctrine and discipline, are in most respects repugnant to each other, it fully evinces their imposture, and authorises us, without a lengthy course of arguing, to determine with certainty, that not one of them had their original from God; 62 as they clash with each other, which is ground of high probability against the authenticity of each of them.

63 A revelation, that may be supposed to be really of the institution of God, must also be

supposed to be perfectly consistent or uniform, and to be able to stand the test of truth; 64 therefore such pretended revelations, as are tendered to us as the contrivance of heaven, which do not tear that test, we may be morally certain, was either originally a deception, or has since, by adulteration become spurious.

65 Reason therefore must be the standard by which we determine the respective claims of revelation; 66 for otherwise we may as well subscribe to the divinity of the one as of the other, or to the whole of them, or to none at all. 67 So likewise on this thesis, if reason rejects the whole of those revelations, we ought to return to the religion of Nature and reason. 68 Undoubtedly it is our duty, and for our best good, that we occupy and improve the faculties, with which our creator has endowed us, 69 but so far as prejudice, or prepossession of opinion prevails over our minds, in the same proportion, reason is excluded from our theory or practice.

70 Therefore if we would acquire useful knowledge, we must first divest ourselves of those impediments; and sincerely endeavour to search out the truth: 71 and draw our conclusions from reason and just argument, which will never conform to our inclination, interest or fancy; but we must conform to that if we would judge rightly. 72 As certain as we determine contrary to reason, we make a wrong conclusion; 73 therefore, our wisdom is, to conform to the nature and reason of things, as well in religious matters, as in other sciences. 74 Preposterously absurd would it be, to negative the exercise of reason in religious concerns, and yet, be actuated by it in all other and less occurrences of life. 75 All our knowledge of things is derived from God, in and by the order of Nature, out of which we cannot perceive, reflect or understand any thing whatsoever; 76 our external senses are natural; and those objects are also natural; so that ourselves, and all things about us, and our knowledge collected therefrom, is natural, and not supernatural; as argued in the fifth chapter.

77 An unjust composition never fails to contain error and

falsehood. 78 Therefore an unjust connection of ideas is not derived from Nature, but from the imperfect composition of human. 79 Misconnection of ideas is the same as misjudging, and has no positive existence, being merely a creature of the imagination; 80 but Nature and truth are real and uniform; and the rational mind by reasoning, discerns the uniformity, and is thereby enabled to make a just composition of ideas, which will stand the test of truth. 81 But the fantastical illuminations of the credulous and superstitious part of humankind, proceed from weakness, and as far as they take place in the world subvert the religion of reason, Nature and truth.

The Book of Divine Panagogue called

EVIL

THE EVIL EYE

Roswell Park

A PRESIDENTIAL ADDRESS BEFORE THE BUFFALO SOCIETY OF NATURAL SCIENCES

1 Belief in magic has been called by Tylor, one of the greatest authorities on the occult sciences, "one of the most pernicious delusions that ever vexed humankind." 2 It has been at all times among credulous and superstitious people made the tool of envy, which Bacon well described as the vilest and most depraved of all feelings.

3 Bacon, moreover, singled out love and envy as the only two affections which have been noted to fascinate, or bewitch, 4 since they both have "vehement wishes, frame themselves readily into imaginations and suggestions and come easily into the eye." 5 He also noted the fact that in the Scriptures envy was called the Evil Eye.

6 It is to this interesting subject in anthropological and folk-lore study, namely, the Evil Eye, that I wish to invite your attention for a time. 7 Belief in it is, of course, inseparable from credence in a personal devil or some personal evil and malign influence, 8 but in modern times and among people who are supposed to be civilised has been regarded ordinarily as an attribute of the devil. 9 Consideration of the subject is inseparable, too, from a study of the expressions "to fascinate" and "to bewitch." 10 Indeed this word "fascination" has a peculiar etymological interest. It seems to be a Latin form of the older Greek verb "baskanein", or else to be descended from a common root. 11 No matter what its modern signification, originally it meant to bewitch or to subject to an evil influence, particularly by means of eyes or tongue or by casting of spells. 12 Later it came to mean the influencing of the imagination, reason or will in an uncontrollable manner, and now, as generally used, means to captivate or to allure. 13 Its use in our language is of itself an indication of the superstition so generally prevalent centuries ago. 14 It is, however,

rather a polite term for which we have the more vulgar equivalent "to bewitch," used in a signification much more like the original meaning.

15 Belief in an evil power constantly at work has existed from absolutely prehistoric times. 16 It has been more or less tacitly adopted and sanctioned by various creeds or religious beliefs, particularly so by the church of Rome, by mediaeval writers and by writers on occult science. 17 Even now it exists not only among savage nations but everywhere among common people. 18 We to-day may call it superstition, but there was a time when it held enormous sway over humankind, and exercised a tremendous influence. 19 In its present form it consists often of a belief that certain individuals possess a blighting power, and the expression in England to "overlook" is not only very common, but an easily recognisable persistence of the old notion. 20 Evidently St. Paul shared this prevalent belief when he rebuked the foolish Galatians, saying as in our common translation, "Who hath bewitched you that ye should not obey the truth?" 21 In the Vulgate the word translated "bewitch" is "'fascinare'," exactly the same word as used by Virgil, and referring to the influence of the evil eye. 22 Cicero himself discussed the word "fascination," and he explained the Latin verb 'invidere' and noun 'invidia' as meaning to look closely at; whence comes our word envy, or evil eye.

23 All the ancients believed that from the eyes of envious or angry people there was projected some malign influence which could infect the air and penetrate and corrupt both living creatures and inanimate objects. 24 Woyciki, in his Polish Folk-lore, relates the story of a most unhappy Slav, who though possessed of a most loving heart realised that he was afflicted with the evil eye, and at last blinded himself in order that he might not cast a spell over his children. 25 Even among the Scotch Highlanders, if a stranger look too admiringly at a cow the people believe that she will waste away of the evil eye, and they give

you of her milk to drink in order to break the spell. 26 Plutarch was sure that certain humans' eyes were destructive to infants and young animals, and he believed that the Thebans could thus destroy not only the young but strong people. 27 The classical writers are so full of allusions to this subject that it is easy to see where people during the Middle Ages got their prevalent belief in witches. 28 Thus, Pliny said that those possessed of the evil eye would not sink in water, even if weighed down with clothes; hence the mediaeval ordeal by water;-- 29 which had, however, its inconveniences for the innocent, for if the reputed witch sank you evidently was not guilty, but if you floated you was counted guilty and then burned.

30 Not only was this effect supposed to be produced by the fascinating eye, but even by the voice, which, some asserted, could blast trees, kill children and destroy animals. 31 In Pliny's time special laws were enacted against injury to crops by incantation or fascination; 32 but the Romans went even farther than this, and believed that their gods were envious of each other and cast their evil eyes upon the less powerful of their own circle; hence the 'caduceus' which Mercury always carried as a protection.

33 To be the reputed possessor of an evil eye was an exceeding great misfortune. 34 Solomon lent himself to the belief when he enjoined, "Eat thou not the bread of him that hath an evil eye." (Proverb, chapter-23, verse:6). 35 The most inconvenient country in which to have this reputation to-day is Italy, and especially in Naples. The Italians apply the term 'jettatore' to the individual thus suspected, 36 and to raise the cry of "'Jettatore'" in a Neapolitan crowd even to-day is to cause a speedy stampede. 37 For the Italians the worst of all is the "'jettatore di bambini'," or the fascinator of infants. 38 Elworthy relates the case of a gentleman who on three occasions acted in Naples in the capacity of sponsor; singularly all three children died, whereupon he at once got the reputation of having the "'malocchio'" 39 to such an extent that mothers would take all sorts

of precautions to keep their children out of his sight. 40 The great Bacon lent himself also to the belief to such an extent as to advise the carrying on one's person of certain articles, such as rue, or a wolf's tail or even an onion, by which the evil influence was supposed to be averted.

41 A most interesting work was written by Valletta and published in Naples in 1787. It was practically a treatise upon fascination and the jettatore. 42 Valletta himself was a profound believer in all this sort of thing, and finished up his work by offering rewards for answers to certain questions, among which were the following:-- 43 "Which jettatore is most powerful, one who has or one who has not a wig? Whether monks are more powerful than others? 44 To what distance does the influence of the jettatore extend, and whether it operates more to the side, front or back? 45 What words in general ought one to repeat to escape the evil eye?"

46 In ancient times it was believed that women had greater power of fascination then men, a belief to which our sex still hold at the present day, 47 although in modern times the evil eye proper is supposed to be possessed by men rather than by women; 48 monks especially, ever since the establishment of religious orders, being considered to possess this fatal influence. 49 Curiously enough, the late Pope, Pius IX, was supposed to be a most pronounced jettatore, and the most devout Catholics would point two fingers at him even while receiving his blessing. 50 Let me quote Elworthy in this connection:--"Ask a Roman about the late Pope's evil eye, and will answer, 'They say so, and it really seems to be true. If he had not the jettatura it is very odd that everything he blessed made fiasco. 51 We did very well in the campaign against the Austrians in '48; we were winning battle after battle and all was gayety and hope, when suddenly he blessed the cause and everything went to the bad at once. 52 Nothing succeeds with anybody or anything when he wishes well to them. 53 When he went to S. Agnese to hold a great festival down went the floor and the people were all smashed

together. 54 Then he visited the Column to the Madonna in the Piazza di Spagna and blessed it and the workmen. Of course one fell from the scaffold the same day and killed himself. 55 He arranged to meet the King of Naples at Porto d'Anzio, when up came a violent gale and storm that lasted a week. Another arrangement was made and then came the fracas about the ex-Queen of Spain.'"

56 The superstition of the evil eye and of witchcraft goes everywhere with the belief in the power of transformation, 57 which at certain periods of history has been so prevalent as to account for many of the stories of ancient mythology, and will account even for such nursery stories as that of Little Red Riding Hood, as well as for the old-world belief in the 'werewolf'. 58 Indeed, a common expression reminds one of this old belief, since it is a common saying to be ready to "jump out of one's skin for joy." 59 This belief in transformation has begotten an ever-present dread of ill omens which is even now one of the most prevalent of superstitions. 60 In Somerset, to see a hare cross the path in front of one is a sign of death. In India they fear to name any sacred or dreaded animal. The black cat is everywhere an object of maversion, 61 and in some parts of England to meet a person who squints is equal to meeting one possessing the evil eye. 62 Surely I do not need to remind this audience of the fear which many people have of taking any important action on Friday. 63 This fear goes so far in some instances as to lead people to deprecate over-praise or apologise for a too positive statement. Your courteous Turk will not take a compliment without "Mashallah;" 64 the Italians will not receive one without "Grazio a Dio;" while the Irishman almost always says "Glory be to God," and the English peasant "Lord be wi' us;" 65 the idea in every instance being to avert the danger of fascination by these acknowledgments of a higher power.

66 In England during the horrible times when the Black Death raged it was supposed that the disease was communicated by a glance from the distorted eyes of a sick man. 67 In 1603 Delrio, a Jesuit,

published a large six-volume folio work entitled "*A Disquisition on Magic*," in which he takes it for granted that the calamities of mortals are the work of evil spirits. 68 He says, "Fascination is a power derived by contact with the devil, who, when the so-called fascinator looks at another with evil intent, or praises by means known to himself, infects with evil the person at whom he looks." 69 Those familiar with the history of so-called animal magnetism, mesmerism or hypnotism, will see a close connection between these beliefs and the practice of this peculiar form of influence. 70 Mesmerism, in fact, as ordinarily practiced, was more or less dependent upon the influence of touch, or actual contact, whose importance has always been by the credulous rated high. 71 In fact, it will be remembered that many of the miracles of the New Testament were performed by the aid of touch, 72 and in the Old Testament it is recorded how disappointed Naaman was when he went to be cured of his leprosy in that the prophet did not 'touch' him. 73 The influence of the 'royal touch' for the cure of scrofula, known for centuries as the King's Evil, will also not be forgotten. 74 In fact, our word to "bless" signifies to touch by making the sign of the cross on the diseased part, 75 as, for instance, in the West of England, where goitre is rather common, it is believed that the best cure is that the swelling should be touched by the hand of a corpse of the opposite sex.

76 The more we deal with the superstitions now under consideration the more evident it becomes that the principal thought among the simple peoples, or even among some of the religious sects of to-day, has been the propitiation of angry deities, 77 or of destructive influences, rather than the worship and exaltation of beneficent attributes. 78 As Elworthy says, "We find that fear and dread have in all human history been more potent factors in humans' conduct than hope and gratitude or love." 79 Take for example the propitiatory sacrifices of Abel and Cain, or the sacrifice which Abraham proposed to make of his own son, or the very words

which have crept into our language such as 'atonement', etc.

80 With this personification of an evil power or attribute in Nature came also belief in transformation, or metamorphosis, of which the Greek and Roman mythology is full. 81 How many of the Christian symbols of to-day, nearly all of which are of pagan origin, convey to the initiated instances of this belief, can hardly be mentioned in this place. Suffice it to say that their number is very great. 82 But I find too many temptations to wander from my subject, which is essentially the evil eye.

83 In mediaeval symbolism, as in ancient, the intent often was to represent either on some amulet, charm or picture a figure of the thing against which it was most desired that a protective influence should be exercised, hence the general prevalence of the eye in some pictorial representation. 84 The ancient Egyptians, as well as the Etruscans, used to paint a huge eye on the bows of their vessels, which was supposed to be a charm against the evil eye. 85 Even to-day in the Orient I have seen Greek boats with eyes painted on either side of their prows. The eye was a common adornment of Egyptian pottery, usually in combination with various other pictures, 86 but as a symbol it seems during the past century or two to have passed out of common employ, except perhaps in Malta, and among the Free-masons, who simply are perpetuating its use. 87 Nevertheless, wax or silver eyes are seen hung up in some foreign churches. A curious feature of these superstitions has been this, that any feature of indecency or obscenity when attaching to these symbols, amulets, etc., has been supposed to make them much more potent. 88 This probably was because anything strange or unusual was more likely to attract the eye, and therefore divert its influence from the individual to the inanimate object, hence the prevalence of phallic emblems in connection with these fancied protections. 89 Many objects of this kind can be to-day picked up in the jewelry stores of Rome and of Naples.

90 Another of the most efficacious of these amulets takes the general form of a hideous mask, often

called the 'Gorgoneion'. In all probability this was largely for the reason given above-- that it was most likely to attract attention. 91 Symbols of this kind are in very general use among people who know nothing of the reason therefore. Thus, we see them on seals, coins, etc. 92 The gargoyles of mediaeval architecture are frequently given this fantastic appearance and for this same purpose. 93 In Roman times the dolphin was a favourite device for a potent charm against the evil eye, and was pictured on many a soldier's shield. 94 Ulysses adopted it as his especial choice, both on his signet and his shield, perhaps because it was supposed to have been through the agency of the dolphin that Telemachus was saved from drowning.

95 To us in the medical profession it is of no little interest that in Rome, according to Varro, there stood three temples on the Esquiline dedicated to the goddess of Fever and one to Mephitis. 96 Tacitus relates that a temple to Mephitis was the only building left standing after the destruction of Cremona, where there was also an altar dedicated to the Evil Eye. 97 We know, also, that in the very centre of the Forum there stood an altar to Cloacina, the Goddess of Typhoid. 98 What complete sway this goddess has held from ancient times to the present I need scarcely tell you. 99 "When Rome, after the fall of the empire, relapsed into its most insanitary condition this old worship reappeared in another shape, and a chapel arose near the Vatican to the 'Madonna della Febre', the most popular in Rome in times of sickness or epidemic." 100 This simply shows a transfer of ideas, the attributes of Diana being conveyed over to her Christian successor, the virgin, whose cult became equally supreme.

101 The principal symbol of this cult was the horned moon or crescent, and, in consequence, horns in one form or another became the most common of objects as amulets against the Evil Eye. 102 So comprehensive and persistent is this belief in Naples that, in the absence of a horn in some shape, the mere utterance of the name 'corno' was supposed to be an effectual protection. 103 Even more than this, the name 'Un

Corno' became applicable to any and every charm or amulet against the Evil Eye. 104 We may find many references to the Horn in Scripture, where it served both as an emblem of dignity and as an amulet. 105 Most curious it is that the phylactery with which the Pharisees adorned their garments, and which called forth the most scathing denunciation by the Master, was undoubtedly an emblem of a horn, and worn as an amulet against the Evil Eye. 106 At the beginning of the Christian era it had become fashionable to wear these, and how they were enlarged and made not only badges of sanctity but marks of worldly honour, we may read in the New Testament.

107 The horn has been an important feature of Christian symbolism, as of pagan, and we constantly see the ram's horn, which was the successor of the bull's horn, made such from economical reasons, all over the ruins of ancient Rome. 108 The married women of Lebanon wear silver horns upon their heads to distinguish them from the single women. 109 The Jewesses of Northern Africa wear them as a part of their regular costume, and even to-day curious spiral ornaments are worn on either side of the head by the Dutch women. 110 In Naples horns in all shapes are exceedingly common upon the trappings of the cab horses. 111 Indeed the heavy trappings and harness of these overloaded animals are usually protected with a perfect battery of potent charms, so that any evil glance must be fully extinguished before it can light upon the animal itself. 112 Thus, we may frequently see upon the backs of these animals two little brazen flags, said to be typical of the flaming sword which turned every way, and which are supposed to be an unfailing attraction to the eye. 113 The high pommel ends usually in a piece of the inevitable wolf's skin, and many coloured ribbons or worsteds are wound about portions of the harness in such a way as completely to protect all that it encloses.

114 But the most numerous of all these emblems is a 'hand' in various positions or gestures. 115 Probably every other cab horse in

Naples carries the hand about them in some form. In Rome these things are not seen so much on horses' backs, although wolf skins, horns and crescents are common enough, 116 but we see large numbers of silver rings for human fingers, to each of which a little pendant horn is attached. 117 These may be seen in the shop windows strung upon rods and plainly marked 'Annelli contra la Jettatura'. 118 Those who have seen Naples thoroughly have noted how cows' horns, often painted blue, are fixed against the walls, especially at an angle, about the height of the first floor. 119 But one of the most remarkable amulets which I have ever seen hangs outside one of the entries to the Cathedral in Seville, where over a door is hung by a chain the tusk of an elephant, 120 and further out, over the same doorway, swung by another chain, an enormous crocodile, sent as a present or charm of special power to Alfonso, in 1260, by the Sultan of Egypt. 121 These two strange charms hang over the doorway of a Christian church of to-day, indicating the acceptance by a Christian people of a Moslem emblem and amulet.

122 Again, in Rome it is very common to see a small cow's horn on the framework of the Roman wine carts or dangling beneath the axle. 123 Much more common and better known among the Anglo-Saxon peoples is the horse-shoe emblem, which with us has lost all of its original signification, as an emblem of fecundity, and has become a charm against evil. 124 It is hung up over doorways, is nailed up in houses, it guards stable doors and protects fields against malign influences. 125 Even in the Paris Exhibition of 1889, where there was a representation of a street from old Cairo, there hung over several of the doors a crocodile with a horse-shoe on own snout.

126 So far I have said very little about the positions of the hand and certain gestures by which it is intended to ward off the evil eye. 127 The Mohammedans, like the Neapolitans, are profound believers in the efficacy of manual signs; 128 thus outside of many a door in Tangier I have seen the imprint of a hand made by placing

the outstretched hand upon some sticky black or coloured material, 129 which was then transferred as by a type or die to the doorway of the dwelling, where in the likeness of the outstretched manus it serves to guard the dwellers within. 130 This is to me one of the most curious things to be observed in Mohammedan countries. A relic of the same belief I have seen also over the great gate of the Alhambra, 131 in the Tower of Justice, where, in spite of the very strict Moslem custom and belief against representation of any living object, over the keystone of the outer Moorish arch is carved an outstretched upright hand, a powerful protection against evil. 132 It is this position of the hand, by the way, which has been observed in all countries in the administration of the judicial oath. 133 Moreover, the hand in this position is the modern heraldic sign of baronetcy.

134 The hand in the customary position of benediction is sometimes open and extended, while at other times only the first and second fingers are straightened. 135 The power which the extended hand may exert is well illustrated in the biblical account (in Exodus, chapter-17, verse:11) "And it came to pass when Moses held up his hand that Israel prevailed, and when he let down his hand Amalek prevailed." 136 And so it happened that when Moses wearied of the constrained position his hand was supported by Aaron and by Hur. 137 This is only one of numerous illustrations in the holy writings showing the talismanic influence of the human hand. 138 There are comparatively few people who realise, to-day, that the conventional attitude of prayer as of benediction, with hands held up, is the old charm as against the evil eye. 139 In one of the great marble columns in the Mosque of St. Sophia in Constantinople there is a remarkable natural freak by which there seems to appear upon the dark marble the white figure of an outspread hand. 140 This is held in the highest reverence by the superstitious populace, who all approach it to pray for protection from the evil eye. 141 The open hand has also been stamped upon many a coin both in ancient and

modern times, and the general prevalence of the hand as a form of doorknocker can be seen alike in the ruins of Pompeii and the modern dwelling.

142 The hand clenched in various forms has been used in more ways than as a mere signal or sign of defiance. 143 In Italy the 'mano-fica' implies contempt or insult rather than defiance. 144 Among all the Latin races this peculiar gesture of the thumb between the first and second fingers has a significant name and a significant meaning. 145 It is connected everywhere with the fig, and expresses in the most discourteous way that which is implied in our English phrase "don't care a fig." 146 It is in common use as an amulet to be worn from the neck or about the body, and conveys the same meaning as that which the Neapolitans frequently express when they say "May the evil eye do you no harm."

147 Another position of the hand, namely, that with the index and little fingers extended, while the middle and ring fingers are flexed and clasped by the thumb, gives also the rude imitation of the head of a horned animal, and is frequently spoken of as the 'mano cornuta'. 148 A Neapolitan's right hand is frequently, in some instances almost constantly, kept in that position pointing downwards, just as hand charms are made to hang downwards, 149 save when it is desired to use the sign against some particular individual, when the hand is pointed toward one, even at one’s very eyes if one appear much to be dreaded. 150 When, however, the hand in this position is pointed toward one's chin it conveys a most insulting meaning and hints at conjugal infidelity. 151 As the Neapolitan cab-people pass each other the common sign is to wave the hand in gesture and in this position. This is true also of many other places.

152 The sign of the cross is very often made with the hand, usually with the first two fingers extended, and seems to mean a benediction of double potency, because both the hand and the cross itself are utilised in the gesture. 153 I have elsewhere discussed the signification of the sign of the cross, and do not care to take it up

again just now. It is certainly of phallic origin and as certainly antedates the Christian era by many hundred years. 154 It is, in other words, a pagan symbol to which a newer significance has been given. 155 Talismanic power has usually been ascribed to it, and in some form, either as the Greek Tau or the Crux Ansata, has been most frequently employed. 156 In one or the other of these forms it was the mark set upon the houses of the Israelites to preserve them from the destroying angel. 157 In the roll of the Roman soldiery, after a battle, it was placed after the names of those still alive; 158 and we read in Ezekiel, chapter-9, verse:4 of the mark which was to be set upon "the foreheads of the men that cry," which was certainly the Greek Tau, because the Vulgate plainly states this. 159 Upon some of the old Anglo-Saxon coins there was placed a cross on each side, usually the handled cross, and upon various seals it has been in use until a comparatively recent period. 160 It may be seen, also, in many illustrations from the catacombs, for instance, dating back to a time before the cross was a generally received Christian emblem, showing both the use of the cross and the hand in the positions to which I have already alluded. 161 The sign of the cross is made by many a schoolboy in his play before he shoots his marble, and I have often seen it made upon the wooden ball before a man has bowled with it. 162 Many a peasant scratches it upon own field after sowing, and many a housewife has scratched it upon her dough.

163 The hand with the first two fingers and thumb extended in the ordinary position of sacerdotal benediction was certainly a charm against evil long before the Christian era. 164 This is not used so much by the common people, but has been appropriated rather by the priests. By a sort of general consent this has been especially the attitude permitted to the Second Person of the Trinity, 165 although there are numerous instances in mediaeval painting where the hand of the First Person has been shown in this position. 166 Indeed, the expression "'dextera Dei'," or "right hand of God," is conventionalised.

167 In many amulets, images and pictures, other charms are combined with that supposed to be exercised by the human hand. 168 An exceedingly common one was the Egyptian scarab. The Egyptians believed that there were no females of this kind of insect, hence it was considered a symbol of virility and manly force, 169 and in connection with the 'mano pantea' just alluded to gave the amulet power to guard both the living and dead. In fact it was almost as common upon these emblems as the human eye itself.

170 Again, the serpent was a frequent emblem in this same connection. As I have elsewhere written upon the subject of serpent-worship I need scarcely more than allude to it here, 171 save to say that to the serpent were ascribed numerous virtues and powers, and that its use upon any charm was supposed to reinforce the virtues already possessed by it.

172 Among the most curious of all the Italian charms against the Evil Eye, and yet one which has been singularly neglected by most writers, is the sprig of rue or, as the Neapolitans call it, the 'cimaruta'. 173 In its simplest form it was undoubtedly of Etruscan or Phoenician origin. Later, however, it became curiously involved with other symbols and quite complicated. 174 It is worn especially upon the breasts of Neapolitan babies, and is considered their especial protection against the much-dreaded jettatura. 175 In ancient times no plant had so many virtues ascribed to it as had the rue. Pliny, indeed, cites it as being a remedy for 84 different diseases. 176 It used to be hung about the neck in primeval times to serve as an amulet against fascination. 177 In most of these amulet forms it consists of three branches, which were supposed to be typical of Diana Triformis, who used often to be represented in three positions and as if having three pairs of arms.

178 Diana, by the way, was the especial protectress of women in child-birth. Silver was her own metal and the moon her special emblem. 179 Therefore, the expression, "the silver moon" is not so meaningless as it would appear. 180 This will in some

measure account for the fact that corals, to which large virtues were ascribed, used always to be mounted in silver, and that the crescent, or new moon, is also almost invariably made of this same metal. 181 Of the many charms which used to be combined in the 'cimaruta' there is scarcely one which may not be more or less considered as connected with Diana, the Goddess of Infants.

182 Frequently, also, we may see representations of the sea-horse quite like the living hippocampi of to-day, which are worn alike by cab horses and by women in Naples. They are known locally as the 'Cavalli marini'.

183 Protection supposed to be most efficient was and is frequently afforded also by another method, namely, printed or written invocations, prayers, formulae, etc., worn somewhere about the body. 184 Sometimes these were worn concealed from view and at others they were openly displayed. Even today on Turkish horses and Arab camels are hung little bags containing passages from the Koran, 185 while the Neapolitan horses frequently carry in little canvas bags prayers to the Madonna or verses from scripture,-- these as a sort of last resort in case the other charms fail. 186 The good Catholic of to-day, especially if of Irish descent, wears own little scapulary suspended around the neck, which is supposed to be a potent protection. 187 Frommannd's large work on Magic offers us a perfect mine of written spells against fascination, which have often to be prepared with certain mystic observances.

188 The various written charms, as against the bite of the mad dog, are only other illustrations of the same superstition. 189 Indeed, many superstitious people believe that the mere utterance of particular numbers exercises a charm. 190 Daily expression of this belief we see in the credulity about the luck of odd numbers, and the old belief that the third time will be lucky. 191 Military salutes are always in odd numbers. More value attaches in public estimation to the number seven than to any other, as we see in the miraculous powers ascribed to the seventh son of a seventh son.

192 An appeal to luck to-day is the equivalent of the old prayer to the Goddess Fortuna, and is voiced in the common idea about the lucky coin and the various little observances for luck which are so popular. 193 These observances are everywhere inclusive of the popular importance attached to expectoration, which is one of the most curious features of these many widespread beliefs. 194 The habit of spitting on a coin, for instance, is very common, just as the schoolboy spits on his agate when playing marbles or on his baseball, or the bowler upon his wooden ball before rolling it. 195 In fact, this whole matter of spitting has been in all ages an expression of a deep-rooted popular belief. 196 Among the ancient Greeks and Romans the most common remedy against an envious look was spitting, hence it was called "'despuere malum'." 197 Old women would avert the evil eye from their children by spitting three times (observe the odd number) into their bosoms.

198 The virtues and properties attributed to saliva among various peoples have been numerous and exalted. 199 To lick a wart on rising in the morning used to be one of its well-recognised cures, and is to-day a popular remedy for any slight wound. Especially was the saliva of a fasting person peculiarly efficacious. 200 Pliny states that when a person looks upon an infant asleep the nurse should spit three times upon the ground. 201 But the most marvellous virtues were attributed to saliva in the direction of restoration of sight. 202 The most conspicuous illustration of this is the instance mentioned in the New Testament when Christ healed the blind man, for it is related that: "He spat on the ground and made clay of the spittle, and did anoint the eyes of the blind man with the clay."

203 The practice of concealing the eyes is prevalent throughout the Orient, and among the Mohammedans, cannot be referred entirely to male jealousy, 204 for the women themselves confess to the greatest reluctance to show their faces to the stranger, fearing the influence of the evil eye.

205 Again, inasmuch as from time immemorial diseases of all kinds

have been considered the direct result of fascination, it was most natural that charms of varied form should be introduced as a protection. 206 Many persons even of considerable education lend themselves to this superstition. The carrying in one's pocket of a potato, a lump of camphor or an amulet is, among other alleged charms, but an everyday illustration of this belief.

207 It would be possible to go on with an almost endless enumeration of the forms of this still generally prevalent belief in the power of the evil eye, and of the charms by which it may be averted. 208 As has been set forth, it is but a particulate expression of a general and widespread belief in the existence of an evil being, 209 for some vague and almost unsubstantial, for others assuming almost the proportions of the personal devil of mediaeval theology, or even of the Tyrolean Passion Plays. 210 A discussion in a general way of this topic I have held to be not entirely foreign to the purpose of this society, it being one of the most interesting subjects of folklore study, 211 and it may perhaps be considered just at the present to have a more particular interest for us in that we have so recently been favoured with a most delightful and scholarly essay on the "*Salem Witchcraft*" by Prof. John Fiske, 212 in which he graphically set forth the mechanism and the consequences of an aggravated expression of this belief, 213 which constitutes the most serious blot which can be found upon the history of the Protestant white races in this country.

THANATOLOGY
A QUESTIONNAIRE AND A PLEA FOR A NEGLECTED STUDY

APPEARED FIRST IN THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, APRIL 27, 1912.

2 Is it possible to watch the "vital spark of heavenly flame," as it quits "this mortal frame" and not be overcome by the mystery of death as the termination of that even greater mystery, life? 2 Is there inspiration in the pagan emperor's address to his soul--

those Latin verses which Pope has so beautifully translated?

3 To the speculative philosopher death may have a different significance, and one not altogether included in that given to it by the physiologist. 4 To the former it is a subject for transcendental speculation; to the latter it is the terminal stage of that adjustment of internal and external relations which, for Spencer, constitutes life. 5 For us its primary and immediate significance is purely mundane, yet it deserves such serious study from a practical viewpoint as it seldom receives.

6 What is death? When does it actually occur? 7 How can it occur when the majority of cells in the previously living organism live on for hours or for days or, under certain favouring circumstances, retain potentialities of life for indefinite periods? 8 These and numberless related questions constitute a line of inquiry that may well call for a separate department of science. 9 Pondering in this wise, I long ago coined an expression which years later I found had been incorporated in the scientific dictionaries, though never before heard by me or encountered in my reading. 10 "Thanatology" is this word, and it may be defined as the study of the nature and causes of death. Inseparable from it, however, are certain considerations regarding the nature and causes of life. 11 Yet I would not introduce a compound term such as "biothanatology," wishing so far as possible to limit the study and the meaning.

12 Let us ask ourselves a few more questions. Does life inhere in any particular cell? In the leukocytes? In the neurons? Both are capable of stimulated activity long after the death of their host. 13 In fact, by suitable electric stimulation, nearly all the phenomena of life may be reproduced after death, save consciousness and mentality alone. Do these then constitute life, and their suppression or abolition death? 14 If so what about the condition of trance, or of absolute imbecility, congenital or induced? 15 Or, again, how can a decapitated frog go on living for hours? Is it perhaps because the heart is 'the' vital organ that the

hearts of some animals will continue to palpitate for hours after their removal from the bodies? 16 Yet the animals which have lost them certainly promptly die. Suddenly stop a human's heart-action by electrocution, or the guillotine, or a bullet, and one dies, we say, instantly. 17 Let it stop equally suddenly under chloroform and there is a period of several minutes during which it may be set going. 18 Let a person apparently drown and this viable period becomes even longer-- say a goodly fraction of an hour. 19 During the interval is one alive or dead, or is there an intermediate period of absolutely suspended animation? And if so, in what does it consist?

20 Is there a vital principle? If so what is it? Is such a thing conceivable? Can such a concept prevail among physicists? 21 Can we consent even to entertain in this direction the notion of what is so vaguely called "the soul?" 22 Of course, those who talk most lucidly about the soul know least about it, and no human can define it in comprehensible terms; 23 but can consideration of the soul (whatever it may be) be omitted from our thanatology? 24 Probably not, at least by many thinkers who cannot segregate their physics from their theology. 25 Sad it is that theology, which might be so consolatory had it any fixed foundation, should be utterly impotent when so much is wanted of it. 26 Theology, however, has little if aught to do with thanatology.

27 Is protoplasm alive? If so, then why may we not believe, with Binet, in the psychic life of micro-organisms? 28 He seems to have advanced good reason for assuming that we may do so, albeit such manifestations in either direction may be scarcely more than expressions of chemiotaxis. 29 But if protoplasm be alive in any proper sense, as it would appear (else where draw the line?), just when does it so appear and whence comes its life? 30 If it be alive, then life inheres in the nitrogen compounds composing it, or else is an adjunct of matter, imponderable, elusive, something 'un'-conceivable if undeniable. 31 The vitalists are of late perhaps attaining an ascendency which for

decades they had lost, since they maintain that life is not to be explained by chemical activities alone. 32 And yet it is possible to set going in the eggs of certain sea animals the phenomena of life, or to liberate them by certain weak solutions of alkaline cyanides, without the pressure or assistance of fructifying spermatozoa. 33 In such cases life or death are determined by ionisation and certain chemicals, or by their absence. 34 Where then, again, is the vital principle? Or is it inherent in the ion, and was Bion correct when he said "electricity is life?" 35 The life of a cell is then necessarily quite distinct from the life of its host, nor can the latter be composed simply of the numerical total lives of its components. 36 Some lower animals bear semi-division, in which case each half soon becomes a complete unit by itself. Others seem to bear the loss of almost any individual part without loss of life, and it is hard to say just which is the vital part. 37 The central pumping organ is perhaps the 'sine qua non', when it exists. But when non-existent, then what? 38 Again, while a living organism may be artificially divided into viable portions, no method seems known by which a series of separate cells may be, as it were, assembled or combined into one, of which a new unit may result from assemblage or combination. 39 The more highly specialised or complex the cell, the more easily does it part with life, and the more difficult becomes its preservation and its reproduction. 40 We may assume that after the death of a human your most specialised cells are the first to die, or more, that their death has perhaps preceded your own. 41 In the ante-mortem collapse seen in many diseases and poisonings, has not this very thing occurred, i. e., that the patient has outlived own most important cells? 42 Certainly when a patient dies of progressive gangrene one has outlived, perhaps, a large proportion of own millions of competent cells. Viewed properly, what a strange spectacle is here presented! 43 Perhaps twenty per cent. of the cells actually dead, the rest bathed in more or less poisonous media, still their host endures yet a little while.

44 "Behold, I show you a great mystery." About which of the poisoned cells does the flame of life still flicker?

45 The life-giving germ-and sperm-cells may exist and persist for some time after the body dies, as numerous experiences and experiments have shown. 46 Ova and spermatozoa do not die the instant the host dies. 47 And herein appears another great mystery, that cells from the undoubtedly dead body may possess and unfold the potentialities of life when properly environed. 48 Among the lower forms of life cells but slightly differentiated go on living and even creating new organisms, though the larger organisms be dead. 49 Moreover, in what way shall we regard the division of one ameboid cell into two, equally alive and complete? 50 Here two living organisms are made out of one, without death intervening, and by permutation alone may one calculate, 51 through how few generations cells need pass in order to be numbered by millions, without a death necessary to the process.

52 Thus far we have had in mind life and death in the animal kingdom alone. But most of what has been said, and much that has not, is equally true in the vegetable kingdom. 53 Even in the mineral kingdom-- as some think-- the invariable and inevitable tendency to assume definite crystalline form represents the lowest type of life. 54 Indeed it might fall in with Spencer's definition as evincing a tendency to adjust internal to external relations, though exhibited only after such ruthless disturbance as liquefaction by heat or solution. 55 But then, is not every disturbance of relations "ruthless," because it follows inexorable habits of Nature? 56 Even a crystal will reform as frequently as appear certain other phenomena of life, if made to do so. 57 Were atoms alive they would suffer with every fresh chemical change, and who knows but that they do?

58 But in the vegetable world we certainly have all the features of life and death in complete form: 59 fructification of certain cells by certain others, development in unicellular form or in most profuse

and complex form, a selection of necessary constituents of growth from apparently unpromising soil, and the production of startling results. 60 Does not the sensitive plant evince a contact sensibility almost equal to that of the conjunctiva? And who shall say that it does not suffer when rudely handled? 61 Does not the production of the complex essential oils and volatile ethers which give to certain flowers their wonderful fragrance, indicating what strange combinations of crude materials have been effected within their cells, 62 show as wonderful a labouratory as any concealed within the animal organisms? 63 Yet death comes to these plants with equal certainty, and presents equally perplexing mysteries. 64 When dies the flower? When plucked and separated from its natural supply or when it begins to fade (a period made more or less variable by the care given it), or when it ceases to emit its odour? 65 And is then death a matter of hours? When the floral stem was snapped what else snapped with it? At what instant did the floral murder occur?

66 Every seed and every seedling possesses marvelous potentiality of life, and so long as it does we say it is not dead; nor yet is it alive. 67 It resists considerable degrees of heat, will bear the lowest temperature, will remain latent for long periods, and still its cells will instantly respond to favouring stimuli. 68 Its actual life is apparently aroused by purely thermic and chemical (electrionic?) activities environing it. In what do its life and its death consist?

69 But life and death are influenced-- we say "strangely" only because it all seems strange to us-- by uncommon or purely artificial conditions. 70 Radium emanations have always an injurious effect on embryonic development. Under their influence, for example, the eggs of amphibia become greatly disturbed. 71 Cells that should specialise into nerve, ganglion and muscle fail to develop, and consequently there may be produced minute amphibian monsters, destitute of nerves and muscles, but otherwise nearly normal. 72 Hertwig has submitted

the sperm-cells of sea urchins to these rays, without killing them, but invariably with consequent abnormal development.

73 The effect of cathode or 'x'-rays is even more widely recognised and has been more generally demonstrated. They seem to possess properties injurious to most cell-life and even fatal to some.

74 Still more puzzling, and weird in a way, are the results of experiments, now widely practiced, 75 which have to do with juggling, as it were, with ova, larvæ and embryos, by all imaginable combinations of subdivision and reattachment of parts, so that there have resulted all kinds of monstrosities and abnormalities. 76 To such an extent has this labouratory play been carried that almost any desired product can be furnished--living creatures with two heads, two tails, or whatever combination may be determined.

77 Among the most remarkable of these efforts have been those of Vianney, of Lyons, who has shown that it is possible to remove the head end of several different insect larvæ without preventing their development and metamorphosis into the butterfly stage. 78 In 'Bombyx' larvæ, for example, the butterflies arrived at the mature stage, with streaked wings and beautiful colouration, but almost headless. These anencephalous insects lived for some time.

79 Few animals survive exposures of any length to a temperature much over 150 F., and most of them are killed by considerably less heat. 80 Freezing has always been considered equally fatal. Gangrene is the common result of freezing a part of the human body, and that means local death. 81 Extraordinary pains must be taken with a frozen ear or finger if its vitality is to be restored. 82 And so even with the hibernating, or the cold-blooded animals, a really low temperature has been generally regarded as fatal.

83 But the recent experiments of Pictet, who did so much in the production of exceedingly low temperatures, freezing of gases, etc., have shown some startling results in the failure to kill goldfish and other of the lower

animals by refrigeration. 84 For instance, goldfish were placed in a tank whose water was gradually frozen while the fish were still moving therein. The result was a cake of ice with imprisoned supposedly dead fish. 85 This ice was then reduced to a still lower temperature, at which it was maintained for over two months. It was then very slowly thawed out, whereupon the fish came to life and moved in apparently their normal and natural ways as if nothing had happened.

86 This confirms Pictet's early experiments and convictions, that if the chemical reactions of living organisms can be suspended without causing organic lesions the phenomena of life will temporarily disappear, to return when conditions are again as usual. 87 It is worth relating that his fish frozen in this way could be broken in small pieces just as if they were part of the ice itself.

88 How often during these recent decades when events have seemed to move faster, when discoveries and inventions have been announced at such frequent and brief intervals that we fail to note them all for lack of time, 89 when haste and rush characterise habits alike of life and thought, do we find that we simply must stop, as it were for breath, while we unload a large amount of accumulated mental rubbish and clear a space in our storage capacity for up-to-date knowledge! 90 It is a decennial mental house-cleaning process. We must unlearn so much of that which ten to forty years ago we so labouriously learned. We must adopt new and improved reasoning processes. 91 But it is hard to do all this. For instance, as a boy I learned the old chemistry quite thoroughly. During a subsequent interval, when I did not need to study it, came the new chemistry, 92 and when I again required it I had not only to study a practically new science-- which was not so bad-- but to rid my brain of much that had really found firm lodgment there, and this was difficult or impossible. 93 So it is with one who, having been brought up on Euclidean geometry, finds oneself confronted with the comparatively new non-Euclidean, 94 and who has then not merely to forget, but to unlearn all

those fundamental axioms which seemed so plain and so indisputable, that is, if one would accept the teachings of Bolyai and others. 95 For example, that a straight line is not necessarily the shortest route between two points shocks our Euclidean orthodoxy, and is at the same time, 'to us', inconceivable; 96 as also that parallel lines indefinitely prolonged 'may' touch, and the like; likewise the concept of four-dimensional spaces, or worse yet, 'n'-dimensional. 97 And now, in somewhat like manner and to a certain degree, must we revise our previous conceptions of death, at least to this extent: 98 Not that we yet know much better than we did what it really is, but that we know more about what it is not. 99 Even save, perhaps, in its instantaneous happening it is 'but a step' toward dissolution, usually not the first, certainly not the last, but yet the most conspicuous.

100 Death is in many respects a biochemical fact. 101 It is so intertwined with ionic changes in the arrangement of matter that we may hope for more information regarding some of its aspects as knowledge of the latter accumulates. But, evidently, we need to clarify our notions as we rearrange our facts. 102 Somatic death is, after all, a most complex process. It may be shortened by instant and complete incineration, but scarcely in any other way. Even dynamite would scarcely simplify the problem. 103 As to conscious death, that is 'probably' (though not certainly) a matter of seconds only or possibly fractions of a second. 104 While we have no accurate appreciation of what constitutes consciousness, nor even just where it resides, the central nervous system appears to be its most probable seat. 105 But conscious death may occur almost instantly without injury to this system, as when a bullet passes through the thorax and the heart, without injuring the spine. 106 But what is it that suddenly checks all concerted and interdependent activity? Or does something or some controlling agency suddenly leave the body?

107 A recent theory, having features to commend it, is to the effect that life is a property or a feature of the ultimate 'corpuscles'

which compose the atom. 108 Since these corpuscles bear to their containing atom a relative size comparable to that of the tiniest visible insect winging its way in a large church edifice, the intricacies of this particular theory readily appear. 109 But it does seem as though among ourselves life has much to do with the hitherto neglected and despised nitrogen atom or molecule, since life inheres 'par excellence' in nitrogen compounds. 110 Moreover, 'vitality is conspicuously a feature of those chemical elements which have the lowest atomic weight', while at the other end of the table of atomic weights stands radium, of whose destructive emanations I have already spoken.

111 Another phase of the general subject of thanatology was suggested especially by Osier, who a few years ago called attention to the fact that but few, if any patients really die of the disease from which they have been suffering. 112 This is not a paradox, and needs only reason and observation to confirm it. 113 His statement was a preliminary to the consideration of terminal infections and toxemias, which of itself would be sufficient to erect thanatology into a dignified special study. 114 Take, for instance, a patient who has long suffered from diabetes. The end is characterised by coma, i. e., an evidence of profound toxemia, and is in large measure due to acetonemia. 115 A patient with chronic Bright's disease dies of uremic poisoning, or one with pneumonia dies of genuine heart-failure. 116 The terminal stage of cancer is, again, toxemia of one kind or another, according as it has interfered with digestion, with respiration, or some other vital function, or has broken down, thus saturating the patient with septic products.

117 This aspect of the subject will bear any amount of study and elabouration, and its mention here should be sufficient for my purpose. 118 Accordingly as it is properly appreciated, it will be recognised as having an important practical bearing, since, if we may foresee the direction from which the final danger threatens, it may be the better and the longer averted.

119 Another very important and practical subject is wrapped up in this one, namely, the utilisation of apparently dead, or at least of only potentially living material (tissue) in the various methods of grafting or transplantation, which are to-day a part of the surgeon's work. 120 The methods are themselves a transplantation of experiences gained by work in the vegetable kingdom. 121 What wonder that the marvels revealed in one department should have incited work along parallel lines in the other? 122 That flowers and fruit of one kind may be made to grow on a tree of a very different kind excites but a small amount of the astonishment it deserves, mainly because it is now a common occurrence, though properly regarded it might seem a miracle.

123 Differing only in minor respect is, for example, the removal of thyroidal tissue from one human being and its implantation into another, with functional success. 124 One may ask just here, how is this matter concerned with thanatology? And the reply is: If this tissue were taken from a fresh corpse it would be by most people regarded as dead tissue. If so, does the dead come to life? 125 Without violating the proper scientific use of the imagination one may fancy something like the following: Let a healthy young woman meet accidental and instantaneous death. It would be possible to use no inconsiderable portion of her body for grafting or other justifiable surgical procedures. 126 The arteries and nerves could be used, both in the fresh state, and the former even after preservation, for suitable transplantation or repair work on the vascular and nervous systems of a considerable number of other people. 127 So also could the thyroid, the cornea, the ovaries and especially the bones. All the teeth, if healthy, could be reimplanted. 128 With the thin bones, ribs especially, plastic operations-- particularly on the noses-- of fifty people could be made. 129 And then the exterior of the body could be made to supply any amount of normal integument with which to do heterologous dermatoplastic operations, 130 or would furnish an almost inexhaustible supply of epidermis for Thiersch grafts, which latter

material need not be used in the fresh state, but could be preserved and made available some days and even weeks later. 131 A portion of the muscles might possibly be made available for checking oozing from bleeding surfaces of others, if used while still fresh and warm, 132 and possibly portions of the ureters or some other portion of the remains might be utilised for some unusual purpose. 133 Then what extracts or extractives might be prepared from other parts of the body, pituitary, adrenals, bone-marrow, etc.? 134 The tendons might also be prepared for sutures. Every one of these procedures would give promise of success, the technic being in every respect satisfactory.

135 But the possible limit is not yet reached, since with each kidney might be carried out experiments like those feats of physiologic jugglery such as Carrel has shown us, 136 by implanting one, say in the neck, connecting up the renal with the carotid artery, and the renal vein with the jugular, while some receptacle would have to be provided as a terminal for the ureter. 137 This is, after all, not a fantastic dream, nor such an extreme picture as would at first appear, since every organ or tissue above-mentioned-- and more-- has been used as indicated, and with success. 138 But imagine the dead body affording viable products, even indirectly life itself, to (possibly) so many others! Does this complicate the study of death? 139 And what must become of the simple credulous faith of the zealot who believes in the actual and absolute resurrection, at some later date?

140 There is something more than mere transcendentalism in the science of thanatology; it has a plausible medico-legal and pragmatic import. 141 Right glad should I be if I might arouse a deserved interest in it. How may I more fittingly conclude than by quoting a few lines from our own Bryant's "*Thanatopsis*":

142 "Earth that nourished thee, shall claim
Thy growth, to be resolved to earth again,
And, lost each human trace, surrendering up
Thine individual being, shalt thou go
To mix forever with the elements."

143 Though were I minded to rehearse certain difficulties met in the preparation of this paper, which I have long had in mind, I might also add the following lines from the same poet's "*Hymn to Death*":

144 "Alas! I little thought that the
stern power
Whose fateful praise I sung, would
try me thus
Before the strain was ended."

145 One may well quote, at this point, Lamartine, who asked, "What is life but a series of preludes to that mystery whose initial solemn note is tolled by death?" 146 (On this theme Liszt built up that wonderful symphonic tone poem "*Les Preludes*.")

Even infinity is now questioned by the mathematicians. This being the case, where shall we, where can 'we' stop?

NOTE

147 While writing the foregoing paper there came to my notice the recent book "*Death; Its Causes and Phenomena*," by Carrington and Meader (London, 1911). 148 It is interesting, but save that it contains a helpful bibliography, is of little assistance to one wishing to pursue the study from its pragmatic aspect. 149 One of the authors is committed to a personal theory that death is caused by cessation of the vibrations which during life maintain vital activity; 150 the other that death is, as it were, the culmination of a bad habit of expectancy that something of the kind must occur, into which we have fallen, 151 in spite of the fact that other living beings below human undergo the same fate, though not capable of expecting anything.

SERPENT-MYTHS AND SERPENT-WORSHIP

A PRESIDENTIAL ADDRESS BEFORE THE BUFFALO SOCIETY OF NATURAL SCIENCES

3 Since the dawn of written history, and from the most remote periods, the serpent has been regarded with the highest veneration as the most mysterious of living creatures. 2 Being alike an object of wonder, admiration and fear, it is not strange that it became early connected with numerous superstitions; 3 and

when we remember how imperfectly understood were its habits we shall not wonder at the extraordinary attributes with which it was invested, nor perhaps even why it obtained so general a worship. 4 Thus centuries ago Horapollo referring to serpent symbolism, said: "When the Egyptians were representing a universe they delineated the spectacle as a variegated snake devouring its own tail, 5 the scales intimating the stars in the universe, the animal being extremely heavy, as is the earth, and extremely slippery like the water; 6 moreover it every year puts off its old age with its skin as, in the universe, the recurring year effects a corresponding change, and becomes renovated, 7 while the making use of its own body for food implies that all things whatever which are generated by divine providence in the world undergo a corruption into them again."

8 In all probability the annual shedding of the skin and the supposed rejuvenation of the animal was that which first connected it with the idea of eternal succession of form, subsequent reproduction and dissolution. 9 This doctrine is typified in the notion of the succession of ages which prevailed among the Greeks, and the similar notion met with among nearly all primitive peoples. 10 The ancient mysteries, with few or perhaps no exceptions, were all intended to illustrate the grand phenomena of Nature. 11 The mysteries of Osiris, Isis and Horus in Egypt; of Cybele in Phrygia, of Ceres and Proserpine at Eleusis, of Venus and Adonis in Phoenicia, of Bona Dea and of Priapus in Rome, all had this in in common, 12 that they both mystified and typified the creation of things and the perpetuation of life. 13 In all of them the serpent was conspicuously introduced as it symbolised and indicated the invigourating energy of Nature. 14 In the mysteries of Ceres, the grand secret which was communicated to the initiates was put in this enigma,-- "The bull has begotten a serpent and the serpent a bull," the bull being a prominent emblem of generative force. 15 In ancient Egypt it was usually the

bull's horns which served as a symbol for the entire animal. When with the progress of centuries the bull became too expensive an animal to be commonly used for any purpose, the ram was substituted; 16 hence the frequency of the ram's horns, as a symbol for Jove, seen so frequently, for example, among Roman antiquities.

17 Originally fire was taken to be one of the emblems of the sun, and thus most naturally, inevitably and universally the sun came to symbolise the active, vivifying principle of Nature. 18 That the serpent should in time typify the same principle, while the egg symbolised the more passive or feminine element, is equally certain but less easy of explanation; 19 indeed we are to regard the serpent as the symbol of the great hermaphrodite first principle of Nature. 20 "It entered into the mythology of every nation, consecrated almost every temple, symbolised almost every deity, was imagined in the heavens, stamped on the earth and ruled in the realms of eternal sorrow." 21 For this animal was estimated to be the most spirited of all reptiles of fiery nature, inasmuch as it exhibits an incredible celerity, moving by its spirit without hands or feet or any of the external members by which other animals effect their motion, 22 while in its progress it assumes a variety of forms, moving in a spiral course and darting forward with whatever degree of swiftness it pleases.

23 The close relationship if not absolute identity among the early races of human between Solar, Phallic and Serpent worship was most striking; so marked indeed as to indicate that they are all forms of a single worship. 24 It is with the latter that we must for a little while concern ourselves. How prominent a place serpent worship plays in our own Old Testament will be remarked as soon as one begins to reflect upon it. 25 The part played by the serpent in the biblical myth concerning the origin of human is the first and most striking illustration. 26 In the degenerated ancient mysteries of Bacchus some of the persons who took part in the ceremonies used to carry serpents in their hands and

with horrid screams call "Eva, Eva;" the attendants were in fact often crowned with serpents while still making these frantic cries. 27 In the Sabazian mysteries the snake was permitted to slip into the bosom of the person to be initiated and then to be removed from below the clothing. This ceremony was said to have originated among the Magi. 28 It has been held that the invocation "Eva" related to the great mother of humankind; 29 even so good an authority as Clemens of Alexandria held to this opinion, but Clemens also acknowledges that the name Eva, when properly aspirated is practically the same as Epha, or Opha, which the Greeks call Ophis, which is, in English, serpent. 30 In most of the other mysteries serpent rites were introduced and many of the names were extremely suggestive. 31 The Abaddon mentioned in the book of Revelation is certainly some serpent deity, since the prefix Ab, signifies not only father, but serpent. 32 By Zoroaster the expanse of the heavens and even Nature itself was described under the symbol of the serpent. 33 In ancient Persia temples were erected to the serpent tribe, and festivals consecrated to their honour, some relic of this being found in the word Basilicus, 34 or royal serpent, which gives rise to the term Basilica applied to the Christian churches of the present era. 35 The Ethiopians, even, of the present day derive their name from the Greek Aithiopes, meaning the serpent gods worshipped long before them; 36 again, the Island of Euboea signifies the Serpent Island and properly spelled should be Oub-Aia. 37 The Greeks claimed that Medusa's head was brought by Perseus, by which they mean the serpent deity, as the worship was introduced into Greece by a people called Peresians. 38 The head of Medusa denoted divine wisdom, while the Island was sacred to the serpent. 39 The worship of the serpent being so old, many places as well as races received names indicating the prevalence of this general superstition; 40 but this is no time to catalogue names,-- though one perhaps should mention Ophis, Oboth, Eva in Macedonia, Dracontia, and last but not least,

the name of Eve and the Garden of Eden.

41 Seth was, according to some, a semi-divine first ancestor of the Semites; Bunsen has shown that several of the antedeluvian descendants of Adam were among the Phoenician deities; 42 thus Carthagenians had as God, Yubal or Jubal who would appear to have been the sun-god of Esculapius; or, spelled more correctly, Ju-Baal, that is Beauty of Baal. 43 Whether or not the serpent symbol has a distinct phallic reference has been disputed, but the more the subject is broadly studied the more it would seem that such is the case.

44 It must certainly appear that the older races had that form of belief with which the serpent was always more or less symbolically connected, that is, adoration of the male principle of generation, 45 one of whose principal phases was undoubtedly ancestor worship, while somewhat later the race adored the female principle which they symbolised by the sacred tree so often alluded to in Scripture as the Assyrian grove. 46 Whether snakes be represented singly, coupled in pairs as in the well known Caduceus or Rod of Esculaipius, 47 or in the crown placed upon the head of many a god and goddess, or the many headed snake drinking from the jewelled cup, 48 or a snake twisted around a tree with another approaching it, suggesting temptation and fall,-- in all these the underlying principle is always the same. 49 Symbols of this character are met with not only in the temples of ancient Egypt but in ruins antedating them in Persia and the East; 50 in the antiquities belonging to the races that first peopled what is now Greece and Italy, in the rock markings of India and of Central Europe, in the Cromlechs of Great Britain and Scandinavia, 51 in the Great Serpent Mound which still remains in Ohio, and in many other mounds left by the mound builders of this country, in the ruins of Central America and Yucatan, and in the traditions and relics of the Aztecs and Toltecs,-- 52 in fact wherever antiquarian research has penetrated or where monuments of ancient peoples remain.

53 There never has been so widespread a superstition, and no

matter what later forms it may have assumed we must admit that it, first of all, and for a long time was human's tribute to the great, all powerful and unknown regenerative principle of Nature, 54 which has been deified again and again, and which always has been and always will be the greatest mystery within the ken of humankind.

55 Brown in his "*Great Dionysiak Myth*" says the serpent has these points of connection with Dionysus, 56 (1) as a symbol of and connected with wisdom, (2) as a solar emblem, (3) as a symbol of time and eternity, (4) as an emblem of the earth, life, (5) as connected with the fertilising mystery, (6) as a phallic emblem. 57 Referring to the last of these he says: "The serpent being connected with the sun, the earth, life and fertility, must needs be also a phallic emblem, and was appropriate to the cult of Dionysos Priapos." 58 Again, Sir G. W. Cox says, "It is unnecessary to analyse theories which profess to see in it worship of the creeping brute or the wide-spreading tree; 59 a religion based upon the worship of the venomous reptile must have been a religion of terror. 60 In the earliest glimpses which we have the serpent is the symbol of life and of love, nor is the phallic cultus in any respect a cult of the full grown branching tree." 61 Again, "This religion, void of reason, condemned in the wisdom of Solomon, probably survived even Babylonian captivity; 62 certainly it was adopted by the sects of Christians which were known as Ophites, Gnostics and Nicolaitans."

63 Another learned author says: "By comparing the varied legends of the East and West in conjunction we obtain a full outline of the mythology of the ancients. 64 It recognises as the primary element of things two independent principles of Nature, the male and female, and these, in characteristic union as the soul and body, constitute the Great Hermaphrodite Deity, 65 the one, the universe itself, consisting still of the two separate elements of its composition, modified though combined in one individual, of which all things are regarded but as parts." 66 In fact the

characteristics of all pagan deities, male or female, gradually mould into each other and at last into one or two; 67 for as William Jones has stated, it seems a well-founded opinion that the entire list of gods and goddesses means only the powers of Nature, principally those of the sun, expressed in a variety of ways with a multitude of fanciful names.

68 The Creation is, in fact, human rather than a divine product in this sense, that it was suggested to the mind of human by the existence of things, while its method was, at least at first, suggested by the operation of Nature; 69 thus human saw the living bird emerge from the egg, after a certain period of incubation, a phenomenon equivalent to actual creation as apprehended by your simple mind. 70 Incubation obviously then associated itself with creation, and this fact will explain the universality with which the egg was received as a symbol in the earlier systems of cosmogony. 71 By a similar process creation came to be symbolised in the form of a phallus, and so Egyptians in their refinement of these ideas adopted as their symbol of the great first cause a Scarabaeus, indicating the great hermaphroditic unity, since they believed this insect to be both male and female. 72 They beautifully typified a part of this idea also in the adoration which they paid to the water lily, or 'Lotus', so generally regarded as sacred throughout the East. 73 It is the sublime and beautiful symbol which perpetually occurs in oriental mythology, and, as Maurice has stated, not without substantial reason, for it is its own beautiful progeny and contains a treasure of physical instruction.

74 The lotus flower grows in the water among broad leaves, while in its center is formed a seed vessel shaped like a bell, punctured on the top with small cavities in which its seeds develop; 75 the openings into the seed cells are too small to permit the seeds to escape when ripe, consequently they absorb moisture and develop within the same, shooting forth as new plants from the place where they originated; 76 the bulb of the vessel serving as a matrix which shall nourish them until they are large enough to burst open and

release themselves, after which they take root wherever deposited. 77 "The plant, therefore, being itself productive of itself, vegetating from its own matrix, being fostered in the earth, was naturally adopted as a symbol of the productive power of the waters upon which the creative spirit of the Creator acted, in giving life and vegetation to matter. 78 We accordingly find it employed in every part of the northern hemisphere where symbolical religion, improperly called idolatry, existed."

79 Further exemplification of the same underlying principle is seen in the fact that most all of the ancient deities were paired; thus we have heaven and earth, sun and moon, fire and earth, father and mother, etc. 80 Faber says "The ancient pagans of almost every part of the globe were wont to symbolise the world by an egg, hence this symbol is introduced into the cosmogonies of nearly all nations, 81 and there are few persons even among those who have made mythology their study to whom the mundane egg is not perfectly familiar; 82 it is the emblem not only of earth and life but also of the universe in its largest extent." 83 In the Island of Cyprus is still to be seen a gigantic egg-shaped vase which is supposed to represent the mundane or Orphic egg. 84 It is of stone, measuring thirty feet in circumference, and has upon it a sculptured bull, the emblem of productive energy. 85 It is supposed to signify the constellation of Taurus, whose rising was connected with the return of the mystic re-invigourating principle.

86 The work of the Mound Builders in this country is generally and widely known, still it is perhaps not so generally known how common upon this continent was the general use of the serpent symbol. 87 Their remain are spread over the country from the sources of the Allegheny in N. Y. state westward to Iowa and Nebraska, to a considerable extent through the Mississippi Valley, and along the Susquehanna as far as the Valley of Wyoming in Pennsylvania. 88 They are found even along the St. Lawrence River; they also line the shore of

the Gulf from Florida to Texas. 89 That they were erected for other than defensive purposes is most clear; without knowing exactly what was the government of their builders the presumption is that it combined both the priestly and civil functions, as obtained centuries ago in Mexico. 90 The Great Serpent Mound, already alluded to, had a length of at least 1,000 feet; the outline was perfectly regular and the mouth was widely open as if in the act of swallowing or ejecting an oval figure, also formed of earth, whose longest diameter was one hundred and sixty feet. 91 Again near Granville, Ohio, occurs the form of an alligator in connection with which was indubitable evidence of an altar. Near Tarlton, Ohio, is another earth work in the form of a cross. 92 There is every reason to think that sacrifices were made upon the altars nearly always found in connection with these mounds. 93 Among the various animal effigies found in Wisconsin, mounds in the form of a serpent are most frequently met with, while circles enclosing a pentagon, or a mound with eight radiating points, undoubtedly representing the sun, were also found.

94 There would seem in all these representations to be an unmistakable reference to that form of early cosmogony in which every vivification of the mundane egg constituted a real act of creation. 95 In Japan this conceptive egg is allegorically represented by a nest-egg shown floating upon an expanse of water, against which a bulb is striking with horns. 96 The Sandwich Islanders have a tradition that a bird, which with them is an emblem of deity, laid an egg upon the waters, which burst of itself and thus produced the Islands. 97 In Egypt, Kneph was represented as a serpent emitting from his mouth an egg, from which proceeds the divinity Phtha. 98 In the Bible there is frequent reference to seraphs; Se Ra Ph is the singular of seraphim, meaning, splendor, fire or light. 99 It is emblematic of the fiery sun, which under the name of the Serpent Dragon was destroyed by the reformer Hezekiah; or, it means, also, the serpent with wings and

feet, as used to be represented in funeral rituals.

100 Undoubtedly Abraham brought with him from Chaldea into lower Egypt symbols of simple phallic deities. 101 The reference in the Bible to the Teraphim of Jacob's family reminds us that Terah was the name of Abraham's father, and that he was a maker of images. 102 Undoubtedly the Teraphim were the same as the Seraphim; that is, were serpent images and were the household charms of the Semitic worshippers of the Sun-God, to whom the serpent was sacred. 103 In the Bible book of Numbers, chapter-21, the serpent symbol of the Exodus is called a seraph; 104 moreover when the people were bitten by a fiery serpent Moses prayed for them, when Jehovah replied, "Make them a fiery serpent, (literally seraph) and set it upon a pole, and it shall come to pass that every one who is bitten when he looketh upon it shall live." 105 The exact significance of this healing figure of the serpent is far to seek.

106 In this connection it must be remembered also, that among several of the Semitic tongues the same root signifies both serpent and phallus, which are both in effect solar emblems. 107 Cronus of the ancient Orphic theogony, probably identical with Hercules, was represented under the mixed emblem of a lion and a serpent, or often as a serpent alone. 108 He was originally considered Supreme, as is shown from his being called Il, which is the same as the Hebrew, El, which was, according to St. Jerome, one of the ten names of God. 109 Damascius in his life of Isidorus mentions that Cronus was worshipped under the name of El. Brahm, Cronus and Kneph each represented the mystical union of the reciprocal or active and passive regenerative principles.

110 The Semitic Deity, Seth, was certainly a serpent god, and can be identified with Saturn and with deities of other people. 111 The common name of God, 'Eloah', among the Hebrews and other Semites, goes back into the earliest times; indeed Bryant goes so far as to say that El was the original name of the Supreme deity among all the nations of the East. 112 He was the same as Cronus, who

again was the primeval Saturn. Thus Saturn and El were the same deity, and like Seth were symbolised by the serpent.

113 On the western continent this great unity was equally recognised; in Mexico as Teotl, in Peru as Varicocha or the Soul of the Universe, in Central America and Yucatan as Stunah Ku, or God of gods. 114 The mundane egg was everywhere received as the symbol of the original, passive, unorganised formless nature, and later became associated with other symbols referring to the creative force or vitalising influence, which was often represented in emblem by a bull. 115 In the Aztec Pantheon all the other gods and goddesses were practically modified impersonations of these two principles. 116 In the simpler mythology of Peru these principles took the form of the Sun, and the Moon his wife. 117 Among the ruins of Uxmal are two long massive walls of stone thirty feet thick, whose inner sides are embellished with sculpture containing fragments of colossal entwined serpents which run the whole length of the walls; in the center of the wall was a great stone ring.

118 Among the annals of the Mexicans the woman whose name old Spanish writers translated "The woman of our Fish" is always represented as accompanied by a great male serpent. 119 This serpent is the Sun-God, the principal deity of the Mexican Pantheon, while the name which they give to the goddess mother of primitive man signifies "Woman of the Serpent."

120 Inseparably connected with the serpent as a phallic emblem are also the pyramids, and, as is well known, pyramids abound in Mexico and Central America. 121 As Humboldt years ago observed pyramids existed through Mexico, in the forests of Papantha at a short distance above sea-level; on the plains of Cholula and of Teotihuacan, and at an elevation which exceeds those of the passes of the Alps. 122 In most widely different nations, in climates most different, human seems to have adopted the same style of construction, the same ornaments, the same customs, and to have placed yourself under the

government of the same political institutions. 123 Mayer describing one of his trips says, "I constantly saw serpents in the city of Mexico, carved in stone and in the various collections of antiquities." The symbolic feathered serpent was by no means peculiar to Mexico and Yucatan. 124 Squier encountered it in Nicaragua on the summits of volcanic ridges; even among our historic Indian tribes, for example among the Lenni Lenape, they called the rattlesnake "grandfather," and made offerings of tobacco to it. 125 Furthermore in most of the Indian traditions of the Manitou the great serpent figures most conspicuously.

126 It has been often remarked that every feature of the religion of the new world discovered by Cortez and Pizarro indicates a common origin for the superstitions of both continents, for we have the same worship of the sun, the same pyramidal monuments, and the same universal veneration of the serpent. 127 Thus it will be seen that the serpent symbol had a wide acceptance upon this continent as well as the other, 128 and among the uncivilised and semi-barbaric races; that it entered widely into all symbolic representation with an almost universal significance.

129 Perhaps the latest evidences of the persistence of this belief may be seen in the tradition ascribing to St. Patrick, the credit of having driven all the serpents from Irish soil; 130 or in the perpetuation of rites, festivals and representations whose obsolete origin is now forgotten. For instance the annual May-day festival, scarcely yet discontinued, is certainly of this origin, 131 yet few if any of those who participate in it are aware that it is only the perpetuation of the vernal solar festival of Baal, and that the garlanded May-pole was anciently a phallic emblem. 132 Among people of my own craft the traditions of Aesculapius are familiar. Aesculapius is, however, inseparably connected with the serpent myth and in statues and pictures he is almost always represented in connection with a serpent. 133 Thus he is seen with the Caduceus or the winged wand entwined by two serpents, or, sometimes with serpents' bodies wound around his own; but rarely ever without some serpent

emblem. 134 Moreover the Caduceus is identical with the simple figure of the Cross by which its inventor, Thoth, is said to have symbolised the four elements proceeding from a common center. 135 In connection with the Cross it is interesting also that in many places in the East serpent worship was not immediately destroyed by the advent of Christianity. 136 The Gnostics for example, among Christian sects, united it with the religion of the Cross, as might be shown by many quotations from religious writers. 137 The serpent clinging to the Cross was used as a symbol of Christ, and a form of Christian serpent worship was for a long time in vogue among many beside the professed Ophites. 138 In the celebration of the Bacchic mysteries the mystery of religion, as usual throughout the world, was concealed in a chest or box. The Israelites had their sacred Ark, and every nation has had some sacred receptacle for holy things and symbols. 139 The worshippers of Bacchus carried in their consecrated baskets the mystery of their God, while after their banquet it was usual to pass around the cup which was called "The Cup of the Good Daemon," whose symbol was a serpent. 140 This was long before the institution of the rite of the Last Supper. The fable of the method by which the god Aesculapius was brought from Epidaurus to Rome, 141 and the serpentine form in which he appeared before his arrival in Rome for the purpose of checking the terrible pestilence, are well known. 142 The serpentine column which still stands in the old race course in Constantinople is certainly a relic of serpent worship, though this fact was not appreciated by Constantine when he set it up.

143 The significance of the Ark is not to be overlooked. First, Noah was directed to take with him into the Ark animals of every kind. 144 But this historical absurdity, read aright and in its true phallic sense, means that the Ark was the sacred Argha of Hindoo mythology, which like the moon in Zoroastrian teachings, carries in itself the germ of all things. 145 Read in this sense the thing is no longer incomprehensible. As 'En Arche'

(in the beginning) Elohim created the Heavens and the Earth, so in the Ark were the seeds of all things preserved that they might again repopulate the earth. 146 Thus this Ark of Noah, or of Osiris, the primeval ship whose navigation has been ascribed to various mythological beings, was in fact the Moon or the Ship of the Sun, in which his seed is supposed to be hidden until it bursts forth in new life and power. 147 But the dove which figures so conspicuously in the biblical legend was consecrated to Venus in all her different names, in Babylon, in Syria, in Palestine and in Greece; it even attended upon Janus in his Voyage of the Golden Fleece. 148 And so the story of Jonah going to Joppa, a seaport where Dagon, the Fish-God was worshipped, and of the great fish, bears a suspicious relation to the same cult, for the fish was revered at Joppa as was the dove at Nineveh.

149 It has been impossible to dissociate serpent and serpent worship from Aesculapius. This is not because this mythological divinity is supposed to have been the founder of my profession, 150 but because he has been given at all times a serpentine form and has been, apparently, on the most familiar terms with the animal. 151 Pausanias, indeed, assures us that he often appeared in serpentine form, and the Roman citizens of two thousand years ago saw in this god "in reptilian form an object of high regard and worship." 152 When this divinity was invited to make Rome his home, in accordance with the oracle, he is represented as saying:

153 "I come to leave my shrine;
This serpent view, that with ambitious play
My staff encircles; mark him every way;
His form though larger, nobler, I'll assume,
And, changed as God's should be, bring aid to Rome."
(Ovid: Metamorphosis XV)

154 When in due time this salutary serpent arrived upon the island in the Tiber he began to assume his natural form, whatever that may have been;

EVIL

155 "And now no more the drooping city mourns,
Joy is again restored and health returns."

156 Considering then the intimate relation between the founder of medicine and the serpent it will not seem strange to you that the serpent myth is a subject of keen interest to every student of the history of medicine.

157 This devotion to serpent worship appears to have lingered a long time in Italy, for so late as the year 1001 a bronze serpent on the basillica of St. Ambrose was worshipped. 158 De Gubernatis speaking of it says, "Some say it was the serpent Aesculapius, others Moses, others that it was the image of Christ; 159 for us it is enough to remark that it was a mythological serpent before which the Milanese mothers offered their children when they suffered from worms, in order to relieve them," a practice which was finally suppressed by San Carlo. 160 Moreover, there has persisted until recently what is called a snake festival in a little mountain church near Naples, where those participating carry snakes around their persons, 161 the purpose of the festival being to preserve the participants from poison and sudden death and bring them good fortune. (Sozinskey).

162 The power of the sun over health and disease was long ago recognised in the old Chaldean hymn in which the sun is petitioned thus:

163 "Thou at thy coming cure the race of human;
Cause the ray of health to shine upon you;
Cure your disease."

164 Probably some feeling akin to that voiced in this way gave rise to the following beautiful passage in Malachi, chapter-4, verse:2: "The Sun of Righteousness shall arise with healing in His wings."

165 As a purely medical symbol the serpent is meant to symbolise prudence; long ago people were enjoined to be "As wise as serpents" as well as harmless as doves. 166 In India the serpent is still regarded as a symbol of every species of learning. 167 It has also another medical meaning, namely, 'convalescence', for which there is

afforded some ground in the remarkable change which it undergoes every spring from a state of lethargy to one of active life.

168 According to Ferguson, the experience of Moses and the Children of Israel with brazen serpents led to the first recorded worship paid to the serpent, which is also noteworthy, since the cause of this adoration is said to have been its intrinsic healing power. 169 The prototype of the brazen serpent of Moses in latter times was the Good Genius, the 'Agathodaemon' of the Greeks, which was regarded always with the greatest favour and usually accorded considerable power over disease.

170 The superstitious tendency to regard disease and death as the visitation of a more or less capricious act by some extra mundane power persists even to the present day. 171 For example, in the Episcopal book of Common Prayer, it is stated, in the Order for the Visitation of the Sick, "Wherefore, whatsoever your sickness be, know you certainly that it is God's visitation," 172 while for relief the following sentiment is formulated in prayer, "Lord look down from heaven, behold, visit and relieve these, thy servants," 173 thus voicing the very ideas which were current among various peoples of remote antiquity and eliminating all possibility of such a thing as the regulation of disease or of sanitary medicine.

IATRO-THEURGIC SYMBOLISM

AN ADDRESS BEFORE THE MAINE MEDICAL ASSOCIATION, PORTLAND, JUNE 2ND, 1898

4 So soon as had subsided the feeling of surprise, caused by a most unexpected invitation to address you, I began at once to cast about for a subject with which I might endeavour so to interest you as to justify the high and appreciated compliment which this invitation mutely conveyed. 2 And so, after considerable reflection, it appeared to me that it was perhaps just as well that medical people should be entertained, even at such a gathering as this, 3 by something which if not 'of' the profession was at least 'for' the profession, and

still not too remote from the purposes which have drawn us together. 4 Accordingly I decided to forsake the beaten path and, instead of selecting a topic in pathology or in surgery, upon which I could possibly speak with some familiarity, 5 to invite your attention to a subject which has always been of the greatest interest to me, yet upon which it has been hard, without great labour and numerous books, to get much information. 6 If I were to attempt to formulate this topic under a distinctive name I could perhaps call it 'Medico-Christian' Symbolism.

7 It is well known to scholars that practically all of the symbols and symbolism of Christianity have come from pagan sources, having been carried over, as one might say, across the line of the Christian era, 8 from one to the other, in the most natural and unavoidable way, although most of these symbols and caricatures have more or less lost their original signification and have been given another of purely Christian import. 9 To acknowledge that this is so is to cast no slur upon Christianity; it is simply recording an historical fact. It would take me too far from my purpose to-night were I to go into the reasons which brought about this change; 10 I simply want to disavow all intention of making light of serious things, or of reflecting in any way upon the nobility of the Christian Church, its meanings or its present practices. 11 But, accepting the historical fact that Christian symbols were originally pagan caricatures, I want to ask you to study with me for a little while the original signification of these pagan symbols, 12 feeling that I can perhaps, interest you in such a study providing that it can be shown that almost all of these emblems had originally an essentially medical significance, 13 referring in some way or other either to questions of health and disease, or else to the deeper question of the origin of humankind and the great generative powers of Nature, at which physicians to-day wonder as much as they did two thousand years ago. 14 Considering then the medical significance of such study I have been tempted to incur the

charge of being pedantic and have coined the term 'Iatro-Theurgic Symbolism', which title I shall give to the essay which I shall present to you to-night.

15 As Inman says, "Moderns who have not been initiated in the sacred mysteries and only know the emblems considered sacred, have need of both anatomical knowledge and physiological lore ere they can see the meaning of many signs." 16 The emblems or symbols then, to which I shall particularly allude, are the 'Cross', the 'Tree' and 'Grove', the 'Fish', the 'Dove', and the 'Serpent'. 17 And first of all the Cross, about which very erroneous notions prevail. It is seen everywhere either as a matter of personal or church adornment, or as an architectural feature, and everywhere the impression prevails that it is exclusively a Christian symbol. 18 This, however, is the grossest of errors, for the world abounds in cruciform symbols and monuments which existed long before Christianity was thought of. 19 It is otherwise however with the Crucifix which is, of course, an absolutely Christian symbol. 20 The image of a dead man stretched out upon the Cross is a purely Christian addition to a purely pagan emblem, though some of the old Hindoo crosses remind one of it very powerfully. 21 No matter upon which continent we look we see everywhere the same cruciform sign among peoples and races most distinct. 22 There perhaps has never been so universal a symbol, with the exception of the serpent. 23 Moreover the cross is a sort of international feature, and is spoken of in its modifications as St. Andrew's, St. George's, the Maltese, the Greek, the Latin, etc. 24 Probably because of its extreme simplicity the ages have brought but little change in its shape, and the bauble of the jeweller of to-day is practically the same sign that the ancient Egyptian painted upon the mummy cloth of his sacred dead. 25 Thus it will appear that the shadow of the Cross was cast far back into the night of ages. The Druids consecrated their sacred oak by cutting it into the shape of a cross, and when the natural shape of the tree was not sufficient

it was pieced out as the case required. 26 When the Spaniards invaded this continent they were overcome with surprise at finding the sign of the Cross everywhere in common use. 27 It was by the community of this emblem between the two peoples that the Spaniards enjoyed a less war-like reception than would otherwise have been accorded to them.

28 That the Cross was originally a phallic emblem is proven, among other things, by the origin of the so-called Maltese Cross, which originally was carved out of solid granite, 29 and represented by four huge phalli springing from a common center, which were afterward changed by the Knights of St. John of Malta into four triangles meeting at a central globe; thus we see combined the symbol of eternal and the emblem of constantly renovating life. 30 The reason why the Maltese Cross had so distinctly a phallic origin, and why the Knights of St. John saw fit to make something more decent of it, is not clear, 31 but a study of Assyrian antiquities of the days of Nineveh and Babylon shows that it referred to the four great gods of the Assyrian Pantheon, and that with a due setting it signifies the sun ruling both the earth and heavens. 32 Schliemann discovered many examples of it on the vases which he exhumed from the ruins of Troy.

33 But probably the most remarkable of all crosses is that which is exceedingly common upon Egyptian monuments and is known as the 'Crux-Ansata', that is the handled cross, which consisted of the ordinary Greek 'Tau' or cross, with a ring on the top. 34 When the Egyptian was asked what he meant by this sign he simply replied that it was a divine mystery, and such it has largely remained ever since. It was constantly seen in the hands of Isis and Osiris. 35 In nearly the same shape the Spaniards found it when they first came to this continent. The natives said that it meant "Life to come."

36 In the British Museum one may see, in the Assyrian galleries, effigies in stone of certain kings from whose necks are suspended sculptured Maltese crosses, such as the Catholics call the Pectoral

Cross. 37 In Egypt, long before Christ, the sacred Ibis was represented with human hands and feet, holding the staff of Isis in one hand and the Cross in the other. 38 The ancient Egyptian astronomical signs of planets contained numerous crosses. 39 Saturn was represented by a cross surmounting a ram's horn; Jupiter by a cross beneath a horn, Venus by a cross beneath a circle (practically the Crux-Ansata), the Earth by a cross within the circle, and Mars by a circle beneath the cross; many of these signs are in use to-day. 40 Between the Buddhist crosses of India and those of the Roman church are remarkable resemblances; the former were frequently placed upon a Calvary as is the Catholic custom to-day. 41 The cross is found among the hieroglyphics of China and upon Chinese pagodas, and upon the lamps with which they illuminated their temples. 42 Upon the ancient Phoenician medals were inscribed the Cross, the Rosary and the Lamb. 43 In England there has been for a long time the custom of eating the so-called Hot-Cross Buns upon Good Friday:-- 44 this is no more than a reproduction of a cake marked with a cross which used to be duly offered to the serpent and the bull in heathen temples, as also to human idols. 45 It was made of flour and milk, or oil, and was often eaten with much ceremony by priests and people.

46 Perhaps the most ancient of all forms of the cross is the cruciform hammer known sometimes as Thor's Battle Ax. 47 In this form it was venerated by the heroes of the North as a magical sign, which thwarted the power of death over those who bore it. 48 Even to-day it is employed by the women of India and certain parts of Africa as indicating the possession of a taboo with which they protect their property. 49 It has been stated that this was the mark which the prophet was commanded to impress upon the foreheads of the faithful in Judah. (Ezekiel, chapter-9, verse:4).

50 It is of interest also as being almost the last of the purely pagan symbols to be religiously preserved in Europe long after the establishment of Christianity, since to the close of the Middle

Ages the Cistercean monk wore it upon his stole. 51 It may be seen upon the bells of many parish churches, where it was placed as a magical sign to subdue the vicious spirit of the tempest.

52 The original cross, no matter what its form, had but one meaning; it represented creative power and eternity. 53 In Egypt, Assyria and Britain, in India, China and Scandinavia, it was an emblem of life and immortality; 54 upon this continent it was the sign of freedom from suffering, and everywhere it symbolised resurrection and life to come. 55 Moreover from its common combination with the yoni or female emblem, we may conclude, with Inman, that the ancient Cross was an emblem of the belief in a male Creator and the method by which creation was initiated.

56 Next to the Cross, the 'Tree of Life' of the Egyptians furnishes perhaps the most ancient and universal symbol of immortality. 57 The tree is probably the most generally received symbol of life, and has been regarded as the most appropriate. 58 The fig tree especially has had the highest place in this regard. From it gods and holy people ascended to heaven; 59 before it thousands of barren women have worshipped and made offerings; under it pious hermits have become enlightened, and by rubbing together fragments of its wood, holy fire has been drawn from heaven.

60 An anonymous Catholic writer has stated, "No religion is founded upon international depravity. 61 Searching back for the origin of life, humans stopped at the earliest point to which they could trace it and exalted the reproductive organs in the symbols of the Creator. 62 The practice was at least calculated to procure respect for a side of Nature liable, under an exclusively spiritual regime, to be relegated to undue contempt. 63 Even Moses himself fell back upon it when, yielding to a pressing emergency, he gave his sanction to serpent worship by his elevation of the brazen serpent upon a pole or cross, 64 for all portions of this structure constituted the most universally accepted symbol of sex in the world."

65 As perfectly consistent with the ancient doctrine that deity is both male and female take this thought from Proclus, who quotes the following among other Orphic verses: "Jupiter is a man; Jupiter is also an immortal maid;" 66 while in the same commentary we read that "All things were contained in the womb of Jupiter." 67 In this connection it was quite customary to depict Jupiter as a female, sometimes with three heads; often the figure was drawn with a serpent and was venerated under the symbol of fire. 68 It was then called Mythra and was worshipped in secret caverns. The rites of this worship were quite well known to the Romans.

69 The hermaphrodite element of religion is sex worship; gods are styled he-she; Synesius gives an inscription on an Egyptian deity, "Thou art the father and thou art the mother; thou art the male and thou art the female." 70 Baal was of uncertain sex and his votaries usually invoked him thus, "Hear us whether thou art god or goddess." 71 Heathens seem to have made their gods hermaphrodites in order to express both the generative and prolific virtue of their deities. 72 I have myself heard one of the finest living Hindoo scholars, a convert to Christianity, invoke the God of the Christian Church both as father and as mother.

73 The most significant and distinctive feature of Nature worship certainly had to do with phallic emblems. 74 This viewed in the light of ancient times simply represented allegorically that mysterious union of the male and female principle which seems necessary to the existence of animate beings. 75 If, in the course of time, it sadly degenerated, we may lament the fact, while, nevertheless, not losing sight of the purity and exalted character of the original idea. 76 Of its extensive prevalence there is ample evidence, since monuments indicating such worship are spread over both continents and have been recognised in Egypt, India, Assyria, Western Europe, Mexico, Peru, Hayti and the Pacific Islands. 77 Without doubt the generative act was originally considered as a solemn sacrament in honour of the Creator. 78 As Knight has insisted, the indecent ideas later attached to

it, paradoxical as it may seem, were the result of the more advanced civilisation tending toward its decline, as we see in Rome and Pompeii. 79 Voltaire speaking of phallic worship says "Our ideas of propriety lead us to suppose that a ceremony which appears to us so infamous could only be invented by licentiousness, 80 but it is impossible to believe that depravity of manners would ever lead among any people to the establishment of religious ceremonies. 81 It is probable, on the contrary, that this custom was first introduced in times of simplicity, and that the first thought was to honour a deity in the symbol of life which it gives us."

82 The so-called Jewish rite of circumcision was practiced among Egyptians and Phoenicians long before the birth of Abraham. 83 It had a marked religious significance, being a sign of the Covenant, and was a patriarchal observance because it was always performed by the head of the family. 84 Indeed on the authority of the Veda, we learn that this was the case also even among the primitive Aryan people.

85 Later in the centuries, as Patterson has observed, obscene methods became the principal feature of the popular superstition and were, in after times, even extended to and intermingled with gloomy rites and bloody sacrifices. 86 The mysteries of Ceres and Bacchus celebrated at Eleusis were probably the most celebrated of all the Grecian observances. 87 The addition of Bacchus was comparatively a late one, and this name Bacchus was first spelled Iacchos; the first half, 'Iao', being in all probability related to 'Jao' which appears in Jupiter or Jovispater, and to the Hebrew Yahve, or Jehovah. 88 Jao was the Harvest God and consequently the god of the grape, hence his close relation to Bacchus. 89 How completely these Eleusinian mysteries degenerated into Bacchic orgies is of course a matter of written history.

90 I have not yet alluded to the reverence paid to the fish, both as phallic emblem and as a Christian symbol. 91 The supposition that the reason why the fish played so

large a part in early Christian symbolism was because of the fact that each letter of the Greek word 'Ichthus' could be made the beginning of words which when fully spelled out, read Jesus Christ, the Son of God, etc., is altogether too far-fetched; 92 though it be true it is a scholastic trick to juggle with words in this way rather than to find for them a proper signification.

93 Among the Egyptians and many other nations, the greatest reverence was paid to the fish. Among the natives the rivers which contained them were esteemed more or less sacred; 94 the common people did not feed upon them and the priests never tasted them, because of their reputed sanctity, while at times they were worshipped as real deities. 95 Cities were named after them and temples built to them. In different parts of Egypt different fish were worshipped individually; the Greek comedians even made fun of the Egyptians because of this fact. 96 Dagon figures as the Fish-god, and the female deity known as Athor, in Egypt, is undoubtedly the same as Aphrodite of the Greeks and Venus of the Romans, who were believed to have sprung from the sea. 97 Lucian tells us that this worship was of great antiquity; strange as this idolatry may appear, 98 it was yet most wide-spread and included also the veneration which the Egyptians, before Moses, paid to the river Nile.

99 It is important to remember that Nun, the name of the father of Joshua, is the Semitic word for fish, while the phallic character of the fish in Chaldean mythology cannot be gainsaid. 100 Nim, the planet Saturn, was the fish-god of Berosus, and the same as the Assyrian god Asshur, whose name and office are strikingly similar to those of the Hebrew leader Joshua. 101 Corresponding to the ancient phallus or lingam, which was the masculine phallic symbol, we have the Kteis or Yoni as the symbol of the female principle; 102 but an emblem of similar import is often to be met with in the shape of the shell, the fig leaf or the letter delta, as may be frequently seen from ancient coins and monuments. 103 Similar attributes were at other

times expressed by a bird, using the dove or sparrow, which will at once make one think of the prominence given to the dove in the fable of Noah and the Ark. 104 Referring again to the fish symbol let me say that the head of Proserpine is very often represented surrounded by dolphins; sometimes by pomegranates which also have a phallic significance. 105 In fact, Inman in his work on Ancient Faiths says of the pomegranate, "The shape of this fruit much resembles that of the gravid uterus in the female, and the abundance of seeds which it contains makes it a fitting emblem of the prolific womb of the celestial mother. 106 Its use was largely adopted in various forms of worship; it was united with bells in the adornment of the robes of the Jewish High Priest; it was introduced as an ornament into Solomon's Temple, where it was united with lilies and with the lotus." 107 Its arcane meaning is undoubtedly phallic. 108 In fact, as Inman has stated, the idea of virility was most closely interwoven with religion, though the English Egyptologists have suppressed a portion of the facts in the history which they have given the world; 109 but the practice which still obtains among certain Negroes of Northern Africa of mutilating every male captive and slain enemy is but a continuance of the practice alluded to in the 2nd Book of Kings, chapter-20, verse:18; Isaiah, chapter-39, verse:17; and 1st Samuel, chapter-18, verse:26.

110 Frequently in sacred Scripture we find allusions to the Pillar as a most sacred emblem, as for example in Isaiah, chapter-19, verse:19, "In that day there shall be an altar to the Lord in the midst of the land of Egypt and a pillar to the border thereof to Jehovah," etc. 111 Moreover God was supposed to have appeared to His chosen people as a 'pillar of fire'. Nevertheless when among idolatrous nations 'pillars' were set up as a part of their rites we find them noticed in Scripture as an 'abomination', 112 as for example, Deuteronomy, chapter-12 verse:3, "Ye shall overthrow their altars and break their pillars;" Leviticus. Chapter-26, verse:1, "Neither rear ye up a standing image."

113 Among the Jews the pillar had much the same significance as the pyramid among the Egyptians or the triangle or cone among votaries of other worships. 114 The Tower of Babel must have been purely a mythical creation but in the same direction. 115 Although Abraham is regarded as having emigrated from Chaldea in the character of a dissenter from the religion of his country (see Joshua, chapter-24, verses:2-3), his immediate descendants apparently had recourse to the symbols to which I have alluded. 116 Thus he erected altars and planted pillars wherever he resided, and conducted his son to the land of Moriah to sacrifice him to the deity, as was done among the Phoenicians. 117 Jeptha in like manner sacrificed his own daughter Mizpeh, and the temple of Solomon was supposed to have been built upon the site of Abraham's ancient altar. 118 Jacob not only set up a pillar at the place which he called Bethel but made libations; Samuel worshipped at the High Places at Ramah, and Solomon at the Great Stone in Gibeon. 119 It remained for Hezekiah to change the entire Hebrew cult. 120 He removed the Dionysiac statues and phallic pillars as well as the conical and omphallic symbols of Venus and Ashtaroth, broke in pieces the brazen serpent of Moses and overthrew the mounds and altars. 121 After him Josiah removed the paraphernalia of sun worship and destroyed the statues and emblems of Venus and Adonis, (2nd Kings, chapter-23, verses:4-20).

122 The Greek Hermes was identical with the Egyptian Khem, as well as with Mercury and with Priapus, also with the Hebrew Eloah; 123 thus when Jacob entered into a covenant with Laban his father-in-law, a pillar was set up and a heap of stones made and a certain compact entered into; similar land marks were usual with the Greeks and placed by them upon public roads.

124 As Mrs. Childs has beautifully said, "Other emblems deemed sacred by Hindoos and worshipped in their temples have brought upon them the charge of gross indecencies. 125 If light with its grand revealings, and heat, making the earth fruitful with beauty,

excited wonder and worship among the first inhabitants of our world, is it strange that they likewise regarded with reverence the great mystery of human birth? 126 Were they impure thus to regard it? Or are 'we' impure that we do 'not' so regard it?"

127 Constant, in his work on Roman Polytheism says, "Indecent rites may be practiced by religious people with the greatest purity of heart, 128 but when incredulity has gained a footing among these peoples then those rites become the cause and pretext of the most revolting corruption."

129 The phallic symbol was always found in temples of Siva, who corresponds to Baal, and was usually placed as are the most precious emblems of our Christian temples to-day, in some inmost recess of the sanctuary. 130 Moreover lamps with seven branches were kept burning before it, these seven branched lamps long antedating the golden candlestick of the Mosaic Tabernacle. 131 The Jews by no means escaped the objective evidence of phallic worship; in Ezekiel, chapter-16, verse:17, is a very marked allusion to the manufacture by Jewish women of gold and silver phalli.

132 As a purely phallic symbol and custom mark the significance of certain superstitions and practices even now prevalent in Great Britain. 133 Thus in Boylase's 'History of Cornwall' it is stated that there is a stone in the Parish of Mardon, with a hole in it fourteen inches in diameter, through which many persons creep for the relief of pains in the back and limbs, 134 and through which children are drawn to cure them of rickets, this being a practical application of the doctrine of regeneration. 135 In 1888 there was printed in the 'London Standard' a considerable reference to passing children through clefts in trees as a curative measure for certain physical ailments. 136 The same practice prevails in Brazil and in many other places, and within the present generation it has been customary to split a young ash tree and, opening this, pass through it a child for the purpose of curing rupture or some other bodily ailment.

137 The phallic element most certainly cannot be denied in Christianity itself, since in it are many references which to the initiated are unmistakable. 138 From the fall of man with its serpent myth and its phallic foundation to the peculiar position assigned to the Virgin Mary as a mother, phallic references abound. 139 However, it should not be forgotten that whatever were the primitive ideas on which these dogmas were based, they had been lost sight of or had been received in a fresh aspect by the founders of Christianity. 140 The fish and the cross originally typified the idea of generation and later that of life, in which sense they were applied to Christ. 141 The most plainly phallic representation used in early Christian Iconography, is undoubtedly the 'Aureole' or elliptical frame work, containing usually the figure of Christ, sometimes that of Mary. 142 The Nimbus also, generally circular but sometimes triangular, is of positive phallic significance, even though it contain within it the name of Jehovah. 143 The sun flowers which sometimes are made to surround the figure of St. John the Evangelist are the lotus flowers of the Egyptians. 144 The divine hand with the thumb and two fingers outstretched, even though it rests on a cruciform nimbus, is a phallic emblem, and is used by the Neapolitans of to-day to avert the Evil Eye, although it was originally a symbol of Isis. 145 Indeed the Virgin Mary is the ancient Isis, as can be most easily established, since the virgin "Succeeded to her form, titles, symbols, rites and ceremonies." (King). 146 The great image still moves in procession as when Juvenal laughed at it, and her proper title is the exact translation of the Sanskrit and the equivalent of the modern Madonna, the Lotus of Isis, and the Lily of the modern Mary. 147 Indeed, as King has written, "It is astonishing how much of the Egyptian symbolism passed over into usages of the following times." 148 The high cap and hooked staff of the god became the bishop's mitre and crozier. The term Nun is purely Egyptian and bore its present meaning. 149 The Crux Ansata, testifying the union of the male

and female principle in the most obvious manner, and denoting fecundity and abundance, is transformed by a simple inversion into an orb surmounted by a cross, the ensign of royalty.

150 The teaching of the Church of Rome regarding the Virgin Mary shows a remarkable resemblance to the teachings of the ancients concerning the female associate of the triune deity. 151 In ancient times she has passed under many and diverse names; she was the Virgin, conceiving and bringing forth from her own inherent power; she was the wife of Nimrod; she has been known as Athor, Artemis, Aphrodite, Venus, Isis, Cybele, etc. 152 As Anaitis she is Mother and Child, appearing again as Isis and Horus; even in ancient Mexico Mother and Child were worshipped. 153 In modern times she reappears as the Virgin Mary and her Son; she was queen of fecundity, queen of the gods, goddess of war, Virgin of the Zodiac, the mysterious Virgin "Time" from whose womb all things were born. 154 Although variously represented she has been usually pictured as a more or less nude figure carrying an infant in her arms. (Inman, "Ancient Faiths").

155 Inman declares without hesitation that the trinity of the ancients is unquestionably of phallic origin, 156 and others have strenuously contended and apparently proven that the male emblem of generation in divine creation was three in one, and that the female emblem has always been the triangle or accepted symbol of trinity. 157 Sometimes two triangles have been combined forming a six-rayed star, the two together being emblematical of the union of the male and female principles producing a new figure; 158 the triangle by itself with the point down typifies the delta or yoni through which all things come into the world.

159 Another symbol of deity among the Indians was the Trident, and this marks the belief in the Trinity which very generally prevailed in India among the Hindoos. 160 As Maurice says, "It was indeed highly proper and strictly characteristic that a three-fold deity should wield a triple scepter." 161 Upon the top of the

immense pyramids of Deoghur, which were truncated, and upon whose upper surface rested the circular cone-- that ancient emblem of the Phallus and of the Sun, was found the trident scepter of the Greek Neptune. 162 It is said that in India is to be found the most ancient form of Trinitarian worship.

163 In Egypt it later prevailed widely, but scarcely any two states worshipped the same triad, though all triads had this in common at least that they were father, mother and son, or male and female with their progeny. 164 In the course of time, however, the worship of the first person was lost or absorbed in the second and the same thing is prevalent among the Christians of today, 165 for many churches and institutions are dedicated to the second or third persons of the Trinity but none to the first.

166 The transition from the old to the new could not be effected in a short time and must have been an exceedingly slow process, 167 therefore we need not be surprised to be told of the ancient worship that after its exclusion from larger places it was maintained for a long time by the inhabitants of humbler localities; 168 hence its subsequent designation, since from being kept up in the villages, the 'pagi', its votaries, were designated 'pagani', or pagans.

169 Even now some of these ancient superstitions remain in recognisable form. 170 The moon is supposed to exert a baneful or lucky influence according as it is first viewed; the mystic horse-shoe, which is a purely uterine symbol, is still widely employed; 171 lucky and unlucky days are still regarded; our playing cards are indicated by phallic symbols, the spade, the triadic club, the omphallic distaff and eminence disguised as the heart and the diamonds. 172 Dionysius reappears as St. Denys, or in France as St. Bacchus; Satan is revered as St. Satur or St. Swithin; 173 the Holy Virgin, Astraea, whose return was heralded by Virgil as introducing the Golden Age, is now designated as the Blessed Virgin, Queen of Heaven. 174 The Mother and Child are to-day in Catholic countries adored as much as were Ceres and Bacchus, or Isis and the infant Horus, centuries ago. 175 The nuns

of Christian to-day are the nuns of the Buddhists or of the Egyptian worshippers of Isis, and the phallic import is not lost even in their case since they are the "Brides of the Saviour." 176 The libations of human blood which were formerly offered to Bacchus found most tragic imitation in the sacrifices of later days. 177 The screechings of the ancient prophets of Baal, and of the Egyptian worshippers, preceded the flagellations of the penitentes. 178 Even recently, during Holy Week in Rome, devotees lash themselves until the blood runs, as did the young men in ancient Rome during the Lupercalia. 179 And even yet in New Mexico the Indian 'penitentes' repeat the cruel flagellations and cross-bearing taught by the Spanish priest, to the extent-- sometimes-- of an actual crucifixion. 180 In the ancient Roman catacombs are found portraits of the utensils and furniture of the ancient mysteries, and one drawing shows a woman standing before an altar offering buns to a certain god. 181 In fact we may say there is no Christian fast nor festival, procession nor sacrament, custom nor example, that do not come quite naturally from previous paganism.

182 The Creation is in fact a 'human rather than a divine product', in this sense that it was suggested to the mind of human by the existence of things, while its method was, at least at first, suggested by the operations of Nature; 183 thus human saw the living bird emerge from the egg, after a certain period of incubation, a phenomenon equivalent to actual creation as apprehended by your simple mind. 184 Incubation obviously then associated itself with Creation, and this fact will explain the universality with which the egg was received as a symbol in the earlier systems of cosmogony. 185 By a similar process creation came to be symbolised in the form of a phallus, 186 and so the Egyptians, in their refinement of these ideas, adopted as their symbol of the first great cause, a Scarabaeus, indicating the great hermaphroditic unity since they believed this insect to be both male and female.

187 Further exemplification of the same underlying principle is seen

in the fact that most all of the ancient deities were paired, thus we have heaven and earth, sun and moon, fire and earth, father and mother, etc. 188 Faber says,-- "The Ancient Pagans of almost every part of the globe were wont to symbolise the world by an egg; hence this symbol is introduced into the cosmogonies of nearly all nations, 189 and there are few persons even among those who have made mythology their study to whom the mundane egg is not perfectly familiar; 190 it is the emblem not only of earth and life but also of the universe in its largest extent."

191 I began this essay with the intention of demonstrating the recondite but positive connection between the symbolism of the Church of to-day and the phallic and iatric cults of pre-christian centuries. 192 Much of the subject matter contained in chapter-3 may be profitably read in this connection. 193 As a humble disciple of that Aesculapius who was the reputed founder of our craft, I have felt that every genuine scholar in medicine should be familiar with these relations between the past and the present.

THE RELATION OF THE GRECIAN MYSTERIES TO THE FOUNDATION OF CHRISTIANITY

5 Ever since mentality has been an attribute of humankind, human has appreciated that you are surrounded by a vast incomprehensible mystery which ever closes in upon you, and from whose environment you may never free yourself. 2 The endeavour to solve this mystery has on one hand stimulated your reasoning power, and on the other nearly paralysed it. 3 Having no better guidance you have in all time attributed to a Great First Cause powers and faculties, even shape and form, more or less human; 4 thus from time immemorial God or the gods have been given a kingdom, a throne, some definite form, and even offspring. 5 To Him or them have been given purely human attributes, and they have been supposed to possess human passions and to be capable of love, wrath, strength, etc. 6 In nearly all

ages lightning, for instance, has been regarded as an expression of divine fury. 7 As intelligence advanced the number of gods was reduced and their manifestations classified and studied more or less imaginatively; 8 and so while humans have always acknowledged the impossibility of explaining the great mysteries of creation and of space, 9 they have seemed to find it necessary to create other equally inscrutable mysteries of purely human invention, such as the incarnation, the trinity, the resurrection, vicarious salvation, metempsychosis, and the like.

10 History shows the love of mystery to be contagious as well as productive of its kind, and the origin of mystic teachings as well as of most secret societies bears out these statements. 11 Secrets, guarded by fearful oaths, personified by meaningless emblems, concealed either in language unintelligible to others, 12 or else hidden in terms whose special meaning is known only to the initiated, made attractive by special signs, symbols, innocent rites, or barbarous observances,-- 13 all of these means were designed solely to keep people banded together for the purpose of forming a propaganda intended to perpetuate yet other mysteries in which the initiates were especially interested. 14 Since history began such associations of people have existed for most diverse ends, all having this in common, that only by this means could they secure and maintain influence and power. 15 And so the series of pictures which represent human in this role may be regarded as a panorama, led by garlanded priests carrying images of Isis or droning hymns to Demeter of Eleusis, or Druids preparing for their human sacrifices; 16 followed by gay and voluptuous Bacchantes, succeeded by white-robed Pythagoreans; next may come the suffering Essenes bearing crosses, then the Latin Brotherhoods, followed by the German and English Guilds, the Stone Masons with their implements, the Crusader Knights, 17 those coming first having an appearance of actual humility and devotion, while those who follow are haughty and contemptuous to a degree. 18 Then would follow the

black-robed Penitentes and the members of the Society of Jesus, sanctimonious, with eyes cast down, human machines, mere tools in the hands of their superiors; 19 the panorama continuing with a widely assorted lot of scholars, artisans and people of all conditions in various regalia, and terminated with an indistinguishable multitude of variously adorned people, 20 some sleek and fat, others ill-conditioned, some devout and sincere, others mere jesters and knaves from every walk of life.

21 It was most natural and to be expected that primitive humans should be most profoundly impressed with the forces of Nature, 22 often terrifying and frightful, often winsome and attractive, and that they should bow themselves down to the unknown cause of these manifestations. 23 With their extremely finite mind they necessarily personified them; after having done this they proceeded to propitiate them by worship with certain forms of ritual. 24 Perhaps fire first and most of all attracted them in this way, and drew from them the earliest acts of worship, 25 for in spite of the general views to the contrary fire is often of natural origin, and must have been known to humans before they became able to produce it by their own efforts. 26 From practical to generalised concepts was a natural step, and thus mythology had its beginnings; 27 the earliest distinctions were as between that which is overhead, i. e. Heaven, and that which is beneath, namely, the earth; these are the beginnings of all cosmogonies. 28 Next the gods were given the attributes of sex; Heaven was represented as masculine, fructifying, powerful; Earth as conceptive, female and gentle. 29 By the union of these two were produced sun, moon and their progeny-- the stars. 30 Later the sun became Poseidon or Neptune, because it appeared from and disappeared into the sea. 31 Then the imagination began to run riot, and gave rise to many individual divinities, gods and goddesses, all with human passions and attributes, mingling and propagating after human fashion, 32 and begetting dynasties and half human races, whose

doings were the subject of countless epics, dramas, myths and romances.

33 Thus time passed on and the original sense or meaning of these myths, descending slowly by oral tradition, became lost, while the myths themselves were for a long time accepted as historical facts. 34 Nevertheless in all ages there have been people who, like Aristotle, Cicero and Plutarch, have questioned the accuracy of these statements and shown themselves intelligent and active sceptics. 35 During all these times, however, a wily priest-craft had lived and thrived on the superstitions of the common people and the practices in which they have indulged; 36 by these people, thus conditioned, any active doubt was regarded as subversive of the system by which they were supported, and as one not to be tolerated;-- 37 this condition pertaining not only to antiquity, since it is too significant a feature even of the early years of the twentieth century. 38 A more or less honest though misinformed priesthood has, in all times, been in favour of the purification of the theology in vogue in their times and among their inner circles, 39 and has in the main given the most rationalistic interpretation to the obscure things which they taught, and practised what their education and environment would permit. 40 But in order to preserve the mysteries, to maintain them as such, and save themselves from becoming superfluous, not to say intolerable, 41 these same mysteries have been tricked out with mysticism, symbolism of the most fantastic character, and allegory of the most bewildering kind; 42 moreover this has often been accomplished by dramatic representations and by moralising or demoralising ceremonies. 43 The countries in which these "mysteries," as they have since been known, were most commonly practised and most widely believed were Egypt, Chaldea and Greece.

44 The sources of the Egyptian mysteries, like those of Egyptian civilisation, are the most difficult to discover. 45 The Nile is necessarily the basis of Egyptian history, geography, activity and habits, and consequently must be also of the Egyptian cult. 46 The

people who were known as Egyptians invaded the land of the Nile from the direction of Asia, and found there a race of negro type whom they subdued and with whom they later mingled. 47 The Semites called the land Misraim; the Greeks finally changed the name of its great river to Neilos. 48 The country is a land of enigmas. Who built those pyramids, and why? Who originated the system of pictorial writing which we call the hieroglyphic? 49 Who planned those wonderful temples now either in ruins, as in upper Egypt, or buried beneath the desert sands, as in lower Egypt? 50 Who brought and erected those mighty blocks of stone or massive slabs from enormous distances, and handled them as we could scarcely do to-day with the best of modern machinery?

51 In course of time two hereditary classes were formed, the priests who dominated the minds, and the warriors who controlled the bodies of the conquered people and the lower classes. 52 The latter kept the throne of Egypt occupied, while the former, having a monopoly of the knowledge of the time, prescribed for the people what they must believe, 53 yet were very far from accepting these precepts for themselves, and in their inner circles made light of that which they preached to the despised classes without.

54 The Egyptians named their Sun God RE, but assigned the various attributes of the sun to different personalities; they had moreover not only gods for the whole land, but Ptah was God of Memphis, Ammon God of Thebes, etc. 55 Local deities were often constructed out of inspiring objects or from animals inhabited by spirits, and thus the fetichism of the original negro race exerted no little influence upon the higher cult of their lighter coloured conquerors. 56 Worship was paid to animals not for their own sake but because of the gods who were supposed to reside within them; thus their prominent gods were represented with the head of some animal. 57 This honour belonged not to any individual animal but of necessity to the entire species, certain representatives of which were maintained at public expense in the temples, where they were

carefully guarded and waited upon by the faithful. 58 To harm one of these animals was to be severely punished, to kill one of them was to die. 59 Conversely when a God failed in responding to the prayers of the faithful his fetich had to suffer, and the priests first threatened the animal, and if menaces were unavailing they killed the sacred beast, albeit in secret, lest the people should learn of it.

60 As time went on there was less of zoölatry, and the Sun-gods and their associates figured more largely among the cult of the people. 61 The sun's course was not represented as that of a chariot, as among the Persians and Greeks, but rather as the voyage of a Nile boat, upon which the God Re navigated the heavens; 62 from which it will appear that the priestly religion was making slow progress to monotheism by means of oligotheism. 63 The secret teaching of the priests was now more and more to the effect that the gods stood not so much for themselves as for something else. 64 During the fourth dynasty the lower Egyptian city Anu was known as the City of the Sun, hence the Greek name for the place, Heliopolis. 65 Still more characteristic was the giving of the name of Osiris, who figured as God of Abdu, which the Greeks called Abydos, 66 in upper Egypt, to the God of the Sunset, who was king of the lower domains and of death, brother and at the same time husband of Isis, brother also of Set, who slew him, and father of Horus, i. e. God of the new sun, who figures after each sunset. 67 Horus fought with Set, but being unable to completely destroy him left him the desert as his kingdom, while himself holding to the Nile valley. 68 This story of the gods was publicly represented in various scenes on certain holidays, but only the priests, i. e., the initiated, knew the real meaning of the representations. 69 Even the name of Osiris and his abode were kept secret, and outsiders heard only of the "great God" dwelling somewhere in "the West."

70 These were the most famous of all the old Egyptian mysteries, though to them were added many others, including that of Apis, the sacred bull of Memphis, who

served also as the symbol of the Sun and of the fructifying Nile; 71 beneath his tongue was to be seen the sacred beetle, and the behaviour of the great animal was supposed to be prophetic and his actions to mean oracular sayings. 72 The Sphinx again was a sun-God his image being repeated throughout the Nile region, and was always thought of as a male; 73 the head was represented as that of some king, while the whole figure stood for the Sun-God Harmachis; although the sphinx later introduced into Greece was always female.

74 While the Egyptians did not attribute to their numerous gods divine perfection, they nevertheless regarded religious practices as a means of currying favour with their divinities, a custom apparently still in favour. 75 The priests believed in a Sun-God as the only true deity, but not so the people; 76 thus the priests in the various cities praised their local and tutelary God as supreme and made him identical with Re, whose name they appended to the original, as for instance 'Amon-Re'. 77 The king, no matter where he was, prayed always to the local deity as lord of heaven and earth, yet in words always the same.

78 At last during the eighteenth dynasty, about 1460 B. C., Amenhotep IV realised that the power of the priesthood was a menace to the crown and therefore proclaimed the Sun as the sole God, not in human shape, but in that of a disk. 79 He ordered all other images of other gods associated with the sun to be destroyed; the priests of these deposed gods lost their places and estates, which latter were confiscated. 80 But his sons-in-law who succeeded him restored the deposed monarchs. Nevertheless they were marked as heretics by those priests who were reinstated in their former power. 81 In consequence of this conflict, which was violent and prolonged, the intellectual life of Egypt was paralysed and the mystic teachings of the priests were henceforth not disturbed by any wave of progress or advance. 82 The people again sank into a stupid and unredeemable formalism, demonism and sorcery. 83 With the purpose of amusing them the

priests furnished gorgeous sacrificial processions and festivals, while at the same time drawing them away from the true God by teaching them a worship of deceased kings and queens. 84 They also built temples, to only the outer portion of which were the people generally admitted, while the innermost portions were guarded by these priests lest the mysteries thus protected be such no longer. 85 They also procured the building of the ancient Labyrinth, near Lake Moeris, of which Herodotus tells us that there were fifteen hundred chambers above ground and as many more under ground, 86 which latter were never shown except to the initiated, and which contained the remains of sacred crocodiles and of the Pharaohs.

87 The Egyptian priests taught that human was made up of 'body', a material essence or the 'soul', 88 which in the shape of a bird left the body at death, and an 'immaterial spirit' which held to the human the same relation which a God held to the animal in which one dwelt, and which at death departed from the body like the image of a dream. 89 They taught also that, if the soul and spirit were to live on, the body should be embalmed and laid in a rock chamber, and that then the relatives must supply meat, drink, and clothing for its use. 90 The spirit took its way to Osiris and by means of a magic formula the dead would be made one with Osiris; 91 hence in the Egyptian "*Book of the Dead*" the deceased was addressed as Osiris with his own name added, and could now lead a happy life in the other world, 92 which life was portrayed on the walls of the Sepulchres in pictures which are still to be seen, showing how the creature comforts of this world were to be enhanced in the next. 93 Having reached the outer world, and having escaped the host of demons that threatened one on one’s passage, one could then revisit this earth at will in any form.

94 The Egyptian priests also taught that there was a judgment of the dead, and that new comers had to appear before Osiris, with his forty-two Assessors, and disclaim the commission of each one of forty-two sins; 95 all of which was

a magic formula for obtaining bliss according to their notion rather than anything intended as a true statement. 96 The hippopotamus figured as an active agent in the Book of the Dead, appearing always as the accuser, when the sins and the good deeds were being weighed in the balance, while the God Thot was the "attorney for the defense."

97 All these secret doctrines of a priestcraft necessitated secret associations, at least of the higher priests, to which the king was always admitted, the only Egyptian outside of the priesthood to be thus taught their secrets. 98 This was purely for protection; having less fear of foreigners these priests often initiated distinguished men from foreign lands, Greeks especially. 99 Thus Orpheus, Homer, Lycurgus, Solon, Herodotus, Pythagoras, Plato, Archimedes, and many others, received the secret doctrine. 100 The ritual was a long and tedious but significant ceremony, taught by degrees like the Masonry of to-day, and necessitated in some cases the right of circumcision; all who passed it were pledged to the most strict silence. 101 According to Diodorus the Orphic Mysteries were in large degree a repetition of the Egyptian, while the Greek legislators, philosophers and mathematicians whom I have named drew their knowledge from the same source; all of which is probably a very gross exaggeration. 102 Nevertheless it would appear from the hieroglyphic remains that high grade schools were conducted by the Egyptian priests, and that foreign scholars could obtain for themselves instruction in the exact sciences of the day. 103 Only the priests, however, were able to write the hieroglyphics, at least in the earlier centuries of Egyptian history.

104 There can be no doubt but that the secret doctrine of the Egyptian priests was both philosophic and religious, and was sharply distinguished from the popular belief which mistook tradition for truth; 105 that it was monotheistic, that it rejected polytheism and zoölatry, and that the true signification of Egyptian mythology was expounded in private. 106 Moreover an essential

part of this mystery concerned the interpretation of myths as allegorical accounts of personified natural phenomena. 107 For instance Plutarch ("Isis and Osiris") writes-- "When we hear of the Egyptian myths of the gods, their wanderings, their dismemberment and other like incidents, we must recall the remarks already made, 108 so as to understand that the stories told are not to be taken literally as recounting actual occurrences."

109 Without now going into the subject of the relative age of the Egyptian and Chaldean cults, I will remind you that the secret wisdom of one race was not excelled by that of the other. 110 The Chaldean races are undoubtedly of Turanian origin, and their form of religion was peculiar to the Ural-Altaic stock and the Turkic races, who originated the Cuneiform writing. 111 Their most ancient writings represented evil spirits as coming from the desert in groups of seven, and contained formulas for exorcising them; 112 they were presided over by the heavens, while from the higher spirits evolved gods and Goddesses in countless number. 113 Upon the original ground work of Chaldean ideas a Semitic race built a superstructure, and the first traces of the Babylonians and Assyrians appeared some four thousand years B. C. 114 Their highest God was an individual whom they named Baal, while the sun and moon were his images. 115 As in Egypt the priests were held in great reverence, standing next after the king, who was 'ex officio' high priest; they too had a secret doctrine withheld from the vulgar. 116 Although the Chaldeans were astrologers rather than astronomers, they were yet familiar enough with the heavens to estimate astral phenomena for what they really were, 117 instead of holding them to be gods, though they may have represented them as such to the common people. 118 Their literature contained numerous mythological poems, so obscure that to understand them a key was required, which key was only in the possession of the priests. 119 Inasmuch as Abraham came from Ur in Chaldea, with him crept into biblical literature

much of the Chaldean tradition and folklore. 120 The Chaldeans had also their Noah, and their deluge, in which the dove figured as in the biblical account. 121 When the proprietor of the Ark finally freed the animals he erected an altar and offered sacrifice, to which the gods gathered "like masses of flies." 122 This story contributes but one section of the great Chaldean epic in which are recounted the exploits of a hero corresponding with the Nimrod of the Hebrew Bible, dating from the twenty-third century B. C., 123 and reminding one forcibly of the Herculean and many other myths recounted in other ancient languages.

124 An off-shoot of the Chaldean culture was that of Persia, whose priestly class were far removed above the warriors and farmers that constituted the other two classes. 125 Priests married only among their own race, possessed all the knowledge, made their king 'ex officio' one of themselves, and practised itinerant teaching, but solely among their own caste. 126 In the holy city, Ragha, the priests alone held rule and no secular power prevailed; Zoroaster was their founder; they were the physicians, astrologers, interpreters of dreams, scribes and officers of justice, 127 while they impressed upon the minds of the people their exclusive duties;-- to reverence the holy fire, which was their greatest mystery, to listen to the teaching of passages from the sacred book, and to perform numerous ceremonies of purification. 128 Only the initiated were taught the meaning of the strife between the good Ormuzd and the evil Ahriman, which was probably the alternation of day and night, and of summer and winter.

129 In India the intense feeling with regard to caste but little altered the condition of things from that obtaining as above described, 130 though the Brahmins were further away from the other castes than in other countries where the priests came from the common people; 131 by the latter the Brahmins used to be regarded as gods and did all they could to perpetuate this feeling. By this fact alone they became a self-constituted mystic organisation, being themselves pantheists while

the people were idolators. 132 Though they taught pantheism in their sacred books, the second and third castes, namely the warriors and farmers, did not understand the teaching, and the fourth caste dared not read them at all.

133 In this pantheism, penitents and hermits were esteemed as above kings and heroes; 134 but even the life of a hermit was not exacting enough for them, so they organised the idea of a soul of the universe so incomprehensible that, as they themselves acknowledged, no human could comprehend it or instruct another in it. 135 Despairing of solving the problem they finally fancied that the universe was a phantasm, and that the earth and all things earthly were nothing. 136 They taught that through countless aeons of time humans grew always worse, and were born only to suffer and die, or to do penance in the torments of an indescribable Hell. 137 Naturally of all these things the people could only understand the teachings pertaining to hell and future punishment, and so the Brahmins contrived for them a supreme deity, having the same name as their Soul of the Universe, namely Brahma, whom they made the creator but playing a passive part. 138 The people were not content, however, with an absentee passive God, but paid much more attention to Vishnu the preserver, and the dreaded Siva, the destroyer. 139 After a while these three gods were united in a sort of trinity, represented by a three headed figure, but without temples or sacrifices. 140 The Brahmins continued their subtleties and divided the people into parties, like the scholiasts and disputants of the middle centuries of our present Christian era, and so the Hindoo religion became more and more debased.

141 However, in the sixth century B. C., Buddha, that great figure in early history, endeavoured to save it by a reform which found much more encouragement in the West, and to the far East of India, than in India itself, 142 and which has since assumed a more composite character by fusion with the religions of the surrounding countries. 143 Buddha formed first a monastic society based upon ethical doctrines, whose

underlying principle was that only by a renunciation of everything can human find safety, peace and comfort. 144 Buddha's first teachings were mystic and for the initiated only; his followers believed also in reincarnation. 145 After his death and that of those who were supposed to have lived before him, and who were expected to appear again, and who had been raised to the dignity of gods, 146 (and after their number had been added to that of the popular Hindoo gods and to the gods of the other people), then Buddhism became a polytheism, 147 and because of the variety of possible explanations and the necessary exegesis, assumed in the end the dimensions of a secret mystic doctrine.

148 The Hellenes undoubtedly did, in the beginning, worship natural forces under the form of animals, especially of serpents; 149 later human and animal forms were united, and so they had deities with heads of animals, or with the bodies of horses like the Centaurs, or with the hoofs of goats like the Satyrs. 150 But the natural Greek taste for the beautiful early asserted itself; the figures of gods came by degrees to express the ideal of physical perfection, that is the human shape, 151 and the Grecian religion became essentially a worship of the beautiful, and not as among Oriental religions a worship of the unnatural or hideous. 152 They forgot the astronomic and cosmic significance of the early myths and held rather to personifications of the normal forces, of which their poets sang as of mortal heroes. 153 They never dreamt of dogma, creed or revelation, demanded only that human honour the gods, but left it to the taste of each one how you should suitably perform your acts of reverence. 154 It must be confessed, however, that in candor and chastity they left much to be desired; but this may be explained when we remember that their own gods set them a very poor example in these respects. 155 Still history will forgive them much because they loved much. 156 The Greeks were exceedingly liberal in their interpretations concerning the gods, while the various peoples constituting the Greek race were not at all agreed

as to the number and respective rank of the gods whom they worshiped. 157 Thus one would be disowned here, another there; while in one place greater honour would be paid to one, or elsewhere to another; exactly as in the case of the Saints among the Catholic people of to-day. 158 They went so far in their worship of the beautiful as to divide the gods among the localities which possessed statues of them, which gods came to be regarded as distinct individuals; 159 so that even Socrates doubted whether Aphrodite of the sky and Aphrodite of the people were or were not the same person.

160 Furthermore in their liberality they made gods to hand for every emergency, and even worshiped the unknown gods, as St. Paul long ago recorded. 161 For the Greeks these gods were neither monsters like those of Egypt, India and Chaldea, nor incorporeal spirits like the gods of Persia and of Israel, but human beings with all the human attributes. 162 For the Greeks neither Jehovah existed, nor a personal devil in any form. 163 Like the Greeks themselves their gods had many human failings, though in them religion survived many mythological creations like the Centaurs, the Satyrs, etc. 164 These were merely folklore beings enacting parts ranging from terror to farce, and never receiving divine honours.

165 Grecian religion was, so to speak, the established church of the Greek states, but came to be in time a cloak for the designs of the politicians; in which respect history has many times repeated itself. 166 For instance Socrates was made to drink his cup of hemlock on the pretext that he had apostatised from the state religion. Still even in his day heresy played no part except among politicians. 167 Every one could plainly state his convictions, and Aristophanes in his comedies introduced gods in the most ridiculous and compromising situations. 168 So long as the public worship of the gods went on, the state cared little for the upholding of positive or suppressing of negative beliefs. 169 The gods were entitled to sacrifices and the people to divine aid, but they could regulate the interchange to suit themselves. 170 The greatest public crimes were

violation of temples and profanation of sacred things; one must leave the images alone even if you did not believe in the gods they represented. 171 Punishment of blasphemy was only inflicted when complaint was made. 172 Foreign gods could be introduced and worshiped at will, providing only that the customary honours were rendered to those at home.

173 Such religious freedom could naturally only exist during the minority or the absence of a priestly class. 174 Anyone could transact business with the gods or conduct sacrifices; priests were employed only in the temples, and outside of them they had neither business, influence nor privileges. 175 Their pantheism was comprehensive; the gods were everywhere, and the honour done to them consisted in invocations, votive offerings and sacrifices. 176 The Grecian religion recognised no official revelation which all were required to believe, though it did not deny the possibility of revelations at any time. 177 Their oracles were obtainable only in particular places and through duly qualified individuals. 178 At one time in ancient Greece conjuration was in vogue, but the gods and demons who indulged in it were all borrowed from foreign sources, and in time it degenerated into pure magic.

179 The Greeks, however, could not get away from the sentimental notion that belief in the gods must have an ethical side and must be subordinate to their faith; 180 in other words that human nature was something entirely different from the divine to which it was subject. 181 Alienation from the God in which they believed led necessarily to the impulse to seek Him, which was the leading motive in the institution of the Grecian mysteries,-- gods who were human's equals were not sufficient for the Greeks. 182 In the beginning of these mysteries they borrowed the art of the popular religion, disregarded the science of the day as well as the philosophic doctrines of their great people, 183 held in contempt both human power and human knowledge, and devoted themselves almost entirely to self-introspection, meditation on revelation, incarnation and resurrection, 184 and presented

these things in dramatic forms and ceremonies, by which illusions they hoped to make more or less impression upon the senses. 185 The Grecian mysteries were the opposite of genuine Hellenism. 186 The true Greek was cheerful, happy, clear in perception, and their gods appeared to them as do their statues to us to-day. 187 But Greek mysticism was full of gloom, symbolism and fantastic interpretations; in every way it was unhellenic and abnormal, having no fit place in their soil nor in their age. 188 It always has been the case that sentimental, romantic or mystical dispositions find delight in the mysterious, while logical minds are unmoved by it. 189 From the Mysteries no human was excluded, save those who had shown themselves unworthy of initiation. 190 They had their origin in the early rites of purification and atonement; the former being at first only bodily cleansing, which later took on a moral significance; 191 while the atonement was a sort of expiation which came with the consciousness of sin and desire for forgiveness. 192 Atonement was most called for in case of blood guiltiness, and consisted largely in the sacrifices of animals, burning of incense, etc. 193 In all the ancient mysteries these two features of purification and expiation played a great part.

194 Of them all the oldest and most celebrated were those instituted at Eleusis, in Attica, in honour of the Goddess Demeter (Latin Ceres), and her daughter Persephone (Latin Proserpina). 195 To these were added later a masculine deity, known at first as Iacchos, whose name is probably related to Jao, which appears in Jovispater or Jupiter, and to the Hebrew Yahve or Jehovah. 196 Later, however, B was substituted for I and Iacchos was made to read Bacchus. Jao was the Harvest God, and consequently God of the grape, hence the close relation to Bacchus. 197 The Greek word Eleusis means 'advent', and commemorates the visit of Demeter while wandering in search of her daughter,-- which reminds one of the Egyptian story of Isis. 198 Moved by gratitude, Demeter bestowed upon the people of Eleusis the bread-grain and the mysteries. 199 From this

city the cult of these two deities spread over all Greece and most of Asia Minor, passed into Italy in modified form, and thus became widely accepted. 200 The people built at Eleusis a temple in pure Doric style and a Mystic House in which the secret festivals were held. 201 The city was connected with Athens by a Sacred Way, which was flanked with temples and sanctuaries, while in Athens itself was a building, the Eleusinion, in which a portion of the mysteries were celebrated. 202 The buildings at Eleusis were in good preservation until the fourth century A. D., when they were destroyed by the Goths under Alaric, and at the instigation of monkish fanatics. 203 You will see, then, that the mysteries were widely observed in Asia Minor, and at a time when they must have deeply tinged the religious views and habits of a large portion of the population prior to the beginning of the Christian Era.

204 The Eleusinian mysteries were always under the direction of the Athenian government, and the report of their celebration was always rendered to the grand council of Athens. 205 The function of the priests was an hereditary and exclusive privilege and the mysteries as a whole were under the immediate care of a sacred council. 206 The people contented themselves mainly with honouring the gods, while in these mysteries the original endeavour was to emphasise the preëminence of the divine over the human, hence their careful guardianship by the authorities of the state. 207 Both were offshoots of pantheism, one seeing the divine in all earthly things, the other constantly searching for it there, and striving to unite with it. 208 Monotheism, that is absolute separation of the human from the divine without hope of union, is a purely Oriental conception, quite incomprehensible to the Greek mind. 209 No ancient Greek ever conceived of a creative deity in the Egyptians' sense, nor of a vengeful Jehovah like that of the Hebrews.

210 The Eleusinian mysteries were most highly venerated among the Greeks; so much so that during their celebration hostilities were suspended between opposing armies, while those who witnessed

them uninvited or betrayed the secret teaching, or ridiculed them, were executed or banished. 211 So late even as the period of the Roman supremacy the Roman Emperors took an interest in maintaining these mysteries, and some of the early Christian Emperors, like Constantius II. and Jovian, while forbidding nocturnal festivals made an exception of these.

212 The sum of the original Eleusinian doctrine is a myth based upon the rape of Demeter's daughter Persephone by Pluto, all of which is the old story of the seasons and the changes brought about in their regular succession; 213 and as Persephone was ultimately united with Bacchus but returned to the lower world for the winter, we see typified first, the fruitfulness of the Sun God; 214 secondly, the fecundity of the soil, and, thirdly, the resurrection of the body, which having been dropped like the grain into the earth was supposed to rise from it again after a similar fashion. 215 How much this may have to do with present Christian beliefs concerning the resurrection may not be easily decided. 216 Nevertheless it is of interest that the doctrine of the resurrection is of pre-Christian origin and is traceable through heathen teachings, even if having no greater support than the analogy above cited. 217 The central teaching of the mysteries was probably that of a personal immortality analogous to the return of bloom and blossom to plants in the spring.

218 There were two festivals held at Eleusis, the 'lesser' in March, when the ravished Persephone came up out of the nether world into the sunlight; and the 'greater' in October when she had to follow her sullen spouse into Hades again. 219 The preliminary celebration was held at Athens, and lasted six days, from October 15th to 20th. They all assembled upon that day and went down to the seashore for the rite of purification, the other days being spent in sacrificing and marching in solemn procession. 220 On the last of them came the grand Bacchic procession, when thousands of both sexes wended their way along the sacred road to Eleusis; the distance to be traveled

was fourteen miles, but many stops were made. 221 Arrived at Eleusis the first evening was devoted to drinking the decoction called 'kykeon', by which Demeter was originally comforted during her wanderings. 222 During the first days the initiated feasted and performed their mystic rites, consisting largely of torch light processions at night. 223 After these were over the festival became a scene of merriment and athletic competition. 224 The fasting and solemn cup, along with others of their rites, remind one of certain Christian observations perpetuated to the present day, 225 while the severe tests to which those desiring initiation were subject have been more or less imitated by the Free Masons and other secret societies of mediaeval or modern times. 226 The Mystic House must have been furnished with all the resources of the stage and the most ingenious stage carpentry of that day, and makes one think of Scottish Rite Masonry of this. 227 The initiates regarded their chances in the next world as much better than those of the common people, as all the ancient Greek writers acknowledge.

228 In age and renown the mysteries of the Cabiri, in the island of Samothrace, rank next to those of Eleusis. They date back to a time preceding the evolution of several of the Grecian deities. 229 These Mysteries implied originally an astro-mythology, losing in time its astral meaning. In these Samothracian mysteries the reproductive forces of Nature figured most prominently, and through them the Phallic worship of the Orientals was transmitted to the Greeks. 230 Into these mysteries women and even children were initiated. 231 There were also Cabirian mysteries in several other Islands in the Grecian Archipelago, as well as on the continent. 232 Mysteries were also celebrated in the Island of Crete, in honour of Zeus. 233 We know but little concerning them save that in the spring time the birth of the God was commemorated in one place, and his death at another, and that amid loud noises the story of the childhood of Zeus was enacted by the young.

234 As already remarked the worship of Bacchus was imported and in him was personified the influence of the sun upon the growth of the vine, 235 while the ultimate tendency was to the glorification of life and force; in other words, it was eminently materialistic and appealed to the grosser senses. 236 The Dionysian mysteries originated in Thrace, and among a people of Pelasgian stock, who were naturally gloomy save when aroused, when their enthusiasm became exaggerated into transports of frenzy. 237 In time a distinction obtained between the Dionysian mysteries and the festivals. At least seven different non-mystic festivals occurred in Attica during the year, which were of popular character, during which the Phallic worship, if any, predominated. 238 The fabled adventures of Bacchus were enacted and the dramatic stage originated at this time and from this beginning. 239 On the other hand, a triennial festival of Dionysos was held in which women participated who, saturated with wine, lost all restraint and humility and were called 'maenades' or mad women, while their festivals were spoken of as 'orgia', whence our modern term orgies. 240 These were conducted at night, upon the mountains, by torch-light, in mid-winter, while the women, who were clothed in skins, shunned all association with men, and drank, danced, sang and committed all sorts of excesses, 241 finally sacrificing a bull, in honour of the god, whose flesh they devoured raw. 242 They then raved about the death of their god and how he must be found again; all hope in rediscovering him centering in the quickening springtime.

243 Bacchus worship, bad as it was in Greece, was surpassed in Rome, Livy even comparing the introduction of the Bacchic cult into Rome to a visitation of the plague. 244 In its Etruscan and Roman form it became simple debauchery with a thin veneering of religion. So abominable did it become in time that in 186 B. C., the Consul Albinus was compelled to suppress it. 245 Seven thousand persons were implicated at that time, and the ringleaders and a multitude of their accomplices

were condemned to death or exile. 246 The senate decreed that the Bacchanalia should never again be held in Rome or Italy, and the places sacred to Bacchic worship were to be destroyed. 247 These orgies continued unchecked outside of Italy, and in time reappeared again even upon Italian soil, until the days of the Roman Emperors, when they reached a pitch of absolute shamelessness, as in the case of the notorious Messalina.

248 Time fails in which to mention all of the other debased mysteries which were met with in the various parts of Greece and Italy. 249 Among them, however, must be recorded those of the mother of Rhea, those of Sebazios, and those of Mithras, all of which were finally collected by the sect of Orpheans. 250 Among the Persians Mithras was the Light, and his worship was perhaps the purest cult that could be imagined. 251 Later it was combined with sun worship, and Mithras became a Sun God, and as such generally recognised among the different peoples. 252 To the early Greeks Mithras was unknown, but in the later days of the Roman Empire his mysteries made their appearance and gained great prominence. 253 The monuments represented a young man in the act of slaying a bull with a dagger, while all around are human and animal figures, the youth standing for the Sun God who, on subduing Taurus in May, begins to develop his highest power. 254 The original beautiful rites later degenerated and became orgies. Among the original rites was a form of baptism and the drinking of a potion made of meal and water. Human sacrifices were in some places a part of the cult.

255 The most disreputable of all these mysteries appear to have been the Sabazian, which were made up of several earlier forms, and were mere excuses for gluttony and lewdness, while the priests of the cult were most impudent beggars. 256 Thus in time the mysteries were stripped of all the beauties of a heavenly origin and became of earth exceedingly earthy, 257 while their initiates, lost to all shame and decency, persisted nevertheless in their sacred hypocrisy, until the

hideous night of the gods disappeared before the glow of a brighter morning.

258 After this rather long preliminary portion, we are now prepared, as otherwise we could not be, to consider the relation between the Christian religion and these ancient mysteries. 259 Granting that Jesus was the founder of the Christian religion, we must remember, nevertheless, that he was distinctly a Jew, spent his life in Judea, and based his teachings upon Judaism; 260 also that long before his day Judaism was thoroughly indoctrinated with Greek elements, and that after his crucification the propaganda was carried on not so much by Jews as by Greeks and people of Grecian education. 261 Between the Greeks and the Jews there were then, as now, the greatest differences; differences which have already been epitomised, but which may be thus summarised. 262 On one side the closest union between God or the gods and human, most lofty sentiments and finest sense of art-form, a priesthood making no pretentions and exerting little influence, a nation sustaining active commercial relations with the world, and all imbued with eagerness to adopt whatever was novel; 263 on the other side, the widest separation between Jehovah and human, a substitution of theology and religious poetry for a study of Nature, a nation ruled by priests and protected against all access from without, either by sea or caravan, adhering determinedly to the old and distrusting whatever was new.

264 After the Jews were liberated from Babylon, by Cyrus, they dispersed widely, living largely under Persian rule, and subjected after Alexander's conquest to Greek influences. 265 Later they were scattered still more widely, becoming in time a mercantile race. 266 In Egypt they enjoyed greater privileges than elsewhere, and in Alexandria saw the acme of Grecian art and teaching. 267 While retaining their reverence for their scriptures and for the temple at Jerusalem, they quite generally adopted the language of the country, and particularly was this true of the Jews living in Alexandria in the third century, B. C, during which the Pentateuch

was translated into the Septuagint, 268 the remainder of the Hebrew bible being translated about 125 B. C. Thus the Greeks gained an introduction to Jewish theology, while the Hellenist Jews learned for the first time a Grecian philosophy; 269 thus, too, among the scholars of one race was begotten a high esteem for the sages and philosophers of the other, while from the polytheism of one and the monotheism of the other was constructed a new mysticism. 270 In this Alexandrian mysticism appeared in particular and for the first time the new idea of divine revelation, which was applied by enthusiasts alike to the Old Testament and to the Grecian writings. 271 The Jew Aristobulus devised a most ingenious allegorical interpretation of the Old Testament, and traced to it all the wisdom of the Greeks, who until recently had never heard of it; 272 and Philo, another Hebrew philosopher, contemporary with Christ, yet of whom he knew nothing, so construed the traditions of his race as to see in the four rivers of Eden the four cardinal virtues, in the trees of paradise the lesser virtues, 273 and in the great figures of Jewish history personifications of various moral conceptions, all of which was out-doing the manner in which his Grecian friends had developed their own mysteries. 274 Moreover, and this is very important, Philo taught that God had made a world of ideas and according to this model had subsequently made a corporeal world; the former having for its central point the Word. 275 This statement that the 'Word' was the first and the 'World' his second deed passed later into the gospel of St. John, which opens "In the beginning was the 'word', and the 'word' was God."

276 Philo founded a sect based upon the doctrine that the soul's union with the body is to be regarded as a punishment from which human should free yourself, for your soul's sake. 277 This sect was known as the Essenes, who in spite of claims to the highest antiquity really were founded during the first century B. C, and who constituted in effect a secret society. 278 They were the true socialists of their day, and held things in common. They invented

a peculiar nomenclature for the angels and imposed upon their new members to keep these names secret. 279 As a society they did not long survive the beginning of the Christian era, being made superfluous by Christian asceticism. 280 The Essenes, however, were of importance in this regard that they constituted the middle terms between the Grecian mysteries and Christianity, as they did between Grecian philosophy and Judaism. 281 They were, in effect, a Jewish imitation of the Pythagorean league. 282 'When with Grecian mysticism were associated the nobility of Socrates, the philosophy of Plato, the science of Aristotle and the Jewish belief in one God, 283 it is not strange that out of these elements, combined with the teachings of simple humanity enunciated by Christ, there resulted a power which transformed the world.' 284 The view that all humankind are brothers, originally Jewish, was also of independent Greek origin 285 and came especially from the Stoics, who had to lie dormant until some tie stronger than mere political association held people together. This tie subsequently became a religious one. 286 Polytheism had nothing more to give up; all the forces had been worked over in the God-making process, the Pantheon was full, and people ridiculed alike the gods, their oracles and their priests. 287 These same priests smiled at each other when they met, and forfeited all public respect by the lives they led. 288 Olympic wantoning and derision of the gods must necessarily have ended so soon as anything better could be substituted therefor.

289 The long felt want was for a God of definite character, of approved prowess, with human feelings, human wrath, and human love, made after human's own likeness, who should stand for a doctrine of personal immortality, and give some promise of a hereafter. 290 The Jews, the only monotheists of the time, were prepared to furnish such a God, but he was too spiritual, and was worshiped by altogether too indefinite rites and peculiar usages. 291 Nevertheless the God of the Jews was utilised for this purpose while the mystic elements

with which he was to be surrounded were furnished by the ancient Grecian mysteries and the doctrines of the Pythagoreans and Essenes. 292 So completely did the Jews and Greeks mingle in Egypt and in Judea, that the idea prevailed among both races that the time had come for something new in them desired direction. 293 The various secret leagues demanded a separation of the divine from the human and their subsequent reconciliation, all of which was subsequently furnished to their satisfaction in the accounts of the origin and death of Christ. 294 Even during the early years of the Roman Empire people looked for a new kingdom in the East, and both Jews and Heathen awaited some divine intervention. 295 This took more definite form in the Jewish expectation of a Messiah who should restore the kingdom of Israel, and in their worship of Jehovah, while the Greeks yearned for something to take the place of their degenerate polytheism.

296 The times were thus ready for the appearance of Jesus, who lived for most of his life in obscurity, and of whose career no mention is made by contemporary Greek and Roman writers. 297 This was perhaps fortunate for his followers, for none could contradict what any other might choose to say of Him who rose above the bigotry of his day and people, 298 who was executed because of his independence of the priests and scribes, and who was thus regarded as the longed for Messiah. 299 On the Jewish branch of his real origin were grafted Grecian mystical off-shoots of superhuman origin;-- an immaculate conception, a vicarious sacrifice, a resurrection and an assumption of a portion of the God-head. 300 Thus, in what has come down to us concerning the Founder of the Christian church, truth and fiction mingle; the former being that which is consistent with highest laws and natural phenomena; and the latter that which conflicts with these. 301 Jesus himself never made pretentions to being more than a man. When he spoke of his father he spoke of him as equally the father of all humankind; 302 he was the greatest moral reformer that ever lived, and he differed

widely from the Essenes in that he sought to save human, not by Essenism and withdrawing you from the world, but by living with you and setting you a beautiful example.

303 The ancients were firm believers in signs and portents from the heavens which were supposed to serve both for the instruction and warning of humankind. 304 Stars, meteors, the aurora, comets and sudden lights of any kind were regarded as presaging events like the birth of gods, heroes, etc. 305 Great lights were supposed to have appeared both at the conception and birth of Buddha, and of Crishna. 306 The sacred writings of China tell of like events in the history of the founder of her first dynasty, Yu, and of her inspired sages. 307 The Greeks and Romans had similar traditions regarding the birth of Aesculapius and several of the Caesars. 308 In Jewish history we read that a star appeared at the birth of Moses, and of Abraham--for whom an unusual one appeared in the East. 309 The prominence which a similar star in the East played in the legends of the Founder of Christianity and the effect which, as also in the case of Moses it had upon Magi, needs here no rehearsing. 310 A very different significance was attached to eclipse or to any phenomena by which unexpected darkness is produced. The Greeks held that at the deaths of Prometheus, Hercules, Aesculapius and Alexander, a great darkness overspread the earth. 311 In Roman history the earth was shadowed in darkness for six hours when Romulus died. Much the same thing is reported to have occurred when Julius Caesar died. 312 So also one of the most conspicuous features attending the crucifixion of Jesus was a similar phenomenon which is made to play a most conspicuous part, for we read in three of the gospels that "darkness spread over the earth from the sixth to the ninth hour;" 313 although the only evangelist who claims to have been present says nothing about it, nor do historians of that time, like Seneca and Pliny, make note of any such event in Judea.

314 In view of all these, however, to deny the star in the East, and the

hours of darkness following the crucifixion, is regarded by many pious people as rank blasphemy or heresy of the deepest dye.

315 The parables in which Jesus taught so unmistakably were similes adapted to the simple comprehension of his people, who likewise often made use of such figurative language. 316 Those who followed him used this form of speech much more freely, and quickly erected his personality into the dignity of a God, magnified him and his mission, 317 and soon saw him generally accepted as the equivalent of the Messiah, for whom Greeks and Jews alike had longed. 318 His alleged miracles were unnecessary, in addition to being contradictory to all known natural sequences, because the simple and sublime truths which he preached could not be made more expressive by any such help. 319 In the light of to-day they seem unnecessary juggleries, quite unworthy of so grand a character. 320 They probably represent the effort of his followers, who portrayed his life and personality in colours which would make them more generally acceptable.

321 Of such transformations as that by which the son of a carpenter was made to appear of divine origin history has no lack. The Grecian polytheism furnished numerous illustrations; 322 Apollo appeared on earth as a shepherd, Herakles, the son of Zeus, and Romulus (who was also the son of a 'virgin' and of 'Mars'), were founders of cities, states and nations. 323 The Jewish accounts of creation stated that God walked the earth, and why not in human form? Why also should not the founder of a religion be the son of God and of a virgin? 324 The rest of the beautiful story upon which we were all brought up must be regarded as fanciful embellishment, beautiful in its imagery, but having no foundation in fact or scientific possibility. 325 The annunciation, the star in the East, the slaughter of the innocents, etc., can only be regarded in this light.

326 The stories of the miracles are probably distinctively purposive. In the Grecian mysteries Demeter and Dionysos figured as givers of bread and wine; 327 Jesus, too, was made lord and giver of these two

sacred viands, all of which appears in his changing water into wine, multiplying the loaves, and later in the institution of the Last Supper, at which bread and wine became a part of these Christian mysteries which are still widely perpetuated. 328 In his quieting the storm, walking upon the water, finding the penny in the fishes' mouth, and the draught of fishes, are portrayed his power over the forces of Nature and lower forms of life. 329 His power over disease was personified by stories of healing paralytics, lepers, blind, deaf and dumb people, casting out devils, and even by restoring the dead to life. 330 Apparitions were common according to the history of his life, as of the holy spirit in form of a dove, his encounter with Satan, the appearance of Moses and Elias, etc. 331 The ancient tendency to personify appears again in the form of Satan or a personal devil, namely the power of evil, while in the Transfiguration is personified the superiority of the new law over the old. 332 Finally the miracles attending his last days, the darkening of the sun, the rending of the veil and the Resurrection, were all occurrences which it would be impossible to omit from the closing scenes in the life of anyone who has figured as a God. 333 They betoken the mourning of Nature, while the Ascension personified the belief in an everlasting Redeemer and the individual immortality of those who believed in him.

334 In thus epitomising the events in the life of Jesus upon which, from his day until now, people have laid such fearful stress, and upon whose acceptance the present life as well as the future of all humans has been conditioned, 335 I should be far from doing justice to myself should I fail to point out my own attitude in the matter. I hold it true that the self-evident truth, 336 as well as the wonderful sublimity of Christ's teachings, become apparent upon the study of the same, and are weakened rather than strengthened by insistence upon all that is supernatural, mysterious and inconceivable in the generally accepted account of his life and labour. 337 My mind is freed from the necessity for the mysterious which the Graeco-Jewish people demanded, and

which the superstitious people of to-day still demand, 338 and I prefer to let Jesus stand for what he seems to me to be,-- 'the greatest moralist and teacher of all time', 339 rather than to surround Jesus with a veil of imagery and with statements so impossible of belief as to make it impossible to accept one part without accepting them all. 340 The Jews already had doctrines of unity of God and love for others; the Grecian philosophy antedated Jesus in insisting upon elevation of life to a higher plane than that of mere gratification of the senses, 341 and everywhere his predecessors and contemporaries could furnish miracles by the hundred, but in force, grandeur and simplicity of his teachings, in his comprehensive humanity, in his directness of appeal, in his condemnations of those who departed from the model which he set, 342 Jesus never has had and probably never will have an equal. In his self-abasement and love for others he was as irresistible as have been these principles in civilising and, in this sense, christianising the world.

343 In Jesus' own day there was no hair-splitting theology; devotion, love of fellow-men, charity, repentance, these were all that were needed. 344 But the beautiful simplicity of his teaching was lost with the death of his first disciples. The system was esteemed too simple, too unadorned to appeal to the people used to something quite the contrary. 345 And so Stephen the Martyr, who was of Grecian education, was stoned because he demanded a repudiation of certain Jewish teachings, although the congregation at Antioch adopted his views.

346 Paul the great leader was an epileptic and had frequent fits and visions, and these made a strong impression, not only on himself but on his followers. 347 On the creations of his imagination the doctrine of the resurrection is largely based. 348 He set up the God-man Jesus as the counterpart of the first man Adam, who represented sin and death, and who was to be crucified and born anew in Christ. 349 Between Paul, the great Gentile Christian, and Peter, the Jewish Christian, the church was quickly split into two parties;

these two soon subdividing into others, and among them all arose the New Testament literature, whose Alexandrine dialect establishes the influence of Greek education.

350 Thus did Christianity develop out of the secret associations of the ancient world. The early Christians themselves constituted, at least while under persecution, a sort of secret society. 351 Their worship was mystical, but not because Jesus so taught;-- rather because of their environment and traditions. 352 The practice of baptism, the last supper and the doctrines of incarnation and resurrection have been as certainly added to the Nazarene's sublime code of ethics as to them in turn, 353 in the centuries to follow, were added every conceivable notion, mystery and stupid absurdity which the diseased minds of humans could imagine, 354 and which have been the cause of more departure from Christ's original teachings, and of more strife and bloodshed than any other feature in the history of humankind.

355 Indeed it is one of the greatest inconsistencies of history that the doctrines of love, unity and peace, taught by the Founder of Christianity, should have been the greatest of all factors to rend humankind apart, 356 beget feelings of hatred, and result in the death, from this cause, of millions of people such as Jesus himself most loved.

THE KNIGHTS HOSPITALLER OF ST. JOHN OF JERUSALEM

6 The three great militant, mendicant and monastic orders of the middle ages were the Knights Hospitaller of St. John, the Knights Templar, and the Teutonic Order. 2 In addition were numerous others, smaller, shorter lived, less important in every respect, scarcely mentioned in even the larger histories, like the knights of Calatrava, Alcantara, Santiago de Compostella, and the English Knights of the Holy Sepulchre. 3 These orders were the immediate as well as the indirect outgrowth of mediaeval conditions for which both the Church and the State were responsible. 4 The secret tenets of the Christians had

been made public, and those who held to them had for some time ceased to be a secret society; 5 their faith was now a part of that church which was essentially the State, and which occupied a goodly part of Europe. 6 Sad to say the Church was rent, and the State suffered accordingly from constant strife between sects and parties, who contested, even to the death, over interpretations to be given to the scriptures, and the matter of creeds. 7 Thus while discussing at point of the sword whether the soul is to be saved by good works, or by grace of God, they disregarded the very essence of the simple teachings of Jesus, 8 and brought upon theology, even in those days, the contempt and ridicule of the liberal minded and the non-believer, so that even to-day it suffers because of the unfortunate light in which it was made to appear. 9 That theology should lead to war is the antithesis of the Christian doctrine, yet no wars have been so fierce and bloody as those waged in "spreading the cross" and propagating a misinterpreted gospel. 10 And so theology suffered doubly from the Monks who perverted it, and from the Knights and the State that inculcated it with fire and sword.

11 For a thousand years nothing of importance was added to human knowledge, and mental confusion reigned supreme. At the end of this period all the original teachings of Christ were forgotten, 12 and after passing through the hands and tongues of fanatics or deluded and ignorant people, Christianity was left with the semblance of a monotheistic basis on which had been crudely built up certain doctrines borrowed from Egyptian and Grecian sources, 13 among which may be mentioned the Trinity, Immaculate Conception, Resurrection and Ascension, as well as certain practices like that of the Lord's Supper, plainly borrowed from pagan customs. 14 There was in all these so much to challenge belief, and so much at first unacceptable to minds not trained to believe it, that, in order to be effective their propaganda had to be carried on with the sword.

15 Moreover to the Christian mystic, anxious to unify the self

with the hidden, unknown deity the idea of Moslem unbelievers in possession of the high places which they regarded with such reverence, was simply intolerable and repugnant beyond description. 16 Hence the Crusades undertaken order to regain the Sepulchre; in which by Papal decree the Monks joined the Knights, 17 and under command of emperors and the greatest generals of their day, made temporary conquest of the Holy Land, founding the kingdom of Jerusalem. 18 The immediate outcome of the general movement was that alliance, made wise and even necessary, when theology and chivalry joined hands, from which resulted the foundation of such orders as those mentioned at the beginning of this paper. 19 These allies of which they were composed, all took the monastic vows of poverty, chastity and obedience, 20 and for a time kept them, until the possession of power and the acquisition of wealth brought their inevitably accompanying temptations. 21 Each of these orders and many of the others passed through the successive stages of poverty, with meekness and constant benefaction, succeeded sooner or later by temporal aggrandisement, selfishness, greed, and rapacity, with all the crimes in the calendar, and the inevitable ultimate downfall. 22 Of them all the Hospital Knights bore by all means the least smirched record, on which account, partly, as well as because of their most prominent purpose, i. e., their work among the sick, wounded and distressed, I deem their careers worthy of more particular study.

23 For this purpose we may quickly dismiss the Teutonic knights from present consideration, simply reminding you that they were really the founders of modern Prussia. 24 They had their own origin in the commendable public spirit of the merchants of Lübeck and Bremen, 25 who during the siege of Acre made tents out of the sails of their ships, in which their wounded countrymen might be nursed and attended. Most of their active service against the Saracens was in Spain.

26 Of the Knights Templar a little must be said here. About 1119 two

Knights, Hugo (or Hugh) of Payens, and Godfrey of St. Omers, associated with themselves six other French Knights in a league of military character, 27 styling themselves "Poor Knights of Christ," and pledged themselves to keep safe for pilgrims the highways of the Holy Land. 28 They prospered and grew, and came into the favour of Baldwin I, king of that kingdom of Jerusalem already mentioned. 29 Inasmuch as their Monastery occupied a part of the site of Solomon's temple of old they were known as 'Templars'. 30 At the synod of Troyes, in 1128, they were recognised as a regular Order, and received monastic rules and habits, with a special banner. 31 They were also known as "Poor Companions of the Temple of Jerusalem," a name which did not very long befit them. 32 At first, like the Hospital Knights, they begged their food, fasted, kept vows, worshipped diligently, and cared for the poor and infirm. 33 Beard and hair were cropped short, the chase was forbidden, and they took the usual vows of chastity. But as they acquired property they forgot the simple life and habit, as well as their vows of obedience and chastity, 34 while their pledge to protect the pilgrim on his way became in time a farce, not alone through their indifference and negligence, but through their treasonable dealings with the Saracens, and even treacherous surrender of their strongholds.

35 Thus, whatever their pristine purpose, lucre and power became the later objects of their strife and the impelling motives of their lives. 36 By the accession of so-called "affiliated members" they avoided the rule of celibacy, and admitted married knights and those engaged to be married.

37 Their Grand Masters in time ranked next after Popes and Monarchs. While the former favoured them it was mainly because they feared them. 38 They were exempt from all episcopal jurisdiction, and subject only to the Pope. 39 So rich and powerful did they become that at the time of their suppression they controlled an Empire of five provinces in the East and sixteen in the West, while the Order possessed some 15,000 houses. 40 They aimed to make all Christendom dependent upon

themselves, with only the Pope as their nominal head.

41 Of their personal bravery, which was usually impeccable, of their affluence and intolerable effrontery, and of many of their traits and characteristics, one may form an excellent idea by reading 'Ivanhoe', where these seem to be quite faithfully depicted. 42 It is, to me I confess, just a little amusing as well as saddening to see the people, who name their secret Masonic associations after the founders of the Order, 43 displaying and imitating, at least in public where alone they can be judged by outsiders, only those features of Templar Knighthood which marked the period of their decadence or their downfall. 44 As imitations they may be historically accurate, but as worthy of emulation, or even of imitation such displays are matters of questionable taste, at least, to those who read medieval history.

45 The Templars in their days of splendour and later downfall, were neither pious, nor learned, nor good Christians. 46 Many of their secret doctrines were of heretical origin, taken from the Waldenses or the Albigenses, and they cared far more for their own possessions than for the Holy Land. 47 They promulgated the shameful excuse that God evidently willed that the Saracen should win; that the defects of the Crusaders were evidently according to His decision, 48 and that therefore they were released from their vows, and could return to Europe, where indeed they rested-- after their fashion,-- from their labours, and passed their time in doing everything their founders had vowed not to do.

49 But this is not intended to be an epitome of Templar history; rather a brief statement of the reasons why they went proudly and sometimes stoically to their final downfall, 50 and why the Hospital Order, though not always keeping up to its earlier standards, nevertheless so far eclipsed them, as to become the recipients of very much of the Templars' enormous resources and wealth, being thought worthy to be thus entrusted. 51 And so it happened that, in 1307, Philip of France had all the Templars in France arrested and their property sequestrated.

This led to a tripartite dispute in which were involved the Templars, the Pope and the King. 52 In 1310 fifty-four Templar Knights were burned alive in Paris. At last the Pope, to prevent their property from falling into secular hands, made over to the Hospitallers most of the Templar estates, excepting however those in Spain. 53 The Grand Master Molay and another Templar were burned to death on an island in the Seine.

54 So much then in brief, for purposes of contrast. Now to the avowed subject of this paper.

55 During the seventeenth century there rose a controversy as to the foundation of a hospital already in existence in Jerusalem, named after the Asmorean prince John Hyrcanus, (the son and successor of Simon Maccabaeus, 56 who restored the independence of Judea and founded a monarchy over which his descendants reigned till the accession of Herod. He died 105 B. C.). 57 This was at a time when the pious merchants of Amalfi planned a refuge for their pilgrims. It was this John whom many suppose to have been the patron of the order, 58 though it seems now clearly established that the first sponsor or the first St. John, in this connection, was the Greek patriarch John surnamed Eleëmon, or the Charitable, because of his practical philanthropy. (See "St. John the Almsgiver," Rev. H. T. F. Duckworth, 1901). 59 But by the time the Crusaders, under Godfrey of Bouillon, had taken Jerusalem from the Saracens, St. John Baptist seems to have become the acknowledged patron saint of the hospital, 60 his image being worn by epileptic patients, and being later adopted as the regular badge for those engaged in hospital work.

61 But this term 'hospital' must not be regarded in its present acceptance; it was used in a broader sense to imply any house of refuge, even from wild animals; in fact a 'hospice'. 62 This particular hospice seems to have been erected on the ruins of one founded by St. Gregory in 603, where it is known that the French Benedictines worked. 63 Two centuries later Charlemagne had claimed the title of Protector of the

Pilgrims. ("De Prime Origine Hospitaliorum," by La Roulx. Paris. 1885). 64 This institution was naturally located in close proximity to the most sacred places, which early Christian traditions made such to the pilgrims who came from all over Western Europe. It was in existence in 1099. 65 It was made doubly necessary by not only the hardships of travel, but by the ill usage of the natives, at a time when the Holy City was in the hands of the Moslems, who demanded an entrance fee often beyond the pilgrims' means. 66 Thus subjected to indignities indescribable, robbed often before their arrival, these misguided pilgrims often died of want, or returned with their primary pious object unattained. 67 Had it not been for one Gerard, the first administrator of the hospice, their hardships had been even greater.

68 The buildings of the Order, at first meagre, were finally enlarged to cover a square, nearly 500 ft. on each side, with one side on the Via Dolorosa and another fronting the Bazaar, and all a little south of the Church of the Holy Sepulchre. 69 Nearby were other churches and hospices. This was the arrangement before the establishment of the kingdom of Jerusalem in 1099. 70 During the next century the Order, under Raymond du Puy, had enlarged the church of St. John Eleëmon into the conventual church of St. John Baptist, while along the south of the square above mentioned ran an excellent building, the hospital of St. John. 71 When Saladin recaptured Jerusalem, in 1187, this church was converted by the Turks into a mad-house, known as the "Muristan," this being finally ceded to Germany in 1869.

72 From the new kingdom of Jerusalem the Hospitallers obtained a constitution, and the Gerard above mentioned was made their first "Master." 73 He was succeeded in 1118 by du Puy, while Baldwin II was the Latin King of Jerusalem. 74 The Hospital had been recognised by the Archbishop of Caesarea in 1112, and had widely extended its sphere of usefulness. 75 It was King Baldwin who was anxious to stamp upon the Order a military character, similar to that conferred

upon the Order of the Temple in 1130. 76 This was natural since the kingdom was isolated, surrounded by fanatic enemies and always beset by and in danger from them. 77 Thus the necessities of the times and the environment made it requisite that all who were able should bear arms, and coöperate for mutual defence.

78 Thus it came about that the Order was divided into three divisions, the first in rank being the Knights of Justice, each of whom must be of noble rank or birth, and have received the accolade of knighthood from secular authority. 79 The second division comprised the ecclesiastics, who were later divided into two grades, the Conventual Chaplains, who were assigned to duty at headquarters, and the Priests of Obedience who served other priories and commanderies in various parts of Europe. 80 The third grade were the Serving Brothers, also divided into the Servants at arms or Esquires, and the Servants at office. 81 The Servants at arms attended the Knights of Justice as their Esquires, and might eventually become eligible to the first division. The Servants at office were little if anything more than menials or domestics. 82 Even these latter, however, possessed certain privileges and emoluments which made admission to this grade advantageous to people of humble origin and faculties.

83 The dress of the Order was a black robe with cowl, having a white linen cross of eight points over the left breast, and was at first worn by all. 84 Later, under Pope Alexander IV, the fighting knights wore their white crosses upon a ground gules.

85 The first recorded appearance of a body of Hospitaller knights in actual war was at Antioch, in 1119, while the complete military constitution of the Order of St. John was achieved in 1128. 86 During the balance of the existence of the Kingdom of Jerusalem then, two colleges or companies of military monastic knights existed, side by side, in the Holy Land, the "chief props of a tottering throne." (Bedford). 87 Between these rival bodies arose in time such jealousy, and within them such intrigues,-- aggravated

always by the animosities of the ordinary clergy, who took offence at the patronage bestowed upon the orders by the Popes, 88 aggravated also by similar difficulties on the part of the knights of the Teutonic Order and that of St. Lazarus,-- 89 that the best interests of the kingdom and of the Church suffered as much from intestine dangers as from those arising from the Moslems surrounding them. 90 Nevertheless it may be said that the Order of the Hospital never lost sight of its primary purposes, and never disgraced itself by the treasonable and treacherous dealings, 91 and correspondence with enemies which disgraced not a few members of other and rival Christian organisations.

92 The result of such disreputable actions lead-- as ever-- to disunion and final disruption, and this to final capitulation and surrender of Jerusalem, in 1187. 93 This meant the abandonment not only of their old home, but of their usefulness there. The Saracens occupied their buildings and premises from that time till ruin overtook them. 94 Thus rudely compelled to emigrate the Order moved the same year (1187) to the town of Margat, where was also a castle of the same name. 95 But the work in Jerusalem had not been abruptly discontinued, since Sultan Saladin, in evidence of his esteem, allowed them possession of their hospital for another year, 96 in order that their charitable work should not be abruptly interrupted, and even made them liberal donations. 97 When during the third Crusade, in which Richard Coeur de Lion bore so valiant a part, Ptolemais was captured, it was then and there that the Order established its headquarters, in 1192, wherefore the town became named St. Jean d'Acre. Here they abode nearly a century.

98 Various other towns in Palestine held out for a time against the Turks, e. g., Carac, Margat, Castel Blanco and Antioch, 99 and in spite of the intense rivalry between the Orders, Thierry, the Grand Master of the Templars, reported in a letter to King Henry II, that the Hospitallers bore themselves even with fervor and the greatest bravery, 100 and praised the aid they gave in the capture of the

Turkish fleet, at Tyre, when seventeen Christian galleys manned by friars, and ten Sicilian vessels commanded by General Margarit, a Catalan, 101 defeated the infidels, and captured their admiral and eight Emirs, with eleven ships, the rest being run aground, where Saladin later burned them, to keep them from falling into Christian hands. (Bedford).

102 Notwithstanding all these, however, the joint occupation of Acre with the Templars had a bad effect on both Orders, who turned not only to luxury and license, but their swords against each other. 103 Acre was at this time a most cosmopolitan city; here mingled at least seventeen different nationalities and languages, each occupying its own part of the city, so that in time extravagance and lust flourished to the last degree of demoralisation. 104 The Hospitallers were at this time far more wealthy than the Templars, who were exceedingly jealous thereof, and both at Margat and still worse at Acre this jealousy was exhibited in many bloody affairs. 105 Weakened thus by this intestine strife they were in reverse proportion strengthened. 106 The Pope who had defended them as against the scathing censure of Emperor Frederick, found need, in 1238, to accuse the knights-- alike of both orders-- 107 of sheltering loose women within their precincts, of owning individual property, both of these in violation of their vows of chastity and poverty, and of treacherously assisting the enemy. 108 Yet many bore witness to the actual good they accomplished, even at this time. In 1259 Pope Alexander, bewailing the lack of a more distinctive dress, permitted the decree that the fighting knights might wear black mantles, while in war they were permitted to wear red surcoats, with a white cross.

109 Later it was permitted to women to join the Order, and many ladies of high degree took advantage of the permission, rivalling in religious zeal and in charitable deeds the most sanctified of the brethren. 110 As the King of Hungary wrote, at one time, after visiting some of their houses, "In a word the Knights of St. John are employed, sometimes

like Mary in contemplation, and sometimes like Martha in action, 111 and this noble militia consecrate their days either in their infirmaries or else in engagements against the enemies of the cross."

112 The deterioration of Acre was not so great as to make cowards of our Knights, however, and with the continued and aggressive siege laid by the Saracens against that city the Hospitallers and the Templars finally made common cause, each endeavouring to outdo the other in deeds of bravery and daring. 113 Though defeated again and again, the Moslem ranks were renewed by fresh soldiers, while the militant and other monks imprisoned within the city saw their combined members steadily diminish. 114 At last it remained for John Villiers, Grand Master, with his few surviving fighters, to carve their way to their boats, leaving no combatants behind them, and then to embark in their galleys to seek a harbour of refuge in the island of Cyprus.

115 'Cyprus and Rhodes.' Settled in Cyprus, the Knights renewed their zeal and their resources. Here they began to build that fleet of galleys which, increased later in Rhodes, became most formidable. 116 When they and the Templars left forever the Holy Land the Templars took the position that their vow to protect the holy places was now either fulfilled or at least at an end, 117 and they distributed themselves among their numerous preceptories all over Europe, where they made themselves 'personae non gratae' to their civil rulers, 118 because of their own real power, their oriental ostentation, and their secularisation and distasteful entrance into and interference with the social and political life and customs of their new environment. 119 Things went from bad to worse, public feeling was more and more aroused, and their extermination was only a matter of time. 120 Finally Pope Clement V and King Phillip le Bel undertook this task with barbarous ruthlessness. Kings, nobility and the people joined hands in the common task. 121 The Templars had acquired various properties, by capture, by bequest, and in every lawful and unlawful manner, which yielded in the aggregate

relatively enormous revenues, too strong a temptation for needy secular rulers to resist. 122 The Pope had at last to intervene in order to prevent the total secularisation of all these great spoils, and thus it happened that no small proportion of it was, after its sequestration, allotted to the Order of St. John, 123 whose Grand Masters and Knights had not forgotten nor abandoned their original vows and purposes, 124 and who held that the inviolacy of their obligations required their continuous residence in some such oriental city as Rhodes.

125 And here we may part company, as did they, only quite peacefully, with the Templar Knights. 126 Driven from Europe they made their last stand in Great Britain, and of their lives and deeds there we have no more readable nor interesting historical account than Scott has given us in Ivanhoe. 127 Any further allusion to them here will be most casual. They offer the conventional picture, only 'in extenso', of original poverty and self-abnegation, coupled with devotion and valour, 128 changed to arrogance, treason, abandonment of purpose, unbridled lawlessness leading to crime and cruelty, all brought about because of affluence, acquired power, selfishness, cupidity and every debasing human weakness. 129 Small wonder then, that they could be no longer tolerated in Christendom.

130 So turn we again to the Hospitallers, now made rich and powerful at the expense of their old rivals and at last enemies. It had soon been made evident that Cyprus did not meet their wants and necessities. 131 Its king was not over friendly, and they sought further. Their gaze fixed on the island of Rhodes, which possessed a fertile soil, a city with an excellent harbour, not too far from the main land, i. e. 132 not too isolated, which was under the-- by that time merely nominal-- suzerainty of the Emperor of the Eastern or Greek empire. 133 After several futile efforts they at last, in 1310, under the twenty-fourth Grand Master Villaret, captured the island, where under their ceaseless energy both hospitals and forts were built. 134 To

Rhodes were brought also Christian refugees from the various Turkish provinces, and thus their numbers were rapidly strengthened. 135 Their fleet, already begun ('vide supra') was greatly increased, and with it they had many a conflict with the Turkish corsairs, whose inroads they practically checked.

136 About the beginning of the fourteenth century changes had been made in the Order, which was now divided into Langues, 137 or arranged according to nationalities, yet without materially altering the original division into the three classes (Knights, Chaplains and Serving Brothers). 138 In this way the Order was apportioned between seven nations or languages, Provence, Auvergne, France, Italy, Aragon, England and Germany. 139 Finally under pressure from Spain the Langue of Aragon was divided into two, Aragon and Castile, the latter including Portugal. 140 The various dignities and offices were divided among these langues, whose principals became a kind of Privy Council to the Grand Master, and were known as Conventual Bailiffs. 141 They were given different names in each country; thus the Grand Commander of the English langue was known as the Turcopolier, of France the Grand Hospitaller, of Italy the Admiral, etc. 142 As the new fortifications arose around the city of Rhodes, each was placed in charge of one of these langues or divisions, while each erected quarters for its own people. 143 It did not follow, however, that every member of each langue came from the country which it represented. 144 While Scotland was an independent kingdom it contributed to the Turcopolier, while many Scotchmen belonged to the French or even the other langues. 145 At this time the inhabitants of the City of Rhodes consisted largely of Christian refugees, who owed their security, even their lives, to the fact that the Knights Hospitaller still adhered to their primary objects, 146 the liberation of the captive and giving assistance to the sick and distressed. This they afforded through their fleet and their hospices. 147 When Smyrna nearly fell into the hands of Timour the

Tartar, about the middle of the fourteenth century, the Order strengthened their habour by erecting a new fort, 148 which they named Budrum (corrupted from Petros-a Rock), where any Christian escaping from slavery found shelter. 149 Here was also kept a remarkable breed of dogs, who were trained not only as watch dogs but to render services similar to those afforded by the Alpine dogs of St. Bernard.

150 As time went on the Sultans became more and more jealous of the naval power possessed by the Order. 151 With the fall of the Eastern Empire and the final retaking of Constantinople by Mahomet II, in 1453 (See "Prince of India"), it was made evident that danger to the Order from this direction was rapidly increasing. 152 This became so urgent that in 1470, after Mahomet had taken the island of Negropont, the Grand Master commanded that all members of the Order should repair at once to Rhodes. 153 In 1476 d'Aubusson began the most active measures for the defense of the place, and thus was ready for the attack, in May, 1480, when 80,000 men in 160 ships, landed on the island coast. 154 In this siege no small part was played by renegade traitors, the most prominent being one George Frapant, a German, whom the Grand Master finally hung in July. 155 In the last sorties which terminated this siege deeds of the greatest bravery were performed; 156 yet here we can only commemorate the fact that the Turks were summarily defeated, leaving 3,500 corpses on the ground after the last decisive attack. 157 The losses of the besieged were small as compared with those suffered by the Turks.

158 Later in the same year the island suffered from a severe earthquake. Mahomet died not long after this, was succeeded by his son Bo-jazet who made truce with the Order, 159 presenting them with a relic of supposedly inestimable value, namely the hand of St. John, which the Turks had taken at Constantinople.

160 Years of comparative quietude succeeded until in the following century, in 1522, Solyman the Magnificent landed upon the island in July, with 100,000

soldiers and 60,000 pioneers. 161 Again ensued all the horrors of a siege. The defenders did their part so bravely that the Sultan publicly disgraced his generals. 162 But the inevitable famine wrought consequent disaffection on the part of the native population, who clamoured for capitulation, and sought treasonable terms therefor, because of which one of the most prominent of them was tried, found guilty and executed. 163 Finally under stress of circumstances no longer endurable, Grand Master Adam agreed to honourable surrender, and on the first of January, 1523, the Hospitaller Knights relinquished the island, 164 the Sultan himself speaking in terms of extravagant praise of their heroism, while at the same time he scathingly censured the Christian monarchs of Europe who had failed to come to their relief. 165 Thus after two hundred and twenty years of occupation and rule of the island of Rhodes, some 5,000 Knights and other members of the Order, and natives, left it to take abode for a short time in their Priory at Messina. 166 Driven from here by plague, they moved on to Viterbo, while their Grand Master travelled in search of a new home. 167 'Malta.' Malta had been early proposed for this purpose, and offered by Charles V, while many wishes turned to the city of Modon, in Greece. 168 After seven years of wandering and indecision Grand Master L'Isle Adam accepted Malta as the best solution of the difficulty. 169 Thither the Order now removed, and there Adam died in the Castle of St. Angelo, erected by the Norman Count Roger of Sicily, still active in improving its existing defences. 170 In 1555 the Order lost nearly all of its fleet in consequence of a violent hurricane, which accident for a while laid the island open to piratical attacks, especially of a corsair named Dragut; 171 but he did little damage, save that with the knowledge of the island and its defences thus gained he persuaded Solyman to undertake another attempt to crush the Order, 172 the latter being justly furious because some galleys belonging to the Order had captured a ship that happened to be loaded with rich valuables belonging to the ladies

of his harem. Therefore war was again declared in 1565.

173 The Turkish fleet was made up of 130 galleys with 50 smaller boats, and carried the Janissaries and 34,000 other soldiers, against whom the Grand Master could only oppose some 9,000 men, 174 700 of whom, however, were desperate men, released from the galleys of the enemy, and eager for vengeance. 175 On May twenty-fourth the siege of St. Elmo was in reality begun by a fierce bombardment, the walls being soon battered, and the garrison forced to take shelter in excavations made in the solid rock. 176 And now the besiegers' force was augmented by the arrival of Dragut, in those days the dreaded corsair of the sea, who came with thirteen more ships and 1,500 more men. 177 June thirteenth saw a desperate conflict when, after six hours of fierce fighting and the loss of only 300 men, the besiegers were repulsed. Soon after this Dragut was killed. 178 Again on June twenty-third another general attack was repulsed, though the garrison was thereby reduced to 60 men. 179 Even this small force, many crippled and maimed, repulsed the first onslaught of the Turks, but had later to sell their lives as dearly as they could. 180 The Turkish general Mustapha took barbarous revenge, even on the corpses of the Knights which he decapitated and then tied to planks that they might float past St. Angelo. 181 La Vallette retaliated by beheading some of his captives and firing their heads at the Turks from his cannon.

182 At this juncture the garrison was reinforced by the arrival of 700 men and 42 Knights from Sicily. Refusing all opportunities to surrender and all parley under flags of truce, 183 Grand Master La Vallette built new defences and strengthened the old, in spite of a fierce July sun. 184 Meanwhile the Turks, also reinforced, prepared for still more desperate sorties, selecting for the land attack men who knew not how to swim, 185 in order that they might fight the more fiercely, and drawing off the boats as soon as their loads were emptied, so that no retreat could be possible. 186 One thousand Janissaries were embarked in ten

large barges, but nine of these were sunk by the artillery fire from the forts. 187 On the other side of the defences a large attacking column was completely routed. The loss to the Turks this day was 3,000 men, that of the garrison 250. 188 And so the siege went on; attack after attack, with but small success to the investing army. 189 But the heroic defenders suffered increasingly under the constant strain, and both armies were exhausted, the Turks losing 800 men from dysentery alone. 190 To such an extent was this true that when the Turkish officers drove their soldiers to the charge by blows of their own swords, it was but necessary to cut down those who led the charges, when the rest would turn and fly.

191 And now came other long expected reinforcements from Sicily, when a fleet landed 8,500 men and returned for 4,000 more. 192 Being now quite unequal to the continuation of the siege the Turks evacuated all the ground they had gained, and finally made a hasty and complete flight, harassed in every way, in their endeavours to escape, by the now victorious garrison.

193 The losses during the period of siege, with its numerous engagements, were estimated at some 30,000 Turks, and 8,000 men and 260 Knights of the Order. 194 Is it strange that by contributions from all over Christian Europe there was soon built up a town bearing the name of Valetta, thus commemorating the heroism and military prowess of the Order's 195 Grand Master La Valette, as well as the "glorious issue" of the struggle for Malta, and the confirmation of the Order as a sovereign independent community? 196 Thus secured from further probable struggle this city of Valetta acquired a certain degree of glory, later even of magnificence. 197 From all parts of Europe, wherever any commandery of the Order was maintained, was paid tribute to the Grand Master, as may be adjudged even to-day, long after French rapacity had robbed the city of many of its treasures. 198 Individual Knights vied with each other in their gifts, and palaces arose wherein were received the

envoys and even ambassadors of foreign courts. 199 The fleet was constantly busied in clearing the Mediterranean of Moslem and other pirates, and many Christians were released from the galleys in which they had been chained to the oars. 200 In this restoration the English langue took a rather small part, and their officers and members had often to be rebuked or punished for insubordination or worse crimes. 201 The Reformation in England interfered, and furnished some reason for their diminishing zeal. 202 The galleys of the Order became more and more like pleasure boats, and many of their cruises were in effect pleasure excursions. 203 Later in their decadence their adventures became more like piratical incursions, until, under letters of marque issued by a decadent Admiralty, the Malta privateer was equivalent to the pirate. (Maroyat). 204 These facts were scarcely offset by that other, that the last fleet of the Order, which left Valetta in 1783, was sent to the relief of earthquake sufferers in Sicily.

205 With regard to their activities in the matter of succouring the sick let it be noted that the Knights found on their arrival at Malta a hospital or hospice already existing. 206 In the buildings of a nunnery still standing may be seen the gateway of their own first hospital. In 1575 they erected one much larger, which had a passageway connected with the waterfront, so that patients could be brought directly from the ships. 207 This building in some part still remains in use as a military hospital. Its great ward is 500 feet in length, and 30 feet high, divided by partitions 15 feet in height. 208 In its best days patients were served from silver utensils. It was under the charge of the Regent of the French Knights, who had as his staff five doctors and three apothecaries. Other knights and servants acted as male nurses. 209 The knights were luxuriously cared for, and 150 beds were always in reserve for those returning from expeditions who might need them. 210 In 1796, only a year before the disintegration of the Order began, the patients numbered from 350 to 400. There

existed also a hospital for women, with 230 beds, and a foundling hospital where some fifty waifs were sheltered.

211 A curious bit of history connecting the middle ages with the more recent past relates to the hospital interests of the Order. 212 The nobles of Dauphigny had founded a fraternity of Hospitallers for the relief of sufferers from St. Anthony's fire (erysipelas), which was erected into the regular Antoine order in 1218. 213 About 550 years later, or to be exact in 1777, a compact was made by which the Order of St. John took over their property, under certain conditions, which involved, among other considerations, a larger expenditure. 214 The Antonine estates, in France and Savoy, were confiscated in 1792, thus entailing a tremendous loss to the Order, so great, in fact that the Valetta treasury became insolvent. (Bedford). 215 From this time we may date the rapid downfall of the Order. Malcontents and traitors gained the supremacy, and in 1798, after treacherous negotiations, Napoleon landed part of his army in Malta, and Valetta surrendered. 216 Thus, as Bartlett says, "ignominiously came to a close, on June 12th, 1798, the once illustrious Order of St. John of Jerusalem, having subsisted for more than 700 years." 217 At this time it consisted of 328 enrolled knights, and a military force of some 7,000 men. 218 Napoleon expressed his surprise at the strength of the fortifications, furnished them with one thousand cannon, left a garrison of 3,000 men, took with him the disciplined soldiers he found there, rifled the island of its treasures, its art work and its bullion, and sailed for Egypt. 219 Several of the traitor knights were put to death by the infuriated populace, whose anger was not appeased by Nelson's victory at Aboukir-- the battle of the Nile-- but took form in open surrection. 220 The French garrison finally took refuge in the old fortifications, where they withstood for two years a siege by the combined insurgents and an English fleet. 221 Finally reduced by famine and disease they capitulated to the English forces

under Gen. Pigot. The latter then selected Capt. Sir Alexander Ball, Nelson's representative, Governor of the Island. 222 At the Peace of Amiens the effort was made to restore the Order as ruling authority, under the protectorate of the Great Powers, but the Maltese themselves objected so vehemently 223 that after no small amount of trouble and dispute the inhabitants of the island elected to place themselves under the sovereignty of Great Britain, an arrangement finally and definitely confirmed at the Congress of Vienna in 1814.

224 Thus disappeared from history one of the most interesting and longest enduring institutions recorded in its pages, and certainly the most long-lived of any of its kind. 225 I say disappeared, meaning thereby only to indicate its disruption, as it were into fragments, its primary purpose, i. e. 226 aid to the needy, being kept ever in view by some, while others preferring the life of a soldier, took service under various rulers or military leaders. 227 The traitors who were responsible for surrender to Napoleon fared badly according to their deserts, though it does not appear that any of them were hung. 228 In the migration England seemed to attract many, perhaps the majority of those who were still inclined to good deeds. 229 The title of Grand Master was still continued, under some pretension to perpetuation of the Order. 230 In Russia the Czar Alexander, in 1801, upon the death of his predecessor Paul, announced himself a Protector of the Order, and designated Count Soltikoff to exercise the functions of the Grand Master. 231 Thus dismembered, disunited and scattered, the fragmentary langues of the Order underwent, on their way to final dissolution, various vicissitudes, through which they cannot here be followed. 232 Complete extinguishment was the eventual fate of most of them. I shall only concern myself now with that of the English langue, and its partial revival in 1830.

233 Rev. Dr. Peat, chaplain to George IV, was one of those to whom the remnants of the English langue appealed, 234 with the result that in 1827 certain notable English gentry, of eminent

attainments, undertook to revive the Order in England, only under quite different conditions from those previously obtaining. 235 In 1831 Dr. Peat was invested with the authority and functions of Grand Prior. 236 It will be at once seen how the matter of religious belief now separated the English Order from all the survivors of the previous regime, and why the last ties were severed. 237 Under the new regime members of the Order dropped all pretense of playing a military role; one may read thereafter of real hospital activity. 238 The Life Boat movement and ambulance work were gradually incorporated into their plans and scope. When First Aid to the Injured began to be publicly taught public and general interest was quickly aroused, and the energetic cooperation of eminent men was assured. 239 In other words the Order gradually took up just that class of work which is now done under the Red Cross. 240 Sir Edward Lechmere established, in 1867, a commandery of the Order in one of his castles, and in 1874 was instrumental in the acquisition of the St. John Gate, which still stands, an example of Tudor architecture as also a well preserved monumental relic of the time, 241 beginning about 1180, when the Order had founded a hospital in Clerkenwell, while the ladies of the order were housed in Bucland, in Somersetshire. 242 The old Priory of the Order in Clerkenwell was practically destroyed in 1381, by the mob led by Jack Straw, in an insurrection which had, along with other results, as an incident, the beheading of Sir Robert Hales, the Prior of the Order. 243 In the slow process of rebuilding the present Gate was not completed till 1504. On the North and South fronts remain projecting towers, while in the Western tower a spiral stair case is still in use. 244 Bedford's work, from which I have drawn heavily, gives excellent pictures of the Gate as it appears to-day, and of the old priory restored.

245 Colonel Duncan, also, deserves honourable mention in this connection; he became Director of the Ambulance Movement in 1875. 246 Finally we have to record here that under a new Charter, granted in 1888, the then Prince of Wales,

later King Edward, became the Grand Prior. 247 Therefore the Order of the Hospital, in England of St. John of Jerusalem is, in fact, the legitimate successor-- one might say the lineal descendant-- of the old Order of Knights Hospitaller, 248 though it is to-day a secular and voluntary society, keeping to the traditions of the past, no longer military nor militant, save as it fights disease and best of all teaches others how to do the same. 249 To follow it further is no longer necessary. Its work is essentially that of the Red Cross. 250 It has, for instance, a depot at old St. John's Gate, whence all the material required in teaching and illustrating as well as rendering first aid is issued. 251 Its work was begun with a two-wheeled litter, an old Esmarch triangular bandage from Germany, and a stretcher from France. Now it distributes all these things throughout the British Empire. 252 Now, too, it maintains ambulances all over the city of London, which do for their own hospitals just what each of our hospitals at home has to do for itself. 253 The German "Samariter-Verein" is virtually a Chapter of the English Order in its revivified form. 254 In 1883 a branch of the Order was organised in India, where among others the native police are instructed in "First Aid." 255 In 1882, by a Firman of the Turkish Sultan, an Ophthalmic Hospital was opened, under the auspices of the Order, in Jerusalem. 256 Only those who have travelled in the East can appreciate what this means to the poor, where squalour vies with ignorance, and, as in Egypt though not so universally, both conspire to the ruin of that greatest of all blessings-- eyesight. 257 But I will not delay to write further of what the Ambulance Brigade of London, and its affiliated corps, have accomplished in many parts of the world; 258 in South Africa, for example, it works under the general supervision of the Order of St. John, as it now exists in London. 259 It does everything that in our country is accomplished by the Red Cross for the general public, and by the Hospital Corps and their Medical Officers for our Army and Navy. 260 Over the graves of eleven members of the

brigade, who died at their posts in South Africa, in St. Paul's, London, not far from the crypts where lie the remains of Nelson and Wellington, has been erected a monument to their memory. 261 Another bearing among other inscriptions this beautiful scriptural quotation:-- "Greater love hath no man than this, that he lay down his life for his friends," 262 was unveiled by His Royal Highness, acting as Grand Prior, in St. John's Church, Clerkenwell, June 11th, 1902. 263 Fifteen hundred men enrolled in the Order had left that church before their departure for the Front, and of these about seventy sacrificed their lives to this sort of duty. 264 Do not the dead deserve all praise and respect, and the survivors all commendation?

265 A few years ago my friend Sir George Beatson, surgeon to the Royal Infirmary in Glasgow, published a little monograph-- "The Knights Hospitallers in Scotland and their Priory at Torphichen" (Printed by Hedderwick and Sons, Glasgow,)-- 266 which aroused my interest sufficiently to prompt a visit to this, the last home of the old Order in that part of the world. 267 The little village Torphichen lies about midway between Glasgow and Edinburgh, and three miles south from the town of Llinlithgow. 268 Here had been founded, in 1124, one of the great Priories or Preceptories under control of the English 'langue'. 269 Here they settled in a magnificent and fertile area, the Grampian hills to their north; to their west could be seen the snow-capped top of what is now known as Ben Lomond. 270 By donation, by cultivation of the arable soil, and by wise management of their resources, they prospered greatly, from the worldly point of view. 271 Here they erected that building, a part of which still exists, and which makes a picturesque ruin which is not yet a scene of desolation. 272 The members of the Order took, here as elsewhere, the view that the best way to serve God was by 'remaining in it' and working, not by 'fleeing from it' into lazy, selfish and profitless solitude as did too many of the monks.

273 In common with other monasteries the Torphichen

Preceptory possessed the Right of Sanctuary, and in its churchyard still stands the short stone pillar, carved with a Maltese cross on its upper surface, 274 which meant that within a mile in every direction therefrom all those charged with any crime, save murder only, might find temporary protection.

275 Here for four hundred years, and until the Reformation upset everything, the Hospitallers carried on their affairs. 276 In 1560 their last Preceptor or Grand Prior made over to the Crown all their properties and effects. The Crown in return made these possessions a temporal Barony, carrying with it the title of Lord of Torphichen. 277 From this time the property began to suffer-- from time, storm, vandalism of the people and neglect. Still the present Lord Torphichen has proven himself a better guardian than did some of his predecessors. 278 A parish church has been built, partly upon the sight of the old structure, partly into it. 279 Dr. Beatson has urged that a combination between the present Order of St. John, in London, and the St. Andrew's Ambulance Association might be effected which might work to the benefit of both, by reviving some of the work done here in days gone by.

280 I have ventured this brief reference to Torphichen, partly because of my interest in the place itself, associated with my visit there, 281 and partly because every such visit to the monuments of past grandeur and usefulness should strengthen our interest and zeal in what human is accomplishing to-day, 282 and should help link together the Past and the Present in a manner not merely fascinating but inspirational, and keep us from forgetting that motto of the Order,

"PRO UTILITATE HOMINUM"
FOR THE WELFARE
OF HUMANKIND.
Giordano Bruno

7 The Renaissance was the fourth of the great events in the history of the Christian Era; 2 the first being the decline of Rome, the second the introduction of the Christian cult, and the third, the intrusion

into Southern Europe of the Teutonic and Slavonic tribes. 3 With none of these however, save the fourth, is this paper primarily concerned, and not even with the fourth save indirectly, though it deals with a special feature of it. 4 Protestants and Catholics alike impeded progress and the self-evolution of reason in every possible way. 5 Italy gave the world the Roman Republic, then the Roman Empire and finally the Roman Church; after that arose a new storm centre in the North which swept toward the Mediterranean. 6 The Teutons effaced the Western Empire, adopted Christianity, and completely modified what remained of Latin civilisation. 7 Then the Roman Bishops separated the Latin from the Greek Church, and under the captious title of The Holy Roman Empire bound Western Europe into what has been called a "cohesive whole." 8 While Romans and Teutons never actually blended homogeneously, they had yet a common bond of union. When this coalition was for a time freed from both Papacy and Empire-- 9 then began intellectual activity and independence of thought, taking form in Italy as the Renaissance; in Germany as the Reformation. 10 In the South it was known as the Revival of Learning. It furnished a 'lux a non lucendo'. Italy gave freedom rather to the mind, Germany rather to the soul. 11 Toward the South people still took refuge behind that form of modified paganism which became Catholicism. 12 In the North they attained a more complete emancipation because of their violent opposition to the Papacy and all that went with it.

13 In the long run both attained the same result, i. e., liberation of the mind from artificial impediments and fetters, though they of the North achieved it in its full extent far earlier. 14 (I am speaking of course, relatively; people's minds are far from free even today, but the state we have reached is a great advance upon that of Bruno's time). 15 The Reformation led people to be far more outspoken than they dared be in the South; the free thinkers of Italy were still content to do homage to a thoroughly corrupt Papal

hierarchy. 16 As critics and warriors Luther and Calvin rank as liberators of the human mind, but later, as founders of mutually hostile sects, they only retarded civilisation, and the churches they founded are today as stagnant pools.

17 In 1548, in the midst of this stormy period in Italian history Bruno was born, in the little village of Nola, not far from Naples, whence Vesuvius was visible in the picturesque distance. 18 His father was a soldier, his mother of very humble origin. Of his family history nothing is known; little explanation is thus afforded, by the doctrine of heredity, for the marvelous mental faculties which he subsequently displayed. 19 Nevertheless his father was a man of some culture, at least, for he was a friend of Tansillo, a poet, under whose influence the growing boy subsequently came. 20 Bruno has told us himself how one Savolino (probably an uncle) annually confessed his sins to his Curé, of which "though many and great" his boon companion readily absolved him. 21 But only once was full confession necessary; each subsequent year Savolino would say: "Padre mio, the sins of a year-- to-day,-- you may know them;" to which the Curé would reply "son, thou knowest the absolution of one year ago;-- go in peace, and sin no more."

22 In those days as in many others superstition was everywhere rife and effective. Its influence must not be disregarded as one studies the formation of Bruno's character. 23 When he was about eleven years old Bruno was sent to Naples to be taught logic, dialectics and humanities. 24 When fifteen he entered the Dominican Monastery in Naples, and assumed the clerical habit of that order. Here he gave up his baptismal name of Filippo and assumed that of Giordano, according to the monastic custom. In 1572 he was ordained priest. 25 His reasons for thus entering the Church are scarcely far to seek. Of intellectual bent, and studious rather than martial in his habits and inclinations, there was but one career open to him. 26 To be sure the Dominican Order was the most narrow and most bigoted of all, as

the current punning expression "'Domini canes'" will indicate. 27 Still it was at that time the most powerful, especially in the kingdom of Naples, which was then ruled by Spain. 28 The old cloister had been once the home of St. Thomas Aquinas, whose works Bruno claimed at his trial he had always by him, "continually reading, studying and restudying them, and holding them dear."

29 This was the age when efforts to put down every heresy had been redoubled. The fanaticism of Loyola, and the decision of the Council of Trent "to erase with fire and sword the slightest traces of heresy," 30 made a poor frame work in which to place the picture of a liberal minded scholar. Bruno soon learned this at his cost. Even during his novitiate he was accused of giving away images of the saints, and of giving bad advice to his associates. 31 In 1576 he was accused of apologising for the heresy of Arius, that the Son was begotten of the Father, and so not consubstantial nor coeternal with Him, but created by Him and subordinate to Him; 32 (which was condemned by the Council of Nice, 325, and contradicted in the Nicene Creed;) admiring its scholastic form, rather than its abstract truth. 33 Disgusted with his treatment he left Naples and went to Rome. Even here he was molested in the Cloister of Minerva (note the pagan name), and was met with an accusation of 130 specifications. 34 He then abandoned his garb and his cloister and escaped from Rome, beginning thus the nomadic life which he continued until immured in the dungeons of the Inquisition at Venice, sixteen years later. 35 Through these wanderings one must follow him, if one would become familiar with his life and traits.

36 He now resumed for a time his baptismal name, and traveled to a town on the Gulf of Genoa, where he taught youth and young gentlemen. 37 Then he passed on to Turin and Venice, where he spent weeks in futile attempts to find work. But the schools and the printing houses were closed because of the plague. 38 In Venice however he managed to print his first book on "*The Signs of the Times*;" or rather this was

his first book to appear in print. It seems that before he left Naples he wrote "*The Ark of Noah*," a satirical allegory. 39 In this he represented that the animals held a formal meeting in the Ark, to settle questions of precedence and rank, and that the presiding officer, the Ass, was in danger of losing his position and his influence, because his power lay rather in hoofs than horns. 40 Throughout most of his life Bruno constantly scored and criticised Asinity; 41 it was frequently the topic of his invective, and those who read between his lines were probably quite justified in regarding these frequent allusions as references to the ignorance, bigotry and credulity of the Monks.

42 From Venice Bruno went to Padua, where some of the Dominican friars persuaded him to resume monastic costume, since it made travel easier and safer. Thence by way of Brescia and Milan he may be followed to Bergamo. 43 At Milan he first heard of his future friend Sir Philip Sydney. From Bergamo he resolved to go to Lyons, but learning that he would find anything but welcome there he turned aside and crossed the Alps, arriving in Geneva in the Spring of 1579. 44 Here he was visited by a distinguished Neapolitan exile, the Marquis De Vico, who persuaded him again to lay aside his clerical garb, and who gave him the dress of a gentleman, including a sword. 45 Here is raised the great question,-- Did Bruno adopt Calvinism? 46 Before the Inquisition fifteen years later he practically denied this, yet acknowledged attending the lectures of Balbani, of Lucca, as well as of others who taught and preached in Geneva. 47 Under the regulations of the Academy (University), where he had already registered, certain regulations must be complied with, and Bruno appears to have obeyed them in at least a certain degree. 48 But the immediate cause for his departure from Geneva appears to have been one of his outbreaks of cynicism and accurate scholarship, 49 since in 1579 he was called before the Council for having caused to be printed a document enumerating twenty errors made by the Professor of Philosophy (de la

Faye) in one of his lectures. 50 The latter was incensed and outraged at this criticism and disparagement of his views and learning, and the quarrel assumed unexpected magnitude, 51 since Bruno, on his second appearance before the Consistory or supreme tribunal of the Church, denied the charges and called the ministers "pedagogues." 52 These gentlemen decided to refuse him communion unless he should confess and repent of his faults and make due apology. 53 His acceptance of these conditions not being hearty enough to suit his judges, he was admonished and excluded from the communion. 54 These steps lead to greater contrition on his part, and the ban of excommunication was withdrawn. 55 This sentence of exclusion was the only one within the power of the Consistory to pass, but does not prove that Bruno had accepted the protestant faith, nor partaken of its communion. 56 In fact at his trial he steadfastly denied this. It seemed however, to disgust him with Calvinism, against which thereafter he never ceased to inveigh. 57 Later he contrasted it with Lutheranism which was far more tolerant, and still later gave him a heartier welcome. 58 Calvin, it must be remembered, had written a polemic against Servetus, "in which it is shown to be lawful to coerce heretics by the sword." 59 As between the council of Trent and Calvin it certainly must have been hard, in those days, to select either a faith, or an abiding place where that faith might be peaceably practised. 60 Doubtless Bruno's views concerning the philosophy of Aristotle conflicted with those of the church authorities, 61 for Beza (Calvin's follower), had stated that they did not propose to swerve one particle from the opinions of that Greek philosopher, to whom, though of pagan origin, the Church, both Roman and Protestant, was for centuries so firmly bound.

62 And so shaking the dust of Geneva from his feet he journeyed to Lyons, where he failed utterly to find occupation, and then on to Toulouse, where he remained about two years. 63 Here he took a Doctorate in Theology in order to compete for a vacant chair. To this he was elected by the students, as

the custom then was in most of the 'scholia' or universities. 64 For two sessions he lectured on Aristotle. Had this University required of him that he should attend mass, as did some others, he could not have done so, owing to his excommunication; 65 though just why exclusion from a Calvinistic academy should debar him from Catholic mass does not appear. Toulouse was a 'warm' place for heretics; the burning of 14,000 of them at its capture will prove this. 66 A few years (35) after he left it Vanini was burned for heretic notions. It is hardly to be believed that Bruno could pass two years or more here without controversies arising from his teaching. 67 But his nominal reason for leaving, in 1581, and going to Paris, was the war then raging in Southern France, under Henry of Navarre.

68 Before leaving Toulouse he completed his "'Clavis Magna'" or "Great Key," the last word-- as he seemed to think-- on the art of memory. 69 Only one volume of this great work, which, in his peculiarly egotistical way, he said is "superlatively pregnant," was ever published, and that in England, the "'Sigillus Sigillorum'." 70 It must not be forgotten that it was on both teaching and practising this art of memory that Bruno, throughout his career, prided himself. 71 He was even not averse, at least at certain periods of his career, to the belief that he had some secret system for this purpose, or even received occult aid. 72 But when summoned before Henry III, to whose ears had come his fame, and asked whether the memory he had and the art he professed were natural or due to magic, 73 he proved that a good memory was a cultivated natural product. He then dedicated to the King a book on "'*The Art of Memory*'." 74 But this was shortly after his arrival in Paris, in 1581, where he quickly became famous. 75 A course of thirty lectures on "'*The Thirty Divine Attributes*'" of St. Thomas Aquinas would have given him a chair, could he have attended mass.

76 His residence in Paris was marked by an extraordinary literary activity. He published in succession '*De Umbris Idearum*' (Shadow of Ideas), dedicated to

Henry III, (this included the Art of Memory just mentioned) '*Cantus Circaeus*' (Incantation of Circe) dedicated to Prince Henry; 77 '*De Compendiosa Architectura et Complemento Artis Lulli'* (Compendious Architecture); '*Il Candelaio*' (The Torchbearer); these all appeared in 1582. These varied greatly in character. 78 The first was devoted to the metaphysics of the art of remembering, with an analysis of that faculty, and these second was given up to the same general topic. 79 It was all obscure, hence perhaps its popularity. Brunnhofer says that it was "a convenient means of introducing Bruno to strange universities, gaining him favour with the great, or helping him out of pressing need of money. 80 It was his exoteric philosophy with which he could carefully drape the philosophy of a religion hostile to the Church, and ride as a hobby horse in his unfruitful humours."

81 Nevertheless we must believe in his sincerity. The "Compendious Architecture" is the first of his works in which Bruno deals with the views of Raymond Lully, a "logical calculus and mnemonic scheme in one" (McIntyre) that had many imitators. 82 For Lully, Bruno seems to have the greatest regard, this appearing in many ways. Lully, by the way, was a Spanish scholastic and alchemist, who was born on one of the Balearic Islands in 1235. 83 He went as a missionary to the Mahommedans, and spent much time in Asia and Africa. He figures largely in the history of the alchemists and as a practitioner of the occult. 84 The "*Torchbearer*" was a work of very different character. It was described as a "Comedy" by one who described himself as "Academico di nulla academia, ditto il fastidito: In tristitia hilaris, hilaritate tristis." 85 It is essentially a satire on the predominant vices of pedantry, superstition and selfishness or sordid love. 86 Though lacking in dramatic power it is regarded as second to nothing of its kind and time. Its 'dramatis personae' are personified types, not individuals. 87 It was realistic even in its vulgarity, for obscenity was prevalent in the literature of those days. But in it Bruno struck at

what seemed to him his greatest enemy, i. e. pedantry.

88 There were at this time in Paris two great Universities, one the College de France, with liberal tendencies, and opposed to the Jesuits and all pedantry; 89 the other the Sorbonne, for centuries the guardian of the Catholic faith, endowed with the right of censorship, which must have been exercised over Bruno's works. 90 In which of these, though surely in one of them, Bruno was made an Extraordinary Lecturer history has failed to record. 91 He must have offended both, since he was anxious to be taken back into the Church, yet was revolutionary in his teaching. 92 More than thirty years later Nostitz, one of his pupils, paid tribute to his versatility and skill, 93 saying "he was able to discourse impromptu on any suggested subject, to speak extensively and elabourately without preparation, so that he attracted many pupils and admirers in Paris." (McIntyre). 94 But Bruno belonged to the literally peripatetic school, and in 1583 he forsook Paris for London, because as he says of "tumults," leaving it to the imagination whether these were civil or scholastic.

95 Elizabeth reigned at this time; her influence made England a habour of safety for religious and other mental suspects. 96 She had a penchant for Italians and their language; two of her physicians were Italians, and Florio was ever welcome at her court. 97 To this court Bruno also was welcomed, and, basking for sometime in the sunshine of her regard and patronage, passed there the happiest portion of his unhappy life. 98 Oxford was at that time the stronghold of Aristotelianism. One of its statutes ordained that "Bachelors and Masters who did not follow Aristotle faithfully were liable to a fine of five shillings for every point of divergence, and for every fault committed against the Logic of the Organon." (McIntyre). 99 In Oxford at this time, unfortunately, theology was the only live issue; of science as of real scholarship there was little or none. 100 (Its predominant trait of those days is still, perhaps, its dominant feature to-day). To this university Bruno addressed a letter, couched in vainglorious and

egotistical terms, craving permission to lecture there. 101 This was not received with favour, while his doctrines met with small encouragement at this ancient seat of learning, which Bruno later stigmatised as the "widow of true science." 102 But opportunity was afforded him to dispute publicly before a noble visitor in June, 1583, a Polish prince; one Alasco, for whom great public entertainment had been provided. 103 His opponent, defeated by fifteen unanswerable syllogisms, resorted to scurrility and abuse. This public exhibition put an end to the lectures on the Immortality of the Soul which Bruno had been allowed to give, and he returned to London.

104 Shortly after this he published his 'Cena' (Ash Wednesday Supper) in which he ridiculed the Oxford doctors, saying among other things that they were much better acquainted with beer than with Greek. 105 But he criticised too cynically and lost thereby in popularity. This led to the appearance of the '*Causa*', a dialogue, in which he was less vindictive. 106 He admitted in this that there was much in the old institution which was admirable; that it was even the first in Europe, that speculative philosophy first flourished there, 107 and that thence, "the splendor of one of the noblest and rarest spheres of philosophy, in our times almost extinct, was diffused to all other academies in civilised lands." 108 What he most condemned was the too great attention given to language and words while the realistics for which words stand were neglected. 109 Doctors were easily made and doctorates too cheaply bought. His charge in brief was that they mistook the shadow for the substance; a charge even yet too commonly justified among the strongholds of theology and other speculative dogmas.

110 Returning to London after this experience Bruno went to live with Mauvissiere, the French Ambassador. 111 While the English records make no mention of his presence it is yet quite certain that he was frequently at Court, and that men like Sydney, Greville, Temple and others were his frequent associates. 112 But as the Ambassador's influence was on

the wane, he was not equal to his great trust. 113 At this time our philosopher spoke of himself as one "whom the foolish hate, the ignoble despise, whom the wise love, the learned admire," etc. (McIntyre). 114 Of Queen Elizabeth he wrote in most fulsome phrases, such as she too dearly loved. 115 Before his judges, a few years later, Bruno apologised for his exaggerated expressions concerning a Protestant ruler, 116 claiming that when he spoke of her as "divine" he meant it not as a term of worship, but as an epithet like those which the ancients bestowed upon their rulers; claiming further that he knew he erred in thus praising a heretic.

117 Bruno published seven works in England. The first was "'*Explicatio triginta Sigillorum*'," the Thirty Seals thus explained being hints for acquiring, arranging and remembering all arts and sciences. 118 To it was added his '*Sigillus Sigillorum*' for comparing and explaining all mental operations. Then came an Italian dialogue "'*La Cena de le Ceneri*'" or Ash Wednesday Supper. 119 This was written in praise and extension of the Copernican theory, 120 indeed quite exceeding it in teaching the identity of matter, the infinity of the universe, the possibility of life on other spheres, with a painstaking attempt to show that these notions do not conflict with those of Mother Church. 121 Next came "'*De Causa, Principio et Uno'*." (Cause, Principle and Unity). This treated of the immanence of spirit, the eternity of matter, the potential divinity of life, the origin of sin and death, and many other similar abstruse topics. 122 It was followed by '*De l'Infinito Universo ed Mondi*', with numerous reasons for believing the universe to be infinite and full of innumerable worlds, with the divine essence everywhere pervading. All these works appeared in 1583. 123 In 1584 appeared his "'*Spacio de la Bestia Triofante*'" or Expulsion of the Triumphant Beast. In this prose poem Jupiter, repenting his errors, resolves to expel the many beasts that occupy his heavenly sphere--the constellations-- and to substitute for them the virtues.

124 In the council of the gods convened by him many subjects are discussed, among them the history of religions, the contrasts between natural and revealed religions and the fundamental forms of morality. 125 In this allegory Jupiter represents of course the human spirit; the Bear, the Scorpion, etc., are the vices to be expelled. 126 Unfortunately the book was quite generally regarded as attack upon the Church or the Pope, though what he really struck at was the credulity of humankind. It was dedicated to Sir Philip Sydney.

127 Then came his "'*Cabala del Cavallo Pegasio*'" or Cabal, dedicated to a suppositious Bishop who was made to impersonate the spirit of ignorance and sloth. 128 It is a mordant satire on Asinity, including credulity and unquestioning faith. 129 After this he dedicated another work to Sidney. "'*Degl' Heroici Furori*'" (Enthusiasms of the Noble), a collection of sonnets with prose commentaries, 130 like Dante's 'Vita Nuova', touching on the love for spiritual beauty arising from that for physical beauty attaining a climax in a sort of ecstasy by union with the divine. 131 These sonnets possess a very high literary value aside from their other interest.

132 When his ambassadorial patron was recalled Bruno probably returned to Paris with him, during the latter part of 1585. Here he spent a year amidst constant turmoil and excitement, and at his own expense. 133 Though he attempted reconciliation with the Church he was regarded as an apostate. 134 He held one more public disputation in which he advanced one hundred and twenty theses against the teaching of the Sorbonne, his side being taken by its rival, the College de France. 135 The outcome cannot have been brilliantly favourable, since he soon after left Paris, in June, 1586. 136 The collection of charges above alluded to was published in Paris after Bruno's departure, and again in Wittenberg, under the title "'*Excubitor*'" (The Ambassador). 137 It was an arraignment of the Aristotelians, based on the words of that great master himself. Bruno claimed the same right to criticise Aristotle that the latter claimed to

criticise his predecessors. 138 In it Bruno says, "It is a poor mind that will think with the multitude because it is a multitude; truth is not altered by the opinions of the vulgar or the confirmation of the many;"-- 139 and again-- "it is more blessed to be wise in truth in face of opinion than to be wise in opinion in face of truth." (McIntyre). 140 In addition to this Bruno had also published, before leaving Paris, a commentary on the Physics of Aristotle.

141 Tarrying somewhat by the wayside Bruno reached Wittenberg, where, in 1586, he matriculated at its University, Marburg having curtly rejected him. Describing him here McIntyre styles him the "Knight Errant of Philosophy." 142 Here Lutheranism dominated the theological faculty, while the philosophical faculty was dominated by Calvinism; 143 views concerning the person of Christ, the "Real Presence," and the doctrine of Predestination keeping them apart in spite of Melancthon's attempt to reunite the two factions. 144 From the Lutheran party Bruno obtained permission to lecture, and so for two years he taught from the Organon of Aristotle, as well as the writings of Raymond Lulli. 145 To the University senate he dedicated a work on Lulli, "'*De Lampade Combinatoria Lulliana*'," whose chief purpose was to teach one how to find "an indefinite number of propositions and middle terms for speaking and arguing." 146 He regarded it as the only key to the Lullian writings, as well as a clue to a great many of the mysteries of the Pythagoreans and Cabalists. 147 It was soon followed by "'*De Progressu et Lampade Venatoria Logicorum*'," intended to enable one to "dispute promptly and copiously on any subject."

148 But again fate compelled a change of residence, for the Calvanistic and Ducal party gained in political ascendancy, to which party Bruno, as a Copernican, would have appeared as a heretic. 149 After delivering an eloquent address of farewell he moved on, his next abiding place being Prague, where Rudolph II, of Bohemia, was posing as the friend

of all learned people. 150 Here he already had friends at court, and here he introduced himself with another Lullian work. 151 To the Emperor he next dedicated a work of iconoclastic type, "One hundred and sixty articles against the mathematicians and philosophers of the day." 152 For this the Emperor granted him the sum of three hundred dollars, and in January, 1589, he shifted again to Helmstadt, in Brunswick, where he matriculated again in the then youngest of the German Universities.

153 This had been founded only twelve years before by Duke Julius, who was extremely liberal in his views, and intended to found a model institution, in which theology should not play too dominant a part. 154 But while he received here a certain recognition fate again sported with him, for the Duke died four months after his arrival. 155 Bruno obtained permission to pronounce a funeral oration, desiring to express his gratitude to the memory of one who had opened such an institution, 156 so free to all lovers of the Muses and to exiles like himself, who were here protected from the greedy maw of the Roman wolf, 157 whereas in Italy he had been chained to a superstitious cult. It was full of allusions to the papal tyranny which was infecting the world with the rankest poison of ignorance and vice.

158 The fatuous simplicity and the worldly blindness which Bruno displayed, in ever setting foot inside of Italian or papal territory after the delivery of this 'Oratio Consolatoria', may in one way be appreciated but never understood or explained. 159 Moreover he had made himself 'persona non grata' as well to the Protestants, who were scarcely more liberal than the Catholics. 160 It appears that the great Boethius, superintendent of the Church at Helmstadt, had acted both as judge and executioner, and publicly excommunicated Bruno without a hearing, since there is extant a letter appealing from his arbitrary judgment and malice. 161 The grounds for this judgment were never made clear, since no attention was ever paid to the appeal; 162 but inasmuch as Bruno never really joined the Protestant

profession it must have been meant to inflict some species of social ostracism. 163 Boethius had himself to be suppressed later. But Bruno, finding too many enemies, left for Frankfort in 1590, "in order to get two books printed."

164 These were his two great Latin Works, "*De Minimo*" and "*De Immenso*," the introduction to the latter being the "*De Monade*." He worked at these with his own hands. 165 In the introduction to the former his publisher stated that before its final revision Bruno had been hurriedly called away by an unforseen chance. 166 This sudden departure may have been due to a refusal of the town Council to permit his residence there, or it may have been a call to Zürich, where he spent a few months with one Hainzel, who had a leaning toward the Black Arts. 167 Bruno wrote for him "'*De Imaginum Compositione*'," a manual of his Art of Memory. 168 In this Swiss city he also dictated a work "'*Summa Terminorum Metaphysicorum*'," which was not published until 1609, and then in Marburg. 169 But Bruno returned to Frankfort in 1591, where he obtained permission to publish his '*De Minimo*'. This work was on the "three fold minimum and measurement, being the elements of three speculative and several practical sciences." 170 This like the two next mentioned was a Latin poem, after the fashion of Lucretius. 171 The '*De Monade, Numero et Figura*' dealt with the Monad, and with the elements of a more esoteric science, while in the '*De Immenso et Innumerabilibus*', the Immeasurable and Innumerable, he dealt with the Universe and the worlds. 172 These three poems contain Bruno's complete philosophy of God and Nature.

173 While thus staying in Frankfort for the second time Bruno was invited by a young Venetian patrician to pay him a visit, and become his tutor in those arts in which the philosopher excelled. 174 It was the most unfortunate event in Bruno's unhappy life when he accepted this apparently tempting invitation. Mocenigo, his host, was of good family, but shallow, vain, weak-minded and dishonest, with the fashionable taste of his day for the black arts.

175 It is quite possible that he was moreover the tool of the Inquisition, which had long desired to entrap Bruno. 176 It is probable moreover that the latter quite failed to appreciate how unenviably he was regarded by that Church to which he still felt that he belonged. 177 Furthermore Venice was then a Republic and free, and he longed for his beloved Italy again. 178 En route to Venice he spent three months in Padua, teaching there and gathering around himself pupils, even in that short time. 179 He had barely left it when Galileo was invited there to teach; as Riehl has said, "the creator of modern science following in the steps of its prophet."

180 Early in 1592 Bruno went to live in Mocenigo's house. Trouble soon began. Entirely apart in temperament and characteristics, they soon disagreed. 181 The pupil was deeply disappointed at not acquiring that mastery over the secrets of Nature for which he had hoped, and found that there was no quick way to acquire a retentive and replete memory. 182 And so Mocenigo announced to his friend Ciotto, the bookseller, his intent to gain from Bruno all he could and then denounce him to the Holy Office. 183 While others were thus conspiring against him Bruno was writing a work on "*The Seven Liberal Arts*" and on "*Seven Other Inventive Arts*," intending to present it to the Pope, hoping thus to obtain absolution and be released from the ban of excommunication. 184 When Bruno at last appreciated the dangers by which he was surrounded he announced his intent to go again to Frankfort to have some of his books printed, and so took his leave of Mocenigo. 185 On the following day, in May, 1592, Bruno was seized by six men, using force, who locked him in an upper story of Mocenigo's house. 186 The next day he was transferred to an underground cellar, and the following night to the prison of the Inquisition. May 23rd his former host denounced him, with a cunning and lying statement concerning some of his views and teachings. 187 Thus he was reported as stating that Christ's miracles were only apparent, that He and the apostles

were magicians, that the Catholic faith was full of blasphemies against God, 188 that the Friars befouled the world and should not be allowed to preach, that they were asses, and the doctrines of the Church were asses' beliefs, etc. (McIntyre). 189 This was followed two days later by a second denunciation in which Mocenigo went to a diabolical extreme of deceit and hypocrisy; stating that all the time he was entertaining Bruno he was promising himself to bring him before the Holy Office. 190 Within forty-eight hours the Holy Tribunal met to consider the matter; before them appeared the book-sellers who had known Bruno in Zürich and Frankfort, and before them came Bruno in his own behalf, professing his entire willingness to tell the whole truth. 191 Within a few days Mocenigo made yet another deposition, denouncing Bruno's statements about the infallible Church. On the following day Bruno was again heard in his own defense, 191 and appealed to the famous and fallacious doctrine of two-fold truth, acknowledging that he had taught too much as a philosopher rather than as an honest man and Christian, 192 and that he had based his teachings too much on sense and reason and not enough on faith;-- so specious had become his argument with the terrors of the Inquisition before him. 193 He further claimed that his intent had been not to impugn the faith but to exalt philosophy. 194 He then beautifully epitomised his own views, claiming that he believed in an infinite universe, in an infinite divine potency, holding it unworthy of an infinite power to create a finite world, when he could produce so vast an infinity; 195 with Pythagoras he regarded this world as one of many stars,-- innumerable worlds. 196 This universe he held to be governed by a universal providence, existent in two forms;-- one Nature, the shadow or footprint of deity, the other the ineffable essence of God, always inexplicable. 197 Concerning the triune Godhead he confessed certain philosophic doubts as well as concerning the use of the term "'persons'" in these distinctions, while he quoted St. Augustine to the same effect. 198 The miracles he had always

believed to be divine and genuine; concerning the Holy Mass and the Transubstantiation he agreed with the Church. 199 As the days went by he became the more insistent upon his orthodoxy. He condemned the heretic writings of Melancthon, Luther and Calvin, expressed respect for the writings of Lulli because of their philosophical bearings, while for St. Thomas Aquinas he had the most profound regard.

200 Other counts in the indictment which he had to face were his doubts concerning the miracles, the sacraments and the incarnation, his praise of heretics and heretic princes and his familiarity with the magic arts. 201 He finally made a formal solemn abjuration of all the errors he had ever committed, and the heresies he had ever uttered, or doubts expressed or believed, praying only that the Holy Office would receive him back into the Church where he might rest in peace. 202 Further examinations were held and the earlier processes against him in Naples and Rome recalled. After this there was a period of apparent quiet save that he remained in prison. 203 It is not known to what tortures he may have been subjected, but it is recorded that he knelt before his judges asking their pardon, and God's, for all his faults, 204 and professed himself ready for any penance, apparently not yet realising the fate in store for him.

205 A little later it transpired that the Sacred Congregation of the Supreme Tribunal of the Holy Office, in Rome, desired to assume all further responsibility for the process against so distinguished a heretic. 206 Accordingly the machinery of the Church was put in motion to this end. Negotiations with the Venetian Republic, somewhat tedious and complicated, which need not detain us now, were at last concluded. January 7, 1603, 207 the Venetian procurator reported of Bruno that "his faults were exceedingly grave in respect of heresies, though in other respects he was one of the most excellent and rarest natures, and of exquisite learning and knowledge," (McIntyre) 208 but that the case was of unusual gravity, Bruno not a Venetian subject, the Pope most anxious, etc. It was then decided to

remit him to the Tribunal of the Inquisition at Rome; 209 whereat it is duly reported, the Pope was deeply gratified. To Rome then he went and here he was lost, so far as documentary records go, for a period of six years.

210 How to explain this fact and this apparent clemency has bothered the biographers not a little. 211 Whether this time was spent in an examination of his voluminous writings, which would seem incredible, 212 or whether the Dominicans laboured so long to procure his more absolute recantation in order to prevent scandal in and reflection on their order, 213 or whether Pope Clement himself regarded kindly-- in some degree-- the great scholar who was so anxious to dedicate to him a '*magnum opus*';-- to these queries history answereth not. 214 The Dominicans pretended-- years later-- to doubt if he ever had been put to death, or whether he had ever really belonged to their order. These statements are too characteristic to provoke more than a sad smile.

215 Finally matters were hastened to an end by the efforts of Fathers Commisario and Bellarmino; the latter being the zealous bigot who decided that Copernicanism was a heresy, who later laid the indictment against Galileo. 216 Through their machinations Bruno was, in February, 1599, decreed on eight counts as a dangerous heretic, who might still admit his heresies, and he was to be granted forty days in which to recant and repent. 217 But this period was stretched out some ten months, until December, when it was reported that Bruno refused to recant, having nothing to take back. 218 Among the Tribunal at this time was San Severino, fanatical, bitter because of his failure to secure the papacy, who had declared that St. Bartholomew's was "a glorious day, a day of joy for Catholics." 219 It was decided that the high officers of the Dominicans should make one last effort to compel or coax Bruno to abjure. This he declined to do, 220 Whereupon, January 20th, 1600, it was decreed that "further measures be proceeded to, 'servatis servandis', that sentence be passed, and that the said Friar Giordano be handed

over to the secular authority." 221 A few days later Bruno was degraded, excommunicated and handed over to the Governor of Rome, with the usual hypocritical recommendation to "mercy," 222 and that he be punished "without effusion of blood," which meant of course burning at the stake. 223 Bruno's reply to his judges deserves to be printed in letters of gold whenever it can be recorded;-- "'Greater perhaps is your fear in pronouncing my sentence than mine in hearing it.'" 224 Let us spare ourselves a too minute account of his execution. Some reports are to the effect that his tongue was tied, because he refused to listen to the exhortations of those members of the Company of St. John the Beheaded, 225 better known as the Brothers of the Misericordia, who accompanied the condemned to the scaffold or the stake, 226 resorting to the most cruel methods in order to provoke at least some appearance of recantation or repentance during the last moments of life.

227 Right here let it be said of Bruno that whatever may have been his weaknesses before the Inquisition at Venice, he stood firmly by his creed when put to the final test, 228 and died an ideal martyr's death because his creed did not agree with that of his persecutors. 229 And so terminated the life of one of Italy's greatest ornaments and scholars. The occasion had not then the importance we assign it now. 230 The burning of a heretic was a frequent spectacle, and the year 1600 was the year of Jubilee, in which the death of one unbeliever more was but the incident of a day. 231 He had himself foreseen it, saying, "Torches, fifty or a hundred, will not fail me, even though the march past be at mid-day, should it be my fate to die in Roman Catholic Country."

232 There remains yet to comment on his character and to analyse his views. 233 The greatest blot upon the former is his attitude before the Venetian Tribunal. Here he was at first defiant, even polemical, strong in his asserted right to use the natural light of sense and reason. 234 Under greater stress he modified this to one of absolute and indignant denial, and finally became submissive to the last

degree, cringing and finally begging for pardon on bended knees. 235 That this attitude changed with his better realisation of his predicament is undeniable. Moreover what keen and sensitive natures may do under the influence of torture is never to be predicated. 236 How many of us could resist the persuasiveness of the rack when it came to modifying our beliefs? 237 But whatever may have been his weakness at that time, he completely rehabilitated himself before his end, 238 for were not his ashes scattered to the winds as a token that he completely failed to recant? 239 Surely no martyr to science or dogma ever died a more dignified death, for the edification or example of others.

240 What shall be said of his persecutors and prosecutors? Let us here be charitable; let us be just. 241 Have we yet that absolute knowledge of right and wrong which can enable us to pass final judgment on people of the past, their motives and actions? 242 Moral perceptions are the product of the race, the age and the environment; they vary greatly with the times. 243 There is no crime in or out of the Decalogue which has at all times and by all peoples been regarded as such. 244 The Church during several centuries enjoyed a monopoly of wisdom or learning as well as of opportunities for acquiring them. 245 Zealotry, bigotry, intolerance, fanaticism, were the natural products of such conditions. So were cruelty and disregard of human life. 246 Join the mind of a bigot to the body of one who knows not fear, and the result will be a Loyola, or a St. Louis of France, who held that the only argument a layman should engage in with a heretic should be a sword thrust through the body.

247 If then heresy was a crime, punishable by a cruel death in all the capitals of Europe, let us blame less the people who were trained and grew up with these notions, but rather more the Church which preached them, whether Catholic or Protestant. 248 Only if one of these really were, as it still claims to be, 'infallible', then what has become of its infallibility? 249 Or if heresy be held still a crime then what shall we say of the Church's

ethics? 250 If one were God-given the other is un-Christ-like. But no free thinker can engage in theological polemics, or with jesuitical sophistries, without letting own reason excite own emotions; 251 and when the emotions enter the door logic flies out of the window.

252 Let us say then that Bruno was in some respects so far ahead of his day and generation that they understood him not. And yet he was a 'torch bearer', 253 save at his own last funeral pyre, shedding forth a light which illumed the centuries to come, and helping to make the period of the Italian Renaissance one of the most important and glorious in the world's history. 254 If better known and more widely studied, he would be by English and American students placed on that pinnacle which he deserves in the Hall of Fame.

255 What shall be said of Bruno as a philosopher? He, first of all men in the middle ages, taught that Nature was lovable and worthy of study. 256 Loving Her, trusting, confiding in Her, he found himself at outs with all the mental processes of his fellow scholars. 257 In this way the natural method was brought into direct opposition with the ponderously artificial and strained methods of his day. 258 He held that our eyes were given us that we might open and look upward. "Seeing, I do not pretend not to see, nor fear to profess it openly," he says. 259 His philosophy was rather a product of intuition than of ratiocination, which became his real religion, 260 for which Catholicism was a cloak, because in those days one was compelled to wear a cloak or live but a short life, and that within prison walls. 261 What the medieval church, Catholic and even Protestant, has to answer for, as to the suppression of truth and provocation of hypocrisy, is beyond the mensuration of human. 262 For the argument from authority he had the greatest contempt, and herein he set the world of thinkers a valuable lesson. 263 "To believe with the many because they were many, was the mark of a slave," (McIntyre). 264 Before Bacon, before Descartes, he saw the necessity of "first clearing the

mind of all prejudice, all traditional beliefs that rest on authority." He thus begins one of his sonnets:-- 265 "Oh, holy assinity! Oh, holy ignorance, holy folly and pious devotion; which alone makest souls so good that human wit and zeal can go no further," etc.

266 By the independence of his mental processes he was thrown quite upon his own resources, and his nature, already dignified and reserved, was made more introspective and self-conscious. 267 In this way he developed strains of vanity and egotism which led him at times to the bombastic self-laudation of a Paracelsus. 268 He had nothing but disgust for the common people and the sort of scholars (pedants) whom they admired. 269 The vulgar mind was more influenced by sophisms, by appearance, by failure to distinguish between the shadow and the substance. 270 Take but two or three of Bruno's conceptions:-- He perhaps first during the middle ages taught the transformation of lower into higher organisms, 271 following the Greeks who first enunciated the doctrine of evolution, which it remained for Darwin and Wallace to edit and illustrate as that law of the organic continuity of life, which we call 'evolution'. 272 He further wrote of the human hand as a factor in the evolution of the human race, in a way which should have commended him to the author of the Bridgewater treatise. 273 He wrote of the changes on the earth's surface brought about by natural processes, 274 which have changed not only the external configuration of the same but the fate and destiny of nations; of the identity of matter throughout the universe; of the universal movement of matter. 275 Long before Lessing he showed how myths may contain the germs of great truths, and should be regarded as indications thereof. 276 In this way, he told us, the Bible was to be regarded, holding its more or less historical statements to be quite subordinate to its moral teachings.

277 When we realise how to such highly developed reasoning powers as Bruno possessed, were added a phenomenal memory, a tremendous power of assimilation,

a developed imagination, a poetic nature, 278 the gift of easy and accurate speech and a temperament easily excited to fervor in attack or defence, we may the better appreciate his dominating greatness as well as his trifling weakness; 279 the former being entirely to his own credit while the latter are ascribed largely to the faults of his time, and the fact that he was really living far ahead of his day and generation. 280 He was not only the forerunner of modern science, he was the prototype of the modern biblical critic, foreshadowing the modern higher criticism, albeit in veiled terms, and as a matter of esoteric teaching; 281 because the biblical critic of those days was burned at the stake, while to-day he is barely ostracised by the shallow and narrow minded, with whom he has at best nothing mentally in common. 282 So much have four centuries of labour and vicarious suffering accomplished for the emancipation of the human mind.

283 Bruno 'had' a creed, but it was too simple for his times. He rejected certain orthodox dogmas, (e. g. the Trinity, the Immaculate Conception) which commend themselves still less to the emancipated and cultivated minds of to-day. 284 He absolutely rejected authority, which was a step toward reason comparable to the freeing of the slaves or serfs. 285 He evolved a theory of evolution from 'a priori' concepts, which it remained for Darwin to complete and demonstrate. He believed in the natural history of religions. 286 His motives were of the loftiest, though his methods were not always those of to-day. He believed that the essence of truth inhered in those differences which kept humans apart, and still sever them. 287 He believed the 'law of love' and that it sprang from God, which is the Father of All, that it was in harmony with Nature, 288 and that by love we may be transformed into something of His likeness. 289 As Bruno himself says:--"This is the religion, above controversy or dispute, which I observe from the belief of my own mind, and from the custom of my fatherland and my race." (McIntyre).

290 And yet this sublime man was burned as a heretic! 291 Let us stop

when we hereafter pass through the Campo dei Fiori, as I have done many a time, and take off our hats to the memory of this great man, 292 who, while small in some human traits, yet was the greatest thinker in Italy during the sixteenth century, whose memory may help us to forget some of the hypocrisies and cant so generally prevalent during the age which and among the people who condemned him. 293 Let us also thank God that there is no Tribunal of the Inquisition to-day, to pass misguided judgment upon us for having gone further than Bruno ever dreamed, though along the same lines, and to condemn us therefore to the Flames.

294 This paper has already been prolonged, perhaps tiresomely, nevertheless I cannot refrain from quoting a few paragraphs from that most versatile student of this period, Symonds, whose estimate of Bruno is as follows:-- (Renaissance in Italy; Catholic Reaction, II Chap. ix). 295 "Bruno appears before us as the man who most vitally and comprehensively grasped the leading tendencies of his age in their intellectual essence. 296 He left behind him the mediaeval conception of an extra-mundane God, creating a finite world, of which this globe is the center, 297 and the principal episode in the history of which is the series of events from the Fall, through the Incarnation and Crucifixion, to the Last Judgment. 298 He substituted the conception of an ever-living, ever-acting, ever-self-effectuating God, immanent in an infinite universe, 299 to the contemplation of whose attributes the mind of human ascends by the study of Nature and interrogation of his conscience."

300 "Bolder even than Copernicus, and nearer in his intuition to the truth, he denied that the universe had "flaming walls" or any walls at all. 301 That "*immaginata circonferenza,*" "*quella margine immaginata del cielo*," on which antique science and Christian theology alike reposed, was the object of his ceaseless satire, his oft-repeated polemic. 302 What, then, rendered Bruno the precursor of modern thought in its various manifestations, was that he grasped the fundamental truth upon which modern science rests,

and foresaw the conclusions which must be drawn from it. 303 He speculated boldly, incoherently, vehemently; but he speculated with a clear conception of the universe, as we still apprehend it. 304 Through the course of three centuries we have been engaged in verifying the guesses, deepening, broadening and solidifying the hypotheses, which Bruno's extension of the Copernican theory, and his application of it to pure thought suggested to his penetrating and audacious intellect."

305 Bruno was convinced that religion in its higher essence would not sufferer from the new philosophy. 306 Larger horizons extended before the human intellect. The soul expanded in more exhilarating regions than the old theologies had offered.

307 "Lift up thy light on us and on thine own,
O soul whose spirit on earth was as a rod
To scourge off priests, a sword to pierce their God,
A staff for human's free thought to walk alone,
A lamp to lead you far from shrine and throne
On ways untrodden where your fathers trod
308 Ere earth's heart withered at a high priest's nod,
And all humans' mouths that made not prayer made moan.
From bonds and torments, and the ravening flame,
Surely thy spirit of sense rose up to greet
Lucretius, where such only spirits meet,
And walk with him apart till Shelley came
To make the heaven of heavens more heavenly sweet,
And mix with yours a third incorporate name."

STUDENT LIFE IN THE MIDDLE AGES

AN ADDRESS GIVEN BEFORE THE CHAS. K. MILLS SOCIETY OF STUDENTS OF THE UNIVERSITY OF PENNSYLVANIA, FEBRUARY 19, 1902.

8 I assume that every university student of today realises that your possibilities and your opportunities are better in every way than were those enjoyed by students of

bygone times. 2 I take it, also, that you would not be averse to listening to an account of the habits, the surroundings, the privileges, and the disadvantages which surrounded students at a time when universities were young and when customs in general, as well as manners, were very different from those of to-day. 3 With all these in view, I shall ask your attention to a brief account of Student Life in the Middle Ages, with especial reference to that of the medical student. 4 Measured by its results, the most priceless legacy of mediæval times to humankind was the university system, which began in crude form and with an almost mythical origin, but which gradually took form and shape in consequence of many external forces. 5 It represented an effort to "realise in concrete form an ideal of life in one of its aspects." 6 Such ideals "pass into great historic forces by embodying themselves in institutions," as witness, for instance, the case of the Church of Rome.

7 The use of words in our language has undergone many curious perversions. Take our word "bombast," for instance. Originally it was a name applied to the cotton plant. 8 Then it was applied to any padding for garments which was made of cotton. Later it was used as describing literary padding, as it were, as when one filled out an empty speech with unnecessary and long words, and, at last, it came to have the meaning which we now give it. 9 So with the word "university." "Universitas" in the original Latin meant simply a collection, a plurality, or an aggregation. It was almost synonymous with "collegium." 10 By the beginning of the thirteenth century it was applied to corporations of masters or students and to other associated bodies, and implied an association of individuals, not a place of meeting, nor even a collection of schools. 11 If we were to be literal and consistent in our use of terms, for the place where such collections of people exercise scholastic functions the term should be "'studium generale'," 12 meaning thereby a place, not where all things are studied, but where students come together from all

directions. 13 Very few of the mediæval studia possessed all the faculties of a modern university. Even Paris, in its palmiest days, had no faculty of law. 14 The name 'universitas' implies a general invitation to students from all over the world to seek there a place for higher education from numerous masters or teachers. 15 The three great 'studia' of the thirteenth century were Paris, transcendent in theology and the arts; 16 Bologna, where legal lore prevailed; and Salernum, where existed the greatest medical school of the world's history. 17 In spite of the fact that these, like all the other 'studia' of the Middle Ages, were under the influence of the Church, from them sprang most of the inspiration that constituted the mainspring of mediæval intellectual activity, 18 although how baneful such influence could be may be illustrated by the Spanish-- that is, the ultra-Catholic University of Salamanca, where not until one hundred years ago were they allowed to teach the Copernican system of astronomy.

19 Under the conditions existing during the Middle Ages, with relatively few institutions of advanced learning, and in the presence of that spirit which led people to travel long distances, and very widely out of the provinces, to the cities of the great scholia, or, as we call them now, universities, 20 the most imperative common want was that of a common language; and so it happened that not only were the lectures all given in Latin, but that it was very commonly used for conversational purposes, and appears to have been almost a necessity of university life. 21 Early in the history of the University of Paris a statute made the ability of the petitioner to state his case before the rector in Latin a test of his bona-fide studentship. 22 This may perhaps, in some measure account for the barbarity of mediæval Latin. Still, as the listener said about Wagner's music, "it may not have been as bad as it sounded," 23 since the period of greatest ignorance of construction and rhetoric had passed away before the university era began. 24 John Stuart Mill even praised the schoolmen of the Middle Ages for their inventive

capacity in the matter of technical terms. 25 The Latin language, which was originally stiff and poor in vocabulary, became, in its employment by these mediæval thinkers, much more flexible and expressive. 26 It was the Ciceronian pedantry of the sixteenth and seventeenth centuries which killed off Latin as a living language. Felicity in Latin counted, then as now, as a mark of scholarship, 27 and six hundred years ago a schoolmaster could come up to the university and, after performing some exercises and passing such an examination as the doctors of music do to-day, could write one hundred verses in Latin in praise of the university, and take his degree. 28 The boys who went to the universities learned their Latin at inferior grammar schools, often in university towns. These schools were mainly connected with cathedrals or churches, 29 although, in the later Middle Ages, even the smallest towns had schools where a boy might learn to read and write at least the rudiments of ecclesiastical Latin. 30 In those days not only were the clergy Latin scholars, but the bailiff of every manor kept his accounts in Latin, 31 and a tutor even formed part of the establishment of a great noble or prelate who had either a family or pages in own care.

32 In those good old days boys were accustomed to seek the university at the ages of thirteen to fifteen. A Paris statute required them to be at least fourteen, and naturally many were older. 33 Many of these students were beneficed, and boys were canons or even rectors of parish churches. 34 In this capacity they obtained leave of absence to study in the universities, and so it was quite common at one time for rectors and ecclesiastics of all ages to appear in the rôle of university students. 35 At the close of the fourteenth century, in the University of Prague, in the law school alone there appeared on the list of students one bishop, one abbot, nine archdeacons, 290 canons, 187 rectors, and still other minor ecclesiastics. 36 At one time in the University of Bologna, in the registry of German corps, more than half the students were church

dignitaries. 37 Sad to relate, many of these clerical students were among the most disorderly and troublesome of the academic population, the statutes vainly prescribing that they should sit "as quiet as girls;" 38 while, as Rashdall says, "even spiritual thunders had at times to be invoked to prevent them from shouting, playing, and interrupting."

39 Considering the youthfulness of what we may call the freshmen, as many of them went up to the universities at the early age already mentioned, it is not strange that we hear of "fetchers" or "carriers" or "bryngers," who were detailed to escort them home; 40 but we must remember that the roads were dangerous in those days, and that protection of some kind was necessary even for men. 41 Proclamations against bearing arms usually made exceptions in favour of students travelling to or from the university. 42 Students, many of them, lived in halls, or, as we would say now, dormitories, and one of them assumed the rôle of principal, or was delegated to exercise certain authority. 43 Quite often this was the man who made himself responsible for the rent, whose authority came only from the voluntary consent of his fellow-students, or who was elected by them.

44 When it came to the matter of discipline, the good old-fashioned birchen rod was not an unknown factor in university government. 45 There seems to have been always a certain relationship between classic studies and corporal punishment. In mediæval university records allusions to this relationship began about the fifteenth century. 46 In Paris, about this time, when there were so many disgraceful factional fights, the rectors and proctors had occasionally to go to the colleges and halls and personally superintend the chastisement of the young rioters. 47 We find also in the history of the University of Louvain that flogging was at one time ordered by the Faculty of Arts for homicide or other grave outrages. 48 It is worthwhile to recall for a moment how grave offences were dealt with in those days. 49 At the University of Ingolstadt one student killed

another in a drunken quarrel, and was punished by the university by the confiscation of his scholastic effects and garments, but he was not even expelled. 50 At Prague a certain Master of Arts assisted in cutting the throat of a friar bishop, and was actually expelled for the deed. 51 In those days drunkenness was rarely treated as a university offence. The penalties which were inflicted for the gravest outrages and immoralities were for the greater part puerile in the extreme. 52 In most serious cases excommunication or imprisonment were the penalties, while lesser offences were punished by postponement of degree, expulsion from the college, temporary banishment from a university town, or by fines.

53 In Leipzig, in 1439, the fine of ten new groschen was provided for the offence of lifting a stone or missile with a view of throwing it at a master, but not actually throwing it; 54 whereas the act of throwing and missing increased the penalty to eight florins, while successful marksmanship was still more expensive. 55 Later statutes made distinction between hitting without wounding and wounding without mutilation, expulsion being the penalty for actual mutilation. 56 With the beginning of the sixteenth century the practice of flogging the very poorest students appears to have been introduced. 57 During these Middle Ages they had a peculiar fashion of expiating even grave offences. 58 For example, at the Sorbonne, if a fellow should assault or cruelly beat a servant he was fined a measure of good wine-- not for the benefit of the servant, but for all the culprit's fellow-students. 59 Those were the days, too, when trifling lapses incurred each its own penalty. 60 A doctor of divinity was fined a quart of wine for picking a pear off a tree in the college garden or forgetting to shut the chapel door. 61 Clerks were fined for being very drunk and committing insolences when in that condition. The head cook was fined for not putting salt in the soup. 62 Most of these fines being in the shape of liquors or wines, I imagine that the practice was more general because the penalty was shared in by all who were near.

63 With lapse of time the statutes of the German universities gradually grew stricter until they became very minute and restrictive in the matter of unacademical pleasures. 64 A visit to the tavern, or even to the kitchen of the college or hall, became a university offence. 65 There were statutes against swearing, against games of chance, walking abroad without a companion, being out after eight in the winter or nine in the summer, making odious comparisons of country to country, etc. 66 This was particularly true of the English universities, where a definite penalty was imposed for every offence, ranging from a quarter of a penny for not speaking Latin to six shillings eight pence for assault with effusion of blood.

67 The matter of constantly speaking Latin led to a system of espionage, by which a secret system of spies, called "'lupi'" or wolves, was arranged; 68 these were to inform against the "'vulgarisantes'," or those offenders who persisted in speaking in their mother tongue. 69 It was the students of those days who set the example and the fashion of initiating, or, as we would say now, of hazing the newcomers. 70 This custom of initiation, in one form or another, seems to have an almost hoary antiquity. As Rashdall puts it, three deeply rooted instincts of human nature combine to put the custom almost beyond suppression. 71 It satisfies alike the bullying instinct, the social instinct, and the desire to find at once the excuse and the means for a carouse. 72 In the days of which we are speaking the 'Bejaunus', which is a corruption of the old French 'Bec-jaune' (or yellow bill), as the academic fledgling was called, 73 had to be bullied and coaxed and teased in order to be welcomed as a comrade, and finally his "jocund advent" had to be celebrated by a feast furnished at his own expense. 74 A history of the process of initiating would furnish one of the most singular chapters in university records. 75 At first there were several prohibitions against all 'bejaunia', for the unfortunate youth's limited purse ill afforded even the first year's expenses.

76 As the years went by certain restrictions were imposed, and by the sixteenth century the 'depositio cornuum' had become in the German universities a ceremony almost equal in importance to matriculation. 77 The callow country youth was supposed to be a wild beast who must be deprived of his horns before he could be received into refined society in his new home. 78 This constituted the 'depositio' for which he was supposed to arrange with his new masters, at the same time begging them to keep expenses as low as possible. 79 Soon after he matriculated he was visited in his room by two of the students, who would pretend to be investigating the source of an abominable odour. 80 This would be subsequently discovered to be due to the newcomer himself, whom they would take at first to be a wild boar, 81 but later discovery to be that rare creature known as a 'bejaunus', a creature of whom they had heard, but which they had never seen. 82 After chaffing comments about his general ferocious aspect it would be suggested, with marked sympathy, that his horns might be removed by operation, the so-called 'depositio'. 83 The victim's face would then be smeared with some preparation, and certain formalities would be gone through with--clipping his ears, removal of his tusks, etc. 84 Finally, in fear lest the mock operation should be fatal, the patient would be shriven; one of the students, feigning himself a priest, would put his ear to the dying man's mouth and then repeat his confession. 85 The boy was made to accuse himself of all sorts of enormities, and finally it was exacted as penance that he should provide a sumptuous banquet for his new masters and comrades.

86 This latter ceremony consisted of a procession headed by a master in academic dress, followed by students in masquerading costume. 87 Certain further operative procedures were then gone through with, the beast was finally dehorned and his nose held to the grindstone, 88 while a little later his chin was adorned with a beard made of burnt cork, and his wounded sensibilities assuaged by a dose of salt and wine. 89 All this

constituted a peculiar German custom, although some means of extorting money or bothering those who were initiated was practically universal.

90 In Germany this ceremony of 'depositio' seems to have led later to the bullying and fagging of juniors by seniors, that gave rise to indignities 91 while at the same time it more than exceeded in brutality anything of which we have read in the English grammar schools. 92 These excesses reached their highest in the seventeenth century, and for a long time defied all efforts of both government and university authorities to suppress them.

93 In southern France this initiation assumed somewhat different form. Here the freshman was treated as a criminal, and had to be tried for and released by purgation from the consequences of his original sin. 94 At Avignon this purgation of freshmen was made the primary purpose of a religious fraternity formed under ecclesiastical sanction, and with a chapel in the Dominican church. (Rashdall). 95 The preamble of its constitution piously boasted that its object was to put a stop to enormities, drunkenness and immorality, but its practices were at extreme variance with its avowed purposes. 96 The matter of academical dress may interest for a moment. During the Middle Ages there was for the undergraduate nothing which could be properly called academic dress. 97 In the Italian universities the students wore a long black garment known as a "cappa." 98 In the Parisian universities every student was required by custom or statute to wear a tonsure and a clerical habit, 99 such "indecent, dissolute, or secular" apparel as puffed sleeves, pointed shoes, coloured boots, etc., being positively forbidden; 100 and so the clothes of uniform colour and material, like those worn in some of the English charitable schools, have been the result of the uniform dress of a particular colour which mediæval students were supposed to wear, and which indicated that at the time they were supposed to be clerks. 101 At one time the so-called Queen's Men in Oxford University were required to wear bright red garments, and differences of colour and ornament

still survive in the undergraduate gowns of Cambridge. 102 While the students usually wore dark-hued material, the higher officials of the universities wore more and more elabourate garments, until the rector appeared in violet or purple, perhaps with fur trimmings. 103 The hoods, which are still worn to-day, were at one time made of lamb's wool or rabbit's fur, silk, such as those which we wear, coming in as a summer alternative at the end of the fourteenth century. 104 The birretta, or square cap, with a tuft on the top, in lieu of the modern tassel on top of the square cap, was a distinctive badge of membership, 105 while doctors and superior officers were distinguished by the red or violet colour of their birrettas.

106 This so-called "philosophy of clothes" throws much light upon the relation of the Church to the universities, as well as on the use and misuse of the term "clericus." 107 That a man was a 'clericus' in the Middle Ages did not necessarily imply that he had taken even the lowest grade of clerical orders. It simply implied that he was a clerk, i. e., a student. 108 Even the wearing of a so-called clerical dress was rather in order that the wearer might enjoy exemption from secular courts and the privileges of the clerical order. 109 The lowest of the people even took the clerical tonsure simply in order to get the benefit of clergy; 110 and to become a clerk was at one time almost equivalent to taking out a license for the commission of murder or outrage with comparative immunity. 111 Nevertheless, the relation between clerkship and minor orders is still quite obscure.

112 It is quite evident that students of those days were not worked as hard as those of the present day. Three lectures a day constituted a maximum of work of this kind, 113 beside which there were disputations and "resumpciones," which seem to have corresponded very much to the quizzes of to-day, scholars being examined or catechised, sometimes even by the lecturer himself. 114 Gradually supplementary lectures were introduced, but there was a period during which the university seemed to decline and decay rather

than the reverse, when intellectual life was not nearly as active and studies not nearly as closely pursued. 115 In the days of Thomas Aquinas intellectual vigour was at its highest, but in the fifteenth century there was a distinct falling off.

116 During these centuries, too, it was not unusual that students attended mass or religious services before going to lectures. This practice grew during the latter portion of the Middle Ages. 117 Attendance was not, however, compulsory. Even at Oxford the statutes of the New College were the first which required daily attendance at mass. 118 In those days lectures began at six in the morning in summer, and sometimes as late as seven in the winter mornings. 119 There is every reason to think that often lectures were given in the darkness preceding dawn, and even without artificial light. 120 It should be said that these lectures were sometimes three hours in duration, and hence it might appear that three such lectures a day were about all that could be expected of a student.

121 The standard of living for the mediæval student was not always so bad as has been sometimes represented. 122 University students then, as now, were recruited from the highest as well as the poorest social classes, and the young sons of princely families often had about them quite an establishment. 123 At the lower end of the university social ladder was the poor scholar who was reduced to begging for his living or becoming a servant in one of the colleges. 124 In Vienna and elsewhere there were halls whose inmates were regularly sent out to beg, the proceeds of their mendicancy being placed in a common chest. 125 Very poor scholars were often granted licenses to beg by the chancellor. This was not regarded as a particular degradation, 126 however, because the example of the friars had made begging comparatively respectable. Those who would have been ashamed to work hard were not ashamed to beg.

127 This custom, for that matter, is by no means yet abandoned. When I was first studying in Vienna, in

1882, I remember a young German nobleman who was reduced to such an extent that he lived absolutely on the charity of others. 128 He kept a little book in which he had it set down that on such a day such a person had promised to give him so much toward his support, 129 and he called regularly on his list of supporters, and almost daily, in order that the gulden which they had promised him might be forthcoming.

130 There is the good old story you know, also, of the three students who were so poor that they had but one cappa or gown between them, in which they took turns to go to lectures. 131 In the small university towns, where thousands of students gathered together during a part of the year-- where means of carrying food were scanty, and food itself not abundant-- it is not strange that student fare was often of the most meagre sort.

132 The matter of food was not the only hardship of student life in those days about which we are talking. 133 At that time such a thing as a fire in a lecture-room was unknown, there being no source of warmth or comfort, save, perhaps, straw or rushes upon the floor. 134 The winter in the northern university towns must have been severe, but it is not likely that either in the lecture-room or in his own apartments did the student have any comfort from heat. 135 This was true to such an extent that they often sought the kitchens for comfort. 136 In Germany it was even one of the duties of the head of the college to inspect the college-rooms lest the occupants should have supplied themselves with some source of heat. 137 In some places, however, there was a common hall or combination room in which a fire was built in cold weather. 138 You must remember, also, that glass windows were an exceptional luxury until toward the close of the period under discussion. In Padua the windows of the schools were made of linen. 139 In 1643 a glass window was for the first time introduced into the Theological School at Prague. 140 In 1600 the rooms inhabited by some of the junior fellows at Cambridge were still unprovided with glass windows. 141 Add to these hardships the relative expense of

lights, when the average price of candles was nearly two pence per pound, and you will see that the poorest student could not afford to study by artificial light. 142 Some of the senior students may have had bedsteads, but the younger students slept mostly upon the floor. 143 In some places there were cisterns or troughs of lead, or occasionally pitchers and bowls were provided, but usually the student had to resort to the public lavatory in the hall.

144 Along with these hardships consider the amusements of this period, which were for the greater part conspicuous by their absence. 145 Statutes concerning amusements were often more stringent than those concerning crime or vice. 146 These were essentially military times, and tournaments, hunting, and hawking, which were enjoyed by the upper social classes, were considered too expensive and distracting for university students, and were consequently forbidden. 147 "Mortification of the flesh" was the cry of those days, as even now among some religious fanatics. 148 Even playing with a ball or bat was at times forbidden, along with other "insolent games." 149 A statute of the sixteenth century speaks of tennis and fives as among "indecent games" whose introduction would create scandal in and against the college. 150 Games of chance and playing for money were also forbidden; nevertheless, they were more or less practised. 151 Even chess enjoyed a bad reputation among the mediæval moralists, and was characterised by a certain bishop of Winchester as a "noxious, inordinate, and unhonest game." 152 Dancing was rather a favourite amusement, but was repressed as far as possible, since the celebrated William of Wykeham found it necessary to prohibit dancing and jumping in the chapel. 153 Apparently, then, in those days a good student amused himself little, if at all, and had to find his relaxation in the frequent interruptions caused by church holidays. 154 At St. Andrew's, in Scotland, however, two days' holiday was allowed at carnival time expressly for cock-fighting. 155 On the evenings of festival days entertainments were

occasionally provided by strolling players, jesters, or mountebanks, who were largely patronised by students.

156 Altogether, it is not strange that students in those days fell into dissolute habits, many having to be expelled or punished. 157 We can even understand how some of them actually turned highwaymen and waylaid their more peaceful brothers as they approached the universities with money for the ensuing season. 158 In the archives of the University of Leipzig there are standard forms of proclamation against even such boyish follies as pea-shooting, destruction of trees and crops, throwing water out of the window upon passers-by, 159 shouting at night, wearing of disguises, interfering with a hangman in the execution of his duty, or attending exhibitions of wrestling, boxing, and the like.

160 Evidently, then, university life had its exceedingly wild side. One needs only to recall the history of the famous Latin Quarter in Paris to be convinced of this. 161 This was the students' quarter in the old city of Paris as extended by Philip Augustus across the river. Paris then was surrounded by a cordon of monasteries, whose abbots exercised jurisdiction over their surrounding districts. 162 Just to the west of the student quarter stood the great Abbey of St. Germain. Between the monks of this monastery and the students there were frequent conflicts, 163 and it is recorded that in 1278, for instance, a pitched battle occurred between the monks, under their provost, on one side, and the unarmed and defenceless boys and masters, on the other, during which many were badly wounded, and some mortally. 164 The matter was finally carried to court, and the monks were required to perform certain penances and to pay certain fines. 165 Their brutality, however, was not effectually suppressed. In 1304 the Provost of Paris hanged and gibbetted a student, and was punished therefor by the king; while the subsequent history of Paris is one of constant conflict between students and the clerical orders. 166 On the other hand, the clerical tonsure in which the Parisian scholar clothed himself enabled him to indulge in all kinds

of crime, without fear of that summary execution which would have been his fate had he been merely an ordinary beggar.

167 Bibulousness was another striking characteristic of mediæval university life. In those days they knew not tea nor coffee nor tobacco, but spirituous liquors in some form were far from unknown to them. 168 No important event of life could be transacted without its drinking accompaniment. At all exercises, public or private, wine was freely provided, and many of the feasts and festivals which began with mass were concluded with a drunken orgie.

169 You have observed that so far I have made frequent mention of clerical matters. In truth, in northern Europe the Church included practically all the learned professions, 170 including the civil servants of the government, the physicians, architects, secular lawyers, diplomatists, and secretaries, who were all ecclesiastics. 171 It is true that in order to be a "clerk" it was not really necessary to take even minor orders, but it was so easy for a king or bishop to reward his physician, his lawyer, or his secretary by a monastic office rather than by a large salary, 172 that the average student, at least in the larger places, looked to holy orders as his eventual destination. 173 How much of insincerity and hypocrisy there were among those reverend gentlemen thus constituted you may imagine better than I can picture. 174 The Reformation, as well as the increasing corruption of the monastic orders, brought about changes which were not rapid, but which became almost complete, and led finally to the partial restoration of the ancient dignity of the early Church.

175 Without pursuing this part of the subject further, it may be imagined what a general alteration and reformation in all branches of study, as well as in the general intellectual life of the people, the founding of the universities accomplished. 176 For the greater part designed for the confirmation of the faith, they often brought about a reaction against it. 177 Like the other integral portions of the university, the medical departments of nearly all the

mediæval institutions came into existence through voluntary associations of physicians and would-be teachers. 178 For a long time medicine was included under the general head of philosophy, whose standard-bearers were Aristotle and the Arabians. 179 At Tübingen, in 1481, the medical student's days were divided about as follows: In the morning you studied Galen's 'Ars Medici', and in the afternoon Avicenna on 'Fever'. 180 During the second year, in the forenoon you studied Avicenna's 'Anatomy and Physiology', and in the afternoon the ninth book of Rhazes on 'Local Pathology'. 181 The forenoons of your third year were spent with the 'Aphorisms' of Hippocrates, and in the afternoon you studied Galen. 182 If any text-book on surgery at all were used it was usually that of Avicenna. Some time was also given to the writings of some of the other Arabian physicians. 183 At that time any person who had studied medicine for three years and attained the age of twenty-one might assume the rôle of teacher if you saw fit, being compelled only, at first, to lecture upon the preparatory branches. 184 You was at that time called a 'baccalaureus'. After three years' further study you became a 'magister' or 'doctor', although for the latter title a still further course of study was usually prescribed. 185 The courses of medical instruction were quite stereotyped in form, and were carefully watched over by the Church. 186 Nevertheless, it came about that the study of medicine once more was taken up by thinkers, although, unfortunately, not logical thinkers, whereas previously it had been almost entirely confined within the ranks of the clerics or clergy.

187 The most celebrated of all these mediæval philosophers in science and medicine was Albert von Bollstaedt, usually known as Albertus Magnus, who died in 1280. 188 His works which remain to us fill twenty-one quarto volumes, in which he discussed both anatomical and physiological questions. 189 It is exceedingly illustrative of the foolishly speculative vein in which many of these discussions were carried on, 190 that they seriously discussed such questions as whether the

removal of the rib from Adam's side, out of which Eve was formed, really caused Adam severe pain, 191 and whether at the judgment day that loss of rib would be compensated by the insertion of another. 192 Those were the days, also, when it was seriously discussed whether Adam or Eve ever had a navel.

193 In spite of such follies, however, Albertus Magnus left an impression upon scholarship in science, in a general way, which long outlasted him. 194 These were the days when the students organised themselves into so-called "nations," whence arose that conspicuous features of German university life of today of so-called students' Corps. 195 These nations-- each composed, for the main part, of men of one nationality-- had their own meeting-places, their own property, etc. 196 One of the principal means of instruction in those days was disputations, or, as we would say, debates, held between students, often of different nations, in which they were expected to prove their knowledge and mental alertness. 197 When it is recalled that universities were larger-- i.e., better attended-- in those days than now, it will be seen to what an extent these nations were developed. 198 Oxford, in 1340, is said to have had no less than 14,000 students; Paris about the same time had 12,000; and Bologna had some 10,000 students, the majority of whom were studying law.

199 The title of doctor came into vogue about the twelfth century. At first it was confined to teachers proper, and was bestowed upon the learned-- i.e., 200 those who had almost solely studied internal medicine, and who were required to take an oath to maintain the methods which had been taught them. 201 For the title of doctor certain fees were paid, partly in money and partly in merchandise. The so-called presents consisted of gloves, clothes, hats, caps, etc. 202 At Salernum it cost about $60 to graduate in this way, while at Paris the cost was sometimes as high as $1,000, and this at a time when money had much more purchasing value than it has to-day. 203 It was then, as now, a peculiar feature of

the English universities that but little systematic instruction in medical science was given. 204 Just as the majority of English students at present study in London rather than at one of the great universities, so in those days did they go to Paris or Montpellier. 205 This will be perhaps as good a place as any to emphasise the fact that the clergy, having so long monopolised all learning and teaching, and having, at the same time, an abhorrence for the shedding of blood, 206 which indeed had been prohibited by many papal bulls and royal edicts, permitted the practice of the operative part of medicine-- i. e., surgery-- to fall into the hands of the most illiterate and incompetent men. 207 Inasmuch as the Church prohibited the wearing of beards, and as many of the religious orders also shaved their heads, there were attached to every monastery and to every religious order a number of barbers, whose duty was to take care of the clergy in these respects. 208 Thus into their hands was gradually committed the performance of any minor operation which involved the letting of blood, 209 and from this, as a beginning, it came about that no really educated man concerned himself with the operations of surgery, but left them entirely to the illiterate servants of the Church. 210 This is really the reason that the barbers for many centuries did nearly all the surgery, and why, at the same time, surgery fell into such general and wide-spread disrepute.

211 From this it was only revived about one hundred years ago. Did time permit, this would be a most appropriate place to digress from the subject of this paper and rehearse to you the various stages in the evolution of the surgeon from the barber; 212 but time does not permit it, and it constitutes a chapter in history by itself, which must be relegated to some other occasion.

213 It was about the beginning of the fifteenth century that the better class of physicians began to belong to the laity, and were called "physici" in contrast to the "clerici." 214 Later they were known as "doctores." Until the fourteenth century most of them studied in Italian or French

universities, the Germans even being compelled to go to these foreign institutions. 215 In Paris they were required to take an oath that they would not join the surgeons. This regulation was founded as much upon spite and envy as upon any other motive. 216 Many of the clerical physicians belonged to the lower class, and were so ignorant that even the Church itself was forced to declare many of their successes miracles. 217 Although monks and the clergy in general had been frequently forbidden to practice medicine, the decrees to this effect were quite generally disregarded, except in the matter of surgical operations. 218 In the ranks of the higher clergy it must be said that well-educated physicians were occasionally found. 219 There is, for instance, the record of a certain bishop of Basel, who was deputed to seek from Pope Clement V. an archbishopric for another person, 220 but finding the Pope seriously ill, cured him, and received for himself in return the electorate of Mayence, which was perhaps one of the largest honourariums ever given to a physician.

221 These were the days when magic, mingled with mystery, played no small rôle in the practice of medicine, and when disgusting and curious remedies were quite in vogue. 222 Superstition and ignorance everywhere played a most prominent part. For instance, it was, in those days, an excellent remedy to creep under the coffin of a saint. 223 When a person was poisoned it was considered wise to hang him up by the feet and perhaps to gouge out one of your eyes, in order that the poison might run out. 224 It should be noted that putting out the eyes was frightfully common in the Middle Ages, mainly as a matter of punishment. 225 It is said, for instance, that the Emperor Basil II. on one occasion put out the eyes of 15,000 Bulgarians, leaving one eye to one of every thousand, in order that he might lead his more unfortunate fellow-sufferers back to their ruler, who, it is said, at the sight of this outrage swooned and died in two days. 226 It is said, too, that this is the reason why the Emperor Albrecht was one-eyed.

227 What the revival of learning could thus and did accomplish

under these conditions as above portrayed may be readily appreciated. 228 The restoration of Greek literature, the revival of anatomy, the habit of independent observation-- all told materially in this renaissance of medicine. 229 The Italian universities became the objective point of all who desired a thorough medical education. The students chose the lecturers and officers of the university and had a large voice in the construction of the curriculum. 230 The officers of their selection negotiated with those of the State, at least until the close of the sixteenth century.

231 In spite of this general renaissance of medical learning and the impetus felt by the inspired few during the sixteenth century, it must be said that the general condition of medical science and of those who practised it was not greatly improved. 232 The superstition of the common people and the timidity and indolence of all concerned were about as marked as they have ever been in the history of human error, 233 and the practice of medicine was at least a century behind the applied knowledge of the other arts and sciences. 234 At that time the best physicians and doctors were to be found in the Italian universities, the French coming next, and, last of all, the German. 235 The Italian universities were the Mecca sought by those who desired the best education of the day, and of all the Italian medical faculties those of Bologna, Pisa, and Padua ranked highest.

236 Those were the days, also, of the travelling scholars-- a very marked feature of mediæval life. 237 They migrated from one of the Latin schools to another, and from one famous teacher to another, sometimes travelling alone, at other times in groups or bands, and practising often the worst barbarities while 'en route', supporting themselves by begging and stealing. 238 On their marches they stole almost everything which was not tightly fastened down, and prepared their food even in the open fields. 239 The result was that most of them fell into dissolute habits of life. A somewhat better class of vagrant students sang hymns before doors and received food as pay. Some earned money singing in the churches. 240 They

apparently both drank more beer and at less cost than at present. At that time the cost of beer was about one cent for a large glass.

241 The younger students were called "schutzen," and, like apprentices in trades, were obliged to perform the most menial duties. 242 The older students were known as the "bacchanten," and each bacchant was honoured in proportion to the number of "schutzen" who waited upon him. 243 When, however, this bacchant himself reached the university he was compelled to lay aside his rough clothing and rude manners and take an oath to behave himself.

244 Not only the students, however, wandered from place to place, but even the professors of the sixteenth century were nomadic, wandering from one university to another; 245 for example, Vesalius, the great teacher of anatomy, taught in Padua, in Pisa, in Louvain, in Basel, in Augsburg, and in Spain. 246 These habits may be partly accounted for by the fact that the students elected at least some of their teachers, and the professors who failed of re-election certainly may be considered to have had a motive for moving on. 247 Salaries were certainly not large in those days. Melanchthon, the great theologian, received during his first eight years a salary of $43 per annum, and by strict economy was able during this period to buy his wife a new dress. 248 During his later years his salary attained the sum of $170, which would be equivalent to $750 to-day. When Vesalius died his salary was $1,000 per annum, to which certain fees were added. 249 It is not strange, therefore, that many of the professors pursued reputable occupations during their odd hours or that they took students to board. 250 We hear to-day of frequent illustrations of the pursuit of knowledge under difficulty, but certainly during the ages to which I have referred the ardent student, were he undergraduate or professor, 251 put up with an amount of hardship, meagre fare, and trouble of all kinds which would stagger most of the young people of to-day.

252 People were human then as now, and the universities were not

above disputes and quarrels, which sometimes became very bitter and dishonourable, but were the indirect instrument of good, since they led in not a few instances to the founding of other universities. 253 Thus, about the beginning of the sixteenth century, Pistorius and Pollich were both teachers in Leipzig, but holding antagonistic views regarding the nature of syphilis, 254 became so embittered that they could not bear each other's presence, and each resolved to seek another home. 255 The former influenced the elector to select Frankfort-on-the-Oder as the site of a new university, while the latter was the means of founding another at Wittenberg.

256 It is pretty hard to keep away from the relation of the barber to the anatomist and surgeon when discussing this subject. 257 In another place I have dealt with the evolution of the surgeon from the barber, and have endeavoured to show that the principal factor which operated to keep back the progress of surgery during the eighteen centuries previous to the last 258 was the influence of the Church, which opposed the study of anatomy and degraded the practice of surgery. 259 In the times to which I am referring now, an operation which caused the shedding of blood was considered beneath the dignity of an educated physician, and, in some circles, was regarded even as disreputable.

260 It was, therefore, left to the only class of men who were supposed to know how to handle a knife or sharp instrument, i. e., the barbers. 261 When operations were done in universities papal indulgences were often required, and these cost money, since in those days the Pope gave nothing for nothing. 262 Public dissection required also papal indulgences, although in Strasburg, in 1517, permission to dissect the body of an executed criminal was granted by the magistrates in spite of papal prohibition.

263 The ceremonies attending demonstrations of this kind were both fantastic and amusing. 264 A corpse was ordinarily regarded as disreputable, and had first to be made reputable by reading a decree to that effect from the chief magistrate or lord of the land, and then, by order of the University,

stamping the body with the seal of the corporation. 265 It was carried upon the cover of the box in which it had been transported into the anatomical hall, which cover, upon which it rested through the ceremonies, was taken back afterward to the executioner, who remained at some distance with his vehicle. 266 If the corpse was that of one who had been beheaded, the head during the performance of these solemn ceremonies lay between its legs. 267 After the completion of the ceremonies the occasion was graced with music by the city fifers, trumpeters, etc., or an entertainment was given by itinerant actors (Baas).

268 In time, however, this folly was given up, and by the latter half of the sixteenth century public anatomical theatres were established. 269 The most celebrated was built by Fabricus ab Aquapendente, in Padua. It was so high, however, and so dark that dissections even in broad daylight could only be made visible by torchlight. 270 The zeal with which gradually the better class of physicians pursued their scientific studies became more and more conspicuous, 271 evidenced in many ways by the hardships with which some of them had to deal, as witness the struggles of many of the great anatomists of those days.

272 And so in time the clergy disappeared almost entirely from the ranks of public physicians, and after the Thirty Years' War completely lost their supremacy even in literary matters, this being gradually usurped by the nobility and the more educated laymen; 273 but even then knowledge was pursued under difficulties, especially the study of anatomy. It was not until 1658 that a mounted skeleton could be found in Vienna. Strasburg obtained one in 1671. 274 The handling of the dead body, which we regard as so necessary, was in those days avoided as much as possible. 275 The professor of anatomy rarely, if ever, touched it himself, but he lectured or read a lecture while the actual dissection was done with a razor by a barber, under his supervision.

276 Practical instruction in obstetrics, which would seem almost as important as that in anatomy, was not given in those days; male students only studied it

theoretically. 277 In the Hôtel Dieu, in Paris, that part which was devoted to instruction in midwifery was closed against men. 278 It was the midwives in those days who enjoyed the monopoly of this teaching, and upon whom the greatest dependence for obstetrical ability was placed. 279 The physicians proper, or 'medici puri' of the seventeenth century, were individuals of greatest dignity and profoundest gravity, who wore fur-trimmed robes, perukes, and carried swords, who considered it beneath them to do anything more than write prescriptions in the old Galenic fashion. 280 Some continuation of this is seen in the distinction made even to-day in England between the physicians who enjoy the title of doctor and the surgeons who affect to disdain it. 281 These old physicians knowing nothing of surgery, nevertheless demanded to be always consulted in surgical cases, claiming that only by this course could things go right. 282 Still when elements of danger were introduced, as in treating the plague, they were glad enough to send the barber surgeons into the presence of the sick, whom they merely inspected through panes of glass. 283 Very entertaining pictures could be furnished you illustrating the habits of the physicians of two or three hundred years ago in dealing with these contagious cases. 284 The masks and armor which they wore and the precautions which they took would seem to indicate protection rather against the weapons of mediæval warfare. 285 At one time they were advised that if they must go into actual contact with these patients they should first repeat the Twenty-second Psalm. 286 You may find in the old books, if you will hunt for them, curious pictures illustrating the precautions taken a few hundred years ago against the pestilence, of whose nature they knew nothing, 287 and seeing them you may imagine the vague dread and even the abject fear which led the 'physici puri' or physicians to send the barbers in to minister to plague-stricken patients, while they contented themselves with ministering at long range to their needs.

288 But gentlemen, I fear lest I weary you with a longer rehearsal

of mediæval customs and student follies. 289 While they have all passed away some of them have survived either in tradition or in modified form, as will surely have occurred to you while they were rehearsed. 290 You will not fail to note the steady progress of an ethical evolution which has toned down the barbarities and the asperities of the past, 291 and which has substituted a far more ennobling life-purpose and method of its accomplishment than seemed to actuate your predecessors of long ago. 292 It is small wonder that the students of those days bore an ill-repute with their surrounding neigbours. 293 You may see better now, perhaps, why the medical student even of to-day has to contend with a prejudice against both own calling and ownself, 294 a prejudice begotten of the many debaucheries and misdeeds of own predecessors, and, I am sorry to say, even certain excesses of to-day. 295 I do not know how I may more fittingly terminate these remarks than by reminding you that the profession which you students hope to enter has suffered most seriously in time past from the character of the people who have entered it, 296 and that even to-day certain of its members fail to have a proper regard for its dignity. 297 It is axiomatic that those slights and indignities from which we often suffer, and the neglect and indifference of which we often complain, are in effect the result of our own shortcomings, 298 and that we are ourselves largely to blame because of that which does not suit us. 299 I beg you then to remember that even at the outset of student life there should be ever before you such an ideal of intellectual force and dignity, of power, of co-ordination of mind and body, as may keep you ever in the right way, 300 so that when you at last attain your goal you may deserve that sort of benediction which I find in one of Beaumont and Fletcher's plays ('Custom of the Country', v. iv.):

301 "So may you ever
Be styled the 'Hands of Heaven,'
Nature's restorers;
Get wealth and honours, and, by your success
In all your undertakings, propagate
A great opinion in the world."

EVIL

A STUDY OF MEDICAL WORDS, DEEDS AND HUMANS

ADDRESS IN MEDICINE, DELIVERED JUNE 24, 1902, AT YALE UNIVERSITY COMMENCEMENT.

[REPRINTED FROM THE 'YALE MEDICAL JOURNAL', JULY, 1902.]

'STUDY NATURE FOR FACTS; STUDY LIVES OF GREAT PEOPLE FOR INSPIRATION HOW TO USE THEM'

9 Never have I more earnestly craved the gift of eloquence than on occasions like this, 2 when young people are about to leave the halls in which and the people with whom they have grown into human's estate, 3 in order to assume the solemn and weighty responsibilities not only of their own lives but those as well of others. 4 The day upon which you are thus released from duties of one kind to assume those of another, welcome and joyous though it may be, should nevertheless be interspersed with some serious and earnest thoughts and resolutions. 5 Old Yale sets now her stamp upon you. It will prove a passport to many homes, but must never be abused. 6 It will entitle you to the society of the cultivated and to the respect of scholars everywhere. 7 It will admit you to the ranks of the learned and cause you to be treated with respect and equality by some of the profoundest and most scholarly thinkers the world has even known. 8 Yale has now furnished you with that which her ripe experience has shown to be requisite for young people commencing professional careers. 9 As contrasted with the total of human knowledge its aggregate is not large, but it has not for centuries been the custom for people to grow gray in studies before undertaking to practice medicine, 10 and when your own qualifications are compared with those which we of the passing generation possessed at the corresponding period of our lives, 11 the comparison will furnish at the same time the most startling illustration of the rapid advance of medicine in the past twenty-five years.

12 Yale has always been eminent for the versatility and originality of her teachers. 13 Her medical history has been so well told

during the past year by one of her most honoured sons, Dr. Welch, that it is not necessary nor wise to go now into such historical details. 14 The trend of science to-day is along the lines of comparative investigation, and the Bible is by no means the only literary collection which to-day is being subjected to the "higher criticism." 15 The inspiration claimed for the contributors to that great ancient Collection is denied to the writers of great modern works, 16 where, nevertheless, fundamental truth is as requisite for the welfare of the body as in the other for that of the soul. 17 Only by painstaking research, labouriously repeated, do we clear the old paths of the rubbish of centuries or discover totally new ones.

18 Pathfinders of this description have always abounded in this great institution, drawn by common impulses or attracted by some centripetal force. 19 And though it were perhaps invidious to mention names, I nevertheless must select two of Yale's great teachers whose names are still green in the memory of all people, 20 and ask you to note how the examples they have set and the work they have done may furnish the line of thought in which I wish you to follow me for a little while.

21 The science of comparative philology would seem to be far removed from that of medicine. Still, it is based upon an ultimate analysis of parts of speech, 22 and men like Professor Whitney were, not only the comparative anatomists, but even the histologists-- if I may use the phrase-- of words. 23 Comparative philology then is to medical terminology what embryology and comparative anatomy are to a study of the structure of the human body. 24 The philologist loves to dissect words and trace them back through rudimentary stages and roots to their earliest forms. 25 He loves also to study the evolution of an idea as conveyed by a word, and trace atavism or reversion in human speech.

26 Again you have here at Yale a wonderful collection of extinct animal remains restored with marvellous accuracy to semblance of their original form and appearance. 27 The indefatigable industry and wonderful ability of

Professor Marsh and his co-workers have enabled us to form ideographs of the living forms of earlier geologic ages upon this earth, 28 which could not have been furnished had it not been for their remarkable knowledge of morphology and skill in synthesis. 29 Indeed, where have powers of analysis and synthesis been more brilliantly displayed than by these men. 30 It used to be said of Cuvier, the great French comparative anatomist, that if given a tooth from any beast, past or present, he could describe the animal and its habits as well as reconstruct his skeleton, so wonderfully are minute differences perpetuated, and so familiar was he with them.

31 Let us see, then, if it be possible to take some of our common medical words and by applying to them the methods of Whitney and of Marsh follow them back to their early forms and significances, 32 and then construct from them ideographs of the customs, habits and superstitions of the people who used them. 33 Such a plan systematically carried out might furnish both a fitting and a novel introduction to the history of medicine.

34 Coleridge, you know, said we might often derive more useful knowledge from the history of a word than from the history of a campaign. 35 Take, for instance, our word 'idiocy'. The Greeks, especially the Athenians, were a race of politicians. Private citizens who cared little or naught for office were the 'idiotai', as distinguished from the public officials and office holders. 35 It came about in time that people of such retiring habits and modest tastes were regarded as persons of degraded intellect and taste. And so the 'iviwrai' were considered of inferior intellectual capacity. 36 In other words, the idiot of those days was the person content with private life. How different from the present day when conditions seem so nearly reversed.

37 Our kindred word 'imbecile' has also present reference to those of feeble, dwarfed or perverted intellect, and refers rather to mental than physical defects, though both must often be associated. 38 But originally the lame and the deformed who were

obliged to use artificial support, walked as it was said, 'in bacillum', upon a stick or crutch, and from this expression we derive our word imbecile.

39 Let us trace, for instance, again, the etymology of our word 'palate'. The Latin 'palatum' is the same as 'balatum', that is, the bleating part. 40 The ancient shepherds of the region of the Campagna watched the sheep as they went bleating ('balatans') over those hills, one of which subsequently became the 'Palatine'.

41 Or take again our word 'mania'. It is derived from 'unv' the moon, meaning the moon-sickness, and corresponds to lunacy from 'luna'. 42 You see the ancient superstition concerning the influence of the moon abides in the name. This brings up again the old ideas concerning the metal silver which was sacred alike to Diana and the moon, and consequently feminine in sex and attributes. 43 Hence comes the mediæval alchemistic term 'lunar caustic', and hence, too, comes its use in the treatment of epilepsy for which it was formerly much in use, since epilepsy was regarded as a form of mania caused by the evil influence of the moon. 44 By the way, this may also remind us of the peculiar views of the alchemists of the middle ages, who believed that the property of sex inhered in the metals. 45 They believed, for example, that arsenic was masculine in sex, and so named it from 'arsen', male, and 'arsenikos', masculine. 46 Medical, like comparative philology, is the more or less direct outcome of the earth's physical features as they have influenced the commingling of races and the conquest of nations.

47 Medicine seems a science of Aryan parentage; in the Sanscrit the literature of medicine is rich; it was cultivated by the Greeks, but it lost much of its original significance by virtue of Roman supremacy, as the Latin races took it over. 48 Under the Arabians it flourished after a fashion. With the revival of Greek learning there was a restoration of much that had been lost, 49 but the supremacy of the Church kept it within extremely narrow limits, though the clericals could not eliminate all the Arabian words which had crept

into its terminology. 50 Greek is to-day the language to which we turn for aid when it becomes necessary to invent new terms by which to indicate fresh discoveries or concepts.

51 The debt of medicine to our Aryan forefathers is great. Surgery was then a dignified branch of the science. 52 Their autoplastic methods were conceived with great ingenuity and carried out with much, albeit with crude skill. 53 The so-called Indian method of reconstructing a nose bears witness to their ability in plastic art. Their itinerant surgeons performed many capital operations; i. e., lithotomy and coeliotomy. 54 There is good reason to believe that Hippocrates knew nothing of practical anatomy, whereas, long before him Susruta urged that all physician priests should dissect the human body in order that they might know its structure; and gave, moreover, directions for the selection of suitable subjects. 55 The Sanscrit writers knew the properties of many plants and of at least five of the metals. Many Greek names of drugs are derived from the Sanscrit, or else they had a common Aryan origin. 56 Thus the Greek equivalents for our words castor, musk, cardamon, chestnut, hemp, mace, pepper, sandal-wood, ginger, nerve, marrow, bone, heart, and head, are unmistakably of much older, i. e., Sanscrit or Aryan stock, 57 several of them coming down in Romanised form, but almost unchanged-- e. g., os, cor, moschus, cannabis, castorion.

58 Although many of the ancient Greeks visited India, it appears that but relatively few words have come to us from this ancient source. 59 Our word sulphur, though, is of Sanscrit origin, the Greek word 'theion' indicating its divine or god-given purifying power, with possible allusion to its utility in that lower world with which the theologians most often associate it. 60 The Greek word appears in our chemical nomenclature as dithionic, trithionic, etc.

61 We note also an almost complete absence of Egyptian words, though many cultured Greeks visited Egypt. 62 Nevertheless, the latter looked

with small favour on barbarisms of speech, and our word pyramid is one of the very few which they thus adopted. 63 The term surgery is of very distinct Greek origin, and meant handwork as distinguished from the action of internal remedies. 64 Medicine seems to be derived from 'medeo' to take care of, to provide, and physic and physician from 'phusis', i. e., nature. 65 The physici were originally naturalists, or scientists, like Aristotle, medical science being but a part of their study. 66 Campbell in his book ("The Language of Medicine") gives a list of at least two dozen common terms of to-day which were employed by Homer. 67 In addition to these, many other Homeric terms are still in use, but with more or less altered or perverted meanings; 68 for example, æther, when used in the sense of its being a narcotic agency; astragalus, which originally meant a die, since the analogous bones of the sheep were used for dice; amoeba, from 'amoibe', change or alteration, alluding to constant change of shape. 69 Ammon originally meant a young lamb, iris a halo, meconium has reference to the juice of the poppy, from 'mekon', opium; 70 molybdenum was so named from its resemblance to lead, narcosis originally meant numbness; the pleura was the side; 71 the original phial was a saucer; the phalanges were so called because they were arranged side by side as it were in a phalanx; 72 our troche was at first a wheel; and our tympanum was the original Greek drum, the word still persisting in musical terminology. 73 The arteries were so named because they were supposed to contain air, while the veins were the gushers, from 'phleo', to gush or flow. 74 The original confusion of nerves and tendons appears in the term aponeurosis.

75 Long ago there were two rival medical factions among the Greeks, the Empirics, from 'empeirikos', meaning experimental-- 76 who believed there were no philosophic underlying principles of medical science, and that experience alone was the safe guide,-- 77 and the Methodists, from 'methodos', who believed it better to follow the

'hodos', or "middle of the road." The present use of the word empiric shows the contempt with which the former came to be regarded.

78 As cure ('curo') meant to care for, so did medicus have the same meaning, as already remarked, 79 while the Greek slave, 'therapon', who waited on his master, became later the therapeutist who cared for his ailments. 80 Our word to heal has also a somewhat similar dislocated meaning, since originally it meant protection, i. e., covering. 81 The same root persists in hell, i. e., hades, referring to a certain supposititious locality so well covered that from it there is no escape.

82 Note, too, the influence of ancient mythology in medical phraseology. Jupiter Ammon, the horned god, is recognised in hartshorn or ammonia. 83 Mars, the god of war, whose symbol is iron, persists in the so-called martial preparations or ferruginous tonics. 84 Venus and Aphrodite naturally appear in venereal and aphrodisiac, while Vulcan's rôle is indicated in the heat to which caoutchouc is subjected in vulcanising rubber. 85 Mercury appears not only in Roman form as a metal, but in his Greek rôle as Hermes, not to be forgotten when receptacles are hermetically sealed. 86 Let us cut short a longer list by simply noting in passing how the Greek Cupid Eros and his mate Psyche are perpetuated in our terms erotic and psychiatry, 87 while Morpheus, the god of sleep, can never be forgotten so long as morphine is in use. 88 That the wrath of the gods was to be dreaded is indicated in our word plague, from 'plege', meaning a 'blow' from that source, that is their vengeance. 89 You thus see the antiquity of the notion that epidemics were a divine visitation, and not due to bad sanitation.

90 Melancholia, 'melas' and 'chole', meant originally black bile. In ancient physiology the bile played a very important part, and the results of hepatic insufficiency were not only indicated by this name, 91 but the advantages of the use of calomel were amply emphasised by its name, 'kalos' and 'melas', for it was a beautiful remedy for this blackness. 92 Another condition indicating

trouble with the liver, which we call jaundice to-day (from the French 'jaunisse'), was known as icterus from 'ikteros', a yellow bird. 93 The poultice which the average housewife of to-day is so fond of using, was originally a 'poltos', or pudding, or perhaps a bean porridge.

94 In the days of ancient sacrifices one part of the animal was not placed upon the altar as an offering to delight the gods. It was that now known as the 'sacrum', which is usually defined to have been considered the sacred bone. 95 The adjective 'sacer' (sacrum), had not only the meaning generally ascribed to it, but meant also execrable, detestable, accursed. The sacrum meant then rather the part that was not acceptable to those to whom it was offered. 96 The word 'calculus', like the term to calculate, must remind us of the presence of pebbles and their early use in facilitating reckoning, 97 while our common terms testimony, testify, must necessarily recall the ancient sacred but phallic methods of oath-taking. 98 Another superstition connected with deity is perpetuated in the term 'iliac passion', formerly applied to volvulus, or one form of acute bowel obstruction with its violent pain, which has been compared to that produced by the spear-point as part of the suffering upon the cross.

99 A keen analysis of the situation at the beginning of the Christian Era reveals the subtlety of the Greek character. 100 The names of those organs which called for deep investigation or dissection are taken directly from the Greek, e. g., hepatic, sphenoid, ethmoid, the aorta, while many of the superficial parts have Latin names, e. g., temporal, frontal.

101 It is to the Greek that all nations almost invariably turn when they seek to fashion new terms with which to characterise or name new discoveries. 102 The Romans showed their appreciation of that which was good when they so readily adopted the science and learning of the Greeks, and were willing to take over even their gods. 103 The Latin races have always been good imitators but poor originators, save perhaps in war and politics. Had they been

willing to imitate the Greeks in these their history might have been very different. 104 When the Latin translators of Greek medical literature lacked for a word they cheerfully took the original, sometimes giving it a Latin dress. 105 For instance, that which we now call the duodenum, meaning only twelve, was originally the dodekadaktulon, meaning that it was of a length equal to the width of twelve fingers, while they twisted the name 'eileon', the twisted intestine, into 'ileum'. 106 But the names of most diseases, like those of the more concealed parts, they copied almost exactly. 107 While in later ages the Church completely dominated, then subordinated, and then finally almost terminated the study of the natural sciences, it is yet of no small interest to note the effect of the rise of Christianity upon the study of medicine. 108 It has been well said that the same "cross which brought light to religion cast a gloom over philosophy" (Campbell). 109 Certain it is that the creed and the tenets which were for centuries the mainstay of Christianity, and which did so much for the uplifting of humankind, were made the excuse for the gradual suppression of all tendency toward investigation of natural phenomena, 110 and the monasteries, where scholars congregated, became the graves of scientific thought and study. 111 And so in time knowledge was exiled from Christian domiciles and transplanted to a Mohammedan environment. 112 With Christian mythology and mysticism soon came also Christian demonology, and disease was generally regarded as an evidence of diabolical possession. 113 This gave rise then, as even now, to the imposters who pretended to cure it by exorcism of evil spirits or invocation of divine or superhuman aid. 114 It has always been a sorry time for rational medicine when superstition is rife. 115 Even under the Arabians, science flourished to but a limited extent. Their religion forbade the portrayal of any living object, animal or vegetable, consequently their works contained mere descriptions, never any illustration of any kind. 116 This, by the way, is the

explanation of their fondness for geometric tracery and of the richness of their ornamental designs. 117 They professed the same horror of the dead body that was later inculcated by the Church and most of them scorned dissection. 118 What wonder then that under Christianity and Islam alike our profession fared badly.

119 But very little now remains in our terminology to remind us of the period of Arabian supremacy. The Arabic words naphtha, sumach, alkali, alcohol, elixir and 'nucha' (neck) are almost the only ones which have survived the renaissance. 120 How different the monkish Latin sometimes is from the classic may appear in the use of the two words os and bucca for mouth, or os frontis and glabella for the frontal bone. 121 But this enumeration must not be prolonged unduly. Let us select three or four more examples almost at random and then pass on. But few will associate Christianity with cretinism. 122 The early Christian inhabitants of the Pyrenees were known as 'Christaas', or in French, as to-day, as Chretiens. 123 A mountainous region did for them what it has done in Switzerland for the races of to-day, and dwarfed the intellects of many while their thyroids underwent great enlargement. 124 Such degenerates are known everywhere to-day as cretins, i. e., Christians.

125 Tarentum was the old Calabrian city later known as Tarento, where during the middle ages the dancing mania appeared in aggravated form. 126 The frenzy was known in consequence as 'tarantism', while the spider whose bite was supposed to cause it was called 'tarantula', and a rapid dance music which alone would suit such rapid movements is still known as the 'tarantella'.

127 Nightmare has reference to the old Norse deity or demigod Mara, who was supposed to strangle people during sleep.

128 The Sardonic grin has reference to a tradition that in Sardinia was found a plant which when eaten caused people to laugh so violently that they died.

129 But turn we now from words to those deeds which are reputed to proclaim yet more loudly the manner and the worth of their

authors. 130 Where may one look for a profession which shall afford greater opportunities? And where may you find one in which incentives are so small? 131 The world's great rewards have been paid to the great destroyers of our race rather than to its saviours. 132 Do you suppose that if Napoleon had saved as many lives as he lost he would have figured in history with his present lustre? 133 It is true that Lister's discovery has saved many more lives than Napoleon took. If so, the Hôtel des Invalides should, when the time comes, contain Lister's monument and not that of a great murderer.

134 Personal courage is one of the noblest characteristics which any human can display, particularly so when it combines the moral and the physical type. 135 Public bravery brings nearly always its meed of public recognition. In fact, publicity is often the stimulus to a kind of bravery which without it would hardly respond to the tests. 136 But your really courageous person is you who cares not for a search-light to reveal your deeds, 137 one who dares and does within the quietude of own environment that from which own weaker fellows would shrink.

138 The soldier stirred to frenzy by the intensity of own passion will accomplish with but little dread that which might easily baffle the resolution of a reasoning person in a calm mood. 139 The religious fanatic, be you Mussulman or Christian, may permit yourself to be rent asunder rather than recant; 140 but your motives are essentially selfish, since you looks forward to the Mohammedan's or the Christian's paradise, and so they are far from altruistic. 141 But for that quiet heroism which shuns publicity, which calls for the highest quality of both mental and physical courage, which looks forward neither to the golden present nor the mystical yet sensuous future, commend me daily, 142 yes hourly, to the sick rooms of patients suffering from diseases which menace the welfare of others, the infectious, the dangerous, the loathsome. 143 One may read of late many stories of army surgeons doing heroic deeds under fire, 144 and one's heart naturally thrills with emotion as

you imagines the scenes and wonders what manner of daring may lead a person to risk own life after this fashion. 145 But I submit to you, that brave as is such a deed and worthy of all possible honour, it has been hundreds of times for one exceeded in the actual devotion to duty 146 and the resolution required to brave the elements, or to face death elsewhere than on the battlefield, or to surrender strength or mayhap life itself, or to invite disaster by infection, 147 or to wear out and work out life in the constant grinding altruistic work of doing for others, who perhaps have violated every known sanitary law and forfeited their every right to live. 148 Here is a theme that might well stir the most eloquent poet or orator that ever lived. How then shall I do it justice? Joanna Bailie has well put it:

149 "The brave person is not you
who feels no fear,
For that were stupid and irrational;
But you whose nobler soul its fear
subdues,
And bravely dares the danger nature
shrinks from."

150 This recognition of our profession was accorded much more unstintingly nearly two thousand years ago, at a time when it was much less deserved, 151 when Cicero wrote ('De Natura Deorum') "'*Homines ad Deos nulla re propius accedunt, quam salutem hominibus dando*.'" (Humans are never more godlike than when giving health to humankind).

152 But we can hardly delay longer here and at this time with the subject of heroism in medicine. 153 I shall not have completed the matters which I wish to present to you to-day until I invite your attention to a short sketch of the careers of four or five of the men who, during the past two or three hundred years have set the example for humans of all times and most climes, 154 whose lives are so replete with that which is interesting, instructive or important that they may be well held up before a graduating class as illustrations of everything which may be advantageously imitated. 155 They belong to that class of whom Longfellow wrote:

"Lives of great people all remind us
We can make our lives sublime."

156 One of those was Jean Fernel, who was born in France about 1497 and died in 1558. I do not know that his life history offers anything so very startling, 157 although he came to be regarded as the most memorable physiologist of his generation, but he adopted a motto which I think we all might well select for our own, 158 and it was because of this motto that I have mentioned his name at this point. It was this: "'Destiny reserves for us repose enough.'" 159 If each of you will take this individually to yourself you will find in it stimulus enough for all kinds of hard work.

160 The first of the eminently great men now to be mentioned in this connection was Herman Boerhaave, born in 1668 and died in 1738. He enjoyed the reputation of being perhaps the most eminent physician who ever lived. 161 The eldest son of a poor clergyman with a large family, he was originally intended for theology, and with this in view studied philosophy, history, logic, metaphysics, philology and mathematics, as well as theology. 162 A mere accident, resulting from intense party spirit and doctrinal differences, prevented his devoting his life to theology, 163 and he turned next to mathematics and then to chemistry and botany, subsequently studying anatomy and medicine. 164 He graduated in 1693 and began at once to practice in Leyden, with such success that he was early offered the position of ordinary surgeon to the king, which, however, he had the moral courage to decline. 165 Subsequently he taught medicine and botany, to which chairs was also added later that of chemistry. 166 This fact of itself will show to you something of the condition of medical science of that day, when one man could teach chemistry, botany and medicine. 167 His rarest talents, however, were developed in the direction of clinical instruction, and in this particular field he won such repute that hearers were attracted to Leyden from all quarters of the world and in such numbers that no university lecture-room was large enough to contain them. 168 His practice grew in extent and remunerativeness in pace with his reputation, and when

he died he left an estate of two millions. 169 So famous was he that it is said of him that a Chinese official once sent to him a letter addressed simply "To the Most Famous Physician in Europe." 170 That he had fixed convictions and practices may be better understood from the fact that so little difference did he make between his patients 171 that he kept Peter the Great waiting over one night to see him, declining to regulate his visiting list by the means or position of his patients.

172 Boerhaave was universally regarded as a great student and a great physician, but it was probably his qualities as a man which led to the astonishing extent of his reputation. 173 Essentially modest, not disputatious nor belligerent, he had a remarkable influence over the young people who came near him, 174 while he had a habit of speaking oracularly or in aphorisms, which are not always so profound as they sound and yet often make a person's dicta celebrated. 175 Save that he introduced the use of the thermometer and the ordinary lens in the examinations of his patients, his teachings do not form any really new system. 176 In the classification of people he would be regarded as a great eclectic, in the purer sense of the term. 177 Probably his greatest service to medicine was in the permanent establishment of the clinical method of instruction, 178 and perhaps his next greatest real claim to glory is the character of the instruction and the inspiration which he gave to two of his greatest scholars, viz.: Haller and Van Swieten. 179 He was not the founder of a school. He left no great nor memorable doctrines for which others should contend, but he left a name for studiousness, honest and logical thinking, which was a priceless heritage for the university with which he was connected.

180 The next great scholar to whose life and works I would invite your attention for a moment, is Morgagni, born in Italy in 1682, died in 1772. He was a pupil of Valsalva, whose assistant he became at the age of nineteen. 181 Brought up in this way, as it were in the domain of anatomy, it is not strange that he devoted his

attention throughout his life especially to the anatomical products of disease. 182 It matters little to us now that he was wont to regard these products as the causes of disease and thus neglected their remote causes. 183 He it was who taught us to apply to pathological anatomy the same scrupulous attention to tissue alterations and changes which the ordinary anatomist would note in dissecting a new animal form. 184 He was scarcely the founder of the science of pathological anatomy, for this credit belongs to Benivieni, but he did very much to popularise the study and to show its importance. 185 More than this, he wrote a work which for his day and generation was colossal. It bore the title "'*De Sedibus et Causis Morborum per Anatomen Indagatis.*'" It consisted of five books. 186 The first appeared in Venice in 1761. This proved a perfect mine of information to which one may often turn even to-day, and read with wonder the observations published one hundred and fifty years ago. 187 They stamp Morgagni as a great scientist as well as anatomist. His industry will be indicated by the fact that even after he became blind he did not cease to work.

188 Perhaps the most wonderful figure in the whole history of modern medicine is that of Albrecht von Haller, of Berne, born 1708, died 1777, and often known as the Great. 189 No more versatile genius than his has ever adorned our profession. A most precocious child, he developed remarkable abilities in the direction of poetry and music, as well as medicine, 190 and the only wonder is that he lived to such a ripe old age, enjoying the fruits of his labours, having displayed throughout his entire life an industry and productiveness which were most remarkable. 191 Before he reached the age of ten he had written a Chaldee grammar, a Greek and Hebrew vocabulary, and a large collection of Latin verses and biographies. 192 During the next few years he translated many of the Latin authors, and wrote an original epic poem of some four thousand verses on the Swiss Confederacy. 193 All of these work he had completed by the age of twenty-one. It is not

strange that among those who knew of his precocity he was generally known and regarded as a "wonder child." 194 It will thus be seen, too, that medicine was but one of the many subjects of his study. He studied a year in Tübingen, where the riotous living of his fellow students repelled him; 195 then he went to Leyden, falling there under the influence of the illustrious Boerhaave. How much he drew from this source no person may accurately say at present, but a more brilliant example he certainly could not have had. 196 He finished his studies in Leyden before he was twenty and then traveled through England and France, but was compelled to flee from Paris to escape arrest for hiding cadavers in his room for purposes of dissection. 197 This will prove an evidence of taste for study if not of taste in other directions.

198 Suddenly developing a passion for mathematics, he went to Basle and worked so hard as to almost ruin his health. 199 This necessitated a trip to the mountains and here his interest in botany was aroused and indirectly that in medicine continued. 200 Soon after he returned to Berne to take up the practice of medicine. Here he studied and worked so hard as to arouse a suspicion of his sanity, 201 but he kept up his health by frequent trips to the Alps in search of flowers. His fondness for botany and his taste for poetry seemed to grow with equal pace 202 and he seems to have been among the first of modern students to appreciate the beauty and grandeur of Swiss mountain scenery. 203 When he was twenty-five years of age appeared the first edition of his poems, many editions appearing later. 204 Here in Berne also he published so many essays on botany, anatomy and physiology that widespread attention was attracted to his eminent learning, 205 and he was called to fill the chair of anatomy and botany in the new university of Göttingen, where he spent seventeen years of extraordinary mental activity, publishing countless papers and at the same time continuing his poetic and his nomadic habits. 206 He established in Göttingen a great botanic garden, founded scientific

societies, published five books on anatomy, all elabourately illustrated, printed a series of commentaries on Boerhaave's lectures, 207 and is said to have contributed altogether thirteen thousand articles relating to almost every branch of human knowledge. 208 It is not strange that the fame of the University of Göttingen depended largely upon Haller's reputation.

209 But Haller developed a clear case of nostalgia, and after being fêted by the nobility, honoured by almost every monarch in Europe, and receiving every honour that universities and philosophic societies confer, he resigned from his chair in Göttingen and returned to Berne, to his 'fatherland'. 210 Here, amid his old home surroundings, he worked for twenty years more at the same tremendous rate, discharging diverse duties of state and private citizenship, 211 founding and promoting industries and asylums, and serving constantly upon commissions of all kinds. 212 While thus engaged appeared that phenomenal work, his great Treatise on Physiology, so full of original observations that it has been stated that should discoveries which have been re-discovered since Haller be collected they would fill several quarto volumes. 213 The physiological institute of Berne is to-day known as the 'Hallerianum', as it should be, for it is distinctly the product of his genius. 214 He died at a ripe age, after having performed an incredible amount of work, the greatest scholar of his own or perhaps of any century, 215 revered and honoured, faithful to the last and exhibiting in his last moments that "philosophic calmness of the cultivated intellect" of which Cicero loved to write. 216 It is related of him that on his deathbed he kept his fingers on his own wrist, watching the ebbing away of his own existence and waiting for the last pulsation from his radial artery. 217 Finally he exclaimed, "I no longer feel it," and then joined the great majority. 218 Perhaps Haller's greatest contribution to physiological lore was his doctrine of irritability of tissues. 219 It took the place of much that had caused previous discussion and is accepted to-day

as explaining, as nearly as we can explain, numerous phenomena.

220 In this same great wonder-century lived also John Hunter, the greatest of England's medical students, the most famous surgeon of his day and the most indefatigable collector in natural history and natural science that ever lived. 221 He was born in 1728 and died in 1783. He was led to study medicine by the fame of his illustrious brother William, and began his studies by acting as prosector for him. 222 He soon became a pupil of Cheselden, perhaps the most famous English surgeon of his generation. 223 Hunter developed very early those extraordinary powers of observation and that originality in investigation which later made him so famous. 224 Early in his medical career he came for a time under the influence of Percival Pott. This was at a time when surgery had emerged from barbarism and when the French Academy of Surgery had erected it into the dignity of a science. 225 He entered St. George's Hospital in 1754 as a surgeon's pupil. Later he became a partner with his brother in the latter's private school of anatomy, 226 but John, being a poor lecturer, was distinguished by his services in the dissecting-room rather than in the amphitheater. 227 The customs of his time and the jealousies of the various medical factions then existing in London led to numerous acrimonious disputes, 228 in the literary part of which William Hunter, who was much the more cultured student, took the lead, while John, who lacked in scholastic ability and had much less education, was relied on to supply the anatomical data. 229 John was painfully aware of his deficiencies in literary culture and is said once to have replied to the disparaging remarks of an opponent: 230 "He accuses me of not understanding the dead languages, but I could tell him that on the dead body which he never knew in any language living or dead."

231 It was in this way that he was led into unseemly encounters with the Munros, of Edinburgh, and with his late teacher, Pott. 232 The same sort of dispute finally separated the two brothers, and

they parted company after a very unseemly exhibition of jealousy and fraternal discord. 233 After studying human anatomy for several years, John Hunter became profoundly impressed with the need for much larger knowledge of comparative anatomy, but about this time ill health compelled a temporary change and so he went into the army as a staff surgeon. 234 This was at the time when Europe was engaged in the sanguinary Seven Years' War, and so it happened that Hunter had ample opportunity for studies and observations in military surgery-- 235 at the siege of Belleisle and later in the war in the Peninsula. Here he made many of those observations on gunshot wounds which he published at various periods later and which helped to make him famous.

236 He resumed his work in London in 1763, and here again he had to undergo a long trial of those qualities of passive fortitude and active perseverance under difficulties which were his prominent characteristics. 237 His personal needs were small but his scientific requirements were large, and to these latter he devoted every guinea which he could earn in his small but slowly growing practice. 238 His own manners were so brusque, and he was so lacking in the refinement of many of his colleagues and competitors, that it took rare mental qualities to force him to the front, to which he nevertheless rapidly advanced. 239 Bacon has said, "He that is only real had need of exceeding great parts of virtue, as the stone had need be rich that is set without foil," and this was never more true than in John Hunter's case. 240 His leisure hours were never unemployed. He obtained the bodies of all animals dying in the public collections in London and so began to form that enormous collection which became known later as the Hunterian Museum. 241 As his means afforded it he built and added to his accommodations and carried on those vast researches into animal anatomy and physiology to which the balance of his life was devoted. 242 Although his practice gradually increased and he became in time the most famous surgeon and consultant in London, 243 he used, nevertheless,

to spend three or four hours every morning before breakfast in dissection of animals, and as much of the rest of the day as he could spare. 244 Pupils and students who wished to consult him had to come early in the morning, often as early as four o'clock, in order to find him disengaged. 245 He had that rare ability to do a maximum of work with a minimum of sleep which has been so conspicuous in the case of Virchow. 246 Before he died, Hunter attained to a large competence, and his anatomical collection, consisting of some ten thousand preparations, made largely with his own hands, 247 was purchased after his death by the Government, for seventy-five thousand dollars, and presented to the College of Surgeons where it forms the chief part of the so-called Hunterian Museum.

248 Hunter's principal claims to greatness obtain in this, that he not only brought the light of physiology to bear upon the practice of our art, but by his writings and teachings and especially by his example led people to follow along the paths he cleared for them. 249 It is no small claim to glory to be known by such pupils as Hunter had. 250 By these, by his colossal industry in building up his museum, and by his writings, he will ever be known as the most prominent figure in the medical history of Great Britain.

251 The fifth man in this quintette of geniuses which I am presenting to you to-day was Francis Xavier Bichat, who was born in France in 1771, and died in 1802. 252 Although he was thirty-one years old at his death, his career was so phenomenal, almost meteoric, that it deserves to be held up as showing what one can do in the early period of his life, if he will but work. 253 As one reads of his originality and talent one is led almost insensibly to compare them with those of some of the world's famous musicians who, also, have died in early humanhood after giving to the world their immortal works, e. g., Schubert, Mozart and Mendelssohn. 254 Bichat was the son of a physician and applied himself early to medical studies in Nantes, Lyons, Montpellier and finally in Paris, where he became the pupil and trusted friend of Desault, then the greatest Parisian

surgeon. 255 When Desault died, in 1795, this young man began lecturing for him, at the age of twenty-four. He displayed a wonderful, almost feverish scientific activity, more particularly in the direction of general and pathological anatomy. 256 He was the originator of the phrase which he made famous: "Take away some fevers and nervous troubles, and all else belongs in the domain of pathological anatomy." 257 Coming upon the stage shortly after Morgagni left it, he was able by his genius, his logical acumen and his graces of speech and manner, to give an attractiveness and importance to this subject which it had hitherto lacked.

258 It was his great service to more clearly differentiate closely related diseased conditions and to insist upon a study of post-mortem appearances in connection with previously observed clinical phenomena. 259 He also established the tendency of similar tissues to similar anatomical lesions. In fact our view of what we call general tissue systems we in reality owe to him, 260 since without use of the microscope he distinguished twenty-one kinds of tissue, which he studied under the head of general anatomy, while he held that descriptive anatomy had to do with their various combinations.

261 To Bichat was largely due the overthrow of purely speculative medicine because he placed facts far in advance of theories and ideas. 262 Books he said are or should be merely "memoranda of facts." 263 That he made many such memoranda will appear from the fact that before his untimely death he had published nine volumes of essays and treatises, nearly all bearing on the general subject of anatomy, normal and morbid. 264 He also had not only his limitations but his faults. He strangely denied the applicability of so-called physical laws to body processes, he minimised the importance of therapeutics, and he sought to place the vitalistic system upon a realistic basis. 265 Nevertheless he set an example not only for the young people of France, but of all times and climes, which should be often held up before them.

EVIL

266 And so I have thus placed before you five bright and shining illustrations of what brains and application can accomplish, 267 selected from different lands in order to show that medicine has no country, and from a previous century in order that you may the better realise how meagre was their environment in those days as compared with that which you enjoy. 268 Perhaps you will say, "there were giants in those days." True, but the race has not entirely died out. 269 While Spencer and Virchow live one may not call the race extinct, nor can the times which have produced such people as Helmholtz, DuBois-Reymond, Darwin, Huxley, Leidy or Marsh, fail to still produce an occasional worthy successor. 270 But it is time now to draw this rather rambling discourse to an end. The effort has been partly to attract your attention to some of the side lights by which the vista of your futures may be the more pleasantly illumined, 271 and partly, by placing before you brief accounts of the careers of some of your illustrious predecessors, 272 to show that eminence in medical science inheres in no particular nationality nor race, neither comes it of heredity nor by request. 273 Like salvation it is available to all who fulfill the prerequisites. It is a composite product of application, direction, fervour in study, logical powers of mind, honesty of purpose, capability of observation, alertness to improve opportunities, 274 all combined with that somewhat rare gift of tact, which last constitutes the so-called personal equation by which many humanitarian problems are solved. 275 'Study Nature for facts; study lives of great people for inspiration how to use them.'

276 "Were a star quenched on high
For ages would its light,
Still traveling downward from the sky,
Shine on our mortal sight.
So when a great person dies
For years beyond our ken,
The light one leaves behind lies
Upon the paths of humans."

277 If then you regulate your mental habits by such a code other habits will of necessity fall into the proper line. 278 The only other admonition I would give you in

parting is summed up in these beautiful lines of our own Bryant:

279 "So live that when thy summons comes to join
The innumerable caravan which moves
To that mysterious realm where each shall take
Your chamber in the silent halls of death,
Thou go not like the quarry slave at night,
Scourged to your dungeon, but sustained and soothed
By an unfaltering trust, approach thy grave
Like one who wraps the drapery of own couch
About you and lies down to pleasant dreams."

280 That the sentiment is not new, however, will appear in this other and ancient version which Sir William Jones has thus rendered from the Persian:

281 "On parent knees, a naked newborn child,
Weeping thou satst while all around thee smiled,
So live that, sinking to thy last long sleep,
Calm mayst thou smile while all around thee weep."

THE CAREER OF THE ARMY SURGEON

COMMENCEMENT ADDRESS AT THE ARMY MEDICAL SCHOOL, WASHINGTON, D. C., MAY 29, 1909.--FROM "'THE MILITARY SURGEON'," JULY, 1909.

10 The experience of listening to a so-called Commencement Address under these peculiar circumstances is doubtless as novel to you as is to me its preparation. 2 So different is this occasion from that usually spoken of as Commencement Day, that it taxed my judgment as much as it did my ability to-- as it were-- "meet the indication," and to try to say the appropriate thing. 3 It behooves me to remember that this is in effect not an address to a class of students just entering a learned profession, but an effort on the part of one on the borderland of experiences gathered from a civil surgeon's work, 4 yet enjoying a quasi military title, with strong ties and leanings-- to some extent inherited-- toward the course of the army surgeon and the fascinations of the soldier's life.

5 Self-evident it is that you need no admonition which I could give, for the very fact of your presence here indicates that your selection by your superior officers stamps their approval of your ability as well as your character.

6 Time has wrought vast changes in the personnel of the army medical corps, as in every other branch of the service. 7 From the days of Xenophon, with his selection of the best material afforded, to the dark middle ages with practically no provision, 8 then to the later centuries with their menial barbers and barber surgeons, and then the very gradually improved conditions which bettered the service, down to the present time, 9 when the best is none too good, there has been that same evolution which has characterised all the rest of humankind's surroundings and human's realisation of own public and private duties.

10 From the days when the first duty of the so-called army surgeon was to minister to own commanding general, and when the private soldier received but the scantiest if any attention, 11 we have arrived at that time when the good health of the entire army is the aim and pride of the medical corps, 12 and when public opinion demands for every enlisted person a degree of watchful care greater than many parents bestow upon their own families. 13 The line officer of to-day can no longer afford to disregard the advice of own medical officers, and camp sanitation is now of even greater importance than operative technique, 14 because preventable sickness and the incapacity caused by disease are recognised as far more to be dreaded than the bullets of the enemy.

15 Public estimate of our duties to the sick and wounded has varied largely during different epochs. 16 Thus Homer makes Nestor say:

17 "A surgeon skilled our wounds to heal,
Is more than armies to the public weal."

18 Homer also lauded the services of the two sons of Aesculapius, whom he deified as the grandest of heroes and the wisest of surgeons, 19 and thus wrote of them at the

siege of Troy, twelve hundred years before the birth of Christ:

20 "Of two great surgeons,
Podalirius stands
This hour surrounded by the Trojan bands,
And great Machaon, wounded, in his tent
Now wants the succor which so oft he lent."

21 Again he thus describes an operation:

"Patroclus cut the forky steel away;
While in his hand a bitter root he pressed,
The wound he washed and styptic juice infused;
The closing flesh that instant ceased to glow,
The wound to torture, and the blood to flow."

22 Contrast the tender mercies thus described with an incident occurring during one of the exciting experiences of Ambroise Paré, 23 who one day, during a battle, saw three desperately wounded soldiers placed with their backs against a wall. 24 An old campaigner inquired, "Can those fellows get well?" "No," answered Ambroise. Thereupon the old campaigner went up to them and cut all their throats, "sweetly and without wrath." 25 Note, if you will, the expression, "sweetly and without wrath," since it implies a primitive form of humanity in providing euthanasia for the hopelessly wounded.

26 While it has been from time immemorial the custom to attach surgeons to various armies, some idea of prevailing notions of antiquity may be gained from the statement that Xenophon had but eight field surgeons with his 10,000 troops. 27 In his army the sick and wounded were cared for in adjoining villages, or, when on the march, were carried in the rear of the troops, being cared for by women from "the baggage." 28 Whether these women were the "vivandieres" of those days I do not quite make out, nevertheless they must have been much the same thing.

29 In the days of Rome's greatest glory each cohort of 420 men had four surgeons, while each legion of ten cohorts had one legionary physician. 30 In the navy there was also one physician to each trireme; nevertheless the wounded on land

or sea received scant attention, 31 although it is interesting to read that each soldier carried with him the most necessary bandages ready for use, an emergency packet supposed to be quite modern.

32 A few hundred years later, in the Eastern Empire, the Emperor Maurice ordered that throughout every division of from two hundred to four hundred cavalry eight or ten of the strongest men be selected, 33 in order to bring to the rear those who were severely wounded, to supply them with water, and to collect the weapons lying upon the field. 34 These mounted cavalrymen received a small reward for each person rescued.

35 Three hundred years later this arrangement was continued in operation by Leo VI. Wherever it was possible the sick and wounded soldiers were cared for by monks or by sisters, 36 in the numerous hospices and institutions which abounded throughout the East, and although the care was often of the worst the efforts made were in the right direction. 37 Holy oil, laying on of hands, supplication, and the use of holy relics constituted a large part of the treatment in vogue; 38 nevertheless these remedies were not quite so injurious as some of the other and more disgusting ones whose use prevailed in those days.

39 Without doubt the two army surgeons who during the last 500 years achieved more fame than any of their colleagues were Ambroise Paré, and Baron Larrey. 40 Such commanding figures were they, not only in their professional work, but in the general influence which they wielded alike upon sovereign and common soldier, that they will ever be regarded as among the most memorable characters of common history. 41 Paré died in 1590, Larrey in 1842. Each was passed along from one ruler or commander to his successor, and each was regarded as about the most priceless legacy which could be thus transmitted.

42 Paré's name has always been most conspicuously mentioned in connection with the history of the introduction of the ligature as a substitute for the cautery iron or boiling oil, 43 previously in use for the checking of hemorrhage, and for his teaching concerning the

nature of gun-shot wounds, which had been previously and universally considered as necessarily poisoned wounds; 44 but his new practice and his new views in these respects were but a small part of the general services which he rendered. 45 It is not worthwhile to try to even epitomise here to-day the history of the ligature; though while its introduction has been widely credited to Paré, you must not forget that it was in use many centuries before his time, and was frequently mentioned by the early writers. 46 What Paré really did was, first, to abolish a barbarous and unscientific method of dealing with hemorrhage, 47 and then to re-introduce or promote the employment of the ligature as a far preferable substitute, more humane, more clean, and more desirable.

48 And so rather than do scant justice by incomplete reference to Paré's actual contributions to knowledge I prefer rather to speak of the other side of this great man's character, 49 and to remind you of some of the many ways by which he secured such marvellous influence over those around him, and made his remarkable personality of the greatest use. 50 As he passed through one campaign after another his reputation became more and more firmly established, and inspired surgeons the world over with the desire to visit him. 51 In almost his every act his sagacity was conspicuously displayed, while, whenever they were called for, his personal courage and absolute lack of fear were equally apparent. 52 Deprived of the benefits of early and liberal training he probably, on that very account, developed his power of thought, his memory and his analytical powers all the more keenly, inasmuch as these were made to take the place of what he might have learned from books.

53 The following anecdote will serve to illustrate, for instance, the general esteem in which he was held. In October, 1552, the army of Charles V. was besieging the city of Metz, and Charles himself came to take command. 54 In the beleaguered city were gathered the nobility and the bluest blood of France, while at the head of the

defending forces was the Duke of Guise. 55 The imprisoned soldiers and civilians suffered alike from the onslaughts of the enemy, the rigours of a frightful winter, the lack of food, and the presence of disease. 56 The Duke had established two hospitals for the soldiers, which he put in charge of the barber surgeons of the city, and furnished them with money with which to procure supplies, 57 but owing to the wretched incompetence of these same barber surgeons nearly all the wounded perished, and the horrible suspicion arose that the soldiers were being poisoned. 58 The Duke sent word to the King of France that the place could hold out for ten months, but that they needed more medicines. 59 The King then sent for Paré, gave him money, ordered him to take all the medicines and other supplies he deemed necessary, 60 and further aided him by bribing an Italian captain to permit the celebrated surgeon, in some way, to enter the besieged city. 61 Braving all dangers, and being finally successful, Paré entered Metz two months later. He had at this time been with the armies for at least sixteen years, and was known by sight to officers and soldiers alike. 62 On the day after his arrival the Duke of Guise dramatically presented him, on the ramparts, to all his officers, who embraced him, and hailed him with loud acclaim, 63 while by the soldiers he was received with shouts of triumph. "We shall not die," they exclaimed, "even though wounded, for Paré is among us." 64 The effect of this great surgeon's appearance was to give new vigour to the defenders, and to it was due the fact that the city was saved.

65 In his time Paré met with success such as to-day would be pronounced most extraordinary. He inspired the wounded with utmost confidence, and displayed, always and everywhere, remarkable firmness. 66 Not the least notable feature in his personal history is it that he should have so long retained favour at court with such outspoken independence of character.

67 Equally reputable among army surgeons of the past, and one of the most commanding figures in

history, medical or other, was Baron Larrey. 68 For more than fifty years he was an army surgeon, and for a great part of that period he stood really closer to Napoleon than almost any of the people whom the latter attached to his person by one or another of those traits that made him such a remarkable figure. 69 That one of the greatest murderers and one of the greatest life-savers of all time should have been so closely drawn to each other, constitutes one of the most noteworthy incidents of history. 70 Alike in many respects, so unlike in so many others, it is one of the most creditable features of Napoleon's career that he should have accorded to Larrey that recognition which he early gave and never withdrew. 71 Never was such tribute more signally deserved nor worthily bestowed. Though he passed through twenty-six campaigns, "from Syria to Portugal, and from Moscow to Madrid," 72 and though his wonderful courage never failed him under the most trying surroundings of carnage and conflict, 73 it may still be questioned whether it did not take a higher degree or order of courage to face Napoleon in his tent, or tell him plain truths in the Tuilleries.

74 The history of campaigning affords innumerable incidents illustrating heroism under fire, or equally trying circumstances, and it is difficult and perhaps unjust to single out a few for individual mention. 75 Bravery is confined to no epoch and to no race; it is simply a God-given trait, not by any means possessed by all humans. 76 Take, for instance, one incident in the career of Larrey. During the landing of the English on the shores of Aboukir Bay, when General Silly had his knee crushed by a bullet, Larrey appreciated that immediate amputation was imperative, 77 and gaining consent performed it, in three minutes, under the enemy's fire. Just as he was finished the English cavalry charged upon them; 78 in his own words, "I had scarcely time," he said, "to take the wounded officer on my shoulders and carry him rapidly toward our army which was in full retreat. 79 I spied a series of ditches across which I passed,

while the enemy had to go around by a more circuitous route. Thus I had the happiness to reach the rear guard of our army before this corps of dragoons reached us. 80 I arrived at Alexandria with this honourable, wounded officer, where I completed his cure."

81 Perhaps under no circumstance did Larrey's courage and zeal show to better advantage than in the awful retreat from Moscow. 82 For example, after the terrible battle of Borodino, Larrey made two hundred amputations, practically with his own hands, where there were neither couches nor coverings of any kind, 83 when the cold was so intense that the instruments often fell from the benumbed fingers of the surgeons, and when food consisted of horse flesh, cabbage stalks and a few potatoes. 84 And all this while the savage Cossacks were hovering around equally ready to kill both surgeons and patients.

85 Soon after came the passage of the Beresina, with its attendant horrors. General Zayonchek, over sixty years of age, had his knee crushed, and was in need of immediate amputation, which Larrey performed under the enemy's fire, 86 amid the falling snow, with no shelter except a cloak, held by two officers over the patient while the operation was being performed. The General recovered, and died fourteen years later as Viceroy of Poland.

87 It was after this passage of the Beresina by the Imperial Guard that it was discovered that all the requisites for the sick and wounded had been left behind and on the other side. 88 Larrey at once recrossed the river, and found himself amidst a furious, struggling crowd, in danger of being crushed to death, when suddenly the soldiers recognised him. 89 Immediately they took him up in their arms, crossed the river with him, crying, "let us save him who saved us," and forgot their own safety in their regard for him whose merciful kindness they had so often experienced.

90 Another incident in Larrey's career: Ever faithful to Napoleon, his adored master, through victory or reverse, Larrey stood one night with a small group of medical men gazing over the field of Waterloo, and upon the wounded and dying

who lay groaning around him. 91 Suddenly they were charged by a squadron of Prussian Lancers, at whom Larrey fired his pistols and galloped away, but was overtaken by the Prussians, who shot his horse, sabred him, and left him for dead. 92 After a while he recovered his senses, and tried to make his way across lots to France, but was again captured by another detachment of cavalry, who robbed him of everything, and then took him to headquarters, where it was ordered that he be shot. 93 Think of such a fate for one who had saved so many lives! 94 But the order would have been carried out promptly had not one of the Prussian surgeons recognised Larrey, having attended his lectures several years previously. 95 Accordingly he was brought before Bülow, and finally before Marshall Blücher, whose son had been wounded and captured by the French in the Austrian Campaign, and whose life had been saved by Larrey's exertions. 96 You may imagine that it did not take long to reverse that order for execution.

97 Praise from Napoleon was most rare, but of Larrey he made this remark in his will, along with a bequest of 100,000 francs, "He is the most virtuous man I have ever known."

98 Let us mention a few other instances. For example, Surgeon Thomson, who during the Crimean war, after the battle of the Alma, volunteered, with his servant, John McGrath, 99 to remain behind on the open, unsheltered field, with five hundred Russians so wounded as to be disabled or even at the point of death. 100 For three days and nights these two Englishmen remained practically alone upon that field, covered only with dead and dying, among foreign foes, none of them able to help themselves, or even to speak in a language that could be understood.

101 At the battle of Inkerman Assistant Surgeon Wolesley had established his field hospital in that awful place of slaughter, the Sandbag Battery. 102 When its defenders were reduced to 150 men, and were forced to leave it, most of them retreated in one direction to find, only thirty paces away, a Russian battalion blocking

their path. 103 There was not one competent officer left, so this surgeon took command. Seizing a bayonet because he had no sword, 104 he spoke hurriedly to the men, and explained that their next fight was not merely for victory, but for their own lives; 105 then he led them in a charge that tore so fiercely through the Russian detachment that but half of them reached the other side alive.

106 During the South African campaign the papers recorded (but how few read of it?) the fate of Surgeon Landon, who was shot through the spine while ministering to the wounded on Majuba Hill. 107 paralysed below the waist, he had himself propped up, and continued his work as best he could until his strength failed, when he said, "I am dying; do what you can for the wounded."

108 It may be of interest to devote here a few minutes to the consideration of conditions obtaining at the time of our Revolutionary War. 109 In 1776 the barber surgeon still had a place in the armies of the world and was even then regarded as scarcely more than a menial. 110 Never was he accorded the respect or the honours of a gentleman, nor was he allowed to carry a sword. 111 On the other hand, he was subjected to corporal punishment, and could be caned by his colonel, or almost anyone else, whenever such an act was provoked. 112 It may be said that the English troops were somewhat better equipped than were the hired Hessians, while the French, who came to our aid, brought with them some far better men, 113 who were in many respects a revelation during our revolution and an inspiration to our own so-called surgeons. 114 But our colonial and general governments dealt very stingily with our army medical department, and their professional equipments were of the most meagre; 115 in fact, the history of surgery of those days, either in the army or in civil life, is practically the history of a few prominent individuals, 116 most of whom had spent the time and money required for study abroad, and who had come home bringing back with them the best of their day, such as it was. 117 For instance, there were the Warren brothers, in Boston, of whom the

elder, Joseph, started Paul Revere on his famous ride. 118 He was elected President of the Provincial Congress, and just before the battle of Bunker Hill was made Major General of the Continental forces, 119 a position which he preferred to that of Physician General, which he had been offered. 120 During the battle he fought with a musket, as though a private, and was shot down just as the conflict ended. The younger brother, John, lived to achieve fame and reputation, and transmitted them to his posterity.

121 During the war some colonial regiments even came into camp without any surgeon, or the slightest provision for disease or injury. 122 In 1776 Congress ordered that there should be one surgeon and five assistants to each 5,000 enlisted men, the former being paid $1.66 per day, the latter $1 a day. 123 Imagine the attention that could be bestowed upon 5,000 soldiers by six men whose services were thus compensated. Camp hygiene, hospital corps, and ambulance service were undreamed of; 124 nevertheless John Warren, then only twenty-three years of age, accomplished a great deal in building up a medical corps, 125 while as much more was done by Benjamin Church, of Boston, who was styled Director General and Chief Physician, and who was paid $4 a day. 126 Unfortunately Church was detected in traitorous correspondence with the enemy, was court-martialed, imprisoned for a year, then allowed to leave the country, and was probably lost at sea. 127 He was succeeded by John Morgan, of Philadelphia, who had to fight the politicians as well as the foreign enemy and, failing to satisfy them, was dismissed from the service, though acquitted from all blame. 128 Thus you see that even in those days the politicians made it hard to secure adequate and proper care for our sick and wounded soldiers. 129 Everywhere at that time were unrest, excitement, and suspicion, and their demoralising effects showed in every department of military as of civil government. 130 After Morgan came Shippen, who held office from 1777 to 1781, under whose guidance affairs in the medical department improved

very much. 131 Smallpox had been perhaps the greatest scourge of the soldiers, as well as of the people in general, but this was kept in subjection by the practice of inoculation, which had been generally accepted in this country by nearly all people from Washington down.

132 A word or two must also be said about that remarkable man, Benjamin Rush, with his many-sided, versatile, erratic, obstinate and querulous character, 133 who nevertheless constituted in his day the most prominent figure in the profession; who served two years in Congress; who signed the Declaration of Independence; and who, in the same year, got his first army medical experience. 134 It was perhaps not strange that, with his peculiar temperament, he failed to come under the influence of Washington's peculiar personal magnetism, 135 and that their personal relations were not at all to Rush's credit, since he endeavoured in many ways to belittle his Commander-in-Chief, and suffered there for a rather ignominious exposure.

136 The temptation is always to place most stress upon accounts of heroism which happens to be most publicly performed. 137 While this is not unnatural it is often an injustice, since an act of courage may be performed in the lime-light of publicity, with a regard for notoriety, that would be lost were it done in private. 138 It perhaps is not kind to think that anyone would ever be more courageous in public than in private, and yet it is to be feared that human nature is not always free from temptation of this kind.

139 But the real silent heroes of military or civil medical life are those who engage in duties which nevertheless have even more of danger about them than spectacular performances upon the battle field. 140 Take for instance, the work done by Major Reed and Dr. Carroll, who devoted themselves for months to the study of yellow fever. 141 Many a person will stand upon the field of battle permitting yourself to be fired upon, but how many will deliberately submit to being bitten by insects believed to be carriers of the germs of yellow fever.

142 Dr. Carroll had this quiet kind of bravery, and allowed himself to be bitten by a mosquito that twelve days previously had filled himself with the blood of a yellow fever patient, 143 and in consequence suffered from a severe attack, barely escaping with his life. 144 Dr. Lazear permitted the same experiment upon himself, but was not at that time infected; 145 but some days later while in the yellow fever ward he was bitten by a mosquito, made careful note of the fact, acquired the disease in its most hideous form, and died a martyr to science, as true a hero as ever died upon fortress or man-of-war. 146 Others, too, willingly exposed themselves, but there was at that time no other fatality to record. But realising the value of the service rendered, the indisputable proof of the nature of the disease, and the method by which it is carried, 147 the value of the demonstration becomes inestimable, since a true prophylaxis was demonstrated, and a means furnished of ridding the community of this fearful pestilence.

148 Moreover, it was shown how unnecessary it is to destroy valuable property, it being only necessary to kill the mosquitoes, and do away with their breeding places. 149 Major Reed died a few years after he had led in this fight against the dread disease, 150 but no monument, or other testimonial which can be erected to the memory of Reed, Carroll and Lazear can adequately express the value of the service which they have rendered to the world.

151 "Peace hath her victories no less than war." This epigram is as true of the conflicts in which the medical profession engage as of any other. 152 This same sentiment has been put in other words. It is said, "That peace hath higher tests of humanhood than battle ever knew." 153 For instance, in New York there is a simple tablet commemorating, in loving remembrance, the death of eighteen young physicians who, one after another, attended a ship load of emigrants sick of typhus fever on Quarantine Island. 154 They fought their good fight and were buried without martial music, adding eighteen names to the

innumerable list of victims who have fought the silent battle of dealing with disease, 155 public gainers only in this, that someone has been thoughtful enough to record their names in this semi-public fashion.

156 Taken again the case of Dr. Franz Muller, of Vienna, who contracted the bubonic plague while working in the labouratory with its germs. 157 Just so soon as he realised that he himself was infected he locked himself in an isolated room, and pasted upon the window pane a sheet of paper containing this message, "I am suffering from plague. 158 Do not send a doctor to me, as in any event my end will come in four or five days." He refused to admit those who were anxious to do for him, 159 wrote a letter to his parents which he placed against the window, so that it could be copied from the outside, then burned the original, fearing that if sent through the mail it might carry the elusive germ. 160 Was not this equal to any instance of valour under the excitement or the stress of battle and cannonade? 161 Could anyone more worthily win a Victorian Cross, or any other emblem of courage and heroism?

162 Many of you have been in, or will go to Havana. It will be worth your while to make a pilgrimage to the cemetery there, 163 where were buried sixteen young medical students who lost their lives under peculiar circumstances, which afford as well an illustration of Spanish tyranny and injustice.

164 In 1871 one of the professors in the medical school died, and was followed to his grave by the students whom he had taught, and who loved him. 165 Unfortunately they committed an indiscretion by scribbling with a pencil in a public place some criticism on the government; in consequence they were reported, arrested and court-martialed. 166 The written paragraphs were evidence sufficient, and the Governor General ordered the ranks of students to be decimated. 167 There were 160 students all told, and in accordance with this sentence sixteen of them were next day shot without any further ceremony. 168 Of these the youngest was not quite sixteen years old, and his father offered

his entire fortune for his life, but without avail. 169 Later the citizens of Havana erected a monument of white marble, at no small cost, to commemorate this sacrifice.

170 There comes over me, as I prepare these words to read to you, a feeling of their inadequacy, and of lack of personal justice to many of my auditors. 171 Brought up in civil life, with but a smattering of military training, I am rehearsing incidents of which you may read as easily as I, 172 while at the same time I do not forget that from the lives of many of my auditors there might be drawn just as many illustrations of courage, fortitude, endurance and personal valour as any that the Surgeon General's library records. 173 Unfortunately I am not familiar with them. They are, happily in one respect, too numerous to mention, and again are not yet public property, 174 because modesty is ever the accompaniment of these other traits which we all admire so much. 175 Hence, gentlemen, if I seem to you to disregard or forget many an incident in your lives or the careers of your friends, ascribe it to my ignorance rather than to my intent, 176 and to the fact that I have never seen a battle, and that my fights with disease have not been fought in camps, but within the walls of the quiet sick room or hospital ward. 177 Nevertheless I am never happier than when I can try to compel a wider public recognition of what you are constantly doing and of your valourous deeds.

178 Next to those general improvements in the service which have come about through natural causes, and as results of a better appreciation of its needs, and of a generally improved state of the profession, 179 nothing has come from outside during the past fifty years which has been so helpful and advantageous as the support afforded by the Red Cross, and the introduction of skilled nurses; 180 in fact the greatest help which the medical service of the army and navy can enjoy is that which comes from this volunteer and outside source. 181 By the way, I wonder how many of you recall, or are familiar with, the beginnings of the Red Cross movement? So important has it become that its

history should be well known to all. 182 In June, 1859, was fought the bloody battle of Solferino, at the conclusion of which some 36,000 French, Sardinian and Austrian soldiers lay dead or dying on the field. 183 The medical corps was, of course, absolutely inadequate to the work thrown upon them, and as usual thousands of wounded men had to care for themselves as best they could. 184 A Swiss traveler, Henri Dunant, viewing the scenes, and being profoundly impressed by them, not only assisted in the work of relief, but wrote a book entitled, "*A Souvenir of Solferino*," in which he urged more humane, widespread and speedy aid to the wounded. 185 M. Moynier, president of the Society of Public Utility, of Geneva, a man of independent means; Dr. Appia, a wise physician, and M. Ador, an eminent lawyer of Geneva, also became interested in the movement. 186 The attention of the General of the Swiss Army was called to it and his co-operation enlisted. In this way came about, in 1863, the formation of a permanent society for the relief of wounded soldiers. 187 At a meeting held in October in the same year people from many countries joined in discussing the subject, 188 and an international conference was held, which resulted in calling an international convention, to be held at Geneva in the autumn of 1864.

189 Such was the beginning of the Red Cross movement, which has now extended all over the world, 190 and has afforded an opportunity for all races, creeds and nationalities to care for those who are made victims of war or pestilence, or who suffer from any other great disaster with which private charity is unable to cope. 191 It marks a step in the evolution of humankind, and has now achieved such universal recognition that national governments and individual potentates are glad to join hands in the great work.

192 A more concrete application of the same idea has been the comparatively recent formation of ambulance corps and later of nursing bureaus, within our own service, and the employment of trained nurses. 193 This has not

been in all respects an easy matter to bring about, nevertheless it has redounded to the credit and to the welfare of all concerned. 194 Never at any time were the sick and injured, either in private or in military practice, so well cared for as now, 195 and America should lead the world to-day, as ever, in the adequacy of its provisions and the perfection of its methods. 196 In private this is notably the case in ordinary hospital work, as seen by all travellers, 197 upon the continent and in Great Britain, who take pains to make comparisons with the way in which things are done there and in our own country. 198 Although Florence Nightingale immortalised herself by showing what woman could do on the battle field and in military camps, 199 it has remained for Americans to improve upon the lessons which she taught, while at the same time revering her for her wonderful devotion to her self-imposed duty and her enthusiasm. 200 In its performance the lessons of the Crimean and the Civil War, for instance, have left their impressions upon history in such a way as may never be erased, 201 and certainly no one was ever more entitled to the designation of "angel of the sick room" than was Miss Nightingale.

202 Wars of conquest bring about curious results and in unexpected ways. 203 While greed, lust and fanaticism have been the three great impelling and underlying motives for most of the wars which human thrusts upon own fellow-humans, 204 one far nobler motive has been the occasional and the only just cause of strife, namely, the desire for liberty; still this is always secondary and the product of some other human's or people's greed. 205 As only by the cataclysms of the natural world has it been prepared for human's habitation, so by some wars have come benefits unforeseen, 206 with an amelioration of the condition of humankind in general, which could not have been secured by any less drastic measures. 207 It is, however, a sad commentary on human's intelligence that most honour is paid to those who have taken the most lives rather than to those who have saved them. 208 No school boy in the remotest

districts but is brought up with some trifling knowledge of the world's heroes, so-called, though they were in reality the world's wholesale murderers. 209 Yet you may find many persons, credited with higher education, who are still densely ignorant of the benefits conferred by those two greatest discoveries in the world's history 210 (both of Anglo-Saxon origin), 'anaesthesia' and 'antisepsis', who will talk entertainingly and at length of Darius, Caesar, Hannibal and the more modern military lights, yet who never heard of Morton nor of Lister. 211 Yet if to-day you inquire what is doing in the various parliaments of the world you learn that the talk is ever of more numerous and more powerful engines of destruction, 212 and that those in power have no time to devote to improvements in the army or navy medical service, and that it is even now impossible to secure anything like adequate attention to our needs in this direction.

213 Means of taking human life must be constantly at hand; means of saving it are of small importance until the emergency has arisen; 214 and then the blame for inadequate provision of both means and humans falls not where it belongs, on the politicians who would not look ahead, 215 but upon the administration of the medical department, who work to the point of desperation and despair in times of peace, 216 who keep perpetual vigil, with scant recognition of the sacredness of their purpose, and scant aid in its accomplishment.

217 Are the lessons of the South African, the Spanish-American and the Russo-Japanese wars to be forgotten almost before they have been recited? 218 Are we prepared to-day to give adequate care and attention to our soldiers and sailors were war in sight? You well know that we are not; 219 every military or naval surgeon knows we are not; the medical profession generally knows it; and our legislators have been told it until we are tired of repeating it. 220 Yet, what is the result? The same indifference on their part, the same ignorance of what it all means; and on the part of the public the same

blindness and fatuous confidence that "everything is all right."

221 For instance, if an adequate medical service is to be built up for war there should be one officer to every 100 of enlisted people. 222 Estimating that an army of at least 400,000 people would be required were we engaged with a first-class power-- and what other would dare to engage with us?-- this means 4,000 army surgeons. 223 Of these at least one-fourth should be regular and experienced medical officers. 224 In other words, there should be for such an army at least 1,000 medical officers in the regular service, and also at least 3,000 volunteer surgeons, professionally and physically equipped for such work. 225 Should anyone object that this exceeds all the provisions of time past, the reply is ready and all sufficient, namely, that in time past all such provisions have been utterly inadequate; 226 that the conditions of modern warfare have undergone an entire change, that a sick, wounded or disabled person is an encumbrance, 227 and that it behooves us to prevent sickness, and to cure the disabled person as quickly as possible. 228 Furthermore, advances in medicine and surgery have been so great that far more is now expected of the medical corps than ever before, 229 and it is a duty which we owe to those who incur the dangers of fighting for us that we should care for them. 230 We are, therefore, under the very highest moral obligation to give them our best, and enough of it. 231 It must be a small inducement that we offer to people to fight our battles if we permit them to feel that they are not objects of our solicitude when sick or wounded.

232 There is another feature which we cannot disregard. So long as army regulations require that a person educated in advanced science spend much of your valuable time in acting as bookkeeper or clerk, 233 there will be less inducement to enter the service, and it will consequently not attract people of highest proficiency. 234 That which is required of you is complicated and exacting. You must be good bookkeepers, good sanitarians, and equally good surgeons, physicians and even obstetricians. 235 Above

all, you are expected to be able to keep all the people under your supervision ready for the "firing line" at a moment's notice. 236 You have received the highest compliment which the State can pay when you have been adjudged versatile and competent enough to fill all these rôles and do all these things.

237 Moreover, as you gain promotion other things will be expected of you, even, I hope, the filling of the chairs in this modern Military Medical School. 238 It is in a way the West Point of the medical corps, and it would seem as though there should not be the slightest difficulty in replenishing vacancies in its faculty by detail from your ranks. 239 The collections and the literary labours of your corps constitute to-day treasures exceeded in value by but few if any in this, the Nation's Capital. 240 The library, the museum and the archives of the medical department have been models from which all the nations of the earth have copied.

241 In this connection there occurs to me, by way of contrast, the story of a French surgeon's experiences when he undertook to teach anatomy in a conquered and reconstructed country. 242 After the French occupation of Egypt, Mehemet Ali took it into his head to introduce European civilisation into Africa, and imported all sorts of artists, scientists and medical men, 243 among them a practitioner of Marseilles, a true Bohemian in the modern acceptance of the expression, who presented himself in most seedy apparel, 244 saying, "I am a doctor of medicine, with plenty of courage, but no clothes; I want to try my fortune." This man was Dr. Clot, who rapidly became a favourite of the Viceroy. 245 He soon learned Arabic so as to speak it fluently, and in six months not only received an army commission, and became a Bey, but took the chair of anatomy in the newly organised school of medicine. 246 Conditions were all against him. Mussulman fanaticism and the prohibitions of the Koran opposed all anatomical pursuits, and so soon as he proposed a dissection there was a general explosion. 247 By Mohammedan ceremonial one

who even touches a dead body is thereby rendered "unclean" for seven days. 248 The Ulemas, the Muftis, and all of the other fanatics, demanded of the Viceroy the closure of the school, and declared dissection a sacrilegious profanation. 249 Mehemet refused this, and ordered Clot Bey to commence his demonstrations. Then one day happened the following incident: 250 The professor, scalpel in hand, standing alongside the cadaver, began to open the thorax, when one of the students, either from sheer fanaticism, or more bold than the others, jumped upon him and stabbed him with a poignard. 251 The blade slid over the ribs, and Clot Bey, perceiving that he was not seriously hurt, applied a piece of plaster to the wound, observing as he did so, 252 "We were speaking of the disposition of the sternum and the ribs, and I now can illustrate to you why a blow directed from above has so little chance of penetrating the cavity of the thorax." 253 He continued his lectures, and turned out some skillful practitioners. He became an officer of almost every order in the world, and acquired more than sixty decorations, although he never wore but one, the red rosette of his own country. ('Med. Times and Gazette', September 19, 1868.)

254 While just such an experience may never be duplicated again, the Philippines, or some other country yet to fall under our rule, may afford an opportunity for a similar display of 'sang froid'. 255 While no one may see far into the future, the maxim, "In time of peace prepare for war," is as true of the medical department as of any. 256 Were it a state secret no one would breathe it here, but it is lamentably true and publicly known that even now we are not prepared as we should be. 257 The awful lessons of the Spanish War have been forgotten. West Point officers have until comparatively recently received no instruction in camp sanitation. 258 Some of us worked hard a while ago to have at least elementary instruction in it introduced into their curriculum. 259 As an illustration I believe that to-day they are taught more about horse's feet and how to keep them in good condition, than about those of their people. 260 Line

officers, especially volunteer, have never been too ready to locate their camps where water and drainage were the best, and the awful mortality of the Spanish War was mainly due to preventable disease, 261 while this was due to stupid and inexcusable disregard, on the part of officers of the line (mainly volunteer) of the advice of their medical officers.

262 But, after all, the discouragements you will meet with will be far fewer than those with which your predecessors had to contend, while the pleasant side of your lives will be far pleasanter than was theirs. 263 In fact, I think your lives have in many respects fallen in pleasanter places than have ours. Discipline and order protect you to a large extent from quackery and idiocy. 264 The fads of the day disappear before the appearance of the flag and the sound of the drum. 265 So-called Christian Science finds no place in your curriculum, and it will be long, I trust, before the army chaplain tinctures the military hospital with sectarian therapeutics or an Emanuel church cult. 266 If by entering the army one may escape disgusting influences of this character, then it may become such a refuge that it shall thereby be made both inviting and invincible.

267 It is pleasing to those of us who co-operated in the movement, to have the assurances of the Surgeon General 268 that the establishment of the Medical Reserve Corps has been of actual benefit to the regular Army Medical Department. 269 While the military rank to which its members found themselves suddenly elevated was not so lofty as to cause any attacks of vertigo, none having been up to the present day reported, 270 it at least gives us satisfaction to realise that help may thus be afforded from private life, and that a closer rapport has been effected.

271 And now it is well nigh as difficult a task to appropriately conclude these remarks as to begin them. 272 People come and go; a few leave imprints of their footsteps; the vast majority make no impression that lingers.

273 "Some when they die, die all;
their mouldering clay
Is but an emblem of their memories;

The space quite closes up through
which they passed."

274 Fain would I believe that many of you would make enduring records. Yet each can do own best, and I doubt not each will do it. 275 You have so much to encourage you, so comparatively little to hamper or hold back. 276 Glorious is your work, glorious may be your fulfillment of it. 277 We have lived in a goodly time; you will enjoy one still more goodly. 278 With scientific progress, whose like the world has never known, and with an altruism which makes the world constantly better, you will be able to do things never done by your predecessors.

279 "'Tis coming up the steeps of
time,
And this old world is growing
brighter!
We may not see its dawn sublime,
Yet high hopes make the heart throb
lighter!
Our dust may slumber underground
When it awakens the world in
wonder;
But we have felt it gathering 'round!
We have heard its voice of distant
thunder.
'Tis coming! Yes, 'tis coming!

280 "'Tis coming now, that glorious
time
Foretold by seers and sung in story,
For which, when thinking was a
crime,
Souls leaped to heaven from
scaffolds gory!
They passed. But lo! the work they
wrought!
Now the crowned hopes of centuries
blossom,
The lightning of their living thought
Is flashing through us, brain and
bosom;
'Tis coming! Yes, 'tis coming."

THE EVOLUTION OF THE SURGEON FROM THE BARBER

11 If one attempt to scan the field of the history of medicine, to take note of all the fallacies and superstitions which have befogged humans' minds, and brought about what 'now' seem to be the most absurd and revolting views and practices of times gone by, 2 and if one search deliberately for that which is of curious nature, or calculated to serve as a riddle difficult of solution, you will scarcely in the tomes which you may consult find anything stranger

than the close connection, 3 nay, even the identity maintained for centuries, between the trade of the barber and the craft of the surgeon. 4 Even after having studied history and the various laws passed at different times, you will still miss the predominant yet concealed reason for this state of affairs. 5 This will be found to be, in the words of Paget, the "maintenance of vested rights as if they were better than the promotion of knowledge." 6 You will wonder also why women were licensed to practise surgery in the fourteenth century and prevented in the nineteenth, 7 or why specialties were legally recognised in the sixteenth century only to lose their dignity and identity a little later.

8 In thus attempting to consider the relations which have existed in time past between barbers and surgeons I must ask you to remember that there was a time when bleeding was deemed necessary for the cure of almost all ailments, 9 and that after the Church had condemned the shedding of blood by any of her officials it was most natural to turn for assistance to the barbers, who were supposed to be dexterous with sharp instruments, with basins and with towels. 10 Thus it happened that when the barbers found themselves permitted to perform this sole act they naturally ventured further and practised many parts of minor surgery independently of the ecclesiastics. 11 Moreover there persist to-day in Europe many relics of the old customs, and the barber surgeon is still a common figure in Germany, and particularly in Russia, where the really educated surgeons are still too few for a vast and widespread population. 12 It must be remembered also that the Church gradually imbued humans' minds with a horror of a dead body, and of the profanation which followed having anything to do with it, and surrounded the study of anatomy with every possible obstacle and obloquy; 13 even to such an extent that to be known as having dissected a human body was to be exposed to indignity, assault and even death. 14 It was, therefore only intense yearning for knowledge, on the part of earnest people, which then permitted

anatomical instruction to be given or encouraged.

15 During the middle ages the greatest medical school in the world was situated at Salernum (or Salerno), but a short distance from Naples. 16 This is not the place in which to discuss its history, although it became famous above almost every other institution of learning of any kind, 17 and though, by one of the freaks of history, even the site of the buildings is now lost and no one seems to know just where they stood.

18 In his time, namely, in 1240, the Emperor Frederick II was the great patron of this college; his decrees concerning the regulation of the study and practice of medicine deserve attention to-day. 19 A part of one of his enactments reads as follows: "Since it is possible for a person to understand medical science only if you have previously learned something of logic, 20 we ordain that no one shall be permitted to study medicine until you have given your attention to logic for three years. After these three years you may if you wishes proceed to the study of medicine." 21 And again: "No surgeon shall be allowed to practise until you have submitted certificates in writing, of the teachers of the faculty of medicine, that you have spent at least one year in that part of medical science which gives skill in the practice of surgery, 22 that in the college you have diligently and especially studied the anatomy of the human body, and is also thoroughly experienced in the way in which operations are successfully performed and healing afterwards brought about."

23 When first we hear of medical people in Great Britain they were commonly spoken of as 'leeches', as among the Danes and Saxons; 24 later the clergy introduced books from Rome, and almost every Monastery had some brother possessed of more or less knowledge of the medicine of the day. 25 The College of Salernum later gave great impetus to the study of medicine, even before the days of William the Conqueror, which was strengthened by the influence emanating from Naples, and particularly from Montpellier. 26 For centuries the Catholic

clergy were almost the only persons with sufficient education to study and practise physic; 27 which profession became in time so lucrative that many of the monks abandoned their monasteries, neglecting their religious duties, and applied themselves to the study of medicine. 28 To such an extent was this true that in 1163 the Council of Tours forbade monks staying out of the monastery for more than two months at a time, or teaching or practising physic. 29 In taking this action the Council only repeated what had been ordained by decree of Henry III in 1216, and by the second Council of Lateran in 1139. 30 No restraint was at first placed upon the secular clergy, and many of the Bishops and other church dignitaries gained both money and honour by acting as physicians to Kings and Princesses.

31 Next to the clergy the Jews possessed the largest share of learning. Their nomadic life permitted an intercourse with the different nations of the world, which was denied to most others, 32 and there were many who studied medicine and practised, not only among those of their own race but amongst Moors and Christians alike. 33 The priests became extremely jealous of Jewish physicians and of lay surgeons, and endeavoured to secure through Rome a formal excommunication of all who committed themselves to the care of a Jew, while by canon law no Jew might give medicine to a Christian. 34 But so celebrated were the Jewish physicians, and so superior to everything else was humans' desire for life and strength, that even the power of Rome could not exclude them from practice. 35 Still less could the clergy restrain the lay surgeons from the performance of their craft, and though it would appear that at first, in England, the priests were not disposed to separate surgery from medicine, 36 the Pope became jealous of so much interruption to the duties of the clergy and looked upon the manual part of surgery as detracting from clerical dignity. 37 Accordingly were made numerous attempts to debar priests from the performance of surgical operations.

38 In 1215 the ecclesiastics were prohibited by Pope Innocent III from undertaking any operation involving the shedding of blood, 39 while by Boniface VIII at the close of the thirteenth century, and Clement V, about the beginning of the fourteenth century, surgery was formally separated from physic and the priests positively forbidden to practice it. 40 It is to the Church then that we owe this absolute abandonment of surgery to an illiterate and grasping laity. 41 For some time, however, the priests kept their hold upon surgery by instructing their servants, the barbers, who were employed to shave their own priestly beards, in the performance of minor operations. 42 It was these people, who were in some degree qualified by the instruction of the clergy, who first assumed the title of barber surgeons, and who gradually formed a great fraternity.

43 In France it was in the reign of Louis XIV that the hairdressers were formally separated from the barber-surgeons, the latter being incorporated as a distinct medical body. 44 In London it was in 1375 that the Company of Barbers were practically divided into two sections, containing respectively those who practiced shaving, and those who practiced surgery. 45 In 1460 the surgeons were finally incorporated by themselves as the Guild of Surgeons and took their place as one of the liveried companies of the city of London. 46 Similar separation occurred in the original great Guild of Weavers, who divided into the Woollen Drapers and Linen Armourers, the latter afterwards becoming the wealthy and powerful Company of Merchant Tailors.

47 To trace the history of the London Company of Barbers a little more fully, it was first formed in 1308 and incorporated in 1462 by a charter. 48 In one of the statutes of Henry VIII it was enacted that: "No person using any shaving or barbery in London shall occult (i. e. practise) any surgery, letting of blood or other matter except only drawing of teeth." 49 In 1540 Parliament passed an act allowing the United Companies of Barbers and Surgeons each to have yearly the bodies of four criminals

for dissection. 50 In 1518 the barbers and surgeons were united in one company; the former being restricted from all operations except tooth drawing, and the latter having to abandon shaving and hair dressing.

51 It is interesting also to note that in Oxford, for instance, the Barbers, Surgeons, Waferers and Makers of "Singing bread" were all of the same fellowship, from 1348 to 1500; 52 when, at last, the Cappers, or knitters of caps, were united to them, in 1551, the barbers and waferers abrogated their charter and took one in the name of the city, until 1675, when they received a charter from the University.

53 The London Guild of Surgeons appears to have been first a mere fraternity which had incorporated itself, and to have originated from an association of the military barber surgeons who had been trained in the hundred years war with France, 1337 to 1444. 54 Its membership, however, was select, and when the physicians declined an alliance with it, it amalgamated with the barber companies in 1540. 55 The United Company of Barbers and Surgeons was peculiar in that strangers and those who were not free men were admitted, while the journeymen of the craft formed a subordinate body within the company. 56 In 1745 the surgeons separated from the barbers and formed a surgeon's company which rapidly acquired influence. 57 By a foolish blunder it forfeited its charter in 1796 but was subsequently incorporated by George III, in 1800, as the Royal College of Surgeons in London; 58 a body which has since maintained its identity, grown tremendously in wealth and strength, and having become one of the licensing bodies of England, 59 has acquired the finest collection of books and specimens in the world and has numbered the brightest intellects which the English surgical profession has contained.

60 In Dublin the Barber Surgeons were incorporated as a guild by charter granted by Henry VI, in 1446. 61 In 1576 they were amalgamated with the independent surgeons, and by Queen Elizabeth with the barber surgeons and wig-makers. 62 This confraternity was dissolved in 1784 and the College

of Surgeons founded immediately afterwards. 63 In Edinburgh the barbers and surgeons were united in 1505, to be separated at about the same time as elsewhere in Great Britain.

64 During the eighteenth and nineteenth centuries on the continent medicine and surgery were abruptly separated, and the latter was almost entirely in the hands of the barbers. 65 For hundreds of years the dissection of corpses and the embalming of those who could afford it, were in the hands of first the butchers and later of the barbers. 66 The greatest contempt was everywhere shown for one who attempted any surgery. 67 If for instance a nobleman while being bled by a barber received the slightest harm the poor barber was heavily fined, 68 while, should the gentleman die, the culprit was given into the hands of the dead man's relatives to be dealt with as they desired. 69 Throughout the monasteries and whenever the influence of the Church was felt it was forbidden to the monks, who had the monopoly of knowledge, to perform any surgical operation since the Church abhourred the shedding of blood.

70 I leave it to defenders of the Faith to reconcile this abhourrence with the persecutions of heretics and the tortures of the Inquisition permitted by the same Church. 71 For hundreds of years the monks were not allowed to wear a beard; this necessitated the employment of tonsors 72 ("tonsorial-artists" they call themselves to-day) to whom was left also the performance of anything that partook of the nature of an operation, such as bleeding, bandaging, etc. 73 This calling, was however, recognised as a most inferior one, and the barbers, like the bathkeeper, the shepherd and the hangman, were not considered of good repute. 74 Consequently, such an one was not eligible for membership in any other guilds or fraternities.

75 In 1406 the Emperor Wenzel was rescued from prison, in Prague, by the daughter of a bathkeeper; in gratitude he made her his mistress, and declared both barbers and bathkeepers to be respectable; 76 but having lost his position his decree had no weight,

and not until 1548, in Augsburg, were they really made eligible to the guilds. At this time their most dignified labour was the sharpening of instruments.

77 In 1696 Leopold I. decreed their profession to be an art, and gave it a position above that of the apothecary so that in their most dignified occupation they were elevated to the making of ointments and plasters. 78 As surgery has for the profession of barber surgery to thank the existence upon man of a beard, 79 so the European continent may thank the Crusaders of the eleventh century for having necessitated the existence of the bathkeeper, because of the leprosy which they brought home from the East. 80 During the Crusades, as is well known, there were founded numerous Orders having for their original purpose the care and protection of pilgrims and injured soldiers. 81 The three most celebrated Orders were the Knights of St. John, the Knights Templar and the Teutonic Order. 82 Were this the place it would be most interesting to go into a history of these religio-medico-military Orders, 83 and show how from most devout purposes and humble origin they grew into despotic and tyrannical associations of great power, which it finally took all the force of Church and State to suppress. 84 As the then humble and enthusiastic members of these Orders returned from the Holy Land they established hospitals for the care of lepers, who became very numerous in Europe. 85 For instance it is stated that in France, in 1225, there were two thousand hospitals for this purpose, 86 while the King Louis the Great founded, in 1260, a special hospital for those made blind by Egyptian ophthalmia. 87 It is well known also that during the middle ages there was the greatest neglect of the ordinary canons of cleanliness both among the upper and lower classes. 88 The number of hospitals and cloisters dedicated to the lepers being insufficient, bath houses were built and bathkeepers were engaged in order, so far as possible, to prevent the spread of leprosy. 89 At this time the bathkeeper was permitted to bathe and cup, later also to bleed,

although the bleeding was required to be done in the bathkeepers' own house, since he was not usually permitted to enter a patient's house. 90 As bathing became less necessary for purposes already mentioned the bathkeeper took to imitating the barber, though much later, 91 and not until about 1750 in some countries, were they permitted to do this publicly, and only after having passed the examinations to which the barber was also subjected.

92 In Prussia they were only allowed to treat wounds and chronic diseases, 93 and so it came about that by the beginning of the eighteenth century a really conscientious and efficient barber surgeon was supposed to have served an apprenticeship in large hospitals, to have witnessed the work of noted surgeons and to have served in the Army or Navy. 94 He was also supposed to be something of a linguist and to know a little botany; 95 particularly was he expected to be conversant with anatomy, although there was a sad lack of cadavers--which was atoned for by the use of carcasses of animals, for the main part swine.

96 Eckardt, writing at this time of the sixteen different virtues of a barber, enumerated, first of all, fear of God; then that he should be careful, prudent, temperate, and ready to use both hands with equal dexterity; 97 he claimed that "Arrogance seems most prevalent among barbers, as a common saying would imply 'barbers are proud animals.'" 98 He expressed his surprise also at the envy and malice between bathkeepers and barbers, and advised them both to consult physicians and other masters.

99 The customs of the time must be blamed for this lamentable condition of affairs. The boy who was destined to become a barber was apprenticed at a time when he had scarcely learned to write. 100 If he could write legibly and read a little Latin no one dared refuse him. He learned to shave and went from house to house for this purpose, 101 spending the little time remaining in sharpening knives, spreading plasters, picking lint, taking care of children, doing all menial duties, 102 and using the

same light as the housemaid because it would have been disrespectful to his master's wife to use any other. 103 After years of this work he was gradually taken to visit patients and then was taught how to bleed, cup, apply leeches, extract teeth and clysters. 104 His master knowing nothing of anatomy could give him no instruction, though by the laws of apprenticeship he was bound to do so. 105 Before concluding this apprenticeship he was supposed to pass an examination, which his master's laziness usually permitted him to escape. 106 He then presented the master with some silver instruments and was dismissed with an injunction to be thankful that such a miserable specimen of God's creatures had ever been taught to shave a beard or spread a plaster. 107 He now became a journeyman, still living at the house of his master, and was not allowed to marry; after a while he received a paltry sum as wages, got his dinners free and began to dabble on his own account.

108 Study was out of the question; these men could not understand what little they did read and served the community mainly as bearers of tales. 109 After some years of activity as journeyman they could become masters by applying to the authorities, presenting certificates, and passing an examination before the physicians of the district.

110 Prussia was the first country to appreciate the necessity of regulating medical practice, and the barbers and bathkeepers were placed under the control of the Medical College founded, in 1685, by Prince Frederick William. 111 In 1724 this institution attained its greatest activity, having a subordinate school in each province. 112 In 1725 King Frederick William issued a famous edict which did much to regulate medical affairs throughout the kingdom, 113 and directed among other things that barbers and bathkeepers should "lead a religious, temperate, retired and sober life, in order to be at their best whenever their services were required." 114 When their business was not sufficiently good they assumed other cares, as, for instance, one man was surgeon, municipal judge and post-master all at once. 115 They were

extremely envious of each other and often dabbled in medicine without permission. 116 It was not until 1779 that the bathkeepers were permitted to rank in Prussia with the barbers, and were allowed to use more than four basins, the bathkeepers' guild being incorporated with that of the barber.

117 There being no temptation to enter these ranks it is not strange that so late even as 1790 good surgeons were rare in Germany; not one in fifty of the barbers really knowing the first principles of the work they were supposed to perform. 118 It came to such a pass that surgeons were compelled to shave and perform other duties of the hairdresser, for no surgeon, however skilled, was allowed to practice as such, 119 unless he was the proprietor of a head-shaving and bathing establishment, with assistants and apprentices, and belonged to the barbers' guild, or unless he was favoured by Royal exemption. 120 It was the general lament in Germany, all through the 18th century, that German surgeons were educated in barber shops. 121 Even by the middle of that century the practice of surgery was not considered an honourable business, and those who practiced it were not permitted to carry a sword, 122 neither was a surgeon admitted into society nor tolerated among physicians; moreover when unsuccessful he was bitterly and relentlessly pursued. 123 Under existing conditions the Reichstag either could or would do nothing to alleviate the distressing condition. The physician boasted of his education and treated the surgeon and his craft with disdain, 124 holding that surgery sustained the same relation to medicine that geometry does to higher mathematics and physics. 125 All this time, however, while the physicians contented themselves with disdaining surgeons they made no attempt to elevate the craft nor to themselves study and adorn it. 126 Even by the beginning of the nineteenth century there were scarcely any physicians in Europe who could diagnose a surgical case, while dentistry they claimed called for no more skill than that sufficient for tooth extraction. 127 It was even claimed that so long as the people

generally were neglectful of their teeth the physician, or even the surgeon, should be ashamed to concern oneself with dentistry.

128 Von Siebold, in his day, deplored the position of the surgeon; 129 his large military experience had shown him the difficulties with which he had to contend before he could enter society, while his ambitions and high motives were scorned. 130 Even the peasantry were bitterly opposed to all operations. So intense were their feelings that he repeatedly removed his patients to other towns before performing operations. 131 Nevertheless it was true that there were the best of reasons for lack of confidence in any barber who dropped own razor for the purpose of treating a fracture, a hernia or an obstetric case. 132 The State required a barber surgeon to call in a physician in all complicated surgical cases. 133 In such a case the physician demanded the control of the case and reserved to oneself the right to judge of what was required. He would not even consider a surgeon who had obtained the doctorate as his equal. 134 Such consultations resulted in little but quarrels and disagreeable scenes. If a village contained no physician the surgeon treated also internal diseases, though he was not allowed to use strong medicines. 135 Every district had its special surgeon who, alone, had charge of several villages where he had the right to keep journeymen and apprentices and to do shaving and cupping. 136 In the Prussian capital city only twenty German and six French surgeons were allowed to practice in 1725, besides the court and private surgeons.

137 Until 1808 every German surgeon carried on a medico-legal business which was later separated from his surgery. 138 In 1782 there were three classes of surgeons; from the lower one might be promoted to a higher after an examination. 139 In Austria, in 1805, there were doctors of surgery who were required to show a general knowledge of medicine and who had the same rights as the physicians; 140 there were also medical surgeons who could practice under restrictions, and bathkeepers for minor surgery.

141 After the year 1773 barbers and bathkeepers were both spoken of in Austria as surgeons; this was to break up the disputes between them. 142 According to an official feebill holding good in Prussia in 1815, the highest fee that could be charged for an operation was for lithotomy in adults, 143 the maximum limit being about M. 140 ($35), while the majority of operations ranged from M. 20 to M. 50 ($5.00 to $13.00 expressed in U. S. money). Of course this was at a time when the value of money was much greater than now.

144 As already made plain, it was the Church which by its decrees brought about the separation of surgery from medicine, a condition not existing during the palmy days of Greece and Rome. 145 Even the University of Paris at one time refused to admit a student who had not foresworn the study of surgery, while the denouncement of anatomy and surgery alike was promulgated by both papal bulls and clerical decrees. 146 While many of the physicians considered surgery too burdensome a study, and many others had a severe prejudice against it, the principal cause operating to keep them apart was probably the fact that for surgeons there was absolutely no social position.

147 In 1774 Mederer was made Professor of Surgery in Freiburg, in Breisgau; he delivered his opening address on the wisdom and necessity of combining medicine and surgery. 148 As a result he was persecuted by the public, insulted by students, abused by surgeons and constantly threatened with personal assault. 149 He maintained his position, however, and fought against the prejudice. 150 Twenty-two years later, when he left Freiburg, he referred in his last lecture to his early experience. 151 By this time public opinion had been so changed that the students serenaded him and humbly apologised for what their predecessors had done. 152 Mederer could then see the success of his efforts in that the constitution of France contained a clause combining medicine and surgery, and the Royal Sanitary Commissioners of Vienna had unanimously resolved in favour of such union.

EVIL

153 The movement begun by Mederer was continued by men like Richter, Von Siebold, Loder and others. 154 In 1797, or over a hundred years ago, the Electoral Academy of Erfurt offered a prize for the best essay on the subject "Is it necessary and possible to combine medicine and surgery theoretically as well as practically?" 155 Fourteen papers were submitted, of which twelve were in favour of union. Nevertheless the Academy awarded the prize to the only writer who had opposed such union. 156 His reasons for such opposition were most puerile, as were all the arguments subsequently advanced against it. 157 Nevertheless a great step was taken in advance, when the guilds and fraternities of barbers and bathkeepers were abolished, in which good work Vienna, in 1783, took the lead. 158 It was then declared that shaving was the business of the hair-dresser, and that barber surgeons must attend lectures in surgery and anatomy. 159 Bavaria followed in 1804, and four years later, in Prussia, no one was permitted to practice surgery without having studied medicine. 160 The rules of 1786 regulating the respective positions and duties between physicians and surgeons were annulled in 1808, 161 and by 1811 the barber license was no longer essential for the practice of surgery, the privileges of the barber, as such, being abolished, while for their trade only a common license was needed.

THE STORY OF THE DISCOVERY OF THE CIRCULATION

A STUDY OF THE TIMES AND LABOURS OF WILLIAM HARVEY

ADDRESS DELIVERED AT THE ANNUAL COMMENCEMENT OF THE MEDICAL DEPARTMENT OF THE UNIVERSITY OF CHICAGO, (RUSH MEDICAL COLLEGE), JUNE 13, 1906.

12 History in general is but a record of the succession of great events or epochs which have moulded the world's affairs. 2 That which is of the greatest import in the life of the individual may count for little in the lives of own contemporaries, 3 and yet it must be said that in the events of to-day there has occurred a great epoch in

the life of each of you, presumably the most important as yet in your personal records. 4 This day is then in your personal histories one of the greatest importance. It is desirable, therefore, that your lives be so moulded and influenced by it that you may long hence look back to it and recall its significance.

5 I do not know what advice I can give you which will be more fruitful of results, than that among your studies you include that of the lives of the great people who have moulded destiny and made the world's history. 6 Their lives were modified by little things, as have been and will be yours, and yet out of small matters grew for them and for us some of the most far reaching effects. 7 Select the really great people of whom you best happen to know and analyse their characters that you may appreciate how they have become great; 8 while if they have, as all great people have, traits of smallness, study even wherein they are small, and how such faults may be avoided.

9 History runs as does a fairly steady stream, save that every now and then some event abruptly diverts its course or influences its current. 10 It has been so, for instance, with the history of medicine. For the first sixteen hundred years of the Christian era people engaged in the crude practices of our profession, utterly ignorant of the course of the blood, as well as of its purposes. 11 Then appeared upon the scene a man who did his own thinking, who was willing to free himself from the shackles of the past, to observe Nature and to reason therefrom. 12 In this way came suddenly upon the world, as it were, an appreciation of the Circulation of the Blood, than which perhaps no event in medical history has been of greater importance or reflected more credit upon its demonstrator.

13 It is my purpose, then, to-day to try to tell you, in a semi-popular way, how William Harvey came to make this great discovery, 14 as well as to give you some idea of the difficulties under which he worked, and of the people and influences that surrounded him, 15 believing that rather than spend a half hour in humorous platitudes which may provoke a smile, but which are quickly forgotten, it is

much better to try to implant something which may linger a while in your memories, 16 and sufficiently impress you with the value of observation and inductive reasoning, since if you become thus fully impressed you will be spared in the future many sad errors of speech and even of thought.

17 Before telling the story of Harvey's life and work let us study for a few moments the general condition of affairs in Europe, 18 in order that we may better understand the people whose influence surrounded him, as well as the spirit of the times and people's habits of thought. 19 Among the monarchs reigning in various parts of Europe during Harvey's time there were, for instance, in that part of the Empire of the West which was called Germany, Rudolph II, Matthias and Ferdinand. 20 In Sweden reigned King Sigismund, Charles IX, the great monarch Gustavus Adolphus, and Queen Christine. 21 In Prussia the throne had been occupied by Joachim, George William and Frederick William, as electors, this being before the days of the Prussian kings. 22 In Russia the Czars Boris Godunow, Michael Theodore and Alexis had occupied the throne.

23 France had but recently passed through the inhuman butchery of the massacre of St. Bartholomew and its accompanying persecution of the Huguenots, under Charles IX, 24 who expressed the hope that not a single Huguenot would be left alive to reproach him with the deed, but who died himself soon after the massacre, which is said to have caused him bitter remorse. 25 Charles had been succeeded by his brother Henry III, a weak, fickle and vicious monarch, whose weakness caused him to be embroiled in civil strife, which was only concluded by his own assassination at the hands of a Dominican friar. 26 Then came Henry IV, he of Navarre, afterwards surnamed The Great, who fought the famous battle of Ivry in 1590, and who reigned for twenty-one years, the greatest and most popular sovereign who ever occupied the throne of France. 27 Notwithstanding his noble qualities he did not succeed in preserving his court from many of

the contaminations of the age, 28 and in his reign it is said that no less than 4,000 French gentlemen were killed in duels, chiefly arising out of quarrels about women. 29 He was succeeded by Louis XIII, who was still on the throne when Harvey died.

30 In Harvey's own country James I was occupying the throne when Harvey appeared upon the scene. He was that royal pedant whom the Duke of Sully pronounced "the wisest fool in Europe." 31 After his death, and when Charles I ascended the throne during his twenty-fifth year, in 1625, Harvey was preparing to publish his great work. 32 It was this Charles I who retained as a favourite the worthless scoundrel Buckingham, whose misconduct in Spain prevented the proposed marriage of the king with the Spanish Infanta and brought about the Civil War. 33 It was because of the cost of this war, and of the king's disputes with Parliament regarding the matter, that England was rent between the conflicts of the Cavaliers and the Roundheads, 34 two of the consequences of this intestine strife being the execution of the Earl of Strafford and of Archbishop Laud. 35 The troubles thus engendered finally cost the life of the king himself, who was beheaded in 1649. 36 Harvey even lived to see the first half of the short tenure of office of Cromwell as the Great Protector, and was perhaps fortunate in dying before began the reign of that odious profligate Charles II.

37 It is worthwhile to enquire for a moment what was doing on this side of the ocean at this period which we have now under consideration. 38 In 1607 Virginia was settled by the English, in 1614 New York, by the Dutch, in 1620 Massachusetts and, three years later, New Hampshire, by the English Puritans; 39 in 1624 New Jersey, by the Dutch, in 1627 Delaware by Swedes and Finns, in 1630 Maine, by the English, in 1634 Maryland, by Irish Catholics, in 1635 Connecticut, by English Puritans. 40 Thus it will be seen that the active period of Harvey's life was synchronous with the beginnings of our colonial activities. 41 Very little knowledge of what was going on in the then world of science was brought to

this country at this period of its existence, 42 however, and it was many years before in these colonies there were any exhibitions of scientific interest save in extremely scattered and sporadic cases.

43 Among Harvey's literary associates were a number of celebrated English poets, for example,-- Marlowe (1593), Spenser (1598), Beaumont (1615), Shakespeare (1615), Herbert (1635), Ben Jonson (1637), Massinger (1639). 44 Lord Bacon died a year or two after the appearance of Harvey's book, while Baron Napier, the inventor of logarithms, had passed away. 45 His contemporaries in Italy, where he had studied, included Tasso (1595) and Galileo (1645). 46 Rubens had died in 1640, Michael Angelo in 1564 and Titian in 1576. 47 In France, Calvin, the practical murderer of Servetus, had passed away in 1564, Beza died in 1605, Descartes in 1650, Pascal in 1662 and Gassendi in 1655. 48 Portugal had produced but one great figure in the 16th century, namely Camoens, who died in 1579. 49 In Spain, Loyola, the ascetic and fanatic founder of the Jesuits, had joined the great majority in 1556; but Cervantes did not die until 1616, Lope de Vega in 1635, Velasquez in 1660 and Calderon in 1667.

50 In Germany some great figures had but recently disappeared. Paracelsus died in 1541, Copernicus in 1543, Luther in 1546, Hans Holbein in 1554, and Melancthon in 1560. 51 Mercator, who introduced a new method of cartography, died in 1594, Tycho Brahe in 1601, Keppler in 1631, Van Dyck in 1641, Grotius, the great scholar, in 1645, Rembrandt in 1668 and Spinoza in 1677.

52 In philosophy, scepticism was the prevailing doctrine in the time of Harvey. 53 It had been founded a hundred years previously by Montaigne, and continued by Charron, the chaplain of Queen Margaret of Navarre, who died in 1603, 54 and who declared all religion to be opposed to human reason;-- a remarkable attitude for a chaplain to assume. 55 Opposed to the scepticism of Harvey's day was the mystic, Cabalistic or supernatural philosophy especially represented by Böhme, 56 a

peasant shoemaker, uneducated and yet wonderfully gifted. He had been the philosophical colleague of that great Meistersinger, Hans Sachs. 57 Later philosophers and thinkers, yet belonging to Harvey's time, were Pascal, the great Jansenist, who discovered the variations of atmospheric pressure at different levels, and Malebranche, who figures prominently in the history of philosophy.

58 Descartes, who died in 1650, held the pineal gland to be the seat of the soul. He was the discoverer of the laws of refraction of light and furnished the explanation for the rainbow. 59 He attained greatest eminence in mathematics, physics and philosophy, and was one of the inventors of modern algebra. 60 One of his greatest opponents was that noble Jew, Spinoza, whose colleagues had expelled him from the Sanhedrim to the sound of the trombone.

61 The Italian Dominican Campanella, who died in 1639, considered the foundation of knowledge to be supernatural revelation and its perception by the senses. 62 In spite of these views he came before The Inquisition on a charge of heresy and of cooperation with the Turks, was tortured by the rack, and imprisoned for thirty years.

63 The mystic or Cabalistic notions of Harvey's day have just been mentioned. Under them we may recognise many degenerate products and amalgamations of the real doctrines of Paracelsus. 64 The doctrines of the Rosicrucians, as well as of Zoroaster and the Cabala, were revived and made to do strange work. 65 There was, for instance, that Sir Kenelm Digby, who died in 1605, a King's chamberlain, who posed among the English as a so-called Rosicrucian. 66 It was he who suggested the famous "'sympathetic powder'," which was to be applied to the weapon by which a wound had been inflicted, 67 after which the 'weapon' was anointed and dressed two or three times a day, while the wound itself was carefully bound up with dressings and left alone for a week. 68 This was perhaps much the better course, but it will show what strange notions prevailed in those days.

69 What it meant to run counter to ecclesiastical policy and theological dogma appears not only in such tragedies as terminated the lives of Bruno and many other martyrs to science, but in such facts as these; 70 for instance, when in 1624, just when Harvey was preparing to publish his work, some young chemists in Paris, seeing the benefit of the experimental method, broke away from Aristotle and the canons of theological reasoning, 71 the faculty of theology appealed to the Parliament of Paris, which latter prohibited all such researches, under the severest penalties.

72 This was the time too when such exhibitions as the following were altogether too frequent;-- 73 One Quaresimo, of Lodi, came out with a ponderous work entitled "*A Historical, Theological and Moral Explanation of the Holy Land,*" in which he devoted great space to the question of The Dead Sea and the salt pillar supposed to represent Lot's wife, 74 dividing a long chapter upon the subject into three parts, dealing with the method and the locality of this transformation and the question of the existence at that time of her saline remains. 75 Thus, with his peculiar powers of reasoning, he was able to decide the exact point where the saline change took place, and finally showed that the statue 'was still in existence'.

76 Lord Bacon was also an older contemporary of Harvey, having been born in 1561 and dying in 1626, shortly after the appearance of Harvey's great work. 77 His services to analytic science need no description here, but it is worthwhile to remember that Harvey, like many others, must have come under his influence and have profited by his teachings in logic and analysis. 78 At about the time when Harvey made known his discovery Bacon was publishing his views of the laws of transmission and reflection of sound. 79 Great man as he was, with a keen foresight into the value of the recent inventions of the compass, gun-powder and printing, he nevertheless was himself so narrow, in some respects, that he placed but little value upon the discovery of Copernicus. 80 He, however, paved the way for one in some

respects still greater, namely Isaac Newton, who, however, had scarcely attained man's stature when Harvey died.

81 How much we owe to the two great Bacons of history one cannot indicate in this short résumé. Roger Bacon (1214-1292) seems to have been the first great thinker along truly scientific lines. 82 He was more than a mere chemist while, as White says, more than three centuries before Francis Bacon 'advocated' the experimental method Roger Bacon had 'practised' it, and in many directions. 83 He did more than anyone else in the middle ages to direct thought into fruitful paths, and only now are we finding out how nearly he reached some of the principal doctrines of modern philosophy and chemistry. 84 Most important of all, his methods were even greater than his results, and this at a time when "theological subtilising" was the only passport to reputation for scholarship.

85 It was Avicenna, the Arabian, who perhaps first announced substantially the modern theory of geology, accounting for changes in the earth's surface by suggesting a stone-making force, 86 but the presence of fossils in the rocks had been always a thorn in the sides of the theologians. 87 It was Leonardo da Vinci, that versatile genius in science and art, who, previous to Harvey's generation, suggested true notions as to the origin of fossils, 88 while, in Harvey's time, Bernard Palissy, another artist, vehemently contended for their correctness. 89 Still, even at Harvey's death, neither geology nor paleontology had come anywhere near scientific accuracy.

90 The 'Academia dei Lyncei', so-called from its seal, which bore the image of a fox, was founded in Rome in 1603. 91 In France The Academy of Science was not founded until 1665, in Germany The Society of Naturalists and Physicians in 1652, and the British Royal Society in 1665.

92 In matters of general interest it may be worth while to say that in architecture the general style of The Renaissance was changed for the more substantial Barocco, 93 while the more formal and limited style of church music had given away to musical drama, i. e.,

opera, albeit in very crude form. 94 The first newspaper had appeared at Antwerp in 1605, the first German paper being published in Frankfort in 1615, and The London Weekly News making its first appearance in 1620. 95 Tobacco, which had been brought over by Raleigh in 1560, had come into quite general use, while coffee, tea and chocolate had gained in public esteem. 96 When coffee was first introduced in England it sold for about $28 a pound. The first coffee house appears to have been established in Constantinople, in the middle of the 16th century, while the first coffee house in London was not opened until a century later.

97 The barbers still retained their ascendency, and the bath keepers had scarcely lost their position next to the barbers. 98 It was not until Harvey had reached a ripe age that the barbers were required in Germany to pass an examination, in which they had to prove not only their knowledge but the legitimacy of their birth, 99 and the fact that they had studied for three years and had worked for three years more as apprentices.

100 Anatomy was studied quite generally, sometimes upon human bodies. 101 A dissecting room had been established in Dresden in 1617, in which stuffed bears, at that time a great rarity, were preserved with other curiosities. 102 In 1623 Rolfink, at Jena, arranged for public dissection upon the bodies of all executed malefactors, delegates being present thereat from various other institutions. 103 It is worthwhile to mention that in Frankfort, for instance, during the expiration of 65 years, but seven dissections were made, and that these were always accompanied by a celebration which lasted several days. 104 Vienna did not possess a skeleton in 1668, and Strassburg did not have one until 1671. 105 Yet it is of interest to remember that the anatomical plates, like those often published to-day, which are meant to be lifted off in layers, existed even at this period. 106 On the other hand, botanical gardens and chemical labouratories existed in several of the universities,-- in Strassburg, for instance, in 1619,-- in Oxford in 1622.

107 Fabricius Hildanus, the father of German surgery, or, as he has been sometimes called, the Ambroise Paré, of Germany, was also a contemporary of Harvey's. 108 His real name was Fabry and he was born in Hilden, but he latinised his name into that form usually adopted to-day.

109 Scultetus was another famous surgeon of the same period.

110 William Gilbert, 1540-1603, had been the talented physician of Queen Elizabeth, and was among the first to study the experimental method. 111 With the appearance of his book upon the magnet, in 1600, began the science of electricity and magnetism. 112 He was the first to teach the fact that the earth itself was a great magnet and he distinguished between magnetic and electric reactions. 113 Later the great Dutch anatomist, Ruysch, afforded corroboration of Harvey's views by another method, when he invented and practised those beautiful minute injections of the vascular system which made him so famous, 114 and built up that great collection of specimens which Peter the Great bought for Russia at an expense of about $75,000.

115 Contemporary with Harvey also was Swammerdam, one of the most versatile men of his time, famous as naturalist, savant, physiologist, linguist and poet. 116 It was during the fifteenth century that astronomy began to assume an importance and degree of accuracy never hitherto known. 117 This was due very largely to the independence of thought and the researches of Copernicus, who was born in Cremona in 1477, and who studied medicine in Krakau and astronomy in Vienna. 118 He lived to the age of 70 and was the real father of the heliocentric theory, now known as the Copernician system, 119 which he substituted for the previous Ptolemaic theory, thus reversing the ancient idea that the sun circled about the earth. 120 Copernicus demonstrated the phases of the moon, but his opponents claimed that if this doctrine were true Venus would exhibit the same phenomena; 121 to which he replied that it was true, though he knew not what to say to these objections, but that God was good and would in time

furnish answer to them. 122 It was Galileo's crude telescope which, in Harvey's younger day, in 1611, furnished this answer and revealed the phases of Venus. 123 To illustrate how the views of Copernicus were received we might add here that Martin Luther paid his compliments to him by declaring that Copernicus was a fool who wished to stand astronomy upon its head.

124 Copernicus was succeeded by Galileo, who was born in 1554 in Pisa, and died 1642. 125 He may be called the creator of dynamic astronomy and mechanics, as well as one of the most brilliant exponents of experimental and inductive reasoning. 126 He was of noble birth and was, in fact, the torch bearer of physics at the period of The Renaissance. 127 He gave up speculation and substituted for it the habit of observation, reaping a large harvest of surprising facts, any one of which might have immortalised him. 128 He not only established the movements of the earth on its own axis as well as around the sun, which Copernicus had shown, but he discovered the weight of the atmosphere and first calculated the law of gravity. 129 He and his successors were governed always by that aphorism which is to-day as true as ever: "Experience is deceptive and judgment difficult."

130 In 1615 when he was before The Inquisition, at Rome, and when its theologians had examined statements extracted from his letters, they solemnly rendered their decision in these words: 131 "The first proposition that the sun is the centre and does not revolve about the earth is foolish, absurd, false in theology and heretical, because expressly contrary to The Holy Scripture. 132 The second proposition that the earth is not the centre, but revolves about the sun, is absurd, false in philosophy and, from a theological point of view, at least, opposed to the true faith." 133 This for a pronunciamento from the 'infallible' Church!

134 Galileo and Bruno have by some writers both been made to stand in an unpleasant light because of their recantation or shifting position before The Inquisition.

135 Bruno was the greatest philosopher and sceptic of the

latter part of the 16th century, and had outlined, withal somewhat vaguely, that which is now known as the nebular hypothesis. 136 He was murdered by The Inquisition in 1600, and the views which he enunciated seem to have been buried with him, not to reappear until long after his sad fate had been consummated. 137 He had, for instance, contended for the truths of the Copernican doctrine, but it was not until ten years after his martyrdom that Galileo proved it with his telescope. 138 That both these great men yielded in some respects to the influences of The Inquisition and renounced some of their scientific "heresies" is largely to be excused 139 by the fact that they were both old, broken in health from the sufferings which they had endured, as well as from their disappointments, 140 and that they had been, under these circumstances, handed over to that Inquisition which knew no mercy. 141 Galileo could well remember the 'auto da fê' in the Piazza dei Fiore, in Rome, the scene of Bruno's martyrdom, as well as the tragic end of many another who had dared to have the courage of his convictions. 142 Let us, then, not judge him harshly, but be grateful even that the enormous power of The Inquisition did not and could not suppress the truth.

143 Galileo's discovery of the satellites of Jupiter, the rings of Saturn, his experiments with the pendulum, his construction of the telescope, as well as of the thermometer, 144 and many other deeds, have stamped him as one of the great figures in the history of progress and science. 145 It is most interesting to note that this contemporary of Harvey's, like himself, was given to inductions obtained from experimental studies.

146 Another great astronomical light of Harvey's time was Keppler, who was driven from one place to another by religious fanaticism, until he ended his life in 1630. 147 It was he who formulated the great principle which underlies the motions of the planets, and who gave to the world his so-called "laws," which so materially advanced the science of astronomy. 148 It was he who really discovered that comet which was later given Hailey's name,

whose periodic return he first foretold.

149 Such was the spirit of the times in which Harvey lived, and such the influences which surrounded his teachers before him and himself in turn. 150 It makes a long preface to a consideration of what Harvey himself accomplished, but it is not without its interest 151 because humans and their deeds must be judged largely by their environment.

152 Now, to speak more particularly of Harvey himself, and what was known of the circulation when he undertook his investigations. 153 The liver had been considered, from time immemorial, as the principal factor in the production and movement of the blood. 154 The ancients supposed that here the veins took their origin and that through them the blood flowed to all parts of the body, returning to its source by an undulating movement or series of alternate waves. 155 The arteries had been supposed to contain only vital spirits, whose great reservoir was the heart, 156 although Erasistratus had admitted that in certain cases blood might escape into the arterial channels. 157 Later Galen showed that the arteries always contained blood, and he knew that blood was poured into the right side of the heart by the great veins, 158 but believed that only a little of it passed from the right ventricle into the lungs, the greater part of it passing through hypothetical pores in the septum and thus into the left ventricle. 159 This opinion, like Galen's in other respects, remained unchanged until the middle of the 16th century. 160 It was also known that valves existed within the veins, and that if an artery were tied on a living animal blood would cease to flow and pulsation be checked below the ligature, 161 while if a vein were tied it shrunk above the ligature and became distended below.

162 Three men before Harvey's time came very near to discovering the secret that made him famous; 163 in fact, they made such advances on what was already known that history should accord them a distinguished place. 164 One was 'Columbus', who was born at Cremona in 1490, and died in 1559. He was first a pupil and

prosector and then a friend of Vesalius, the great anatomist. 165 Later he succeeded him at The University of Padua and unfortunately, after gaining his position, ungratefully turned upon his old teacher. 166 He was, however, for his day a good anatomist and especially a good osteologist. It was he who first demonstrated experimentally that blood passes through the lungs into the pulmonary veins and that the latter connect with the left ventricle. 167 He thus practically established the fact of the lesser circulation. He suffered, however, as did Servetus, from the prevailing notion that spirits and blood were mixed together. 168 From Padua, Columbus went to Pisa, and then to Rome. He wrote with elegance and correctness of style and even described the vessels which penetrate the bone cells, 169 the ossicles of the ear, the minute anatomy of the teeth, the ventricles of the larynx, as well as those valves which prevent the return of blood from the lungs to the heart. 170 In fact, he narrowly missed the significance of the actual facts of the case, simply failing in his final analysis and assembling of those facts which he had already demonstrated.

171 'Cesalpinus', who lived a little later, came still nearer the mark, having accepted the teachings of Columbus regarding the course of the blood through the lungs. 172 He added that the ultimate arterial branches connect with those of the veins, 173 and he taught that blood and vital spirits, from which the ancients could never separate themselves, passed from the arteries into the veins during sleep, as was demonstrated by the swelling of the veins and the diminution of the pulse at that time.

174 A little later came 'Michael Servetus', who figures principally in history as a theologian and a victim of theologians, since he perished a martyr to Calvin's jealousy. 175 He was, in effect, a wisely and widely educated man who did a great deal for science, 176 one of the offences attributed to him being an edition of Ptolemy's geography, in which Judea was described as a barren and inhospitable land instead of one "flowing with milk and

honey." 177 This simple statement of a geographical fact was made a tremendous weapon of offence by Calvin, who replied that even if Servetus had only quoted from Ptolemy and, although there were ample geographical proofs, 178 it nevertheless "unnecessarily inculpated Moses and grievously outraged The Holy Ghost." 179 Servetus dared to deny the passage of the blood through the septum of the heart, and contended that that which comes into the right side was distributed to the lung and returned to the left ventricle. 180 He published his views, however, in a religious treatise on *Errors concerning The Trinity*, a most unfortunate place in which to inject such an important fact, since it gave his enemies a still greater opportunity to vent and ventilate their spleen. 181 Had he been able to leave out that notion of vital spirits, which prevailed with all his predecessors, he might actually have made the great discovery left for Harvey to enunciate.

182 I have not been able to refer to original documents in this matter, but it is claimed by some that his description of the circulation was contained in another religious work concerning the *Restitution of Christianity*, which was printed in Nuremberg in 1790. 183 Such was the actual state of knowledge concerning the movements of the blood and the functions of the heart when Harvey published his great work. 184 It behooves us now to proceed with a short account of Harvey's own life and researches.

185 'William Harvey' was born at Folkestone on the first of April, 1578. 186 He was the eldest son of a prosperous merchant who raised a large family and who occupied the highest positions of honour in his own town. 187 The son William was born to his second wife, by whom he had seven sons and two daughters. All of these children were helped to remunerative or honourable positions. 188 They became merchants or politicians or secured prominence in some way, but William was the only one to study medicine. 189 He was sent to the King's school at Canterbury, in 1588, and he was admitted at Caius, in Cambridge, in 1593, where he graduated in arts in 1597. 190 The following year he went to

Padua, which then had one of the greatest medical schools of the time, and he obtained his medical diploma in 1602, when twenty-four years of age. 191 Returning to England he received a doctor's degree at Cambridge, and shortly afterward married a daughter of a London physician and entered upon the practice of medicine in London. 192 In the great city his practice as a physician seems to have been from the outset successful, and his knowledge and ability procured him various valuable appointments. 193 He was made a Fellow of The College of Physicians in 1607. This Royal College of Physicians was given a grant of incorporation by Henry VIII in 1518, 194 at the intercession of Chambers, Linacre and Ferdinand Victoria, the King's Physicians, it being under the patronage of Cardinal Wolsey. 195 The first meetings were held at Linacre's house which he bequeathed to the corporation at his death. 196 Until this College was founded practitioners of medicine were licensed to practise by the Bishop of London or by the Dean of St. Paul's. 197 A few years later Harvey was appointed Physician-Extraordinary to King James I, 198 and later yet, after the publication of his great treatise and its dedication to the King, he was made Physician-in-Ordinary to Charles I, whom he attended during the Civil Wars.

199 It must have been about 1615 when Harvey first began expounding his views on the circulation of the blood, during lectures which were delivered at The College of Physicians, 200 but it was not until thirteen years later, i. e., in 1628, that his great work *DE MOTU CORDIS* was published in Latin, as was customary among scholars, and a Frankfort-on-the-Main, since that was then the great center of the book publishing trade. 201 The treatise was dedicated to King Charles I, in a manner which to us would seem servile, 202 and yet which was according to a custom followed by nearly all of the scholars of the day, who desired to attract not only the attention of royalty, but, in most instances, their benevolent assistance. 203 It is worthwhile to quote at this point the first sentence or two of his dedication:

"To the Most Serene and Invincible CHARLES, of Great Britain, France and Ireland, KING: DEFENDER of the FAITH, Most Serene King,

204 "The heart of animals is the basis of their life, the principle of the whole, the Sun of their Microcosm, that upon which all movement depends, from which all strength proceeds. 205 The King in like manner is the basis of his Kingdom, the Sun of his World, the heart of the Commonwealth, whence all power derives, all grace appears. 206 What I have here written of the movements of the heart I am the more emboldened to present to your Majesty, according to the Custom of the present age, 207 because nearly all things human are done after human examples and many things in the King are after the pattern of the heart."

208 The dedication was followed by a Proemium which one may hardly read to-day without emotion. 209 In it he sets forth the mystery that has surrounded the subject of the motion and function of the heart, as well as the attendant difficulties of the subject, speaking of his own early despair that he would ever be able to clear up the subject. 210 He even said that at one time he found the matter so beset with difficulties that he was inclined to agree with Fracastorius "that the movements of the heart and their purpose could be comprehended by God alone." 211 Only later was this despair dispelled by a suggestion when, as he says: "I began to think whether there might not be a movement in a circle" when thus the truth dawned fully upon him.

212 We shall have to speak later of the opposition provoked by the appearance of this work and its almost general rejection. 213 It is perhaps, however, but just to those who disputed Harvey's discoveries to recall that no complete and actual demonstration of the actual circulation was possible at that time, nor for many years after, 214 and until the introduction of the microscope, the common magnifying glass of that day being the only lens in use. 215 It remained for Malpighi to demonstrate the blood actually in circulation in the lung of a frog some three or four years after Harvey's death, in 1657. 216 But Harvey lived long enough to see his views gain general acceptance,

and though at first, and as the result of the opposition provoked by his publication, his practice fell off mightily, 217 he later regained his professional position and rose to the highest eminence, being elected in 1654 to the Presidency of the College of Physicians. 218 To this institution he proved a great benefactor, making considerable additions to the building after its destruction in The Great Fire of 1666 and its subsequent restoration. 219 He also left a certain sum of money as a foundation for an annual oration, to be delivered in commemoration of those who had been great benefactors of the College. 220 This oration is still regularly delivered on St. Luke's Day, i. e., the 18th of October, and is ordinarily known as the Harveian oration. 221 In these orations more or less reference to Harvey's work and influence is always made. 222 This great man passed away on the 3rd of June, 1657, within ten months of his eightieth birthday, 223 thus affording a brilliant exception to the list of people who have rendered great service to the world and not lived long enough to see it appreciated.

224 As one reads Harvey's own words, the wonder ever grows that it should have remained for him, after the lapse of so many centuries, to not only call attention to what had been said by Galen but apparently forgotten by his successors, 225 namely, that "the arteries contained blood and nothing but blood, and, consequently, neither spirits nor air, as may be readily gathered from experiments and reasonings," which he elsewhere furnishes. 226 He furthermore shows how Galen demonstrated this by applying two ligatures upon an exposed artery at some distance from each other, and then opening the vessel itself in which nothing but blood could be found. 227 He calls attention also to the result of ligation of one of the large vessels of an extremity, the inevitable result being just what we to-day know it must be, and the procedure terminating with gangrene of the limb.

228 Not long before Harvey's own publication, Fabricius, he of Aquapendente, had published a

work on respiration, stating that, as the pulsation of the heart and arteries was insufficient for the ventilation and refrigeration of the blood, therefore were the lungs fashioned to surround the heart. 229 Harvey showed how the arterial pulse and respiration could not serve the same ends, combating the view generally held, that if the arteries were filled with air, a larger quantity of air penetrating when the pulse is large and full, 230 it must come to pass that if one plunge into a bath of water or of oil when the pulse is strong and full it should forthwith become either smaller or much slower, since the surrounding fluid would render it either difficult or impossible for air to penetrate. 231 He also called attention to the inconsistencies between this view and the arrangement of the prenatal circulation; 232 also to the fact that marine animals, living in the depths of the sea, could under no circumstances take in or emit air by the movements of their arteries and beneath the infinite mass of waters, 233 inasmuch as "to say that they absorb the air that is present in the water and emit their fumes into this medium, were to utter something very like a figment;" 234 furthermore "when the windpipe is divided, air enters and returns through the wound by two opposite movements, but when an artery is divided blood escapes in one continuous stream and no air passes."

235 Discussing further the views which he stigmatised as so incongruous and mutually subversive that every one of them is justly brought under suspicion, 236 he reverts again to the statements of Galen, calling attention to the fact that from a single divided artery the whole of the blood of the body may be withdrawn in the course of half an hour or less, and to the inevitable consequences of such an act; 237 also that when an artery is opened the blood is emptied with force and in jets, and that the impulse corresponds with that of the heart; 238 again that in an aneurism the pulsation is the same as in other arteries, appealing for corroboration in this matter to the recent statements of Riolan, who later became his avowed enemy. 239 Harvey also called attention to

the fact that while ordinarily there was a seemingly fixed relation between respiration and pulse-rate, this might vary very much under certain circumstances, 240 showing that respiration and circulation were two totally different processes. 241 Harvey utilised also the results of his researches in comparative anatomy and physiology, for early in his work he called attention to the fact that every animal which is unfurnished with lungs lacks a right ventricle. 242 In his Proemium he then proceeds to ask certain very pertinent questions which can only be briefly summarised in this place. 243 He asks:

First, why, inasmuch as the structure of both ventricles is practically identical, it should be imagined that their uses are different, 244 and why, if tricuspid valves are placed at the entrance into the right ventricle and prove obstacles to the return of blood into vena cava, 245 and if similar valves are situated at the commencement of the pulmonary artery, preventing return of blood into the ventricle, 246 then why, when similar valves are found in connection with the other side of the heart, should we deny that they are there for the same purpose of prevention "here the egress" and "there the regurgitation of the blood?" 247 Secondly, he asks why, in view of the similarity of these structures, it should be said that things are arranged in the left ventricle for the egress and regress of spirits, and in the right ventricle for those of blood? 248 Thirdly, he enquires why, when one notes the resemblance between the passages and vessels connected with the opposite sides of the heart, 249 one should regard one side as destined to a private purpose, namely, that of nourishing the lungs, the other to a more public function?

250 Furthermore, he enquires, since the lungs are so near, and in continual movement, and the vessels supplying them of such dimensions, what can be the use of the pulse of the right ventricle, which he had often observed in the course of his experiments? 251 He sums up his inability to accept the explanations previously offered with a phrase which reads rather strangely, even in original Latin: 252 "Deus bone! Quomodo

tricuspides impediunt aëris egressum, non sanguinis." i. e., "Good God! how should the mitral valves prevent the regurgitation of air and not of blood?" 253 He then takes up the views of those who have believed that the blood oozed through the septum of the heart from the right to the left side by certain secret pores, 254 and to them he replied "By Hercules, no such pores can be demonstrated, nor, in fact, do any such exist." 255 Again, "Besides, if the blood could permeate the substance of the septum, or could be emptied from the ventricles, what use were there for the coronary artery and vein, branches of which proceed to the septum itself, to supply it with nourishment?"

256 Further on in the treatise Harvey sets forth his motives for writing, stating how greatly unsettled had become his mind in that he did not know what he himself should conclude nor what to believe from others. 257 He says: "I was not surprised that Laurentius should have written that the movements of the heart were as perplexing as the flux and reflux of Euripus had appeared to Aristotle." 258 He apologises for the crime, as some of his friends considered it, that he should dare to depart from the precepts and opinions of all anatomists. 259 He acknowledged that he took the step all the more willingly, seeing that Fabricius, who had accurately and learnedly delineated almost every one of the several parts of animals in a special work, had left the heart entirely untouched.

260 Passing more directly to the actual work of the heart, he shows that not only are the ventricles contracted by virtue of the muscular structure of their own walls, 261 but further that those fibers or bands, styled "Nerves" by Aristotle, that are so conspicuous in the ventricles of larger animals when they contract simultaneously, by an admirable adjustment, 262 help to draw together all the internal surfaces as if with cords, thus expelling the charge of contained blood with force. 263 Later on he says that if the pulmonary artery be opened, blood will be seen spurting forth from it, just as when any other artery is punctured, 264 and that the same result follows division of

the vessel which in fishes leads from the heart. 265 He furnishes a very happy simile to prove that the pulses of the arteries are due to the impulses of the left ventricle by showing how, when one blows into a glove all of its fingers will be found to have become distended at one and the same time. 266 He quotes Aristotle, who made no distinction between veins and arteries, but said that the blood of all animals palpitates within their vessels and by the pulse is sent everywhere simultaneously, all of this depending upon the heart.

267 It is in Chapter Five of the treatise that he gives, probably for the first time, an accurate published account of just what transpires with one complete cycle of cardiac activity. 268 The passage need not be quoted here, but deserves to be read by everyone interested in the subject, as who should not be? 269 One sentence, however, is worth quotation or, at least, a summary, as follows: "But if the divine Galen will here allow, as in other places he does, that all the arteries of the body arise from the great artery, and that this takes its origin from the heart; 270 that all the vessels naturally contain and carry blood; that the three semilunar valves situated at the orifice of the aorta prevent the return of the blood into the heart, and that they were here for some important purpose,-- 271 I do not see how he can deny that the great artery is the very vessel to carry the blood, when it has attained its highest triumph of perfection, from the heart for distribution to all parts of the body."

272 His Chapter Six deals with the course by which blood is carried from the right into the left ventricle, and here one must admire the large number of experimental demonstrations which Harvey had undertaken upon all classes of animals, 273 for he speaks even of that which occurs in small insects, whose circulation he had studied so far as he could with the simple lens. 274 Furthermore he described the prenatal circulation, omitting practically nothing of that which is taught to-day, 275 showing that in embryos, while the lungs are yet in a state of inaction, both ventricles of the heart are employed, as if they were but one, for the

transmission of blood. 276 In concluding this chapter he again states briefly the course of the blood, and promises to show, first, that this may be so and, then, to prove that it really is so.

277 His Chapter Seven is devoted to showing how the blood passes through the substance of the lungs from the right ventricle and then on into the pulmonary vein and left ventricle. 278 He alludes to the multitude of doubters as belonging, as the poet had said, to that race of people who, when they will, assent full readily, and when they will not, by no matter of means; 279 who, when their assent is wanted, fear, and when it is not, fear not to give it. 280 A little later on he says: "As there are some who admit nothing unless upon authority, let them learn that the truth I am contending for can be confirmed from Galen's own words, 281 namely, that not only may the blood be transmitted from the pulmonary artery into the pulmonary veins and then into the left ventricle of the heart, 282 but that this is effected by the ceaseless pulsation of the heart and the movements of the lungs in breathing." 283 He then shows how Galen explained the uses of the valves and the necessity for their existence, as well as the universal mutual anastomosis of the arteries with the veins, 284 and that the heart is incessantly receiving and expelling blood by and from its ventricles, for which purpose it is furnished with four sets of valves, two for escape and two for inlet and their regulation.

285 Harvey then noted a well-known clinical fact, that the more frequent or forcible the pulsations, the more speedily might the body be deprived of its blood during hemorrhage, 286 and that it thus happens that in fainting fits and the like, when the heart beats more languidly, hemorrhages are diminished and arrested. 287 The balance of the book is practically devoted to further demonstration and corroboration of statements already made. 288 A study of this work of Harvey's illustrates how much respect even he and his contemporaries still showed for the authority of Galen. 289 It shows still further how nearly Galen came to the actual truth concerning the circulation. 290 Had

the latter not adopted too many of the notions of his predecessors concerning the nature of the soul (Anima) and the spirits (Pneuma) of human, he might himself have anticipated Harvey by a thousand years, 291 and by such announcement of a great truth have set forward physiology by an equal period. 292 Independent and original as Harvey showed himself, he seems to have failed to get away from the notion of the vapours and spiritual nature of the blood which he had inherited from the writings of Galen and many others. 293 Nevertheless he also alludes to this same blood as alimentive and nutritive. We must not forget, however, that this was years before Priestly's discovery of oxygen 294 and that Harvey had, like others, no notion of the actual purpose of the lungs, believing that the purification and revivification of the blood was the office of the heart itself.

295 Along with its other intrinsic merits Harvey's book possesses a clear and logical arrangement, the author first disposing of the errors of antiquity, 296 describing next the behaviour of the heart in the living animal, showing its automatic pumplike structure, its alternate contractions and the other phenomena already alluded to, 297 thus piling up facts one upon another in a manner which proved quite irresistible. 298 The only thing that he missed was the ultimate connection between the veins and the arteries, i. e., the capillaries, 299 which it remained for Malpighi to discover with the then new and novel microscope, which he did about 1657, showing the movement of the blood cells in the small vessels, 300 and confirming the reality of that ultimate communication which had been held to exist. 301 Malpighi discovered the blood corpuscles in 1665, but it remained for Leeuwenhoek, of Delft, in 1690, by using an improved instrument to demonstrate to all observers the actual movements of the circulating blood in the living animal. 302 One historian has said that with Harvey's overthrow of the old teachings regarding the importance of the liver and of the spirits in the heart "fell the four fundamental humours and qualities" 303 while Daremberg

exclaims: "As in one of the days of the creation, chaos disappeared and light was separated from darkness."

304 It remains now only to briefly consider how Harvey's great discovery was received. To quote the words of one writer: 305 "So much care and circumspection in search for truth, so much modesty and firmness in its demonstration, so much clearness and method in the development of his ideas, should have prepossessed everyone in favour of the theory of Harvey; 306 on the contrary, it caused a general stupefaction in the medical world and gave rise to great opposition."

307 During the quarter of a century which elapsed after Harvey's announcement there probably was not an anatomist nor physiologist of any prominence who did not take active part in the controversy engendered by it; 308 even the philosopher Descartes was one of the first adherents of the doctrine of the circulation, which he corroborated by experiments of his own.

309 Two years after the appearance of Harvey's book appeared an attack, composed in fourteen days by one Primerose, a man of Scotch descent, born and educated in France, but practising at Hull, 310 in which he pronounced the impossibilities of surpassing the ancients or improving on the work of Riolan, who already had written in opposition to Harvey, and who was the only one to whom the latter vouchsafed an answer. 311 It was Riolan who procured a decree of the Faculty of Paris prohibiting the teaching of Harvey's doctrine. 312 It was this same Riolan who combated with equal violence and obstinacy the other great discovery of the age, namely,-- the circulation of the lymph.

313 One of the earliest and fiercest adversaries of Harvey's theory was Plempius, of Louvaine, who, however, gave way to the force of argument 314 and who finally publicly and voluntarily passed over to the ranks of its defenders in 1652, becoming one of Harvey's most enthusiastic advocates.

315 Harvey's conduct through the controversy was always of the most dignified character; 316 in fact, he rarely ventured to reply in any way to his adversaries,

believing in the ultimate triumph of the truths which he had enunciated. 317 His only noteworthy reply was one addressed to Riolan, then Professor in the Paris Faculty and one of the greatest anatomists of his age, to whose opinion great value was always attached. 318 Even in debating or arguing against him, Harvey always spoke of him with great deference, calling him repeatedly The Prince of Science. 319 Riolan was, however, never converted, though whether he held to his previous position from obstinacy, from excess of respect for the ancients, or from envy and jealousy of his contemporary, is not known.

320 Another peculiar spectacle was afforded by one Parisunus, who died in 1643, a physician in Venice, who, like Harvey, had been a pupil of Fabricius of Aquapendente, who had been stigmatised by Riolan as an ignoramus in anatomy, 321 but who joined with others in declaring that he had seen the heart beat when perfectly bloodless, and that no beating of the heart and no sounds were to be heard as Harvey had affirmed.

322 With the later and more minute studies into the structure and function of the heart we are not here concerned. The endeavour has been rather to place before you the sentiments, 323 the knowledge and the habits of thought of the people of Harvey's time, with the briefest possible epitome of what they knew, or rather of how little they knew, 324 to account for this later slavish adherence to authority by unwillingness to reason independently, or to observe natural phenomena intelligently, still less to experiment with them. 325 It is, then, rather the brief history of an epochal discovery than an effort to trace out its far-reaching consequences that I have endeavoured to give.

326 Here must close an account which perhaps has been to you tedious, and yet which is really brief, of Harvey's life and labours. 327 He lived to see his views generally accepted and to enjoy his own triumph, a pleasure not attained by many great inventors or discoverers. 328 Lessons of great importance may be gathered

from a more careful study of this great historical epoch, but they must be left to your own powers of reasoning rather than to what I may add here. 329 I commend it to you as a fertile source of inspiration, and a line of research worthy of both admiration and imitation. 330 Few people have rendered greater service to the world by the shedding of blood than did Harvey, in his innocent and wonderful studies of its natural movement. 331 Perhaps it might be said of him that he was the first man to show that "blood will tell." What he made it tell has been thus briefly told to you.

332 I know not how I may better close this account than by quoting the concluding words of his famous book, 333 and especially repeating the lines which he has quoted from some Latin author whom I have not been able to identify. His paragraph and his quotation are as follows: 334 "Finally, if any use or benefit to this department of the republic of letters should accrue from my labours, it will, perhaps, be allowed that I have not lived idly, and, as the old man in the comedy says:

335 'For never yet hath anyone attained
To such perfection, but that time, and place,
And use, have brought addition to own knowledge;
Or made correction, or admonished you,
That you was ignorant of much which you
Had thought you knew; or led you to reject
What you had once esteemed of highest price.'"

HISTORY OF ANAESTHESIA AND THE INTRODUCTION OF ANAESTHETICS IN SURGERY

Commemorative Address delivered at the Medical Department, University of Buffalo, October 16, 1896.

IN COMMEMORATION OF THE SEMI-CENTENNIAL OF THE INTRODUCTION OF ETHER AS AN ANAESTHETIC AGENT

13 Fifty years ago to-day-- that is to say, on the 16th of October, 1846,-- there occurred an event which marks as distinct a step in

human progress as almost any that could be named by the erudite historian. 2 I refer to the first demonstration of the possibility of alleviating pain during surgical operations. 3 Had this been the date of a terrible battle, on land or sea, with mutual destruction of thousands of human beings, the date itself would have been signalised in literature and would have been impressed upon the memory of every schoolboy, 4 while the names of the great military murderers who commanded the opposing armies would have been emblasoned upon monuments and the pages of history. 5 But this event was merely the conquest of pain and the alleviation of human suffering, 6 and no one who has ever served own race by contributing to either of these results has been remembered beyond own generation or outside the circle of own immediate influence. Such is the irony of fate. 7 The world erects imposing monuments or builds tombs, like that of Napoleon, to the memory of those who have been the greatest destroyers of their race; 8 and so Cæsar, Hannibal, Genghis Khan, Richard the Lion-hearted, Gustavus Vasa, Napoleon and hundreds of other great military murderers have received vastly more attention, because of their race-destroying propensities and abilities, than if they had ever fulfilled fate in any other capacity. 9 But the people like Sir Spencer Wells, who has added his 40,000 years of life to the total of human longevity, 10 or like Sir Joseph Lister, who has shown our profession how to conquer that arch enemy of time past, surgical sepsis, 11 or like Morton, who first publicly demonstrated how to bring on a safe and temporary condition of insensibility to pain, 12 are people more worthy in our eyes of lasting fame, and much greater heroes of their times, and of all time,-- 13 yet are practically unknown to the world at large, to whom they have ministered in such an unmistakable and superior way.

14 This much, then, by way of preface and reason for commemorating in this public way the semi-centennial of this really great event. 15 Because the world

does scant honour to these people we should be all the more mindful of their services, and all the more insistent upon their public recognition. 16 Of all the achievements of the Anglo-Saxon race, I hold it true that the two greatest and most beneficent were the discovery of ether and the introduction of antiseptic methods,-- one of which we owe to an American, the other to a Briton.

17 The production of deep sleep and the usual accompanying abolition of pain have been subjects which have ever appeared, in some form, in myth or fable, and to which poets of all times have alluded, usually with poetic license. 18 One of the most popular of these fables connects the famous oracle of Apollo, at Delphi, 19 whence proceeded mysterious utterances and inchoate sounds, with convulsions, delirium and insensibility upon the part of those who approached it. 20 To what extent there is a basis of fact in this tradition can never be explained, but it is not improbable from what we now know of hypnotic influence.

21 From all time it has been known that many different plants and herbs contained principles which were narcotic, stupefying or intoxicating. 22 These properties have especially been ascribed to the juices of the poppy, the deadly nightshade, henbane, the Indian hemp and the mandrágora, which for us now is the true mandrake, whose juice has long been known as possessing soporific influence. 23 Ulysses and his companions succumbed to the influence of 'Nepenthe'; and, nineteen hundred years ago, when crucifixion was a common punishment of malefactors, 24 it was customary to assuage their last hours upon the cross by a draught of vinegar with gall or myrrh, which had real or supposititious narcotic properties. 25 Even the prophet Amos, seven hundred years before the time of Christ, spoke of such a mixture as this as "the wine of the condemned," 26 for he says, in rehearsing the iniquities of Israel by which they had incurred the anger of the Almighty: 27 "And they lay themselves down upon the clothes laid to pledge by every altar, and they drink the wine of

the condemned in the house of their God," (Chapter-2, verse:8), 28 meaning thereby undoubtedly that these people, in their completely demoralised condition, drank the soporific draught kept for criminals.

29 Herodotus mentions a habit of the Scythians, who employed a vapour generated from the seed of the hemp for the purpose of producing an intoxication by inhalation. 30 Narcotic lotions were also used for bathing the people about to be operated upon. 31 Pliny, who perished at the destruction of Herculaneum, A. D. 79, testified to the soporific power of the preparations made from mandrágora upon the faculties of those who drank it. 32 He says: "It is drunk against serpents and before cuttings and puncturings, lest they should be felt." 33 He also describes the indifference to pain produced by drinking a vinous infusion of the seeds of eruca, called by us the rocket, upon criminals about to undergo punishment. 34 Dioscorides relates of mandrágora that "some boil down the roots in wine to a third part, and preserve the juice thus procured, and give one cyathus of this to cause the insensibility of those who are about to be cut or cauterised." 35 One of his later commentators also states that wine in which mandrágora roots have been steeped "does bring on sleep and appease pain, 36 so that it is given to those who are to be cut, sawed or burnt in any parts of their body, that they may not perceive pain." 37 Apuleius, about a century later than Pliny, advised the use of the same preparation. 38 The Chinese, in the earlier part of the century, gave patients preparations of hemp, by which they became completely insensible and were operated upon in many ways. 39 This hemp is the cannabis Indica which furnishes the 'Hasheesh' of the Orient and the intoxicating and deliriating 'Bhang', about which travellers in the East used to write so much. 40 In Barbara, for instance, it was always taken, if possible, by criminals condemned to suffer mutilation or death.

41 According to the testimony of medieval writers, knowledge of these narcotic drugs was practically applied during the last of the Crusades, 42 the probability

being that the agent principally employed was this same hasheesh. Hugo di Lucca gave a complete formula for the preparation of the mixture, 43 with which a sponge was to be saturated, dried, and then, when wanted, was to be soaked in warm water, and afterward applied to the nostrils, until he who was to be operated upon had fallen asleep; after which he was aroused with the vapour of vinegar.

44 Strangely enough, the numerous means of attaining insensibility, then more or less known to the common people, and especially to criminals and executioners, do not appear to have found favour for use during operations. 45 Whether this was due to unpleasant after-effects, or from what reason, we are not informed. 46 Only one or two surgical writers beside Guy de Chauliac (1498) refer in their works to agents for relief of pain, 47 and then almost always to their unpleasant effects, the danger of producing asphyxiation, and the like. 48 Ambrose Paré wrote that preparations of mandrágora were formerly used to avert pain. 49 In 1579, an English surgeon, Bulleyn, affirmed that it was possible to put the patient into an anaesthetic state during the operation of lithotomy, but spoke of it as a "terrible dream." 50 One Meisner spoke of a secret remedy used by Weiss, about the end of the 17th Century, upon Augustus II., king of Poland, 51 who produced therewith such perfect insensibility to pain that an amputation of the royal foot was made without suffering, even without royal consent. 52 The advice which the Friar gave Juliet regarding the distilled liquor which she was to drink, and which should presently throw her into a cold and drowsy humour, although a poetic generality, is Shakespeare's recognition of a popular belief. 53 Middleton, a tragic writer of Shakespeare's day, in his tragedy known as "*Women beware Women,*" refers in the following terms to anesthesia in surgery:

54 "I'll imitate the pities of old surgeons
To this lost limb, who, ere they show their art,
Cast one asleep; then cut the diseased part."

55 Of course, of all the narcotics in use by educated people, opium has been, since its discovery and introduction, the most popular and generally used. 56 Surgeons of the last century were accustomed to administer large doses of it shortly before an operation, which, if serious, was rarely performed until the opiate effect was manifested. 57 Still, in view of its many unpleasant after-effects, its use was restricted, so far as possible, to extreme cases.

58 Baron Larrey, noticing the benumbing effect of cold upon wounded soldiers, suggested its introduction for anesthetic purposes, 59 and Arnott, of London, systematised the practice, by recommending a freezing mixture of ice and salt to be laid directly upon the part to be cut. 60 Other surgeons were accustomed to put their patients into a condition of either alcoholic intoxication or alcoholic stupour. 61 Long-continued compression of a part was also practised by some, by which a limb could, as we say, be made to "go to sleep." 62 A few others recommended to produce faintness by excessive bleeding.

63 It was in 1776 that the arch-fraud Mesmer entered Paris and began to initiate people into the mysteries of what he called 'animal magnetism', which was soon named mesmerism, after him. 64 Thoroughly degenerate and disreputable as he was, he nevertheless taught people some new truths, which many of them learned to their sorrow, 65 while in the hospitals of France and England severe operations were performed upon patients thrown into a mesmeric trance, and without suffering upon their part. 66 That a scientific study of the mesmeric phenomena has occupied the attention of eminent people in recent years, and that hypnotism is now recognised as an agent often capable of producing insensibility to pain is simply true, 67 as these facts have been turned to the real benefit of human by scientific students rather than by quacks and charlatans.

68 In 1799, Sir Humphrey Davey, being at that time an assistant in the private hospital of Dr. Beddoes, which was established for treatment of disease by inhalation of gases, 69 and which

he called ‘The Pneumatic Institute’, began experimenting with nitrous oxide gas, and noticed its exhilarating and intoxicating effects; also the relief from pain which it afforded in headache and toothache. 70 As the results of his reports, a knowledge of its properties was diffused all over the world, and it was utilised both for amusement and exhibition purposes. 71 Davey even wrote as follows of this gas: As nitrous oxide, in its extensive operation, appears capable of destroying physical pain, it may probably be used with advantage during surgical operations in which no great effusion of blood takes place.

72 It is not at all unlikely that Colton and Wells, to be soon referred to, derived encouragement, if not incentive, from these statements of Davey. 73 Nevertheless, Velpeau, perhaps the greatest French surgeon of his day, wrote in 1839, that "to escape pain in surgical operations is a chimera which we are not permitted to look for in our day."

74 Sulphuric ether, as a chemical compound, was known from the 13th Century, for reference was made to it by Raymond Lully. 75 It was first spoken of by the name of ether by Godfrey, in the Transactions of the London Royal Society, in 1730, while Isaac Newton spoke of it as the ethereal spirits of wine. 76 During all of the previous century it was known as a drug, and allusion to its inhalation was made in 1795 in a pamphlet, probably by Pearson. 77 Beddoes, in 1796, stated that "it gives almost immediate relief, both to the oppression and pain in the chest, in cases of pectoral catarrh." 78 In 1815, Nysten spoke of inhalation of ether as being common treatment for mitigating pain in colic, and in 1816 he described an inhaler for its use. 79 As early as 1812 it was often inhaled for experiment or amusement, and so-called "ether frolics" were common in various parts of the country.

80 This was true, particularly for our purpose, of the students of Cambridge, and of the common people in Georgia in the vicinity of Long's home. 81 It probably is for this reason that a host of claimants for the honour of the discovery appeared so soon as the true

anesthetic properties of the drug were demonstrated. 82 There probably is every reason to think that, either by accident or design, a condition of greater or less insensibility to pain had been produced between 1820 and 1846, by a number of different people, educated and ignorant, 83 but that no one had the originality or the hardihood to push these investigations to the point of determining the real usefulness of ether. 84 This was partly from ignorance, partly from fear, and partly because of the generally accepted impossibility of producing safe insensibility to pain. 85 So, while independent claims sprang up from various sources, made by aspirants for honours in this direction, 86 it is undoubtedly as properly due to Morton to credit him with the introduction of this agent as an anesthetic as to credit Columbus with the discovery of the New World, 87 in spite of certain evidences that some portions of the American continent had been touched upon by adventurous voyagers before Columbus ever saw it.

88 The noun "anesthesia" and the adjective "anesthetic" were suggestions of Dr. Oliver Wendell Holmes, who early proposed their use to Dr. Morton in a letter which is still preserved. 89 He suggests them with becoming modesty, advises Dr. Morton to consult others before adopting them, but, nevertheless, states that he thinks them apt for that purpose. 90 The word anesthesia, therefore, is just about of the same age as the condition itself, and it, too, deserves commemoration upon this occasion.

91 As one reads the history of anesthesia, which has been written up by a number of different authors, each, for the main part, having some particular object in view, or some particular friend whose claims he wishes especially to advocate, 92 he may find mentioned at least a dozen different names of people who are supposed to have had more or less to do with this eventful discovery. 93 But, for all practical purposes, one may reduce the list of claimants for the honour to four men, each of whose claims I propose to briefly discuss.

94 These men were Long, Wells, Jackson and Morton. Of these four, two were dentists and two practising physicians, 95 to whom fate seems to have been unkind, as it often is, since three of them at least died a violent or distressing death, 96 while the fourth lived to a ripe old age, harassed at almost every turn by those who sought to decry his reputation or injure his fortunes.

97 Crawford W. Long was born in Danielsville, Ga., in 1816. In 1839 he graduated from the Medical Department of the University of Pennsylvania. 98 In the part of the country where Long settled it was a quite common occurrence to have what were known as "ether frolics" at social gatherings, 99 ether being administered to various persons to the point of exhilaration, which in some instances was practically uncontrollable. 100 Long's friends claim that he had often noticed that when the ether effect was pushed to this extent the subjects of the frolic became oblivious to minor injuries, and that these facts, often noticed, suggested to his mind the use of ether in surgical operations. 101 There is good evidence to show that Long first administered ether for this purpose on the 30th of March, 1842, and that on June 6th he repeated this performance upon the same patient; 102 that in July he amputated a toe for a negro boy, but that the fourth operation was not performed until September of 1843.

103 In 1844 a young man, named Wilhite, who had helped to put a coloured boy to sleep at an ether frolic in 1839, became a student of Dr. Long's, to whom Long related his previous experiences. 104 Long had never heard of Wilhite's episode, but had only one opportunity, in 1845, to try it, again upon a negro boy. 105 Long lived at such a distance from railroad communication (130 miles) as to have few advantages, either of practice, observation or access to literature. 106 Long made no public mention of his use of ether until 1849, when he published An Account of the First Use of Sulphuric Ether by Inhalation as an Anesthetic in Surgical Operations, 107 stating that he first read of Morton's

experiments in an editorial in the 'Medical Examiner' of December, 1846, 108 and again later; on reading which articles he determined to wait before publishing any account of his own discovery, to see whether anyone else would present a prior claim. 109 No special attention was paid to Long's article, as it seemed that he merely desired to place himself on record. 110 There is little, probably no reasonable doubt as to Long's priority in the use of ether as an anesthetic, although it is very doubtful if he carried it, at least at first, to its full extent. 111 Nevertheless Long was an isolated observer, working entirely by himself, having certainly no opportunity and apparently little ambition to announce his discovery, and having no share in the events by which the value of ether was made known to the world.

112 Long's strongest advocate was the late Dr. Marion Sims, who made a strong plea for his friend, and yet was not able to successfully establish anything more than has just been stated. 113 As Dr. Morton's son, Dr. W. J. Morton, of New York, says, when writing of his father's claim: "People used steam to propel boats before Fuller; electricity to convey messages before Morse; vaccine virus to avert smallpox before Jenner; and ether to annul pain before Morton." 114 But these people are not generally credited with their introduction by the world at large and, he argues, neither should Long or the other contestants be given the credit due Morton himself. 115 In fact, Long writes of his own work that the result of his second experiment was such as to make him conclude that ether would only be applicable in cases where its effects could be kept up by constant use; 116 in other words, that the anesthetic state was of such short duration that it was to him most unsatisfactory.

117 Sir James Paget has summed up the relative claims of our four contestants in an article entitled *Escape from Pain*, published in the 'Nineteenth Century' for December, 1879. 118 He says: "While Long waited, and Wells turned back, and Jackson was thinking, and those to whom they

had talked were neither acting nor thinking, Morton, the practical man, went to work and worked resolutely. 119 He gave ether successfully in severe surgical operations; he loudly proclaimed his deeds and he compelled humankind to hear him."

120 Horace Wells was born in Hartford, Vt., in 1815. In 1834 he began to study dentistry in Boston, and after completing his studies began to practise in Hartford, Ct. 121 He was a man of no small ingenuity, and devised many novelties for his work. In December, 1844, he listened to a lecture delivered by Dr. Colton, who took for his subject nitrous oxide gas, 122 the amusing effects of which he demonstrated to his audience upon a number of persons who visited the platform for that purpose. Wells was one of these. 123 Wells, moreover, noticed that another young man, who bruised himself while under its influence, said afterward that he had not hurt himself at all. 124 Wells then stated to a bystander that he thought that if one took enough of that kind of gas he could have a tooth extracted and not feel it. 125 He at once called upon a neigbouring dentist friend and made arrangements to test the anesthetic effects of the gas upon himself the next morning. 126 Accordingly Colton gave him the gas, and Riggs, the friend, extracted the tooth; and Wells, returning to consciousness, assured them both that he had not suffered a particle of pain. 127 He began at once to construct an apparatus for its manufacture. Dr. Marcey, of Hartford, then informed Wells that while a student at Amherst he and others had often inhaled nitrous oxide as well as the vapour of ether, for amusement, and suggested to Wells to try ether. 128 After a few trials, however, it was found more difficult to administer, and Wells accordingly resolved to adhere to gas alone. 129 This was in 1844, two years after Long's obscure experiments, of which, of course, they were ignorant. 130 In 1845, Wells visited Boston for the purpose of introducing his discovery, and among others called upon his former partner, Morton, trying to establish the use of the gas. 131 He soon became

discouraged, however, and returned to Hartford, resuming his practice. 132 There he continued to use gas for about two years, but failed to secure its introduction into general surgery, owing to prejudice and ignorance on the part of dentists and physicians alike. 133 Wells's claims have been advocated by many of his fellow-citizens, and in Bushnell Park, in Hartford, stands a monument erected by the city and the state, dedicated to Horace Wells, "who discovered anesthesia, November, 1844."

134 C. T. Jackson was born in Plymouth, Massachussets, in 1805. He graduated in the Harvard Medical School in 1829, after which he went abroad, where he remained for several years, 135 made the acquaintance of the most distinguished men, experimented in general science, electricity and magnetism and even devised a telegraphic apparatus, similar to that which Morse patented a year later. 136 Returning, in 1835, he opened in Boston a labouratory for instruction in analytical chemistry, the first of its kind in the country. 137 He also made quite a reputation as a geologist and mineralogist and received official appointments from Maine, Rhode Island, New Hampshire and other states. 138 In 1845 he discovered and opened up copper and iron mines in the Lake Superior district. 139 In 1846 and 1847 he was much aroused by Morton's experiments with sulphuric ether, and claimed even that he had suggested the use of ether to Morton, 140 claiming also that he had himself been relieved of an acute distress by inhalation of ether vapour, 141 and that it was from reflection on the phenomena presented in his own case that the possibility of its use for relief of pain during surgical operations suggested itself to him. 142 This led to a triangular conflict for the priority of discovery between Wells, Jackson and Morton, each claiming the honour for himself. 143 Wells health soon gave way. He went abroad and got recognition from the French Institute and the Paris Academy of Sciences, which did not, however, endorse his claim as discoverer nor accept nitrous oxide as an anesthetic. 144 Wells returned to

find that Morton was on the tide of popular favour, the public having endorsed ether as the only reliable anesthetic. 145 His mind became unbalanced, and in a fit of temporary aberration he ended his own life in a prison cell, in New York city in 1848.

146 Wells being out of the way, Jackson became Morton's most violent opponent, and the two indulged in a most bitter fight and unseemly discussion. 147 A few years later, Jackson, who, as remarked, had an extensive acquaintance abroad, visited Europe and presented his claim to the credit of the discovery of ether before various individuals and learned bodies, 148 and so well did he work upon the French Institute as to be recognised as the discoverer of modern anesthesia. 149 A select committee of the House of Representatives, to whom in 1854 Congress referred the matter, announced the following conclusions: 150 "First, that Dr. Horace Wells did not make any discovery of the anesthetic properties of the vapour of ether which he himself considered reliable and which he thought proper to give to the world. 151 That his experiments were confined to nitrous oxide, but did not show it to be an efficient and reliable anesthetic agent....

152 "Second, that Dr. Charles T. Jackson does not appear at any time to have made any discovery in regard to ether which was not in print in Great Britain some years before. * * * * *

153 "Fifth, that the whole agency of Dr. Jackson in the matter appears to consist entirely in his having made certain suggestions to aid Dr. Morton to make the discovery."

154 In 1873, Jackson's mind gave way, and after seven years of confinement in an asylum he died in 1880, at the age of 75, having been the recipient of many honours from foreign potentates and learned societies.

155 William T. G. Morton was born in Charleston, Massachussets, in 1819. After a disastrous experience in business he was sent to Baltimore in 1840 and began the study of dentistry. 156 In 1841 he entered the dental office of Horace Wells as student and assistant, becoming a partner in 1842. In 1843 partnership was dissolved, Wells removing to Hartford, as

before stated. 157 Morton, ambitious for a medical degree, entered his name as a student in the office of Charles T. Jackson, in 1844, and the same year matriculated in the Harvard Medical School, though he never graduated. 158 Having learned through Wells of the latter's successful use of nitrous oxide gas, but not knowing how to make it, 159 he sought the advice of Dr. Jackson, who informed him that its preparation entailed considerable difficulty, and inquired for what purpose he wanted it. 160 On Morton's replying that he wished to use it to make patients insensible to pain, Jackson suggested the use of sulphuric ether, 161 as Marcey had suggested it to Wells two years previously, saying that it would produce the same effect and did not require any apparatus. 162 Jackson also told Morton of the ether frolics common at Cambridge among the students. 163 That same evening, September 30, 1846, Morton administered ether to a patient and extracted a tooth for him without pain. 164 The next day he visited the office of a patent lawyer, for the purpose of securing a patent upon the new discovery. 165 This lawyer ascertained that Jackson had been intimately connected with its suggestion, and came to the conclusion that a patent could not safely issue to either one independently of the other. 166 But Jackson being a member of the State Medical Society, against whose ethical code it is to patent discoveries that pertain to the welfare of patients, 167 and fearing the censure of his colleagues, agreed at once to assign his right over to Morton, receiving in return a 10 per cent. commission upon all that the latter made out of it. 168 Morton, as a dentist, having no more compunction then than dentists have now upon the securement of a patent,-- in other words, being actuated by no fine ethical scruples,-- 169 secured the patent, and then called upon Dr. J. Mason Warren, one of the surgeons in the Massachusetts General Hospital. Warren promised his coöperation and appointed the 16th of October, 1846, for the first public trial.

170 Upon this occasion the clinic room was filled with visitors and

students, when Morton placed the young man under the influence of his "letheon," as he called it then; after which Warren removed a tumor from his neck. 171 The trial was most successful. Another took place on the following day, and on November 7th an amputation and an excision of the jaw were made, both patients being under the influence of letheon and oblivious to pain. 172 At this time the nature of the anesthetic agent was kept a secret, the vapour of ether being disguised by aromatics, so as not to be recognised by anyone present. 173 True to the highest traditions of their craft, the staff of the Massachusetts General Hospital now met and declined to make further use of a drug whose composition was thus kept secret. 174 It was then that Morton revealed the exact nature of it as sulphuric ether, disguised with aromatic oils.

175 In a report made by the commissioner of patents, it was set forth that: "For many years it had been known that the vapour of sulphuric ether, when freely inhaled, would intoxicate as does alcohol when taken into the stomach, but that the former was much more temporary in its effects. 176 But notwithstanding the records of its effects to this extent, which were familiar to so many, no surgeon had ever attempted to substitute it for the palliatives in common use previous to surgical operations. 177 That, in view of these and other considerations, a patent had been granted for the discovery."

178 In 1846 an English patent was obtained. Morton soon began the attempt to sell office rights, as do the dentists of to-day, 179 while the medical profession was then, as ever, antagonistic to patents, holding them to be subversive of general good. 180 His patent was soon opposed and then generally infringed upon. Litigation followed without end, and the government stultified itself by refusing to recognise the validity of the patent issued by itself. 181 And so, without any compensation to the discoverer, ether soon came into general use in this country as abroad. While receiving many congratulations from friends and humanitarians, 182 Morton's success aroused the jealousy of some of his professional brethren,

among them one Dr. Flagg, who commenced a terrible onslaught upon the new application of ether and its promoter. 183 By his machinations a meeting of Boston dentists was called and a committee of twelve appointed to make a formal protest against anesthesia. 184 This committee published a manifesto in the Boston Daily Advertiser', in which all sorts of untoward effects and unpleasant results were attributed to the new anesthetic. 185 This proclamation was spread broadcast, and did Morton, for the time, very much harm. 186 Equally obstreperous was Dr. Westcott, connected with the Dental College in Baltimore. He made fun of Morton's "sucking bottles," as his inhalers were dubbed; 187 and in various of the medical and secular journals of the day, bitter, often foolish and absurd, attacks were made. 188 The editors of the New Orleans Medical and Surgical Journal said: "That the leading surgeons of Boston could be captivated by such an invention as this, heralded to the world under such auspices and upon such evidences of utility and safety as are presented by Dr. Bigelow, excites our amazement. 189 Why, mesmerism, which is repudiated by the savants of Boston, has done a thousand times greater wonders, and without any of the dangers here threatened. What shall we see next?"

190 These and similar statements created a very strong prejudice against Morton, who, in December, 1846, sent to Washington, to a nephew of Dr. Warren, 191 to endeavour to urge upon the government the advantages of employing ether in the army during the Mexican war, then in progress. 192 The chief of the Bureau of Medicine and Surgery reported that the article might be of some service for use in large hospitals, but did not think it expedient for the department to incur any expense by introducing it into the general service; 193 while the acting surgeon-general believed that the highly volatile character of the substance itself made it ill-adapted to the rough usage it would necessarily encounter upon the field of battle, and accordingly declined to recommend its use.

194 In January of 1853, Morton demonstrated at the infirmary in Washington, before a congressional committee and others, the anesthetic effect of ether, which he continued through a dangerous and protracted surgical operation. 195 This was the result of a challenge to compare the effects of nitrous oxide and those of ether, the advocates of the former not putting in an appearance. 196 The balance of Morton's life seems to have been spent in continued jangles. 197 The government, having repudiated its own patent, was repeatedly besought by memorials and through the influence of members of Congress to bestow some testimonial upon or make some money return to Morton for his discovery. 198 Several times he came near a realisation of his hopes in this respect, when the action of some of his enemies or the termination of a congressional session, or some other accident, would doom him again to disappointment. 199 The pages of evidence that were printed, the various reports issued through or by government officers, the memorials addressed from various individuals and societies, if all printed together, would make a large volume; but all of these were of no avail. 200 Morton spent all his means, as he spent his energies and time, in futile endeavour to get pecuniary recognition of his discovery, but was doomed to disappointment. 201 He seemed alike a victim of unfortunate circumstances and of treachery and animosity upon the part of his opponents. Especially did the fight wage warm between him and his friends and Jackson. 202 Plots to ruin his business were repeatedly hatched and his life was made miserable in many ways. 203 Mere temporary sops to wounded vanity and impaired fortune were the honourary degrees and the testimonials that came to him from various institutions of learning and foreign societies. 204 In 1850 both Morton and Jackson received from the French Academy prizes valued at 2,500 francs each.

205 Finally, Morton fell into a state of nervous prostration, suffered from anxiety and insomnia, and in a fit of temporary aberration exposed himself in Central Park,

New York, became unconscious, 206 and was taken to St. Luke's hospital, dying just as he reached the institution, on the 15th of July, 1868. 207 In Mount Auburn cemetery, in Boston, there stands a beautiful monument to William T. G. Morton, bearing this inscription: 208 "Inventor and revealer of anesthetic inhalation, before whom in all time surgery was agony; by whom pain in surgery was averted and annulled; since whom science has control of pain."

209 Again, in the Public garden in Boston there was erected, in 1867, a beautiful monument to the honour of the discoverer of ether, upon whom at that time they could not decide. 210 Upon the front are these words: "To commemorate that the inhaling of ether causes insensibility to pain, first proven to the world at the Massachusetts General hospital, in Boston, October, A. D. 1846." 211 Upon the right side are the words: "'Neither shall there be any more pain.'-- Revelations." 212 Upon the left: "'This also cometh forth from the Lord of Hosts, which is wonderful in counsel and excellent in working.'-- Isaiah." 213 And upon the other: "In gratitude for the relief of human suffering by the inhaling of ether, a citizen of Boston has erected this monument, A. D. 1867. The gift of Thomas Lee."

214 Summing up, then, the claims of our four contestants in the light of a collected history of the merits of each, 215 it would appear that Wells first made public use of nitrous oxide gas for limited purposes, but failed to introduce it into general professional use. 216 That Long, in an isolated rural practice, a few times used ether, with which he produced probably only partial insensibility to pain, and that he had apparently discontinued its use before learning of Morton's researches. 217 That Jackson made no claim to the use of the agent on his own part, but simply of having suggested it to Morton. 218 And, finally, that Morton quickly accepted the suggestion, made careful and scientific use thereof, but especially, and above all other things, first 'demonstrated' to the world at large the capability and the safety of this agent as an absolute, reliable and efficient anesthetic. 219 So, though Morton permitted his cupidity to run away

with finer ethical considerations, and attached a higher pecuniary than humanitarian value to sulphuric ether, 220 he, nevertheless, must be generally credited with having, to use the modern expression, "promoted" its introduction, and having shown to the world at large what an inestimably valuable therapeutic agent had been added to our resources for the control of pain.

221 The synthetic compound known as chloroform was discovered independently by three different observers between 1830 and 1832. These were respectively Guthrie, of Sackett's habour, N. Y.; Soubeiran, of France, and Liebig, of Germany. 222 The honour of introducing it to the profession as an anesthetic for surgical purposes is universally accorded to James Y. Simpson, then of Edinburgh. 223 Yet claim was at one time advanced in favour of Surgeon-Major Furnell, of the Madras Army Medical Corps, 224 who in the summer preceding the announcement of Simpson's brilliant discovery experimented with what is known as chloric ether, which is not an ether at all, but a solution of chloroform in alcohol. 225 It is said that he found that it would produce the same results as sulphuric ether, with less unpleasant sensations, and suggested its use to Coote, a well-known London surgeon. 226 However, such claims as those made in favour of Furnell are no more entitled to recognition than are those of Wells or Long in the matter of the introduction of ether to the public; 227 for although individual observations were favourable to the compound, it never came to public notice on this surmise.

228 Sir James Y. Simpson was born in 1811, took the degree of doctor of medicine in 1832 and advanced rapidly in his professional career until, in January, 1847, he was appointed one of her majesty's physicians in Scotland. 229 Having already obtained a large reputation, particularly in midwifery and gynecology, he directed his special attention toward the use of anesthetics in childbirth, 230 and he had quickly recognised the value of sulphuric ether when

introduced the previous year. He sought, however, for a substitute of equal power, having less disagreeable odour and unpleasant after effect. 231 Upon inquiry of his friend Waldie, Master of Apothecaries Hall of Liverpool, if he knew of a substance likely to be of service in this direction, Waldie, familiar with the composition of chloric ether, suggested its active principle chloroform; 232 with which Simpson experimented, and, upon the 4th of November, 1847, established its anesthetic properties. These he first made known to the Medico-Chirurgical Society of Edinburgh in a paper read November 10th. 233 Three days later a public test was to have been made at the Royal Infirmary, but Simpson, who was to administer the chloroform, being unavoidably detained, the operation was done as heretofore without an anesthetic, and this patient died during the operation.

234 You can readily see that had this occurred under chloroform it would have been ascribed to the new drug, which would then and there have received its death blow. 235 As it was, the first public trial took place two days later and the test was most successful. 236 One would think that such a boon as Simpson had here offered to the world would have been gratefully-- not to say greedily-- accepted by all. 237 Simpson's position was such as to give the new anesthetic every advantage that his already great reputation could attach to it, and it became at once the agent in common use in midwifery practice. 238 But the Scotch clergy of his day still possessed altogether too much of the old fanatic spirit of the church of the middle ages. 239 One is never allowed to forget, in scanning the history of medicine, how bitterly the church has opposed, until recently, every advance in our science and our art. 240 It was in A. D. 995, for instance, that the son of one of the Venetian Doges was married, in Venice, to a sister of the emperor of the Eastern Roman Empire. 241 At the marriage feast the princess produced a silver fork and gold spoon, table novelties which excited both amusing and angry comment. 242 But the Venetian aristocracy took up with this new

table fad, and forks and spoons as substitutes for fingers soon became the fashion. 243 But the puissant church disapproved most strongly even of this arrangement, for priests went so far as to say, "to use forks was to deliberately insult the kind Providence which had given to human fingers on each hand." 244 It was this same spirit that led the Scotch clergy to attack Simpson most vehemently and denounce him from their pulpits as one who violated the moral law, 245 for they said: "Is it not ordained in Scripture, 'in sorrow shalt thou bring forth children?' and yet this man would introduce a substance calculated to mitigate this sorrow."

246 We of to-day can scarcely imagine the rancour with which these attacks were made for many months. 247 Finally, however, these fanatic defenders of the faith were routed by a quotation from the same Scriptures in which they claimed to find their authority; 248 for Simpson, most adroitly turning upon them with their own weapons, called their attention to the first chapter of Genesis, in which an account of Eve's creation appears, 249 and reminded them that when Eve was formed from the rib of Adam, the Lord "caused a deep sleep to fall upon" him. 250 So weak was their cause that with this single quotation their opposition subsided and within a week or two the entire Scotch clergy was silenced. 251 Sir James Simpson received from his own government that which was never accorded to Morton: that is, due recognition of the great service he had rendered humanity. 252 He died in 1870, and upon his bust, which stands in Westminster Abbey, are the following words: "To whose genius and beneficence the world owes the blessings derived from the use of chloroform for the relief of suffering."

253 It is scarcely necessary that I delay you now with an account of all of the other ethereal anesthetic agents which have from time to time been advocated since the memorable days to which I have devoted most of my time to-night. 254 Two only are at present ever thought of-- namely, bichloride of methylene and bromide of ethyl!-- and these are used by only a few, though each has its advantages.

255 It is well known that nearly all of the ethers have more or less of anesthetic property, coupled with many dangers and disadvantages. 256 Sulphuric ether and chloroform hold the boards to-day as against any and all of their competitors. 257 Nitrous oxide gas, as already mentioned, was known to and used by Wells, in Hartford. With the advent of ether this gas fell at once into disuse, to be revived some fifteen years after the death of Wells, mainly through the use of Dr. G. Q. Colton. 258 Since this time its use has been quite universal, although confined for the main part to the offices of dentists. 259 Its great advantages are ease of administration and rapidity of recovery, making it especially useful for their purposes, 260 while the difficulties attendant upon prolonged anesthesia by it makes it less useful for the surgeon.

261 I will spend no further time upon it nor upon the subject save to do justice to modern anesthesia by a very different method and by means of a very different drug, which is to-day in so common use that we almost forget to mention the man to whom we owe it. 262 I allude to 'Cocaine' and its discoverer, Koller.

263 Cocaine is now such a universally recognised local anesthetic that there is the best of reason for referring to it here-- 264 the more so because it affords another opportunity to do honour to a discoverer, who has rendered a most important service to not only our profession, but to the world in general. 265 This principal active constituent of cocoa leaves was discovered about 1860 by Niemann, and called by him cocaine. 266 It is an alkaloid which combines with various acids in the formation of salts. It has the quality of benumbing raw and mucous surfaces, 267 for which purpose it was applied first in 1862 by Schroff, and in 1868 by Moreno. In 1880, Van Aurap hinted that this property might some day be utilised. 268 Karl Koller logically concluded from what was known about it that this anesthetic property could be taken advantage of for work about the eye, 269 and made a series of experiments upon the lower animals, by which he established

its efficiency and made a brilliant discovery.
270 He reported his experiments to the Congress of German Oculists, at Heidelberg, in 1884. 271 News of this was transmitted with great rapidity, and within a few weeks the substance was used all over the world. 272 Its use spread rapidly to other branches of surgery, and cocaine local anesthesia became quickly an accomplished fact. 273 More time was required to point out its disagreeable possibilities, its toxic properties and the like, but it now has an assured and most important place among anesthetic agents, and has been of the greatest use to probably 10-per cent. of the civilised world. 274 To Koller is entirely due the credit of establishing its remarkable properties.

The Book of Divine Panagogue called

VISION

TOWARDS A NEW THEORY OF VISION

George Berkeley

1 My design is to show the manner wherein we perceive by sight the distance, magnitude, and situation of OBJECTS. 2 Also to consider the difference there is betwixt the IDEAS of sight and touch, and whether there be any IDEA common to both senses.

THE DISTANCE FROM US OF THE OBJECTS OF SIGHT

3 It is, I think, agreed by all that DISTANCE, of itself and immediately, cannot be seen. 4 For DISTANCE being a Line directed end-wise to the eye, it projects only one point in the fund of the eye, which point remains invariably the same, whether the distance be longer or shorter.

5 I find it also acknowledged that the estimate we make of the distance of OBJECTS considerably remote is rather an act of judgment grounded on EXPERIENCE than of SENSE. 6 For example, when I perceive a great number of intermediate OBJECTS, such as houses, fields, rivers, and the like, which I have experienced to take up a considerable space, 7 I thence form a judgment or conclusion that the OBJECT I see beyond them is at a great distance. 8 Again, when an OBJECT appears faint and small, which at a near distance I have experienced to make a vigorous and large appearance, I instantly conclude it to be far off: 9 And this, it is evident, is the result of EXPERIENCE; without which, from the faintness and littleness I should not have inferred anything concerning the distance of OBJECTS.

10 But when an OBJECT is placed at so near a distance as that the interval between the eyes bears any sensible proportion to it, 11 the opinion of speculative people is that the two OPTIC AXES (the fancy that we see only with one eye at once being exploded) concurring at the OBJECT do there make an ANGLE, 12 by means of which, according as it is greater or lesser, the OBJECT is perceived to be nearer or farther off.

13 Betwixt which and the foregoing manner of estimating distance there is this remarkable difference: 14 that whereas there was no apparent, necessary connection between small distance and a large and strong appearance, or between great distance and a little and faint appearance, 15 there appears a very necessary connection between an obtuse angle and near distance, and an acute angle and farther distance. 16 It does not in the least depend upon experience, but may be evidently known by anyone before you had experienced it, 17 that the nearer the concurrence of the OPTIC AXES, the greater the ANGLE, and the remoter their concurrence is, the lesser will be the ANGLE comprehended by them.

18 There is another way mentioned by optic writers, whereby they will have us judge of those distances, in respect of which the breadth of the PUPIL hath any sensible bigness: 19 And that is the greater or lesser divergency of the rays, which issuing from the visible point do fall on the PUPIL, 20 that point being judged nearest which is seen by most diverging rays, and that remoter which is seen by less diverging rays: 21 and so on, the apparent distance still increasing, as the divergency of the rays decreases, till at length it becomes infinite, when the rays that fall on the PUPIL are to sense parallel. 22 And after this manner it is said we perceive distance when we look only with one eye.

23 In this case also it is plain we are not beholding to experience: it being a certain, necessary truth that the nearer the direct rays falling on the eye approach to a PARALLELISM, the farther off is the point of their intersection, or the visible point from whence they flow.

24 I have here set down the common, current accounts that are given of our perceiving near distances by sight, which, though they are unquestionably received for true by MATHEMATICIANS, 25 and accordingly made use of by them in determining the apparent places of OBJECTS, do, nevertheless seem to me very unsatisfactory: and that for these following reasons:--

VISION

26 FIRST, It is evident that when the mind perceives any IDEA, not immediately and of itself, it must be by the means of some other IDEA. 27 Thus, for instance, the passions which are in the mind of another are of themselves to me invisible. 28 I may nevertheless perceive them by sight, though not immediately, yet by means of the colours they produce in the countenance. 29 We often see shame or fear in the looks of a person, by perceiving the changes of own countenance to red or pale.

30 Moreover it is evident that no IDEA which is not itself perceived can be the means of perceiving any other IDEA. 31 If I do not perceive the redness or paleness of a person's face themselves, it is impossible I should perceive by them the passions which are in your mind.

32 Now from verses:3 and 4 it is plain that distance is in its own nature imperceptible, and yet it is perceived by sight. 33 It remains, therefore, that it be brought into view by means of some other IDEA that is itself immediately perceived in the act of VISION.
